<tbody>
<tr>
<td>All Categories</td>
<td>Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a category group, its visibility is defaulted to All Categories.</td>
</tr>
<tr>
<td>None</td>
<td>Users cannot see any categories in the category group.</td>
</tr>
<tr>
<td>Custom</td>
<td>Users can view a selection of categories in the category group.</td>
</tr>
</tbody>
</table>

In the Category Group Visibility Settings, you can:

- To view a category group’s setting details, click its name.
- To modify a category group’s visibility settings, click Edit next to it.
Modify Default Data Category Visibility

You can edit the default data category visibility.

1. From Setup, enter Default Data Category Visibility in the Quick Find box, then select Default Data Category Visibility.

   All active and inactive category groups are listed.

2. Pick a category group and click Edit.

3. To make all the categories in the category group visible by default, select All Categories. To make none of the categories visible by default, select None. To make some of the categories visible by default, select Custom.

4. If you chose Custom, move categories from the Available Categories area to the Selected Categories area as needed. Selecting a category implicitly includes its child and parent categories as well. Move categories from the Selected Categories area back to the Available Categories area to remove default visibility.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in Enterprise, Performance, Unlimited, and Developer Editions.

Salesforce Knowledge is available in Performance and Developer Editions and in Unlimited Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: Enterprise and Unlimited Editions.

USER PERMISSIONS

To view categories:
- “View Data Categories”

To manage data categories:
- “Manage Data Categories”
  
  AND
  
  “View Data Categories”

To assign default category groups:
- “Manage Data Categories”
Edit Category Group Visibility

You can edit your data category visibility.

1. Go to the data category visibility settings page in Setup.
   - For roles: enter Roles in the Quick Find box, then select Roles.
   - For a role on the Customer Portal or partner portal: enter Users in the Quick Find box, then select Users.
   - For permission sets: enter Permission Sets in the Quick Find box, then select Permission Sets.
   - For profiles: enter Profiles in the Quick Find box, then select Profiles.

2. Open a data category group for edit.
   - For roles, in the Category Group Visibility Settings related list, click Edit next to the category group you want to modify.
   - For permission sets and profiles:
     a. Click a permission set or profile name.
     b. Click Data Category Visibility.
     c. Click Edit next to the data category group you want to assign.

3. Select a visibility setting.

<table>
<thead>
<tr>
<th>Visibility Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Categories</td>
<td>Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a category group, its visibility is defaulted to All Categories.</td>
</tr>
<tr>
<td>None</td>
<td>Users cannot see any categories in the category group.</td>
</tr>
<tr>
<td>Custom</td>
<td>Users see your custom selection of categories. For roles, you can choose from the categories that are visible to the parent role. If the parent role's visibility changes to be less than its child's visibility, the child role's category visibility is reset to its parent's category visibility. To select categories, double-click the category in the Available Categories box. Alternatively, select a category and then click Add. Selecting a category implicitly includes its child and parent categories as well. Categories that are grayed out are not available for selection because their parent has already been selected.</td>
</tr>
</tbody>
</table>

**Note:** When you customize a role, permission set, or profile set to All Categories, first remove All from the Selected Categories box before you select specific categories.

4. Click Save.
Data Category Visibility Best Practices

• When you create a category group, its visibility is defaulted to All Categories.
• When you grant visibility to a category, you also grant visibility to its child and parent categories. If you want to give access to all categories in a branch of the category hierarchy, select the top-level category All Categories.
• Users who are not assigned to a category's visibility by role, permission set, or profile can only see uncategorized articles and questions unless:
  – The user has the “View all Data” permission.
  – A category group has been made visible to all users on the Default Data Category Visibility page in Setup.
• For role-based visibility, Customer Portal users and partner portal users inherit the role assigned to their account managers by default. You can change the category group visibility settings for each portal role.
• Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community.
• For role-based visibility, always set up data category visibility in a top-down approach from the top of the role hierarchy down to the bottom. Give the highest roles the most visibility and give subordinate roles reduced visibility.

Category Group Article Visibility Settings Examples

Review examples of category group settings for article visibility permissions.

There are three types of visibility:

• All Categories: All categories are visible
• None: No categories are visible
• Custom: Selected categories are visible

With custom data category visibility, you can only see the data categories permitted by their role, permission sets, or profile.

These examples are based on two sample category groups, Products and Geography:

Note: Although category group visibility settings are available with answers communities (questions) and Salesforce Knowledge (articles), the examples below apply to articles only.

Answers communities support one category group and one data category per question.

Example 1: A Role Hierarchy

In this example, the Acme Electronics organization manufactures hardware and provides customer support for both consumers and enterprises. The Engineering department is organized by products. The Support department is organized geographically. Europe and the Americas are managed by corporate teams, but Asia is outsourced. Within the corporate and outsourced teams, there are subteams dedicated either to consumer or enterprise support.

The table below shows the categories visible to each role in the Acme Electronics organization, and states whether the visibility settings are inherited from the parent role or if they are custom visibility settings.

<table>
<thead>
<tr>
<th>Acme Electronics Role Hierarchy</th>
<th>Visible Geographic Categories</th>
<th>Visible Product Categories</th>

</tr>
<tr>
<td>Enterprise Support Team</td>
<td>Asia</td>
<td>Enterprise Electronics, Computers</td>
</tr>
<tr>
<td></td>
<td>Inherit from Outsourced Support</td>
<td>Custom</td>
</tr>
</tbody>
</table>

### Example 2: Article Visibility

The table below is an in-depth example of how category visibility settings restrict what users see. This example has three sample users whose category settings are noted in parentheses.

<table>
<thead>
<tr>
<th>Categories</th>
<th>When User 1’s visibility is All countries/Computers, the category is:</th>
<th>When User 2’s visibility is America/All products, the category is:</th>
<th>When User 3’s visibility is France/None, the category is:</th>
</tr>
</thead>
<tbody>
<tr>
<td>All countries/Laptop</td>
<td>VISIBLE</td>
<td>VISIBLE</td>
<td>NOT VISIBLE</td>
</tr>
</tbody>
</table>

Table 45: Example: How Category Visibility Settings Restrict What Users See
<table>
<thead>
<tr>
<th>Categories</th>
<th>When User 1's visibility is All countries/Computers, the category is:</th>
<th>When User 2's visibility is America/All products, the category is:</th>
<th>When User 3’s visibility is France/None, the category is:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Canada/Computers</td>
<td>VISIBLE</td>
<td>VISIBLE</td>
<td>NOT VISIBLE</td>
</tr>
<tr>
<td>USA/All products</td>
<td>VISIBLE</td>
<td>VISIBLE</td>
<td>NOT VISIBLE</td>
</tr>
<tr>
<td>Europe/Switches</td>
<td>NOT VISIBLE</td>
<td>VISIBLE</td>
<td>NOT VISIBLE</td>
</tr>
<tr>
<td>Europe/No Categories</td>
<td>VISIBLE</td>
<td>NOT VISIBLE</td>
<td>VISIBLE</td>
</tr>
</tbody>
</table>

User 1: The user must be granted visibility in each category that classifies the article, or each category that classifies the article must be visible by default. In this example, User 1 can see Europe, because Europe is the child of All Countries, but he cannot see Switches, because Switches does not belong to Computers. That’s why User 1 cannot see articles classified with Europe/Switches.

User 2: When a category is made visible to a user through custom settings or is made visible by default, its child and parent categories are implicitly included; therefore, User 2 can see articles categorized with All Countries because it is the parent category of America. He can also see Articles classified with USA because it is the child of America.

User 3: If a user has no access to the whole category group, he can only see articles that are not categorized in that group. User 3 cannot see the articles categorized with All countries/Laptop because he has no visibility in the category group that includes Laptop, but he can see articles categorized with Europe/No categories.

### Case Teams and Queues

Create teams of people who work together to resolve cases faster, and create queues to share workloads among teams.

#### Case Teams

Case teams help groups of people work together to solve a case, such as a support agent, support manager, and a product manager.

#### Queues

Queues help you prioritize, distribute, and assign records to teams who share workloads. You can access queues from list views, and queue members can jump in to take ownership of any record in a queue. Queues are available for cases, leads, orders, custom objects, service contracts, and knowledge article versions.

### Case Teams

Case teams help groups of people work together to solve a case, such as a support agent, support manager, and a product manager.

If your admin has set up case teams, you can add people to the Case Team related list on cases. When adding a team member, choose one of the predefined roles that the person plays on the case. Roles determine the level of access to a case, such as read-only or read and write access.

You can add contacts to case teams, but they can only access cases when they’re enabled as customer portal users assigned to case page layouts. Customer portal users can’t update case teams or view case team roles. Case teams aren’t available for the partner portal.
Note: Admins can predefine case teams so that you can quickly add people who you frequently work with. Admins can create assignment rules that add predefined teams to cases that match specific criteria. Admins can also create email alerts that notify team members when an action happens on a case.

Tip: To filter case lists when you’re a team member, choose **My Case Teams**. To report on case teams that you belong to, run a case report, then choose **My team’s cases** from the View filter.

Set Up Case Teams
Create case teams to help groups of people work together to solve cases. Before you create case teams, define team roles.

Create Case Team Roles
Before you set up case teams or predefine case teams, create roles to determine team members level of access to cases.

SEE ALSO:
Queues

Set Up Case Teams
Create case teams to help groups of people work together to solve cases. Before you create case teams, define team roles.

To let people create and work on case teams, add the Case Team related list to case page layouts. Optionally, create email alerts that notify team members when actions happen on a case, such as when a comment is added. Also, if you’ve predefined case teams, create assignment rules that add teams to cases that match specific criteria, such as when cases originate from emails.

Note: Case teams count toward your org’s overall storage limit. Each team member on a case counts as 2 KB of storage space.

Set Up Assignment Rules

EDITIONS
Available in: Salesforce Classic
Available in: Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS
To set up case teams:
• “Customize Application” AND
  “Manage Users”
To add team members:
• “Edit” on cases
Create Case Team Roles

Before you set up case teams or predefine case teams, create roles to determine team members level of access to cases.

You can create an unlimited number of case team roles, but we recommend no more than 20 so as not to overwhelm team members.

1. From Setup, enter Case Team Roles in the Quick Find box, then select Case Team Roles.
2. Click New, and enter the role’s name.
3. From Case Access, choose the role’s level of access to cases.
   - **Read/Write**
     Members can view and edit cases and add related records, notes, and attachments to them.
   - **Read Only**
     Members can view cases and add related records to them.
   - **Private**
     Members can’t access cases.
4. If you want members in the role visible to customer portal users viewing cases, choose Visible in Customer Portal. Even if Visible in Customer Portal isn’t chosen, customer portal users added to case teams can view themselves on Case Team related lists.
5. Click Save.

**Note:** You can’t delete roles, but you can click Replace next to a role you want to replace across all cases. If your org has one role, you can’t replace it.

**Tip:** Roles don’t change a case owner’s access to cases, which is Read/Write by default.

Predefine Case Teams

After you define case team roles, you can predefine case teams so that support agents can quickly add people who they frequently work with to cases.

Set Up Email Alerts for Case Teams

Create email alerts for case teams so that each time a case is created or updated, team members are notified.

SEE ALSO:

- Case Teams
- Set Up Case Teams
Predefine Case Teams

After you define case team roles, you can predefine case teams so that support agents can quickly add people who they frequently work with to cases.

1. From Setup, enter Predefined Case Teams in the Quick Find box, then select Predefined Case Teams.
2. Click New, and enter the team’s name.
3. Add team members.
   a. Choose a team member type: User, Contact, or Customer Portal User. Contacts can access cases only when they’re enabled as customer portal users and assigned to case page layouts.
   b. Click Lookup and select a member.
   c. Choose a role for the member.
4. Click Save.

**Note:** To delete a predefined case team, remove it from assignment rules first. If you delete a predefined case team, it’s removed from all cases it’s on, and you can’t retrieve it from the Recycle Bin. When you remove members from a predefined case team, they’re removed from all cases in which they were members of the team.

SEE ALSO:
- Case Teams
- Set Up Case Teams

Set Up Email Alerts for Case Teams

Create email alerts for case teams so that each time a case is created or updated, team members are notified.

1. Create email templates for notifications.
2. Set up workflow rules that specify which actions on a case send email alerts to team members.
   a. From Setup, enter Workflow Rules in the Quick Find box, then select Workflow Rules.
   b. Click New Rule.
   c. From Select object, choose Case and click Next.
   d. Enter a rule name.
   e. Choose the evaluation criteria. To ensure that every case is evaluated for an email alert, we recommend that you set the evaluation criteria to **Evaluate the rule when a record is: created, and every time it’s edited**.
   f. Enter your rule criteria. We recommend that you choose **criteria are met** and select the criteria that a case must match to send email alerts. For example, if you want team members to receive an email alert each time a case’s status is set to New, set the criteria to **Case: Status equals New**.
   g. Click Save & Next.
3. Add email alerts to your workflow rule’s criteria.
a. Click **Add Workflow Action** and choose **New Email Alert**.

b. Enter a description and unique name for the email alert. Because you chose Case as the object for the workflow rule, object appears as read only.

c. Choose an email template.

d. Select who receives email alerts from the workflow rule. To select all members of a case team, choose **Case Team** from Recipient Type, and add the team as selected recipients. You can enter up to five more email addresses.

e. Click **Save**.

4. Activate the workflow rule and its email alert.

a. From Setup, enter **Workflow Rules** in the Quick Find box, then select **Workflow Rules**

b. Click **Activate** next to the name of the rule.

   **Note:** To prevent the rule from sending email alerts, click **Deactivate** at any time. If you deactivate a rule with pending actions, the actions finish as long as the case that triggered the rule isn’t updated.

- Manage Email Templates

### Queues

Queues help you prioritize, distribute, and assign records to teams who share workloads. You can access queues from list views, and queue members can jump in to take ownership of any record in a queue. Queues are available for cases, leads, orders, custom objects, service contracts, and knowledge article versions.

You can add a record to a queue manually by changing the record’s owner. Or, an assignment rule can add cases or leads to a queue based on criteria, such as **Origin equals Email**. Records remain in a queue until they’re assigned an owner, or a queue member volunteers to own them. Any queue members or users higher in a role hierarchy can take ownership of records in a queue.

Some examples of queues include lead queues for distributing and sharing leads among salespeople assigned to specific regions, such as western or eastern. Case queues for distributing and sharing cases among support agents assigned to different service levels, such as gold or silver service. Knowledge article version queues for distributing new versions of articles to people who can translate articles into specific languages.

**Create Queues**

Create queues to prioritize, distribute, and assign records to teams who share workloads. There’s no limit to the number of queues you can create, and you can choose when queue members receive email notifications.

SEE ALSO:

- Case Teams

### EDITIONS

**Available in:** both Salesforce Classic and Lightning Experience

**Available in:** Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com Editions

Service contract queues available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions with the Service Cloud

Lead queues and case queues are not available in Database.com

2748
Create Queues

Create queues to prioritize, distribute, and assign records to teams who share workloads. There’s no limit to the number of queues you can create, and you can choose when queue members receive email notifications.

1. From Setup, enter Queues in the Quick Find box, then select Queues.
2. Click New.
3. Type a label and name. The label appears in the user interface as a list view, and the name is used by the API and managed packages.
4. Choose email notification settings for the queue.

<table>
<thead>
<tr>
<th>To notify</th>
<th>You must</th>
</tr>
</thead>
<tbody>
<tr>
<td>One email address when new records are added to the queue.</td>
<td>Add an email address to Queue Email. You can add an email address for an individual or an email distribution list.</td>
</tr>
<tr>
<td>All queue members individually when new records are added to the queue.</td>
<td>Leave Queue Email blank.</td>
</tr>
<tr>
<td>All queue members and the Queue Email individually when new records are added to the queue.</td>
<td>Add an email address to Queue Email and select Send Email to Members.</td>
</tr>
</tbody>
</table>

5. If your org uses divisions, select the queue’s default division. Cases inherit the division of the contact they’re related to, but when a case doesn’t have a contact, it’s assigned to the default global division.
6. Add the objects available to the queue. You can add cases, leads, orders, custom objects, service contracts, or knowledge article versions.
7. Add queue members. You can add individuals, roles, public groups, territories, connections, or partner users.
   depending on your org’s sharing settings, only queue members and users above them in the role hierarchy can take ownership of records in the queue.
8. Click Save.

Tip: After you create a queue for cases or leads, you can set up assignment rules to route cases or leads to it.

Note: Before you can delete a queue, reassign its records to another owner and remove it from any assignment rules.

Adding Social Customer Service

Welcome to Social Customer Service

Social Customer Service lets you create cases or leads out of social media posts and send personalized responses on the same social media channels.

⚠️ Important: If you have two or fewer social accounts to track, you can use the free starter pack. Otherwise, you must have sufficient Social Studio accounts.

Watch the following video for a brief overview on getting started with Social Customer Service. 👈 Support Your Customers on Their Social Networks (2:58)

Social Customer Service integrates with Radian6 and Social Studio so service agents and sales representatives can engage customers by responding to cases and leads created from Facebook, Twitter, and other social networks.

<table>
<thead>
<tr>
<th>Social Network</th>
<th>Release State</th>
</tr>
</thead>
<tbody>
<tr>

<tr>
<td>LinkedIn</td>
<td>Pilot Program</td>
</tr>
<tr>
<td>Sina Weibo</td>
<td>Pilot Program</td>
</tr>
</tbody>
</table>

The social publisher action on the case or lead feed is the primary interface for replying to consumers or prospects. Inbound and outbound social posts appear as items in the feed, making it easy to follow the thread of the conversation. Permission sets allow you to grant access to your managed social accounts to different sets of users. Out of the box, default settings control how inbound social posts are processed. Optionally, you can modify an Apex class to apply your own custom business logic.

🔍 Note: When a lead is converted to an account or contact, the social items in the feed are removed.

In Salesforce1, agents can see and reply to social content from mobile devices.

For Twitter accounts, agents can use case and lead feeds to see the content they are responding to, retweet, mark as favorite and follow tweets, send replies to tweets and direct messages, and delete tweets managed by your social accounts.

For Facebook accounts, cases and leads are created from your managed Facebook page and agents can use the feeds to see the content they are replying to, like posts and comments, send posts, comments, replies, and private messages, and delete posts managed by your social accounts.

For both Facebook and Twitter, you can click the View Source link to open an item in its native social media Web site. This allows you to gain context so you can provide a more informed response.
### Social Customer Service Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of active managed social accounts</td>
<td>500 accounts</td>
</tr>
<tr>
<td>Maximum number of post tags</td>
<td>200 post tags</td>
</tr>
<tr>
<td>Maximum number of errors before inbound posts are paused</td>
<td>100 errors. When errors reach 100, inbound posts are stopped until the errors are cleared. This allows administrators to ensure post are processed correctly.</td>
</tr>
</tbody>
</table>

## Implementing Social Customer Service

Enable social customer service in your organization and customize your support agents’ experience.

- Set up Social Customer Service
- Create the Social Action Interface
- Enable Moderation for Social Customer Service
- Modify the Default Apex Class

SEE ALSO:
- Social Action Tips
- Managing Social Posts
- Managing Social Personas
Set up Social Customer Service

Enable Social Customer Service, install the SocialCustomerService package, sync your social accounts, and assign social handles.

**Important:** If you have two or fewer social accounts to track, you can use the free starter pack. Otherwise, you must have sufficient Social Studio accounts.

Radian6, part of Marketing Cloud’s Social Studio, provides social media monitoring. With the free starter pack, you don’t need an explicit Radian6 login. Simply connect up to two Facebook or Twitter accounts and Salesforce handles the rest of the details. If you are a Social Studio customer, set up data sources in Social Studio that can be synced with Service Cloud.

**Important:** Case Feed Tracking for All Related Objects must be enabled for case feed items to be created. See Set Up Case Feed on page 2527. For Leads, from Setup, enter Feed Tracking in the Quick Find box, then select Feed Tracking and ensure Enable Feed Tracking and All Related Objects are checked. When a lead is converted to an account or contact, the social items in the feed are removed.

1. From Setup, enter Social Media in the Quick Find box, then select Social Customer Service.
   
   **Tip:** Enter med as a shortcut to bring up the Social Media section more quickly.

3. If you want posts approved before they send, check Enable approvals for social posts.

   As part of a job training or quality review process, you may require some agents to have their posts approved rather than allowing them to post freely. With approval processes and user permissions, selected agents can submit social posts for approval, recall the posts, and retry or resubmit them. Approvers can approve and reject posts for publication. See Enable Social Post Approvals on page 2755.

4. If you want to map new posts to parent posts, which are the first posts that generated a case, select Enable retrieval of parent posts for added context.

5. Under Radian6 Credentials, either create a Social Studio account with the starter pack by clicking Create Account, or click Login and enter your Social Studio credentials.

   **Note:** With the Social Customer Service Starter Pack, you can enable Social Customer Service and up to two social accounts from any social network. For example, if you add one Twitter account, you can only add one Facebook account. You can’t downgrade from a Social Studio account to the starter pack. The starter pack doesn’t support the moderation feature (all posts become cases) and the default Apex code can’t be customized.

6. On the Social Accounts tab, click Add Account and select your social network, for example Twitter or Facebook.

   The social network opens and asks you to authenticate the account. Once your account is authenticated, Salesforce returns you to the Social Accounts tab.

   **Note:** If you receive an error “We’re sorry, but we currently do not support Facebook business accounts registration.” or “Your Facebook account can’t be added due to unsupported features.”, you might need to set a user name on your Facebook page.

7. Click the refresh icon next to Add Account.

   **Warning:** Deleting a Social Account deletes it everywhere, including in Social Studio. This action cannot be undone.
8. If you are using the Starter Pack, check the **Case Creation** box to indicate that you want cases created automatically when posts come from the social account. For example, if you have two Twitter handles, one for support and one for marketing or brand-focused information, you can have cases created automatically only from the support handle. The tweets from the marketing handle go in a social post queue for review. See Managing Social Posts on page 2293.

   **Note:** If you are using the full Social Customer Service version, you can set up case moderation through Social Studio. See Enable Moderation for Social Customer Service on page 2756.

9. If you have a portfolio of managed social accounts, set the **Default Responses** for each Twitter, Instagram (pilot), and Sina Weibo (pilot) account. This lets you standardize and raise awareness of your brand’s support by setting a dedicated support handle, for example @acmehelp or @acmesupport. Also, agents have fewer clicks when they send outbound posts because the chosen account appears as the default value in the account drop-down in the social publisher. The default response handle doesn’t apply for Twitter direct messages and doesn’t affect Facebook, Google Plus, or LinkedIn, as they are restricted to the page handle itself.

10. On the **Inbound Settings** tab, you can see which Apex class controls how the inbound content is processed in your organization and which user it’s set to run under. If you are using the default Apex class, you can select inbound business rules to determine how incoming social data is handled.

   **Enable Case Reopen**
   If a new post, from the same social persona, is associated to a closed case, the case is reopened within the designated number of days. The number must be greater than or equal to 1 and less than or equal to 3000.

   **Use Person Accounts**
   Assign a person account of the selected type for the social persona parent record.

   **Create Case for Post Tags**
   Override the social hub's case creation rules and create a case when selected post tags are present on a social post. Post Tags are used to answer the question “What is the topic of this one post?”. Post tags, set in Social Hub, help to provide further context to what the individual post is about.

   **Note:** Social Customer Service only shows 200 post tags. If you have more post tags in Social Studio, you can view them in that program.

   The default Apex class creates a social post, social persona, case, contact, and supports common use cases. For information on modifying the default Apex class, see Modify the Default Apex Class.

   **Note:** If you are using the starter pack, the Apex class can’t be changed but you can change the user it is run under.

11. To assign social handles to a profile or permission set, still within Setup:
   - Enter **Profiles** in the **Quick Find** box, then select **Profiles**.
   - Enter **Permission Sets** in the **Quick Find** box, then select **Permission Sets**.

12. Click an existing profile or permission set or create a new one.

13. In the **Apps** section, click **Assigned Social Accounts**.

14. Click **Edit**.
15. Assign the social accounts you need to make available to your users with this profile or permission set.

**Important:** All users must have the profile or permission set you chose or created in step 8.

16. Save your changes.

17. Ensure that the profile or permission set has the correct field visibility.

- For profiles, from Setup, enter **Profiles** in the Quick Find box, select **Profiles**, then select the profile you chose or created earlier. Next, in the Field Level Security section, select **Social Post**.
- For permission sets, from Setup, enter **Permission Sets** in the Quick Find box, select **Permission Sets**, then select the permission set you chose or created earlier. Next, click **Object Settings**, and then select **Social Post**.

18. Click **Edit**. Under Field Permissions, ensure all fields available are set to Visible (not Read-Only) for profiles or Edit for permission sets. Click **Save**.

19. Optionally, set up Quick Text so agents can create ready-to-send responses to social networks. See **Enable Quick Text**.

20. Optionally, give social post read access to external community and portal users.

   There are three requirements to make social posts available in communities and portals.

   - Ensure the user has access to cases in the community.
   - Give users read permission to social posts on their profiles.
   - On your organization’s Social Post object, enable visibility to individual fields through the field level security settings.

   **Note:** Once these requirements are met, external users can see all social posts exposed to them. For example, if a case or lead feed is exposed externally, all social posts in the feed are visible. There is no way to limit visibility at the social post object level.

Turning on history tracking on for the Social Persona and Social Post objects is recommended for the first few months of using Social Customer Service. History tracking helps identify who made what changes when and for differentiating between automatic and manual changes.

Enable Social Post Approvals

Social care agents are both problem solvers for your consumers and the voice of your brand on social networks like Facebook and Twitter. You can have guidelines so your agents write with a consistent tone and syntax that's in line with your organization's social media strategy. For example, you require social agents to sign their tweets in a standard manner, such as "~John."

Salesforce Admins can create approval processes and assign agents and approvers permissions accordingly.

1. From Setup, enter Social Media in the Quick Find box, then select Settings.
2. Select Enable approvals for social posts.
3. Build and activate approval processes for social posts using either the Jump Start Wizard or the Standard Setup Wizard.

**Important:** The Jump Start Wizard is a streamlined way to create approval processes in Salesforce. However, the let the submitter choose the approver manually option is not supported in the Jump Start Wizard. Choosing that option results in an error later when an agent submits a post for approval.

4. From Setup, go to Administer > Manage Users > Permission sets.
5. Enable the new Require Social Post Approvals user permission.
6. Assign the Require Social Post Approvals user permission with a permission set to agents that need their posts reviewed before they are sent.

    When assigning user permissions, remember these two points.
    
    • Because approving a post automatically submits it for publishing, approvers must have the same access to social accounts as the agents whose work they're reviewing. Otherwise, the posts they approve result in an error.
    
    • If your user permissions include Require Social Post Approvals, then the submit button on the social publisher always reads Submit for Approval rather than "Comment," "Tweet," or other words. This is true even if no active approval process applies to the user. In that situation, clicking Submit for Approval publishes the social post normally since there is no active approval process in effect.

For more information, see Create an Approval Process with the Standard Wizard on page 4282, Prepare to Create an Approval Process on page 4279, and Sample Approval Processes.

**Tip:** If your agents work with social post record detail pages, rather than in the case feed, we recommend removing the approvals related list from the page layout. The same page layout is shared between inbound and outbound social posts. Removing the approvals related list avoids confusion when viewing an inbound post that is an invalid candidate for an approval process. Approvers can still approve or reject posts through all other normal means such as email, Chatter, and list views.
Enable Moderation for Social Customer Service

Use moderation to triage incoming posts and only create cases for posts that are actionable requests for help. Moderation helps your organization focus on real customer issues and avoid opening unnecessary cases.

Not all posts require a case, for example, a complimentary tweet or post does not need agent assistance. However, when the default social customer service is configured, cases are automatically created from each social post. Using moderation, agents can manage which posts get cases and which are ignored. Moderation is enabled with a Social Hub rule in your Social Studio account to turn off automatic case creation.

Note: With the Starter Pack, you can decide if you want cases created automatically when posts come from a particular social account on the Social Accounts tab. See Set up Social Customer Service on page 2753.

1. From your Social Hub account, click the Rules tab.
2. Create a rule, or use an existing one, to indicate that no case is created in Salesforce. For example, the rule should have the following setup.
   a. Action: send to Salesforce.
   b. Create Case checkbox unchecked.
3. Save and enable your rule.

Note: You can enable your rule for all social posts or only those coming from certain managed accounts.

Case creation can also be customized by implementing a custom Apex case logic. To do so, from setup, enter Social Media in the Quick Find box, then select Settings. See Modify the Default Apex Class.

Note: If you started using Social Customer Service before Spring ’16 and have a custom Apex class, you may need update your Apex class to benefit from the latest moderation features. If your custom Apex is extended from the default Apex class, you get the update for the default apex functions you call. If your custom Apex isn’t extended from the default Apex class (you copied the default and changed it), you must update manually.

To manually update your custom Apex class, add the following code and update your moderation social post list view.

1. Call this method directly before inserting the post, after all the relationships have been set on the post.

   ```
   private void setModeration(SocialPost post){
       //if we don't automatically create a case, we should flag the post as requiring moderator review.
       if(post.parentId == null)
           post.reviewedStatus = 'Needed';
   }
   ```

   In the default Apex, see lines 50 and 61-65.

2. Update your moderation social post list filter from:

   ```
   Parent EQUAL TO "" AND ReviewStatus NOT EQUAL TO "ignore"
   ```

   To:

   ```
   Parent EQUAL TO "" AND ReviewStatus EQUAL TO "Needed"
   ```
To ensure that you don’t lose track of social posts currently in your moderation queue, make a list view with the new filter, and switch to it once the new and old filters show the same results.

Create the Social Action Interface

The social action is created when you install Social Customer Service. You can add, remove, and organize fields to suit your organization.

The social action is created when Social Customer Service is enabled.

1. From the object management settings for cases, go to Button, Links, and Actions.
2. Click Layout next to the social action.
3. Edit the desired fields.

   Note: Changing field values could invalidate incoming posts against the Social Customer Service Apex class.

To send social content, the social action must have the following fields:

- In Reply To:
- Managed Social Account
- Message Type
- Content

Headline and Name are required fields. To remove them, create a predefined value for each field and remove them from the action. See Set Predefined Field Values for Quick Action Fields.

4. Click Save.
5. From the object management settings for cases, go to Page Layouts.
6. In Case Page Layouts, click Edit next to Feed-Based Layout.
7. In the palette, click Quick Actions.
8. Ensure that the social action is in the Quick Actions in the Salesforce Classic Publisher section of the layout.
9. Optionally, repeat steps 5 through 8 for the Leads object to enable the social action on leads (from the object management settings for leads, go to Page Layouts).

Modify the Default Apex Class

If you aren’t using the Starter Pack, you can customize the default Apex class to specify how inbound social content is processed.

Note: You can’t modify the default Apex class if you are using the Starter Pack. The free Starter Pack lets you simply connect up to two Facebook or Twitter accounts and Salesforce handles the rest of the details, like a Social Studio account.

The default Apex class for Social Customer Service creates a social post, social persona, case, contact, and supports common use cases. To customize how information is processed, by create a new Apex class.

Important: If your agents use the Social Customer Service feature to send private messages to Facebook users, prevent or resolve errors by upgrading your Apex classes to the latest
available version of the Salesforce API. In particular, the Apex class that inserts the post must be version 32 or higher.

If you alter the default Apex class, be sure to select your new Apex class on the setup page, where you can also see Apex processing errors. From Setup, enter Social Media in the Quick Find box, then select Settings. An email is sent to the administrator when there are errors and, in most circumstances, the data is saved and can be reprocessed. If too many errors are waiting for reprocessing, the Salesforce Social Hub rules are automatically paused to ensure social content is not missed.

We have provided tests for the default Apex class. If you alter your Apex class, you must alter the tests accordingly.

Note: Social personas created after the Summer ’15 release have a field indicating which social network created the persona: Source App. This field is set on creation and is not updateable. If your organization uses custom Apex, update it to use this field. Keep in mind that personas created before the Summer 15 release do not have the field. Also, every time new fields are added to the social action you must update your Apex version or the new fields aren’t saved.

To create an Apex class, in Setup, enter Apex Classes in the Quick Find box, then select Apex Classes. You can use the following code to:

- Support person accounts
- Designate a default account ID
- Change the number of days before closed cases are reopened

```apex
global class MyInboundSocialPostHandlerImpl extends Social.InboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global override SObject createPersonaParent(SocialPersona persona) {
        String name = persona.Name;
        if (persona.RealName != null && String.isNotBlank(persona.RealName))
            name = persona.RealName;
        String firstName = ''; String lastName = 'unknown';
        if (name != null && String.isNotBlank(name)) {
            firstName = name.substringBeforeLast(' ');
            lastName = name.substringAfterLast(' ');
            if (lastName == null || String.isBlank(lastName))
                lastName = firstName;
        }
        //You must have a default Person Account record type
        Account acct = new Account (LastName = lastName, FirstName = firstName);
        insert acct;
        return acct;
    }

    global override String getDefaultAccountId() {
        return '<account ID>';}
}

global override Integer getMaxNumberOfDaysClosedToReopenCase() {
    return 5;
}
}
```

You can use the following code to implement your own social customer service process.

```apex
global class MyInboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
```
The default Apex class sets the contact as the persona parent. To set the persona parent as an account, person account, or lead, create a method to override the persona parent.

If you want a post to go to the error queue, so errors are not lost, your custom apex must do one of two things.

1. Bubble up an exception (recommended).

```
global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post, SocialPersona persona, Map<String, Object> rawData) {
    Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();
    result.setSuccess(true);
    try{
        //handle the post here
    } catch(Exception e){
        //log exception, etc
        throw e;
    }
    return result;
}
```

OR

2. Set the success flag on the response object to false.

```
global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post, SocialPersona persona, Map<String, Object> rawData) {
    Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();
    result.setSuccess(true);
    try{
        //handle the post here
    } catch(Exception e){
        //log exception, etc
        result.setSuccess(false);
    }
    return result;
}
```
Default Apex Class Process

}
Data Populated into Social Objects

Details on which fields exist in the standard objects, Social Post and Social Persona, and which fields are currently populated by data from Social Studio.

When Social Studio is configured to work with Social Customer Service (SCS), Social Studio sends data to Salesforce in raw format, which is then decoded by the SCS data intake system and appended to two standard Salesforce objects: Social Post and Social Persona. Social Post contains information that is post specific (posts in this context encompass tweets, Twitter direct messages, Facebook posts, comments, comment replies, etc.). Social Persona stores social identity information gleaned from the author information on posts received by SCS.

Note: If you’ve modified the default Apex class, you may experience alternate mappings.

Social Post

The following fields exist on the Social Post object.

<table>
<thead>
<tr>
<th>Salesforce Field</th>
<th>Data Value from Social Studio</th>

Reporting on Support Activity

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

Using Custom Report Types to Report on Support Activity

Cases and Solutions come with a number of custom report types that you can use to track your team’s work with cases and solutions.

Tips for Effective Support Reporting

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

Using Custom Report Types to Report on Support Activity

Cases and Solutions come with a number of custom report types that you can use to track your team’s work with cases and solutions.

Use the built-in custom report types to create reports on the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of case fields.

You can also report on your organization’s solutions, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date.

Some custom report types become available only when you enable their related features. For example, when you enable historical trend reporting for Cases, you automatically get a Cases with Historical Trending custom report type.

Cases with Historical Trending

Use the Cases with Historical Trending custom report type to analyze changes in case data over time. Available when Historical Trend Reporting is enabled.

Cases and Emails

Create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is available when Email-to-Case or On-Demand Email-to-Case is enabled.

Translated Solutions

Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.
Contact Role

Choose the Contact Role report to show all cases with their associated contact roles.

Cases with Articles

Choose the Cases with Articles report to see the articles attached to cases. This report is available if Salesforce Knowledge is enabled.

The report displays articles even if they’re not marked as available for the internal app channel.

Case Lifecycle

Run case lifecycle reports to view the results of the Range field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Service Contracts with Entitlements

Use the Service Contracts with Entitlements report type to report on the services your customers are entitled to. Available when Service Contracts with Entitlements is enabled.

Accounts with Entitlements with Contacts

Lists accounts with entitlements that include contacts (named callers). Available when Service Contracts with Entitlements is enabled.

Service Contracts with Contract Line Items

Lists service contracts with contract line items (products). Available when Service Contracts with Contract Line Items and Entitlements is enabled.

Cases with Milestones

You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is available if entitlements is enabled.

Note: Milestone status in list views and reports is based on the related entitlement process’ end time. If a user’s profile doesn’t include access to the Entitlement Process End Time case field, reports and list views that they view may show an incorrect milestone status on cases. The case record and Case Milestones related list will still display the correct milestone status values.

Case History/Solution History

Use the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields’ old and new values. You can’t use filter conditions to search the results of the Old Value and New Value fields.

Entitlements and Contracts

Use custom report types to define report criteria from which users can run and create reports on entitlements, service contracts, and contract line items. After entitlement management is enabled, Salesforce automatically includes the following custom report types:

<table>
<thead>
<tr>
<th>Custom Report Type</th>
<th>Description</th>
<th>Report Type Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounts with entitlements with contacts</td>
<td>Lists accounts with entitlements that include contacts (named callers).</td>
<td>Accounts &amp; Contacts</td>
</tr>
<tr>
<td>Service contracts with contract line items</td>
<td>Lists service contracts with contract line items (products).</td>
<td>Customer Support Reports</td>
</tr>
<tr>
<td>Service contracts with entitlements</td>
<td>Lists service contracts with entitlements.</td>
<td>Customer Support Reports</td>
</tr>
</tbody>
</table>
Tips for Effective Support Reporting

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

- When reporting on cases, add the Parent Case Number field to your report. This field indicates if a case is associated with a parent case.
- When reporting on first-call resolution of cases, add the Closed When Created field to your report. This field indicates cases that were closed by support reps via the Save & Close button during the creation of the case.
- You can create a case report containing contact email addresses, export that data to Excel, and then do a mass mail merge using Microsoft Word.

Standard Report Types

- Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.
- Choose the Contact Role report to show all cases with their associated contact roles.
- Choose the Cases with Articles report to see the articles attached to cases. This report is only available if Salesforce Knowledge is enabled. The report displays articles even if they’re not marked as available for the internal app channel.

Custom Report Types

- You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is only available if entitlements is enabled.
- Choose the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields’ old and new values. You can’t use filter conditions to search the results of the Old Value and New Value fields.
- You can create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is only available to organizations with Email-to-Case or On-Demand Email-to-Case enabled.
- You can run case lifecycle reports to view the results of the Range field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Cases in Portals

If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

- When reporting on case comments, use the Public Case Commented field to indicate if the comment is private or public. Public comments are indicated with a check mark. To limit report results to public comments, customize the report and add a field filter where Public Case Commented equals True. Likewise, the filter Public Case Commented equals 0 yields only private case comments.
- Choose the Closed by Self-Service User field to report on how many cases have been closed by users via suggested solutions on the Self-Service portal.
Solution Categories

Create a custom report that sorts solutions by category. Select the Category Name field to display the solution’s category and the Parent Category Name field to display the category directly above the solution’s category.

- If you restrict your report to solutions in a particular category, the report includes only solutions that are directly associated with that category. It does not include solutions in subcategories of the specified category.
- To report on uncategorized solutions, use the advanced report filters. Choose the Category Name field and the “equals” operator, and leave the third field blank.

Team Members

- You can report on case teams in which you are a member. After you run a case report, select My case team’s cases from the Show drop-down.
- Owner Role for case reports is defined differently than for other objects. For most objects, Owner Role is defined in the Role Name as displayed on reports field on the user’s role. Cases uses the Label field instead.
- You can limit any case report to cases owned by users or cases in queues. Choose User Owned Cases or Queue Owned Cases from the View drop-down at the top of a case report.
No man is an island, even in Salesforce. Complete tasks quickly and efficiently by collaborating with people either inside or outside of your organization.

Here you’ll find information on collaboration tools like Chatter, Salesforce CRM Content, and even documents. There’s no limit to what you can accomplish with others—figure out the best way to do it here.

Collaborate Within Your Company
Stay current with what’s happening in your company. Share your knowledge in Chatter posts and comments, collaborate in groups, and access files and data across your organization.

Collaborate with Partners and Customers
Share updates with customers and partners in Chatter groups.

Other Resources
Need more info about Chatter? Check out these videos and tipsheets.

Collaborate Within Your Company

Stay current with what’s happening in your company. Share your knowledge in Chatter posts and comments, collaborate in groups, and access files and data across your organization.

Share Updates with People (Chatter)
Share updates with coworkers, collaborate in Chatter groups, and view record updates.

Create, Share, and Organize Files
Post files to feeds and records, share files with customers in the Salesforce cloud, and sync files between your local drive and Salesforce.

Share Updates with People (Chatter)
Share updates with coworkers, collaborate in Chatter groups, and view record updates.

Chatter Overview
Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

Get Started with Chatter
Connect with people and share business information securely and in real time.

Work with Feeds
Stay up to date on posts and comments you and other people make, as well as record changes across your Salesforce organization.

Work with Posts
Share information and collaborate with other people inside and outside your organization.
People in Your Organization
Update your personal profile and view the profile of other people in your organization.

Records and List Views
Configure your follow settings for records, view Chatter feeds on list views, and learn more about record recommendations.

Collaborate in Chatter Groups
Use public, private, or unlisted Chatter groups to collaborate with specific people in your company.

Chatter Messenger (Chat)
Chat instantly and securely with coworkers. Chatter Messenger is not available in new orgs created after the Spring ’16 release.

Private Messages
Use Chatter messages for secure private conversations with other Chatter users.

Chatter Questions
Got questions? Use Chatter Questions to post a question in your Chatter feed, then watch the solutions roll in.

Chatter Overview
Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

Chatter works in accordance with all of the security and permission settings in your Salesforce organization. Chatter is enabled by default for organizations created after June 22, 2010. For existing organizations, your administrator must enable Chatter. You can access the Chatter app in the app menu in the top right corner of any page. If your administrator added Chatter tabs to other apps and you previously customized your display, you need to add the tabs manually.

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser’s plug-ins and extensions and try again.

Chatter Overview
Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

Chatter is not supported:
- Using Microsoft® Internet Explorer version 6.0
- For external users in Customer Portals or partner portals
- In the Console tab

Posts and comments that users make in Chatter are retained during the entire time that a customer’s applicable org remains provisioned. We reserve the right to enforce limits on:
- The number of system-generated tracked feed updates. Currently tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the audit history for that field is still available.
- The number of email notifications that can be sent per org per hour.

The limits are subject to change. Contact Salesforce for more information.

Get Started with Chatter
Connect with people and share business information securely and in real time.

Chatter Tab Overview
The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.
The People and Records You Auto-Follow Initially

Liking Posts and Comments
Like posts or comments to show your support and receive email notifications if others comment on that post.

Replying to Chatter Email Notifications

Navigate to Chatter Email Settings
Find your Chatter email settings so you can change your preferences for receiving email notifications and digests.

Chatter Email Digests
Email digests conveniently summarize recent activity in Chatter so you don’t miss important discussions. You can choose to receive daily or weekly summaries of updates from your personal feed or any group’s feed.

Guidelines for Managing Your Personal Chatter Email Settings
Control the number of Chatter emails you receive by choosing the most important emails and the appropriate frequency of personal and group digests.

What do “company” and “organization” mean in Chatter?
Can I invite people from my company who don’t have Salesforce licenses?

Chatter Tab Overview
The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.

From the Chatter tab you can:
- **Make a post** that’s shared with people who follow you, or comment on someone else’s post.
- **Like posts or comments** to show your support.
- **Share a post** to your profile or to a group, or send a link to the post to other Chatter users in an email or instant message.
- **View, filter, and sort your feed** on the left side to view posts from people and records you follow and groups you’re a member of, posts that mention you, posts you bookmarked, or all posts from your company.
- **Search the feed** to quickly find information in the feed posts and comments on the Chatter tab.
- **Bookmark a post** to keep track of future comments on the post, or to remember to follow up on the post later.
- **Add topics to a post** to categorize the post and give it more visibility.
- **Access your people, groups, files, and topics lists.**
- **View or update your profile**, such as your profile photo or your contact information.
- **Read or send private messages**, such as your profile photo or your contact information.
- **Access your favorites** to see the latest posts and comments for your favorite topics, list views, and Chatter feed searches.
- **View your recommendations** for people, groups, files, and records that closely relate to your job and interests.
- **View trending topics** that people are discussing in Chatter right now.
- **Invite people to join your Chatter network** if they don’t have Salesforce licenses to use Chatter.
Chatter Desktop

Chatter Desktop Overview

Chatter Desktop is a free desktop application that lets you collaborate in Chatter without a browser. Use Chatter Desktop to post and comment in Chatter, and receive updates about your groups and the people, records, and files you follow. Chatter Desktop also supports chat, private Chatter messages, and displays Chatter updates and private messages as popup notifications in your Windows taskbar or Mac OS X Dock.

Note: Customer users can install and use Chatter Desktop but can’t access all of its functionality. For example, customer users can’t follow users or records, chat, or access administration options.

Install Chatter Desktop

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- **Windows**
  - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
  - 512MB of RAM (1GB recommended)

- **Mac**
  - Intel® Core™ Duo 1.83GHz or faster processor
  - Mac OS X v 10.5, 10.6, or v10.7
  - 512MB of RAM (1GB recommended)

Important: Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe’s cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The standard version:

- Requires administrator privileges on your machine
- Doesn’t require administrator privileges in Salesforce
- Automatically installs the required version of Adobe® Integrated Runtime (AIR®)
- Requires acceptance of an end user license agreement the first time Chatter Desktop launches
- Posts “Installed Chatter Desktop” to Chatter the first time Chatter Desktop launches
- Periodically checks Salesforce for new versions

To install the standard version:
1. From your personal settings, enter Chatter Desktop in the Quick Find box, then select Chatter Desktop.

2. Click the Download Now badge.

3. Follow the on-screen instructions.

**Note:** Administrators can disable the Chatter Desktop download page and block users from accessing Chatter Desktop.

**Important:** Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from Adobe’s website, install it, and open it at least once to complete the installation.

Uninstalling Chatter Desktop

Connecting Chatter Desktop

If you have multiple Salesforce or Chatter logins, create a connection for each login. The connection lets Chatter Desktop access the Chatter data you can access with that login on the Web.

1. Click and select Settings.

2. In the Connections section, enter a name for the connection and the URL from which you log in. The URL must begin with https:// and end with salesforce.com or chatter.com. For example, if your organization has a European division that you log into from https://emea.salesforce.com, enter that URL and name the connection Europe.

   By default, Chatter Desktop connects to your main instance of Salesforce (Production) or your Force.com sandbox.

3. Click Authorize and follow the on-screen instructions to authorize Chatter Desktop to connect using the login.

   Use the radio buttons on the Settings screen to specify a default connection. To quickly switch connections while using Chatter Desktop, click , select Switch Connection, and choose the connection.

**Note:** You can create multiple connections, but Chatter Desktop can log into only one connection at a time. You cannot use Chatter Desktop to display data from multiple connections simultaneously.

Configuring Chatter Desktop
Configuring Chatter Desktop

The default Chatter Desktop configuration is appropriate for most users, but several Chatter Desktop settings are configurable. To access Chatter Desktop settings, click and select Settings. From the Settings screen, you can:

- Configure Chatter Desktop to launch when you start your computer.
- Configure Chatter Desktop to minimize when you close it.
- Turn popup notifications on or off. Popup notifications are enabled by default.
- Manage alerts for new feed posts and comments (advanced settings).
- Configure Chatter Desktop to always display in the foreground (advanced settings).
- Move the chat window to the foreground when you receive a new message.
- Play sounds when someone starts a new chat with you, or play a sound for every chat message when a chat is minimized or out of focus (for example, if you have multiple chats or are using another application).
- Edit your connections.

Using Chatter Desktop

In the Chatter Desktop window:

<table>
<thead>
<tr>
<th>Click: Your profile photo</th>
<th>To: Change your chat status. Select Available, Away, or Offline. People can’t chat with you when you’re Offline.</th>
</tr>
</thead>
<tbody>
<tr>
<td>See feed updates from everyone and everything you follow, and post an update.</td>
<td></td>
</tr>
<tr>
<td>- For any feed post, click Comment to add a comment, Like to receive email notifications if others comment on that post, or Delete to delete the post, if you have access.</td>
<td></td>
</tr>
<tr>
<td>- To post a file from your computer, drag the file to , or click , which appears when you type a post.</td>
<td></td>
</tr>
<tr>
<td>- To post a link, type the link in the text box at the top of your feed, or click , which appears when you type a post.</td>

</tr>
<tr>
<td>- Use the Sort By filter at the top of a feed to sort updates:</td>
<td></td>
</tr>
<tr>
<td>- Post Date—Sorts feeds by post date. To see comments, you must click Show All Comments below a post.</td>
<td></td>
</tr>
<tr>
<td>- Post and Comment Date—Sorts feeds by post and comment date. Each comment appears again when you click Show All Comments under its associated post.</td>
<td></td>
</tr>
</tbody>
</table>
See and comment on updates directed to you.

Chat with people and see their updates. Chat messages are displayed in a separate window.

- Click Chat Favorites to see people or chats you’ve added as favorites. To add a favorite, click 🌟 next to someone’s name or in any active chat with one or more people.
- Click Following or Followers then click a person’s name to see their updates or post to their feed.
- Hover over someone’s name:
  - Click ✉️ to send them a private message.
  - Click 🌟 to add them as a favorite chat. Their name appears in your Chat Favorites list.
  - Click ➕ to follow someone or ✗ to stop following them.
  - Click 🗓️ to start a chat. You can then add up to 10 people to the same chat by clicking 👤 in the chat window and searching for people to add. You can’t chat with people who are Offline.

Note: Chat is only available if it’s enabled in your organization.

Read and reply to private Chatter messages. Click a message to view it, or click New Message to send a new message.

Note: Messages are only available if they are enabled in your organization.

See feed updates from groups:

- Click a group name or search for a group to view its feed or to post updates. You can post in all public groups and any private groups that you belong to.
- Click Join to join a group, or Member to leave the group.
- Click 🌞 to view the group description.

See and comment on records you follow. From the drop-down menu at the top, select the type of record you want to view, for example, Account. If you’re not following records, there won’t be any records in the list. Click a record’s name to view its details. Chatter Desktop shows the first eight fields on a record.

Edit your Chatter Desktop settings or switch your connection.

Instantly synchronize your data. While Chatter Desktop synchronizes your data automatically, it does not always happen instantly.

## The People and Records You Auto-Follow Initially

Starting in June 2010, when your administrator initially turns on Chatter, we help get you started by automatically following certain users and records in your organization. Who and what you auto-follow differ based on the size of your organization:

<table>
<thead>
<tr>
<th>If Your Organization Has:</th>
<th>Users You Follow</th>
<th>Records You Follow</th>
</tr>
</thead>
<tbody>
<tr>
<td>15 users or fewer</td>
<td>All users in your organization</td>
<td>Up to 25 of your most recently used records, in the following order:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>1. Open opportunities you own</td>
</tr>
<tr>
<td></td>
<td></td>
<td>2. Accounts you own</td>
</tr>
<tr>
<td></td>
<td></td>
<td>3. Open cases you own</td>
</tr>
<tr>
<td></td>
<td></td>
<td>4. Contacts you own</td>
</tr>
<tr>
<td></td>
<td></td>
<td>5. Open opportunities you created</td>
</tr>
<tr>
<td></td>
<td></td>
<td>6. Accounts you created</td>
</tr>
<tr>
<td></td>
<td></td>
<td>7. Open cases you created</td>
</tr>
<tr>
<td></td>
<td></td>
<td>8. Contacts you created</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>9. Open opportunities you last modified</td>
</tr>
<tr>
<td></td>
<td>10. Accounts you last modified</td>
</tr>
</tbody>
</table>
If Your Organization Has:  | Users You Follow | Records You Follow |
---|---|---|
11. Open cases you last modified |  | |
12. Contacts you last modified |  | |
13. Open opportunities you viewed |  | |
14. Accounts you viewed |  | |
15. Open cases you viewed |  | |
16. Contacts you viewed |  | |

**Note:** The auto-follow setting for records only applies to the records that already exist at the time your administrator turns on Chatter. For any future records you create, auto-follow is disabled by default to reduce the number of updates you receive in your Chatter feed. However, if you want to receive updates on all future records you create, you can enable auto-follow in your personal settings.

**Liking Posts and Comments**

Like posts or comments to show your support and receive email notifications if others comment on that post.

Below a post or comment, click **Like**.

After you click **Like** on a post, you receive email notifications if others comment on that post. If you click **Like** on a comment, only the user who posted the comment receives an email notification, but you receive an email notification for any subsequent comments. You can change your email notification settings on page 2833.

- To stop liking a post or a comment, click **Unlike**. When you stop liking a post or a comment, you don’t receive email notifications for subsequent comments or likes.
- View the profiles of others who have liked a post by clicking their name at the bottom of the post or comment, for example, "**John Smith** likes this."
- If more than three people like a post, click the link to see the full list; for example, "You, **John Smith**, and **2 others** like this." From that list, you can follow or stop following people.
- Likes on comments show how many people have liked the comment, for example, "**1 person**" or "**7 people**". To see their names, click the link.

SEE ALSO:
- Guidelines for Managing Your Personal Chatter Email Settings
### Replying to Chatter Email Notifications

When you receive certain email notifications, you can conveniently perform some actions by replying directly from your email. You can reply to the types of email listed in the table, or any notification that displays a From address of reply@chatter.salesforce.com.

**Note:** To reply to email notifications, your administrator must enable email replies for your organization.

<table>
<thead>
<tr>
<th>Action</th>
<th>Type of Email</th>
<th>Text to Include in Your Reply</th>
<th>Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bookmark a post</td>
<td>Someone posted to your profile or a group, mentioned you in a post, or shared your post</td>
<td>bookmark</td>
<td>N/A</td>
</tr>
<tr>
<td>Comment on a post</td>
<td>Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment</td>
<td>The text of your comment</td>
<td>1,000 characters maximum. Replies that exceed the limit are truncated to the first 1,000 characters.</td>
</tr>
<tr>
<td>Follow someone</td>
<td>Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment</td>
<td>follow</td>
<td>N/A</td>
</tr>
<tr>
<td>Like a comment</td>
<td>Someone commented on your post or also commented after you</td>
<td>like or +1</td>
<td>N/A</td>
</tr>
<tr>
<td>Like a post</td>
<td>Someone posted to your profile or a group, mentioned you in a post, or shared your post</td>
<td>like or +1</td>
<td>N/A</td>
</tr>
<tr>
<td>Mute a post</td>
<td>Any post or comment email when you no longer want to receive notifications for the original post</td>
<td>mute</td>
<td>N/A</td>
</tr>
<tr>
<td>Respond to a Chatter message</td>
<td>Someone sent you a message</td>
<td>The text of your response</td>
<td>10,000 characters maximum. Replies that exceed the limit are truncated to the first 10,000 characters.</td>
</tr>
</tbody>
</table>
**Action** | **Type of Email** | **Text to Include in Your Reply** | **Limits**
--- | --- | --- | ---
Unfollow someone | Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment | unfollow | N/A
Unlike a post | Someone posted, commented on your post, or also commented after you on a post that you previously liked | unlike or -1 | N/A

Consider these tips when sending email replies.

- Replies must be sent from the email address specified on your profile. If you use email aliases or email forwarding services that send replies from a different email address, your replies aren’t processed.
- Replies to bookmark, mute, like or unlike, and follow or unfollow must contain only the single word or exact text, such as like (case insensitive) or +1. If you include extra white spaces or the original message that some email applications automatically include, we ignore them and process the reply as a like, bookmark, etc. However, if you include any other text in the body, such as Like! or Like this?, we process your reply as a comment rather than a like, bookmark, etc.
- If replies contain your personal email signature, the signature text is treated as part of your comment. Default signatures inserted by mobile devices, such as Sent from my iPhone, are automatically removed from replies. Before replying, delete custom signatures and any extra text you don’t want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
  - Dash (–)
  - Equal sign (=)
  - Underscore (_)

  You can also use any combination of these characters.
- Attachments and mentions in replies are ignored.
- Before replying, check the email address that displays in the To field of your email. Valid addresses contain tokens, or long character strings, both before and after the @ symbol, such as w8t27apy1@j321imd9gbs.d8rx.d.chatter.yourInstance.salesforce.com. Some email applications automatically use the From address from the original email, reply@chatter.salesforce.com, which is not a valid address for receiving replies. If you see this shortened address in the To field of your reply email, replace it with the valid reply-to address in the email header information. For example, in an application such as IBM® Lotus Notes®:
  1. Open the original email.
  2. Click View > Show > Page Source.
  3. In the Reply-To section, copy the email address that looks like:
     w8t27apy1@j321imd9gbs.d8rx.d.chatter.yourInstance.salesforce.com
  4. Paste the reply-to address in the To field of your reply email.

Liking Posts and Comments
Navigate to Chatter Email Settings

Find your Chatter email settings so you can change your preferences for receiving email notifications and digests.

- From your personal settings, enter Chatter in the Quick Find box, then select Chatter Email Settings or Email Notifications—whichever one appears.
- Or, from any group page, click Email Me... > Email Settings.

To receive Chatter email notifications and digests, your administrator must enable email notifications for your organization. Select Receive emails to receive Chatter email.

⚠️ Warning: Deselecting this option prevents you from receiving all Chatter email notifications.

SEE ALSO:
- Chatter Email Digests
- Guidelines for Managing Your Personal Chatter Email Settings
- Personalize Your Salesforce Experience

Chatter Email Digests

Email digests conveniently summarize recent activity in Chatter so you don’t miss important discussions. You can choose to receive daily or weekly summaries of updates from your personal feed or any group’s feed.

Personal digests include the updates you see in your own Chatter feed, such as updates about the people, records, and files you follow and your groups. Group digests include the updates you see in a particular group’s Chatter feed.

Daily digests include up to the 50 latest posts from the previous day while weekly digests include up to the 50 latest posts from the week. Both include the three latest comments on each post. Chatter sends daily digests at approximately 12:00 a.m. every day, and weekly digests at approximately 12:00 a.m. on Sunday. For user digests, the time is according to the user’s time zone. For group digests, the time is according to the organization’s time zone. Neither time is configurable.

When you join or are added to a group, you don’t receive email notifications initially because they’re turned off by default. You can use Set default frequency for groups I join: to choose how often you want to receive emails when joining new groups. Changing the default frequency doesn’t affect the groups you already belong to. If your organization existed before Summer ’11 and is a Professional, Enterprise, Unlimited, or Developer Edition organization, you might still be receiving daily digests by default.

What do “company” and “organization” mean in Chatter?

An organization is a single deployment of Salesforce with a defined set of licensed users who may or may not use Chatter. The words “company” and “organization” are used interchangeably in Chatter. So for example, if you see “share a file with all Chatter users in your company,” it means you’re sharing with everyone in a specific Salesforce organization who uses Chatter.

SEE ALSO:

Chatter Overview

Can I invite people from my company who don’t have Salesforce licenses?

If enabled by your administrator, you can invite other people from your company. Invited users can view profiles, post on their feed, and join groups, but can’t see your Salesforce data or records.

You can invite users from the People tab or when adding members to a group.

Additionally, you can add customers to private groups you own or manage.

Work with Feeds

Stay up to date on posts and comments you and other people make, as well as record changes across your Salesforce organization.

Feeds Overview

Follow people and records and see their updates in Chatter feeds on profiles, groups, the Home tab, topic detail pages, and on record detail pages.

View a Particular Feed

Change your Chatter feed to display a particular subset of posts.

Filter and Sort Your Feeds

Use the filter and sort options to see updates that are relevant to you.

Create a Task from a Post

Read a post that you want to follow up on? Use the Create New Task action to create a task directly from that post.

Viewing Your Recommendations

Chatter Favorites Overview

Feeds Overview

Follow people and records and see their updates in Chatter feeds on profiles, groups, the Home tab, topic detail pages, and on record detail pages.

Typically, they show updates for:

- Chatter feed comments and posts
- Posts, comments, and files on Chatter groups you’re a member of
- Shared files and links
- Tasks and events
- Converted leads
- Record field changes, like changes to record owner and closed opportunities and cases.
Record updates are also called system-generated posts. They are updates that Salesforce automatically generates when someone creates a record or changes a tracked field on a record. The record updates you see depend on how your administrator has configured feed tracking and whether you have access to the record. You don’t see tracked feed updates that are older than 45 days and have no likes or comments, because they are deleted automatically.

SEE ALSO:
Sharing a Chatter Post

View a Particular Feed
Change your Chatter feed to display a particular subset of posts.

By default, you see your What I Follow feed when you go to your Chatter page. Use the feed selections on the left sidebar of the Chatter page to view a subset of posts in your feed. For example, view only posts that mention you, or posts you bookmarked, or all posts in your company.

1. Click Feed to see the available feeds.
2. Click a feed to display the associated subset of posts in your feed.

What I Follow
Shows updates for everything you follow, including posts from people you follow, groups you are a member of, and files and records you’re following. Use the drop-down list at the top of your feed to further narrow the subset of posts.

To Me
Shows posts that are made on your profile page, including
- Posts others make on your profile page
- Posts and comments where you have been mentioned
- Posts you made that have comments

Bookmarked
Shows your bookmarked posts in your feed.

All Company
Shows posts and comments from your entire company, including posts and comments from:
- People in your company
- Public groups
- Private groups you are a member of
- Feed tracked changes for records and fields and system-generated posts, if someone liked or commented on the post. You must have access to the record to see the post.

SEE ALSO:
Filter Your Files List
Filter and Sort Your Feeds

Use the filter and sort options to see updates that are relevant to you.

Filtering and sorting your feed is useful when you want to view a particular set of posts instead of all posts in your feed.

Filter Your Feed
Use filters to condense the number of posts that appear in your feed.

Sort Your Feed
Sort your feed by most recent posts or by most recent comments.

Available Feed Filters per Feed
The feed filter options vary, depending on how your administrator set up Salesforce and which feed you’re viewing. Not all filters are available on all feeds.

Filter Your Feed

Use filters to condense the number of posts that appear in your feed.

The filters you see depend on how your administrator has set up Salesforce. Filter your feed on the Chatter page, your profile, group pages, record detail, and search result pages. Not all filters are available on all feeds.

- Above a feed, click next to Show and select a filter option.

All Updates (Default)
Shows all posts and comments from people and records you follow, posts from groups you’re a member of, and all system-generated posts.

Fewer Updates
- Shows all posts and comments from people and records you follow and groups you’re a member of
- Hides system-generated posts from records that nobody has commented on

People
Shows the posts and comments from people you follow.

Groups
Shows the posts in groups you’re a member of.

Files
Shows posts that include:
- Files you follow
- File posts that someone you follow has commented on

Example: Use the Fewer Updates filter to hide system-generated posts. For example, you’re following the Acme account, and the account executive for Acme creates an opportunity. Later, the account executive also changes a tracked field on the Acme account. In both cases, Salesforce automatically generates an update about each change and posts the updates in your Chatter...
feed and the feed on the Acme account detail page. The Fewer Updates filter hides these system-generated posts in your feed, unless someone has commented on the posts. If you want to see the system-generated posts, select the All Updates filter.

SEE ALSO:
Available Feed Filters per Feed

Sort Your Feed

Sort your feed by most recent posts or by most recent comments.

1. Above a feed, click next to Show.
2. Below Sort By, select Post Date to sort by most recent posts, or Most Recent Activity to sort by posts with the most recent comments, including polls with new comments.

Your feed is sorted by Most Recent Activity by default. You can toggle between sorting by Post Date and Most Recent Activity at any time.

Example: For example, let’s say you’re following many people and records and bookmarked the posts you’re interested in. At the end of your work day, you want to know whether there are any updates for your bookmarked posts. You click Bookmarked to view all your bookmarked posts and then sort the posts using the Most Recent Activity filter. The posts are listed in the order of recent comments, starting with the post that has the latest comment.

Feeds FAQs

I see updates to private groups in my profile feed. Who else can see these updates?

Only the members of a private group can see updates to that group, even on your profile feed.

SEE ALSO:

Post Visibility

Can I see a list of records and people I’m following?

To see people and records you follow, view the Following list on your profile and filter the results by user or by an object type. You can also see a list of people following you in the Followers list on your profile.

SEE ALSO:

Chatter Profile Overview
Why do I only see certain people and records in my Chatter feed?

You only see updates by people and records that you follow. Follow more records and people to see more updates in your Chatter feed on your Home tab and Chatter tab. Click People on the Chatter tab to find a list of people in your organization to follow or unfollow.

SEE ALSO:
- The People and Records You Auto-Follow Initially

Bookmark Posts

Bookmarks Overview

Bookmarking lets you keep track of individual posts you’re interested in.

After you bookmarked a post, you can quickly find it using the Bookmarked feed on the left sidebar. The Bookmarked feed shows you only the posts you bookmarked.

When someone comments on a post you bookmarked, you receive an email notification. Email notifications for bookmarks are enabled by default, but you can change your email notifications on page 2833.

Bookmarks are private and other users can’t see which posts you bookmark. There is no limit on the number of bookmarks you can add. When you are no longer interested in a post you saved, you can remove the bookmark and the post no longer appears in your saved posts when you click Bookmarked.

SEE ALSO:
- Liking Posts and Comments
- View a Particular Feed
- Guidelines for Managing Your Personal Chatter Email Settings

Bookmark a Post

Track the posts you’re interested in and view your saved posts in your Bookmarked feed.

1. Click at the top right corner of the post you want to bookmark to expand the drop-down menu.

2. Click Bookmark.
   - The bookmark icon ( ) displays next to the post to indicate that you successfully saved the post to your bookmarks.

Click Feed > Bookmarked on the Chatter sidebar to see your saved posts in your feed.

There is no limit for the number of bookmarks. You can add as many bookmarks as you like.

SEE ALSO:
- Liking Posts and Comments
Collaborate with Everyone

Remove a Bookmark

1. Click Feed > Bookmarked on the sidebar to see your saved posts in your Chatter feed.
2. Find the saved post in your Chatter feed.
3. Click ☰ at the top right corner of the post to expand the drop-down menu.
4. Click Remove Bookmark.

When you remove a bookmark from a post, the post no longer appears in your saved posts when you click Bookmarked.

Create a Task from a Post

Read a post that you want to follow up on? Use the Create New Task action to create a task directly from that post.

You can create a task from any post made by you or someone else in your organization, including posts with attachments. You can’t create a task from a system-generated post, like a record update.

1. Click ☰ on a post.
2. Click Create New Task.
   
   If you don’t see the Create New Task action, your Salesforce administrator didn’t enable this action for your organization.

3. In the Create New Task dialog, add a subject and a due date. If applicable, associate the task with a contact or lead and an object, like an account. Use the search boxes to find available contacts, leads, and objects.

4. Click Create, when you’re done.

The task is assigned to you and posted to your profile feed. The task also appears in your My Tasks section on your Home tab.

Click the task subject link (1 or 2) to open the task. Click the post link (3) to display the post from which the task was created.
Viewing Your Recommendations

Chatter provides recommendations to help you identify the people, groups, files, and records that closely relate to your job and interests. The more recommendations you accept, the more updates you see in your feed.

- Click **Follow** next to the person, record, or file you want to follow.
- Click **Join** to become a group member.
- Click **
** to dismiss a recommendation.
- Click **More** to display the Recommendations page where you can use the side filters to narrow your recommendations to people, files, records, or groups.

SEE ALSO:
- People Recommendations
- Chatter Group Recommendations
- Record Recommendations
- File Recommendations

Find Information in Feeds

Searching in Feeds

Quickly find information in posts and comments across Chatter.

- Use the header search box (Global Search) to find information in feeds across Chatter.
  
- To find information in a specific Chatter feed, use feed search ( ) in that context.
- To create a quick shortcut to a frequently performed search in Chatter, save a feed search as a favorite and click the favorite link from the Chatter page.

Chatter Feed Search Results

Watch a Demo: Search in Salesforce Classic

Search results for Chatter feeds display posts and comments that include your search terms. Chatter feed searches aren’t affected by your search scope; Chatter feed search results include matches across all objects.

**Note:** Changes to record fields aren’t included in search results. For example, if you’ve enabled feed tracking on the Billing Address field for the Acme account and modified the Acme billing address, search results for **Acme — Suzanne Powell Looking for volunteers to help with the Acme account**, but don’t include **Acme — Suzanne Powell changed Billing Street to 10 Main Road**.

- Sort your search results by posts only or by posts and comments, just as in feeds.
- Comment on, like, share, bookmark, and delete posts in the search results, just as in feeds.
- Add, edit, or delete topics on posts in the search results, just as in feeds.
- Follow, share, download, preview, and upload new versions of files in the search results, just as in feeds.
- View the detail pages for Chatter files, groups, topics, and people by clicking the respective name in the update.
• **View a single feed update** by clicking the timestamp below the update, for example, **Yesterday at 12:57 AM**.

• **Click Add to Favorites** to save a Chatter feed search to your **favorites** on the Chatter tab.

To view search results for records, such as accounts, contacts as well as Chatter people, groups, topics, and files, click **Records** at the top left of the page.

⚠️ **Tip:** For a more focused search of the feeds in a specific group, profile, record, or other Chatter feed, use **feed search**.

---

### Searching in a Specific Feed

Use feed search to find information in a specific context.

You can search for information in feeds on records, groups, topic pages, user profiles, and on the Chatter and Home tabs. A contextual feed search is helpful when you want to confirm if something was once discussed in that specific feed.

1. Click 🔍 above the feed to look for information in that feed. For example, use the feed search on a group’s page to find information in that group.

2. Type your search terms and press **ENTER** or click 🔍.

You can search for hashtag topics, mentions, and files posted in the feed, or refine your search using wildcards, operators, and quotation marks to match on exact phrases.

⚠️ **Tip:** To search for hashtag topics with multiple words, use brackets after the hashtag and around the words. For example, to find all instances of #Universal Paper, type `#[universal paper]` in the search box.

Search results display with matching terms highlighted. Filters or sorting criteria used in the feed apply to feed search results as well.

Click ✗ to clear your search results and return to the feed.

Feed search behavior may vary slightly depending on where you perform the search.

• Feed search is not supported for feeds on list views.

• You can only search feeds you have access to via sharing rules.

---

2844
On the Chatter tab, feed search results are also limited by your feed type selections. For example, if you select the To Me feed type, and select additional filters and sorting criteria, all of those criteria apply to the feed search results.

- Feed search results are limited to the posts that are accessible from the context you search within. For example, if you search the feed on a user's profile, the results include the posts and comments accessible from the user's profile. This includes both the posts and comments shared by or with the user.
- Feed search returns matches for file or link names shared in posts, but not in comments.
- Record field changes aren’t included in record feed search results.

Adding a Chatter Feed Search as a Favorite

Add a Chatter feed search as a favorite to access feed updates quickly without leaving the Chatter tab.

1. Enter terms in the header search box and click Search.
2. Click Search Feeds to see the posts and comments that include your search terms.
3. Click Add to Favorites.
The favorite name on the Chatter page is the same as the search terms you entered. For example, if you searched for *competitive analysis*, your favorite is *competitive analysis*.

**Tip:** Save a search for a Chatter group name as a favorite to quickly access the group feed from the Chatter page. Similarly, save a search for a person’s name as a favorite to quickly see that person’s posts, comments, and mentions.

SEE ALSO:
- Chatter Feed Search Results
- Chatter Favorites Overview

**Chatter Favorites Overview**

Chatter favorites on the Chatter tab give you easy access to list views, Chatter feed searches, and topics that you want to stay on top of. For example, if you and your coworkers use the hashtag topic #acme to track information about your customer Acme, you might want to add #acme as a favorite so you can easily access these updates without leaving the Chatter tab.

You can have up to 50 favorites. If you haven’t added any favorites, the Favorites section doesn’t appear on the Chatter tab.

Chatter displays the four favorites most recently added or viewed.

- Click a favorite to see the updates.
- Click *X more* to see all your favorites.
- Click *X*, which appears on hover, to remove a favorite.

**Work with Posts**

Share information and collaborate with other people inside and outside your organization.

**Posting Overview**

Use the Chatter publisher to make posts, delete posts, ask questions, and create polls.

**Post Visibility**
Collaborate with Everyone

Can I prevent people from seeing my posts?
Do posts that I make on a group appear on my profile where others can see them?
Mute a Post
Control what appears in your news feed and mute posts you’re no longer interested in.
Who Can See My Attached Files and Links?
Share files and links with people by attaching them to posts or comments.

Posting Overview
Use the Chatter publisher to make posts, delete posts, ask questions, and create polls.

The publisher appears on your Home tab, Chatter tab, user profile page, group, and record detail pages. Use publisher to write a post (1), attach a file (2) or link (3) to your post, add a poll (4) or ask a question (5). Posts and comments can be up to 10,000 characters long. Use the rich text editor to format your posts (6).

By default, the publisher displays the Post, File, Link, Poll, and Question actions. Your Salesforce administrator can change the order of the actions and add more actions. Therefore, which actions you see, depend on how your administrator configured the publisher.

When you post to a feed, everyone with access to the post can comment on the post, like the post, and share it (1). From the drop-down menu (2), they can also bookmark the post and add topics.

Click Edit to modify your own posts and comments. If you’re a group owner or manager, you can also edit other people’s posts on the group feed. Click Delete to remove your post from the feed. However, you can’t delete other people’s posts or posts that are automatically generated by Salesforce. For example, you can’t delete record updates like a post about a changed field on an account.

| A record page  | To the record only | • Everyone following this record and has permission to access the record sees your post in the What I Follow feed.  
• People that are mentioned in the post and have permission to access the record see the post in the What I Follow, To Me, and profile feeds. | Everyone with permission to access the record can see your post on the record detail page, on your profile, in feed search results, and in the All Company feed. | If you attach a file to the post, the file is associated with the record. Everyone with sharing rights to the record has access to the file. |

**Note:** You can’t create new posts on archived groups. Comments on existing posts in an archived group follow the same visibility settings as before the group was archived.

**Can I prevent people from seeing my posts?**

Anyone except customers can see your posts on your profile, and people following you can see your posts in their Chatter feed. However, if you change a record, only people who have permission to see the record can see the record update in a feed.

SEE ALSO:

* Sending Chatter Messages

**Do posts that I make on a group appear on my profile where others can see them?**

Yes, but who can see the posts depends on the type of group. If you post to a group that is:

• Public, anyone except customers can see the post on your profile.
• Private, only other group members can see the post on your profile.
• Private and allows customers, all members can see the post in the group. Customers who are members of the group can see your posts on the group page but not on your profile.
• Unlisted, only group members and users with the “Manage Unlisted Groups” permission can see the post on your profile. Customers who are members of the group can see your posts on the group page but not on your profile.

Chatter Groups

Mute a Post
Control what appears in your news feed and mute posts you’re no longer interested in.

You can mute posts from the feed and from a feed post’s detail view. Muting is available on the Home and Chatter tabs, but not on group, profile, or record feeds. If your admin enabled email replies, you can mute posts by replying to post emails with the single word mute.

To mute a post in a feed, select Mute from the post’s drop-down menu.

To mute a post from its detail view:

1. Go to detail view in the feed by clicking the post’s date stamp, or, in an email notification, by clicking the View/Comment button.

2. From the post’s drop-down menu, select Mute.

After you muted a post,
• The post no longer appears in your feed on the Home and Chatter tab.
• You no longer get notifications for updates to that post.
• You can use the Muted filter on the side panel to view your muted posts.
• If someone mentions you on a muted post, the post is automatically unmuted. It reappears in your feed and if you have email notifications enabled, you get a notification about the update.
• If the post was originally posted to a group, profile, or record feed, it still appears on that feed.

For example, someone posts to a group that you’re a member of. The post appears on the group feed and your news feed on the Home and Chatter tab. You can mute the post in your news feed, but the post remains visible in the group feed.

Example: Here’s how you mute a post from the drop-down menu.

To view all posts you muted, select the Muted filter.
Mention People and Groups

@Mention People and Groups in Posts and Comments

@Mention individual people or a group to keep them informed when you’re discussing something relevant to them.

1. When you write a post, type @ followed by the first few letters of the person or group name.
2. Select the person or group from the list of matches.
   - The list includes all matches for
     • People, typically users you interact with the most
     • Public groups
     • Private groups you’re a member of
   You can have up to 25 mentions in a single post or comment. You can’t mention archived groups, unlisted groups, customer groups, and private groups you’re not a member of.
3. Click Share to post your update.

After you posted your update,

- The person’s name becomes a link to their profile, and the group name becomes a link to the group page.
- For people you mention, your update appears on the mentioned person’s profile feed and in their To Me feed.
- For people who choose to receive emails when mentioned, Chatter sends an email notification.

Note: There’s an exception: if you @mention yourself, you don’t receive a notification.

- For groups you mention,
  - Your update appears on the group feed and each group member’s What I Follow feed.
  - Chatter sends an email notification to the group members who enabled the Email Every Post preference for the group.

Note: On mobile devices, we don’t currently send push notifications for group mentions.

- If the mention is on a record feed, the record appears in the group records list.
Example: Your coworker Madison posts that she’s looking for information about an Acme product feature. You reply to Madison’s post with the comment: “Talk to @Bob Smith—he’s the Acme account manager. @Acme Products, do you have any additional information for Madison about this feature?” Both Bob Smith (if he chose to receive emails when mentioned) and members of the Acme Products group get an email notification about your post. Madison can click @Bob Smith in the update to view Bob’s profile, or click @Acme Products to see their group page.

Chatter enforces security and sharing rules in Salesforce. Let’s say you make a post to a record or a private or unlisted group and @mention someone who doesn’t have access to that record or isn’t a member of the group. In this case, the @mention appears as a gray link. The mentioned person can’t see your post and doesn’t get notified about the post. For example, Madison creates a private group for her project team and forgets to add her coworker Sandy Dunn to the group. When Madison posts an update to this group and @mentions Sandy Dunn, Sandy isn’t notified about the update. Sandy also can’t see the update because she’s not a member of the private group. If Madison later adds Sandy to the group, Chatter doesn’t notify Sandy about the previous mentions.

SEE ALSO:
- Sharing a Chatter Post
- Sharing a Link to a Chatter Post
- View a Single Chatter Post
- User and Group @Mentions—Visibility

User and Group @Mentions—Visibility

When you @mention people or groups in an update, anyone who has access to the update can see the post and all comments.

This table describes where you can find posts and comments that mention people, public groups, and private groups. You can’t mention private groups with customers and unlisted groups.

<table>
<thead>
<tr>
<th>If the post was made on</th>
<th>And mentions</th>
<th>Then these people can see the post and comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>A person’s profile</td>
<td>Other people</td>
<td>Anyone with access to the person’s profile.</td>
</tr>
<tr>
<td></td>
<td>Public group</td>
<td>Anyone with access to the person’s profile.</td>
</tr>
<tr>
<td></td>
<td>Private group</td>
<td>Anyone with access to the person’s profile, even if they’re not a member of the private group.</td>
</tr>
<tr>
<td>Public group A</td>
<td>Other people</td>
<td>Anyone with access to public group A.</td>
</tr>
<tr>
<td></td>
<td>Public group B</td>
<td>Anyone with access to public group A.</td>
</tr>
<tr>
<td></td>
<td>Private group</td>
<td>Anyone with access to public group A, even if they’re not a member of the private group.</td>
</tr>
<tr>
<td>Private group A</td>
<td>Other people</td>
<td>Members of private group A.</td>
</tr>
<tr>
<td></td>
<td>Public group</td>
<td>Members of private group A.</td>
</tr>
<tr>
<td></td>
<td>Private group B</td>
<td>Members of private group A, even if they’re not a member of private group B. People who are members of both private groups can also see the post in the feed of private group B.</td>
</tr>
</tbody>
</table>
If the post was made on | And mentions | Then these people can see the post and comments |
--- | --- | --- |
Unlisted group A | Other people | Members of unlisted group A and users with the "Manage Unlisted Groups" permission. |
Public group |  | Members of unlisted group A and users with the "Manage Unlisted Groups" permission. |
Private group B |  | Members of private group B who are members of unlisted group A or have the "Modify Unlisted Groups" permission. |
Record detail page | Other people | People with sharing access to the record. |
| Public group |  | People with sharing access to the record. |
| Private group |  | People with sharing access to the record, even if they’re not a member of the private group. |

The visibility of posts and comments depends on sharing access to the post. Anyone with access to the original post also has access to all subsequent comments on the post.

Who Can See My Attached Files and Links?

Share files and links with people by attaching them to posts or comments.

Attach links and files to posts and comments from your device, Salesforce Files, Files Connect external sources, and Salesforce CRM Content libraries. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.

This table describes who can see a file you attached and where it appears:

Attach Files or Links

Attach a File to a Post or Comment

Share files and links from Salesforce or from your computer with people by attaching them to posts or comments.

You can attach all file types, including Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. The maximum file size is 2 GB.

When you attach a file, consider the following:

- When a file is posted to a feed, everyone in your company can see it even if the file started out as private. Only files posted in a private group stay private within that group.
- Attaching a file from a group or library creates a reference to the file. If you update a file in Salesforce CRM Content, the updates are also reflected in the feed.
- You can post a file from an external data source. From the file selector, choose an external source and navigate through the folders to the file you want to post. A new file reference or copy is created in Salesforce for the corresponding external file. If a file reference already exists for the file you select, it will be reused.

1. Click File at the top of your feed to attach a file to a post, or Attach File below a comment to attach a file to a comment.
   If you’re commenting on an update resulting from feed tracking on a file, the Attach File option isn’t available.

2. Do one of the following:
   - Click Select a file from Salesforce to attach a file that has already been uploaded to Salesforce, synced from your Salesforce Files Sync folder, or that exists in a Files Connect external data source.
   - Click Upload a file from your computer to attach new files from your computer.

3. Browse for the file you want to attach.
   Links, Google docs, documents from the Documents tab, and attachments from the Notes and Attachments related list aren’t included in the Select a File to Attach list. For more information about finding files to attach, see Searching for Files to Attach to a Chatter Feed.

4. Add a post or comment about the file.
   If you don’t enter any text, a generic update is posted with your attachment.

5. Below the text box, select My Followers to publish the post on your profile. To post to a group, select A Group. Type part of the group’s name in the Search Groups field, and select the group from the drop-down list. You can only select a group you’re a member of.

6. Click Share.

Searching for Files to Attach to a Chatter Feed

From the file selector, you can see a list of Salesforce files you own and have access to. In Salesforce Classic, click File above the feed, and then select a file from Salesforce. In Lightning Experience, click the paperclip icon below the post to open the Select File window. The 25 most recently viewed files are listed by default.

From the file selector you can see and search a certain group of files by clicking a specific filter on the sidebar.

- **All Files**—All files you own and have access to, including:
  - Files that have been shared with you
  - Files you're following
  - Files in your Chatter groups
  - Files in your libraries
  - Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you're a member or not, and private groups you’re a member of, but not private groups you’re not a member of.

  This filter is only available in Salesforce Classic.

- **Recent**—The most recent files you’ve viewed.

- **MY FILES**—All files you own, files shared with you, and files you follow.

  - **Owned by Me**—Files you have:
    - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, share them, and attach them to Chatter feeds.
    - Attached to Chatter feeds from your computer.
    - Synced using your Salesforce Files Sync folder.
    - Uploaded to Salesforce CRM Content libraries you’re a member of and your private library.

  - **Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.

  - **Following**—All files that you’re following. *(Requires Chatter)*

- **FILES IN MY GROUPS**—All files you and other people shared to groups you’re a member of. The last five groups you’ve visited are listed.

- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you’re a member of and all files you uploaded to your private library. The first five libraries you’re a member of, including your private library, are listed. If you’re a member of more than five libraries, click More to see a complete list.

- **Synced**—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the “Sync Files” permission.

- **EXTERNAL FILES**—All files you have access to in Files Connect external data sources. Search is restricted to the selected external data source.

  **Note:**
  - Only files from libraries that you’re a member of and where you have Post Content to Chatter Feeds or Manage Library checked in your library permission definition are listed.
  - Users who have the “Sync Files” permission don’t see the **All Files, MY FILES, or FILES IN MY GROUPS** filters. Users who don’t have the “Sync Files” permission don’t see the **Synced** filter.

To search for files from the search box:
1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.

2. Enter your search terms in the search box. You can search by file name, description, owner, type, or within the file’s text.

3. Click Search to see a filtered list of all relevant files based on your search terms. Or click to clear your search terms.

The Select a File to Attach list doesn’t include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.
- Links attached to posts in Chatter
- Files from your personal library

Search for Files

Performing Actions on a File in a Chatter Feed

You can perform the following actions on files in feeds:

- Preview—Click the file thumbnail or click More Actions > Preview next to the file.
- Download—Click More Actions > Download next to the file.
- Upload new version—Click More Actions > Upload New Version next to the file.
- View file detail page—Click the file name or More Actions > View File Details next to the file.
- Follow—Click Follow next to a file to receive updates about the file in the Chatter feed. Click to stop receiving updates about the file.
- Share—Click More Actions > File Sharing Settings next to the file to share the file with people, groups, or via link.
- If you have the “Sync Files” permission and are the owner of the file, click Sync to sync a file between your Salesforce Files Sync folder on your computer and Chatter. Click Unsync to stop syncing the file.

To learn who can perform which actions on a file, see Who Can See My File?.

Downloading and Previewing a File in a Chatter Feed

Not only can you download and save files posted to Chatter feeds, you can also preview files in your browser without downloading them.

There are several places in Chatter where you can download and preview files:

- On the Files page—Click ➔ Download or click the preview ( ) icon next to the file.
- On any Chatter feed—Click More Actions > Download next to the file, or to preview the file, click on the file thumbnail or click More Actions > Preview.
- On the Files Owned by list on a profile—Click ➔ Download or click the preview ( ) icon next to the file.
- On the Files Shared with list on a group—Click ➔ Download or click the preview ( ) icon next to the file.
- In the Notes and Attachments related list on a record, click Download next to the feed attachment, or to preview the file, click Preview next to the feed attachment.

Previewing a file opens it in your browser with the enhanced document viewer. The enhanced document viewer provides the following capabilities for viewing documents:

- In addition to using the next page ( ), previous page ( ), first page ( ), and last page ( ) icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing Next Page and Previous Page.
- You can use the scroll bar to move continuously through a document without needing to click the Next Page and Previous Page icons. Continuous scrolling is not available for PowerPoint files.
- You can jump directly to a page by entering the page number in the page field and pressing Enter.
- From the right-click menu you can choose Fit Width to expand the width of the document, or Fit Full Page to preview the whole page of the document. The fit width icon ( ) and fit full page icon ( ) are also available on the toolbar.
- From the right-click menu you can choose Full Screen to preview the document in full screen mode, or Exit to exit full screen mode. The full screen icon ( ) and exit icon ( ) are also available on the toolbar.
- From the right-click menu you can Zoom In or Zoom Out. The zoom-in icon ( ) and zoom-out icon ( ) are also available on the toolbar.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
  - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
  - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
  - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
  - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Note:
- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can’t be previewed, the Preview option isn’t available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don’t display correctly in previews. If a file can be previewed, but a preview doesn’t exist, contact your Salesforce administrator who may be able to regenerate the preview.
In Internet Explorer 11, the Preview option redirects to the file detail page.

SEE ALSO:
- Who Can See My Attached Files and Links?
- Delete Files and Links from Feeds

Delete Files and Links from Feeds

To delete a link from a Chatter feed, simply delete its post. To delete a file, go to the file detail page or content detail page. Only a file owner can delete the file. Users with the "Modify All Data" permission can delete all comments, posts, files, and links.

Delete a File from a Chatter Feed on a Record

There are two ways to remove a file on a Chatter feed on a record:

- Remove the file on a Chatter feed by deleting its post. This deletes the post, removes the file from the feed and from the Notes and Attachments related list, but the file remains in its original location. If the file isn’t posted anywhere else, it goes back to being private, but can be shared again later.

- Remove the file on a Chatter feed by clicking Del next to the feed attachment on the Notes and Attachments related list. This removes the file from all Chatter feeds where it’s been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking on the Recycle Bin, selecting the file, and clicking Undelete. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list also removes it from the post, but doesn’t delete it from its original location.

Deleting a link from a Chatter Feed

To delete a link on a Chatter feed, you must delete its post.

Deleting a File from a File Detail Page

Click Delete on a file's detail page to delete the file and remove it from all locations where it’s been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the Recycle Bin link on the Home page. Select the file and click Undelete. The file is restored as well as all of the shares that were associated with it.

Deleting a File from a Content Detail Page

When you post a file in Chatter, the file also appears in Salesforce CRM Content. To delete the file from Chatter, Salesforce CRM Content, and all locations where it’s been shared, click the name of the file on the Libraries, Content, or Subscriptions tab. From the content details page, click Edit > Delete Content to delete the file. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter. Select the checkbox for the content file you want to restore, and click Undelete.

- Post Visibility
Attaching a Link to a Post

Share links with people by attaching them to a post.

If you share a URL for which we provide rich media support, your post shows a preview of the linked content. For information about currently supported URLs, see Sites That Generate a Preview in Posts.

1. Above your feed, click **Link**.
2. Type the URL to share.
3. Optionally, type a **Link Name**.
   
   If you leave the Link Name field blank, the preview shows the title or name from the site URL.
4. Optionally, type a post.
   
   If you don’t type any text, a generic update is posted with your link.
5. Below the text box, select **My Followers** to publish the post on your profile. To post to a group, select **A Group**. Type part of the group’s name in the Search Groups field, and select the group from the drop-down list. You can only select a group you’re a member of.
   
   If you’re posting on someone else’s profile or on a record, the **My Followers** and **A Group** options aren’t available.
6. Click **Share**.

SEE ALSO:

- Sites That Generate a Preview in Posts

Sites That Generate a Preview in Posts

Salesforce provides rich media support for over 400 URLs. When you share a supported URL in a post, your post shows a preview of link content.

Embed.ly, a third-party service, powers file previews, which include thumbnails, descriptions, and video players for links to videos. If a post doesn’t render a link as a rich preview, the URL domain isn’t supported or Embed.ly was unable to return the preview content.

We don’t share any content, user, organization, or account data with Embed.ly. We share only the URLs that are on Embed.ly’s custom provider whitelist. The whitelist also includes versions of URLs that are shortened by third-party shorteners, like bit.ly, goo.gl, and tinyurl.com. All our URL requests pass through a Salesforce proxy. Embed.ly never receives calls directly from the client and therefore doesn’t have information about who’s making the URL request.

**Note:** For a look-up list of supported URL domains, see “URL Domains for Rich Link Previews in Feeds.”

SEE ALSO:

- Attaching a Link to a Post
Post a Poll

Polls

Use polls to conduct a survey. A poll contains a list of choices in a feed post that lets people cast a vote by selecting one of the choices.

Polls are a great way to get people’s opinions. For example, you are in charge of planning an annual sales meeting and need to find out when most people are available to attend the meeting. Instead of emailing everybody in the sales organization, you could create a poll in the Sales Chatter group that lists possible dates and ask people to vote for the date that works best for them.

When you create a poll, anybody with access to the feed or the poll can vote on the poll. So when you post a poll, consider who you want to participate. For example, if you post a poll in a private group, only the members of that group can see the poll and vote. Keep the following in mind about polls:

- When you create a poll, you can add up to ten choices.
- When voting on a poll, you can only select one choice.
- Polls are anonymous. You can see how many people voted, but you can’t see who voted.
- Click Refresh to see the latest poll result and the number of votes that were cast.
- You can’t repost a poll.
- People can only cast one vote, but they can change their vote.
- You can mention someone and include hashtag topics in the poll question.
- You and others can add topics to your poll question after posting.
- The email notification options you enabled in your Chatter Email Settings apply to polls just as they do to posts. For example, if you get a notification whenever someone comments on a post you made, you also get an email notification when someone comments on a poll you posted.

Note: The poll result doesn’t always add up to 100 percent due to rounding. For example, if a poll has three choices and each gets one vote, the result adds up to 99 percent.

SEE ALSO:
Liking Posts and Comments

Create a Poll

Post a poll in your feed to gather people’s opinions.

1. Above the feed, click Poll.
2. Type a question in the text box. Add a hashtag or mention someone.
3. Type at least two choices. Click Add more choices to add another choice. You can enter up to ten choices.
4. Select to post the poll to your followers or to a group. If you’re posting the poll to a group, select the name of the group from the drop-down list.
Collaborate with Everyone

5. Click **Share** to post the poll.

SEE ALSO:
- Vote on a Poll

**Vote on a Poll**

1. In the post that contains the poll, select your choice. You can only select one choice.

2. Click **Vote**. The post shows the current result of the poll. To change your vote click **Change vote** and select your new choice.

⚠️ **Note**: The poll result doesn’t always add up to 100 percent due to rounding. For example, if a poll has three choices and each gets one vote, the result adds up to 99 percent.

Filters for Sorting the Topics List

Use the topic filters to narrow the topics list to your favorite topics or topics you use, and then sort the topics by the number of people talking about them or alphabetically by name.

On the Topics list, under Show, you can filter the topics.

**All**
- All topics that have been added to posts in your organization

**My Favorites**
- Topics you added to your favorites

**Topics I Use**
- Topics you added to posts and topics on posts that you commented on

Within the topics you filtered, you can sort by the following columns.

**People Talking About This**
- Sorts by the number of people talking about the topic. This includes:
  - The number of people adding the topic to updates
  - The number of people commenting on posts with the topic

**Name**
- Sorts alphabetically by the topic name.

Viewing Details about a Topic

View a topic detail page to see the topic description and a feed with topic updates from all users and public groups.

To open a topic detail page, click a topic or hashtag. On the topic detail page, you can:

- **Search a topic feed** to quickly find relevant information. Or scan the feed to learn about the topic and discover which people and public groups are interested in it.
- **Add a post directly to the topic feed.** Your followers automatically see the post, and you can even add the post to a group you’re a member of by using an @mention. Because you added the post on the topic feed, the topic is automatically added to your post.
- **Discover who’s knowledgeable** about the topic and endorse people you think are knowledgeable. If you appear in the Knowledgeable People list and you don’t want to, you can hide yourself.
- **Click Follow** to follow the topic and see updates to the topic in your feed.
- **Edit the topic name and description.** In the upper right, click ✎, and choose Edit Details. You can change only the capitalization and spacing of topic names.
  - **Note:** Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.
- **If available, find out more about a topic using the lists on the right.**

**Related Topics**
- Other topics that were added together with the current topic.

**Recent Files**
- Files you have access to that were most recently posted to the topic feed.
Groups Talking
Public groups and groups you’re a member of that most recently used the topic.

Following Topics
Follow topics so you can see updates in your Chatter feed.

To follow a topic, click Follow on the:
- Topic detail page
- Topics list

You can follow a maximum combined total of 500 people, topics, and records. To see how many items you’re following, view the Following list on your profile.

To stop following a topic, click next to Following. After you stop following a topic, you don’t see future updates to the topic in your Chatter feed.

If your administrator disables feed tracking for topics, you can’t follow new topics but you continue to follow the ones you followed when feed tracking was enabled. These topics count toward the maximum number of people, topics, and records that you can follow. To stop following a topic after your administrator disables feed tracking, you must use the Chatter REST API.

Find and Endorse People Knowledgeable about a Topic
Discover and recognize experts using the Knowledgeable People section of topic pages and the Overview tab of user profile pages.

The topic page shows the five most knowledgeable people based on their activity on the topic and recognition received for the topic. For example, Chatter considers how often people:
- Were mentioned in posts or in comments on posts with the topic
- Received likes on comments on posts with the topic
- Received endorsements for the topic

Endorsements are a strong signal of knowledge, so if someone endorses you, you’re automatically included in the list of knowledgeable people.

Note: Knowledgeable people are calculated and updated once a day.
To change endorsements:

- Endorse someone you think is knowledgeable about a topic by clicking **Endorse** under the person’s name. If the person you want to endorse doesn’t appear in the Knowledgeable People section, click **Endorse People** to see the full list and to search for other people. (You can’t endorse yourself, Chatter Free users, or customers.)

- Remove your endorsement of someone at any time by clicking 📡 next to Endorsed under the person’s name. Removing your endorsement of someone doesn’t necessarily remove them from the knowledgeable people list; they might be endorsed by other people or have significant activity on the topic.

To remove yourself from the knowledgeable people list:

- Opt out by clicking **Hide me** under your name. No one can see you in the list after you hide yourself. If you change your mind, you can opt back in by clicking **Endorse People** and then **Show me** next to your name.

To see a person’s full range of expertise:

- Navigate to their user profile page, and click the Overview tab. Then click topic names to see topic detail pages, or click thumbs-up icons to add or remove your endorsements.

---

**Important:** If Work.com Skills are enabled, they replace knowledgeable topics on profile pages. (For Salesforce Communities users, skills replace topics only in the default community.) Self-declared skills are considered when calculating knowledge levels.

SEE ALSO:

- **Skills Overview**
Add Topics to Posts

Add topics to posts to organize them or to increase their visibility. You can add topics to your own posts immediately after posting, or you can add topics to any posts at any time directly in the feed.

- **Note:** All topic names appear in the topics list and all topic names and descriptions are searchable, including topics used solely in private groups or on records.

- **Note:** When you add topics to posts that contain files, the topics are also added to those files.

1. In the top corner of the post, click 🗖.
2. Click Add Topics or Edit Topics.
3. In the topic editor, start typing your text. As you type, you can pick a topic from the list of suggestions, or keep typing to create your own unique topic. To add more than one topic, type a comma after each topic.
   
   Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

   Posts can have up to 10 topics.

4. When you’re done adding topics, click Done or press ENTER.

The topics you add become links to the topic detail pages.

SEE ALSO:

Add Hashtag Topics to Posts and Comments
Adding a Topic as a Favorite

Add Hashtag Topics to Posts and Comments

Add topics to posts and comments to organize them or to increase their visibility.

For example, if you post that you’re working on a sales presentation for your customer Universal Paper, you might want to add the hashtag topic #Universal Paper in your update. Anyone can click the topic to find out more information about Universal Paper and to see which people and groups are talking about Universal Paper.

- **Note:** When you add topics to posts that contain files, the topics are also added to those files.

To add a hashtag topic:

1. When writing an update, type # followed by any text. As you type, you can pick a topic from the list of suggestions, or press ENTER at any time to add a new topic that can be up to three words.
   
   Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

2. Click Share.
The hashtag topic becomes a link to the topic detail page. The topic (without the hashtag) is also automatically added to the top-level post in the update. For example, if you include #Universal Paper in a comment under your coworker’s post, the topic Universal Paper is added to your coworker’s post.

Once you post an update, the only way to remove a hashtag topic is to delete the entire post or comment. You can, however, remove the topic from the top-level post.

SEE ALSO:
Add Topics to Posts

Add Topics to Files

Use topics to make files more visible. Topics added to feed posts are also added to any files in the post or its comments. When you search for those topics, the files are included in results.

To add topics to files posted in feeds, simply add the topics you want to the feed post on page 2869 where the file is attached. You can add regular topics or hashtag topics on page 2869. The topics are automatically added to any files attached to the post or its comments.

Note: While Lightning Experience supports adding hashtag topics, searching and viewing topic details are available only in Salesforce Classic.

Example:

Since Kimmy added the topics Sales Training, Western Region, and Feedback Request to her post, these topics are also added to the file she attached. Now, her coworkers can click a topic to find other posts, files, and records associated with that topic. If the topic is associated with records other than files, go to the Records tab and choose Files. Otherwise, use the Feeds tab to see all posts and files for the topic.
Remove Topics from Posts

Remove a topic from a post if it no longer applies.
You can remove topics from posts in the feed, whether they’re regular topics or hashtag topics. Removing topics doesn’t delete them altogether; it only removes them from the post. Deleting the text of hashtags doesn’t delete hashtag topics. Before you remove a topic from a post, consider whether you or someone else added it. Someone else may be tracking the update with topics you’re not aware of.

1. In the top corner of the post, click X.
2. Click Edit Topics.
3. Click X next to the topic you want removed from the post.
4. Click Done or press ENTER.

Removing a topic from a post removes the post from the topic feed on the topic detail page and from the feeds of any followers.

Adding a Topic as a Favorite

Add a topic as a favorite to quickly see the latest on the topics you’re interested in.

1. Click a topic name to navigate to the topic detail page.
2. In the upper-right, click X, and choose Add to Favorites. The favorite name is the same as the topic name.

Tip: When viewing a topic favorite, you can click the topic name at the top of the feed to go directly to the topic detail page.

SEE ALSO:
Viewing All Topics

Viewing the Topics People Are Talking About

The topics you’re talking about appear in your Chatter profile in the Recently Talked About section. This section helps people learn which topics you’re knowledgeable about or interested in. These are the topics that you and others have frequently and recently (within the last two months) added to your posts and to posts you’ve commented on. For privacy reasons, Recently Talked About topics don’t include topics used solely in private groups or record feeds. You can see up to five topics, with the most frequently and recently added topic appearing first. If you’re new to topics or if you haven’t used topics in the last two months, the Recently Talked About section doesn’t appear until you start using topics more frequently. Click a topic in this section to see the topic detail page.

Note: If the Knowledgeable About list or Work.com Skills are enabled, those features replace the Recently Talked About section on profile pages.
**View the Topics Groups Are Talking About**

The topics that a group is talking about appear on the group detail page in the Recently Talked About section. This section helps people understand which topics a group is knowledgeable about or interested in. These are the topics most frequently and recently added to group posts over the last two months. You can see up to five topics, with the most frequently and recently added topic appearing first. If a group isn’t using topics, the Recently Talked About section doesn’t appear until the group starts using topics more frequently. Click a topic in this section to see the topic detail page.

**Viewing Your Company’s Trending Topics**

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don’t include topics used solely in private groups or record feeds.

**SEE ALSO:**
- Viewing the Topics People Are Talking About

**Share Posts**

**Sharing a Chatter Post**

Sharing lets you quickly copy a public post to your profile or a group.

You can share public Chatter posts that contain text, links, or files to your profile, with a group, or using a link to the post.

When you share a post, keep in mind:

- You can share a post to your own profile, but not to another person’s profile.
- You can share the original post, including any files and attachments, but you can’t share any comments or likes.
- You can comment on the shared post, but you can’t edit a shared post.
- You can’t share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
- You can’t share a post from a record feed.
- You can only share posts with a group you’re a member of.
- You can share a post to a group that allows customers. However, customers and other group members can’t share posts from a private group.
Only Chatter users inside your company can see a post that you shared using a link in an email or instant message.

When someone shares your post, you receive an email notification. To change your email notifications, from Setup, enter Chatter Email Settings in the Quick Find box, then select Chatter Email Settings.

Sharing a Chatter Post to Your Profile
Copy a public post to your profile to share it with the people who follow you.

You can share public posts, but you can’t share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.

1. Find the post you want to share in your Chatter feed.
2. Click Share.
3. Write a comment about the post or leave the comment field blank.
4. In the drop-down list, select My profile.
5. Click Share.

The shared post appears in the Chatter feed on your profile.

Sharing a Chatter Post with a Group
You can share posts with a group that you’re a member of.

You can share public posts, but you can’t share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions. You can’t share posts with archived or unlisted groups.

1. Find the post you want to share in your Chatter feed.
2. Click Share.
3. Type a comment about the post or leave the comment field blank.
4. In the drop-down list, select A group.
5. Type part of the group name and select the group from the list.

If you are sharing a post with a file, select Viewers to allow group members to only view the file, or select Collaborators to allow group members to download and modify the file.

6. Click Share.

The shared post appears in the feed of the group.

Sharing a Link to a Chatter Post

Share a post with other Chatter users via email or instant message.

When sharing a link to a post, keep in mind:

- You can’t share a link to a post from a private group.
- You can share public posts, but you can’t share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
- In order to see the post, the people to whom you send the link to the post must be Chatter users.

1. Find the post you want to share in the Chatter feed.
2. Click Share.
3. In the top corner, click Show link to post.
4. Copy and paste the link in an email or instant message and send it to the people with whom you want to share the post.

When recipients of the email or instant message click the link to the post, the post appears in their Chatter updates.

SEE ALSO:
- Post Visibility

View a Single Chatter Post

You can view a single Chatter post in a feed for a user, record or group.

- In a feed, click the timestamp displayed below the post, for example, Yesterday at 12:57 AM.
- In a Chatter email notification, click the link in the body of the email to view only the related post.
- To view the full feed, above the post, click All Updates.

See your personal Chatter activity statistics, such as how many posts you’ve made and how many likes you’ve received, and check your relative Chatter influence.

Inviting People to Join Chatter

People Overview
The People tab and the People list on the Chatter tab display a list of the users in your organization.

- Click a person’s name or photo to view his or her profile.
- Click Follow to see a person’s updates in the Chatter feed. You can’t follow customers.
- Click Following to stop seeing a person’s updates in the Chatter feed.
- Click a column header to sort the list:
  - Name sorts alphabetically by name. By default, the list is sorted alphabetically, in ascending order.
  - Following sorts based on who you’re following and not following.
- Search for users by typing characters of a first or last name in the search box at the top of the page. The list automatically filters based on what you type.
- At the top of the list, click a letter to list everyone whose last name begins with that letter.
- Your organization’s size determines what you see in the people list. For example, in the largest organizations, we don’t display any users until you start searching for a person’s name. We count all Salesforce user license types when calculating the approximate number of users, including internal users, Communities users, and Chatter users.

<table>
<thead>
<tr>
<th>Approximate number of users</th>
<th>Defaults to view</th>
<th>All People filter defaults to</th>
</tr>
</thead>
<tbody>
<tr>
<td>25 or fewer</td>
<td>All People</td>
<td>Everyone in the organization</td>
</tr>
<tr>
<td>26 to 25,000</td>
<td>Recently Viewed People</td>
<td>People whose profiles you recently viewed</td>
</tr>
<tr>
<td>More than 25,000</td>
<td>Recently Viewed People</td>
<td>No one until you start searching</td>
</tr>
</tbody>
</table>

- Invite people to join your Chatter network. Invited users can view profiles, post on their feed, and join groups, but can’t see your Salesforce data or records.
- View the people that Chatter recommends you follow. Click More in the Recommended People section to view all of your recommendations. If no recommendations appear, then you’re already following all the recommended people.

Chatter, Profile, People, Groups, and Files tabs are available by default in the Chatter app. Select the Chatter app from the app menu in the top right corner of any page. If your administrator has added these tabs to other apps, you see the tabs in those apps unless you previously customized your display. In that case, add the tabs to those apps.

  - Chatter Moderators
Chatter Profile Overview

Customize your personal Chatter profile with a photo and information about yourself so others can learn more about you.

Click your name anywhere around the application to view your profile. If available, you can also click the Profile tab or Your Name > My Profile at the top of the page. View other people’s profiles by clicking their name.

From this page you can:

1. Change your profile picture.
2. Click in the Contact section to edit your contact information.
3. View content on different tabs. Your administrator configures the tabs and can add custom tabs or remove the default tabs.
   • Feed tab—View your Chatter feed or post an update.
   • Overview tab—Update your About Me section, view your activity in a Q&A or Ideas community, view your groups, or see who’s following you and who you’re following.
4. Edit your profile or access your personal settings.
Note: More options are available when viewing someone else’s profile. For example, if available, you can follow or unfollow someone or send them a private message.

Profile Best Practices
When using profiles, consider these tips:

- Information in the About Me section is searchable and makes you more visible to others.
- Your posts display in your Feed tab and the feeds of people following you. To delete your posts from feeds, hover over the post and click x.
- To change your email address in your contact information, you must click the link in the confirmation email sent to your new email address.
- Not all users have profiles. This includes portal users and the Connection User in organizations using Salesforce to Salesforce.

Using the Following and Followers Lists
View the Following and Followers lists on your profile to see who, what, and how many items you’re following, and who is following you. If you’re not following anyone, click Find people to follow in the Following list to view the People list and start following people. You can also view the Following and Followers lists on other people’s profiles.

Note: When your administrator turns on Chatter, you automatically follow some users and records in your organization.

In either list, click Show All to view the full list in alphabetical order.

- Use the Next and Previous links to see more of the list.
- Optionally filter the Following list by people or objects, for example, accounts or files.
- In your Following list, click x to stop following a person or record.
- In another person’s Following list, click Follow to follow a person or record.
- In any Followers list, click Follow to follow a person, or x to stop following them.
- Click Done to close the window.

SEE ALSO:
- Post Visibility
- People Recommendations
People Recommendations

Chatter recommends people in your organization that you might want to follow based on similar interests. For example, Chatter recommends people who:

- Follow the same people as you.
- Are in your management hierarchy, such as your manager, people who report to your manager, and people who report to you.

Salesforce uses the Manager field on your personal information page to determine these recommendations. If this field is blank, Chatter won’t recommend people based on your management hierarchy. Only your Salesforce administrator can edit the Manager field.

- Are popular, which means they have many followers.
- Are new to Chatter.
- Are interested in the same records as you. For example, someone who has looked at or edited an account that you’ve recently viewed.
- Are often followed together with people you already follow. For example, if you follow Madison Rigsby, you get a recommendation for Suzanne Powell if many people who follow Madison also follow Suzanne.

To see an expanded list of your recommendations, click More in the Recommendations section. If no recommendations appear, then you’re already following all the recommended people.

  - Chatter Profile Overview

Give Thanks to Your Coworkers

Recognize your coworkers with badges and post your thanks directly to their Chatter feed.

Note: The Chatter Free license has limited functionality with Thanks features.

Rewards features require a Work.com license. This includes giving, creating, or receiving badges tied to rewards.

Thank someone if they’ve done a great job or to recognize an achievement.

Walk Through It: Give Thanks in Chatter

1. From the Chatter publisher, click Thanks.
   - If Thanks isn’t displayed, click More and select Thanks from the publisher’s drop-down menu.

2. Type the name of the person you want to thank.
   - Currently, you can only thank one person at a time, but you can mention other people in your post’s message.

3. Select Change Badge to select a different badge for your post or keep the default badge.
   - You can choose from twelve pre-defined badges. Select the badge image to see more information about the badge.

4. Type a message for the person you’re thanking.

5. Select your audience.
   - My Followers to post to all your followers
• **A Group** to post to a specific group. Search for the group and select the group from the list. The person you’re thanking is mentioned at the beginning of the post’s message. When you post to a private group, only the group’s members can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient’s profile.

6. **Click Share.**

Your Thanks post appears in your feed and the feed of the person you’re thanking. If you’re posting to a public group or a record page, the post appears on the group or record feed and their profile. If you’re posting to a private group, only members of the private group can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient’s profile.

**Files Owned Lists on Profile Pages**

The Files Owned list on a person’s profile shows the files that person most recently attached to a Chatter post.

The list includes files that the profile owner attached to a post on the profile, a group, or record page, or uploaded to Salesforce CRM Content libraries. Hover to see available options or click the file name to go to the file detail page.

Click **Show All** to see a list of all the files the profile owner attached and uploaded. The list doesn’t include files you don’t have access to, documents from the Documents tab, and attachments from the Notes and Attachments related list. On this list you can:

• Upload private files or share files with people, groups, or via a link
• Preview a file, if a preview is available
• Follow a file to receive updates in your feed
• Click the file name to view the file detail page

SEE ALSO:

[Filter Your Files List](#)

**Chatter Activity and Influence**

See your personal Chatter activity statistics, such as how many posts you’ve made and how many likes you’ve received, and check your relative Chatter influence.

Chatter activity statistics include how many posts and comments you’ve made, how many comments you’ve received, and how many people liked your posts and comments. Chatter influence shows how your activity stacks up to other people’s.

• **Top Influencers** lead collaboration efforts by regularly sharing essential content.
• **Active Influencers** encourage others to get involved and share knowledge.
• **Observers** are quiet participants or just getting started in Chatter.

You can see your Chatter activity statistics and influence on your profile under your photo. You can also see your coworkers’ Chatter activity and influence on their profiles. When viewing a profile, hover over [ ] under the profile photo for details about how that person is uniquely influential.

[Chatter Profile Overview](#)
Inviting People to Join Chatter

You can invite people from your company that don't have Salesforce licenses to use Chatter. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

To invite people to Chatter:

1. Click **Invite People to Chatter** on the People page or **Invite Coworkers**! on the Chatter page.
   
   **Note:** You can only invite people with email addresses in your company's domains. Portal users can't send invitations.

2. To send invitations from Chatter, enter email addresses and click **Send**.

3. To send invitations using your own email account, click **send your own email invitation**. If you have a default email client set, an email containing an invitation link opens in your mail program. Otherwise, you see an invitation link that you can copy and paste into an email.

You can also invite coworkers to join a public group even if they don't use Chatter yet. Additionally, owners and managers of private groups can send invitations. If customer invitations are enabled, owners and managers can also invite customers. When someone accepts an invitation to join the group, they join Chatter as well.

1. Click **Groups** and click on a group name.

2. In the Members section on the group detail page, click **Invite People**.

   If you are the group owner or manager, you can also click **Add/Remove Members**, then click **Invite them to Salesforce Chatter!**

3. Enter email addresses and click **Send**.

   **Note:** If a user doesn't accept the invitation within the first day, Chatter sends an email reminder the second day. If the user doesn't accept that invitation, Chatter sends another reminder the following day.

   A user has up to 60 days to accept an invitation to join Chatter. If during that time, an administrator deselects **Allow Invitations** or removes the user's domain from the list, the user can't accept the invitation.

   When delegated authentication single sign-on is enabled in your organization, invited users bypass the password registration page. If their username already exists, they won’t be able to accept the invitation.

Moderate Chatter Free Users

Chatter Moderators

A moderator is a Chatter user with some additional privileges such as:

- Activate or deactivate Chatter Free users
- Assign a Chatter Free user as moderator or take the privilege away
- Access to details about all users in your org
- Delete posts and comments that they can see

You can tell if someone is a moderator by the special banner on their profile picture.

SEE ALSO:

What Your Chatter Group Role Allows You To Do

Assign Moderator Privileges to Chatter Free Users

As a moderator, you can assign moderator privileges to Chatter Free users in your organization. You can also remove them if needed.

1. Go to the person’s profile page by clicking their name in the People tab or on a feed.
2. On the profile page, you can take these actions from the user action menu.

   - If you want the person to be a moderator, select Assign Moderator Privileges.
   - If the person is a moderator and you want to revoke those privileges, select Remove Moderator Privileges.

SEE ALSO:

Change Chatter Group Roles
Deactivate Chatter Free Users

As a moderator, you can deactivate Chatter Free users if, for example, they left the company.

1. Go to the person’s profile page by clicking their name in the People tab or on a feed.
2. On the profile page, click **Deactivate User** from the user action menu.

![User Profile Menu]

If you need to re-activate a Chatter Free user, you must use global search to find their profile, as deactivated users don’t show up on the People tab. To activate a user:

1. Find the person’s profile using global search.
2. On the profile page, click **Manage User** and select **Activate User**.

Records and List Views

Configure your follow settings for records, view Chatter feeds on list views, and learn more about record recommendations.

- **Automatically Follow Records You Create**
  When you follow records you create, updates are sent to your Chatter feed when you or someone else changes a tracked field on those records.

- **Viewing Record Feeds**
  View the Chatter feed associated with a record you follow to see updates about the record.

- **Can I create a custom report for records I’m following?**
- **Can other people follow records I own?**

- **Record Recommendations**
  - **Viewing Chatter Feeds on List Views**
    Switch to an object’s Chatter feed directly from a list view to see updates for the records included in the list view.
  - **Adding a List View as a Chatter Favorite**
    Add a list view as a Chatter favorite to monitor key business processes directly from your Chatter tab.
Automatically Follow Records You Create

When you follow records you create, updates are sent to your Chatter feed when you or someone else changes a tracked field on those records.

By default, you don’t automatically follow the records you create. If you want to automatically follow the records you create, enable auto-follow in your Chatter Settings.

1. From your personal settings, enter My Feeds in the Quick Find box, then select My Feeds.
2. Select Automatically follow records I create.
3. Click Save.

Consider the following tips around auto-following records:

- When you create a child record, the owner of the parent record becomes the owner of the child record by default. So you don’t automatically follow the child record, unless you’re the owner of the parent record.
- The Account Owner field of a record is updated to change the account owner. The new account owner only follows the account automatically, if the Account Owner field is feed-tracked and the new account owner has auto-follow enabled.
- If a workflow changes the Account Owner field while the record is created, the user who created the record doesn’t automatically follow the account.

Consider the following scenario. You are creating a record. Saving the record starts a workflow that immediately reassigns the Account Owner field to another user and then saves the record. Meaning, the workflow changes the Account Owner field before the record is saved. In this case, you don’t follow the record automatically, because you never were the record owner, even though you technically created the record.

SEE ALSO:
- Viewing Record Feeds
- Record Recommendations
- Personalize Your Salesforce Experience

Viewing Record Feeds

View the Chatter feed associated with a record you follow to see updates about the record.

Record feeds allow you to track information for records you have access to. On the record detail page, click Show Feed to display the record feed above the account details.

Note: Access is all-important. For example, let’s say you reassign a record and then realize it needs an update. Often, you can open and update the record. But if, after the reassignment, you no longer have access, then you won’t be able to see or update the record.

In the record feed, you can

- View posts, comments, and tracked field changes.
- Write an update about the record and share it with other people who follow the record.

Updates on the record detail page also appear on the Chatter page of people who follow the record. Anyone who has access to the records can see the update on the All Company feed.

- See who is following the record.
• Search the record feed ( ).

Note: Record field changes in the feed aren’t included in search results.

Can I create a custom report for records I’m following?
Currently, you can’t customize a report based on records you’re following in Chatter.

SEE ALSO:
The People and Records You Auto-Follow Initially

Can other people follow records I own?
Yes, provided that they can already see the record. People can only follow records they can see, and by extension, can only see updates to records they can see.

SEE ALSO:
Record Recommendations

Record Recommendations
Following records helps keep you up-to-date on important changes to accounts, contacts, opportunities, and more. Chatter recommends records that you’ve viewed or edited, records that you own (and aren’t already following), and parent accounts of records that you’re following.

Chatter won’t recommend records that your Salesforce administrator has disabled feed tracking for. Only opportunities, accounts, leads, contacts, and articles are included in record recommendations.

To see an expanded list of your recommendations, click More in the Recommendations section.
To see your record recommendations by object, click the object in the side filters. For example, click Accounts to view only your account recommendations.

If no recommendations appear, then you’re already following all the recommended records.

SEE ALSO:
Viewing Record Feeds
Viewing Chatter Feeds on List Views

Switch to an object’s Chatter feed directly from a list view to see updates for the records included in the list view.

If Chatter is enabled for your organization, Chatter feeds on list views are available for most feed-tracked objects. Some feed-tracked objects don’t have a Chatter feed associated with their list view. Currently, you can view Chatter feeds on list views for opportunities, accounts, cases, leads, campaigns, contacts, and custom objects.

- Click Chatter on a standard or custom object list view to see a Chatter feed with updates from the last 30 days for the records included in the list view.
  - If drag-and-drop scheduling on list views is enabled, you won’t see Chatter feeds on the list views for accounts, contacts, or leads.
- Click List to display the list view again.

SEE ALSO:
  Viewing Record Feeds

Adding a List View as a Chatter Favorite

Add a list view as a Chatter favorite to monitor key business processes directly from your Chatter tab.

1. Open an existing list view or create a list view for a set of records, like for example accounts, opportunities, or leads.
2. Click Feed in the top-right corner to see the Chatter updates for the list items.
3. Click Add to Favorites.
   - The favorite name on the Chatter tab is the same as the list view name.

SEE ALSO:
  Viewing Record Feeds
Dashboards and Dashboard Components

Following Dashboard Components

If feed tracking is enabled for dashboards, you can view updates and field changes in the Chatter feed. You can also follow dashboards and certain dashboard components.

Following components isn’t supported for dynamic dashboards.

Only unfiltered data is used to generate alerts. This prevents alerts being sent out (incorrectly) because a component’s value appeared to cross a breakpoint as a result of filtering.

If you don’t see feeds, ask your administrator to enable feed tracking for dashboards.

For example, to receive alerts when total sales for a gauge fall below a certain amount, set conditional highlighting on that component, then follow it.

- Hover over a component to display the menu.
  To clear the hover menu, click an empty part of the screen.
- Click Follow this Component.

To stop following a component, click and select Following.

SEE ALSO:
Viewing Record Feeds

About Posting Snapshots to User and Group Feeds

When you post a component snapshot to a Chatter feed, consider who you would like to share and comment on the component.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed. Post a component snapshot to a user or group feed to share and comment on that component. For example, post a snapshot of this month’s sales to your team.

Each snapshot has a “Viewing As” label. This is the name of the running user whose dashboard component you’re viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they’re taken to your filtered view of the dashboard if the filters are still valid. If the filters aren’t valid, they see the unfiltered dashboard.

If you don’t see the option to post a snapshot, talk to your administrator about enabling dashboard component snapshots.

Important: Posting a snapshot to a user or group feed makes it potentially visible to the entire organization:

- Posting to a user feed makes the snapshot public. Anyone who views that user’s profile can see it.
- Posting to a public group makes the snapshot public. Anyone who views your profile or the group feed can see it.
- Posting to a private group shows the snapshot to all group members.

People can see it whether they have access to the dashboard or not. Make sure the component doesn’t contain sensitive information!

SEE ALSO:
Following Dashboard Components
Posting Snapshots to Chatter

Post a snapshot of a dashboard component to a Chatter feed to help other users follow changes in the data.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed.

- Post a component snapshot to its dashboard feed to share information with everyone following the dashboard. For example, post a snapshot of a regional sales chart to let your team know that sales are down in the Midwest.
- Post a component snapshot to a user or group feed to spark comment or action from that user or group.

Each snapshot has a “Viewing As” label. This is the name of the running user whose dashboard component you’re viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they’re taken to your filtered view of the dashboard if the filters are still valid. If the filters aren’t valid, they see the unfiltered dashboard.

If you don’t see feeds, ask your administrator to enable feed tracking for dashboards.

1. Hover over a component to display the menu.
   To clear the hover menu, click an empty part of the screen.

2. Choose where you want your snapshot to appear.
   a. To show it in a dashboard, click Post Snapshot to Dashboard Feed.
   b. To show it to a user or group, click Post Snapshot to User or Group Feed.

3. Write a comment in the text box and click OK. If you’re posting a filtered component, you may want to mention that in your comment.
   The snapshot and comment immediately appear in the dashboard feed.

   Note: Snapshot images display in feeds for four months. After four months, only the comments remain.

Collaborate in Chatter Groups

Use public, private, or unlisted Chatter groups to collaborate with specific people in your company.

Chatter Groups

Chatter groups let you collaborate with specific people. For example, if you’re working on a team project, you can create a group for your team to share project-related files and information.

Unlisted Groups Overview

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the “Manage Unlisted Groups” permission can access unlisted groups in list views, feeds, and search results.

Broadcast Groups

Broadcast groups are a special type of public, private or unlisted group where only group owners and managers can create new posts. Group members can comment on the posts created by the group owner or manager.

Using the Chatter Groups Page

The Groups page displays a list of the Chatter groups in your company.
Join or Leave Groups
Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

Chatter Groups

Chatter groups let you collaborate with specific people. For example, if you’re working on a team project, you can create a group for your team to share project-related files and information.

You can join up to 300 groups, and your company can have a total of 30,000 groups. Chatter groups have different levels of access:

- **Public**: Anyone can see and add posts, comments, and files. Anyone can join a public group.
- **Private**: Only group members can see and add posts, comments, and files. People must ask to join or be added by the group’s owner or managers. Users with the “Modify All Data” and “View All Data” permission can see group posts, updates, and files across the organization. Users with the “Manage All Data” permission can also join private groups directly and change group settings.
- **Unlisted**: Only group members and users with the “Manage Unlisted Groups” permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group’s owner or managers. Unlisted groups offer more privacy and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren’t available by default; your administrator must enable them for your organization.
- **Optionally, select Allow Customers**: The group owner and managers can invite customers to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.

After you allow customers in a group, you can’t change the group access level.

Additionally, if your administrator has enabled the feature, some groups may be archived. When a group is archived, users can’t create new posts but group data is retained for reference.

SEE ALSO:
- What Your Chatter Group Role Allows You To Do
- About Chatter Customers in Private Groups

Unlisted Groups Overview

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the “Manage Unlisted Groups” permission can access unlisted groups in list views, feeds, and search results.

Unlisted groups are similar to private groups, in that, only members can view an unlisted group’s detail page, feed, or files. However, unlisted groups provide more privacy compared to private groups.

- Unlisted groups don’t display in list views, feeds, and search results for nonmembers. Only members and users with the “Manage Unlisted Groups” permission can find and access unlisted groups.
- Nonmembers can’t visit the group detail page.

(With private groups, nonmembers can see a truncated version of the detail page, which shows the name, description, and member list, but not the feed or files.)
• You can convert unlisted groups to public or private groups, but not the other way around.
• Only group owners, group managers, and users with the “Manage Unlisted Groups” permission can add group members. Users can’t ask to join them.
• Users can’t see unlisted groups on other user profiles unless they have access to the group.
• Files shared in unlisted groups are visible only to the members of the unlisted group. If the file is shared outside the unlisted group, then other users with permissions can update the file.
• Even users with the “Modify All Data” or “View All Data” permissions can’t access an unlisted group or its files unless they’re members. They also can’t change group settings unless they own or manage the group.
• Only users with the “Manage Unlisted Groups” permission can access or modify unlisted groups and its files and feed content without membership.

Limitations
If you decide to create an unlisted group, make sure that you consider these limitations.
• Custom pages or third-party applications integrated with Salesforce could expose unlisted group information to users who don’t have access via the Salesforce UI. Check in with your administrator about who can access information in unlisted groups in your organization.
• You can’t use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn’t created, and the link won’t work.
• You can’t mention unlisted groups in posts or comments.

SEE ALSO:
  Enable Unlisted Chatter Groups
  Unlisted Group Limitations

Broadcast Groups
Broadcast groups are a special type of public, private or unlisted group where only group owners and managers can create new posts. Group members can comment on the posts created by the group owner or manager.

By restricting the ability to post, group owners and managers can keep group discussions focused and relevant by cutting down noise from off-topic posts. Public, private, and unlisted groups support this feature.

To set a group to broadcast mode, select Broadcast Only in the group settings.

Example: Creating broadcast groups are ideal when one person or a fixed set of individuals regularly needs to communicate or share information with a large group of people. Some examples include:

• Organization-wide updates from the executive leadership in the company
• Policy changes from your company’s HR department
• Event updates from the organizer of large events or company conferences
• Important action alerts from key IT personnel, including their awesome Salesforce administrator

Broadcast group setting in Salesforce Classic.
Broadcast group setting in Lightning Experience.
Using the Chatter Groups Page

The Groups page displays a list of the Chatter groups in your company.

Click Groups on the sidebar of the Chatter page to display the list of Chatter groups. On the Groups page you can

**Create a new group**

Click New Group to access the New Group page and create your group.

**Filter and sort the groups list**

Use the following filters to filter your groups.

- **Recently Viewed** shows the groups you recently looked at, starting with the group you viewed last
- **My Groups** shows the groups you belong to, own, or manage
- **Active Groups** shows the active groups in your company
• **My Archived Groups** shows the archived groups you belong to, own, or manage.

  Click a column header to sort the list. The Group column sorts by group name; the Last Activity column sorts by the date of the last post or comment on a group; the Membership column sorts based on your membership status.

**Search for a group**

  Search for groups by typing two or more letters of a group name or description in the Find Groups box. The list automatically filters based on what you type.

**View a group**

  Click a group name to view the group. You can view all groups, but you’ll only see updates and files for public groups, and for private groups you belong to. Groups that allow customers say (With Customers).

**Join a public group or ask to join a private group**

  Click **Join** to join a public group. For private groups, click **Ask to Join** to email a request to join to the group’s owner and managers. Users with the “Modify All Data” permission can directly join private groups, and therefore see **Join** for private groups.

**Leave a group or withdraw a request to join a group**

  Click **x** to leave a group or to withdraw a request to join a group.

**View the group owner’s profile**

  Click a group owner’s name to see his or her profile.

**Get a group recommendation**

  View the groups that Chatter recommends you join based on the group’s popularity and the number of connections you have in the group in the Recommendations section. Click **More** to see the full list. If you don’t see recommendations, you already belong to all the recommended groups.

SEE ALSO:

  Group Files Lists

**Join or Leave Groups**

Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

1. Go to group’s detail page.

2. To join a public group, click **Join** or **Join Group**. To join a private group, click **Ask to Join**. Your request is sent to the private group’s owner and managers, who accept or decline your request.

You can join up to 300 groups. All groups count toward this limit, except archived groups. For example, if you’re a member of 300 groups, of which 10 are archived, you can join 10 more groups.

To leave a group you joined or withdraw your request to join a private group, go to the group detail page and click **x** or **Leave Group**. If you don’t see these options, ask your Salesforce admin to adjust the page layout.
Create and Manage Groups

Create Chatter Groups

Create public, private, and unlisted Chatter groups to collaborate with your teams and work together on projects.

1. Navigate to the list of groups.
   - In Salesforce Classic, click the Groups tab.
   - In Lightning Experience, click in the navigation menu.

2. To the upper-right, click New Group, and enter a group name and description.
   - **Note:** Group names must be unique across public and private groups. Unlisted groups don’t require unique names.
     - If Communities is enabled, public and private group names must be unique within the community.

3. Select an access level:
   - **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
   - **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group’s owner or managers. Users with the “Modify All Data” and “View All Data” permission can see group posts, updates, and files across the organization. Users with the “Manage All Data” permission can also join private groups directly and change group settings.
   - **Unlisted:** Only group members and users with the “Manage Unlisted Groups” permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group’s owner or managers. Unlisted groups offer more privacy and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren’t available by default; your administrator must enable them for your organization.
   - Optionally, select Allow Customers. The group owner and managers can invite customers to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.
     - After you allow customers in a group, you can’t change the group access level.

4. Optionally, if your administrator has enabled group archiving, change the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.

5. Click Save.
Note: You own groups you create. To assign a new owner, finish creating the group, then edit the group settings.

SEE ALSO:
Can I change a group’s access level, for example, to make a private group public?

Edit Group Settings
Edit the group settings to change the owner, modify archiving settings, group access level, and delete the group.

You can edit settings for Chatter groups you own or manage.

1. Click Group Settings on the group detail page in the Salesforce Classic. In the Lightning Experience, click Edit Group from the buttons in the group header.

2. Optionally, edit the group name and description.

3. Optionally, type a name or click the lookup icon to search the group members to assign a new Owner. Only the current owner or people with the “Modify All Data” permission can change the owner, and you must choose the owner from existing members. Customers can’t own groups.

4. Optionally, if your administrator has enabled archiving for groups, edit the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.

5. Optionally, change the access level for the group. For example, you can convert an unlisted group to a public or private group if you want to open it up to a wider audience.

   Note: If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can’t be converted to other group types.

   - Public: Anyone can see and add posts, comments, and files. Anyone can join a public group.
   - Private: Only group members can see and add posts, comments, and files. People must ask to join or be added by the group’s owner or managers. Users with the “Modify All Data” and “View All Data” permission can see group posts, updates, and files across the organization. Users with the “Manage All Data” permission can also join private groups directly and change group settings.
   - Unlisted: Only group members and users with the “Manage Unlisted Groups” permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group’s owner or managers. Unlisted groups offer more privacy and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren’t available by default; your administrator must enable them for your organization.
   - Optionally, select Allow Customers. The group owner and managers can invite customers to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.

   After you allow customers in a group, you can’t change the group access level.

6. Click Save.

If you have the necessary permissions, you can also:

   - Archive the group.
• Delete the group.

SEE ALSO:
Add and Remove Chatter Group Members

Can I change a group’s access level, for example, to make a private group public?
If you're a group owner or manager, you can change groups from private to public, or from public to private by editing the group settings. If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can’t be converted to other group types. You can’t change the group access level for private groups that allow customers.

SEE ALSO:
What Your Chatter Group Role Allows You To Do

Add and Remove Chatter Group Members

Own or manage a Chatter group? Here's how you add or remove group members.

1. In Salesforce Classic, on a group detail page, click Add/Remove Members. In Lightning Experience, click Add Member from the group highlights panel (your administrator must add this quick action to the group publisher).
2. Start typing the name of the user you want to add or remove to filter the list of users.
3. Click Add to add a member, or ✗ to remove a member. For people who have requested to join, click Accept to accept the request, or ✗ to decline.
4. Click Done when you’re finished.

SEE ALSO:
View Chatter Group Members

Accept or Decline Private Group Requests

As the owner or manager of a private Chatter group, you can accept or decline requests to join the group. Additionally, users with the “Modify All Data” permission can view and manage requests for all public and private groups, and users with “Manage Unlisted Groups” can manage group membership requests for all unlisted groups in the organization.

1. View the list of requests by doing one of the following:
   • On a group detail page, click the Request link, for example, 3 Requests
   • On a group detail page, click Add/Remove Members and then click the Requests filter, or scan for requests in the Everyone filter
   • Click the link provided in the email request
2. Accept or decline the requests.

Note: An email is sent to each person to tell them that their request was accepted or declined.
• Click **Accept** to accept. If there are more than two requests, you can accept them all by clicking **Accept x of y**, for example, **Accept 3 of 3**.
• Click **x** to decline. Optionally enter a message that will be included with your decline email and click **Send**. If you change your mind, you can click **Cancel** to go back.

3. Click **Done** to close the window.

If you make a private group public, any pending requests are automatically accepted.

**Group Roles**

What Your Chatter Group Role Allows You To Do

This table describes the actions that can be performed by members, managers, and owners of public and private Chatter groups. Customers can be group members and managers, but not owners.

<table>
<thead>
<tr>
<th>Action</th>
<th>Owner</th>

</tbody>
</table>

Users with the “Modify All Data” permission can perform all actions on all private and public groups, and users with the “View All Data” permission can view details of all private and public groups, regardless of membership.

Additionally, in unlisted groups:
• Users with the “Manage Unlisted Groups” permission can find and perform all of these actions in unlisted groups, even if they aren’t members.

• Users with the “Modify All Data” or “View All Data” permission can only find and access unlisted groups if they are members. Unlike public and private groups, users with the “Modify All Data” permission can’t perform group owner actions in unlisted groups. They can perform group manager actions if that role is assigned to them in the unlisted group.

SEE ALSO:
What happens when the owner of a Chatter group is deactivated?

Change Chatter Group Roles

To change Chatter group roles for groups you own or manage:

1. Click Change Roles on a group detail page.

2. To search for members, start typing in the search box. Optionally sort the list by toggling between Managers and All Members.

3. Select the Manager checkbox for people you want to be managers. If a customer is selected as a manager, they will be able to see people who ask to join the group, even if they aren’t in other common groups, and will be able to approve requests.

   Note: To change the group owner, you must own the group. Users with the “Modify All Data” permission can also change the owner in public and private groups, and users with the “Manage Unlisted Groups” permission can do this for unlisted groups. Click the Group Settings link next to the current owner to assign a new owner.

4. Click Done.

SEE ALSO:
What happens when the owner of a Chatter group is deactivated?

What happens when the owner of a Chatter group is deactivated?

The deactivated user still owns the group, but a user with the “Modify All Data” permission can assign a new owner for a public or private group. In the case of unlisted groups, a user with the “Manage Unlisted Groups” permission can assign a new owner.

SEE ALSO:
Change Chatter Group Roles
Archiving and Activating Chatter Groups

Archived Chatter Groups

When a Chatter group is archived, group members can no longer make posts or share files with the group. Previous posts, comments, and files remain available in the group for future reference.

Users can still comment on existing posts, mention people, and search the feed in archived groups. Users can also join and leave archived groups, create reports that include archived groups, and use global search to find archived groups and their content. Group owners and group managers can archive groups, activate them, and enable and disable automatic archiving for groups at any time. Users with the “Modify All Data” permission can perform these actions on public and private groups in their organization, while users with the “Manage Unlisted Groups” permission can perform these actions on unlisted groups.

Archived groups allow users to focus on the active groups in your organization:

- Archived groups don’t count toward a user’s group membership limits.
- Posts from archived groups don’t display in Chatter feeds, unless someone adds a new comment. Posts with new comments display in the All Company feed and the feed of each group member.
- File and feed sharing is limited to active groups only, making group searches more efficient.
- Archived groups display only in My Archived Groups and not in the Active Groups list.

**Example:** Archiving the group is useful for groups that have little or no feed activity, but contain useful information that you want to retain. Some examples include:

- A group that a sales team created while pursuing a deal. Though there probably won’t be much group activity after lead conversion, the sales team can still access important information about the customer.
- A group used for planning a company event. It can be archived after the event to reuse vendor information and planning discussions.
- A service desk type group used to track key issues for a major deployment for a customer. Archiving it after deployment issues are ironed out still gives support agents access to relevant information for future troubleshooting.
- When a legacy group is replaced by a new group that serves the same or broader purpose, the legacy group can be archived to redirect traffic to the new group.
- Team groups can be archived when a team changes or team members leave the company, while preserving team discussions for future reference.

Turning off automatic archiving is useful for groups that aren’t updated on a regular basis but contain important information, such as a group used for company-wide announcements. This way groups without activity for more than 90 days won’t get archived and users won’t miss any important posts.
Archive Chatter Groups

Archive a group manually or edit automatic archiving settings.

Feed activity in groups is reviewed on a weekly basis. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. Mentioning a group doesn’t count as feed activity and doesn’t delay group archiving. Group owners, group managers, and users with the “Modify All Data” permission can manually archive or edit automatic archiving settings for groups at any time.

1. Click Group Settings on the group detail page in the Salesforce Classic. In the Lightning Experience, click Edit Group from the buttons in the group header.

2. Configure archiving for the group in one of two ways:
   - Click Archive to archive the group right away.
   - Select Archive this group if there are no posts or comments for 90 days and click Save to set up automatic archiving.

After you archive a group:
- The publisher on the group page is hidden and members can’t create new posts or share files in the group.
- The group no longer appears in the Active Groups filter on the Groups tab.
- Previous group posts and comments no longer appear in the Chatter feed, unless someone adds a new comment. Posts with new comments display in the All Company feed and the feed of each group member.

Use the My Archived Groups filter in the Groups list to find the archived groups that you own, manage, or belong to. You can also use global search to find archived groups or associated content. Note that archived groups don’t count toward your group membership limit.

Note:
- Group members don’t receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- If your administrator disables archiving for groups, you can’t archive groups or edit automatic archiving settings. You can activate archived groups at any time, even if the feature is disabled.

SEE ALSO:
- Archived Chatter Groups
- Activate Archived Chatter Groups

Activate Archived Chatter Groups

Group owners, group managers, and users with the “Modify All Data” permission can activate an archived Chatter group from the group detail page.

1. Navigate to the group you want to activate.
   - Use the My Archived Groups filter on the Groups list view to find the archived groups you own, manage, or belong to.
   - To find other archived groups, use global search, run a report, or ask your administrator for help.

2. Click Activate on the group detail page. You can also activate an archived group from the group settings page.
After a group is activated, the group detail page displays with the publisher enabled so members can create new posts and share files with the group.

Note:
- Group members don’t receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- You can only activate one group at a time. To activate multiple groups at once, use the Salesforce API.

SEE ALSO:
- Archived Chatter Groups
- Archive Chatter Groups

Delete Chatter Groups

Only the group owner and users with the “Modify All Data” permission can delete a group.

In Lightning Experience, you can delete the group by clicking Delete Group from the buttons in the group highlights panel.

In Salesforce Classic:

1. Edit the group settings. Click Group Settings on a group detail page.
2. Click Delete.
3. Click OK.

Deleting a group permanently deletes the updates of the group, including any links posted to the group. When you delete a group that includes files, you’re not deleting the files, just the references to the files. The files remain in their original location, such as in each file owner’s Owned by Me. If the files were posted to the group and not shared in other locations, deleting the group also removes the references to the files. The files remain in the file owner’s Owned by Me, where they’re private but can be shared again later.

Tip: To retain group data for future reference, archive groups instead of deleting them.

Working in Chatter Groups

Get Familiar with Your Chatter Group

Click a group’s name in a feed, in the Groups list, or on someone’s profile to see the group’s updates, files, and group members.

How much detail you see and what you can do on a group’s page depends on the type of group, whether you’re a member, owner or manager of the group, and on your group role.

Non-Members of Public Groups

If you’re viewing the group detail page of a public group you’re not a member of, you can

Post and comment
Type an update above the feed or comment below a post in the feed and click Share.

Join the group
Click Join to join the group.

View group description and information
The group description and information display in a separate column next to the feed.

View the group’s members
The Group Members section shows the group’s current members, including any customers invited to the group.

View, download, and search files posted to the group
Files posted to the group feed or shared with the group appear in the Group Files section.

View the topics the group is talking about
The group’s topics display below posts in the group feed.

Search for group information
Click above the feed to search for information in the group.

Non-Members of Private Groups

If you’re viewing the group detail page of a private group you’re not a member of, you can only

Ask to join the group
Click Ask to Join to send an email to the owner and managers of a private group requesting to join.

View the group’s picture and description
The group description displays below the group photo.

View the group’s members
The Group Members section shows the group’s current members, including any customers invited to the group.

Nonmembers of Unlisted Groups

If you’re not a member of an unlisted group, you can’t view the group detail page.

Group Members of Public, Private, and Unlisted Groups

When you’re a member of a public, private, or unlisted group, you can also
Change Email Settings and In-App Notifications for Salesforce1 Mobile Apps

In Salesforce Classic, click Email Me... to be emailed about activity in the group, either every time someone posts, daily, or weekly. Selecting Every Post also turns on in-app notifications for groups in the Salesforce1 mobile apps. To stop receiving email and mobile notifications for the group’s activity, click Turn Off Group Email. Click Email Settings to modify all your Chatter email settings.

In Lightning Experience, click Email Notifications from the group highlights panel to modify your group email settings.

Invite People

If your administrator has enabled invitations, click Invite People to invite people not using Chatter to join the group. For private groups, only the group manager, group owner, or users with the “Modify All Data” permission can invite people. For unlisted groups, only the group manager, group owner, or users with the “Manage Unlisted Groups” permission can invite people.

Leave the group

Click X, or to withdraw a request to join a private group. To leave a group you own, you must first assign a new owner.

Group Owners and Group Managers

When you’re the owner or manager of a public, private, or unlisted group, you can also

Add or remove group members

Change the group photo

Edit group settings

Edit the Information section

Click Add Information or $ in the Information section to add additional information for the group's members. You can customize this section, including its title, to say anything you want.

Edit the Description section

Click Add Description or $ in the Description section to add a description of the group.

Change member roles

Accept or decline requests for private groups

Group Files Lists

View Chatter Group Memberships

The Groups list on your profile shows you the Chatter groups you belong to, sorted by the most recent activity date. You can join or create groups on the groups tab. You can also view the Groups list on other people’s profiles to see their group memberships.

Note: On other people’s profiles, you can see unlisted group memberships only if you’re also a member.

- To view the full list in alphabetical order, click Show All.
- To see more of the list, use the Next and Previous links.
- To leave a group or withdraw a request to join, click X.
- To join a public group on another person’s groups list, click Join.
- To send a request to join a private group on another person’s groups list, click Ask to Join.
To close the window, click **Done**.

**SEE ALSO:**
- What Your Chatter Group Role Allows You To Do

### View Chatter Group Members

The Members section on a Chatter group page shows all of the members of a group, including customers.

1. Click **Show All** in the Members section to view the full group member list in alphabetical order.
   
   In the Members window, you can:
   - Filter the list to see all members, managers, or the owner
   - Use the **Next** and **Previous** links to see more of the list
   - Search using the **Find Members** search box
   - Click **Follow** or **x** next to a person’s name to start or stop following them.

You can’t follow customers.

2. Click **Done** to close the window.

### Chatter Group Recommendations

Chatter recommends groups that you might want to join based on:

- The popularity of the group determined by the number of members.
- The number of people you’re following in the group. Chatter recommends groups with the most members you’re following.
- If the group is new (created in the last month).

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you already belong to all the recommended groups. Hover over the recommendations and click **x** to dismiss them, and they won’t appear again.

### Use Email to Post to Chatter Groups

Email your posts to Chatter groups you have access to.

If your admin has enabled this feature, you can email your posts to any public group. Additionally, your admin can allow you to include attachments. You can email posts to a private or unlisted group only if you’re a member. You must use the email address associated with your Salesforce user account.

1. In Salesforce Classic, from the group detail page, click **Post by email** below the group description to launch a blank email to the group using your local email client.

2. Type your message in the email body, including attachments if needed, and send the email.
   
   Attachments to the email are added as files in Chatter and shared with the group.

   The email content displays as a post on the group detail page. Any hashtags you include in the email body (for example, #TeamExcellence) are converted to topics on the post. If more than one attachment is included with the email, the first attachment is included as part of the post. Additional attachments are added in comments.
Tip: Save the group's email address as a contact in your mail client or mobile device for easy access in the future. If you copy and paste the mailto link directly into the contact's email field, some mail clients may consider the link invalid and prevent you from sending email to the contact. Try removing the parenthetical group name from the first part of the email address. For example, remove (My Group) from (My Group)0f9b000000004cmkaq@post.k-pxyvmac.kp0.chatter.salesforce.com.

The following limitations apply to posting to a group using email:

- The 10,000 character limit for Chatter posts applies to posts created using email. Any text in your email beyond this limit is not included in the post.
- The maximum message size is 25 MB, including text and attachments.
- The email subject is not included in the post.
- You can create text posts using email and include links in the text. You can also include up to 25 attachments. You can’t mention people, create polls, or give titles to links when posting to the group by email.
- Character-level formatting, such as the use of bold or different type sizes, is not supported.
- Email addresses must be unique at the group level. If multiple user profiles in your organization use the same email address, and that email address is used to post to a group, then the user profile associated with that particular group is used for the post in the group feed. If the email address is shared between multiple user profiles in the same group, the email is blocked.
- Signature text is treated as part of your post. Default signatures inserted by mobile devices, such as Sent from my iPhone, are automatically removed. Before sending your email, delete custom signatures and any extra text you don’t want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
  - Dash (-)
  - Equal sign (=)
  - Underscore (_)
- You can also use any combination of these characters.

Post Announcements in Chatter Groups

Post group announcements to highlight important messages on the group page.

**Note:** Groups display the global publisher layout by default. If the Announcement action doesn’t appear in groups, ask your administrator to override the global publisher and add the Announcement action to a custom group publisher layout.

Only group owners, group managers, and users with the “Modify All Data” permission can post and delete group announcements.

1. On the group page, click Announcement in the publisher.
2. Type your message. The character limit is 5,000, and you can include links or mention users and groups in your announcement. Due to space constraints, approximately 137 characters of the announcement displays on the group page. Click More to see the rest of the message.
3. Specify an expiration date for the announcement.
4. Click Share.

Group announcements display until 11:59 p.m. on the selected expiration date, unless they’re replaced by a new group announcement. Users can discuss, like, and post comments on announcements in the group feed. Group members receive an email notification when you post an announcement, same as for other posts, depending on their selected group email notification frequency.
Deleting the feed post deletes the announcement. To remove the announcement from the group page without deleting the feed post, click in the top corner of the announcement, then select the option to dismiss the banner.

**Send Email Notifications for Announcements (Beta)**

Group owners and managers can now send email notifications to all group members for group announcements. Previously, only group members who opted to be notified for each post in the group were notified. Group owners and managers require the “Send emails on announcements” permission to do this. If this feature is enabled, select **Email all group members** next to the announcement expiration date to notify all group members.

**Note:** This release contains a beta version of email notifications for group announcements, which means it’s a high-quality feature with known limitations. For information on enabling this feature in your org, contact Salesforce Support. Email notifications for group announcements isn’t generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can’t guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

**SEE ALSO:**

- Customize the Chatter Group Layout and Publisher

**Group Files Lists**

The Group Files list on a Chatter group page shows the recent files posted to that group.

Hover to see available options or click the file name to go to the file detail page. To see a list of all the files posted to a group, to search for a specific file, or to perform actions on a file, expand the files list **Show All**. The 25 most recently viewed files are listed by default. On this list you can:

- Search for files that have been posted to the group. The list includes files that you and other people have attached to the Chatter feed on the group. The list doesn’t include:
  - Documents from the Documents tab.
  - Attachments from the Notes and Attachments related list.
- Upload private files or upload and share files with people, groups, or via a file link.
- Preview a file without downloading it.
- Follow and receive updates about a file in the Chatter feed. Click next to the file you’re following to stop receiving updates about the file. (Requires Chatter.)
- Click to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the file detail page.
- Click a file owner’s name to see his or her profile.

**Note:**

- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can’t be previewed, the **Preview** option isn’t available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don’t display correctly in previews. If a file can be previewed, but a preview doesn’t exist, contact your Salesforce administrator who may be able to regenerate the preview.
Files without a file extension or with an unrecognized file extension show "unknown" in the Type column.

Records in Chatter Groups

Create Records in Chatter Groups

Use the group publisher to create records in Chatter groups.

The actions available to you in the group publisher depend on your permissions, your role in the group, the type of group, and how your administrator has configured the group publisher.

- Depending on how your administrator configures the groups publisher layout, you can create account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren’t supported.
- When you create a record in a group, a record creation post displays several places, including in the group feed, on your profile, in the record feed, and in your company’s Chatter feed. Only users with the necessary permissions (via license, profile, permissions, and sharing rules) can view the record and the record creation feed post.

Tip: Filter the group feed to Show All Updates to view record creation posts.

- All comments on the record creation post display in the group feed. This includes comments made on the post in the record feed, and those made by users who don’t belong to the group. For example, John creates a record in a private group and the record creation post displays in the group feed and in the record feed. Sally isn’t a member of the same private group, but she has access to the record detail page and the record feed. Sally comments on the record creation post in the record feed, and it appears in the private group’s feed.

- Record visibility in groups respects user permissions and sharing access rules in your organization. Group members with permissions can view the record and comment on it from any context (in a group, on the owner’s profile, on the record detail page, in the company’s Chatter feed).

Group members without permissions, such as Chatter Free users, can’t see the record or the record feed in the group or anywhere else.

- You can’t create records in groups that allow customers.

- If your administrator has enabled the ability to add records to groups, as well:
  - Creating a new record within a group automatically creates a group-to-record relationship, same as when you add an existing record.
  - The group records list displays the records you create, in addition to the records you add.

You can remove records from Chatter groups.
Add Existing Records to Chatter Groups

Add records to groups so you can collaborate on and discuss the records as a team.

1. From the group publisher, click Add Record.
   
   Note: If you don’t see this option, your administrator needs to include the Add Record action to the group publisher. Groups that allow customers don’t allow you to add records.

2. Select the type of record from the Record list.
   You can add account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren’t supported.

3. In the blank search field, type the name of the record you want to search for and click . Leave the field blank to search for all available records of the selected type.

4. From the lookup search results list, click the record you want to add to the group to select it.

5. Click Create.

A success message confirms when the record is added to the group and the record appears in the Group Records list. If your administrator has added the Groups related list to the record detail page, you can also see the list of groups the record is associated with on the record detail page. There is no limit to the number of records you can add to a group.

Note: Adding a record to a group doesn’t affect its visibility. Only users with the necessary permissions (via license, profile, permission sets, or sharing) can see the records in a group. For example, Chatter Free users don’t see any records in groups. Or, a user with permissions to view accounts and contacts can’t view any case records in the group. This sometimes means that users see fewer records than the actual count indicated on the group records list.

Example: Here are some ways to use Chatter groups as a collaboration space for records that you’re working on.

- A sales team working together on an account can track the related opportunities, contacts, and leads in one group. Team members with permissions can access records directly from the group. New team members can use the group as a one-stop reference to familiarize themselves with historical discussions about the account and its child records.
- Customer service teams can use groups to track the cases they handle. The group can become the team’s forum to monitor cases, discuss solutions, and analyze trends in common problem areas.
- Marketing teams can use groups to track their campaigns, plan events, and discuss the potential leads and contacts to invite for the event. Groups also make for a great space to collaborate on marketing content or campaign artifacts.
**Remove Records from Chatter Groups**

Remove records you no longer use from your Chatter groups. Anyone with access to the record in a group can remove it from the group.

1. On the group detail page, click **Show All** next to the Group Records list.
   
   Tip: The group records list appears on the group detail page only if your administrator allows you to add existing records to groups.

2. Optionally, select an option from the **Filter By** list to view records of that type.

3. Find the record you want to remove, then click **Remove** next to the record’s name.

Removing a record from a group deletes the group-record relationship, but not the record itself. You can restore the group-record relationship from the Recycle Bin.

**Chatter Messenger (Chat)**

Chat instantly and securely with coworkers. Chatter Messenger is not available in new orgs created after the Spring '16 release.

- **Using Chatter Messenger**
  
  Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click ![click](image) in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

- **Using the Chat List**
  
  Tips for using the chat list.

- **Adding People to the My Favorites List in Chat**
  
  The list of people you follow in Chatter can be long. Add up to 100 chats with one or more people to your My Favorites list and they'll always show up at the top of your chat list.

- **Removing People from the My Favorites List in Chat**
  
  Remove chats with one or multiple people from your My Favorites list if you chat with them less often. People you follow in Chatter will still show up in your People I Follow list.

- **Changing Your Chat Status**
  
  Let people know if you're available to chat, or set your status to **Offline** if you don't want to chat.

- **Chatting with People**
  
  Chat with one or more people in Chatter.

- **Chat History**

Can I change the sounds I hear in chat?

Using Chatter Messenger

Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click  in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

A few considerations apply to using Chatter Messenger:

• Chatter Messenger is not available in new orgs created after the Spring ’16 release.

• Your administrator can disable Chatter Messenger at the organization level. In addition, you can access Chatter Messenger only if your administrator has selected “API enabled” in your profile permissions. If you don’t see Chatter Messenger when you log in to Salesforce, ask your administrator if they have disabled the feature and granted the necessary permissions to access Chatter Messenger.

• Chatter Messenger is not available with Communities. It is available for internal users only when the organization-wide default for the user object is set to Public Read Only.

• Chatter Messenger is not supported on Microsoft® Internet Explorer® version 7.0. Internet Explorer 7 users appear offline to other Chatter Messenger users.

With chat, you can:

• Let people know if you’re available to chat.

• Chat with people.

• Add people to and remove people from your My Favorites list.

• Pop out your chat to a separate browser window.

• Use emoticons when you chat with people.

• Customize your chat options, such as sounds and notifications.

• View your chat history.

Using the Chat List

Tips for using the chat list.

Note: Chatter Messenger is not available in new orgs created after the Spring ’16 release.

• Use the search box at the top of your chat list to quickly find and chat with any online Chatter user, including the people you don’t follow.

• Switch between active chats by clicking a chat in the Current Chats list.

• To add someone to your chat list, follow them in Chatter.

• Add people you chat with frequently to your My Favorites list.

• Click  to customize your chat options.

• Click your status at the top of the chat list to change your chat status.
• When a chat is minimized, you’ll see the new message indicator 🔄 for new messages.

Changing Your Chat Status

Let people know if you’re available to chat, or set your status to **Offline** if you don’t want to chat. People can see your status:

- In their chat lists
- On your profile
- On people hovers

To change your chat status, click **Available**, **Away**, or **Offline** at the top of your chat list. For example, if your status is set to Available but you don’t want to chat with others, click **Available** and choose **Offline**.

Your status automatically changes to idle if you’re idle for 15 minutes. To change this setting, click **Chat > Options**, then select **General Settings**.

Note: Administrators enable or disable Chat for an organization. Chatter Messenger is not available in new orgs created after the Spring ’16 release.

Chatting with People

Chat with one or more people in Chatter.

Note: Chatter Messenger is not available in new orgs created after the Spring ’16 release.

1. Start a chat with any online Chatter user.
   - Use the search box at the top of Chatter Messenger to find and start a chat with anyone in your organization. Alternatively, click a name in the People I Follow or My Favorites list.
   - From a person’s profile, click **Start Chat**.
   - From any feed, hover over a person’s name and click **Start Chat**.

2. Optionally, add up to 10 people to the chat.
   
   a. Drag people from your chat list to the active chat, or click **+** at the top of the active chat to search for and add any online user in Chatter.
   
   b. Repeat until you’ve added everyone you need for the chat.

Click **** to see a list of everyone in the chat.

Note: When you leave a chat with multiple people, the other people in the chat can continue chatting without you. You need to be added back to the chat to participate again.

SEE ALSO:

Private Messages
Use Chatter messages for secure private conversations with other Chatter users.

Chatter Messages
Send your a question to another person privately, or to communicate with a few select people when a discussion isn’t relevant to everyone you work with. Messages also notify people when a file has been shared with them.

Searching for Chatter Messages
Sending Chatter Messages
Send messages to communicate privately in Chatter.

Chatter Messages
Send your a question to another person privately, or to communicate with a few select people when a discussion isn’t relevant to everyone you work with. Messages also notify people when a file has been shared with them.

Messages don’t appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

View your messages by clicking the Messages link in the Chatter tab. On the My Messages page, you can:

- See the most recent message in each of your conversations. The most recent message displays at the top of the list.
- See the photo of the person who sent the most recent message in a conversation.
- See if you have unread messages (●).
- See if you sent the most recent reply (●) in a conversation.
- Click any message to view the full history of messages exchanged in that conversation.
• Send a message by clicking New Message.

Your messages are organized into conversations, with each conversation defined by the unique combination of people participating in it. For example, let’s say you send a message to Sally Smith. When Sally replies, her message continues your one-on-one conversation. Every new message you send to Sally—even if it’s about a different topic—also continues the same conversation. Over time, you build a rich conversation history with Sally that contains every message you’ve ever exchanged with her. At the same time, let’s say you send a message to both Sally Smith and Bob Johnson. That message is considered part of a separate conversation between you, Sally, and Bob. When Sally replies, her message continues a separate conversation from your one-on-one conversation with Sally.

Consider these tips for using Chatter messages.

• You can send messages to anyone in your Chatter organization. It doesn’t matter who you follow, who’s following you, what groups you belong to, or if the recipient is a customer.
• Conversations can involve just one other person, or up to 10 people total, including yourself. You can’t send a message to yourself.
• Conversation participants are established when someone sends the first message in the conversation. No one can add people or remove people from the conversation after the first message is sent.
• As others reply, the Messages link on the Chatter tab shows the number of conversations with new messages. If you’re already receiving Chatter email notifications, you’ll automatically be notified of new messages.
• You can’t delete messages or conversations.
• If after reading the messages in a conversation you want to mark the conversation unread, you can do so only via the Chatter REST API, not via the user interface.

Searching for Chatter Messages

To search for people and text in your Chatter messages:

1. In My Messages, enter your search terms in the search box above your messages. Keep in mind these simple search tips:
   • If you’re viewing your list of conversations, search looks for matches across all conversations. If you’re viewing a single conversation, search looks for matches only within that conversation.
   • Searching for a person’s name (such as bob johnson) finds both the conversations where Bob Johnson is named in the text as well as conversations where he’s a participant. If you search for your own name, search results will include all of your messages and conversations because you’re a participant in every conversation.
   • Searching for bob jo finds both Bob Jones and Bob Johnson. We automatically search for terms starting with bob jo, as if you had entered the * (asterisk) wildcard (bob jo*).
   • If you search for the term customer, you’ll see matches on that term within the text of messages. Matches don’t include people who are identified as customers in a conversation’s participant list.

2. Click Search.

3. Once you see the search results, you can:
   • Refine your search by entering additional search terms or using wildcards or operators.
   • Click a message to view the full conversation if you initially searched across all conversations.

If there are matches on names in the participant list and the conversation involves lots of people, the match might not be visible because the participant list doesn’t show everyone’s name. In other words, you’ll see the conversation included as a match but the highlighted name match might be hidden from view.
Clear your search terms by clicking . Chatter automatically clears your search when you enter a reply, send a new message, or leave My Messages.

SEE ALSO:
Share Files with People in Salesforce Classic

Sending Chatter Messages
Send messages to communicate privately in Chatter.

To send a Chatter message:
1. Start the message from one of these locations:
   • Click the Messages link on the Chatter tab, then click New Message in My Messages.
   • Click a person’s name anywhere in Chatter to view their profile and click Send a message.
   • Click Send a message on a person’s hover.
   • When viewing the full message history of a conversation, use the text box under the most recent message to send a reply.
   • When viewing the email notification about a message you’ve received, if email replies to Chatter are enabled, reply to the email.

   Sharing a file with people is another way to send a Chatter message. When you share a file, recipients automatically receive a message that lets them know the file has been shared, as well as any additional information you provided.

2. If you started in the Send a Message dialog box, you can add people’s names to the recipient list. Type a name in the To field and click the name to select it. Add more people to the conversation by entering additional names.
   If you’re replying within a conversation or via email, the conversation participants can’t be changed.

3. Write your message. Messages can be up to 10,000 characters.

4. Submit your message using the appropriate method:
   • In the Send a Message dialog box, click Send.
   • If you’re replying within a conversation, click Reply (or Reply All if the conversation involves multiple recipients).
   • If you’re replying via email, use the Send option in your email application.

If your message continues an existing conversation, your reply is added to the conversation and appears at the top of the list in My Messages. If your message starts a new conversation because you haven’t previously exchanged messages with that unique combination of recipients, your message appears at the top of the list in My Messages as a brand new conversation.

Chatter Questions
Got questions? Use Chatter Questions to post a question in your Chatter feed, then watch the solutions roll in.

Chatter Questions
Extend the best possible self-service community by promoting community engagement internally and externally with questions in Chatter.
Display Similar Questions and Articles in Chatter
Your users might ask similar questions. Chatter Questions helps reduce duplicate content in your Salesforce organization—and in any communities with Chatter—by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in Chatter.

Display Similar Questions and Articles in the Napili Search
Your community users may ask similar questions. Chatter Questions helps reduce duplicate content in self-service communities built on the Napili template by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in the Search field.

Enable Similar Articles for Chatter Questions
When users ask questions in Chatter, similar questions appear as they type. If you’d like relevant Salesforce Knowledge articles to appear as well as questions, enable Similar Articles.

Selecting a Best Answer for a Question in Chatter
One of the advantages of asking a question in Chatter is that users can select the best answer for a question. When a question has a best answer, your users can quickly resolve their issue by going directly to the best answer.

Chatter Questions FAQ
Chatter Questions lets users in communities and Salesforce ask questions in the feed. Take a look at some common questions about the feature.

Track Chatter Questions Use in Your Salesforce Organization and Communities
Keep tabs on the use and adoption of Chatter Questions in your organization or community with out-of-the-box reports and dashboards.

Differences Between Q&A Features in Salesforce
Salesforce offers a variety of question-and-answer features that you can implement in your Salesforce organization and communities. Because some of these features use similar terminology, take a moment to review the differences between them.

Question-to-Case Overview
Question-to-Case lets moderators create cases from questions in Chatter, which makes it easier to track and resolve your customers’ issues. Question-to-Case is available in the full Salesforce site and the Salesforce1 mobile browser app, as well as in communities where Chatter Questions is enabled.

Set Up Question-to-Case
Add Question-to-Case to your communities, your Salesforce organization, or both.

Enable Question-to-Case
Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers’ questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

Add the Question from Chatter Field to the Case Detail View
When a case is created from a question in Chatter, the Question from Chatter field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

Add the Escalate to Case Action to the Feed Item Layout
Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

Confirm Access to the Escalate to Case Action
Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.
Customize the Escalate to Case Action Layout
Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

Automatically Assign Cases from Questions to a Queue
Case assignment rules aren’t supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you’d like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

Automatically Create Cases from Unresolved Questions in Chatter
As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

Create a Case from a Question in Chatter
If a question in Chatter hasn’t been resolved, moderators can create a case from the question. Question-to-Case must be enabled in your organization or community.

Chatter Questions
Extend the best possible self-service community by promoting community engagement internally and externally with questions in Chatter.

With Chatter Questions, users can ask questions in their Chatter feed, in groups, and in records by selecting Question in the action drop-down menu of the Chatter Publisher. After a question is asked, moderators and the person who asked the question can select a best answer. The best answer is prominently displayed in the feed, allowing other users to quickly and easily find the information they need.

Your users can organize their information with the question title and details about their question. They can ask the question to their followers, to a group, or to a specific person, as they can with other Chatter feed items.
To enable Chatter Questions in your organization, add the Question action to the global publisher layout. If your organization was created after Summer '14, the Question action is automatically added, but we recommend dragging it to the far left to increase its visibility. If you’re using a customized publisher layout in groups or on records, make sure that the Question action is added to those layouts as well. Chatter Desktop doesn’t support Chatter Questions.

Chatter Questions FAQ

Display Similar Questions and Articles in Chatter

Your users might ask similar questions. Chatter Questions helps reduce duplicate content in your Salesforce organization—and in any communities with Chatter—by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in Chatter.

Note:
- Communities with Chatter include those built with Salesforce Tabs + Visualforce.
- The Similar Questions and Similar Articles search features are also available in communities built on the Napili template. For more information, see Display Similar Questions and Articles in the Napili Search.
- Similar Questions and Similar Articles aren’t available in Salesforce1 or mobile browsers.

When a user enters a question in Chatter, similar questions automatically appear in a drop-down list below the question title field. To display relevant Knowledge articles along with similar questions, enable Similar Articles.

Drop-down search results of similar questions and articles:

- 1: Book and question mark icons indicate whether a search result is an article or a question.
- 2: Question results show the question title, the number of answers, and a green flag with the text Answered if a best answer was selected.

Users see up to 10 results in the drop-down list, with questions appearing before articles. Salesforce displays an equal number of questions and articles, but if there aren’t enough of one result type, extra results of the other type are displayed. If no question or article title matches the text entered by the user, the drop-down list doesn’t appear.

The drop-down results are based on whether the question or article title contains the text entered by the user. The search accounts for partially matching terms and non-adjacent terms; for example, the results for “best backpack” could include a question titled “Which backpack is best for day hikes?”, and the results for “backpack” could include an article titled “Backpacking Tips.”
If the user wants to conduct a more in-depth search that also scans question descriptions and article text, they can press TAB or click out of the title field. This displays a separate drop-down list of results below the question publisher.

**Advanced drop-down search results of similar questions and articles:**

![](image)

If none of the results answer the user’s question, they can post their question by clicking **Ask**.

SEE ALSO:
- Track Chatter Questions Use in Your Salesforce Organization and Communities
- Display Similar Questions and Articles in the Napili Search

**Display Similar Questions and Articles in the Napili Search**

Your community users may ask similar questions. Chatter Questions helps reduce duplicate content in self-service communities built on the Napili template by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in the Search field.

**Note:** Similar Questions and Similar Articles are also available in internal Salesforce organizations with Chatter and in communities built with Salesforce Tabs + Visualforce. To learn more, see **Display Similar Questions and Articles in Chatter**.

When a user in a Napili community enters a question in the Search field, similar questions and Knowledge articles automatically appear in a drop-down list below the field. The drop-down list contains two tabs: **Articles** and **Questions**. To also expose an **All** tab that shows combined results (recommended), enable **Similar Articles**.

By default, each tab contains up to six results. The **All** tab shows both matching articles and questions, with articles appearing first. It displays an equal number of questions and articles, but if there aren’t enough of one type of result, more results of the other type are displayed to reach the maximum. To see results of a particular type, users can click the **Articles** and **Questions** tabs. If a search only returns one result type (for example, questions), users still see all of the tabs.

**Note:** For a community user to see similar articles, Knowledge must be enabled in the community and the user must have access to it.
• **1:** The Articles and Questions tabs let users view results of each type. Users can use the Up and Down arrow keys to navigate between results on any of the tabs. Clicking a question or article in the drop-down list navigates directly to it.

• **2:** Text and chat bubble icons indicate whether a search result is an article or a question.

• **3:** Questions in the list show the number of answers and a green checkmark with the text *Best Answer* if one was selected.

• **4:** The drop-down search results are based on whether the question or article title contains the text entered by the user. When the user performs a full search by clicking *Search*, the search engine also scans question descriptions and article text for matching terms.

You can customize the search settings by editing the properties of the Search Publisher component in Community Builder. For details, see Using Templates to Build Communities.

Enable Similar Articles for Chatter Questions

When users ask questions in Chatter, similar questions appear as they type. If you’d like relevant Salesforce Knowledge articles to appear as well as questions, enable Similar Articles.

Note: Chatter and Salesforce Knowledge must be enabled in your organization.

Enabling Similar Articles turns on the feature in:

- Your internal Salesforce organization
- Your communities built with Salesforce Tabs + Visualforce or the Napili template

1. From Setup, enter Knowledge Settings in the Quick Find box, then select Knowledge Settings.

2. Under Chatter Questions Settings, select Display relevant articles as users ask questions in Chatter (also applies to communities with Chatter).

Note: Make sure that the Question action has been added to the desired page layouts. Otherwise, users can’t see it.

To learn more about how Similar Articles and Similar Questions work, see:

- Display Similar Questions and Articles in Chatter
- Display Similar Questions and Articles in the Napili Search

Question-to-Case Overview

Selecting a Best Answer for a Question in Chatter

One of the advantages of asking a question in Chatter is that users can select the best answer for a question. When a question has a best answer, your users can quickly resolve their issue by going directly to the best answer.

Moderators and the person who asked the question can:

- Select the best answer for a question
- Remove the best answer status from an answer

Only one answer can be selected as the best answer. Moderators can be the Chatter moderator, the community moderator, or the Salesforce administrator. If a user doesn’t have permission to select the best answer for a question, they don’t see the Select as Best option.
When an answer is selected as a best answer, a check mark (✔️) appears next to it. A copy of the best answer also appears at the top of the list of answers so other users can quickly spot it.
Chatter Questions FAQ

Chatter Questions lets users in communities and Salesforce ask questions in the feed. Take a look at some common questions about the feature.

**Why should I use Chatter Questions instead of asking my question in a Chatter text post?**

Asking a question in Chatter saves you time. When you ask a question, similar questions and articles appear as you enter your question. Chances are that someone already asked the same question, and it could have many answers or a best answer. Chatter Questions harnesses the value of content that already exists in Chatter.

**Can I filter the Chatter feed to show only questions?**

Yes. At the top of your Chatter feed, click [next to Show](#) and select Questions.

**Can I search for questions in Chatter?**

Yes. Use the Search This Feed button (🔍) at the top of your Chatter feed. Questions are included in the feed search results.

**Is Chatter Questions available in Salesforce1?**

Currently, Chatter Questions is available in the Salesforce1 mobile browser only.
What happens when someone asks a question?

Their question appears in the Chatter feed for their followers or the person or group they asked the question of. An email notification is also sent to the person or group they asked the question of. After a user asks a question, other users can then answer the question directly in Chatter.

Who can select a best answer for a question?

The person who asked the question and moderators can select the best answer for a question. Moderators can be the Chatter moderator or the community moderator. Your Salesforce administrator can also select the best answer for a question. For details, see Selecting a Best Answer for a Question in Chatter.

Can I track Chatter Questions use and adoption in my Salesforce organization?

Yes. For details, see Track Chatter Questions Use in Your Salesforce Organization and Communities.

Track Chatter Questions Use in Your Salesforce Organization and Communities

Keep tabs on the use and adoption of Chatter Questions in your organization or community with out-of-the-box reports and dashboards.

Reports on Chatter Questions help you answer questions such as:

- What kinds of questions are users asking?
- How many questions were asked in the past month?
- What percentage of questions go unanswered?
- Which topics do users ask the most questions about?
- Which departments are asking the most questions?

To track the use of Chatter Questions in your Salesforce organization, download the Salesforce Chatter Dashboards on the AppExchange. For help getting started, see Report on Chatter with the Dashboards Package.

To track the use of Chatter Questions in your communities, download the Salesforce Communities Management (for Communities with Chatter) on the AppExchange. For help getting started, see Report on Communities with the Dashboards and Insights Package on page 3188.

Create a Case from a Question in Chatter
Salesforce offers a variety of question-and-answer features that you can implement in your Salesforce organization and communities. Because some of these features use similar terminology, take a moment to review the differences between them.

Salesforce has released three features that let users post questions and answers in a public forum setting. While these features share a common purpose, they represent an evolution of Salesforce’s Q&A features.

<table>
<thead>
<tr>
<th>Q&amp;A Feature</th>
<th>Description</th>
<th>Structure</th>
<th>How Users Access It</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Version 1: Answers</strong></td>
<td>Answers, released in Winter ’11, was Salesforce’s first Q&amp;A feature for communities. Starting in Summer ’13, Answers isn’t available in new orgs.</td>
<td>Answers is built on the Question standard object.</td>
<td>Internal users access the Answers feature via the Answers tab in Salesforce.</td>
</tr>
<tr>
<td><strong>Version 2: Chatter Answers</strong></td>
<td>Chatter Answers, released in Spring ’12, was intended for customers who liked the Answers user experience but wanted additional functionalities. Chatter Answers let companies maintain an out-of-the-box, self-service site where users could help address each other’s questions, and provided a feed view of users’ questions. Starting in Summer ’16, Chatter Answers isn’t available in new orgs.</td>
<td>Chatter Answers is built on the Question standard object.</td>
<td>Internal users access Chatter Answers via the Q&amp;A tab, and moderators can view a list of questions in the Questions tab.</td>
</tr>
<tr>
<td><strong>Version 3: Chatter Questions</strong></td>
<td>Chatter Questions, released in Winter ’15, represents the most advanced developments in Salesforce Q&amp;A functionality. Because it takes advantage of Chatter Questions is built on the Chatter data model, and uses the Feed Post and Feed Comment objects.</td>
<td>Internal users access Chatter Questions within Chatter. They use the Question action in the Chatter publisher to post a question, and all</td>

Question-to-Case Overview

Question-to-Case lets moderators create cases from questions in Chatter, which makes it easier to track and resolve your customers’ issues. Question-to-Case is available in the full Salesforce site and the Salesforce1 mobile browser app, as well as in communities where Chatter Questions is enabled.

When a customer uses the Question action in Chatter to ask a question, similar questions and Knowledge articles appear below the Chatter publisher. If the similar questions and articles don’t address the issue, the customer posts the question. If a question isn’t resolved, you can escalate the question to a case. Users with the “Moderate Chatter” or “Moderate Communities Feeds” user permission can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

When a customer’s question is turned into a case, the customer receives an email with the case number and a link to the case. The customer can view the case via a link on the question that’s visible only to them, while moderators see a note on the question indicating that a case was created.

Note: The person who asked the question must have access to cases so they can view their case.
Note: On escalated questions in Salesforce (as opposed to communities), the notification is visible to all users, not just moderators.

When agents find a solution, they can respond to questions directly from the console, and the customer sees the agent’s response on the question or in the My Cases view. Agents choose whether the reply is visible to the community, or only to the customer who asked the question.

To get started, see Set Up Question-to-Case.

**EDITIONS**

Available in: Salesforce Classic

Available in: **Group**, **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

**USER PERMISSIONS**

To enable Question-to-Case:

- “Customize Application”
Add the **Question from Chatter** Field to the Case Detail View

When a case is created from a question in Chatter, the **Question from Chatter** field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

First, use field-level security to specify which users can see the **Question from Chatter** field on case detail pages.

1. From the object management settings for cases, go to Fields.
2. Click **Question from Chatter**.
3. Click **Set Field-Level Security**.
4. Select **Visible** for any profile that you want to be able to use Question-to-Case.
5. Click **Save**.

After you make the field visible to users, you can choose to add it to the Case Details view.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to the page layout that you want to customize.
3. Drag the **Question from Chatter** field from the Fields section of the page layout editor palette to the Case Information section of the page.
4. Click **Save**.
5. Click **Page Layout Assignment** to confirm that the user profiles which need Question-to-Case are assigned to the page layout that you customized. In addition, assign internal users who need access to the **Question from Chatter** field on cases to that page layout.

**SEE ALSO:**
- Add the Escalate to Case Action to the Feed Item Layout

Add the Escalate to Case Action to the Feed Item Layout

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

1. From Setup, enter **Feed Item** in the Quick Find box, then select **Feed Item Layouts**.
2. Click **Edit** next to Feed Item Layout.
3. Drag the Escalate to Case action from the Quick Actions category in the palette to the Quick Actions in the Salesforce Classic Publisher section.
4. Click **Save**.
5. Click **Page Layout Assignments** to confirm that the user profiles that need Question-to-Case are assigned to the Feed Item Layout.

**SEE ALSO:**
- Confirm Access to the Escalate to Case Action
Confirm Access to the Escalate to Case Action

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

First, check which record type is assigned to the profiles that need access to the Escalate to Case action.

1. From Setup, enter Profiles in the Quick Find box, then select Profiles.
2. Click the name of a profile.
3. In the Record Type Settings section, make a note of which case record types the profile uses.
4. In the Permissions section, make sure that the user profile has either the Moderate Chatter or Moderate Communities Feeds permission enabled.

Then, check which record type the Escalate to Case action uses, and change it if necessary.

1. From Setup, enter Actions in the Quick Find box, then select Feed Item Actions.
2. Click Edit next to the Escalate to Case action.
3. Confirm that the Record Type field shows a record type that's assigned to the profiles that need access to this action. If it doesn’t, select an appropriate record type from the drop-down list.
4. Click Save.

SEE ALSO:

Customize the Escalate to Case Action Layout

Customize the Escalate to Case Action Layout

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

1. From Setup, enter Actions in the Quick Find box, then select Feed Item Actions.
2. Click Layout next to the Escalate to Case action.
3. Drag any fields you want to add to the action from the action layout editor palette, and reposition them if necessary.
4. Click Save.

Note: In public communities, you can’t look up a contact when the case is submitted, so we recommend that you remove the Contact field from the Case Action layout.

SEE ALSO:

Automatically Assign Cases from Questions to a Queue
Automatically Assign Cases from Questions to a Queue

Case assignment rules aren’t supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you’d like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue if the Type field on the case is equal to Question. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions will depend on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see Create Queues.

SEE ALSO:
Automatically Create Cases from Unresolved Questions in Chatter

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

**Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that’s you? See Differences Between Q&A Features in Salesforce on page 2926.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than 10 likes, and a best answer hasn’t been selected.
- Create a case from a question immediately if the question contains the word “competitor.”

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- `BestCommentId`: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- `CommentCount`: The number of comments on a question.
- `LikeCount`: The number of likes on a question.

**Tip:**

- Each flow variable’s data type must match the feed item field’s data type. `CommentCount` and `LikeCount` are number fields, while `BestCommentId` is a text field.
• The creation of a feed item can trigger a process, but updates to feed items (such as likes and comments) cannot. Depending on your process, you might need to specify how much time must pass before a related flow runs.

SEE ALSO:
- Lightning Process Builder
- Cloud Flow Designer

Create a Case from a Question in Chatter

If a question in Chatter hasn’t been resolved, moderators can create a case from the question. Question-to-Case must be enabled in your organization or community.

1. Navigate to the question in the feed.
2. Select Escalate to Case in the action drop-down menu.

To create a case from a question in Salesforce:
- “Moderate Chatter” OR “Modify All Data” AND “Create” on cases

To create a case from a question in a community:
- “Moderate Chatter” OR “Modify All Data” OR “Moderate Communities Feeds” AND “Create” on cases
A window appears that’s pre-populated with the case subject, contact, and description. Unless Question-to-Case has a queue associated with it, the case is automatically assigned to you.

3. If needed, edit the case details.

4. Create the case.

After a case is created from a Chatter question, the customer who asked the question receives an email notifying them that a case was created from their question. The email provides the case number and a link to the case.

Agents can post a response to the question directly from the case feed using the Community action in the publisher. Agents choose who can view the response by selecting either “Customer Only” or “Everyone”. They can also navigate to the original question from the case’s detail page by clicking the link in the Question from Chatter field.

### Attachments

**Documents Tab**
- attaching them to records.

**Files Home**
- Salesforce files in the cloud.

**Salesforce CRM**
- deliver them to customers.

**Salesforce Knowledge**
- knowledge base. Internal users and customers (on your Customer Portal, partner portal, Service Cloud Portal, or Force.com Sites) can quickly find and view articles they need.

### Supported File Types
- All
- All
- All
- All
- All

### Maximum File Sizes
- 2 GB
- 2 GB
- 5 MB for attachments
- 5 MB
- 20 KB for a custom-app logo
- 25 MB for file attachments

### Common Uses

**Files Home**
- Upload a file and store it privately until you’re ready to share it. Share the file with coworkers and groups to collaborate and get feedback. Attach files to posts in a Chatter feed on the Home tab, Chatter tab, a profile, a record, or a group. Users with access to Salesforce Files Sync can access, sync, and share files in their Salesforce Files Sync folder.

**Salesforce CRM**
- Create, clone, or modify a sales presentation and save it so only you can see it and work on it. When you’re ready, publish it so other users in your company have access to it. Create a content pack and send it to customers.

**Salesforce Knowledge**
- Write, edit, publish, and archive articles using the Articles Management tab or find and view published articles using the Articles tab. Customers and partners can access articles if Salesforce Knowledge is enabled in your Customer Portal, partner portal, Service Cloud Portal, or Force.com Sites. Create a public knowledge base so website visitors can view articles.

**Documents Tab**
- Add a custom logo to meeting requests by uploading your logo to the Documents tab.

**Attachments**
- Add a file to a specific record, like an event, marketing campaign, contact, or case by attaching it on the Attachments related list.

**Customers and partners can access company have access in a Chatter feed on articles if Salesforce can access it. Create a content the Home tab, Chatter tab, a profile, a record, or a group. Users with access to Salesforce Files Sync can access, sync, and share files in their Salesforce Files Sync folder.**

- Delete a File from the File Detail Page
Files Overview

Use the Files tab to work with files in Salesforce.

Working with files in Salesforce means:

- Collaborating with coworkers by posting files to feeds and directly to records, such as Accounts, Cases, Leads, and more.
- Sharing files with customers in the secure Salesforce cloud.
- Syncing files between your local drive and Salesforce.
- Learning how users work with files by running standard and custom file reports.

The Files tab provides a powerful toolset for working with and managing your files.

- Filter your file list (1) so that it only shows the files you want to see. Click any of the filter names to change the scope of your file list.
- Select or drag one or more files to upload (2) them to Salesforce. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.
- Use the files-specific search tool (3) to find the files you need. Filtering your file list also filters your search. Search all files you have access to from the Recent filter.
- Preview, follow, download, version, share, and sync files directly from the file list (4). Click on a file name to open the file detail page. On the file detail page, you can run reports about the file, see who is following the file, edit details about the file, and more.
- Download Salesforce Files Sync (5) to sync files between your computer and Salesforce.

Files are automatically added to the file list when:

- You upload a file.
- You attach a file to a record.
• You or someone else attaches a file to a Chatter feed or comment. This includes files attached to all public groups, whether you’re a member or not, and private groups you’re a member of, but not private groups you’re not a member of.
• You sync a file in your Salesforce Files Sync folder.
• Someone else shares a file privately with you using the Sharing dialog box.
• You upload a file to a Salesforce CRM Content library.
• Someone else uploads a file to a library you’re a member of.
• You or someone else creates a content pack or uploads a Web link in Salesforce CRM Content. You only see files from content packs and Web links you have access to.

**Note:** In Internet Explorer 11, the **Preview** option redirects to the file detail page.

As you work with files in Salesforce, keep these file limits in mind:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>File size</td>
<td>• 2 GB when uploaded via the Web interface</td>
</tr>
<tr>
<td></td>
<td>• 2 GB when uploaded via the Salesforce Files Sync desktop client</td>
</tr>
<tr>
<td></td>
<td>(or 500 MB when using proxy)</td>
</tr>
<tr>
<td></td>
<td>• 100 MB when uploaded from a mobile device</td>
</tr>
<tr>
<td>Maximum number of versions per file</td>
<td>2,048 versions</td>
</tr>
<tr>

<td>Users can sync up to 10,000 files.</td>
</tr>
<tr>
<td>Maximum number of users who can sync the</td>
<td>1,000 users</td>
</tr>
<tr>
<td>same file simultaneously</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**
• For information about the different file tools and solutions in Salesforce, see *Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments*.
• To learn who can perform which actions on a file, see *Who Can See My File?*.
• File syncing functionality, such as the Synced filter, is only available if Salesforce Files Sync is set up for you and your organization.
• Files connected to Salesforce from repositories such as Microsoft® SharePoint® are only available if Salesforce Files Connect is enabled for you and your organization.
• Chatter feeds, groups, and the ability to follow files are only available for organizations that have Chatter enabled.
If your organization uses profile-based Chatter rollout, users must have Chatter permissions enabled for Files to be available.

Files Home

Files Home

Files home lets you store files privately, share files with others, and view files that have been shared with you.

From Files home, you can:
- See all the files you own or have access to and filter your list of files.
- Search for files using filters and by typing terms in the Files search box, or the search box at the top of the page.
- Upload private files or upload and share files with people, groups, or via a file link.
- If you have the "Sync Files" permission, access synced files in your Salesforce Files Sync folder.
- Preview a file without downloading it.
- Follow and receive updates about a file in the Chatter feed. Click x next to the file you're following to stop receiving updates about the file. (Requires Chatter.)
- Click to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the file detail page.
- Click a file owner’s name to see his or her profile.

SEE ALSO:
- Filter Your Files List
- Who Can See My File?
Filter Your Files List

The filters on the Files page provide quick access to your files in Salesforce. The Files page lists all the files you have access to. Filters show you different groups of those files, letting you find what you’re looking for quickly.

<table>
<thead>
<tr>
<th>Filter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All Files</td>
<td>All files you own and have access to.</td>
</tr>
<tr>
<td>Recent</td>
<td>The most recent files you've viewed.</td>
</tr>
<tr>
<td>Owned by Me</td>
<td>Only the files you own.</td>
</tr>
<tr>
<td>Shared with Me</td>
<td>Only files that have been shared with you either by a private share or a public post to your profile.</td>
</tr>
<tr>
<td>Following</td>
<td>Only the files you’re following in Chatter. This filter is available only in organizations that use Chatter.</td>
</tr>
<tr>
<td>Synced</td>
<td>All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the &quot;Sync Files&quot; permission.</td>
</tr>
<tr>
<td>Libraries</td>
<td>Files anyone has uploaded to libraries you're a member of, as well as all files you uploaded to your private library, grouped by library name.</td>
</tr>
</tbody>
</table>

View Where a File is Shared

Search for Files

Use the files-specific search field on Files home in Salesforce to find just what you're looking for. Files home lists the files you own and have access to, including files posted to feeds. The 25 most recently viewed files are listed by default. You can see and search a certain group of files by clicking a specific filter on the sidebar. The search results are filtered based on the terms entered.

Note: Users who have the "Sync Files" permission don’t see the All Files, MY FILES, or FILES IN MY GROUPS filters. Users who don’t have the "Sync Files" permission don’t see the Synced filter.

- All Files—All files you own and have access to, including:
  - Files that have been shared with you
  - Files you’re following
  - Files in your Chatter groups
  - Files in your libraries
  - Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you’re a member or not, and private groups you’re a member of, but not private groups you’re not a member of.

This filter is only available in Salesforce Classic.
Recent—The most recent files you’ve viewed.

MY FILES—All files you own, files shared with you, and files you follow.
  
  **Owned by Me**—Files you have:
  
  - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, share them, and attach them to Chatter feeds.
  - Attached to Chatter feeds from your computer.
  - Synced using your Salesforce Files Sync folder.
  - Uploaded to Salesforce CRM Content libraries you’re a member of and your private library.

  **Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.

  **Following**—All files that you’re following. *(Requires Chatter)*

FILES IN MY GROUPS—All files you and other people shared to groups you’re a member of. The last five groups you’ve visited are listed.

FILES IN MY LIBRARIES—All files you and other people uploaded to libraries you’re a member of and all files you uploaded to your private library. The first five libraries you’re a member of, including your private library, are listed. If you’re a member of more than five libraries, click More to see a complete list.

Synced—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the “Sync Files” permission.

EXTERNAL FILES—All files you have access to in Files Connect external data sources. Search is restricted to the selected external data source.

In Salesforce Classic, to search for files using the Files search:

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.

2. Enter your search terms in the Search field on the Files tab. You can search by file name, description, owner, type, or within the file’s text.

3. Click Search to see a filtered list of all relevant files based on your search terms. Or click to clear your search terms.

In Salesforce Classic and Lightning Experience, you can search for files from the header search field. Use feed search to find files posted in a specific Chatter feed, such as on a profile, on a record, or in a group.

**Note:** Feed search returns matches for file or link names shared in posts, but not in comments.

The Files list doesn’t include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn’t searched, but the file’s name, description, type, and owner are.

Filter Your Files List

Upload and Share Files

Upload Files
Upload files from Files home, in feeds, and on opportunities or other records.

Upload files from:
- **Files** home
- Any Chatter feed post or comment field
- **Files** card or list on groups, user profiles, opportunities, and other records

All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. Files up to 2 GB can be uploaded by default. However, your maximum file size is determined by your organization.

Files Home
When you upload files, they’re added to the **Owned by Me** filter on **Files** home, with you as the owner. Files you upload from **Files** home are automatically uploaded as private.

You can also add files to Salesforce by:
- Attaching a file to a Chatter feed.
- Uploading files to Salesforce CRM Content private and shared libraries.
- Syncing a file in your Salesforce Files Sync folder.
- Creating content packs or uploading Web links in Salesforce CRM Content.

The Files list doesn’t include:
- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

**Note:** Files without a file extension or with an unrecognized file extension show “unknown” in the Type column.

Available in: both Salesforce Classic and Lightning Experience
Available in: **Group**, **Enterprise**, **Professional**, **Performance**, **Unlimited**, **Contact Manager**, and **Developer** Editions
Private Files
A private file is private, not shared with anyone, and you are the file owner. Only file owners and users with the "View All Data" permission can see private files. Private files show a lock icon in the Files list and on the file’s detail page. You can search for your private files in Chatter and on the Files list.

Sharing Private Files
You can share private files from the file detail page or by attaching them to a Chatter feed, a profile, a record, or a group. You can also share a file via a link. When you share a private file, it’s no longer private. To learn who can perform which actions on a file, see Who Can See My File?.

File Size Limits in Salesforce
The following are maximum file size limits for files in Salesforce.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
</table>
| Attachments related list | • 25 MB for file attachments  
                           | • 2 GB for feed attachments                                             |
| Documents tab            | • 5 MB                                                                  |
|                          | • 20 KB for a custom-app logo                                           |
| Salesforce CRM Content   | • 2 GB                                                                  |
|                          | • 2 GB (including headers) when uploaded via Chatter REST API          |
|                          | • 2 GB (including headers) when uploaded via REST API                  |
|                          | • 38 MB when uploaded via SOAP API                                     |
|                          | • 10 MB when uploaded via Bulk API                                     |
|                          | • 10 MB for Google Docs                                                 |
|                          | • 10 MB when uploaded via Visualforce                                  |
| Salesforce files         | 2 GB                                                                    |
| Salesforce Knowledge     | 5 MB for attachments                                                   |

The size limit for an attached file is 25 MB when attached directly to the related list.
The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file.

SEE ALSO:
Upload Files

Upload a New Version of a File
You can upload a new version of a file so your viewers and collaborators always have access to the latest and greatest. If your original file was uploaded via a feed post, use Upload New Version to replace the old with the new, without needing to create a whole new post.

Uploading a new version replaces all previous versions, but previous versions are still available by clicking Show all versions on the file detail page.

1. Click Upload New Version from any of these locations:
   - The file detail page
   - The file previewer
   - The Files page, via the actions arrow for the file
   - On a file in a feed, via the More Actions arrow (available in Salesforce Classic only)

2. Click Choose File, and select a file from your computer.

3. Optionally, enter a note about what changed in the What Changed? field. This information is shown on the Version History list.

4. Click Upload New Version (Salesforce Classic) or Start Upload (Lightning Experience).

The file detail page and any previous posts show the updated version.

Note:
- Only file owners, collaborators, and users with the “Modify all Data” permission can upload new versions. To learn who can perform which actions on a file, see Who Can See My File?
- The file owner doesn’t change when a collaborator uploads a new version.
- If the file is from Salesforce CRM Content, you can’t upload a new version from the file detail page. You can click Go to Content Detail Page and upload a new version there. (Available in Salesforce Classic only.)

**Note:**
- **No Access** means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they're a member of.
- Users with "Modify All Data" permission can view, preview, download, share, attach, make private, restrict access, edit, upload new versions, and delete files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users with "View All Data" permission can view and preview files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users must have the "Sync Files" permission to sync files.
- Groups (including group members) and records have viewer permission for files posted to their feeds.
- Permissions for files shared with libraries are determined by the library.

**SEE ALSO:**
- Make a File Private
- View Where a File is Shared
- Prevent Others from Sharing and Unsharing a File
Change File Access

Decide who can view and modify the files you own.

File owners and collaborators can change file permissions for people and groups from viewer to collaborator and vice versa. They can also change file permissions for files shared with their company to viewer, collaborator, or no access.

- **Viewers** can view, download, and share files.
- **Collaborators** can view, download, share, change permission, edit the file, and upload new versions.
- **Set by Library** for a file in a library means that access to the file follows access to the library. This setting can’t be toggled.
- **Set by Record** for a file attached to a record means that access to the file follows access to the record. Those with read/write access to the record have **Collaborator** access to the file. Those with read-only access to the record have **Viewer** access to the file. This setting can be toggled in Salesforce Classic only.
- **No Access** means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they’re a member of.

To change file access:

1. On a file detail page, click **Share File > Sharing Settings**.
2. Find the person or group whose access you want to change. Or change access for **Any Chatter user in your company**.
3. Select **Viewer**, **Collaborator**, or **No Access** (for your company). Or, for files shared with records (Salesforce Classic only), change to **Set by Record**. The change happens immediately.
4. Click **Close**.

**Note:**

- A file is shared with your company when it’s posted to a feed that all users can see, a profile, a record, or a public group. **Any Chatter user in your company** is given viewer permission by default. If you change the permission from viewer or collaborator to no access, you remove the share to company and to public groups.
- When you share a file with someone, they are given **Collaborator** access by default. When you share a file with a group, the group members are given **Viewer** access by default. You can change the default access when you share a file for the first time. File owners and collaborators can change access after a file has been shared.
- File link recipients can only view and download files. They can’t be collaborators.

**SEE ALSO:**

- Who Can See My File?
- Make a File Private
- Prevent Others from Sharing and Unsharing a File
Make a File Private

File owners and users with the “Modify All Data” permission can make a file and file link, if applicable, private if they decide they don’t want it to be shared anymore. Making a file private removes it from any posts it’s attached to and removes it from everywhere it’s been shared. Only the owner and users with the “Modify All Data” permission will have access to it. Alternately, file owners and users with the “Modify All Data” permission can restrict access to a file that originated in a Salesforce CRM Content library to remove the file from everywhere it’s been shared, except the library.

If the file is shared using a content delivery, the content delivery becomes inaccessible, but is not deleted. If the file is shared using Share via link in Chatter, the link to the file is deleted.

1. From the file detail page of the file you want to make private or restrict access, click either Share File > Sharing Settings or Show All on the Shared With list.
2. On the Sharing Settings dialog box, click Make private (or Restrict access if the file originated in a Salesforce CRM Content library).
3. On the confirmation dialog box, click Make private (or Restrict access).

SEE ALSO:
Post Visibility
View Where a File is Shared
Prevent Others from Sharing and Unsharing a File

Share Files with Groups

Share files in Chatter with public or private groups so that members of the groups can view and download the files from their feed.

Share a file with a private or unlisted group so only members of that group can see it, or share a file with a public group so members of that group and all Chatter users in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more Chatter groups:

1. Share the file from one of these locations:
   - On the detail page of the file you want to share—Click File Sharing Settings > With group. Or click Show All on the Shared With list then click Groups on the Sharing Settings dialog box.
   - Next to the file in a feed—Click More Actions > File Sharing Settings then click Groups on the Sharing Settings dialog box.
   - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click Share with groups.
   - On a file hover—Click Share File then click Groups on the Sharing Settings dialog box.
   - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on Salesforce Files Sync, then click Share with groups.
2. Type the name of the group you want to share the file with and click the name to select it. Repeat this step to share with more groups.
3. Select access levels for each group. By default, private group access is set to Collaborator, while public group access is set to Viewer.
4. Optionally, add a message to your post. You can @mention people and groups in your message to notify them and post the file in their feed.

5. Click Share and Close. The file is posted to each group you shared it with and @mentioned.

A private file shared with a private or unlisted group becomes a privately shared file and displays the privately shared icon (🔒). The file is posted to the group’s feed and only the file owner and group members can find and view the file. Any file shared with a public group is viewable by all users in your company, displays the your company icon (🌐), and is posted to the group’s feed.

On the Sharing Settings dialog box, click ✗ next to a person’s or group’s name to stop sharing the file with them.

Note:
- Documents from the Documents tab and attachments from the Notes and Attachments related list aren’t listed on Files home and can’t be shared as Salesforce Files.
- Content files may be shared with more people than shown in Share with People if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:
- Group Files Lists
- View Where a File is Shared

Share Files with People in Salesforce Classic

Share files with people privately and set Viewer or Collaborator access for each person you share the file with.

Share a file privately so only specific people in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more users in your company:

1. Start by sharing the file from one of these locations:
   - On the detail page of the file you want to share—Click File Sharing Settings > Share with people. Or click Sharing Settings and then click People on the Sharing Settings dialog box.
   - Next to the file in a feed—Click More Actions > File Sharing Settings then click People on the Sharing Settings dialog box.
   - Next to the file on the Files home page—Click Share with people.
   - On a file hover—Click Share File then click People on the Sharing Settings dialog box.
   - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on Salesforce Files Sync, then click Share with people.

2. Type the name of the person you want to share the file with and click the name to select it.

3. Choose the file permission you want them to have. By default, they have collaborator permission which lets them view, download, share, change permission, edit the file, and upload new versions. Select Viewer to give them permission to view, download, and share files.

4. If you want to share the file with more people, enter more names.

5. Optionally, add information to the message that recipients receive.
6. Click **Share** and **Close**. Recipients receive a message that you have shared a file with them, along with a link to the file. Lightning Experience users receive this message as an email notification. Salesforce Classic users get a private Chatter message on their My Messages page on the Chatter tab, and also get an email notification if they have email notifications for Chatter messages enabled. Unless the file was already shared with your company, it’s privately shared and displays the privately shared icon (🔒). It’s not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon (.Microsoft) and anyone in your company can find and view it.

On the Sharing Settings dialog box, click 🗑️ next to a person’s or group’s name to stop sharing the file with them. If you don’t want others to change who can access the file, select **Prevent others from sharing and unsharing**.

**Note:**
- Documents from the Documents tab and attachments from the Notes and Attachments related list aren’t listed on Files home and can’t be shared as Salesforce Files.
- Content files may be shared with more people than shown in Share with People if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:
- View Where a File is Shared

### Share Files with Libraries

Share files with libraries to take advantage of the permission-setting capabilities of content libraries while still using the features of Salesforce Files.

If your administrator has turned on this feature for your organization, you can share any file with a library. The **Libraries** tab in Salesforce lists the libraries in your company along with the permissions assigned to each. The **Share with library** option in Chatter lets you share Chatter files with a library, leveraging the permissions set for the library.

**Note:** Sharing files with libraries requires that:
- Your user detail page has the **Salesforce CRM Content User** setting enabled. Your administrator can enable this setting.
- Your organization has the **Files user interface allows sharing files with libraries** setting enabled. Your administrator can enable this setting on the Salesforce CRM Content page in Setup.

1. On the **Files** tab, click 🗑️ next to the file you want to share with a library.
2. Select **Share with library**. Or, for external file references (only applicable for Files Connect users), select **Share a reference**, and choose **Library** in the **Sharing Settings** dialog box.
3. Do one of the following, depending on what happens next:
   - If the **Publish Content to Multiple Libraries** dialog box appears, this means the file is already managed by a library. Select one or more additional libraries, and click **Publish**.
   - If the **Share files with a library** confirmation message appears, it means that the file has been shared with people who have Collaborator access, or it has been synced. If you proceed, Collaborators and those who have synced the file will have only Viewer access. (A library administrator can give them editing access later.) Click **Share** to continue, or **Cancel** if you’ve changed your mind.
   - If the **Publish Content** dialog box appears, enter a title for the file. Select the library you want to share it with, and enter any tags as metadata. Select a record type, enter any optional information, and click **Publish**.

The file is now listed on the **Libraries** tab and in **Files in My Libraries** on the **Files** tab.
Prevent Others from Sharing and Unsharing a File

You can prevent others from sharing and unsharing a file you own. This doesn’t affect existing shares.

1. On Files home, find the file you want.
2. Go to Sharing Settings or Share File for the file. (Or, if the file is in a library, open the Content Detail page from the Libraries tab.)
3. Select the Prevent others from sharing and unsharing checkbox.
4. Click Save.

Example: Let’s say I post a file in Chatter, and share it with a private group. I’m okay with members of the group having access to the file, but I don’t want them to share it further. I can prevent sharing and unsharing so the existing shares remain but new ones can’t be added, except by me or an admin.

You can also prevent others from sharing and unsharing a file in the API by using the SharingOption field on ContentVersion and other objects.

Share Files with People in Lightning Experience

Share files with people privately and set Viewer or Collaborator access for each person you share the file with.

Share a file privately so only specific people in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more users in your company:

1. Start by sharing the file from one of these locations:
   • Next to the file on Files home—Click Share.
   • On the detail page of the file you want to share—Click Share.
   • From the file preview player—Click Share.
2. Type the name of the person you want to share the file with and click the name to select it. Enter additional names if you wish to share with more than one person.
3. Choose the file permission you want them to have. By default, they have collaborator permission which lets them view, download, share, change permission, edit the file, and upload new versions. Select Viewer to give them permission to view, download, and share files.
4. Optionally, add information to the message that recipients receive.
5. Click Share and Close. Recipients receive a message that you have shared a file with them, along with a link to the file. Lightning Experience users receive this message as an email notification. Salesforce Classic users get a private Chatter message on their My Messages page on the Chatter tab, and also get an email notification if they have email notifications for Chatter messages enabled.

On the Sharing Settings dialog box, click next to a person’s name to stop sharing the file with them.

From the Share File window, click Who Can Access to see everyone the file has been shared with. Update file permissions or click X next to the name of a person or group to stop sharing the file with them. If you want to prevent others from changing who can access the file, select Prevent others from sharing and unsharing.

Note:

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren’t listed on Files home and can’t be shared as Salesforce Files.
- Content files may be shared with more people than shown in Share with People if they are part of a content pack or delivery.
The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

See File Updates in Your Feed

Follow a File

Follow a file to see updates in your Chatter feed, including when a new version of the file is uploaded. If you stop following a file, the file remains in your Files list, but you won’t see updates about it in your feed anymore.

Click + Follow to start seeing updates, or click x Unfollow to stop seeing updates. In Lightning Experience, follow a file from the file detail page. In Salesforce Classic, follow a file from a feed, file detail page, or files list.

Note: The option to follow files is only available in organizations that use Chatter.

View File Version History

The file detail page shows the current version number of the file. View the Version History list to see all versions of the file that have been uploaded, including the current version. From the list you can download the file, see who updated it and when, and see the description if provided. The file detail page always shows the most current version of a file.

File Recommendations

Chatter recommends files that you might want to follow based on the popularity of the file, determined by the number of people who have viewed or downloaded the file. To see an expanded list of your recommendations, click More in the Recommendations section. If no recommendations appear, then you already follow all the recommended files.
File Previews and Details

View File Details

To open file details, click a file name in a feed, on a files list, on a file hover, or by clicking More Actions > Preview next to the file in a feed. On the file detail page, you can see details about Salesforce Files.

From a file detail page, you can:

• View the file without downloading it. Use the arrow keys in the document previewer to see each page, zoom in or out, or change the preview width and screen size. Files owners and anyone with access to the file can preview it.

  **Note:** Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can’t be previewed, the Preview option isn’t available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don’t display correctly in previews. If a file can be previewed, but a preview doesn’t exist, contact your Salesforce administrator who may be able to regenerate the preview.

• See if the file is private ( ), privately shared ( ), or shared with your company ( ).

• Click Download to open or save the file. Anyone who can see a file can download it.

• Click File Sharing Settings to share a file with people, groups, or via file link, or see the Sharing Settings. By default, anyone who can see a file can share it.

• Click Make private on the Sharing Settings dialog box to remove the file and file link, if applicable, from everywhere it’s been shared. Or click Restrict access if the file originated in a Salesforce CRM Content library to remove the file from everywhere it’s been shared except the library. Only owners and users with the “Modify all Data” permission can make a file private ( ) or restrict access.

• Click Upload New Version to update the file with a newer version. Only file owners, collaborators, and users with the “Modify all Data” permission can upload a new version of a file.

• Click Edit Details to edit the name or description of the file. Only file owners, collaborators, and users with the “Modify all Data” permission can edit file details.

• If you have the “Sync Files” permission and are the owner of the file, click Sync to sync a file between your Salesforce Files Sync folder on your computer and Chatter. Click Unsynchronized to stop syncing the file.

• Click Delete to delete the file. Only file owners and users with the “Modify all Data” permission can delete files.

• See who the file is owned by and when it was last modified.

• See the file’s description and click the edit icon ( ) to edit the description, or add a description by clicking Add Description.

• See the file’s current version number and click Show all versions to see the file’s version history.

• Click Show file report to see data about the file, such as how many times the file has been downloaded, shared, liked, and commented on. Show file report is visible only to users with the “Run Reports” and “View Reports in Public Folders” permissions.

• Click Follow to follow the file or click to stop following the file.

• See who’s following the file.

• See who and what locations the file is shared with.

• If the file originated in Salesforce CRM Content, click Go to Content Detail Page to see the content detail page of that file. Most actions performed on files that originated in Salesforce CRM Content must be done on the file’s content detail page instead of the file detail page.

• Click the Files or Chatter links at the top of the page to go to the Files list or the Chatter page.
See other files that people who viewed this file also viewed. If no other files have been viewed by the same people, the People Also Viewed section doesn’t appear on the file detail page.

SEE ALSO:
- View File Version History
- View Where a File is Shared

Edit File Details
To edit a file’s name and description:

1. On a file detail page, click Edit Details or click the edit icon (✓) next to the description.
2. Optionally, edit the file name and description.
3. Click Save.

If there is no description and you want to add one, click Add Description or click the edit icon (✓) next to the description.

File owners, collaborators, and users with the “Modify All Data” permission can edit file details.

SEE ALSO:
- View File Details

View Where a File is Shared
Find out who can see a file, and what level of access they have. From the File Detail page, you can access a full list of every person or object the file is shared with.

The Shared With list on a file detail page shows you who the file is shared with, and their level of access.

In Salesforce Classic, click Show All to open Sharing Settings, where you can:

- See who the file is shared with and their permission: owner, collaborator, viewer, or no access.
- Click People on the Sharing Settings dialog box to share the file with specific people.
- Click Groups on the Sharing Settings dialog box to share the file with specific groups.
- Click Library to share the file with a library.
- Click Anyone with link on the Sharing Settings dialog box to create and share a file link.
- Click Make private to remove the file and file link, if applicable, from everywhere it’s been shared. Or click Restrict access if the file originated in a Salesforce CRM Content library to remove the file from everywhere it’s been shared except the library. Only owners and users with the “Modify All Data” permission can make a file private (✓) or restrict access.
- On the Sharing Settings dialog box, click ✓ next to a person’s or group’s name to stop sharing the file with them.

SEE ALSO:
- Make a File Private
- Who Can See My File?
File and Content Engagement Report

See how many times a file has been downloaded, shared, liked, and commented on.

From the file detail page, click Show file report to run and view the File and Content Engagement report, which has these fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Number of times users...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Downloads</td>
<td>Downloaded the file.</td>
</tr>
<tr>
<td>Posts</td>
<td>Posted the file to a feed. This number doesn’t count the number of times the file has been attached to comments on posts.</td>
</tr>
<tr>
<td>Post Comments</td>
<td>Commented on file posts in feeds.</td>
</tr>
<tr>
<td>Likes</td>
<td>Liked file posts on feeds. This number doesn’t count likes received by comments on the file post.</td>
</tr>
<tr>
<td>Shares</td>
<td>Shared the file using Share with people and Share with groups. If a user clicks Share on a file post, it’s counted as a post and not as a share.</td>
</tr>
<tr>
<td>Links</td>
<td>Shared the file using Share via link. If the file is uploaded to a Salesforce CRM Content library, then content deliveries are also counted.</td>
</tr>
</tbody>
</table>

Example: Numbers in the File and Content Engagement report are cumulative for all versions of a file. For example, if there are 2 versions of the file, and version 1 has been downloaded 4 times while version 2 has been downloaded 5 times, then Total Downloads reports 9 downloads.

Sync Files

Get Started with Salesforce Files Sync

Salesforce Files Sync makes file management, syncing, and sharing easier than ever!

Watch a Demo: Get Started with Salesforce Files Sync

Getting started with Salesforce Files Sync is almost effortless. Just save your files in the Salesforce Files Sync folder on your desktop, and Salesforce Files Sync does the rest.

Access your synced files anywhere

Saving a file in Salesforce Files Sync means that the file is automatically available everywhere you need it. Just look in the Synced filter in Files home — it’ll be there.
Share files right from the Salesforce Files Sync folder on your desktop
Right-click on a file to share it with people and groups in Chatter, or share the file with anyone using a link.

Always have the latest version of every file
Whenever you or one of your collaborators edit a file saved in the Salesforce Files Sync folder on your desktop, the file is instantly updated for everyone. Salesforce Files Sync supports versioning, so you can access older versions of the file, just in case.

Salesforce Files Sync System Requirements
Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.
To use Salesforce Files Sync, we recommend:

<table>
<thead>
<tr>
<th>System Requirement</th>
<th>Windows</th>
<th>Mac</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported operating systems</td>
<td>Microsoft® Windows® 7 and later</td>
<td>Apple® Mac OS X 10.8 Mountain Lion and later</td>
</tr>
<tr>
<td>Processors</td>
<td>2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices</td>
<td>Intel® Core™ Duo 1.83 GHz or faster processor</td>
</tr>
<tr>
<td>Memory</td>
<td>512 MB of RAM (1 GB recommended)</td>
<td>512 MB of RAM (1 GB recommended)</td>
</tr>
<tr>
<td>Hard drive</td>
<td>4 GB of free space recommended for sync operations</td>
<td>4 GB of free space recommended for sync operations</td>
</tr>
</tbody>
</table>

Install Salesforce Files Sync
Install the Salesforce Files Sync client on your desktop to sync files between your computer, Salesforce, and Salesforce1 on mobile devices.
1. From your personal settings, enter Files Sync in the Quick Find box, then select Salesforce Files Sync. Multiple results? Select the one under Personal Setup.
2. Click Download.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.
After Salesforce Files Sync is installed, you’re notified automatically when an update is available.

Note: Salesforce Files Sync client must run on a local drive. External locations such as network drives or mounted devices are not supported.

Salesforce Files Sync System Requirements
Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.

Connect Salesforce Files Sync to Other Salesforce Organizations

Configure Salesforce Files Sync to connect to other Salesforce organizations.

After disconnecting Salesforce Files Sync from one Salesforce organization, your synced files are backed up in a folder called “Salesforce Files_Old.” On Windows, the backup folder is located at C:\Users\User Name\Salesforce Files_Old where User Name is your Windows user name. On Mac, the backup folder is located at /Users/User Name/Salesforce Files_Old where User Name is your Mac user name. Your synced files are always accessible online in the Salesforce organization they’re synced with.

⚠️ Warning: Before connecting Salesforce Files Sync to a new Salesforce organization, close all files and folders saved in your Salesforce Files Sync folder. Any files and folders that are open when you disconnect Salesforce Files Sync from a Salesforce organization aren’t backed up and automatically sync with the next Salesforce organization that you connect Salesforce Files Sync to.

To sync files with a different Salesforce organization, set up a new connection for Salesforce Files Sync.

1. In your system tray or menu bar, right-click Salesforce Files Sync.
2. Click Preferences.
3. If necessary, click Log out to disconnect yourself from your current Salesforce organization.
4. Under New Connection, enter a Name for the new connection.
5. Enter the https:// login URL for your Salesforce organization.
6. Click Log in.
7. Enter your login credentials and click Log in.
8. Click Allow to enable Salesforce Files Sync.

After connecting to the new organization, any files you add to your Salesforce Files Sync folder sync with that organization. If you’ve already synced files with the organization that you’re connecting to, the synced files automatically download to the Salesforce Files Sync folder on your desktop.

Sync Files and Folders

Sync files and folders by saving them in your Salesforce Files Sync folder on your computer or by clicking Sync while viewing a file in a feed post, comment, file list, or file detail page.

Watch a Demo: Salesforce Files Sync

Before you can sync files, you must install Salesforce Files Sync on your desktop.

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync folder on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.

USER PERMISSIONS

To sync files:

- “Sync Files”
You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files.

To sync your files:

1. From the Salesforce Files Sync client, either save your files in your Salesforce Files Sync folder or drag and drop the files you’d like to sync into your Salesforce Files Sync folder.
   
   On Windows, your Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where `User Name` is your Windows user name. On Mac, your Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where `User Name` is your Mac user name.
   
   From the Files tab, a feed post, or anywhere in the full Salesforce site where a file is posted or listed, click ![Sync](https://example.com/sync_icon.png).

2. The files sync.

   After your files sync, you can easily access them in Salesforce and in Salesforce1 on mobile devices. If you delete a file from your Salesforce Files Sync folder, you can still access the file in the Owned by Me filter in Files home.

---

**Access Synced Files on Your Computer, Online, and on Mobile Devices**

Access synced files in your Salesforce Files Sync folder on your desktop, in Salesforce online, and in Salesforce1 on your mobile device.

**Find Synced Files on Your Desktop**

On your desktop, your synced files are kept in your Salesforce Files Sync folder. On Windows, the Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where `User Name` is your Windows user name. On Mac, the Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where `User Name` is your Mac user name.

To open your Salesforce Files Sync folder from your system tray or menu bar, right-click `Salesforce Files Sync > Open Salesforce Files Sync Folder`.

---

**Warning:** Moving your Salesforce Files Sync folder from its default directory location prevents file syncing. To ensure that your files always sync, don’t move your Salesforce Files Sync folder.

**Find Synced Files in Salesforce**

In Salesforce, your synced files are available in Files home.

From Files home, click **Synced** to view your synced files and folders. Your most recently synced files are listed first.

**Find Synced Files on Your Mobile Device**

On your mobile device, your synced files are accessible in Salesforce1.

From Files home, tap ![Sync](https://example.com/sync_icon.png) and select **Synced** to view a list of your synced files.

**Working with Synced Files and Folders**

Synced files and folders are just like any other file in Salesforce, but they have a few additional features.

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.
You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files in Chatter.

SEE ALSO:
- Personalize Your Salesforce Experience

### Share Synced Files

Synced files can be shared directly from the Salesforce Files Sync folder on your desktop.

Share synced files with people and Chatter groups in your organization, or people outside your organization using a generated link. Synced files are private by default, but when you share them you can assign view-only or collaborator privileges.

If you share a file with a person or group with Collaborator rights, then when collaborators download, edit, and upload a new version of the file, you’ll get the latest version automatically synced. When you edit and sync a new version of the file, the people and groups you’ve shared with will automatically get the latest version too.

To share a file directly from your Salesforce Files Sync folder:

1. On your desktop, in your Salesforce Files Sync folder, right-click the file you’d like to share.
2. Choose a menu option under **Salesforce Files Sync**: share with people in your organization, with Chatter groups, or with people outside your organization via link.
3. When prompted, enter the names of the people or groups in your organization, assign **Viewer** or **Collaborator** permission, and enter an optional message to share the file with them. If you’re sharing the file via link, copy the link.
4. Click **Share**.

An email notification is sent to everyone you shared the file with.

### Manage Versions of Synced Files

Just like all Salesforce files, you can work with prior versions of a synced file as needed.

After you first sync a file, you see that file as Version 1 in your files list. If you make changes to it on your computer or mobile device, a new version is automatically created each time you save the file. To view previous versions, just visit the file detail page.

Anyone who is following the synced file receives a notification in their Chatter feed when new versions are created. File collaborators can upload new versions of your synced files.

⚠️ **Warning**: If a synced file is open on your desktop when a collaborator uploads a new version, then you won’t receive the new version until you close the file without saving. If you save your open file, your version will overwrite your collaborator’s changes.

### Salesforce Files Sync Limits

Be aware of file syncing limits while using Salesforce Files Sync.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization-wide storage</td>
<td>Storage is based on the number of Salesforce licenses purchased. Additional storage can be purchased. For more information, refer to Salesforce Files Sync Storage Limits.</td>
</tr>
<tr>
<td>Maximum number of synced files</td>
<td>Users can sync up to 10,000 files.</td>
</tr>
<tr>
<td>Maximum number of synced folders</td>
<td>500 folders</td>
</tr>
</tbody>
</table>
## Salesforce Files Sync Storage Limits

Two storage limits affect Salesforce Files Sync: shared organization-wide storage and individual storage.

### Shared Organization-Wide Storage

Your organization’s shared file storage is calculated by multiplying a per-user file storage allocation by the number of users in your organization and adding a per-organization allocation. For example, a Professional Edition org with 10 users receives 11 GB of file storage, or 100 MB per user multiplied by 10 users plus an additional 10 GB. A Professional Edition org with 100 users receives 20 GB of file storage, or 100 MB per user multiplied by 100 users plus an additional 10 GB.

If your organization is using its entire shared storage allocation, then Salesforce Files Sync will continue to sync your existing files, but won’t sync new files unless you or your organization removes existing files or purchases more storage from Salesforce.

<table>
<thead>
<tr>
<th>Salesforce Edition</th>
<th>File Storage Allocation Per Organization</th>
<th>File Storage Allocation Per User License</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact Manager</td>
<td>11 GB</td>
<td>612 MB</td>
</tr>
</tbody>
</table>

Salesforce Files Sync continues to sync existing files, but won’t sync new files if:

- Your Salesforce Files Sync folder exceeds 10 GB of files.
- Your organization reaches its shared file storage limit.
- Your Salesforce Files Sync folder contains more than 10,000 files or 500 folders.
- The new file’s file size exceeds the individual file size limit.

Salesforce Files Sync stops syncing files if:

- You move your Salesforce Files Sync folder from its default directory location. On Windows, the default directory location is `C:\Users\User Name\Salesforce Files`, where `User Name` is your Windows user name. On Mac, the default directory location is `/Users/User Name/Salesforce Files`, where `User Name` is your Mac user name. Salesforce Files Sync resumes syncing after the Salesforce Files Sync folder is returned to the default directory location.

### Salesforce Files Sync temporarily stops syncing files if you reach the Maximum number of Connect API calls. Syncing resumes automatically in about an hour.
<table>
<thead>
<tr>
<th>Salesforce Edition</th>
<th>File Storage Allocation Per Organization</th>
<th>File Storage Allocation Per User License</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group</td>
<td>11 GB</td>
<td>612 MB</td>
</tr>
<tr>
<td>Professional</td>
<td>11 GB</td>
<td>612 MB</td>
</tr>
<tr>
<td>Enterprise</td>
<td>11 GB</td>
<td>2 GB</td>
</tr>
<tr>
<td>Performance</td>
<td>11 GB</td>
<td>2 GB</td>
</tr>
<tr>
<td>Unlimited</td>
<td>11 GB</td>
<td>2 GB</td>
</tr>
<tr>
<td>Developer</td>
<td>20 MB</td>
<td>N/A</td>
</tr>
<tr>
<td>Personal</td>
<td>20 MB</td>
<td>N/A</td>
</tr>
</tbody>
</table>

**Note:** If your organization uses custom user licenses, contact your administrator to determine if these licenses provide additional storage.

**Individual Storage**

Salesforce Files Sync syncs up to 10 GB of files between the Salesforce Files Sync folder on your desktop, Salesforce on the Web, and mobile devices with Salesforce1. Salesforce Files Sync will continue to sync your existing files, but won’t sync your new files if you add more than 10 GB of files to your Salesforce Files Sync folder. If you reach the individual 10 GB storage limit, you must remove existing files to sync new files.

**File Names and Extensions that Prevent Syncing**

Some file characteristics can prevent files from syncing between your devices and the Web.

- Zero-byte files
- Files without an extension
- Files with names that start with:
  - AUX.
  - CLOCK$.
  - COM1.
  - COM2.
  - COM3.
  - COM4.
  - COM5.
  - COM6.
  - COM7.
  - COM8.
  - COM9.
  - CON.
  - LPT1.
  - LPT2.
Files with these names:
- desktop.ini
- thumbs.db
- .DSStore

Files with these extensions:
- .tmp
- .conflicted
- .part
- .partial
- .download
- .crdownload
- extensions starting with .sb-

Different operating systems have different file name restrictions. Salesforce Files Sync syncs any file whose name is allowed by your operating system. That means that if you can name a file on your desktop, you can sync it using Salesforce Files Sync. If you sync a file from Mac® OS X®, it will sync to the Web, but if the file name isn’t allowed by Microsoft Windows®, the file won’t download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using these characters in file names:
- \ (backslash)
- : (colon)
- * (asterisk)
- ? (question mark)
- ‘ (apostrophe)
- < (less than sign)
- > (greater than sign)
- / (slash mark)
- | (pipe)
- ™ (trademark symbol)
- ∞ (infinity sign)
Files with names longer than 254 characters

Synced Folder Name Restrictions

Some folders aren’t synced by Salesforce Files Sync because of folder name restrictions.

Different operating systems have different folder name restrictions. Salesforce Files Sync syncs any folder whose name is allowed by your operating system. That means that if you can name a folder on your desktop, you can sync it using Salesforce Files Sync. If you sync a folder from Mac® OS X®, it will sync to the Web, but if the folder name isn’t allowed by Microsoft Windows®, the folder won’t download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using folder names that:

• Contain these characters:
  – / (forward slash)
  – \ (backslash)
  – : (colon)
  – * (asterisk)
  – ? (question mark)
  – “ (quotation marks)
  – < (less than sign)
  – > (greater than sign)
  – | (pipe)

• Exceed 255 characters
• Are identical to another folder name in the same directory
Delete a File from the File Detail Page

Click **Delete** on a file’s detail page to delete the file and remove it from all locations where it’s been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

**Note:** Only file owners and users with the “Modify All Data” permission can delete files. To learn who can perform which actions on a file, see *Who Can See My File?*.

Files Connect External Files

Browse, search, and share files that are stored elsewhere right from Salesforce.

- **Authenticate to Files Connect External Data Sources**
  If your administrator configured a data source like SharePoint to employ per-user authentication, provide your credentials for that system in Salesforce.

- **Access and Share External Files Using Files Connect**
  After your admin enables Files Connect, you can access files from external sources like Google Drive and SharePoint, or share them via feeds and Files home.

- **Search for External Files with Files Connect**
  Search an external data source like Google Drive, Box, or SharePoint right within Salesforce.
Authenticate to Files Connect External Data Sources

If your administrator configured a data source like SharePoint to employ per-user authentication, provide your credentials for that system in Salesforce.

Set Up Authentication to an External Data Source
When you connect to a Files Connect external data system for the first time, set up your authentication in just a few clicks.

Manage Your External Data Source Authentication Credentials
You or your Salesforce admin can set up and manage your authentication settings for external data sources using Files Connect. With valid authentication settings, you can access files from external systems right from Salesforce.

EDITIONS
Available in: both Salesforce Classic and Lightning Experience
Files Connect for cloud-based external data sources is available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions
Files Connect for on-premises external data sources is available for an extra cost in: Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS
To access cloud-based data sources like SharePoint Online:
• “Files Connect Cloud”
To access on-premises data sources like SharePoint 2010:
• “Files Connect On-premises”
Set Up Authentication to an External Data Source

When you connect to a Files Connect external data system for the first time, set up your authentication in just a few clicks.

If you haven’t set up your authentication to an external data system in My Settings, you are prompted to authenticate the first time you try to access an external system in Salesforce. Click the link or button to complete most of the authentication automatically.

- If you are connecting to Box, Google Drive, SharePoint Online, or OneDrive for Business:
  1. Select **OAuth 2.0** as the authentication protocol.
  2. When you see a message requesting permission for Salesforce to access information from your external system, click **Allow**.
  3. After the authentication process has finished, you are redirected to Salesforce.

- If you are connecting to SharePoint 2010 or SharePoint 2013:
  1. You are redirected to Authentication Settings for External Systems.
  2. Enter your username and password credentials for the external system.

**EDITIONS**

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited, and Developer** Editions

**USER PERMISSIONS**

To access cloud-based data sources like SharePoint Online:

- “Files Connect Cloud”

To access on-premises data sources like SharePoint 2010:

- “Files Connect On-premises”
Manage Your External Data Source Authentication Credentials

You or your Salesforce admin can set up and manage your authentication settings for external data sources using Files Connect. With valid authentication settings, you can access files from external systems right from Salesforce.

Your admin defines external systems in external data sources and named credentials. Before you begin, your administrator:

- Sets up the external data source or named credential to use per-user authentication.
- Grants you access to the external data source or named credential.
- Tells you the authentication settings to enter.

If you don’t see the expected settings or options, ask your admin for help.

1. From My Settings, enter Authentication in the Quick Find box, then select Authentication Settings for External Systems.
2. Click New to set up a new connection. Click Edit to modify an existing external data source.
3. From the External System Definition menu, select “External Data Source.”
4. From the External Data Source menu, select a data source created by your administrator.
5. Select the authentication protocol required by the external system.

For SharePoint 2010 or 2013, set the following options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Protocol</td>
<td>Choose Password Authentication</td>
</tr>
<tr>
<td>Username and password</td>
<td>Enter your SharePoint username and password</td>
</tr>
</tbody>
</table>

For Box, Google Drive, SharePoint Online, or OneDrive for Business, set the following options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Protocol</td>
<td>Choose OAuth 2.0</td>
</tr>
<tr>
<td>Authentication Provider</td>
<td>Choose the provider created for this data source by your administrator</td>
</tr>
<tr>
<td>Scope</td>
<td>Leave blank</td>
</tr>
<tr>
<td>Start Authentication Flow on Save</td>
<td>Select to immediately verify your login credentials with the external data source.</td>
</tr>
<tr>
<td></td>
<td>When you click Save, the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org.</td>
</tr>
<tr>
<td></td>
<td>Redo the OAuth flow when you need a new token—for example, when the token expires—or if you edit the Scope or Authentication Provider fields.</td>
</tr>
</tbody>
</table>
6. Click Save.

SEE ALSO: Personalize Your Salesforce Experience

Access and Share External Files Using Files Connect

After your admin enables Files Connect, you can access files from external sources like Google Drive and SharePoint, or share them via feeds and Files home.

Download or Share Files on Files Home

Download external files to your local system or share them with a general set of people in your organization from Files home.

1. Navigate to Files home.
2. The External Files list in the left column shows available external data sources. Select one and navigate through the folders, or use the search bar to find a file.

   Note: Salesforce supports Google documents, spreadsheets, presentations, and drawings. In the Recent list, Google Drive content is limited to the 24 most recently accessed documents from the last 30 days.

3. Click next to the file name, and choose one of the following:
   - Open the file in the external data source, such as SharePoint.
   - Download the file to your local system. (From on-premises systems like SharePoint 2010, 2 GB is the maximum download size.)
   - Share the file either as a copy or as a reference. Your admin has determined which type of sharing is used at your organization. When sharing, you do one of the following:
     - Share a copy of the external file stored in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system. Salesforce Files won’t reflect any revisions to the file in external systems.
     - Share a reference to the external file stored outside Salesforce. Files can be downloaded only by users with access to the external system. Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup. Salesforce Files won’t reflect any revisions to the file in external systems, but the reference does point to the latest version of the file in those systems.

   Note: To download files referenced from an external system, users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup.

When a user selects an external file from the file selector, a file reference or copy is created in Salesforce. If a file reference already exists, it is reused.

Share Files in the Feed

If you want to include external files in a specific Chatter conversation, use the feed. All files shared in the feed are either copies or references, as determined by your administrator.
In Salesforce Classic

1. While authoring a post, click **File** above the feed, and then click **Select a file from Salesforce**.
2. In the left column, click the external source, such as SharePoint.
3. Next to the file you want to share, click **Attach**.
4. In the body of your post, @mention the groups or people you want to share with.

In Lightning Experience

1. While authoring a post, click the paperclip icon below the post to open the Select File window.
2. From the left column, click the external source, such as SharePoint or Google Drive.
3. Select the file you want to share and click **Add**.
4. In the body of your post, @mention groups or people that you want to share with.
SEE ALSO:

Share Files with People in Salesforce Classic
Share Files with Groups
Share Files with Libraries
Search for External Files with Files Connect

Search an external data source like Google Drive, Box, or SharePoint right within Salesforce.

Search in a Specific External Data Source

In Salesforce Classic

1. From the left column of Files home or your Chatter feed, click the data source name.
2. In the search box, enter terms such as document title or author. (The specific information you can search for depends on the configuration of the external data source.)

Note: You can also search external data sources from the file selector when attaching a file to a Chatter post. In Salesforce Classic, click File above the feed, and then select a file from Salesforce. In Lightning Experience, click the paperclip icon below the post to open the Select File window.

Search Globally for Salesforce and External Data

If your administrator enables global search for an external data source, you can conveniently search its contents along with your Salesforce data.

In Salesforce Classic

1. In the global search box at the top of the Salesforce window, enter your search terms.
2. To filter the results down to a specific external data source, click its name in the left column (for example, "SharePoint Online").

Tip: If you often want to see content from a specific external data source, pin it to the top of global search results: In the left column, hover over the data source name, and click the pin icon. (If you don’t see the data source listed, click Search All.)

In Lightning Experience

1. From Files home, enter a search term into the global search box in the header.
2. You can filter your search results to return only Files by selecting “In Files” after entering your search in the global search box, or by doing a global search and then selecting Files from the global search results.
Document Libraries

Store files without attaching them to records.

Document Library Overview

Each document that is stored in the document library resides in a folder. The folder’s attributes determine the accessibility of the folder and the documents within it.

Documents Home
View Document Lists
Upload and Replace Documents
Search for Documents
Delete Documents

Document Library Overview

Each document that is stored in the document library resides in a folder. The folder’s attributes determine the accessibility of the folder and the documents within it.

Document libraries store documents that aren’t attached to records. Access your library documents via the Documents tab. If your Documents tab is not visible, customize your display to show it.

Note: The Documents tab is not part of Salesforce CRM Content.

SEE ALSO:
Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments

Documents Home

Clicking on the Documents tab displays the documents home page.

Note: If the Documents tab is not visible, you can customize your display to show it.

• Under Find a Document, enter keywords to search for a document.
• In the Document Folders section, select a folder to view all the documents contained in that folder.
• The Recent Documents section displays the last ten or twenty-five documents you viewed, with the most recently-viewed document listed first. This list is derived from your recent items and includes records owned by you and other users. Toggle the Show 25 items and Show 10 items links to change the number of items that display.
• In the Recent Documents section, click New to upload a new document.

Note: The Documents tab is not part of Salesforce CRM Content.

SEE ALSO:
Upload and Replace Documents
View Document Lists
View Document Lists

The documents list page displays a list of documents in a selected folder. From this page, you can view detailed document information or manipulate the document.

- Click the document name to view the document properties.
- Click Edit next to a document to edit the document properties.
- Click Del to move the document to the Recycle Bin.
- Click View to open the file in its associated application. If a file type is not recognized or the application is not loaded on your machine, Salesforce displays a standard download dialog prompting you to choose a save option.
- Choose a folder to view a list of documents stored in that folder.
- Click any column heading to sort the documents in ascending or descending order by the information in that column.
- At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
- Click Next Page or Previous Page to go to the next or previous set of documents.
- At the bottom of the document list, select fewer or more to view a shorter or longer display list.
- Click Printable View to display the current list view in a format that is ready for printing.

Note: If you can’t find a document, you may not have access to the folder that contains it.

Change Document Authors

Upload and Replace Documents

Uploading a New Document

To upload a document:

1. Click New Document from the Documents tab or click New next to Recent Documents on the documents home page. If you do not have a New Document option, check if you have the correct permissions.

2. On the Upload New Document page, specify a descriptive Document Name. If you want to use the file name, leave this field blank. The file name will appear automatically when you upload the file.

3. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.

4. You can check one of the following:
   - Indicate Document is Internal: When checked, a flag is added to the document indicating that document viewers should not share the file outside of the organization.

   Note: Checking this box does not expressly enforce any security rules.

EDITIONS
Available in: Salesforce Classic
Available in: All Editions except Database.com

USER PERMISSIONS
To view documents:
- “Read” on documents
To change document properties:
- “Edit” on documents
To replace documents:
- “Edit” on documents
To delete documents:
- “Delete” on documents
5. Select a folder for the document.
6. Enter a description to use later as search criteria.
7. Enter keywords that you can use later as search criteria.
8. Select a document or path option.
   - To upload a document, click **Browse**, choose the file, and click **Open**.
   - To store a link to the document, enter the location of the document. Enter a path and file name or a URL such as:
     - C:\Quotes\quote.doc
     - \Server\Departments\Marketing\logo.doc
     - http://www.salesforce.com
9. Click **Save**.

### Replacing a Document
To replace a document with an updated version:

1. Display the document you want to replace. For instructions on locating a document in the document library, see Search for Documents.
2. Click **Replace Document**.
3. Select a document or path option.
   - To upload a replacement, click **Browse**, choose the file, and click **Open**.
   - To store a link to the replacement, enter the location of the replacement. Enter a path and file name or a URL such as:
     - C:\Quotes\quote.doc
     - \Server\Departments\Marketing\logo.doc
     - http://www.salesforce.com
4. Click **Replace Document**.

### Tips for Uploading or Replacing Documents
- Documents stored as links cannot be attached to emails, but they save space in your document library.
- If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.
- Salesforce stores the most recent upload date as the modified date.
- You can upload documents that have file names of up to 255 characters including the extension.
- The size limit for any document you upload is 5 MB. The maximum size for a custom-app logo is 20 KB.
- Your organization’s used file storage includes all files stored in the document library.
If the Don't allow HTML uploads as attachments or document records security setting is enabled for your organization, you cannot upload files with the following file extensions: .htm, .html, .htt, .htx, .mhtm, .mhtml, .shtm, .shtml, .acgi, .svg.

SEE ALSO:
Display and Edit Document Properties

Search for Documents
To find specific documents, use the Find Document button on the documents home page.

1. Click the Documents tab.
2. Enter your search terms. Salesforce searches the following fields:
   - Document Name
   - Keywords
   - Description
3. Click Find Document.
   The search returns a list of documents that match all your search terms. The search results are listed in order of the closest matches. The Keywords and Document Name fields are used to determine the closest matches. The fields you see are predefined and cannot be changed.

   Tip: Use quotation marks around a phrase to search for the words in that sequence. For example, a search for "my logos" returns documents whose fields or content contains that exact phrase, as well as my and logos. Without quotation marks, your search returns any document whose fields or content includes any of the words in the search. For example, my logos returns documents whose fields or content contains my and logos.

4. Select any document to jump directly to the detail page for that document, or click View to open the document in a new window.
If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.

   Note: Salesforce automatically determines if the contents of a document can be searched. If the Document Content Searchable property is checked on a document, then its contents have been processed successfully and can be searched. If your document is large, it may take several minutes before Salesforce searches the contents of a document and marks the Document Content Searchable property.

You can also find documents using global search.
1. Enter your search terms in the header search box.
2. Select Search Options... from the drop-down and select Documents to narrow your search results.
3. Click Search.
The following file types are supported for a document content search.

   Note: The contents of documents that exceed the maximum sizes are not searched; however, the document fields are still searched. Only the first 1,000,000 characters of text are searched. Text beyond this limit is not included in the search.

<table>
<thead>
<tr>
<th>File Type</th>
<th>File Extensions</th>
<th>Maximum Size</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTML (only the text within a &lt;body&gt; tag)</td>
<td>.htm, .html, .xhtml</td>
<td>5 MB</td>
</tr>
<tr>
<td>File Type</td>
<td>File Extensions</td>
<td>Maximum Size</td>
</tr>
<tr>
<td>-----------</td>
<td>----------------------------------</td>
<td>--------------</td>
</tr>
<tr>
<td>PDF</td>
<td>.pdf</td>
<td>25 MB</td>
</tr>
<tr>
<td>PPT</td>
<td>.pot, .pps, .ppt</td>
<td>25 MB</td>
</tr>
<tr>
<td>RTF</td>
<td>.rtf</td>
<td>5 MB</td>
</tr>
<tr>
<td>Text</td>
<td>.c, .cpp, .css.csv, .ini, .java,</td>
<td>5 MB</td>
</tr>
<tr>
<td></td>
<td>.log, .sql, .txt</td>
<td></td>
</tr>
<tr>
<td>Word</td>
<td>.doc, .dot</td>
<td>25 MB</td>
</tr>
<tr>
<td>XLS</td>
<td>.xls, .xlt</td>
<td>5 MB, or a maximum cell limit of 100,000 cells</td>
</tr>
<tr>
<td>XML</td>
<td>.xml</td>
<td>5 MB</td>
</tr>
</tbody>
</table>

In some instances documents are not searched. These include:

- If a file extension is changed to a different format, it is not searched, even if both extensions are valid. For example, a `.txt` file that is renamed to `.rtf` is not searched.
- PDF and Word documents may have security restrictions that prevent them from being searched. To ensure that the content is searchable, the “content extraction” property on your file must be set to “Enabled” when creating your document.

SEE ALSO:

Search for Content
Search for Files

Delete Documents

To delete a document, click **Del** next to the document on the documents list page. Alternatively, click **Delete** on the documents detail page.

When you delete a document, Salesforce stores it in the Recycle Bin. You can restore the document to your document library within that time by clicking **Undelete** from the Recycle Bin.

**Note:**

- You can delete any document in your personal folder but you can only delete a document in a public folder if you have the “Manage Public Documents” permission.
- If you delete a document that’s included in a letterhead or HTML email template, any emails using the letterhead or template display a broken link in its place. You can fix the broken link by removing the document from the Recycle Bin.
- You can’t delete a document that’s being used as a custom logo in meeting requests. To delete it, you must either select another document to use as a logo or uncheck the option to display a custom logo in meeting requests.

</tbody>
</table>

**Displaying Documents** - Once you have located a document on the documents home or list pages, click the document name to display detailed information.

**Editing Document Properties** - To update document properties, click **Edit**.

**Deleting Documents** - To delete a document, click **Delete**.

**Updating Documents** - To replace a document with an updated version, click **Replace Document**.

**Emailing Documents** - To email a document to a contact, click **Email Document**, fill in the details of the email, and click **Send**. The document is sent as an attachment to the email and is logged in the Activity History for the contact. Documents that reference URLs rather than physical files cannot be emailed. For a document that is an image embedded in an HTML email template, such as a logo in a letterhead, make sure the document is marked as **Externally Available** on the Documents tab so that a user who does not have a Salesforce username and password can view the image when it is received in an email.

**Searching a Document** - To search for a document, enter search terms and click **Find Document**. A list of documents that match your search terms displays. You can search for terms using the following fields:

- Document Name
- Keywords
- Description

If **Document Content Searchable** is checked, the content of a document can also be searched.

**Viewing Folder Contents** - To view all the documents in a folder, click the folder name.

**Moving Documents** - To store a document in a different folder, click **Edit**, choose a new folder, and click **Save**.

Document Properties

Below is a description of the properties in alphabetical order that are stored for each document in the document library.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Author</td>
<td>The main point of contact for a document. Initially, the person uploading the document is the author. Thereafter, the author can be any selected user.</td>
</tr>
<tr>
<td>Created By</td>
<td>The name of the person who originally uploaded the file.</td>
</tr>
<tr>
<td>Modified By</td>
<td>The name of the person who last uploaded the file.</td>
</tr>
<tr>
<td>Folder</td>
<td>The name of the folder that contains the document.</td>
</tr>
<tr>
<td>Document Content Searchable</td>
<td>A checkbox that indicates if the content within a document can be searched via the Find Document button on the Documents tab. This checkbox is automatically set by Salesforce.</td>
</tr>
<tr>
<td>Document Name</td>
<td>The name of the document including its file extension.</td>
</tr>
<tr>
<td>Document Unique Name</td>
<td>A unique name used to refer to the document when using the Force.com API. In managed packages, this name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With this field, a developer can change certain components’ names or titles in a managed package and the changes are reflected in a subscriber’s organization.</td>
</tr>
<tr>
<td>Description</td>
<td>A statement distinguishing this document from others.</td>
</tr>
<tr>
<td>Indicate Document is Internal</td>
<td>A checkbox that adds a flag to the document indicating that document viewers should not share the file outside of the organization. Checking this box does not expressly enforce any security rules. The Indicate Document is Internal and Externally</td>
</tr>
</tbody>
</table>

Available in: Salesforce Classic

Available in: All Editions except Database.com

2979
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Available Image</td>
<td>checkboxes are mutually exclusive; you cannot select both.</td>
</tr>
</tbody>
</table>
| Externally Available Image                | A checkbox that indicates if the document is an image available for HTML email templates, such as a logo in a letterhead, and does not require a Salesforce username and password to view in an email.  
This checkbox indicates if the document is an image used as a custom app logo or custom tab icon, which require a Salesforce username and password to view.  
The **Indicate Document is Internal and Externally Available Image** checkboxes are mutually exclusive; you cannot select both. |
| Keywords                                  | An open text field containing one or more words that describe the document. The program checks for matches in this field when doing a search. |
| Path                                      | Stored in place of Document Name if you prefer to create a link to the document instead of uploading it.                                                                                                  |
| Size                                      | The size of the document in bytes.                                                                                                                                                                       |
| Type                                      | The file type is determined by the file extension. For example, filename.ppt is recognized as a PowerPoint file. If the Don't allow HTML uploads as attachments or document records security setting is enabled for your organization, you cannot upload files with the following file extensions: .htm, .html, .htt, .htx, .mhtm, .mhtml, .shtm, .shtml, .acgi, .svg. |

SEE ALSO:  
[Change Document Authors](#)
Change Document Authors

Since documents are stored in folders that control user access, documents do not have owners like other types of records, but they do have authors. The author represents the user that originally uploaded the document file.

To change the author of a document:

1. View the document you want to modify.
2. Click Change next to the Author field.
   The Change link displays only on the detail page, not the edit page. If you do not see the Change link, you may not have sufficient privileges to change a document author.
3. Enter a new author name. Alternatively, click the lookup icon to choose from a list of users.
4. Check the Send Notification Email box if you would like to alert the new author of this change.

Note: When you change document authorship, Salesforce does not change the document’s visibility.

Organize, share, search, and manage all types of files within your organization.

Salesforce CRM Content Overview
Organize, share, search, and manage content within your organization and across key areas of Salesforce with Salesforce CRM Content. Content includes all file types, from traditional business documents such as Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs.

View and Edit Libraries
Manage Libraries

Salesforce CRM Content Overview
Organize, share, search, and manage content within your organization and across key areas of Salesforce with Salesforce CRM Content. Content includes all file types, from traditional business documents such as Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs.

To learn the different ways files are used in Salesforce, see Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments.

Salesforce CRM Content simplifies content management by incorporating user-friendly features into the following tasks:

Organizing
Rather than keep files in folders that make content difficult to find, Salesforce CRM Content stores files in fully searchable file repositories known as libraries. Administrators can create
multiple libraries based on any classification, such as department name, job function, or team, then configure user permissions within the library to balance content access with security. Authors assign descriptive labels called tags to help classify and organize content across libraries. You can view a list of all content that belongs to a particular tag or filter search results based on a tag or tags. Salesforce CRM Content also provides private libraries, which allow users to reduce the clutter on their desktops while using content-management benefits such as document search and version control.

**Searching**

The powerful Salesforce CRM Content search engine scans the entire body of the document as well as content properties such as the title, description, tags, categorization data, and author name. You can filter searches by featured content, file format, author, tags, libraries, or custom fields and then view the results with various levels of detail, providing an easy way to find relevant content quickly. If Chatter is enabled for your organization, you can also filter your search results by Chatter files. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare documents within a search result set.

**Subscribing**

Once a file is located, subscribing to it ensures that you receive an email notification when new versions are published or changes are made to the file's properties. You can also subscribe to authors, tags, and libraries, thus reducing the time spent searching for new or updated content. Notification emails will arrive real-time or once daily, depending on your preferences.

**Previewing**

In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

**Contributing**

Uploading new or revised files in Salesforce CRM Content is fast and easy. During the upload process you choose a library and record type for your file or Web link, write a description, assign one or more tags, and fill out any customized fields that help categorize and define your content. Version management does not require checking files in and out, rather, you simply upload a new version of the file and Salesforce CRM Content maintains a version list accessible from the content details page. You can download past versions of a file and read all reason-for-change comments that an author may have included with a new version.

**Reviewing Usage and Providing Feedback**

Salesforce CRM Content provides several methods for determining whether content is valuable to readers. Featuring a piece of content increases its visibility in search results. Voting thumbs up or thumbs down on a file, Web link, or Google doc and adding comments allow you to participate directly in content improvement. You can also see who has subscribed to a file, link, or doc and how many times files have been downloaded. The Reports tab allows you to create standard or custom reports on Salesforce CRM Content data. If the content delivery feature is enabled, you can send content to colleagues, leads, and contacts and then track how often the content has been previewed or downloaded.

**Sharing Content in Salesforce**

Salesforce CRM Content is also integrated with leads, accounts, contacts, opportunities, cases, products, and custom objects. If Salesforce CRM Content functionality is enabled on the Opportunity tab, for example, Salesforce CRM Content uses the fields on the opportunity detail page to search for files that may be relevant to that opportunity. You can drill down in the search results as needed or run your own search and then attach one or more files to the opportunity. The most current version of the file will be available on the detail page for the life of the opportunity.

**Sharing Content in Salesforce Classic Mobile**

Salesforce CRM Content is available in Salesforce Classic Mobile. Users can share content with customers and colleagues from the mobile application when they’re away from their desks. Ask your administrator to set up mobile Content.

Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments
Contribute Content

Publish Files to Libraries

Publish files to libraries by uploading them from your computer, contributing them from your private library to a shared library, or sharing them from Chatter.

1. On the Libraries tab, do one of the following:
   - To upload a file, click Contribute and choose a file from your local drive.
   - To publish files from your private library, click the My Private Files tab, select one or multiple files, and click Publish Selected.
   Or, to share files from Chatter with a library, see Share Files with Libraries on page 2951 (and skip the rest of these steps).

2. Enter a title for each file. Optionally, enter descriptions.

3. If you are adding a new file that you just uploaded, choose either Save in my private library or Publish to a shared library. If you choose the second option, select a library. This becomes the managing (home) library, meaning that the content can be shared with another library but only revised by a user with author permissions in the managing library.

4. Optionally, choose a language. The Language drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.

5. To publish the content on behalf of another author, choose that author from the drop-down list.

6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
   - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the Tags field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the Tags field automatically.
   - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the Tags field automatically.
   - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
   - You can’t change or delete tag names. You can remove tags from a document, but that doesn’t delete the tag.
   - Tags are case insensitive. You can’t have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

7. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.

8. After completing the custom fields, click Publish or Save.

Note:
- Unique values in custom fields that are set for the first version of a file aren’t included if you upload a new version. You can set the unique values in the new version as long as they aren’t the same as a previous version.
Files published to a shared library are added to your Files tab and available to other Chatter users in your organization. Files published to your private library are added to your Files tab, but are private and not shared with anyone. For information about the different file tools and solutions in Salesforce, see Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments.

Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

### Upload and Publish Content

Add files to libraries to take advantage of the permission setting and content delivery capabilities of Salesforce CRM Content.

The Libraries tab has several publishing-related options at the top of the page that let you upload, classify, and publish files, content packs, Web links, and Google docs in Salesforce CRM Content.

**Note:** The Add Google Doc button on the Libraries tab is available only if your Salesforce admin has enabled the Add Google Doc to Salesforce service.

To publish files, Web links, and Google docs in Salesforce CRM Content, or to create content packs, refer to the following topics:

- Publish Files to Libraries
- Contribute Web Links to Salesforce CRM Content
- Create and Modify Content Packs in Salesforce CRM Content

SEE ALSO:
- Update Content Versions
- Creating Content Deliveries

### EDITIONS

Available in: Salesforce Classic

Available in: Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions

### USER PERMISSIONS

To upload and publish files and Web links:

- Manage Libraries checked in your library permission definition
  OR
- Add Content checked in your library permission definition

To publish Google docs:
- Google Apps account
Salesforce CRM Content File Size Limits

The following are maximum file size limits for files in Salesforce CRM Content:

- 2 GB
- 2 GB (including headers) when uploaded via Chatter REST API
- 2 GB (including headers) when uploaded via REST API
- 38 MB when uploaded via SOAP API
- 10 MB when uploaded via Bulk API
- 10 MB for Google Docs
- 10 MB when uploaded via Visualforce

SEE ALSO:

File Size Limits in Salesforce

Contribute Web Links to Salesforce CRM Content

To classify and publish a Web link in Salesforce CRM Content:

1. Click the Libraries tab.
2. To add a new link, click Contribute > Do you want to link to a website instead?, then enter the URL, and click Contribute. To publish a link that is already in your private library, click the My Private Files tab, locate the link, and click Publish.
3. Assign a title and description to your Web link.
4. Choose a library. This becomes the managing (home) library, meaning that the Web link can be shared with another library but its content details page can only be edited by a user with relevant permissions in the managing library. If you do not want the link to be visible to other users in your organization, choose Save in my private library.
5. Optionally, choose a language. The Language drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
6. To publish the content on behalf of another author, choose that author from the drop-down list.
7. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
   - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the Tags field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the Tags field automatically.
   - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the Tags field automatically.
   - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
   - You can’t change or delete tag names. You can remove tags from a document, but that doesn’t delete the tag.
8. Tags are case insensitive. You can’t have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

9. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.

9. After completing the custom fields, click Publish or Save.

Manage Libraries

Update Content Versions
Clicking a file name on any Salesforce CRM Content tab opens the content details page.

Publishing a New Version
To publish a new version of the file and update its properties:

1. Click Edit > Upload New Version. This option does not appear for Web links, content packs, or Google docs.

To add or remove files from a content pack, see Create and Modify Content Packs in Salesforce CRM Content.

2. Click Browse to find and select the updated file.

3. As needed, update the Title and Description fields.

4. Fill out the Reason for change field. This text is included on the email notifications sent to subscribers and the version list located on the content details page.

5. To publish the content on behalf of another author, choose that author from the drop-down list.

6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

• If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the Tags field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the Tags field automatically.

• If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the Tags field automatically.

• If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.

• You can’t change or delete tag names. You can remove tags from a document, but that doesn’t delete the tag.

• Tags are case insensitive. You can’t have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

7. Update any custom fields as needed.

8. Click Publish.
Notes on Content Versions

Consider the following information when creating or modifying a new version:

- You cannot edit a file within Salesforce CRM Content. To edit a file, download it from Salesforce CRM Content to your computer, make your changes, then upload the updated version using the **Upload New Version** button.
- The Versions subtab on the content details page lists all content versions. The Recent Activity list on the Libraries tab also notifies users of new content versions.
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

SEE ALSO:
  - Upload and Publish Content

Delete, Archive, and Restore Content

There are two methods for removing content from libraries: archiving and deleting.

Archiving lets you continue to store files in Salesforce without them being in a library or exposed in search results. Deleting files moves them to the **Recycle Bin**, where files remain for 15 days before being permanently, automatically deleted. Within 15 days of deleting a file, you can restore it from the **Recycle Bin**. You can also restore archived files.

Before you delete or archive content, it’s important to know what’s similar and different about these two methods:

<table>
<thead>
<tr>
<th>Effects of Archiving or Deleting Content</th>
<th>Archived Content</th>
<th>Deleted Content</th>
</tr>
</thead>
<tbody>
<tr>
<td>Counts towards file storage limits (storage size as well as number of documents)</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Removed from libraries</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>New versions can no longer be uploaded</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Content can no longer be downloaded (until restored)</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Content no longer appears in search results</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Content can be restored</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Automatically removed from subscription lists (without notifying subscribers)</td>
<td>✔️</td>
<td>✔️</td>
</tr>
<tr>
<td>Permanently deleted by emptying recycle bin</td>
<td>✔️</td>
<td>✔️</td>
</tr>
</tbody>
</table>

To archive or delete content files:

1. On the **Libraries**, **Content**, or **Subscriptions** tab, click the name of the file you want to remove.
2. On the **Content Details** page, click **Edit** > **Archive Content** or **Edit** > **Delete Content**.

To delete files in content packs:
• By default, you must first delete the content pack, and then delete the file.
• If your admin has enabled the Salesforce CRM Content setting that allows files to be deleted from content packs, you can delete a file without having to first remove it from a content pack. This removes all versions of that file from all content packs, including content packs you don't have access to, like those in Private Libraries.

To restore archived content files:

1. Do one of the following to open the Content Details page for an archived file:
   • Follow a bookmark to the archived content.
   • On the Libraries tab, click a library name to open the Library Details page. Click the View Archived Content link to see a list of archived content on the Content tab. Click the name of the content file you want to restore.

   Note: The View Archived Content link only displays if you have the Archive Content, Add Content, or Manage Libraries privileges in your library permission. If you have the Archive Content or Manage Libraries privileges, you will see a list of all archived content in the library, regardless of author. If you do not have those privileges but have the Add Content privilege, you will only see archived content that you authored and archived.

2. On the Content Details page, click Edit > Restore Content.

To restore deleted content:

1. On either the Libraries or Subscriptions tab, or on the Content Details page, go to the Recycle Bin.
2. Select the checkbox for the content file you want to restore, and click Undelete.

Note:
• Authors can always archive and restore their own content. Authors do not require the Archive Content library permission option.
• If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn’t remove the Chatter post.
• Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

Delete a File from the File Detail Page
Create and Modify Content Packs in Salesforce CRM Content

A **content pack** is a collection of related documents or files that are stored as a group in Salesforce CRM Content. For example, you may want to create a content pack with a product list, price quote, and contract to send to a particular customer. Any file in Salesforce CRM Content can be added to a content pack, from traditional business documents such as Microsoft® PowerPoint presentations and Adobe® PDF files, to audio files, video files, and Google docs. Using email or instant messaging, you can distribute the content pack to colleagues in your organization or leads and contacts outside your organization. The recipient of a **content delivery** can click a single URL to open a preview player with which he or she can preview and download the content. You can then view tracking information to see how often the content pack was viewed and which documents were downloaded.

**Note:** Content packs support all file types; however, the preview player launched by the content-delivery URL displays only PowerPoint, Word, Excel, and PDF files. The preview player does not display copy-protected PDFs. Also, working with content packs requires Adobe Flash® Player, version 9.0.11.5 or higher. If you do not have Flash installed, Salesforce provides a link to Adobe’s website where you can download Flash for free.

To work with content packs:

1. Depending on whether you want to create, customize, or modify a content pack, use one of the following options:
   - **Note:** The following options are available only if Enable content pack creation is selected on the Salesforce CRM Content page in Setup. If content pack creation is disabled after packs have been created, Salesforce doesn’t delete the packs, but they can’t be customized or modified.
   - To create a new content pack, click the **Libraries** tab and then choose **Create New > Content Pack**.
   - To create a new content pack by copying an existing pack and adding, removing, or reordering files, open the content details page for the pack and click **Clone & Customize**.
   - To update a content pack and publish a new version, open the content details page for the pack and click **Edit > Edit Content Pack**.

2. Click **Search files** to display all the content in your libraries. To refine your results, select a specific library to search or enter a search term in the text box.
   - In addition to files and documents, search results also list content packs.

3. Drag the desired content from the search results into the assembly section in the lower half of the window. The following options help you assemble your content pack:
   - In the search results, click a document to preview it in the lower half of the window. Choose **Add to Content Pack** or **Hide preview** as needed.
   - In the search results, hover over a document and click the folder icon ( liste ) to view the content packs that use the document.
   - In the search results, hover over a content pack and click the folder icon ( liste ) to view all the documents in the pack.
   - In the assembly section, hover over a document and click the garbage can icon ( liste ) to remove that document from the pack you are assembling.
   - Click **Clear** at any time to revert your changes; click **Cancel** to return to the Libraries tab.

**Note:** The maximum number of files that can be included in a content pack is 50.
4. When you are done assembling or modifying your content pack, click **Save** and assign or change the content pack’s name.

5. In the Save or Publish Content dialog:
   a. Select a library. If you do not want the content pack to be visible to other users in your organization, for example if your work is still in progress, choose **Save in my personal library**.
   b. Optionally, add or modify the content pack’s description.
   c. Optionally, choose a language. The **Language** drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
   d. If you are modifying the content pack, complete the **Reason for Change** field.
   e. To publish the content on behalf of another author, choose that author from the drop-down list.
   f. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
      - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
      - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
      - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
      - You can’t change or delete tag names. You can remove tags from a document, but that doesn’t delete the tag.
      - Tags are case insensitive. You can’t have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
   g. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.
   h. Click **Publish**. You can then view the content details page, return to the Libraries tab, or publish another file.

*Viewing and Editing Content Deliveries*
Find Content

Find Salesforce CRM Content Related to Records

Quickly find content files that are related to leads, accounts, contacts, opportunities, products, cases, or custom objects by using the related lists on those records.

If your organization has Salesforce CRM Content enabled, you can take advantage of Salesforce CRM Content functionality on detail pages for leads, accounts, contacts, opportunities, products, cases, or custom objects. The Related Content related list allows you to search for files, content packs, Web links, or Google docs and attach them to the record. When you attach a file, the latest version will be available for the life of the record unless the file is removed.

Note: The Related Content and Content Deliveries related lists are only available on a record if they have been added to the corresponding page layout by an administrator.

From the Related Content related list, you can:

• Click the content’s title to view the content details page where you can perform several tasks, such as commenting and voting on content, downloading files, opening Web pages and Google docs, and subscribing to content, authors, tags, or libraries. For more information, see View and Edit Content Details.
• Click Del next to a piece of content to remove it from the record. This does not delete the content from the Salesforce CRM Content library.
• If content deliveries are enabled in your organization, click Deliver Content to create a content delivery. A content delivery allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature. For more information, see Creating Content Deliveries.
• Search for related content:

1. Click Find Content or Search All. In both cases, Salesforce CRM Content searches within the libraries that you have access to. If you click Search All, the search results display all the content in your libraries. For the Find Content search, your search results contain content that is relevant to the record; Salesforce CRM Content searches for content with text or attributes that match the following fields:
   - On an opportunity, the Opportunity Name, Account Name, and all competitors and products.
   - On an account, the Account Name and Industry.
   - On a case, the Case Reason, Subject, Account Name, and Industry.
   - On a lead, the Name, Company, Industry, and Title.

   Note: On a custom object, clicking Find Content returns search results that contain the full custom object name in the document’s text or attributes. If no content meets this criterion, the search results will be empty and a Search All search should be used instead.

2. On the search results page, filter your results as needed by entering search terms or selecting filter criteria from the sidebar.
3. Click Attach for any file that you want to attach to the record.
4. Click the Back link to return to the detail page.
Search for Content

The Content tab displays files, content packs, Web links, and Google docs published in your Salesforce CRM Content libraries. If Chatter is enabled, and your administrator has enabled the setting to show Salesforce Files in Salesforce CRM Content, files posted to Chatter groups, and other files that aren't private or privately shared, are also displayed on the Content tab. The top twenty most recently modified items are listed by default. You can filter the list using the Filter Your Results sidebar.

To search for specific content:

1. From the Search drop-down list, restrict your search to a specific library or choose to search in all libraries. If available, restrict your search to just Salesforce Files or just files in Chatter groups you’re a member of.

   Tip: To display all the locations where the content appears, click Display Options and select Display Locations. The locations are listed under each title.

2. Enter your search term(s) and click Go!. Salesforce CRM Content performs a full-text search of the following document types: rich text format (RTF), UTF-8 encoded TXT, HTML, XML, Adobe® PDF, and Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files.

3. If your administrator has enabled multi-language support, you can restrict your search to a specific language. By default, Salesforce CRM Content searches all the content in your libraries that is published in your default user language. Searching in all languages also searches the titles, author names, tags, file extensions, and custom fields of content in all languages.

   Note: Searching in all languages does not search the text or description of documents that were published in languages other than your default user language.

4. Optionally, in the Filter Your Results sidebar, filter your search results by file format, featured content, author, tag, libraries, language, custom field, or Chatter group (if available). The number in parentheses next to each filter type shows you how many matching files, content packs, Web links, and Google docs are in the search results.

The Content tab provides several options:

- Click Display Options to customize your view by adding sortable columns for various content criteria (such as Size and Publication Date), or choosing to display descriptions, tags and locations. Display Locations shows the libraries and Chatter groups where the content appears. My Libraries: none or My Chatter Groups: none means that the file is a Salesforce file and is not part of any libraries or Chatter groups. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare files, content packs, Google docs, and links within a search result set.

   Note: Chatter groups are only included in Display Locations if Chatter is enabled, and your administrator has enabled the setting to show files in Salesforce CRM Content.

- Select one or more files and click Download to create a zip file with your selected content. Web links and Google docs cannot be included in zip files.

- Hover over a file icon to see a snapshot of information about the specific file, content pack, Google doc, or Web link and options such as subscribing, voting, and downloading.

- Click the subscription icon next to the file name to toggle a subscription on or off. For more information, see View and Edit Content Subscriptions.

- Click the file name to view the content details page. The content details page provides all the available information about a file, content pack, Google doc, or link. For more information, see View and Edit Content Details.

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn’t searched, but the file’s author name, tags, file extension, and custom fields are.

**EDITIONS**

Available in: Salesforce Classic  
Available in: Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions
Deliver Content checked in your library permission definition

Deliver Uploaded Files and Personal Content checked in your library permission definition

Post Content to Chatter Feeds checked in your library permission definition

To deliver content from a shared library:

To deliver content from a personal library:

To post content from a library to a Chatter feed:

Clicking a file name on the Libraries, Content, or Subscriptions tabs opens the content details page, which is a central access point to preview content and gather information about a particular file, Web link, content pack, or Google doc in Salesforce CRM Content. Starting with the Summer '10 release, if Chatter is enabled for your organization, files posted to Chatter are also listed.

The Preview tab displays if your file is one of the following types:

- Adobe® PDF. Copy-protected PDFs can’t be previewed.
- JPG, BMP, GIF, and PNG.

The following options may be available on the Content Details page, depending on: the type of content you are viewing; your library permissions; and whether the content is in a public or private library, or from Chatter:

- Click the thumbs up or thumbs down icon to vote for the file, Web link, content pack, or Google doc. To change your vote, click the opposite icon. After you cast a vote, the Recent Activity list on the Libraries tab indicates whether you like or dislike the content.
- Click Deliver Content to create a content delivery. Click Deliver Content > Show Content Deliveries to view a list of deliveries associated with the content.
- For Web links or Google docs, click the Open button to open the Web page in a separate window. For files, click the Download button to open or save the file.
- Click Subscribe or Subscribed to toggle your subscription on or off.
- For files, click the Content Packs subtab to see which content packs include this file.
  - Library administrators can click Remove from all to remove the file from all content packs that include the file.
  - Click the name of the content pack that includes the file to view the details of that content pack.
- For content packs, click Clone & Customize to create a new pack by adding or removing files and slides. Salesforce CRM Content saves or publishes your customized pack as new content, not a version of the pack you copied.
- Click Edit > Edit Content Details to modify standard and custom fields.
- Click Edit > Edit Content Pack to create a new version of a content pack by adding or removing files.
- For files, click Edit > Upload New Version to replace the file with a new version. The version option is not available for Web links, content packs, or Google docs.
  
  **Note:** If the Add New Version button is grayed out, your organization has exceeded its file storage allowance and new content cannot be uploaded.

- Click Edit > Archive Content to remove the file, Web link, content pack, or Google doc from the library. Authors can archive and restore their own content regardless of library permissions. If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn’t remove the Chatter post.
- Click Edit > Delete Content to delete the file, Web link, content pack, or Google doc from Salesforce CRM Content by moving it to the Recycle Bin. Authors can delete and undelete their own content regardless of library permissions. Deleting a Google doc removes the doc’s association with Salesforce CRM Content but does not delete the doc in Google Apps. You cannot delete a file that is
included in a content pack or content delivery. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

- Click **Edit > Library Actions** and choose **Move to Another Library** to move the content to a different managing (or “home”) library. Choose **Share to Another Library** to share content into additional libraries without changing the managing library. Sharing or linking content to other libraries enables members of those libraries to find your content. If the managing library and shared library have different tagging rules, the most restrictive tagging rule applies. If you want to remove content from a library where the content is shared, click **Remove from Libraries**. This option does not remove content from its managing library.

- Click the Comments subtab to view, add, edit, or delete comments.

- Click the Versions subtab to view a list of all file versions and the reason-for-change statements provided by the authors.

- Click the Downloads subtab to view a list of all Salesforce CRM Content users who have downloaded the file. Download data is not available for Web links or Google docs.

- Click the Subscribers subtab to view a list of all Salesforce CRM Content users subscribed to the file, Web link, or Google doc. To subscribe to an author, click the drop-down button next to the author’s name. To subscribe to a library, click the drop-down button next to the library name.

- Click a tag name to view all the content associated with that tag. Click the arrow next to the tag to remove the tag or to subscribe to all content with that tag.

- To add a new tag, enter a tag name in the **Add Tags** field and click **Save**. As you type a tag, Salesforce CRM Content autosuggests tags based on the tags in your My Recent Tags list in the Save or Publish window and the Popular Tags section on the Libraries tab.

  **Note:** If your administrator applied a library tagging rule, you may not be able to enter new tags. If the guided tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags or enter new tags. If the restricted library tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags, but you cannot enter your own tags.

- Click the author’s name to see a list of the author’s published content. Click the arrow next to the author’s name and choose **Subscribe to Author** to subscribe to all content published by that author.

- Click **Feature** or **Don’t Feature** to toggle the “feature” designation on or off. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. Featured content is also listed on the library overview and library detail pages for quick access.

- Click a library name to view details about the library. Click the arrow next to the library name and choose **Subscribe to Library** to subscribe to all content in the library or **Show Library Content** to view a list of all files, content packs, Web links, and Google docs published to the library.
Using the Content Related List

The Content related list on a record detail page includes links to all of the content that has been associated with that record in Salesforce CRM Content. Click the file name to open the content details page.

Only Salesforce CRM Content users who are members of the library where the content was published can see the published file in the Content related list. For example, if you select the “Big Deal” opportunity when publishing BigDealStrategy.doc into the Sales Collateral library, the Content related list on the “Big Deal” opportunity includes a link to BigDealStrategy.doc only for members of the Sales Collateral library. Users who are not members of that library do not see the link.

You can use the Related Content related list to access Salesforce CRM Content from leads, accounts, contacts, opportunities, products, cases, or custom objects. For more information, see Find Salesforce CRM Content Related to Records on page 2991.

View and Edit Content Subscriptions

Clicking the Subscriptions Content tab displays the Subscriptions home page, where you can view your Salesforce CRM Content subscriptions and toggle them on or off.

Note: To subscribe to a file, content pack, Web link, or Google doc, view its content details page and click Not Subscribed. From the content details page you can also subscribe to a tag, author, or library by using the drop-down menus next to the tag, author, or library name.

On the Subscriptions tab, click the Content, Tags, Authors, or Libraries subtabs to view your subscriptions. Depending on your notification settings, you are notified of changes to your subscribed content via real-time emails or a once-daily email.

Tip: To configure your notification settings, go to your personal information page, click Edit, and select Receive Salesforce CRM Content email alerts. If you want to receive a once-daily summary rather than real-time email alerts, also select Receive Salesforce CRM Content emails as daily digest.

Subscriptions generate the following notifications:

- If you subscribe to a file, you are notified when a viewer adds comments to the file or when a new version of the file is published. If you subscribe to a Web link or Google doc, you are notified when comments are added but not when the link is changed or the doc is edited.
- If you subscribe to a content pack you are notified when a new version of the pack is published. Unless you are subscribed to the individual files within a content pack, you are not notified when new versions of the files are published.
- If you subscribe to a tag, you are notified of any newly published content that is associated to the subscribed tag. To be notified that new versions of the tagged content are available, subscribe to the content.
- If you subscribe to an author, you are notified when the author publishes new content. To be notified that new versions of an author's content are available, subscribe to the content.
If you subscribe to a library, you are notified when new content is added to the library, including existing content that has been newly linked to your subscribed library. To be notified that new versions of the library content are available, subscribe to the content.

View and Edit Libraries

Once you have located a Salesforce CRM Content library in the My Libraries area of the Libraries tab home page or on a content details page, click the library name to display detailed information. For details about the publishing options at the top of the page, see Upload and Publish Content.

From the library title area, you can click the following quick links:

- **Browse** to view search results showing all the content in the library.
- **Edit** to change the library name or description.
- **Delete** to delete an empty library. If you want to delete a library that contains content, you must first move the content to another library or delete it and empty the Recycle Bin.

  **Note:** If your Recycle Bin is empty and you are unable to delete the library, another user’s Recycle Bin may contain deleted content from the same library. A library cannot be deleted until all its content is permanently deleted or moved to another library.

- **Edit Members** to add or remove library members or change their library permission.
- **Tagging Rules** to change the tagging method permitted in the library.
- **Record Types** to restrict the record types available to library contributors.
- **View Archived Content** to view a list of archived content in the library. If you do not have the Archive Content or Manage Libraries privilege in your library permission, the archived content list only contains content that you authored and archived, not content that other authors archived.

The library detail page contains the following sections:

- **Members**
  This section lists all the Salesforce CRM Content users who are members of the library. To limit the member list, enter a username and click **Filter**. You can filter by the beginning of a username but not the last name.

  To add new members to the library:

  1. Click **Add Members**.
  2. If the member you want to add isn’t listed, start to enter their first name in the search box and click **Find**.
  3. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

  **Tip:** If you have many Salesforce CRM Content users, create a public group and add it to a library rather than adding users to the library individually.
  4. Click **Add** to add the members to the library.
5. Click **Next**.

6. Select a library permission for each user or public group and click **Save**.

To remove a member from the library, click **Remove**. To change a member’s library permission, click **Edit** and choose a new library permission from the drop-down list.

### Featured Content
This section lists the five pieces of content in the library most recently designated as “featured.” If no content has been featured, this section does not display. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle the feature status on or off, go to its content details page.

### Top Content
This section includes lists that summarize content activity in your library. Within a list, click a file icon to download the content or click the title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.

- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.

- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.

- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

### Popular Tags
This “tag cloud” shows you how the content in your library has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

### Recent Activity
This section is a snapshot of activity within your library. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

### Most Active Contributors
This section shows the authors who have uploaded content into your library most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

**SEE ALSO:**
- Manage Libraries
- Update Content Versions
Manage Libraries

On the Libraries tab, access your private library, create new libraries, choose libraries to view or edit, and analyze library usage and activity. For details about the publishing options at the top of the page, see Upload and Publish Content. The libraries home page has two tabs: Shared Content, which provides information about shared libraries, and My Private Files, which contains information about your private library.

Shared Content

The Shared Content tab on the libraries home page contains the following sections:

My Libraries
This section lists all the libraries to which you have access. Click a library name to view details about that library or click Browse to view a list of all the content in the library. Click the New button to create new libraries, add users to a library, or assign library permissions to users.

Featured Content
This section lists the five pieces of content in your libraries most recently designed as “featured.” Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term sales asset, any featured files with that term will appear at the top of the search results list. To see all featured content, click Show All. To toggle a piece of content’s feature status on or off, go to its content details page.

Top Content
This section includes lists that summarize content activity across all your libraries. Each list sorts content according to specific criteria. Within a list, click a file icon to download content or click a title to open the associated content details page. In the Top Content section you can choose from the following categories:

• Publication Date—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the Show All button to list all the published files, Web links, and Google docs.

• Num Downloads—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the Show All button to list all the downloaded content.

• Rating—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the Show All button to list all the content with votes.

• Num Comments—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the Show All button to list all the content with associated comments.

Popular Tags
This section, commonly referred to as a “tag cloud,” shows you how the content in your libraries has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.
Recent Activity
This section is a snapshot of activity within your libraries. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the Older and Newer buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors
This section shows the authors who have published content into your libraries most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

My Private Files
The My Private Files tab on the libraries home page is your private library. When you upload or create content and do not select a public library, your content is stored in your private library. You can publish content to a public library at any time or leave content in your private library indefinitely. Content in your private library can be assembled in content packs. It can also be sent to leads and contacts outside your organization using the content delivery feature. See Set Up Content Deliveries on page 3291 for more information. The My Private Files tab has the following sections:

Private Library
If you choose the Save to my private library option when publishing a file, Web link, content pack, or Google doc, your content is saved here. You can publish or delete files from this list or click the file’s name to view its content details page. The following options that are available on the content details page for shared content are not available for private-library content: tagging, rating, subscribing, tracking downloads, tracking subscriptions, or using custom fields. If you publish a file from the Private Library list and click Cancel during the publishing process, your file is deleted.

Upload Interrupted
If an error occurs when you are uploading a new file, for example your browser crashes or your session times out, the file you were uploading is saved here. Click Publish to publish the file to a public library or save it to your private library. If you click Cancel on the Save or Publish Content dialog, your file will be deleted.

Revision Upload Interrupted
If an error occurs when you are uploading a new version of a file, the file you were uploading is saved here. Users can continue to access the original version. Click Publish to publish the file to a public library or save it to your private library. If you click Cancel on the Save or Publish Content dialog, your file will be deleted.

Google Apps
Integrate Google apps like Google Docs and Gmail with Salesforce.

Google Apps Overview
Use Google Docs in Salesforce
Add Google Docs to Salesforce
Add an existing Google doc to any record or library in Salesforce.
Google Apps Overview

Google Apps™ is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. Salesforce integrates key Google Apps services and provides several AppExchange apps that enhance and customize Google-related functionality.

The following services for Google Apps are integrated with Salesforce and require a simple activation by a Salesforce administrator:

Add Google Docs to Salesforce
Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators. When the Add Google Docs to Salesforce service is activated, you can:

- Use the Google Docs, Notes, & Attachments or Google Docs & Attachments related list on any Salesforce record to create, edit, or view Google docs and associate them to a record.
- Share a Google doc with any Google Apps user in your organization.
- Associate Google docs with Salesforce records even when you are not working in Salesforce by using the Add Google Doc to Salesforce browser button.
- Add Google docs to Salesforce CRM Content, which allows you to manage all types of content in a centralized location.

Gmail to Salesforce
Gmail™ is a Web-based email application that operates on all standard browsers and can be used with your company’s domain. Use Gmail to Salesforce to automatically log emails you send from your Gmail account as activities on lead and contact records in Salesforce.

Gmail Buttons and Links
Gmail Buttons and Links adds Gmail links next to email fields on all records and adds Compose Gmail buttons in Activity History on leads and contacts. When you select a Gmail link or Compose Gmail, Salesforce automatically logs you in to your Gmail account and automatically populates the To field. If Gmail to Salesforce is activated, Salesforce also populates the BCC field with your Email to Salesforce address.

Use Google Docs in Salesforce

Use Google Docs™ to create and share on-demand documents, presentations, and spreadsheets (“Google docs”) and see your changes in real time as you collaborate with other users. Because your content is stored within Google, there is no need to manage versions or send attachments by email—simply log in with your Google Apps account and view the current document or its revision history.

Salesforce and Google Apps allows you to integrate Google Docs with Salesforce. The Docs home page in your Google Apps account lists all the Google documents, presentations, and spreadsheets that you have created or that other Google Apps users have shared with you.

For information about Google Docs, refer to Google’s online help.
Add Google Docs to Salesforce

Add an existing Google doc to any record or library in Salesforce.

Note: To use a Google Apps service in Salesforce, you must be logged in to your Google Apps business account. Business accounts use your organization’s domain; for example, john.doe@company.com. If you are unsure of your Google Apps username and password, contact your administrator.

Add a Google Doc to a Salesforce Record

1. Open a case, opportunity, or other record.
2. On the Google Docs, Notes, & Attachments related list or the Google Docs & Attachments related list, click Add Google Doc.
3. Enter the name of the Google doc.
4. Enter the Google doc URL.
5. Click Save.

Add a Google Doc to a Salesforce CRM Content Library

1. On the Libraries tab or on a library detail page, click Add Google Doc. Log in to Google Apps if prompted.
2. Enter the Google Doc URL.
3. Click Contribute.
4. Enter a title and select a library. See Publish Files to Libraries for detailed instructions on publishing content to a library.
5. Click Publish.

Note: While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only people with access to the Google doc in their Google Apps account can open the doc from Salesforce.

Tip: For information about using Google Docs, refer to Google’s online help.

Collaborate with Partners and Customers

Share updates with customers and partners in Chatter groups.

Share Files via Link
Chatter Customer Groups

About Chatter Customers in Private Groups

Chatter customers are users outside your company’s email domains who can only see groups they’re invited to and interact with members of those groups; they can’t see any Salesforce information.

Chatter customers:

- Can only be added to Chatter if:
  - A manager or owner of a group that allows customers invites them to the group.
  - An administrator adds them in Setup by entering Users in the Quick Find box, then selecting Users.

- Can only see:
  - Groups they belong to.
  - People in groups they belong to. Customers only see limited profiles including photo, name, title, email, common group memberships, common files, and activity statistics and influence. They can’t post to profiles.
  - Files shared to groups they belong to.

- Can’t see:
  - Records or other Salesforce information, even in search results.
  - Topics, including topics in the feed, the topics list, topic detail pages, Recently Talked About, and Trending Topics. (Customers can see hashtag (#) topics.)
  - Recommendations and can’t be recommended to others. Additionally, groups that allow customers can’t be recommended.

- Are identified as a customer in profiles and groups they belong to. Customers and groups with customers are easily identified by the orange upper left corner of their photo.

- Have limited profiles, including name, photo, title, company, email, feed, group membership, file ownership, and activity statistics and influence.

- Can’t be followed. Additionally, customers can’t follow people or files.

- Can be group members and managers. If the customer is a manager, they will be able to see users who request to join the group, even if they aren’t in other common groups, and approve requests.

- Can’t own, create, delete, moderate, join, or ask to join groups.

- Can invite people that they’re in common groups with to join groups that they manage.

- Can’t invite people inside your company’s domain whose profiles they can’t see.

- Can’t chat on page 2909 with other users.

Note:

- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they’re already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.

- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.

- If a customer loses their password, they can use the Forgot Password option to reset it. If they don’t have their username, they should contact the administrator of the organization in which they’re a customer to recover it.
Considerations for Mobile Users

Chatter customers are able to log in and use the Salesforce1 apps and the Chatter Mobile for BlackBerry app. The same restrictions are applied to customer users as when using Chatter on the Web.

SEE ALSO:
- Chatter Groups
- Adding or Removing Customers in Chatter Groups

Adding or Removing Customers in Chatter Groups

If customer invitations are enabled for your organization, you can add, remove, and invite customers in private groups you own or manage that allow customers.

1. Navigate to a group detail page.
2. To add people who aren’t already customers in your company, click Invite People, or Add/Remove Members > Invite them to Salesforce Chatter! Enter email addresses separated by commas, and an optional message, and click Send.
   When someone accepts your invitation, they join Chatter and become a member of the group.
3. To add people who are already customers in your company, click Add/Remove Members, then:
   - Search using the Find People search box.
   - Toggle between Members of the group and Everyone in your company.
   - Use the Next and Previous links to see more of the list.
   - Click Add to add a customer, or to remove a customer.
   - Click Done when you’re finished.

Note:
- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they’re already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.
- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.
- If a customer loses their password, they can use the Forgot Password option to reset it. If they don’t have their username, they should contact the administrator of the organization in which they’re a customer to recover it.

Share Files via Link

In Salesforce Classic, you can share a file with anyone by creating a file link and sending it via email or IM. Creating a link generates an encrypted URL that you can send to any recipient, such as leads, customers, partners, and coworkers, inside or outside of your company. When your recipients click the link, they see a web-based version of the file that they can easily view and download. Sharing via link is available in Salesforce Classic, and is on by default for most orgs. Administrators can enable sharing via link by enabling these permissions:

1. From Setup, enter Content Deliveries in the Quick Find box, then select Content Deliveries. Select Enable content deliveries and Enable Creation of Content Deliveries for Salesforce Files.

2. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets. Select a permission set, click System Permissions, and select Create and Share Content Deliveries for Salesforce Files.

3. From Setup, enter Profiles in the Quick Find box, then select Profiles. Select a profile, click Edit. In General User Permissions, select Create and Share Content Deliveries for Salesforce Files. You don't need this permission for files in a shared Salesforce CRM Content library. Instead, complete steps 1 and 2 and then ensure that the user is a library member and that Deliver Content is checked in the library permission definition.

Create and share a file link:

1. Start by sharing the file from one of these locations:
   - On Files home — Click Upload files, select a file from your device, then click Sharing Settings and choose Anyone with Link. Copy the link provided to share with people inside or outside your company.
   - On the Home page — Click Create New > File, click Choose File and select a file from your computer, then click Share via link from the dropdown menu.
   - On a file detail page — Click File Sharing Settings > Via link.
   - On the Sharing Settings dialog box — Click Anyone with link from the Share with list.
   - Next to the file on the Files page, the Files Owned by list, or the Group Files list — Click > Share via link.
   - Next to the file in a feed or on a file hover — Click More Actions > File Sharing Settings, then click Anyone with link from the Share with list.
   - In your Salesforce Files Sync folder on your desktop — Right-click on a file, hover on Salesforce Files Sync, then click Share via link.

2. Click Copy if available (or copy the link manually), and paste the link into an email or IM. File link recipients can only view and download files. They can’t be collaborators.

Unless the file was already shared with your company, it’s privately shared and displays the privately shared icon (🔒). It’s not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon (🔒) and anyone in your company can find and view it.

On the Sharing Settings dialog box, click ✗ next to a link to stop sharing it. Anyone with the link will no longer be able to access the file.

Note:
- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
• The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:
Creating Content Deliveries

Content Deliveries

Creating Content Deliveries

A content delivery allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

A content delivery can be created from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

To create a new content delivery:

1. From the Content Deliveries related list, Related Content related list, or the content details page, click Deliver Content.

2. Upload a file or confirm the file name. If you are a Salesforce CRM Content user, search for the content in your libraries that you want to deliver. Salesforce CRM Content users can search for content in shared libraries or a personal library.

3. Optionally, modify the Delivery Name field. This is the name that identifies your content delivery in Salesforce. We recommend using a name that will make the delivery easily distinguishable from other deliveries on the same record. The default delivery name includes the file name and today’s date.

4. Select the delivery methods that determine how your content can be viewed. The options that appear depend on the file format you uploaded.

   • Choose Allow Recipient to View in the Browser to create an online version of the file that recipients can view in their browser.

   • Choose Allow Recipient to Download as [file type] file to allow the recipient of your content delivery to view the content in its original format. For example, if you uploaded a Microsoft® Word file, this field will be Allow download as .doc file.

   Note: If a preview of the file doesn’t exist in Salesforce, users can download the delivered file regardless of whether or not downloading is allowed. File previews are made the first time they are requested in Salesforce, but not before. Viewing a file’s detail page or posting it to a feed generate file previews.
Choose Allow Recipient to Download as PDF to allow recipients to download a .pdf version of the file. This option is only available for Microsoft® PowerPoint, Word, and Excel files.

5. Select Notify Me of First View or Download if you want to receive an email the first time your recipient clicks the content-delivery URL.

6. If the content you are delivering is time-sensitive, select the Remove Access to Content on checkbox and enter an expiration date. By default, the expiration date is 90 days from the current date. After creating your content delivery, you can change the expiration date at any time on the delivery detail page.

7. Optionally, select Require a Password to Access Content. When you create the content delivery you will receive a password to include with the delivery URL that you send to your recipients. The password is available for the life of the delivery on the delivery detail page.

8. Optionally, use the lookup to associate your content delivery with a Salesforce record. The record you were viewing when you clicked Deliver Content is selected by default.

9. Click Save & Next. Your delivery will usually be ready within a few moments, but you can click Notify Me to exit the content delivery wizard and be notified via email when your content delivery is ready.

10. If you did not exit the content delivery wizard, click Preview to verify that you are satisfied with the delivery.

   **Important:** Formatting in the original file may not display correctly in the online version. If you chose Allow Recipient to View in the Browser, preview your content delivery before sending its URL to your recipients. If you are not happy with the quality of the online version, click Previous and choose to make your content available in its original file format or a PDF only.

11. Copy and paste the delivery URL and, if applicable, its password into an email or instant message for delivery. The URL is available on the delivery detail page. For more information, see Viewing and Editing Content Deliveries.

SEE ALSO:

Share Files via Link
Viewing and Editing Content Deliveries

On the Content Deliveries related list or the Content Deliveries list page, click the name of a content delivery to open the detail page.

Viewing Content Delivery Details

The delivery detail page provides all the information associated with a content delivery, including the number of times the delivery has been viewed, and the delivery settings. The URL providing access to the content delivery is visible only if you have access to the content or to a record associated with the content, or are the content delivery owner. For a description of each field, see Content Delivery Fields.

Editing Content Delivery Details

Click **Expire Now** to immediately remove access to the content delivery. Click **Edit** to modify details such as the delivery methods, expiration date, or the record the delivery is associated with. For a description of each field, see Content Delivery Fields.

Deleting Content Deliveries

Click **Delete** to remove access to the content delivery and delete the delivery record from Salesforce. Salesforce CRM Content users cannot delete files that are associated with a content delivery until the content delivery is deleted.

Tracking Content Deliveries

Each time a content delivery’s URL is opened, Salesforce records the event as a view. The Views related list on the content delivery detail page lists every view associated with the delivery. Information about the view includes the date and time, whether the view was by an internal (Salesforce) user, and whether the view included a download. If the content delivery provided the ability to download the file in its original file format or as a PDF file, the **File Downloaded** flag indicates that a download occurred, but you cannot distinguish between file types.

SEE ALSO:

Create and Modify Content Packs in Salesforce CRM Content
Using the Content Deliveries Related List

A content delivery allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

From the Content Deliveries related list on leads, business accounts, contacts, opportunities, cases, campaigns, and custom objects you can:

- Click Deliver Content to create a new content delivery and associate it with the record you are viewing. For more information, see Creating Content Deliveries.
- Click Preview to open the content delivery. Each time you view a content delivery, it is recorded as one internal view on the Views related list.
- Click the content delivery name to open the detail page for that delivery. For more information, see Viewing and Editing Content Deliveries.

Salesforce Communities Overview

Communities are branded spaces for your employees, customers, and partners to connect. You can customize and create communities to meet your business needs, then transition seamlessly between them.

Communities are a great way to share information and collaborate with people outside your company who are key to your business processes, such as customers or partners.

You can use Communities to:

- Drive more sales by connecting your employees with your distributors, resellers, and suppliers
- Deliver world-class service by giving your customers one place to get answers
- Manage social listening, content, engagement, and workflow all in one place

You can create multiple communities within your organization for different purposes. For example, you could create a customer support community to reduce support costs, or a channel sales community for partner deal support, or you could have a community dedicated to an upcoming event.

Communities can be based on standard Salesforce functionality and tabs, or on one of our preconfigured templates. Communities may contain a subset of features and data available in your internal Salesforce organization and can be customized to use your company branding. In addition, you can choose which members from your company and which customers, partners, or other people outside your company can join.

Communities live inside your org and can be easily accessed from the global header using the drop-down menu in the top left corner of Salesforce or in the Salesforce1 Mobile Browser App. Use this menu to switch between your communities and your internal Salesforce org.

Plan Your Implementation

Planning Ahead

It helps to make a few key decisions well in advance of setting up your community and customizing it.

- Determine the business requirements of the community. What types of users are you creating the community for? You could start by identifying the main use cases you want to support, such as customer support, self-service, or marketing.
- Estimate the size of the community. This will help determine your licensing requirements.
- Decide if you want your community content to be publicly available to guest users without licenses
• Plan the look-and-feel of your community and then evaluate the available customization options. With Communities, you have the following choices:

- **Use Visualforce to customize the out-of-the-box community tabs**: Communities comes with some out-of-the-box branding themes that you can use along with standard Salesforce tabs in your community. In addition, you can use Visualforce to extensively customize your community’s appearance and leverage all the capabilities of the Force.com platform. This option requires programming capabilities.

- **Use Community Builder with templates**: Community Builder comes with rich, stylized templates for communities targeted at customer support scenarios. Templates offer easy customization via an intuitive GUI and allow for a quick rollout of your community with minimal configuration in Site.com. This option doesn’t require programming experience or knowledge of the Force.com platform. Need help deciding on a template? Check out the template comparison.

For more information about these options, see Choosing Between Community Builder and Force.com Sites

• Determine if any of the community limits will affect your implementation.

### Set Up and Maintain Your Community

#### Enable Salesforce Communities

Enabling Salesforce Communities is the first step to creating communities.

Enabling Communities enables the Salesforce Classic 2010 user interface theme, which updates the look and feel of Salesforce.

**Note:** Once you enable Communities, you can’t turn it off.

If your organization’s access to Communities is suspended for non-payment of fees due, all of your communities are deactivated, including those in Preview status. When Communities is enabled again, all communities are in Inactive status. You can activate these communities, but can’t return them to Preview status.

1. From Setup, enter Communities Settings in the Quick Find box, then select Communities Settings.

   **Note:** If you don’t see this menu, Communities may not be enabled for your organization. Contact your Salesforce account executive.

2. Select Enable communities.

3. Select a domain name to use for your communities, then click Check Availability to make sure it’s not already being used.

   We suggest that you use something recognizable to your users, such as your company name. Although the domain name is the same for all communities, you create a unique URL for each community during the creation process. For example, if your domain is UniversalTelco.force.com and you’re creating a customer community, you can designate the URL as UniversalTelco.force.com/customers.

   **Important:** Keep in mind that you can’t change the domain name after you save it.

   You can designate a completely custom domain by entering it in on the Domain Management page. From Setup, enter Domains in the Quick Find box, then select Domains.

4. Click Save.
You can now create communities.

The “Create and Set Up Communities” permission is required to create and customize communities. It also gives the user the ability to manage the Site.com site associated with the community.

After enabling Communities, we recommend that you give the “View Global Header” permission to internal users who need access to the community. The global header allows users to easily switch between their internal organization and any communities they’re a member of. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the Switch to Lightning Experience link in the Your Name menu. Communities aren’t supported in Lightning Experience, so to create, manage, or access communities from the global header, you’ll have to switch back to Salesforce Classic.

Can I use the same domain name for my Force.com Sites and my Communities?
Who Can See What in Communities
Update Org-Wide Community Settings

Set the Default Number of Community Roles

Set the default number of roles created when adding partner or customer accounts to communities. These settings apply if your community is set up with Partner Community or Customer Community Plus user licenses. The limit is three roles; the system default is one.

For example, if three partner roles are currently created when an account is enabled for your community—Executive, Manager, and User—but you need only the User role for new accounts, you can reduce the number to one role. For better performance, we recommend setting this value to 1. You can then use Super User Access to grant specific users access to data owned by other users in their account.

To set the number of roles:

1. From Setup, enter Communities Settings in the Quick Find box, then select Communities Settings.
2. Select the number of roles per account.
   a. If you’re using Partner Community licenses, set the Number of partner roles.
   b. If you’re using Customer Community Plus licenses, set the Number of customer roles.
3. Click Save.

The number of roles for existing accounts isn’t affected by this setting.

SEE ALSO:
- Portal Roles Limit
- Create Communities Users
Enable Super User Access in Communities

When you enable super user access, partner users in communities can access more records and data.

If your community is set up with Partner Community user licenses, this setting applies. You can also grant super user access to users with Customer Community Plus licenses. For more information, see Grant Super User Access to Customer Users in Your Community on page 3024.

Granting super user access to external users in your community lets them access more data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only. External users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. From Setup, enter Communities Settings in the Quick Find box, then select Communities Settings.
2. Select Enable Partner Super User Access.
3. Click Save.

You can now assign super user access.

To disable super user access, deselect Enable Partner Super User Access. If you re-enable this feature, all users who were assigned super user access before the feature was disabled automatically get super user access again.

SEE ALSO:
Create Communities Users

Enable Report Options for External Users

Allow external users with Partner Community or Customer Community Plus licenses with the “Run Reports” permission, to view and modify report options so that they can summarize and filter reports.

1. From Setup, enter Communities Settings in the Quick Find box, then select Communities Settings.
2. Select Enable report options for external users.
3. Click Save.

External users with Partner Community or Customer Community Plus licenses that have the “Run Reports” permission, now see report options on the run report page.

SEE ALSO:
The Report Run Page
Sharing Set Overview

Grant portal or community users access to records that are associated with their accounts or contacts using sharing sets, based on their user profiles.

Previously, a sharing set granted access to any record that has a lookup field to an account or contact that matches the user’s account or contact. With Spring ’14, you can also determine how access is granted using an access mapping in the sharing set, which supports indirect lookups from the user and target record to the account or contact. You can determine the objects to use in the access mapping, and they must both either point to an account or contact.

For example, you might want to use a sharing set if you would like to:

• Grant users access to all cases related to their account or contact record.
• Grant users access to all cases related to a parent account or contact that is identified on the user’s account or contact record.

You can use sharing sets to grant access to accounts, contacts, cases, service contracts, users, and custom objects. Sharing sets can be used with these user profiles:

• Authenticated Website
• Customer Community User
• Customer Community Login User
• High Volume Customer Portal
• High Volume Portal
• Overage Authenticated Website User
• Overage High Volume Customer Portal User

The following example shows an access mapping on a sharing set, which grants portal or community users access to all cases associated with the entitlements on their account, even if they are not directly associated with the case.
Example:

1. Account lookup on portal or community user
2. Related account on entitlement
3. Entitlement lookup on case

Note: Portal or community users gain access to all order entitlements and order items under an account to which they have access. To share records owned by high-volume portal users, use a share group instead.

- Granting High-Volume Portal Users Access to Records
- Granting High-Volume Portal or Community Users Access to User Records
- About High-Volume Community Users
- Grant High-Volume Community Users Access to Records
- Share Records Owned By High-Volume Community Users

About High-Volume Community Users

High-volume community users are limited-access users intended for orgs that have thousands to millions of communities users.

Unlike other community users, high-volume community users don’t have roles, which eliminates performance issues associated with role hierarchy calculations. High-volume community users include the Customer Community, High Volume Customer Portal, and Authenticated Website license types.

Characteristics

High-volume community users:

- Are contacts enabled to access a community.
- Are assigned to the Customer Community, High Volume Customer Portal, or Authenticated Website license.
- Only share the records they own with Salesforce users in sharing groups.

Access to Records

High-volume community users can access records if any of the following conditions are met:

- They have “Update” access on the account they belong to.
• They own the record.
• They can access a record’s parent, and the organization-wide sharing setting for that record is Controlled by Parent.
• The organization-wide sharing setting for the object is Public Read Only or Public Read/Write.

Admins can create sharing sets to grant high-volume community users additional access to records; see Grant High-Volume Community Users Access to Records.

Limitations
• High-volume community users can’t manually share records they own or have access to.
• You can’t transfer cases from non-high-volume community users to high-volume community users.
• High-volume community users can’t own accounts.
• You can’t add case teams to cases owned by high-volume community users.
• You can’t include high-volume community users in:
  – Personal groups or public groups.
  – Sharing rules.
  – Account teams, opportunity teams, or case teams.
  – Salesforce CRM Content libraries.

These limitations also apply to records owned by high-volume community users.
• You can’t assign high-volume community users to territories.

SEE ALSO:
Share Records Owned By High-Volume Community Users

Grant High-Volume Community Users Access to Records

Grant high-volume community users access to records using sharing sets.

A sharing set grants high-volume users access to any record associated with an account or contact that matches the user’s account or contact. You can also grant access to records via access mapping in a sharing set, which supports indirect lookups from the user and target record to the account or contact. For example, grant users access to all cases related to an account that’s identified on the users’ contact records.

Sharing sets apply across all communities a high-volume community user is a member of.

High-volume community users have either the Customer Community or High-Volume Portal User license. For more information, see “Sharing Set Overview” in the Salesforce Help.

To grant users access to selected users in the same community, you would typically create a sharing set if you deselected the Community User Visibility checkbox on the Sharing Settings page.

1. From Setup, enter Communities Settings in the Quick Find box, then select Communities Settings.

2. In the Sharing Sets related list, click New to create a sharing set, or click Edit next to an existing sharing set.
3. In the Sharing Set Edit page, fill in the **Label** and **Sharing Set Name** fields. **Label** is the sharing set label as it appears on the user interface. **Sharing Set Name** is the unique name used by the API.

4. Enter a description.

5. Select the profiles of the users to whom you want to provide access.

6. Select the objects you want to grant access to.
   
The Available Objects list excludes:
   - Objects with an organization-wide sharing setting of Public Read/Write
   - Custom objects that don’t have an account or contact lookup field

7. In the Configure Access section, click **Set Up or Edit** next to an object name to configure access for the selected profiles, or click **Del** to remove access settings for an object.
   
   ![Note](image) **Note**: Objects with **Set Up** in the Action column aren’t configured for high-volume user access. Until you configure an object, high-volume users have limited or no access to its records.

8. Grant access based on an account or contact lookup:
   - Select a value in the User drop-down list to determine the account or contact lookup on the user.
   - Select a value in the Target Object field to determine the account or contact lookup on the target object.

   For example, to grant access to all cases associated with an account identified on the user’s contact record, select **Contact.Account** and **Account** respectively.

   ![Note](image) **Note**: Both selected fields must point to either an account or contact. For example, **Contact.Account** and **Entitlement.Account** both point to an account.

9. Choose an access level of Read Only or Read/Write. (If the object’s organization-wide sharing setting is Public Read Only, then only Read/Write is available.)

10. Click **Update**, then click **Save**.

    After creating a sharing set, create share groups to give other users access to records created by high-volume community users.

    **SEE ALSO:**
    - About High-Volume Community Users
Share Records Owned By High-Volume Community Users

Share groups allow you to share records owned by high-volume community users with internal and external users in your communities.

High-volume users are limited-access users intended for organizations with many thousands to millions of external users. Unlike other external users, high-volume users don’t have roles, which eliminates performance issues associated with role hierarchy calculations. Because high-volume community users are not in the role hierarchy while Salesforce users are, a share group allows you to specify the Salesforce other external users who can access records owned by high-volume community users.

Share groups apply across communities.

To set up share groups for your communities:

1. From Setup, enter Communities Settings in the Quick Find box, then select Communities Settings.
2. In the Sharing Settings for High-Volume Community Users related list, click Edit next to an existing sharing set.
3. Click the Share Group Settings tab.
4. Click Activate to turn on the share group.
   Activating the share group can take a while. An email is sent to you when the process finishes.
   
   **Note:** Deactivating a share group removes all other users’ access to records owned by high-volume community users. An email isn’t sent to you when the deactivation process finishes.
5. Click Edit to add users to the share group. You can add both internal users from your organization as well as external users from the same parent account as the high-volume user.
   a. From the Search drop-down list, select the type of member to add.
   b. If you don’t see the member you want to add, enter keywords in the search box and click Find.
   c. Select members from the Available Members box, and click Add to add them to the group.
   d. Click Save.

SEE ALSO:
- About High-Volume Community Users
- Grant High-Volume Community Users Access to Records
Community Setup Basics

Create Communities Users

To allow an external user to access your community, enable the user’s contact record as a customer user or partner user, depending on the user’s license type. Your community can contain users with Partner Community, Customer Community, and Customer Community Plus licenses.

If your organization has person accounts, you can’t use them as partner accounts or create partner users that are associated with them. You can use only business accounts as partner accounts.

1. To create partner users:
   a. View the external account you want to create a user for.
   b. Create a contact. Click **New Contact** from the Contacts related list. Fill in the appropriate details, then click **Save**.

      **Note:** A non-partner account can’t own a partner contact. Person accounts can’t own partner users.

   c. On the contact detail page, click **Manage External User**, then **Enable Partner User**.

      **Note:** If you don’t see the **Enable Partner User** button, ask your administrator to check whether it’s included in the Contact page layout.

   d. Edit the user record for this external user.
      - Select the Partner Community user license.
      - Select the appropriate profile. Remember that profiles give users access to tabs in your community, so be sure that you choose a profile that has the appropriate tabs exposed.

      **Note:** The available profiles for external users are limited to the Partner Community User profile or profiles cloned from it. Unlike a standard user, the partner user role is automatically assigned based on the account name. The partner user role is a subordinate of the account owner’s role. Therefore, all data for the partner user role rolls up to the partner account owner’s role. If you disable a partner user, the partner user role becomes obsolete, and the data no longer rolls up to the partner account role.

      - Deselect **Generate new password and notify user immediately** so that users don’t receive a password before the community is activated. When you activate the community, the user receives a welcome email with the login information, as long as the Send welcome email option is selected for the community.

      **Note:** If you select this option but your organization doesn’t have Active communities that the user is a member of, Salesforce doesn’t send the email.

   e. Click **Save**.

   3021
Note: Creating an external user with a Customer Community Plus license is similar to creating a partner user. On the contact record, select Manage External User, then Enable Partner User. Also, when editing the user record, you select the Partner Community User profile or a profile cloned from it.

2. To create customer users:
   a. Create a contact.
   b. On the contact detail page, click Manage External User, then Enable Customer User.
      
      Note: If you don’t see the Enable Customer User button, ask your administrator to check whether it’s included in the Contact page layout.
   c. Edit the user record for this external user.
      • Select the appropriate profile. The available profiles are limited to the Customer Community User profile and any profiles cloned from it. Remember that profiles give users access to tabs in your community, so be sure that you choose a profile that has the appropriate tabs exposed.
      • Deselect Generate new password and notify user immediately so that users don’t receive a password before the community is activated. When you activate the community, the user receives a welcome email with the login information, as long as the Send welcome email option is selected for the community.
      
      Note: If you select this option but your organization doesn’t have active communities that the user is a member of, Salesforce doesn’t send the email. If Send welcome email is disabled for your community, the user doesn’t receive an email with the username and password. You must manually send the information.
   d. Click Save.
      
      Note: Customer Users don’t see the Notes & Attachments related list on accounts or contacts.

To troubleshoot issues or ensure that the community is configured appropriately, on the contact detail page, click Manage External User and choose Log in As Partner User or Log in as Customer User. You must have Edit permission on Accounts to log in as a Partner User or Customer User. A new browser window opens and you are logged in to the community on behalf of the external user.

When you log in as an external user, you see the behavior that the external user sees. For instance, external users only see the community drop-down menu if they have access to more than one active community. Also, if an external user who is only a member of one active community is given the URL for Preview community, the user doesn’t see the drop-down menu when in the Preview community.

Note: As a security measure, when administrators are logged in as another user, they can’t authorize OAuth data access for that user. For example, admins can’t authorize OAuth access to user accounts, including single sign-on to third-party applications.

Consider the following when creating external users.
External users can’t be deleted. If you no longer want an external user to have access to a community, deactivate the user.

SEE ALSO:
Delegate External User Administration
Add Members to Your Community
How do external community members get login information?
Reset An External User’s Password for Communities

Delegate External User Administration

You can delegate user administration to external users so that they can decide who should access the community.

External users who are delegated administrators can:

- Create external users
- Edit external users
- Reset passwords for external users
- Deactivate existing external users

You can grant delegated external user administration rights to users with Partner Community, Customer Community Plus, Gold Partner, Enterprise Administration, and Customer Portal Manager licenses.

1. From Setup, enter Profiles in the Quick Find box, then select Profiles and click a custom profile.
   You can’t edit standard profiles.
   You can add Delegated External User Administrator to a permission set that you assign to a standard profile.

2. Click Edit.

4. Click Save.

5. Click Edit in the Delegated External User Profiles related list.

6. Select the profiles you want users with this profile to be able to administer.

7. Click Save.

Consider the following when setting up delegated external user administration.

- You can also grant delegated administration rights using permission sets.
- On the profile you’re granting delegated administration rights to:
  - Add the “Create” and “Edit” permissions on contacts so that delegated administrators can create and update contacts related to their account.
  - Set the Accounts and Contacts tab settings to Default On so that delegated administrators can view the Accounts and Contacts tabs and easily manage contacts related to their accounts.
- Add the Accounts and Contacts tabs to your community.
• Set field level security and page layouts so that delegated external user administrators can access only the account and contact fields you specify.

SEE ALSO:
Create Communities Users
Grant Super User Access to Partner Users in Your Community

Grant Super User Access to Partner Users in Your Community
Partner Super User Access must be enabled in your Communities Settings before you can grant access to users. Use this information to grant super user access to users with Partner Community licenses. You can also grant super user access to users in your community with Customer Community Plus licenses. To learn more, see Grant Super User Access to Customer Users in Your Community.

Granting super user access to external users in your community lets them access more data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only. External users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. View the contact record for the user.
2. Click Manage External Account, then choose Enable Super User Access.
3. Click OK.

Grant Super User Access to Customer Users in Your Community
Enable super user access so that external users in communities can access additional records and data.

You can only grant customer super user access to users with Customer Community Plus licenses.

To grant super user access to users with Partner Community licenses, see Grant Super User Access to Partner Users in Your Community.

The “Portal Super User” permission lets delegated external user administrators do the following for their own account:
• View, edit, and transfer all cases
• Create cases for contacts
• View and edit all contacts, whether communities-related or not
• View account details when they’re the contact on a case
• Report on all contacts, whether portal enabled or not, if the Reports tab is added to your community and the user has the “Run Reports” permission

Add the “Portal Super User” permission to a permission set and assign it to Customer Community Plus users so that they have access to their account and can view and edit all of its cases and contacts without having the ability to manage other external users.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets.
2. Either create or clone a permission set.
3. In the App Permissions section, add the “Portal Super User” permission.
4. Click Save.
5. Assign the permission set to your Customer Community Plus users by clicking Manage Assignments and then adding the appropriate users.
Create Communities

Create communities using a wizard that helps you choose a community template that meets your business needs.

The number of communities you can create for your organization is listed on the All Communities page in Setup.

1. To start creating communities, from Setup, enter Communities in the Quick Find box, select All Communities, then click New Community.
   The Community Creation wizard appears, with different template options for you to choose from.

2. Hover over a template to see more information about it.
   - **Kokua**
     A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can’t find what they’re looking for. Supports Knowledge and Cases.
   - **Koa**
     A text-based, responsive self-service template that lets users search for and view articles or contact support if they can’t find what they’re looking for. Supports Knowledge and Cases.
   - **Napili**
     A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.
   - **Aloha**
     A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication.
   - **Salesforce Tabs + Visualforce**
     Standard Salesforce structure and tabs that you can customize using Visualforce. Supports most standard objects, custom objects and Salesforce1.

3. Hover over the template you want to use, and then click Choose.

4. If you selected Koa or Kokua, specify the categories and Company Name for your template, then click Next.

   - **Category Group Name**
     This is the unique name of the data category group that contains the data categories for your site. The name reflects the hierarchy of categories that you’ve set up for your community and is used throughout the site to organize articles.

   - **Top Level Category**
     This is the highest-level category that you want to display. Only the children of this category appear in the community. You can have several nested layers of categories above this category, but the page will show this category as the parent and show its subcategories as children.

   - **Company Name**
     This is the name of your company as you want it to appear in the community header.

5. Enter a community name.

**Note:** If you’re creating multiple communities, keep in mind that community names may be truncated in the global header drop-down menu. Users can see up to 32 characters of the name, and the Preview and Inactive status indicators count toward that number. Make sure that the visible part of the name is distinctive enough for users to distinguish between multiple communities.
6. Enter a unique value at the end of the URL field. This value is appended to the domain you entered when enabling communities to create a unique URL for this community. For example, if your domain is UniversalTelco.force.com and you're creating a customer community, you can designate the URL as UniversalTelco.force.com/customers.

**Note:** You can create one community in your organization that doesn’t have a custom URL.

You can change your community name and URL after the community is activated, but users won’t be redirected to the new URL. If these changes are necessary, be sure to inform your community members before making the change.

7. Click **Create Community**.

The community is created in **Preview** status.

8. On the confirmation page, click **Go to Community Management** to customize your community. If you chose a template other than Salesforce Tabs + Visualforce, you can customize your community in Community Builder.

When you create a community, default pages for login, self-registration, change password, forgot password, and your home page are set based on your community template. You can customize or change these default pages at any time in Community Management.

**Important:** When you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it’s **Active**. If you don’t want all users with your profile to have access, you can remove the profile and give yourself access through a different profile or permission set.

### How many communities can my organization have?

You can have up to 50 communities in your Salesforce org. Active, inactive, and preview communities, including Force.com sites, count against this limit. To see this limit in your org, from Setup enter **Communities** in the Quick Find box, then select **All Communities**. The **Maximum number of communities** field displays 50.

SEE ALSO:

- Create Communities
Create Your Community Using a Preconfigured Template

Create a community and select a template to apply to your community. Define your template and community properties in one place, then use Community Builder to finish designing and organizing your community.

1. **From Setup, enter All Communities in the Quick Find box, then select All Communities, and then click New Community.**
   The Community Creation wizard appears with different template options for you to choose from.

2. **Hover over a template to see more information about it.**

   - **Kokua**
     A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can’t find what they’re looking for. Supports Knowledge and Cases.

   - **Koa**
     A text-based, responsive self-service template that lets users search for and view articles or contact support if they can’t find what they’re looking for. Supports Knowledge and Cases.

   - **Napili**
     A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

   - **Aloha**
     A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication.

   - **Salesforce Tabs + Visualforce**
     Standard Salesforce structure and tabs that you can customize using Visualforce. Supports most standard objects, custom objects and Salesforce1. Keep in mind that the Salesforce Tabs + Visualforce template is based on the standard Salesforce tab structure and doesn’t work with Community Builder.

3. **Hover over the template you want to use, and then click Choose.**

4. **If you selected Koa or Kokua, specify the categories and Company Name for your template.**

   - **Category Group Name**
     This is the unique name of the data category group that contains the data categories for your site. The name reflects the hierarchy of categories that you’ve set up for your community and is used throughout the site to organize articles.

   - **Top Level Category**
     This is the highest-level category that you want to display. Only the children of this category appear in the community. You can have several nested layers of categories above this category, but the page will show this category as the parent and show its subcategories as children.

   - **Company Name**
     This is the name of your company as you want it to appear in the header.

5. **Click Next.**

6. **Enter the name and optional URL for your community.**
   Selecting this option automatically updates your community’s settings with the URL for the custom pages you create in this step. You can override this login page with another login page in your community’s settings. For detailed instructions on creating custom login, logout, and self-registration pages for your community, see Getting Started with Communities.
7. Click **Create Community**.
   The community is created in preview status.

8. On the confirmation page, click **Go to Community Management** to customize your community.
   
   If you selected the Napili template, use Community Management to set the topics that appear in the navigation menu or that feature prominently on your home page.

   Use Community Management to configure community settings such as your default login and registration pages, header and footer, and email templates.

To try out a different template, go back to Community Management and change your template selection. But don’t worry—you can always switch back to the first template you chose. To switch back, set the home page back to its original URL in Site Configuration in Site.com Studio.

**Important:** When you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it’s Active. If you don’t want all users with your profile to have access, you can remove the profile and give yourself access through a different profile or permission set.

_customizeCommunities

Customize Communities

Update basic community settings like your URL, community name, members, login options, and general preferences in the Administration section of Community Management.

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration, then select the part of the community you want to customize:

   Important: The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to Administration > Preferences and enable Show all settings in Community Management.

   - Members
   - Tabs
   - Branding
   - Login & Registration
   - Emails
   - Pages
   - Preferences
   - Settings

   Note: To perform advanced customizations, such as adding custom pages or pages that don’t require login, from Community Management click the Community Management menu in the global header, then click either Go to Force.com or Go to Site.com Studio to go to the site associated with this community. If you used the Aloha, Koa, Kokua, or Napili templates, select Go to Community Builder to customize the community.

3. To share the community with stakeholders while it’s still in Preview status, copy the URL displayed on the Administration > Settings page and share it.

   This allows you to get their feedback, and take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

   Keep in mind that you can only share the URL with users who you added as members of the community.
Add Members to Your Community

Use profiles and permission sets to manage community membership during the setup process. Using profiles and permission sets, you can:

- Grant or remove access for groups of users. Once you add a profile or permission set, all users assigned to that profile or permission set become members of the community.
- Enforce a membership policy. New users added to a profile or permission set that is already associated with a community automatically gain access.

Permission sets allow added flexibility for adding members. You can grant community access to a subset of users from the same profile, without needing to clone the profile.

Standard, Chatter, and portal profiles can be added to communities; Chatter customers, from private groups with customers, can't be added to communities even if they're assigned permission sets that are associated with communities.

Note: Profiles and permission sets associated with communities can't be deleted from Salesforce. You must remove the profiles or permission sets from the communities first.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Members.

3. To add members using profiles:
   a. To filter profiles, select a profile type from the drop-down menu. To search for a specific profile, enter a search term and click Find.

   Search returns profiles for the selected filter.

   Note: Search results include profiles that are already part of the community.

   b. Select the user profiles you want to allow access to your community. Press CTRL to select multiple profiles.

   c. Click Add. To remove a profile, select it and click Remove.

   If you remove a profile from a community, users with that profile lose access to the community, unless the users are assigned permission sets or other profiles that are still part of the community. Their posts and comments still appear.
Important: If you’re an administrator and accidentally remove yourself from a community, you won’t be able to access the Administration settings in Community Management. To add yourself back to the community or make other membership updates, use the API.

4. To add members using permission sets:
   a. To search for a specific permission set, enter a search term and click Find.
   b. Select the permission sets you want to allow access to your community. Press CTRL to select multiple permission sets.
   c. Click Add.

   If you remove a permission set from a community, users with that permission set lose access to the community, unless the users are associated with profiles or other permission sets that are still part of the community. Their posts and comments still appear even after they lose access.

5. Click Save.

   If the community is Active and welcome emails are enabled, users with the profiles or permission sets you added receive a welcome email. The welcome email includes a username and a change password link if it is sent to an external user who hasn’t logged in to a portal or community yet.

   When the community is Active, welcome emails are sent and the community is discoverable by members. When a community is in Preview status, only members with the login URL can view the community. If a community is Inactive, only users with the “Create and Set Up Communities” permission can access it through the Community menu, regardless of membership.

   There are additional options for granting access to your community:
   • Enable self-registration so that external users can register on their own
   • Enable authentication providers, such as Facebook, so that external users can log into the community without creating an account

   For more information about these additional options, see Customize Login, Logout, and Self-Registration Pages in Your Community.

How do I update community membership using the API?

If you aren’t a member of a community, you can’t access Community Management to update administration settings, including membership. As an alternative, you can use the API and Data Loader to add yourself and others to a community.

Tip: You can also use other data loaders to update your community membership such as Workbench.

1. Get the networkId for your community.

   From Setup, enter All Communities in the Quick Find box, select All Communities, and then right-click your community URL and select Inspect. The data-networkId property provides your networkId.

2. Get the profileId or permissionsetId you want to add.

   From Setup, enter Profiles in the Quick Find box, then select Profiles or Permission Sets. Click on the profile or permission set that you want to add. The ID is the last part of the URL.

   For example, at mycompany.salesforce.com/00aa11bb22, the ID is 00aa11bb22.
3. Create a .csv file with columns for networkId and parentId. For parentId, list the profileId or permissionsetId you want to add.

4. Open Data Loader and select the Network Member Group object. Specify the location of the .csv file you created and complete the Data Loader steps.

Once you have successfully added members using Data Loader, the members will be able to access Community Management from the Manage link on the All Communities page in Setup.

Note: In order to access Community Management, the member must also have “Create and Set Up Communities” or “Manage Communities” permission.

SEE ALSO:
Insert, Update, or Delete Data Using Data Loader

Add Tabs to Your Community

If you’re using the Salesforce Tabs + Visualforce template, you can add tabs to your community.

Tip: If you want to use all custom pages in your community, you can choose to hide tabs. Not sure which option works best for you? Check out Tabs vs. Community Builder on page 3033.

Before you begin, keep these things in mind:

• The tabs you enable should be required for the type of activity you’re performing in this community, whether it be sharing accounts and opportunities with your partners or sharing cases and solutions with customers who need support. Don’t clutter your community with tabs that users don’t need.

• Profiles control access to tabs, so some tabs you choose may be hidden for profiles associated with the community. In that case, you must manually expose the tabs in the profiles for your community members so that they can see the tabs in the community.

• Lightning Component tabs aren’t supported in Communities.

• Chatter Free users in your community don’t see any tabs except the Chatter tab.

After you identify the features you want your community members to see, you can expose those features by choosing the corresponding tabs during setup. The tabs that you select also determine community navigation in Salesforce1.

1. Access Community Management in one of the following ways.
   • From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   • From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   • From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Tabs.
   Tip: If you’re using one of the preconfigured templates instead of Salesforce Tabs + Visualforce, the Tabs node is hidden by default. To display the node, click Administration > Preferences, then select Show all settings in Community Management.
3. Select the tabs to include in your community from the Available Tabs list. Press CTRL to select multiple tabs.

4. Click Add to add the tab. To remove a tab, select it in the Selected Tabs list and click Remove.

5. Click Up or Down to change the order that the tabs display.
   The tab at the top of the list is the landing tab for the community. When members access the community, it is the first tab they see. If members don’t have access to the community landing tab, they see the first tab they have access to from the selected community tabs. If they don’t have access to any of the tabs, they see the Home tab.

6. Click Save.

Important: Changing from the Salesforce Tabs + Visualforce template to a Community Builder-based template removes all tabs from your community.

- Customize Communities
- Rename the Chatter Tab

Tabs vs. Community Builder

Not sure whether to use standard Salesforce tabs or the Community Builder when setting up your community? Here is some more information about each option to help you decide.

Tabs
Selecting the Salesforce Tabs + Visualforce template when creating your community means you will use out-of-the-box Salesforce tabs or Visualforce pages.

Pros
- Some theming options available out-of-the-box for tabs
- Support for all sales, service, marketing, and platform features
- Full Force.com platform capability

Cons
- Visualforce is the preferred approach for better customization, yet Visualforce requires coding capability
- Requires some knowledge of the Force.com platform

Community Builder
Selecting one of the preconfigured templates when creating your community means that you will use the WYSIWYG user interface of the Community Builder.

Pros
- Out-of-box app targeted at self-service communities
- More CSS styles available
- Great for a quick rollout of simple self-service community use case

Cons
- Limited to self-service functionality (cases, Salesforce Knowledge, and Chatter Questions)
- Doesn’t support other sales, service, or platform use cases
Doesn’t have full platform capability

Add Tabs to Your Community
Community Builder Overview

Rename the Chatter Tab

Most likely, many of your community members will use the Chatter tab as their home base. You can customize it to meet your company’s branding.

The Chatter tab is the fastest way for your community members to see what’s most important to them: activity feeds, groups, bookmarks, files, and more. Many of your community members will most likely use the Chatter tab as their home base. Customize the name of the Chatter tab in your community to match your company branding—for example, you can use your company’s name or any other name that would be recognizable to your members.

1. From Setup, enter Rename Tabs and Labels in the Quick Find box, then select Rename Tabs and Labels.
2. Select your default language from the Select Language drop-down list at the top of the page.
3. Under Chatter Tabs in Communities, click Edit next to the community you want to edit.
4. Type the singular and plural versions of your preferred tab name, for example, Partner and Partners. Select Starts with a vowel sound if appropriate.
5. Click Save.
Brand Your Community

If you are using the Salesforce Tabs + Visualforce template, you can customize the look and feel of your community in Community Management by adding your company logo, colors, and copyright. This ensures that your community matches your company’s branding and is instantly recognizable to your community members.

Important: If you are using a self-service template or choose to use the Community Builder to create custom pages instead of using standard Salesforce tabs, you can use the Community Builder to design your community’s branding too.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Branding.

3. Use the lookups to choose a header and footer for the community.
   The files you’re choosing for header and footer must have been previously uploaded to the Documents tab and must be publicly available. The header can be .html, .gif, .jpg, or .png. The footer must be an .html file. The maximum file size for .html files is 100 KB combined. The maximum file size for .gif, .jpg, or .png files is 20 KB. So, if you have a header .html file that is 70 KB and you want to use an .html file for the footer as well, it can only be 30 KB.
   The header you choose replaces the Salesforce logo below the global header. The footer you choose replaces the standard Salesforce copyright and privacy footer.

4. Click Select Color Scheme to select from predefined color schemes or click the text box next to the page section fields to select a color from the color picker.
   Note that some of the selected colors impact your community login page and how your community looks in Salesforce1 as well.

<table>
<thead>
<tr>
<th>Color Choice</th>
<th>Where it Appears</th>
</tr>
</thead>
</table>
| Header Background | Top of the page, under the black global header. If an HTML file is selected in the Header field, it overrides this color choice.  
Top of the login page.  
Login page in Salesforce1. |
| Page Background   | Background color for all pages in your community, including the login page.     |
| Primary           | Tab that is selected.                                                            |
| Secondary         | Top borders of lists and tables.  
Button on the login page. |
5. Click **Save**.

- Customize Communities

## Customize Email Sent from Communities

You can customize email sender information, Chatter email branding, and templates in your community emails. You can perform customizations in either the user interface or the Network object in Salesforce APIs.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☰ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
   - From Setup, enter **All Communities** in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

2. Click **Administration > Emails**.

3. Enter custom values for the email sender’s name and address to replace the default values.

   **Note:** If you change the sender’s email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn’t take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

   If you enter a custom value for the sender’s address and you have enabled mail relay, your Chatter emails will use the relay.

   **Important:** Both a logo and email footer text are required. Keep in mind that:
   - All Chatter emails display the Chatter logo and Salesforce information by default unless you replace them with your organization’s own logo and information.
   - If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to null.

   a. Choose a logo to replace the default Chatter logo.
The logo must be an existing document in the Documents tab and must be marked Externally Available Image. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.
The default text includes Salesforce’s name and physical address. We strongly recommend including your organization’s physical address to comply with applicable anti-spam laws.

5. Select Send welcome email to send email to users when they’re added to the community.

⚠ Important: Welcome emails contain login information for external members. If you don’t select this option, you’ll have to manually send external members their usernames and passwords.

The link provided in the welcome email is valid for 6 months.

Welcome emails are sent when:

- A community changes from Preview status to Active status. Emails are not sent when a community is in Preview or Inactive status.
- An administrator adds a new profile or permission set to a Active community.
- A user is assigned a profile or permission set that is part of a Active community.

Note: If a profile or permission set is part of multiple communities, users with that profile or permission set receive a welcome email from each community. The first email contains login credentials, but emails from subsequent communities simply contain a link to the community.

6. Use the default email templates or use the lookups to select different templates for welcome emails to new community members, forgotten password emails, and notification emails about reset passwords. If your organization uses email templates to submit case comments, you can select a template (none is provided by default).

User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don’t expire. You can customize any default template.

Note: If you customize the contents of an email template, we recommend that you use the {!Community_Url} merge field. This custom merge field populates the unique URL for a community, ensuring that emails to users contain URLs with the correct parameters and direct users to the appropriate community to log in or change a password.

7. Click Save.

Emails sent as a result of approvals, workflows, and case comments are sent based on community membership. For example, if a workflow triggers an email, all the recipients are grouped based on community membership and then one email is sent to each group. If the user is a member of multiple active communities, the email comes from the oldest active community.

Another way to customize community emails is to use these fields on the API Network object:

- CaseCommentEmailTemplateId—ID of the email template used when submitting a comment on a case.
- ChangePasswordEmailTemplateId—ID of the email template used when notifying a user that their password has been reset.
- EmailFooterLogoId—ID of the Document object that displays as an image in the footer of community Chatter emails.
- EmailFooterText—Text that displays in the footer of community Chatter emails.
- EmailSenderAddress—Read only. Email address from which community emails are sent.
- EmailSenderName—Name from which community emails are sent.
- ForgotPasswordEmailTemplateId—ID of the email template used when a user forgets their password.
- NewSenderAddress—Email address that has been entered as the new value for EmailSenderAddress but has not been verified yet. After a user has requested to change the sender email address and has successfully responded to the verification email,
the `NewSenderAddress` value overwrites the value in `EmailSenderAddress`. This becomes the email address from which community emails are sent.

- If verification is pending for a new email address and you set `NewSenderAddress` to null, this cancels the verification request.
- `NewSenderAddress` is automatically set to null after `EmailSenderAddress` has been set to the new verified address.
- If verification is pending for a new email address and you specify a different new address for this field, only the latest value is retained and used for verification.

- `OptionsSendWelcomeEmail`—Determines whether a welcome email is sent when a new user is added to the community.
- `WelcomeEmailTemplateId`—ID of the email template used when sending welcome emails to new community members.

**SEE ALSO:**
- Merge Fields for Communities
- Customize Communities

### Merge Fields for Communities

You can add merge fields to Communities email templates.

When you enable Salesforce Communities in your organization, three text-based email templates are created:

- **Communities: Changed Password Email**
- **Communities: Forgot Password Email**
- **Communities: New Member Welcome Email**

These templates use unique merge fields. These merge fields are not available to select and copy when editing a template, but you can enter them manually. These merge fields will only work properly if used in a text or HTML template selected for a community.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{!Community_Name}</code></td>
<td>The name of the community, as entered during community creation.</td>
</tr>
<tr>
<td><code>{!Community_Ur</code></td>
<td>The URL to the login page of a community. For instance, <a href="https://acme.force.com/partners/login">https://acme.force.com/partners/login</a>. If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page. This field is populated only if:</td>
</tr>
<tr>
<td></td>
<td>- The template containing this field is selected as the Welcome New Member template for a community, and Send welcome email is selected, OR</td>
</tr>
<tr>
<td></td>
<td>- The template containing this field is selected as either the Forgot Password or Change Password template and the user receiving the email is an external user who is a member of the community.</td>
</tr>
</tbody>
</table>
You can create custom email templates for communities using Visualforce, which allows you to use custom company branding in your email templates. For Visualforce email template, use the $Network global merge field type and its properties, as described in this table.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{!Receiving_User.Username}</td>
<td>The user name of the user who will receive the welcome email.</td>
</tr>
<tr>
<td>$Network.Name</td>
<td>The name of the community, as entered during community creation.</td>
</tr>
<tr>
<td>$Network.NetworkUrlForUserEmails</td>
<td>The URL to the login page of a community. For instance,</td>
</tr>
<tr>
<td></td>
<td>If this merge field is part of the welcome email being sent to a new</td>
</tr>
<tr>
<td></td>
<td>external user, the URL is appended with a link to a reset password page.</td>
</tr>
<tr>
<td></td>
<td>This field is populated only if it is used in a Visualforce email</td>
</tr>
<tr>
<td></td>
<td>template for one of three email types supported for Communities.</td>
</tr>
</tbody>
</table>

If your community is using cases, approvals, or workflows, emails created from an email template that use the {!any_object>.Link} or {!Case.Link} merge fields include a link to the record in the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>

Enable Community Preferences

Customize Communities Preferences

Enable or disable nickname display, access to the community without login, Chatter private messages, content flagging, reputation levels, knowledgeable people, and file limits in your community.

To use these settings, Chatter must be enabled in your organization.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ⬇️ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click *Community Management*.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click *Community Management*.

2. Click *Administration > Preferences*.

3. Change the desired settings.

   **General**
   - Display nicknames instead of full names in your community. Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.
   - Enable access to public Chatter content in your community so that guest users can access it without logging in. Allowing this access is a way to boost adoption and helps customers easily find information they need without having to log in, register, or contact your company directly.
   - Enable Chatter messages, which allow you to have secure private conversations with other Chatter users. To expose Chatter messages for external users, administrators must also enable the Chatter tab.
   - Use custom Visualforce error pages, if you want authenticated users to see your custom branded Visualforce error pages.
   - Show all settings available in Community Management that are hidden by default based on how you set up your community. Enabling this setting overrides the dynamic navigation provided in Community Management.
Community Management

- Allow members to flag posts, comments, or files for moderation within your community. Members may want to flag items that contain inappropriate language or sensitive information.
- Enable Reputation to allow community managers to set up a point system that rewards users who participate in the community. Administrators set up corresponding reputation levels that users see on their profile.
- Enable knowledgeable people so you can discover who’s knowledgeable on topics and endorse people for their knowledge on a topic.

Files

- Set the maximum size in MB for files uploaded to the community.
- Specify the types of files that can be uploaded in the community.

4. Click Save.

SEE ALSO:
- Show Nicknames Instead of Full Names in the Community
- Enable Public Access to Community Content

- Enable Members to Flag Items in Your Community
- Enable Reputation in Your Community
- Limit Files in Your Community

Show Nicknames Instead of Full Names in the Community

Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.

All users have nicknames by default, which they can modify by going to Your Name > Edit Contact Info in the global header or from their Chatter user profile.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities* permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Preferences.

3. Select Enable nickname display, then click Save.

EDITIONS

Available in: Salesforce Classic

Available in: Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To enable nickname display:
- “Create and Set Up Communities” AND
  - Is a member of the community whose Community Management page they’re trying to access.
Nicknames are shown in place of first and last names in almost all locations in the community, including in feeds, list views, groups, search results, recommendations, and on user profiles and files. Additionally, Salesforce1 and any community sites activated using community templates show nicknames as well.

A few restrictions to keep in mind about nickname display:
- Private messages display full names. You can choose to turn off private messages to avoid this.
- Records and user lookups on records show full names. Keep in mind, though, that you can control record and user visibility with sharing rules.
- Mobile notifications in Salesforce1 show full names. You can turn off mobile notifications in Salesforce1 to avoid this.
- Searches by first, last, and full names aren’t restricted and return matches, but the search results display only nicknames. The auto-complete recommendations in global search and the recent items list show any first, last, and full names that the user has already searched by or has accessed via a record or another location.

SEE ALSO:
- Customize Communities Preferences

Enable Public Access to Community Content

Enable access to community content for guest users (unlicensed users) without requiring them to log in or register with the community.

Public communities lend themselves well to business-to-consumer (B2C) type scenarios and allow you to reach a broader audience. Consider the example of a customer support community maintained by a sports equipment manufacturer. A community with public discussions, questions, known issues, and solutions posted by customer support would allow existing and potential customers to view this information without contacting the company directly.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☀️ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities’ permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Preferences.

3. Select Allow public access to Chatter, then click Save.

Enabling public access allows you to expose groups, topics, user profiles, and feeds for guest users via Chatter in Apex, but it doesn’t expose this data in the community. To allow guest users to view this information, do one of the following:
- Use a community template from the Community Builder that allows guest user access for one or more of these objects (Napili, for example). See the Community Templates for Self-Service Implementation Guide for detailed instructions.
Note:

- If you have enabled profile-based rollout for Chatter in your organization, guest users won’t be able to access your public community until you enable Chatter access on the guest user profile. For more information, see Control Chatter Access through User Profiles in the Salesforce Help.
- You can’t attach files to questions in a public community from Internet Explorer 9.

SEE ALSO:

- Customize Communities Preferences

Use Custom Visualforce Error Pages for Authenticated Users

If you have customized Visualforce error pages, you can have those pages display for authenticated community users.

To assign or customize your Visualforce error pages, from Community Management, click the Community Management menu in the global header and select Go to Force.com. The Error Pages section lists your current page selections.

When Use custom Visualforce error pages is selected, users who are logged in to the community will see your custom Visualforce error pages. When Use custom Visualforce error pages isn’t selected, users logged in to the community see the default Visualforce error pages. Guest users who aren’t logged in to the community will always see the custom Visualforce error pages, regardless of whether or not you select the checkbox.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Preferences.
3. Select Use custom Visualforce error pages, then click Save.

SEE ALSO:

- Assigning Force.com Site Error Pages
Limit Files in Your Community

Restrict the size and types of files that your community members can upload. This whitelist of file types lets you control what your community members upload and also prevents spammers from polluting your community with inappropriate files.

Community file moderation must be enabled for your org before you can limit files in your community. If you don't see the option to limit files in Community Management, contact Salesforce.

Your community file limits apply to files uploaded by community members anywhere in the community—in posts and comments, directly in the Files tab, and also from Salesforce1. You can also set community file limits using the SOAP API or Metadata API.

Keep the following things in mind:

- A file must meet the file limits set in the community in which it’s uploaded. For example, if a customer uploads a file on a case and then an agent uploads a newer version in your Salesforce internal org, the limits from the customer community still apply.
- Files uploaded in your internal Salesforce org that are shared in a community aren’t subject to community file limits.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Select Administration > Preferences, then enter your limits in the Files section on the page.
   - Maximum file size in MB—Enter a number between 3 MB and your org’s maximum file size. To use the default limit of 2 GB, leave this field empty or enter 0.
   - Allow only these file types—Enter file extensions separated with a comma (for example: jpg, docx, txt). You can enter lowercase and uppercase letters. You can enter up to 1,000 characters. To allow all file types, leave this field empty.

3. Click Save.

After you set your community’s file limits, members receive an error message if their file is larger than the size you set or if their file extension isn’t allowed.

When a member tries to upload multiple files at once and a file is found that doesn’t meet your limits, none of the files are uploaded.

SEE ALSO:
   - Customize Communities Preferences
Enable the Global Header for Communities

When Communities is enabled, the global header allows you to easily switch between your communities and your internal organization.

Communities must be enabled in your organization to use the global header.

The View Global Header permission is disabled by default for all standard profiles. To view the global header, users must be assigned the "View Global Header" permission either by selecting it on standard profiles, creating custom profiles, or by creating a permission set. Create permission sets to easily assign this permission to specific people.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets.
2. Click New and create a permission set that includes the System Permission View Global Header.
3. Assign the permission set to the appropriate users.

Users with this permission set see the global header at the top of all pages. They can use the menu on the left to switch between their internal organization and any communities they have access to.

The Your Name menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the Switch to Lightning Experience link in the Your Name menu. Communities aren’t supported in Lightning Experience, so to create, manage, or access communities from the global header, you’ll have to switch back to Salesforce Classic.

When in a community, users with either the Manage Communities or the Create and Set Up Communities permission see a gear icon (⚙️) they can use to switch to Community Management. Within Community Management, they see an additional menu that they can use to preview the community or access the community settings via Community Builder, Site.com Studio, or Force.com.

Note: Within Community Management, users see the global header and the Community Management menu, even if they don’t have the “View Global Header” permission. However, we recommend that you still assign the “View Global Header” permission to users who need to switch between your internal organization and communities.

SEE ALSO:

Navigate to Your Communities
Share a Link to Your Community

You can allow members to preview your community before making it active.

You can only share the link for a preview community with users who were added as members of the community.

Sharing a link to a community in Preview status allows you to easily gather stakeholder feedback. The community functions just as it will when you make it active, so stakeholders can try out all functionality and review your branding and customizations. Additionally, you can take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☯ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Settings.

3. Copy the URL displayed on the page and share it with your stakeholders.

   Keep in mind that you can only share the URL with users who you added as members of the community.

- Communities Statuses
Make Your Communities Active

Activating a community makes it visible to members. You can customize the community while it's active, or you can deactivate the community to make your changes. Keep in mind that once a community is active, everything in the community is visible to members. Be sure to finish all major customizations while in Preview status.

**Note:** If welcome emails are enabled, an email with a link to the community is sent to each member when you first activate the community. For any members from outside the company who don’t have a password or use single sign-on, the welcome email includes a link to set their password and security question.

An external user with access to multiple communities within one organization uses the same login credentials for all communities.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ![community icon](image) in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
   - From Setup, enter **All Communities** in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the “Create and Set Up Communities” permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

2. Click **Administration > Settings**.

3. Click **Activate Community**.
   Your community is active and online.

Communities Statuses

Communities can have one of the following statuses.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preview</td>
<td>Customization of the community isn’t complete, and the community has never been activated. Once you activate a community, you can’t go back to Preview status. Users with “Create and Set Up Communities” can access communities in Preview status if their profile or permission set is associated with the community. They can also share a link to these communities with users whose profiles or permission sets...</td>
</tr>
</tbody>
</table>
**Status** | **Description**
---|---
are associated with the community. The link for sharing a Preview community is located on the Community Management page.  
No welcome emails are sent even if Send welcome email is selected.  
**Note:** If your organization’s access to Communities is suspended for non-payment of fees due, all of your communities are deactivated, including those in Preview status. When Communities is enabled again, all communities are in Inactive status. You can activate these communities, but can’t return them to Preview status.

| Inactive | The community was previously Active but was deactivated.  
You may want to deactivate a community if you need to:  
• Add or remove members  
• Add, remove, or change the order of tabs  
• Change the color scheme  
• Change the community URL  
When you deactivate a community, it no longer appears in the drop-down menu. Users with “Create and Set Up Communities” can still access the setup for Inactive communities regardless of membership. If members try to access Inactive communities using a direct link, they see an error page. |

| Active | The community is active and available to members.  
Welcome emails are sent to new members if Send welcome email is selected. |

Update Your Community Settings

Manage your community name, description, URL, community status, and community template all from one spot.

You can change your community name and URL after the community is activated, but users won’t be redirected to the new URL. If these changes are necessary, be sure to inform your community members before making the change.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☄️ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities’ permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Settings.

3. Edit your community settings as needed:
   - Edit your community name, description, and URL, by clicking 📝 next to your community name.
   - Manage the status of your community.
   - Change your community template.

SEE ALSO:
- Change Your Community Template
- Communities Statuses
Deactivate a Community

You may want to deactivate a community if you need to:

• Add or remove members
• Add, remove, or change the order of tabs
• Change the color scheme
• Change the community URL

1. Access Community Management in one of the following ways.
   • From the community:
     – In Salesforce Tabs + Visualforce communities, click 📋 in the global header.
     – In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   • From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities” permission.
   • From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Settings.

3. Click Deactivate.

Your community is inactive and offline.

When a community is inactive, members still see it in the menu, but can’t access it unless they have the “Create and Set Up Communities” permission.

Customize Communities
Change Your Community Template

Change your community template if the requirements of your community evolve from when you first set it up.

⚠️ Tip: You won’t lose any data when you change templates, but make sure to review Considerations for Changing Your Community Template before performing the steps below.

If your community is already active and you change templates from a Salesforce Tabs + Visualforce template to a Community Builder-based template, or from a Community Builder-based template to another Community Builder-based template, your template change is saved in a draft version that you can further customize in Community Builder. You must publish your changes in Community Builder before your active community is updated.

If your community is already active and you change templates from a Community Builder-based template to a Salesforce Tabs + Visualforce template, your active community is updated immediately. In this scenario, we recommend that you first deactivate your community. Once you have made all of your changes, you can then re-activate it.

If your template is listed as None, this means you’re not using a predefined Community Builder-based template or you have modified a Community Builder-based template.

If you are using a Community Builder-based template and you customize your template, the Settings page shows the name of template you have in draft mode in Community Builder. A warning message reminds you to publish your changes in Community Builder.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☐ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities” permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Settings.

3. Click Change Template.

4. Choose a template that meets your community’s needs.
   - To learn more about using the Kokua, Koa, and Napili templates, see the Community Templates for Self-Service Implementation Guide.
   - To learn more about using the Aloha template, see the Getting Started with the Aloha Community Template for Salesforce Identity.

5. When prompted, select Change Template to confirm your changes.

After you change the template, you are taken back to Community Management.

Check to make sure your community pages, such as the Login page or Community Home page, are still the best choice for your updated community template. For example, if you previously had a Salesforce Tabs + Visualforce template and switched to a Community Builder-based template, you might want to update your pages to use Community Builder pages instead of Visualforce pages. If required, customize your community in Community Builder and publish any changes you make.
Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

- You may need to change your community’s template to see some new communities features introduced by Salesforce. If you want to keep your current template, you must switch to another template and then switch back to your current template. For example, let’s say you are using the Napili template for your community. Salesforce introduces a feature that requires a change (not a simple update) to the template. You must switch your community’s template to another template, such as Koa or Kokua, and then switch it back to Napili.

- Salesforce object data carries over, but all branding and component customizations do not. You’ll need to redo all customizations.

- Switching between templates updates the navigation in Community Management. To view all available options in Community Management, regardless of template selection, select Administration > Preferences > Show all settings in Community Management.

- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to a Community Builder template, or vice versa. For example, in Community Builder-based templates /s is appended to your URL. Be sure to update any links to your community with the new URL.

To learn more about using the Kokua, Koa, and Napili templates, see the Community Templates for Self-Service Implementation Guide.

To learn more about using the Aloha template, see the Getting Started with the Aloha Community Template for Salesforce Identity.

Manage Communities Users

Reset An External User’s Password for Communities

An external user’s password can be reset either by the user or by the administrator of the organization hosting the community.

In either case, when someone initiates a reset of an external user’s password, an email is sent to the user with a link to reset their password. User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don’t expire. When the user clicks the link, they will be required to reset their password before proceeding.

If a user-initiated password reset request can’t be processed, they receive an email telling them why. Password reset requests fail if a user’s account is temporarily or permanently locked due to too many unsuccessful login attempts or if the request was sent outside approved login hours, IP ranges, or network locations.

SEE ALSO:

- Create Communities Users
- How do external community members get login information?
How do external community members get login information?

External users get their login credentials in welcome emails from a community.

When you enable a contact as a customer user or partner user, they don’t receive their login credentials until you add them to a community with welcome emails enabled. If welcome emails are disabled for the community, the external user won’t receive credentials and you must manually send them. To do so, from Setup, enter Users in the Quick Find box, select Users, select the checkbox next to the user’s name, and then click Reset Password. An email containing the user’s username and a link to reset their password will be sent to the user. The link in this email doesn’t expire.

Reset An External User’s Password for Communities

Set Up Search Engine Optimization (SEO) for Your Community

Have search engines, such as Google™ or Bing®, index your community so that customers, partners, and guest users can easily discover community pages via online searches. SEO can significantly improve discovery for public communities.

There are a few standard files and SEO properties that you need to know about when setting up SEO for your community.

sitemap.xml

sitemap.xml contains a list of the URLs of your community. Search engines use this list to find out which pages of your community are available for crawling and indexing. The sitemap.xml file is automatically generated at the root level of your community. To view the site map, navigate to https://<community_URL>/s/sitemap.xml.

If your community supports multiple languages, the site map automatically includes an entry for each supported language as follows:

```html
<xhtml:link rel="alternate" hreflang="language_code" href="page_URL?language=language_code" />
```

For example, `<xhtml:link rel="alternate" hreflang="fr" href="https://mycommunity.com/s/?language=fr" />`.

You can submit the sitemap.xml file directly to search engines, such as Google™ Webmaster Tools and Bing® Webmaster Tools to allow users of those search engines to discover content in your community.

robots.txt

robots.txt uses include and exclude rules to inform web spiders and robots about which areas of your community to index. This standard file is used across the Web for SEO and gives you complete control over what users can discover via search engines. robots.txt is automatically generated if your community exists at the root level (without a subpath in the URL). To view the file, navigate to https://<community_URL>/robots.txt.

The auto-generated file allows your entire community to be indexed. However, you can choose to allow indexing of specific areas only by creating a Visualforce page to host the information.
Page Title and Description properties

The title and description tags in the page <head> are important for SEO because they represent the link title and description that appear in search results pages.

You can customize the title and description for your community’s standard pages in the Page Manager area of Community Builder. However, some pages, such as the Article Detail and Topic Detail pages, set these properties dynamically according to the components on the page. For example, for the Article Detail page, the title and description values are updated according to the article’s title and summary, respectively.

Create a Custom Robots.txt File for Your Community

The robots.txt file uses include and exclude rules to inform web spiders and robots about which areas of your community to index. To allow only specific areas of your community to be indexed, create a Visualforce page to host this information. After you specify your rules, search engines use the file to index your community pages.

Best Practices for Using SEO in Your Community

Follow these guidelines and best practices when using SEO in your community.

SEO for Communities FAQ

Answers to common questions about using SEO in your community.

SEE ALSO:

Page Properties and Types in Community Builder

Create a Custom Robots.txt File for Your Community

The robots.txt file uses include and exclude rules to inform web spiders and robots about which areas of your community to index. To allow only specific areas of your community to be indexed, create a Visualforce page to host this information. After you specify your rules, search engines use the file to index your community pages.

Available in: Salesforce Classic

Available in: Enterprise, Performance, and Unlimited Editions

Your custom robots.txt file must contain the path to the auto-generated site map—for example, https://<<community_URL>>/s/sitemap.xml. robots.txt is placed at the root level of your community.

Here's an example of a Visualforce page with indexing rules for a community:

```apex
<apex:page contentType="text/plain">
User-agent: *
Disallow: / # hides everything from ALL bots
Allow: /<path-prefix-1>/s # add path you want to open to bots
Allow: /<path-prefix-2>/s # add path you want to open to bots
</apex:page>
```
To create and use a custom robots.txt file:

1. Create a list of include and exclude rules for the different areas of your community that you want to expose or hide from search engines. Save this information in a text file.

2. In Setup, enter Visualforce Pages in the Quick Find box, then select Visualforce Pages and click New to create a Visualforce page. Give it any name; you can even call it robots.

3. Paste the list of indexing rules in the Visualforce page. The final contents should look similar to the example above, with more rules as required.

4. Click Save.

5. Back on the Community Management page for your community, click Administration > Pages > Go to Force.com and then Edit on the Site Details page.

6. In the Site Robots.txt field, enter the name of the Visualforce page you created, or click to search for the file.

7. Click Save.

8. Optionally, submit your sitemap.xml file directly to search engines. For example, submit the file to Google™ Webmaster Tools and Bing™ Webmaster Tools to allow users of those search engines to discover content in your community.

To confirm that the robots.txt file is available for robots and spiders, navigate to https://<community_URL>/robots.txt. Similarly, to view the site map, navigate to https://<community_URL>/s/sitemap.xml.

Set Up Search Engine Optimization (SEO) for Your Community

Best Practices for Using SEO in Your Community

**Best Practices for Using SEO in Your Community**

Follow these guidelines and best practices when using SEO in your community.

Available in: Salesforce Classic

Available in: Enterprise, Performance, and Unlimited Editions

- Don’t create a custom site map; use the auto-generated sitemap.xml file.
- If you create a custom robots.txt file, ensure that it points to the auto-generated site map—for example, http://<community_URL>/s/sitemap.xml.
- If your org supports multilingual Knowledge articles, we recommend against replacing the URL of translated articles with language-specific URLs. Instead, retain the same URL as the base language article.
If your community supports multiple languages, the site map automatically includes an entry for each supported language as follows:

```xml
<xhtml:link rel="alternate" hreflang="language_code" href="page_URL?language=language_code" />
```

- In Page Manager, ensure that each page’s Title and Description fields have meaningful entries, where applicable. The page title is used in the browser tab or window, search engine results, and bookmarks. Content in the Description field is shown in search engine results to help people quickly decide whether it’s the page they want.

- Before submitting the `sitemap.xml` file to search engines for crawling, navigate to `https://<community_URL>/s/sitemap.xml` as an unauthenticated user. (We suggest using Google Chrome's incognito mode.) Ensure that the URLs listed in the site map are appropriate for guest users.

If a URL is mistakenly included in the list available to guest users, ensure that the correct permissions are enabled on the guest user profile and that your org is set up correctly. For example, to prevent Case Detail URLs from being included in the site map, from Setup, enter `Sharing Settings` in the Quick Find box. Then, click `Edit` and set the Default Internal Access for Case to `Private`.

- Redirecting HTTP requests to HTTPS is an SEO best practice. Therefore, we recommend against disabling the `Require Secure Connections (HTTPS)` setting on the Site Details. To verify that the checkbox is selected, in Community Management, click `Administration` > `Pages` > `Go to Force.com`.

- 301 redirects are a great way to ensure that users and search engines are directed to the correct page. For example, for a URL such as `www.my_community.com`, we recommend creating a redirect to `my_community.com`. You can set up these redirects with your DNS provider.

### SEO for Communities FAQ

Answers to common questions about using SEO in your community.

| Available in: | Salesforce Classic
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Enterprise, Performance, and Unlimited</strong> Editions</td>
<td></td>
</tr>
</tbody>
</table>

**Why does `sitemap.xml` have references to other site maps?**

The auto-generated `sitemap.xml` file is an index file that lists other site maps. `sitemap.xml` can contain only a limited number of URLs, so if your community contains many site map URLs, we partition them into several smaller site map files.

**Does the site map include URLs for Salesforce object pages that come with my community template?**

If you created a detail page for the object and enabled the object’s “Read” permission on the guest user profile, the URLs for the object’s pages are included in the site map.

**Does the site map include URLs for the custom object pages that I create?**

If you created a detail page for the object and enabled the object’s “Read” permission on the guest user profile, the URL for the detail page is included in the site map. However, URLs for the list and related list pages aren’t included.

**How do I exclude the URLs for Case Detail from the site map and prevent them from showing up in search engine results?**

To prevent Case Detail URLs from being included in the site map, from Setup, enter `Sharing Settings` in the Quick Find box. Then, click `Edit` and set the Default Internal Access for Case to `Private`.

---

3056
Why doesn’t the auto-generated `robots.txt` file appear when I navigate to `https://<community_URL>/robots.txt`?

Your community must be at the root level of your custom URL for the auto-generated `robots.txt` file to show up. If you don’t have a custom URL set up and are using the *.force.com domain, then a community without the path prefix must exist for `robots.txt` to show up.

How do I override the content of `robots.txt`?

You can override `robots.txt` by creating a Visualforce page to host the information.

Can I remove the `/s/` from the default community URL?

No, the `/s/` is required in the default community URL.

Is URL rewriting for creating custom vanity URLs supported?

No, URL rewriting isn’t currently supported for template-based communities.

Does each article have its own URL?

Yes, each article that appears in the Article Detail page has its own URL, which is retrieved from the Knowledge article’s URL Name field.

If your org supports multilingual Knowledge articles, we recommend against replacing the URL of translated articles with language-specific URLs. Instead, retain the same URL as the base language article.

Can I add titles and descriptions to articles for SEO purposes?

Each Knowledge article has a URL Name, a Title, and a Summary field. When the article is displayed in the Article Detail page in Community Builder, these fields are used for the page URL, and the title and description tags in the page `<head>`, respectively.

The title and description tags in the page `<head>` are important for SEO because they represent the link title and description that appear in search results pages.

Set Up Search Engine Optimization (SEO) for Your Community
Optional Community Enhancements

Configure a Custom Domain for Your Community

Set up a custom domain so that your community URLs reflect your company brand.

Note: Custom domains are supported only in non-sandbox instances. You can configure a custom domain in a sandbox instance and then migrate it to a production instance, but the custom domain is only active in production.

When you add a domain, you also have the option of attaching a certificate and key for connection security. If you’re going to use a certificate, make sure you’ve already added it using Certificate and Key Management before you try to attach it to your domain. Only CA-signed certificates are supported, and they must be 2048 bits in length. To support all domains that are hosted by sites in your organization, use a wildcard or Subject Alternative Name certificate.

1. From Setup, enter Domains in the Quick Find box, then select Domains.
2. Click Add a Domain.
3. Enter the Domain Name.
4. Add a certificate if you have already set up a CA-signed certificate that supports this domain.
5. Click Save. Alternatively, click Save & New to add multiple domains.

If you plan to host more than one community on a domain, you’ll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the communities within that domain. From Setup, enter Custom URLs in the Quick Find box, then select Custom URLs.

Before you switch the CNAME of your domain name to point to a new target name, ensure that the new target name exists in the DNS by using dig or nslookup. When you created your domain names affects the target of your CNAME:

- Domain names that were added before Summer ’13, typically need to have their CNAME adjusted to point to the fully qualified domain followed by .live.siteforce.com instead of to the organization’s force.com sub-domain. For example, if your pre-Summer ’13 domain is www.example.com, then the target of its CNAME will need to be www.example.com.live.siteforce.com instead of example.force.com before HTTPS will work.
- Domain names that were added in or before Summer ’13, don’t have the 18-character organization ID in the CNAME target.
- Domain names that were added in or after Summer ’13, already point to the proper place for setting up HTTPS in a custom domain.
- Domain names that were added in or after Winter ’14, use a CNAME that points to the fully qualified domain followed by your organization’s 18-character ID and .live.siteforce.com. For example, if your domain name is www.example.com and your 18-character organization ID is 00dxx0000001ggxeay, then the target of its CNAME will need to be www.example.com.00dxx0000001ggxeay.live.siteforce.com.

Add the Global Search Box to Your Customized Community HTML Header

If you customize your Salesforce Communities with an HTML header, you hide the global search box. To take advantage of this search functionality, add a form to your custom header.

1. In your customized HTML header, embed a form similar to this one.

   ```html
   <form action="/<community name>/search/SmartSearch" method="get">
     <input id="phSearchInput" type="text" name="str"/>
     <input type="submit" value="Search"/>
   </form>
   ```

2. Replace `<community name>` with the unique value you used for the URL when creating the community.

   For example, if you entered `customers` as the unique value for your community URL, the form would look like this example:

   ```html
   <form action="/customers/search/SmartSearch" method="get">
     <input id="phSearchInput" type="text" name="str"/>
     <input type="submit" value="Search"/>
   </form>
   ```

Login, Self-Registration, and Password Management In Your Community

Customize Login, Logout, and Self-Registration Pages in Your Community

Configure the standard login, logout, password management, and self-registration options for your community, or customize the behavior with Apex and Visualforce or Community Builder (Site.com Studio) pages.

By default, each community comes with default login, password management, and self-registration pages and associated Apex controllers that drive this functionality under the hood. You can use Visualforce, Apex, or Community Builder (Site.com Studio) to create custom branding and change the default behavior:

- Customize the branding of the default login page.
- Customize the login experience by modifying the default login page behavior, using a custom login page, and supporting other authentication providers.
- Redirect users to a different URL on logout.
- Use custom Change Password and Forgot Password pages
- Set up self-registration for unlicensed guest users in your community.
Brand Your Community’s Login Page

If you selected the Salesforce Tabs + Visualforce template, you can add your company logo and custom footer text to the standard login page that comes out-of-the-box with your community.

The header and page background colors used on the standard login page are inherited from the community’s branding color scheme.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click 📊 in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Login & Registration and make your changes in the Header and Footer section.

3. Upload a logo for the community login page header.
   The file can be .gif, .jpg, or .png. The maximum file size is 100 KB. Images larger than 250 pixels wide or 125 pixels high aren’t accepted. Uploading a logo automatically creates a Communities Shared Document Folder on the Documents tab and saves the logo there. Once created, you can’t delete the folder.
   The header logo displays at the top left of the standard login page. It is also used when you access the community in Salesforce1. The header logo doesn’t appear on custom login pages.

4. Enter custom text for the community login page footer, up to a maximum of 120 characters.
   The footer displays at the bottom of the login page. This footer text doesn’t display on custom login pages.

5. Click Save.
   The logo and custom footer text display to all users (internal, external, and unlicensed guest users) on the login page.

SEE ALSO:

- Customize Login, Logout, and Self-Registration Pages in Your Community
- Customize the Login Process with Apex
Customize Your Community’s Login Experience

Customize the default login process for external users in your community. You can also use a custom Community Builder, Site.com Studio, or Visualforce login page, support multiple authentication providers, and configure single sign-on with any template.

External users are users with Community, Customer Portal, or partner portal licenses.

- The login page you select in Community Management overrides other login page assignments in the Site.com or Force.com site settings.
- If your community uses the Salesforce Tabs + Visualforce template, the login page assigned to the community by default is called CommunitiesLogin. Use Visualforce to customize the appearance of this page.
- If your community uses the Napili template, the login page assigned to the community by default is called login. Use Community Builder (Site.com Studio) to customize its appearance.
- To update the login behavior for both Visualforce and Community Builder pages, update the CommunitiesLoginController Apex controller.
- Custom Community Builder pages must be published before they can be assigned to the community. Remember to modify the CommunitiesLoginController Apex controller and the Site.login() Apex method to use your custom login page.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Login & Registration and make your changes under the Login section.

3. Optionally, choose a custom login page for your community. Select the page type (Community Builder or Visualforce), enter the name of the page in the search field, and click . In the search results window, click the name of the page to select it.

   Tip: To revert to the default login page for your community’s template, select Default Page.

4. Optionally, select Allow internal users to log in directly to the community. This setting allows your internal users to use their internal credentials on the community login page.

   Internal users must be members of the community to log in directly from the community login page. After your internal users log in, they land on the community home page.

5. Select which login options you want to display.

   By default, users log in to the community using the default community username and password. If you want to allow them to log in with other credentials, such as their Facebook®, Janrain®, or Salesforce credentials from another organization, select those from the list.

   Important: Configure these authentication provider options in advance to be able to use them for community logins. From Setup, enter Auth. Providers in the Quick Find box, then select Auth. Providers.
6. Optionally, allow external users to log in with their SAML single-sign on identity.

This option is available only if your organization has successfully set up SAML for your community on page 3089 including:

- SAML settings for single sign-on, which enables login to Salesforce using your corporate identity provider. Note that you must enter an Identity Provider Login URL.
- A custom domain name, which changes the application URLs for all of your pages, including login pages. Contact Support if you need to enable My Domain.

To offer multiple SAML single sign-on options, enter Single Sign-On Settings in the Quick Find box, select Single Sign-On Settings, and then click Enable Multiple Configs. If you already had SAML enabled and you then enable multiple SAML configurations, your existing SAML configuration is automatically converted to work with multiple additional configurations.

Users see the option to Log In with Single Sign-On. If you have enabled multiple SAML single sign-on options, each login button displays labeled with the SAML configuration’s Name field.

7. Click Save.

Note: Renaming or deleting the default login page can cause problems with the default community login flow.

Customize Login, Logout, and Self-Registration Pages in Your Community

Customize the Login Process with Apex

You can provide community members outside your company with a completely custom login page that reflects your organization’s style and branding. Use Visualforce and Apex to either customize the CommunitiesLogin page and CommunitiesLoginController, or create your own Visualforce page.

To redirect from the default community login page to your custom login page:

1. From Setup, enter Apex Classes in the Quick Find box, then select Apex Classes.
2. Click Edit next to CommunitiesLoginController.
3. Add the following code:

```java
global PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');
    return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' + EncodingUtil.urlEncode(startURL, 'UTF-8'));
}
```

4. If you created a completely custom login page, replace SiteLogin with the name of your Visualforce page.
5. Click Save.
6. Click Edit next to CommunitiesLandingController.
7. Add the following code:

```java
public PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');
```

USER PERMISSIONS

To create and edit Visualforce pages:
- “Customize Application”
To edit Apex classes:
- “Author Apex”
  AND
- “Customize Application”
return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' + EncodingUtil.urlEncode(startURL, 'UTF-8'));

8. If you created a completely custom login page, replace SiteLogin with the name of your Visualforce page.

9. Click Save.

10. From Setup, enter Visualforce Pages in the Quick Find box, then select Visualforce Pages.

11. Click Edit next to CommunitiesLogin.

12. In the first line of code, add the following:

   action="{!forwardToCustomAuthPage}"

13. Click Save.

14. Click Edit next to CommunitiesLanding.

15. In the first line of code, add the following:

   action="{!forwardToCustomAuthPage}"

16. Click Save.

Redirect Community Members to a Custom URL on Logout

Specify the URL that community members should be redirected to when they log out from your community.

When community members log out, they are taken to the community login page by default. You can choose to point them to a different location, such as your company web site for example.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Login & Registration.

3. In the Logout section, enter the URL you want to redirect community members to.

4. Click Save.

SEE ALSO:

Customize Login, Logout, and Self-Registration Pages in Your Community
Use Custom Change Password and Forgot Password Pages in Your Community

Use a custom Community Builder or Visualforce page instead of the default Change Password and Forgot Password pages.

The Forgot Password page can be customized in Community Builder or Visualforce. If you want to use a custom Community Builder Forgot Password page, first publish your page in Community Builder.

The Change Password page can only be customized in Visualforce.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☰ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Login & Registration.

3. In the password section, select the Page Type: Community Builder or Visualforce.

4. Enter the name of the page or leave the field blank to search for all available pages.

5. Click , then click the name of the page in the search results to select it.

6. Click Save.

To revert to the default login page for your community’s template, select Default Page as the page type.

SEE ALSO:

Customize Login, Logout, and Self-Registration Pages in Your Community

EDITIONS

Available in: Salesforce Classic

Available in: Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To create, customize, or activate a community:
- “Create and Set Up Communities” AND
- Is a member of the community whose Community Management page they’re trying to access.
Set Up Self-Registration for Your Community

Enable self-registration to allow unlicensed guest users to join your community. You can choose to save them as contacts under a business account or create a person account for each self-registering user.

When you enable self-registration, these Visualforce pages and Apex controllers are associated with your community.

- **CommunitiesSelfReg** page and **CommunitiesSelfRegController**—Provide the form for partners or customers so they can register with your community. You can modify the **CommunitiesSelfRegController** Apex controller to change the default self-registration process, but it is no longer required starting with the Spring ’15 release.

  **Note:** Apex customizations for the self-registration process take precedence over the defaults specified in Community Management. In organizations created prior to the Spring ’15 release, existing Apex customizations for self-registration remain in effect as before.

- **CommunitiesSelfRegConfirm** page and **CommunitiesSelfRegConfirmController**—If a user doesn’t create a password during self-registration—either because they left the password field blank or your organization customized the self-registration form to omit the password field—this page confirms that a password reset email has been sent. Users landing on this page can’t log in until they reset their password.

The default self-registration pages and controllers are shared by all of your organization’s communities. If you enable self-registration for multiple communities, you must further customize the self-registration experience to direct users to different pages, assign different profiles or permission sets for different communities, and so on.

  **Note:** Renaming or deleting the default self-registration page can cause problems with the default self-registration flow.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☐ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter **All Communities** in the Quick Find box, then select **All Communities** and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click **Administration > Login & Registration**.

3. In the Registration section, select **Allow external users to self-register**.

4. Optionally, choose a custom self-registration page for your community. Select the page type (Community Builder or Visualforce), enter the name of the page in the search field, and click ☐. In the search results window, click the name of the page to select it. To revert to the default self-registration page (**CommunitiesSelfReg**), select Default Page.

Community Builder pages must be published, else they aren’t included in the page lookup search results. Remember to modify the self-registration **CommunitiesSelfRegController** and **CommunitiesSelfRegConfirmController** Apex controllers if you use a custom page.

5. Select the default **Profile** to assign to self-registering users.
6. Select the business **Account** that you want to assign self-registering users to.

   The self-registering user is assigned as a contact of the account you specify. To **create a person account** (if enabled) for each self-registering user, leave this field blank.

   Ensure that the account you use is enabled as a partner. To do so, go to the account, click **Manage External Account**, then click **Enable as Partner**.

7. Click **Save**.

   After you set up self-registration, a **Not a member?** link directs external users to the self-registration page from the login page. When a user self-registers to join your community:

   - Salesforce creates a new user record with the information they provide on the self-registration page.
   - The user is assigned the profile you specified when you set up self-registration.
   - The user is associated with a business account or a person account, depending on how you set it up.
   - Customer Community Plus and Partner Community licenses require user records to be associated with a role in your organization. If you don’t specify a role in the default self-registration profile, Salesforce assigns them the **Worker** role.

   **Note:** Keep in mind that each time a user self-registers, they consume one of your Communities licenses. When setting up your self-registration page, be sure to add some criteria to ensure that the right people are signing up. Additionally, to prevent unauthorized form submissions, we recommend using a security mechanism, such as **CAPTCHA** or a hidden field, on your self-registration page.

SEE ALSO:

- Customize Login, Logout, and Self-Registration Pages in Your Community
- Customize the Community Self-Registration Process with Apex
- Create Person Accounts for Self-Registering Users

### Create Person Accounts for Self-Registering Users

If your business deals mostly with individuals, instead of creating them as contacts under a single business account, you can assign each self-registering user to a person account.

**Important:** You must have Person Accounts enabled in your organization. Only Customer Community and Customer Community Plus licenses support the creation of person accounts.

In Community Management, under **Administration > Login & Registration**, enable self-registration and leave the **Account** field blank. Specify a default profile to assign self-registering users to.

Salesforce creates separate person accounts for each self-registering user. Each user is assigned the default profile you specified while setting up self-registration, and a default role. If you don’t specify a role, either on the profile or via the self-registration Apex controller, Salesforce assigns the **Worker** role to the self-registering users.

You can further customize this functionality by using the **self-registration Apex controller** (`CommunitiesSelfRegController`), but it’s not required.
You can also manually create person accounts and assign them to community users with Customer Community and Customer Community Plus licenses.

SEE ALSO:
- What Is a Person Account?
- Enable Person Accounts

Customize the Community Self-Registration Process with Apex

Update the CommunitiesSelfRegController to customize the default self-registration process for your community. You can use the same controller for the default self-registration page (CommunitiesSelfReg) or a custom Visualforce or Community Builder self-registration page.

You can configure self-registration entirely in Community Management. This customization is recommended only if you want to modify the self-registration behavior beyond the defaults, if you have more than one community in your organization, or if you are using a custom self-registration page.

**Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API deploy call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

1. From Setup, enter *Apex Classes* in the Quick Find box, then select *Apex Classes*.
2. Click *Edit* next to *CommunitiesSelfRegController*.
3. Optionally, enter a value for *ProfileId* to define the type of profile the user should be assigned.

   If you selected a default profile while setting up self-registration in Community Management, the value in the Apex code will override that default.

   **Note:** Note that regardless of which role you enter for the *roleEnum*, the role for new users will default to *None*. Once a user self-registers, you can update their role on the user detail page.

4. Enter the account ID for the partner or customer account that users who self register should be associated with.

   If you selected a default account while setting up self-registration in Community Management, the value in the Apex code will override that default.

   Ensure that the account you use is enabled as a partner. To do so, go to the account, click *Manage External Account*, then click *Enable as Partner*.

5. If you're enabling self-registration for multiple communities, add code to create appropriate types of users for each community, that is, assigning the correct profile, role, and account ID per community.

6. Click *Save*.
7. Enable access to accounts and contacts for the guest profile. The guest profile is automatically associated with your community’s Force.com site.

   a. From Setup, enter *All Communities* in the Quick Find box, then select *All Communities* and click the *Manage* link next to a community. To access this page, you need the Create and Set Up Communities’ permission.

   b. From Community Management click *Administration > Pages > Go to Force.com*.

   c. Click *Public Access Settings*.

   d. Click *Edit*.
e. In the Standard Object Permissions section, select Read and Create next to Accounts and Contacts.

f. Click Save.

g. In the Enabled Apex Class Access related list, click Edit.

h. Add the CommunitiesSelfRegController and click Save.

i. In the Enabled Visualforce Page Access related list, click Edit.

j. Add the CommunitiesSelfReg and click Save.

8. Optionally, if you want to customize the contents of the default self-registration page, edit the CommunitiesSelfReg page.

   a. From Setup, enter Visualforce Pages in the Quick Find box, then select Visualforce Pages.

   b. Click Edit next to CommunitiesSelfReg.

   c. Add code to customize the fields required for self-registration or the page’s look and feel.

      In the default form, all fields except Password are required.

   d. Click Save.

Once setup is complete, external users who submit the completed self-registration form (including a password) are logged in to the community.

⚠ Note: If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user.

If you’re using a custom Visualforce self-registration page instead of the default CommunitiesSelfReg page, add the following code to CommunitiesSelfRegController. Replace CommunitiesCustomSelfRegPage with the name of the custom self-registration page. Then add this to the first line of code in the CommunitiesSelfReg page.

---

**Use Other Salesforce Features In Your Community**

**Enable Cases for Communities Users**

Enable cases for external users so that they have access to and can create cases in your communities.

When you enable cases for external users in your community, you can assign cases to those members. Additionally, external members can edit cases, create new cases, add case comments, reassign cases, find case solutions, and create case teams. External users can’t edit case comments, associate assets with cases, or delete cases.

⚠ Note: Case comments added by external users in communities are public and can be viewed by any user that can view the case.

1. Add the Cases tab to the list of available tabs in your community.

2. Set tab visibility and “Read,” “Create,” and “Edit” object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.

   a. If using a profile, such as the Partner Community profile, set the cases tab setting to Default On and enable the “Read,” “Create,” and “Edit” object permissions for cases.

   b. If using a permission set, create a permission set with the following settings for cases:

      • In the Tab Settings, select Available and Visible.
In the Object Settings, select “Read,” “Create,” and “Edit”.

If case comment notification to contacts is enabled, emails sent to external users include a link to the community. Emails sent to contacts for case creation and update notifications also include a link to the community.

SEE ALSO:
- Merge Fields for Communities
- Enable Portal Reply Email Notifications in Case Feed

Set Up the Community Case Feed

Community Case Feed

With the community case feed, agents and community users see the life cycle of a case from start to finish: all case interactions appear in a unified, chronological Chatter case feed. Community users benefit from the added functionalities of Chatter, while support-side features help agents provide efficient, personalized support.

The community case feed gives community users an intuitive, versatile environment where they can manage their cases. Internal and external users see the following interactions in the community case feed:

- Chatter text, file, and link posts
- Questions in Chatter that are associated with the case
- Case emails

Note: To learn more about case email visibility, see Emails in the Community Case Feed.

If the Salesforce administrator exposes read-only social posts on cases, these also appear in the feed.

Community case feed in a community built on the Napili template:
Using the publisher (1), users create posts and attach files to the case. The feed (2) comes fully equipped with Chatter’s collaboration tools: users can bookmark, like, and comment on posts, and mention other users. Images and comments appear inline, making it easy to scan the feed for details. The Attachments component (3) displays all case attachments.

When the community case feed is enabled, support agents can:

- Use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases
- Expose or hide a published post or email in the community case feed of external users

The community case feed is available in all communities that use the self-service community templates or Salesforce Tabs + Visualforce.

**Known Issues**

- In communities built on templates, emails in the community case feed don’t display inline images or clickable links.
In communities built on the Koa or Kokua community templates, users’ names in the community case feed look like links but don’t lead anywhere.

- Community Case Feed Considerations
- Set Up the Community Case Feed
- Expose or Hide a Published Post or Email in the Community Case Feed

Set Up the Community Case Feed

The community case feed lets community users and support agents see all case interactions in a unified feed, and lets agents take more actions directly from the console. To set up the community case feed, enable it in your organization and make sure that the case page in your community is properly configured.

**Important:** Before setting up the community case feed, read Community Case Feed Considerations.

1. Enable the community case feed:
   a. From Setup, enter Support Settings in the Quick Find box, then select Support Settings.
   b. Select Enable Community Case Feed.
   c. Optionally, select Enable Email Notifications for Case Posts (recommended).
   d. Click Save.

2. If your community was built using Salesforce Tabs + Visualforce, make sure that your case page includes a Chatter feed.

3. If your community uses the Koa, Kokua, or Napili template, confirm that your active case detail page supports the community case feed:
   a. In Community Builder, click .
   b. Click Page Management.
   c. Find Case Detail in the Name column, and make sure that the active page assigned to it is either Chatter Case Detail (the default) or Record Detail.

If you change the active case detail page, publish your change.

**Important:** If the community case feed is enabled and you use Basic Case Detail as your active case detail page, external users only see case comments—not Chatter posts or emails—in their case feed. This gives external users far less visibility into their cases. To give users a full view of their case interactions, use Chatter Case Detail or Record Detail as your active case detail page.
**Community Case Feed Considerations**

Before setting up the community case feed, review this essential information.

**If the community case feed is enabled:**

- Agents can use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases.
- Agents can expose or hide published Chatter posts and emails in the case feed of external community users.
- External community users with access to a case see associated Chatter posts, questions, and emails in their case feed.

**If email notifications for case posts are enabled:**

- The case contact is notified by email when someone makes an externally visible post on their case. Users can comment on the post by replying to the email.
- If you’re already using custom email notification settings, such as those triggered by workflows, selecting this preference may create duplicate email notifications.
- Users in communities built on the Napili template or Salesforce Tabs + Visualforce can turn off these notifications in their email notification settings by deselecting **Posts on one of my cases** under “Email me when someone...”.

**SEE ALSO:**

- [Emails in the Community Case Feed](#)
- [Expose or Hide a Published Post or Email in the Community Case Feed](#)
- [Set Up the Community Case Feed](#)

**Emails in the Community Case Feed**

When you enable the community case feed, external users with access to a case see case emails in their feed. Emails in the community case feed include the email’s author, recipients, text, and time sent.

By default, if the case contact sends or receives a case email, that email appears in the feed of all users—both internal and external—with access to the case. For an external user to view the case, their profile must include access to cases in the community.

For example, suppose Rita, an external user, posts a question in a community. The question remains unresolved, and a community moderator creates a case from it using the Question-to-Case action. If the support agent assigned to the case emails Rita from the email publisher, Rita and all other users with access to the case see the email in their case feed. Users with access to a case typically include the assigned support agent and the case contact.

If the community case feed is enabled, you can write an Apex trigger or process to hide or expose all case emails in the feeds of external community users. The **IsExternallyVisible** field of the EmailMessage object controls the visibility of email messages in the community case feed. When the field is set to `true`, emails sent or received by the case contact are visible to external users with access to the case.

**Example:** The following trigger exposes all case emails in the feeds of external users with access to the case. This means that case emails between internal users will also be visible to external users with access to the case (for example, if the assigned support agent used the email publisher to email their shipping vendor). To hide all case emails from external users’ case feeds, simply change `true` to `false`:

```java
trigger makepublic on EmailMessage (before Insert) {
    for(EmailMessage oe:trigger.new)
    {
        oe.IsExternallyVisible=true;
    }
}
```
Exposure or Hide a Published Post or Email in the Community Case Feed

When necessary, support agents can expose or hide individual case emails and published Chatter posts in the case feed of community users.

To change the external visibility of a published Chatter post or email on a case:

1. Navigate to the post or email in the compact case feed.
2. In the post or email’s drop-down menu:
   - Select **Make Public** to expose an internal Chatter post or email in the case feed of external users with access to the case
   - Select **Make Private** to remove a Chatter post or email from the case feed of external users with access to the case

**Make Public option on a case Chatter post:**

![Make Public option on a case Chatter post](image)

**Make Public option on a case email:**

![Make Public option on a case email](image)
The agent who owns the case and their superiors see the **Make Public** and **Make Private** options on all case emails and Chatter posts on the case. Internal users who don't own the case also see these options on case posts or emails that they authored.

**Making Emails and Chatter Posts Private**

Clicking **Make Private** on a case Chatter post or email means that the case contact and any other external users with access to the case no longer see the post or email in their case feed. (It still appears in the feeds of internal users with access to the case.) An agent might choose to make an email or post in the community case feed private if they want to hide their correspondence with the case contact from the case feed of other external users with access to the case.

⚠️ **Note:** Keep in mind that when you make an email private, the email recipient(s) already received the email. Similarly, when you make a Chatter post private, remember that external users with access to the case may have been notified by email when it was first posted.

**Making Emails and Chatter Posts Public**

Clicking **Make Public** on a case Chatter post or email means that the case contact and any other external users with access to the case now see the post or email in their case feed. An agent might choose to make an email or post in the community case feed public in order to keep the case contact updated about internal progress on the case.

⚠️ **Note:**

- The case feed offers handy visual cues to help agents quickly identify which case posts are externally visible. To learn about enabling these visual cues, see “Feed View Options” in *Settings for Feed Views in Case Feed*.
- You can write an Apex trigger or process to hide or expose all case emails from the community case feed of external users. For more information, see *Emails in the Community Case Feed*.

**SEE ALSO:**

- Community Case Feed
Post on Cases and Community Questions with the Community Action in the Case Feed

The Community action in the case feed is your default option for responding to customers on cases that originated from a community or customer portal.

To post on cases in a customer portal or community:

1. Click Answer Customer on the Case Feed page.
2. Click ☰ and select Community. Depending on how your administrator has set up Case Feed, you may be able to click Community without first having to click Answer Customer.
3. Enter the message to the customer.

4. If you’re working on a case that was escalated from a question in Chatter Questions or Chatter Answers, choose who you want your post to be visible to:
   - Select Customer Only to post your answer as a private reply, or Everyone to post it as a public reply.
   - Select Customer Case to make a post visible to all internal and external users with access to the case, or Community Question to post a public answer on the community user’s question. If you select Customer Case and your Salesforce administrator has enabled the community case feed, you’ll be creating a Chatter post instead of a case comment.

5. Optionally, select Send Email to send a message to the customer letting them know that a reply to their question has been posted to the case.

   Note: This option is only available if your administrator has enabled it, and if the customer you’re replying to is associated with the case and has a valid email address. If your organization uses the community case feed and email notifications for Chatter case posts are enabled, users are automatically notified by email about public posts on their cases and this option doesn’t appear.
6. Optionally, attach a Knowledge article to the post.
7. Click the button to publish your post.

Note: If the community case feed is enabled in your organization, you can change the visibility of case posts after they are published. For details, see Expose or Hide a Published Post or Email in the Community Case Feed.

Enable Chatter Questions in Your Community

Chatter Questions helps you promote community engagement by giving users the ability to ask and answer questions in their Chatter feed, in groups, and in records. Members in your users’ groups and communities can answer questions in Chatter just as they would comment on a Chatter post. Users in communities built on the Napili template can also attach files to questions.

To set up Chatter Questions in your community, simply add the Question action to the global publisher layout. In organizations created after Summer ’14, the Question action is automatically added, but we recommend dragging it to the far left to increase its visibility.

Note: Chatter Questions is not available in communities built on the Koa and Kokua community templates.

1. From Setup, enter Publisher Layouts in the Quick Find box, then select Publisher Layouts.
2. Click Edit next to the global publisher layout.
3. Drag the Question action from the palette to the global publisher layout. If the Question action already appears in the layout, drag it to the location where you want it.
4. Click Save.
Enable Chatter Answers in Your Community

Chatter Answers is a self-service support community where users can post questions and receive answers and comments from other users or your support agents.

To set up Chatter Answers in Salesforce Communities, follow these high-level steps:

1. Enable Chatter Answers.
   a. From Setup, enter Chatter Answers Settings in the Quick Find box, then select Chatter Answers Settings.
   b. Select Enable Chatter Answers.

2. Ensure that your community members have access to the following objects within your organization:
   - Questions
   - Knowledge Articles
   - Data Categories

3. Create a zone for Chatter Answers.
   a. Enable the zone for Chatter Answers.
   b. Set the Visible In setting to the community that you want the zone shown in.
   c. As a best practice, select a public group from your organization to designate as a Customer Support Agents Group.

4. Add the Q&A tab to your community.
   a. From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities “Customize Application” permission.
   b. Click Administration > Tabs.
   c. Add the Q&A tab to the Selected Tabs list.
   d. Click Save.
   e. Click Close.

5. Make the Q&A tab visible on profiles that need access to it.
   a. From Setup, enter Profiles in the Quick Find box, then select Profiles.
   b. Click Edit for the profile that you want to make the Q&A tab visible for.
   c. Under Standard Tab Settings, set the Q&A tab to Default On.
   d. Click Save.

After you have enabled Chatter Answers in your community, consider the following extra deployment options:

- A public-facing Force.com site with or without a portal.
• A Visualforce tab, which provides branding, a customized landing page, and custom access to Chatter Answers within your community.

If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user. Set permissions for Chatter Answers on the community user.

Set Up Question-to-Case

Add Question-to-Case to your communities, your Salesforce organization, or both.

Question-to-Case lets moderators create cases from unresolved questions in Chatter, which makes it easier to track and resolve your customers’ issues. Moderators can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

Question-to-Case is only available in communities where Chatter Questions is enabled.

1. Enable Question-to-Case
   Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers’ questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

2. Add the Question from Chatter Field to the Case Detail View
   When a case is created from a question in Chatter, the Question from Chatter field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

3. Add the Escalate to Case Action to the Feed Item Layout
   Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

4. Confirm Access to the Escalate to Case Action
   Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

5. Customize the Escalate to Case Action Layout
   Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.
6. **Automatically Assign Cases from Questions to a Queue**

Case assignment rules aren’t supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you’d like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

7. **Automatically Create Cases from Unresolved Questions in Chatter**

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

- Enable Question-to-Case

---

**Enable Question-to-Case**

Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers’ questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

1. From Setup, enter *Support Settings* in the Quick Find box, then select *Support Settings*.

2. To enable Question-to-Case in all communities where Chatter Questions is enabled, select *Enable Question-to-Case in Communities*.

3. To enable Question-to-Case in your Salesforce organization, select *Enable Question-to-Case in Salesforce*.

4. Click *Save*.

**Note:** Make sure your case page layout is feed-based. The feed-based case page layout lets agents and moderators use the Community action to respond to escalated questions. If your organization was created before Spring ’14, your case page layout may not be feed-based.

**SEE ALSO:**
- Add the Question from Chatter Field to the Case Detail View

---

**EDITIONS**

Available in: Salesforce Classic

Available in: Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions

**USER PERMISSIONS**

To enable Question-to-Case:
- “Customize Application”
Add the **Question from Chatter** Field to the Case Detail View

When a case is created from a question in Chatter, the **Question from Chatter** field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

First, use field-level security to specify which users can see the **Question from Chatter** field on case detail pages.

1. From the object management settings for cases, go to Fields.
2. Click **Question from Chatter**.
3. Click **Set Field-Level Security**.
4. Select **Visible** for any profile that you want to be able to use Question-to-Case.
5. Click **Save**.

After you make the field visible to users, you can choose to add it to the Case Details view.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to the page layout that you want to customize.
3. Drag the **Question from Chatter** field from the Fields section of the page layout editor palette to the Case Information section of the page.
4. Click **Save**.
5. Click **Page Layout Assignment** to confirm that the user profiles which need Question-to-Case are assigned to the page layout that you customized. In addition, assign internal users who need access to the **Question from Chatter** field on cases to that page layout.

Add the Escalate to Case Action to the Feed Item Layout

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

1. From Setup, enter **Feed Item** in the Quick Find box, then select **Feed Item Layouts**.
2. Click **Edit** next to Feed Item Layout.
3. Drag the Escalate to Case action from the Quick Actions category in the palette to the Quick Actions in the Salesforce Classic Publisher section.
4. Click **Save**.
5. Click **Page Layout Assignments** to confirm that the user profiles that need Question-to-Case are assigned to the Feed Item Layout.

SEE ALSO:
- Confirm Access to the Escalate to Case Action
Confirm Access to the Escalate to Case Action

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

First, check which record type is assigned to the profiles that need access to the Escalate to Case action.

1. From Setup, enter Profiles in the Quick Find box, then select Profiles.
2. Click the name of a profile.
3. In the Record Type Settings section, make a note of which case record types the profile uses.
4. In the Permissions section, make sure that the user profile has either the Moderate Chatter or Moderate Communities Feeds permission enabled.

Then, check which record type the Escalate to Case action uses, and change it if necessary.

1. From Setup, enter Actions in the Quick Find box, then select Feed Item Actions.
2. Click Edit next to the Escalate to Case action.
3. Confirm that the Record Type field shows a record type that’s assigned to the profiles that need access to this action. If it doesn’t, select an appropriate record type from the drop-down list.
4. Click Save.

SEE ALSO:

Customize the Escalate to Case Action Layout

Customize the Escalate to Case Action Layout

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

1. From Setup, enter Actions in the Quick Find box, then select Feed Item Actions.
2. Click Layout next to the Escalate to Case action.
3. Drag any fields you want to add to the action from the action layout editor palette, and reposition them if necessary.
4. Click Save.

Note: In public communities, you can’t look up a contact when the case is submitted, so we recommend that you remove the Contact field from the Case Action layout.

SEE ALSO:

Automatically Assign Cases from Questions to a Queue
Automatically Assign Cases from Questions to a Queue

Case assignment rules aren’t supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you’d like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue if the Type field on the case is equal to Question. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions will depend on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see Create Queues.

SEE ALSO:
Automatically Create Cases from Unresolved Questions in Chatter

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

**Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that’s you? See Differences Between Q&A Features in Salesforce on page 2926.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than 10 likes, and a best answer hasn’t been selected.
- Create a case from a question immediately if the question contains the word “competitor.”

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- BestCommentId: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- CommentCount: The number of comments on a question.
- LikeCount: The number of likes on a question.

**Tip:**
- Each flow variable’s data type must match the feed item field’s data type. CommentCount and LikeCount are number fields, while BestCommentId is a text field.
The creation of a feed item can trigger a process, but updates to feed items (such as likes and comments) cannot. Depending on your process, you might need to specify how much time must pass before a related flow runs.

SEE ALSO:
- Lightning Process Builder
- Cloud Flow Designer
Enable Salesforce Knowledge in Your Community

Enable Salesforce Knowledge to let community users view Knowledge articles.
You can use Communities to access your knowledge base articles if your Salesforce organization has a Salesforce Knowledge license. Once Salesforce Knowledge is enabled, complete the following steps to view articles in your communities.

1. Update profiles:
   - Clone the Customer Community User, Customer Community Plus User, or Partner Community User profiles and enable the “Read” permission for article types you want to share with community users.
   - Verify that the tab visibility for the Articles (or Knowledge) tab is Default On.
   - Remember to click Edit Profiles, at the bottom of the detail page, and activate the new profile.

2. Add the Knowledge tab to each community.

   **Note:** Community members without the Knowledge One permission cannot access Knowledge through Communities. They also can’t access Knowledge in communities via the Salesforce1 mobile browser and downloadable apps.

3. If you want your community users to have different category group visibility settings, change the visibility settings by permission set, profile, or role. For example, you can prohibit users with the Customer Community User profile from seeing articles in a certain category group by changing the data category visibility for that profile.

4. Notify users who create articles that they must select Customer for users with Customer Community or Customer Community Plus licenses, or Partner for users with Partner Community licenses, as a channel option when creating or modifying an article. If the appropriate channel is not selected, the article is not published in the community.

Enable Ideas in Your Community

Ideas enable a group of users to post, vote for, and comment on ideas. Enabling Ideas in a community provides an online, transparent way for you to attract, manage, and showcase innovation.

To manage organization-wide settings for Ideas, follow these high-level steps:

1. From Setup, enter Ideas Settings in the Quick Find box, then select Ideas Settings:
   a. To enable Ideas for your organization, select the Enable Ideas checkbox.
   b. Optionally, select Enable Text-Formatting, Images and Links to enable the Ideas HTML editor, which gives users WYSIWYG HTML editing and image referencing capabilities when they post or comment on ideas. Once you enable the HTML editor, you can’t disable it.
   c. Ensure that the multi-select Categories field is enabled by clicking the Enable button located below the Categories message at the top of the page. This button is not displayed if your organization already has the Categories field enabled.
   d. To let Ideas members associate more than one category with an idea, select Enable Categories. Once you enable multi-select categories, you can’t disable it.
   e. To let users earn points and ratings based on their activity in each zone, select Enable Reputations.
   f. In the Half-Life (in Days) field, enter the number of days. The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life.

2. Define and customize fields for Ideas:
   a. Define picklist values for the Categories and Status fields. Make sure that you add the categories and statuses to the zones you’ll be including in the community.
   b. Set field-level security for standard and custom fields.
   d. Optionally, add the Attachment field to the layout and set field-level security to enable users to add files to their ideas.

3. To enable experts within your zones, create a public group that includes these users.
4. Optionally, enable Idea Themes in your organization.
5. Create one or more zones to organize ideas into logical groups, and associate the zones with the community.
6. Customize your Ideas page layouts to display the information you want to see.
7. Create validation rules that prevent offensive language from being used in the zone.
8. Set up Apex triggers and validation rules for comments on ideas.
9. Enable user profiles for community members and moderators and ensure the profiles can access Ideas.
10. Add the Ideas tab and the Idea Themes tab to the community.

SEE ALSO:
   Customizing Ideas Settings
Enable Leads for Partner Users

Enable leads for partner users so that they have access to and can create leads in your communities. When you enable leads for partner users in your community, you can assign leads to those members. Additionally, partner users can edit leads, create leads, import leads, and also mass update leads in a list view.

1. In Community Management, click **Administration > Tabs**, and add the **Leads** tab to the list of available tabs in your community.

2. In Setup, set tab visibility and object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.
   a. If using a permission set, use the following settings for leads:
      - In the Tab Settings, select Available and Visible.
      - In the Object Settings, select “Read,” “Create,” and “Edit.”
   b. If using a profile, such as the Partner User profile, set the leads tab setting to **Default On** and enable the “Read,” “Create,” and “Edit” object permissions for leads.

3. Optionally, you can assign extra permissions that enable advanced features for your partners. If you plan to apply these permissions to only some of your partner users, we recommend creating separate permissions sets.

   **Note:** Partner users with legacy portal licenses can use these advanced features in communities, but not in portals.

<table>
<thead>

**USER PERMISSIONS**

To enable leads for partner users:

- **Manage Profiles and Permission Sets**
Set Up Approvals for External Users in Your Community

Customer and partner users in your community can be assigned as approvers on records or added directly to queues. They can see and take action through the My Approvals and Approval History related lists on the record. Approvals can also be triggered directly from the Chatter feed.

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

% Note:

- Users with high-volume licenses, such as High Volume Customer Portal and Authenticated Website, can’t approve records.
- External users with legacy portal licenses can approve records in communities, but not in portals.

When setting up approvals or queues, use the lookup fields to find customer and partner users. For example, when setting up an approval, if you want to automatically assign a customer user as an approver use the lookup list to find and specify the user.

If you set up email notifications for your approval workflows, emails are sent based on community membership. If the user is a member of multiple active communities, the email comes from the oldest active community. Any links included in the email point users directly to the approval within the community.

In Salesforce1, users can see and take action from the Approval History related list, but they can’t submit requests for approval. To submit requests for approvals, the user must do so from the full Salesforce site.

Enable Wave Analytics in Your Community

Enable Wave for Communities to allow your partner and customer users to view and explore Wave Analytics dashboards in your community.

Note: Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

Complete the following steps to share Wave dashboards in your community.

1. Set up Wave Analytics in your Salesforce org, as described in the Wave Platform Setup section.
2. Enable Wave for Communities and set up community members. See Enable Wave Analytics for Communities.
3. In Wave, create dashboards and save them in a Wave app. Designate that app for sharing with the community. For more information about working with Wave, refer to the Wave Analytics Library.
4. Embed your Wave dashboards in Visualforce pages in your community. For more information, see Add a Wave Analytics Dashboard to a Visualforce Page. If you embed a dashboard in a new Visualforce page, create a tab for the page and add the tab to your community.
5. From the Wave app containing your dashboards, give access to community members by selecting Share. In the Share dialog, select Enable sharing with Communities. Invite community partners and customers to share the app.

For information, see Share Wave with Communities.

Community Security and Authentication

You can help keep your community more secure by authenticating users and encrypting some of the community's data.

Authenticate Community Users

You have several options for authenticating users in your community. By default, external users authenticate by logging in with the username and password that Salesforce assigns them for the community. (External users are users with Community, Customer Portal, or partner portal licenses.) Your organization’s internal users just follow the employee login flow using their Salesforce username and password.

Encrypt Community Data

You can add a measure of security to your community by encrypting files, attachments, and many popular data fields. After encryption is enabled, only users with the “View Encrypted Data” permission can see that information.

Authenticate Community Users

You have several options for authenticating users in your community. By default, external users authenticate by logging in with the username and password that Salesforce assigns them for the community. (External users are users with Community, Customer Portal, or partner portal licenses.) Your organization’s internal users just follow the employee login flow using their Salesforce username and password.
Note: All authentication options also work with custom HTTPS web addresses.

Configure SAML for Communities
If your organization uses an existing single sign-on capability to simplify and standardize your user authentication, you can extend this capability to communities.

Configure Authentication Providers
External users can log in using their credentials from Facebook®, Janrain®, or another Salesforce organization if you set up authentication providers on the Auth. Providers page in Setup and choose to display them on the community login page.

Configure Authentication Flows with OAuth
If your organization wants to build integrations between communities and custom-branded apps, such as mobile or desktop apps, you can use OAuth to create a branded login page.

SEE ALSO:
Customize Login, Logout, and Self-Registration Pages in Your Community

Configure SAML for Communities
If your organization uses an existing single sign-on capability to simplify and standardize your user authentication, you can extend this capability to communities.

The following information assumes that you are already familiar with Security Assertion Markup Language (SAML) authentication protocols and know how to work with your identity provider to configure single sign-on for your organization. When implementing SAML for communities, the key is to use the community URL associated with login for the single sign-on flow. Also make sure that the community URL in the SAML assertion POST includes /login.

Here is a summary of how SAML requests and responses are processed between the user’s browser, the community, and your identity provider.
This table compares what’s required for community SAML assertions to what’s required for other types of Salesforce domains.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Standard</th>
<th>Portal</th>
<th>Force.com Sites</th>
<th>Community</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL where SAML assertion POST is made.</td>
<td>login.salesforce.com</td>
<td>login.salesforce.com</td>
<td>login.salesforce.com</td>
<td>community URL</td>
</tr>
<tr>
<td>Are organization_id and portal_id required in assertion?</td>
<td>No</td>
<td>Yes—passed as an attribute</td>
<td>Yes—passed as an attribute</td>
<td>No</td>
</tr>
<tr>
<td>Is siteUrl required in assertion?</td>
<td>No</td>
<td>No</td>
<td>Yes—passed as an attribute</td>
<td>No</td>
</tr>
</tbody>
</table>
The following sample SAML assertion shows the community URL specified as the Recipient, for a sample customer community in the Acme organization. This example applies to an organization that has a single SAML configuration.

```xml
<samlp:Response ID="_f97faa927f54ab2c1fef230eee27cba212d4264205456"
    IssueInstant="2009-06-17T18:43:25.456Z" Version="2.0">
    <samlp:Status>
    </samlp:Status>
    <saml:Assertion ID="_f690da2480a8df7fcc1cbee5dc67ddbb1245264205456"
        IssueInstant="2009-06-17T18:43:25.456Z" Version="2.0">
        <saml:Subject>
            <saml:NameID Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified">saml_portal_user_federation_id</saml:NameID>
            <saml:SubjectConfirmation Method="urn:oasis:names:tc:SAML:2.0:cm:bearer">
                <saml:SubjectConfirmationData NotOnOrAfter="2009-06-17T18:48:25.456Z" Recipient="https://acme.force.com/customers/login/?saml=02HKiPo4f49GRMsOdFmhTgi_0nR7BBAflodnD3gtixujECWp9k1Aw"/>
            </saml:SubjectConfirmation>
        </saml:Subject>
            <saml:AudienceRestriction>
            </saml:AudienceRestriction>
        </saml:Conditions>
            <saml:AuthnContext>
            </saml:AuthnContext>
        </saml:AuthnStatement>
    </saml:Assertion>
</samlp:Response>
```

If your organization has multiple SAML configurations, the previous sample SAML assertion applies but note these differences in the Recipient:

- The trailing slash after `login` is not required.
The so parameter is required and must specify the organization ID.

The Recipient would look like this:

```
Recipient="https://acme.force.com/customers/login?so=00DD0000000JsCM"
```

When logging out of a community, external users authorized using SAML for single sign-on are redirected to the Identity Provider Logout URL, if one is set in the community's SAML settings. To access the SAML settings, from Setup, enter Single Sign-On Settings in the Quick Find box, then select Single Sign-On Settings.

SEE ALSO:
- Example SAML Assertions
- Best Practices for Implementing Single Sign-On
- Single Sign-On with SAML on Force.com

### Configure Authentication Providers

External users can log in using their credentials from Facebook©, Janrain©, or another Salesforce organization if you set up authentication providers on the Auth. Providers page in Setup and choose to display them on the community login page.

**Note:** The following information assumes that you are familiar with the use of authentication providers for single sign-on.

If you're using a custom Visualforce login page instead of the default login page, use the Single Sign-On Initialization URL from an Auth. Provider detail page as the target URL of a custom login button. For example:

```
```

If you're using Janrain as the authentication provider you can pass the following to the Janrain login widget that's deployed on your site.

```
```

SEE ALSO:
- About External Authentication Providers
- Using Request Parameters with Client Configuration URLs
- Customize Login, Logout, and Self-Registration Pages in Your Community

### Configure Authentication Flows with OAuth

If your organization wants to build integrations between communities and custom-branded apps, such as mobile or desktop apps, you can use OAuth to create a branded login page.

The following information assumes that you're familiar with OAuth protocols and authentication flows for remote access applications. Communities support all available authentication flows, except for the username-password OAuth authentication flow and the SAML assertion flow. When implementing branded OAuth flows for communities, you configure the authorize URL to use the community URL. The authentication flow then directs users to the application approval page.

**Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.
For example, to authenticate a user using an authorize URL like the following:

https://login.salesforce.com/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri

Replace the login.salesforce.com host name with the full path to the community URL:

https://acme.force.com/customers/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri

When implemented successfully, this URL directs users to the community login page. After they authorize the app, you then set a user access token and refresh token for future authentication. In requests for the token endpoint, replace the host with the community, like this:

https://acme.force.com/customers/services/oauth2/token

Note: After you acquire the access_token you can pass it as a Bearer token in the Authorization header request. Following is an example of a REST API call to communities: https://acme.force.com/customers/services/data/v32.0/
-H "Authorization: Bearer
00D50000000IehZ\!AQcAQH0dMHfz972Szmpkb58urFRkgeBGs\L_QJWwYmfAbUeeG7c1E6
LYUfiDkWe6H34r1AAwOR8B8fL3z6n04NFGRq0FBM"

Encrypt Community Data

You can add a measure of security to your community by encrypting files, attachments, and many popular data fields. After encryption is enabled, only users with the "View Encrypted Data" permission can see that information.

Keep the following things in mind:

• You can encrypt data in communities, but not in portals.
• If you are using Classic Encryption, data in encrypted custom fields is still masked.
• Your community’s specific settings for personally identifiable information (PII) apply regardless of whether data is encrypted.
• Only licensed community users can have the "View Encrypted Data" permission. You can’t assign it to guest users.

For users with the "View Encrypted Data" permission, data encryption doesn’t change anything about the community experience. However, encrypting the Account Name field has an effect on how users’ roles are displayed to admins. Normally, a community user’s role name is displayed as a combination of their account name and the name of their user profile. When you encrypt the Account Name field, the account ID is displayed instead of the account name.

For example, when the Account Name field is not encrypted, a user belonging to the Acme account with the Customer User profile would have a role called Acme Customer User. When Account Name is encrypted, the role is displayed as something like 001D0000000IRt53 Customer User.
Only users with the “View Encrypted Data” permission can create community users from a contact record that contains encrypted standard fields.

Design and Page Management

Plan Your Community Design Strategy

If you chose to use custom pages in your community instead of out-of-box tabs and branding, you need to decide whether to use Community Builder or Force.com. Once you make the decision, use the following sections to help you customize community pages:

- Use Visualforce and Force.com Sites
- Using Community Builder With Templates
- Use Community Builder (Site.com) Without Templates

You can also customize these other areas of your community:

- Add the Global Search Box to Your Customized Community HTML Header on page 3059
- Configure a Custom Domain for Your Community
- Rename the Chatter Tab

Choosing Between Community Builder and Force.com Sites

If you want to add new pages or customize existing pages in your community, you can use Force.com Sites or Community Builder. With either option, you can create branded, publicly available pages such as landing or marketing pages, and private custom pages that only community members can access.

So which option should you use to customize your community? Well, that depends on your skills and the needs of your organization. You can even use a mixture of Force.com pages and Community Builder pages for complete control over your customizations.

Community Builder

Community Builder is an intuitive, convenient tool for customizing your community. Community Builder lets you create a community based on a preconfigured template, and then apply branding, edit pages, update your template, and publish changes all from one user-friendly interface.

Here’s what you can achieve with Community Builder:

- Use one of the self-service templates—Koa, Kokua, or Napili—to easily create a responsive self-service community.
- Use the Aloha template to create a configurable App Launcher.
- Design pixel-perfect, branded pages.
- Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
- Build and iterate quickly using drag-and-drop reusable page elements.
- Use ready-made forms to create web-to-lead forms or gather customer feedback.
- Create data-driven pages, such as product catalogs or other listings, using your organization’s data.
- Set a home page and set up multilingual support for your community in Site.com Studio, a Web content management system that provides extra configuration options. Site.com Studio is easily accessible from Community Management.
Force.com Sites

Suitable for developers with experience using Visualforce, Force.com Sites lets you build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you. Here’s what you can achieve with Force.com:

- Create public, branded pages that anyone can access.
- Leverage Visualforce to create private pages that you can add as a tab within your community.
- Write your own controllers, or extensions to controllers, using Apex code.
- Create custom login or self-registration pages.
- Build dynamic web applications, such as an event management application.

Features At a Glance

### Use Community Builder With Templates

Community Builder in conjunction with community templates for self-service lets you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company’s branding.

With Community Builder and templates you can:

- Quickly style the community to match your company’s branding.
- Edit community pages and components with the Community Builder to customize their design and content.
- Preview your community to ensure that it appears correctly on different devices.
- Publish your changes to make them available to everyone in your community.
- Apply template updates to your community as soon as they become available.

You can use the Community Builder to customize communities created using these templates:

**Kokua**
A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can’t find what they’re looking for. Supports Knowledge and Cases.

**Koa**
A text-based, responsive self-service template that lets users search for and view articles or contact support if they can’t find what they’re looking for. Supports Knowledge and Cases.

**Napili**
A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

**Aloha**
A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication.

To access Community Builder and continue customizing your community or update its template version:

1. From Setup, enter *All Communities* in the *Quick Find* box, then select *All Communities*.
2. Next to the community name, click *Manage*.
3. Click the Community Management menu in the global header, then click *Go to Community Builder*.
4. In Community Builder, you can:
   - Brand your community on page 3110
   - Edit community pages and page components.
   - Update your community template.
Note: Community Builder doesn’t support branding for sites that weren’t created using one of the preconfigured templates. Instead, you must use Site.com Studio To get there, click Site.com Studio from the Communities menu in the toolbar.

To learn more about using the Kokua, Koa, and Napili templates, see the Community Templates for Self-Service Implementation Guide.

SEE ALSO:
Choosing Between Community Builder and Force.com Sites

Use Community Builder (Site.com) Without Templates

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don’t require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.

Before You Begin

Communities users with the “Create and Set Up Communities” permission automatically have full site administrator access to a community’s Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See About Site.com User Roles on page 4509.

Tips and Considerations

• Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.

• You can’t create, delete, or duplicate community sites in Site.com.

• When working with data-bound components, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.

• When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click Configure under Field Properties in the Properties pane, select Global Property as the source, and select Current userID as the value.

• The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under Administration > Pages and Administration > Login & Registration. Community error pages are specified in Force.com Setup, under Error Pages.

• When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.

• The contributor’s view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See About Feature Licenses in the Site.com help for details. Alternatively, a user can...
preview the Site.com Community site as a contributor by appending ?iscontrib to the site’s URL. For example: https://sitestudio.na1.force.com/?iscontrib

SEE ALSO:
- Choosing Between Community Builder and Force.com Sites
- Use Site.com to Customize Your Community
- Salesforce Communities Overview

Use Visualforce and Force.com Sites

Each community has one associated Force.com site that lets you make advanced customizations to your community. For example, with Force.com Sites you can:

- Add public pages to your community that don’t require login.
- Use branded self-registration and login pages to enable users to register for or log into your community.
- Customize out-of-the-box error pages to reflect the branding of your community, including “Authorization Required (401)” and “Page Not Found (404)” pages.
- Leverage Visualforce pages to create private pages that only community members can access.

For detailed information about using Force.com Sites, refer to the online help.

Tips and Considerations

- Force.com Sites pages automatically include the branding styles you specify in the Create Community wizard. To disable these styles, set the standardStylesheets attribute on the <apex:page> tag to false.
- Consider these limitations when using Force.com Sites with Communities:
  - Out-of-the-box RSS feeds, analytics tracking, and custom portal profile pages aren’t available.
  - Custom change-password pages aren’t available.
  - Login to custom domains is only available with HTTPS.
- Because Force.com sites are served directly from the Force.com organization, a site’s availability is directly related to the organization’s availability. During your organization’s maintenance window for major releases, your sites will be unavailable; users who try to access a site will see a Force.com-branded maintenance page or your custom Service Not Available Page.
- You can redirect a community home page to its companion Site.com home page. To do this, set a URL Redirect on the Force.com site detail page. Set the Source URL to /, which represents the home page for the community, and set the Target URL to s, which represents the home page for the Site.com site.

SEE ALSO:
- Choosing Between Community Builder and Force.com Sites
Custom Community Pages

Override Default Pages in Your Community with Custom Pages

Use company-branded Community Home and Service Not Available pages by overriding the standard pages in your community.

- **Use a Custom Community Home Page**
- **Use a Custom Page for Service Unavailability**

You can override other default community pages in the Site.com or Force.com settings for the community. To do this, click the Community Management menu in the global header and then click **Go to Force.com** or **Go to Site.com Studio**. Page selections in Community Management automatically override any previously specified page selections in the Site.com or Force.com settings.

Use a Custom Page for Service Unavailability

On rare occasions, if your community is not available because of a service outage, Salesforce displays a generic Service Not Available page with Force.com branding. You can replace this page with a custom company-branded static resource page for a personalized user experience for your community members.

The Service Not Available static resource:

- Must be a public .zip file 1 MB or smaller.
- Must contain a page named `maintenance.html` at the root level of the .zip file. Other resources in the .zip file, such as images or CSS files, can follow any directory structure.
- Must contain only files that have file extensions.

For more information, refer to Assigning Force.com Site Error Pages in the Salesforce Help.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ![Community Icon](image) in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
   - From Setup, enter **All Communities** in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

2. Navigate to **Administration > Pages**.

3. Click ![Search](image) next to **Service Not Available** to search for and select your custom page.

4. Click **Save**.

If there is a service outage at any time, your community displays your selected page. A couple things to keep in mind:

- This page selection doesn’t affect communities that use Site.com Studio pages.
- The Service Not Available page, once customized, is available for all communities in the same domain. Depending on the needs of your organization, this might not be desirable. To avoid using the same page for all the communities in your domain, create and assign separate Service Not Available pages for each community.
For example, consider a scenario where you have two communities in your domain: a customer community (universalteleco.force.com/customer) and a partner community (universalteleco.force.com/partner). If you use a custom Service Not Available page for only the customer community, then the partner community will display the same page during a service outage, unless you create and assign a separate Service Not Available page to the partner community.

SEE ALSO:
Override Default Pages in Your Community with Custom Pages

Use a Custom Community Home Page

Personalize the standard community home page with company branding by using a custom Community Builder (Site.com Studio) or Visualforce page.

The community home page is shown to unauthenticated users in a public community and it allows you to specify a landing page for guest users without setting up redirects. This page is also known as your Active Site Home page.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☐ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Pages.

3. For the Community Home page:
   a. Select the page type: Community Builder or Visualforce.
   b. Enter the name of the page or leave the field blank to get a list of available options.
   c. Click ☐, then click the name of the page in the search results to select it.

   Note: Only published Community Builder (Site.com Studio) pages are included in the search results.

4. Click Save.

Page selections in Community Management automatically override any previously specified page selections in the Site.com or Force.com site properties.

SEE ALSO:
Configure the Default Community Login Page to Use a Custom Home Page
Override Default Pages in Your Community with Custom Pages
Configure the Default Community Login Page to Use a Custom Home Page

If you’re using external authentication providers and a custom home page, ensure that users are accessing the correct home page.

To do so, edit the `CommunitiesLandingController` so that it has the correct `startURL` for your community. The `CommunitiesLandingPage` is the Active Site Home Page for your community, meaning that it is shown when someone enters a direct URL to your community. For instance, if your domain is `universalTELco.force.com` and your community URL is `customers`, the `CommunitiesLandingPage` is shown when someone enters `http://universalTELco.force.com/customers`.

There are 2 methods for using a custom home page:

- Update the `CommunitiesLandingController` code to redirect to the new page:
  1. From Setup, enter Apex Classes in the Quick Find box, then select Apex Classes.
  2. Click Edit next to `CommunitiesLandingController`.
  3. Replace the code so that it reads:

```java
public with sharing class CommunitiesLandingController {
    // Code we will invoke on page load.
    public PageReference forwardToStartPage() {
        String communityUrl = 'https://universalTELco.force.com';
        String customHomePage = '/apex/hello';
        if (UserInfo.getUserType().equals('Guest')) {
            return new PageReference(communityUrl + '/login?startURL=' + EncodingUtil.urlEncode(customHomePage, 'UTF-8'));
        } else {
            return Network.communitiesLanding();
        }
    }
    public CommunitiesLandingController() {} }
```

- Update the `CommunitiesLandingPage` so that it has the correct `startURL` for your community.

For instance, if your domain is `universalTELco.force.com` and your community URL is `customers`, the `CommunitiesLandingPage` is shown when someone enters `http://universalTELco.force.com/customers`.

To do so, edit the `CommunitiesLandingController` code to redirect to the new page:

1. From Setup, enter Apex Classes in the Quick Find box, then select Apex Classes.
2. Click Edit next to `CommunitiesLandingController`.
3. Replace the code so that it reads:

```java
public with sharing class CommunitiesLandingController {
    // Code we will invoke on page load.
    public PageReference forwardToStartPage() {
        String communityUrl = 'https://universalTELco.force.com';
        String customHomePage = '/apex/hello';
        if (UserInfo.getUserType().equals('Guest')) {
            return new PageReference(communityUrl + '/login?startURL=' + EncodingUtil.urlEncode(customHomePage, 'UTF-8'));
        } else {
            return Network.communitiesLanding();
        }
    }
    public CommunitiesLandingController() {} }
```
4. Replace https://universaltelcom.force.com with the URL for your community.
5. Click Save.

- Alternatively, you can replace the Active Site Home Page with a custom Visualforce page.
  1. From Setup, enter All Communities in the Quick Find box, then select All Communities.
  2. Click the Manage button next to the community name.
  3. Click Administration > Pages > Go to Force.com.
  4. In the Site Detail section, click Edit.
  5. In the Active Site Home Page field, select your custom Visualforce page.
  6. Click Save.

When a user enters the community URL, they see the new Active Site Home Page.

SEE ALSO:
Use a Custom Community Home Page

Add Custom Pages That Don’t Require Login

Within a community, you can have publicly available pages that are accessible without requiring login, making them ideal for landing or marketing pages.

Communities leverage Force.com Sites technology to set a custom domain for your organization and a URL prefix for each community created in your organization. If you want to further customize your communities beyond what’s available in setup, you can use Force.com Sites or Site.com to create completely customized pages.

Tip: Communities can have a combination of Visualforce and Site.com pages. By default, the pages you create don’t require login, but you can add authenticated pages if needed.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Click Administration > Pages and then in the Advanced Customizations area, click either:
   - Go to Force.com to create pages that don’t require login or edit out-of-the-box error pages.
   - Go to Site.com Studio to open Site.com Studio, where you can create public, branded pages. (You can also create authenticated pages that require login.)

3. After you create a public page in Site.com Studio, you must publish the Site.com site to allow users to access the page.

For more information about creating pages, refer to these resources:
- Creating Site.com Pages on page 4562
- Managing Force.com Site Visualforce Pages on page 4700
Community Templates

Which Community Template Should I Use?

Community templates let you quickly and easily build a self-service community that gives customers the same visual and functional experience whether they use a tablet, a mobile device, or their desktop.

Your customers want an easy way to interact with your company whenever and wherever they are. A self-service community gives your customers an easy way to access the information they need when they have questions. With communities built on the Koa and Kokua templates, customers can search for information using knowledge articles and contact support, if necessary. When they’re in a community based on the Napili template, they can search for articles as well as ask questions and get crowd-sourced answers from the community. If they still can’t find what they’re looking for, they can contact support without having to log in. The self-service templates let you extend your community to various devices with a consistent user experience every time.

A wizard guides you through selecting a template and then walks you through the initial setup for your data categories or topics—depending on which template you’re using.

- Kokua is a visually rich self-service template that presents users with knowledge articles organized by data categories. Users can also submit cases to get help from agents.
- Koa is a text-based self-service template that’s optimized for mobile devices. It lets users search for and view articles by text representations of data categories, and contact support if they can’t find what they’re looking for.
- Napili is a powerful support community template that lets your customers post questions to the community and search for and view articles. If they don’t find what they’re looking for, they can contact a support agent.
Community Builder makes it super easy to customize your community. Simply edit a few of the components to include information about your community, add a few images to extend your branding, and you’re ready to go—without any coding! Additionally, if you want a more custom experience, you can create custom pages, add components to pages, use custom Lightning components, and expose additional Salesforce objects.

Communities are automatically displayed in a logged-in user’s profile language, so you don’t need to create and manage a separate community for each language. With Community Builder, you can extend the support for Guest users in communities so that if their language isn’t supported, they can choose one from a language picker on each community page. And because all languages are maintained within the community, you don’t need to create and manage a separate community for each language.

Napili Template Community Setup Checklist

Building a community is the result of research, mapping of goals, and defining your audience. At the same time, you must have all your ducks in a row so the actual implementation process is seamless. You know your org best, but use this general checklist to help you organize what you need for a community using the Napili template.

Have you considered everything on these lists?

Before you begin:

Gather your branding assets:

- High-resolution image of your company logo
- Color scheme (or an image to upload to automatically generate one)
- Image to use as a header
- Thumbnail images (385x385 pixels), if you’re using Featured Topics

In your internal Salesforce org:

- Enable Salesforce Communities. Choose a unique URL that works for your business, because you can’t change it after it’s been set.
- Set up email templates for any communication between the community and its members (welcome email, resetting password email, etc.).
- Enable the Global Header for Communities for the system administrator profile, and any other profiles accessing your community from the internal org.
- Enable any Service Cloud features you plan to use in the community, such as Salesforce Knowledge.
- Review profiles and add permission sets as needed.
- Set up Web-to-Case.

If you’re using Salesforce Knowledge:
Review your data categories.
Enable feed tracking for your Knowledge article types.

As You’re Making Your Community:

*In your internal Salesforce org:*
- Add members to your community.

Configure the Guest User Profile (access using Community Management or the Community Builder):
- Give read and create permissions for the case object.
- If using Salesforce Knowledge, give guests access to your data categories.

*In Community Management:*
- Set up navigational topics and subtopics, and associate articles to each topic.
- Set up featured topics and associated images
- Download the latest Salesforce Communities Management from the AppExchange.
- Set up moderation criteria and rules.
- Enable and set up reputation.

*In Community Builder:*
- Customize your community to match your company’s branding.
- Add standard and custom Lightning components to customize their design and content.

After Making Your Community

- Set up an internal Chatter group for feedback, and invite people to take a test drive while the community is still in preview mode.
- Incorporate their feedback, and then publish your community.
- Seed the community with some initial content: welcome posts, groups, and relevant or fun articles.

Customize Templates with Community Builder

Community Builder Overview

Community Builder in conjunction with community templates for self-service lets you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company’s branding.

With Community Builder, you can:
- Quickly style the community to match your company’s branding.
- Edit community pages and components with the Community Builder to customize their design and content.
- Preview your community to ensure that it appears correctly on different devices.
- Publish your changes to make them available to everyone in your community.
- Apply template updates to your community as soon as they become available.
Community Builder works in conjunction with all of the preconfigured templates.

**Note:** If you don’t want to use the preconfigured templates, you can still create a custom community in Site.com Studio. However, you won’t be able to use Community Builder for branding.

To try out a different template, go back to Community Management and change your template selection. But don’t worry—you can always switch back to the first template you chose. To switch back, set the home page back to its original URL in Site Configuration in Site.com Studio.

**Known Limitations**

- Community Builder doesn’t support branding for sites that weren’t created by using one of the preconfigured templates.

**SEE ALSO:**

- Navigate Community Builder
- Manage Your Community’s Settings in Community Builder
- Implementation Guide: Using Templates to Build Communities

**Navigate Community Builder**

Community Builder lets you quickly create and style your custom community to match your organization’s branding.

**Note:** Community Builder only supports branding for communities that were created with one of the Community Builder-based templates.

Access Community Builder from any of the following:

- From the global header menu in Community Management, click **Community Management > Go to Community Builder**
- From the All Communities page in Setup, click **Builder** next to the community name
- From a community, use the Community Builder link in the profile menu

In Community Builder, you can:

- **Brand the community** to match your organization’s style (1).
- **Edit your community pages** in the Page Editor to add, update, or remove page components (2).
- **Manage, create, delete, and set the visibility** of community pages in the Page Manager (3).
- **Accept updates** to your community’s template and **edit community settings** (4).
- **Navigate** to the community page that you want to style by clicking links and navigation menu items (5).
- **Use the Communities menu** (6) to:
  - Go to the community, once it has been activated.
  - Access Community Management to manage community analytics, login, registration, reputation, topics, and other settings.
  - Go to Site.com Studio to add advanced community customizations.
- **See how your community appears on different devices** (7).
- **Preview the community** in a new browser window (8).
- **Publish your changes** to make your updates available to everyone in your community (9).
Use the profile menu (10) to:

- Access My Profile in your internal Salesforce org.
- Access My Settings in your internal Salesforce org to quickly change your personal settings.
- Go to the Developer Console integrated development environment.

Manage Your Community's Settings in Community Builder
Implementation Guide: Using Templates to Build Communities
Brand Your Community with Community Builder

Use Community Builder’s enhanced Branding Editor to efficiently apply color and style to your community. Choose a color scheme with the color palette, which provides a wide range of colorized text elements for a personalized design. Match your colors precisely by uploading your own logo to automatically generate a custom color palette.

Each template includes predefined styles to control the appearance of the pages. These styles give you a head start with your community, and you can easily customize the styles further to suit your needs. After you’ve created a community, brand and style your pages with Community Builder’s Branding Editor.

Depending on the template that you select, you can use Community Builder to:

- Apply a color scheme that’s appropriate for your template with the color palette.
- Choose colors for text, borders, and button backgrounds.
- Upload your own company logo image to generate a custom color palette based on its main colors.
- Maintain your own color palettes by saving or removing them as needed.
- Specify font family, style, and weight.
- Change header and page background color, font family, font size, and font color.
- Use custom CSS to apply your own styles

Note: The available branding options vary depending on the template that you’re using and the page that you’ve selected.
When you upload your own logo to the Branding Editor, Community Builder extracts its colors behind the scenes, and suggests a set of colors based on those. To modify a suggested color, click the color swatch and adjust the color by using the slider or by entering hex values.

To brand your community:

1. Navigate to the pages that you want to view as you brand by using the Page menu in the toolbar.

2. Define styles, such as:
   - The range of colors that are used by the entire site, by selecting a palette swatch.
   - A specific color, by using the relevant color picker or entering a hex value.
   - An image, by clicking the image area and uploading an image.
   - The font type, size, or weight, by selecting an option in the relevant drop-down list.

   Your changes are saved automatically and appear instantly on the page canvas.

Alternatively, click 🖌️ on the Branding Editor toolbar to use your own CSS styles. We recommend using CSS sparingly and only when necessary, because future releases of template components might not support all CSS customizations.

- Community Builder Overview
- Preview Your Community with Community Builder
- Implementation Guide: Using Templates to Build Communities
Manage Your Community’s Pages in Community Builder

Page Manager centralizes all your page-related needs, from page creation to profile-based page visibility and everything in between.

Note: This functionality is available in the Winter ’16 and later versions of the Koa, Kokua, and Napili templates and the Spring ’16 and later versions of the Aloha template.

In Page Manager (1), you can:

- **Create custom pages** (2).
- Search for a page and select it (3) to **edit its properties** (4).
- Create alternative variations of the selected page and, in Napili, **set profile-based page visibility** (5).
- Preview, edit, and **delete the selected page** and its variations (6).
Create Custom Pages with Community Builder

Extend your community template by creating custom pages and adding content that meets your unique business needs. And in the Napili template, you can also create custom record detail, list, and related list pages to get the most from your Salesforce data.

**Note:** This functionality is available in the Winter ’16 and later versions of the Koa, Kokua, and Napili templates and the Spring ’16 and later versions of the Aloha template.

1. In Community Builder, click on the left sidebar to display the Page Manager.
2. Click on the toolbar.
3. To create:
   - A blank standard page that’s based on a layout or one of the template’s pages, click **Create a Page**. For example, you could start with the Home page template and customize it to your needs. Give the page a unique name and specify the static portion of the page’s URL.
   - A record detail, a list, and a related list page associated with one of your Salesforce objects, click **Create Object Pages** (in Napili only). Select the object that you want to associate with the page.

4. Click **Create**.

Custom standard pages that are based on a layout appear under My Pages in Page Manager. Pages that are based on a default template page appear under its Page Variations section.

Custom object pages appear under Salesforce Object Pages.
5. Open a standard page by clicking **Edit** on the toolbar, or open an object page by clicking ☰ > **Edit** in the Page Variations section.

6. Add and configure page components.

7. If you’re using the Napili template, set the page’s visibility.

8. Preview and publish your community when you’re done.

**Tip:**

- When a page is selected in Page Manager, its Page Variations tab lets you quickly create alternative versions of the page. For example, you could create three different Question Detail pages to test out various layouts or styles, or to assign them to different audiences. To create a page variation, click **New Page Variation** in the Page Variations tab.

  You can also duplicate a page variation by clicking ☰ > **Duplicate**.

- Use the Navigation Menu component to create custom navigation nodes for new pages. For more information about templates and components, see *Using Templates to Build Communities*.

---

### Profile-Based Page Visibility in Community Builder

Profile-based page visibility lets you create one version of a page for your customers and another for your partners, and control who sees which page based on their profile.

**Note:** This functionality is available in the Winter ’16 and later versions of the Napili template.

### Page Variations

Page variations are alternative versions of a page. You can use them to try out different page layouts and styles, or create variations that are aimed at distinct audiences. Every page in your community, including custom pages, must have one default page variation. You can add as many extra variations as you need on the page’s Page Variations tab.

You can also duplicate page variations, which really speeds things up when you’re creating page variations that have only minor differences.
Example: Let’s say you have a financial services community and you want your clients and your brokers to see a different Home page based on their profile. You can create two variations of the Home page, each with content targeting a specific audience—clients and brokers in this case—and set the visibility of each page to different profiles. All members go to the same URL, but your clients see Home A, whereas your brokers see Home B.

Who Exactly Sees What?

After you create the page variations you need in Page Manager, you can set their visibility. Choose from three visibility options that, when combined with a page’s published status, determine whether a page is visible to your community members.

Default: All users unless set by profile

When the page is published, it’s visible to all valid community members, except members whose profiles are assigned to a different page variation. Each page must have one default page variation.

By Profile

When the page is published, it’s visible only to users with the selected profiles.

None

Even if the page is published, it’s not visible to users.

Example: Here are several Home page variations with differing visibility and published statuses.

- Home A is visible only to Profile A members.
- Home B is visible only to Profile B members, but they can’t see pending changes.
- Home C isn’t visible.
- Home D is visible to all members, except Profile A and Profile B members.
- Home E isn’t visible.
Manage Page Visibility in Community Builder

Choose from three visibility options that combine with a page’s published status to control whether a page is visible to your community members.

**Note:** This functionality is available in the Winter ’16 and later versions of the Napili template.

To assign profiles to a page variation.

1. In Page Manager, select the page in the menu on the left.
2. Open the Page Variations tab.
3. Click > Manage Visibility.

**Note:** If a page variation’s visibility is set to Default, you can’t access the Manage Visibility dialog box. Every page must have one default page variation.
4. Select the profiles that you want.

5. To update the visibility settings of:
   - An unpublished page, click **Save**. The visibility changes don’t go live until you publish your community.
   - A published page variation, click **Publish Visibility Changes**. The visibility changes go live immediately, but any other pending changes must be published separately.

To set the visibility of a page variation to Default, click **> Set Visibility to Default**.

To set the visibility of a page variation to None, remove any assigned profiles or set the visibility of another variation to Default, as appropriate.

**Page Properties and Types in Community Builder**

Use Page Manager to view and edit the properties of the various pages that make up your community.
Page Types (1)

We’ve grouped your community’s pages by type in Page Manager.

My Pages
The custom standard pages that you create. (Custom object pages appear under Salesforce Object Pages.)

Template Name* Pages
*Napili, Koa, Kokua, or Aloha
The default pages that come with the community template.

Salesforce Object Pages
The pages of the objects in your community, which include the object’s record detail, list, and related list pages.

Generic Record Pages
The default record detail, list, and related list pages that come with the Napili template only. These generic pages are used to display record information for a Salesforce object when custom object pages don’t exist.

Login Pages
The default login pages that come with the community template.

Page Properties (2)

The properties available to each page depend on the page type selected.

Name
The name of the page as it appears in Community Builder. Editable only in custom standard pages.
Edit Community Pages and Components in Community Builder

You can add new components to your community’s pages or edit the properties of existing components to customize each page to suit your needs.

Note: Drag-and-drop components are available in the Winter and Spring ’16 versions of the Koa, Kokua, and Napili templates and the Spring ’16 version of the Aloha template.

If you’re adding components to a new custom page, spend some time planning the composition of the page based on the goals for the page.

1. In Community Builder, click on the left sidebar to display the Page Editor.
2. From the Page menu in the top toolbar, select the page that you want to edit.

The Lightning Components tab lists only components that are compatible with the selected page. For example, you can’t add the User Profile Detail component to the Home page.

3. Drag the required component from the Lightning Components tab onto an editable area of the page.
4. To edit the properties for a component on the page, select it on the main page canvas or on the Page Structure tab. When you select a component, Community Builder highlights the component with a blue border and displays the component’s properties in the Property Editor on the right.
5. Update the component as required.

Example: Here’s a sample configuration of the Headline component (1) on the Home page with the list of supported Lightning components (2) and properties (3).
Tip: You can also create custom Lightning components and use them on community pages. For more information on creating custom Lightning components and enabling them for Community Builder, see the Lightning Components Developer's Guide.

Change the Page Layout in Community Builder

Quickly change the look of your community’s pages by switching to a different layout. You can even create your own custom layouts in the Developer Console and import them to use in your community.

Note: This functionality is available in the Winter ‘16 and later versions of the Koa, Kokua, and Napili templates and the Spring ‘16 and later versions of the Aloha template.

1. In Community Builder, click on the left sidebar to display the Page Editor.
2. From the Page menu in the top toolbar, select the page that you want to edit.
3. Click **Change Layout** in the Property Editor.

4. Select the new layout. If you’ve added a custom layout, you can access it in the Custom tab.

5. Click **Change**.
   If the structure of the new layout is different from the current layout, some regions won’t be visible. However, the regions are still available and you can switch to a different layout at any time.

   **Note:** If you change the layout of a default template page, the only way to revert to the original layout is to click **Undo**.

For more information on custom layouts, see the *Lightning Components Developer’s Guide*. 
Add Markup to the Page `<head>` to Customize Your Community

Add custom analytics, improve your SEO results, and more by adding custom markup to the page `<head>` in Community Builder.

**Note:** This functionality is available in the Winter ’16 and later versions of the Koa, Kokua, and Napili templates and the Spring ’16 and later versions of the Aloha template.

For example, you can customize your community’s pages to suit your needs by adding:

- Custom analytics code, such as Google Analytics™
- SEO meta tags that are visible only to search engines
- References to external JavaScript files and third-party libraries
- Custom JavaScript blocks
- A favicon or web page icon

1. In Community Builder, click on the left sidebar and click Advanced.

2. Click Edit Head Markup.

3. Enter the required HTML or JavaScript.

4. Save your changes.

When you add custom markup, the code is added to the `<head>` of every page.

**Example:** Here we’ve added HTML to include a favicon on our community’s pages.
Delete a Page in Community Builder

Remove a community page or page variation that you no longer need by deleting it in Page Manager. Keep in mind that you can’t delete:

- The default pages and objects that come with the template
- A page’s default page variation
- A custom object page (detail, list, or related list) but you can delete the entire object

1. In Community Builder, click on the left sidebar to display the Page Manager.
2. Select the page that you want to remove.
3. Click **Delete** on the toolbar or click > **Delete** in the Page Variations tab.

Share More Salesforce Object Data in Your Community

Napili allows you to share record data for accounts, cases, contacts, tasks, events, and custom objects with minimal configuration. Record data respects user permissions via licenses, profiles, permission sets, and sharing rules.

- **Note:** This functionality is available in the Winter ’16 and later versions of the Napili template.
- Create a list of records and link to it.
- Display record details in your community with the out-of-the-box Record Detail page or create a custom page.
  
You can also add groups to your community in the same way.

SEE ALSO:

Using Templates to Build Communities
Share a List of Records in Your Community

Create record list views for accounts, cases, contacts, and custom objects and link them from the Napili navigation menu. Use an out-of-the-box or custom page layout to display the list of records.

**Note:** This functionality is available in the Winter ’16 and later versions of the Napili template.

1. In Community Builder, drag and drop the Navigation Menu component to add it to the appropriate page in the template. We recommend adding it to the Home page.

2. Create a navigation menu item pointing to a supported Salesforce object. Currently, Napili supports accounts, cases, contacts, and custom objects.

3. Publish your changes.

**Note:** If your community is active, your navigation menu item changes will immediately appear to your community members.

That’s it! This creates a navigation menu item, which links to a list of the selected object’s records. Under the hood, your data is retrieved from Salesforce and displayed using the generic Record List page. This page is available out-of-the-box in Napili and uses the Record Home List View Lightning component to display data in an appropriate layout.

**Note:** The generic Record List page provides the default list view layout for objects that don't have a predefined or custom list view page assigned. For example, if you create a navigation menu item for another Salesforce object, it uses this same page. If you modify the Record List page, be sure to account for all the affected objects.

**Example:** A list view page for a custom object called Featured Products.
• Creating a navigation menu item is the easiest way to link to a list of records for an object. If you prefer to use a custom list view page for an object, you can create a new page for your community using Community Builder. Choose the Standard page type with a single-column layout. Add the Record Home List View component to the page, configure the component properties to point to the object, and then publish the page. To link to the page, create a custom navigation menu item and use the internal page URL.

• Users can access only records they have access to via licenses, profiles, permissions, and sharing rules, same as in Salesforce. Users with the "Create" permission for the object can create records from the list view page. The ability to create records from this page isn't supported on mobile devices.

• You can hide a navigation menu item from guest users to block access to the associated record list view page.

• When users click a record on this page, the record details are displayed using the layout from the generic Record Detail page. If you create a custom record detail page and assign it to the object, we use that page instead.

• Clicking a record in the list view displays the record details, which are displayed using the Record Detail page that comes out of the box with the Napili template.

• The Record List page and the Record Home List View component are not available in the Koa and Kokua templates.

SEE ALSO:
Using Templates to Build Communities
Display Record Details in Your Community

Display record details using the generic Record Detail page or create custom record detail pages.

Note: This functionality is available in the Winter ’16 and later versions of the Napili template.

Napili supports a record detail page that you can use out of the box with no configuration. All objects in your community without a preassigned record detail page use this generic page, called Record Detail, to display record data. For example, consider the scenario where a user lands on a case detail page (that uses a preassigned case detail layout) and clicks on a contact in the related records. If you haven’t created a custom record detail page for contacts, the contact information is displayed using the generic Record Detail page. Under the hood, the Record Detail page uses the Record Headline and Record Information Lightning components to display record data.

- **Record Headline**: Displays the record name and key record highlights along with buttons to edit and delete the record.
- **Record Information**: Displays all record details including related records and the record feed. It also allows users to create new related records and post to the record feed.

Optionally, you can create custom record detail pages for accounts, contacts, cases, tasks, events, and custom objects.

1. Create a new Data Detail page in Community Builder and pick a supported object.
2. Add the Record Headline and Record Information components to the page and configure the component properties from the Property Editor on the right.
3. Click to access Page Management in the Community Builder settings, and then select the custom page as the active page for the object.
4. Publish your changes.

Note: If your community is active, your navigation menu item changes will immediately appear to your community members.

Example: The record detail page for a custom object with the Record Headline (1) and Record Information (2) components.
• Some objects have preassigned, active record detail pages to display record data (such as cases). You can check the available pages and assignments for each object in Community Builder settings, under Page Management.

• Objects without preassigned record detail pages use the generic Record Detail page. If you modify the Record Detail page layout or configuration, be sure to account for all objects that use this page layout.

• Users without the necessary license, profile, and permissions can’t access record data.

• Users with the necessary permissions can create records from the related lists, and edit and delete the record from the record headline. These actions aren’t supported on mobile devices.

• Page layouts for each object in Salesforce determine what fields display in the Record Information component, and the fields in the Highlight Panel layout determines what displays in the Record Headline component. This feature includes support for record types.

• You must enable feeds on records in Salesforce to allow users to post on them in communities.

• The Record Detail page, the Record Headline component, and Record Information component are not available in the Koa and Kokua templates.

SEE ALSO:

Using Templates to Build Communities

Add Groups to Your Community

Want more collaborative communities? Allow community members and guest users to browse and join groups in your Napili community. Use the out-of-the-box design for groups in Napili, or create your own customized version of the group detail page using separate components.

Note: This functionality is available in the Winter ’16 and later versions of the Napili template.

1. To enable groups in your community, add groups to the community navigation menu.

This automatically displays a menu item that links to a list of groups in your community. If you make the menu item publicly available, even guest users who aren’t logged in to your community can browse through the list of active public groups.
2. Publish your community.

3. If you haven’t already, customize the group publisher layout to include the Add Member action. This action allows group owners and managers to add members to the group, and isn’t shown in the list of actions in the group by default.

When users click on the name of an active group in the community, they’re redirected to the group detail page. If it’s a private group, they’re asked to log in. Only logged-in group members can view private group content.

A few things to keep in mind:

- When you enable groups in your community, the default Group Detail page is used to display group data. This page uses the Group component under the hood for formatting and layout. The Group component is a composite, one-stop component that includes the group banner, group details, related lists, and the group feed. We recommend using this composite component, especially if you want your community pages to be responsive across desktop and mobile device browsers.

- If you prefer to use a different layout or want more granular control over the placement of group content, create a custom community page and use the Group Banner, Group Details, Group Related List, and Feed components. Depending on how you use the individual components, custom pages might not be responsive across all devices.

- Group announcements aren’t supported in communities.

**Group list in Napili**
A group detail page in Napili website, showing active groups:

<table>
<thead>
<tr>
<th>Name</th>
<th>Last Activity</th>

</table>
Manage Your Community’s Settings in Community Builder

Use the Settings area to track which template you’re using, view your community’s status, and customize your template. If you’re using the Napili template, easily access your navigational and featured topic settings.

To access the Settings area in Community Builder, click on the left sidebar.
In the General area, settings include:

**Community Title**
- Lets you set the title for your community. The title briefly appears in the browser’s title bar before your community’s Home page loads.

**Community Template**
- Displays the name and version of the template that your community is using.

**Published Status**
- Indicates whether your community is published. If it’s published, click the link to open the live community in a separate browser tab.

**Guest User Profile**
- Displays the associated guest user profile. Clicking the link takes you to the Profile page in Salesforce Setup, where you can modify profile settings, such as which permissions the guest user has. For more information about configuring the guest user profile, see “Configure the Guest User Profile for Unauthenticated Users” in the *Using Templates to Build Communities Guide*.

**Set Navigational Topics (Napili template only)**
- Click the link to go to Community Management, where you can define topics to be used for navigation.

**Set Featured Topics (Napili template only)**
- Click the link to go to Community Management and define featured topics.

In the Theme area, you can select:

**Hide the header region and navigation**
- (Napili Winter ’16 and Koa, Kokua, and Napili Spring ’16 versions only)
  - Hide the defaults community header (which includes the header image, search box, community menu, and user profile navigation menu) in all the pages of your community. Select this option if you want to replace the header with your own custom version.

**Show loading indicator as the page loads**
- (Napili Spring ’16 version only)
Displays a ghost version of your community page until the page loads completely, which enhances the loading experience. If the page header is highly customized and the ghost version varies vastly from the real version loading in the browser, you can disable this option.

- In the Languages area, you can access Site.com where you can set the multilingual properties for your community. When set, these properties are used by the Language Picker component, which lets guest users select their preferred language on a page in your community. See “Language Picker” in the Using Templates to Build Communities Guide.
- In the Advanced area, you can add markup to the page head.
- In the Updates area, you can update your community’s template to the latest version.

Update Your Community’s Template in Community Builder

We introduce amazing features and enhancements with every release, so don’t get left behind! When you update your template, you benefit from the latest Community Builder and template features. Why miss out on better performance and more?

**Note:** Effective Summer ’16 (May 2016), we no longer support Koa, Kokua, or Napili template versions before Winter ’16 (October 2015). To continue receiving Salesforce support for your template, update it to Summer ’16.

**Important:** If you don’t update your template, it doesn’t affect your community. However, if issues arise with outdated templates, Salesforce Customer Support can’t assist you.

If your community uses the Spring ’16 version of the templates, sit back and relax. We automatically update your template version to Summer ’16, so you can start adding the latest features to your community straight away.

If your community uses a Koa, Kokua, or Napili template that is earlier than Winter ’16, read on because you have some housekeeping tasks.

**Tip:** If you’re not sure which template version your community uses, check out the Settings area in Community Builder.

The impact of updating a template depends on the version your community is using.

<table>
<thead>
<tr>
<th>Template Type and Version</th>
<th>What to Expect When Updating to Summer ’16</th>
</tr>
</thead>
</table>
| Winter ’16 Koa, Kokua, or Napili | - Your customizations are maintained for all pages, except login pages.  
 - Login pages retain branding but lose custom code or component customizations. |
| Before Winter ’16 Koa, Kokua, or Napili  
Before Spring ’16 Aloha template | Most component customizations and properties are overwritten. However:  
 - For Koa and Kokua, general settings, such as Category Group Name, Top-Level Category, and Company Name, carry over.  
 - For Napili, topic definitions carry over.  
 Most branding properties defined using the Branding Editor in Community Builder are maintained. However, sometimes your community’s colors are reset to the default value. After you update |
To update your template:

1. From Community Management, click the Community Management menu in the global header, then click **Go to Community Builder**. You can also access Community Builder from the All Communities page in Setup by clicking **Builder** next to your community name.

2. Click **Settings > Updates**.

3. Click **Update** and confirm the update when prompted.

4. Review all community pages to make sure that your branding and styles are as you expect.

5. Publish your community to apply the template updates.

- Manage Your Community’s Settings in Community Builder
- Community Builder Overview
Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

- You may need to change your community’s template to see some new communities features introduced by Salesforce. If you want to keep your current template, you must switch to another template and then switch back to your current template. For example, let’s say you are using the Napili template for your community. Salesforce introduces a feature that requires a change (not a simple update) to the template. You must switch your community’s template to another template, such as Koa or Kokua, and then switch it back to Napili.

- Salesforce object data carries over, but all branding and component customizations do not. You’ll need to redo all customizations.

- Switching between templates updates the navigation in Community Management. To view all available options in Community Management, regardless of template selection, select Administration > Preferences > Show all settings in Community Management.

- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to a Community Builder template, or vice versa. For example, in Community Builder-based templates /s is appended to your URL. Be sure to update any links to your community with the new URL.

To learn more about using the Kokua, Koa, and Napili templates, see the Community Templates for Self-Service Implementation Guide. To learn more about using the Aloha template, see the Getting Started with the Aloha Community Template for Salesforce Identity.

Preview Your Community with Community Builder

Preview how your community appears in a desktop browser window and on mobile devices. Community Builder’s preview option lets you see how your community will appear when it’s live.

- To preview the community in a browser window, click Preview in the toolbar.

- From Preview mode, you can further opt to see the community in its own browser tab as a customer would see it by clicking the pop-out button next to Preview.

- Use the options in the menu to preview how the community looks on different devices:
  - For smartphones, click Phone.
  - For tablets, click Tablet.
  - For desktop computer screens, click Fluid.
Publish Your Customizations with Community Builder

Publish your changes in Community Builder to make the updates available to everyone in your community.

**Note:** Your community must be active before you can publish the changes you’ve made in Community Builder.

1. From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.

2. From Community Management, click the Community Management menu in the global header, then click Go to Community Builder. You can also access Community Builder from the All Communities page in Setup by clicking Builder next to your community name.

3. Optionally, preview your community to make sure that your updates appear as expected.

4. When you’re happy with your changes, click Publish in the toolbar to publish your changes. You’ll receive an email notification when your changes go live.

Implementation Guide: Using Templates to Build Communities

Community Management

Community Management is your one-stop shop for administering, managing, and moderating your community.

Community Managers, Moderators, and Admins Working Together
Communities can thrive when community managers, moderators, and admins understand their unique roles and work together effectively.

Measure Community Success with Dashboards
Use Community Management dashboards to view your community’s analytics, such as metrics and trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement, providing you with a high-level view into the health of your community. Dashboards also help you monitor return on investment (ROI) and key performance indicators (KPI).
Insights for Community Engagement

Insights are reports that help your community managers monitor activity and take action on that activity. Insights make it easier to manage day-to-day moderation tasks, encourage community engagement, and drive member adoption. You can set up Insights to monitor new members, unanswered questions, newly created groups, trending topics, and even recent Chatter contributions.

Community Moderation Strategies and Tools

Community moderation allows you to empower members of your community to monitor content and ensure that it’s appropriate and relevant. Set up rules to automate moderation and do the heavy lifting for you.

Organize Self-Service Communities with Topics

Topics are a fantastic way to organize content in any community. Community members can add topics to posts and discussions, and structure content organically. When you set up a self-service community with the Napili template, you can use the Community Management page to quickly guide members to key navigational and featured topics.

Customize Recommendations in Communities

Create recommendations to drive engagement for your community, encouraging users to watch videos, take trainings, and more. Edit these recommendations in Community Management, where you can target specific audiences and use channels to specify locations for the recommendations.

Reputation Overview

Your reputation in the community directly corresponds to how active you are. The more you post, comment, and share, the higher your reputation level will be.

Community Managers, Moderators, and Admins Working Together

Communities can thrive when community managers, moderators, and admins understand their unique roles and work together effectively.

A community manager and moderator work hand-in-hand. They are partners and support one another in fostering engagement and harmony in the community. Sometimes, they perform some of the same tasks, but each has unique contributions. While the community manager is typically responsible for monitoring adoption and engagement, the moderator is typically responsible for ensuring the community is a healthy environment and that members feel encouraged to be active and helpful to each other.

Community managers, moderators, and admins all work together to protect, engage, and measure community success.

Prevent spammers, bots, and trolls from attacking the community.

Protect the community from trademark infringement and legal issues.

Ensure community members use appropriate language and adhere to the terms of use.

Welcome new members, add contributors, and connect members with resources.

Help ensure that members questions are answered quickly.

Acknowledge helpful members and thank them.

Review analytics on community health.

Measure return on investment (ROI) and key performance indicators (KPI), such as money saved and cases deflected.

Identify and track community trends.

EDITIONS

Available in: Salesforce Classic

Available in: Enterprise, Performance, Unlimited, and Developer Editions
Manage Your Community
Community Management is your one-stop shop for setting up and monitoring your community. Administrators can manage basic setup information including membership and branding. Community managers can view dashboards about groups, members, feed activity, and license usage, and manage the community’s reputation system. Moderators can see which items have been flagged for review.

What’s a Community Manager?
Every community needs someone to take an active role in making sure that the community thrives. Community managers spend time every day encouraging member participation, keeping conversations going, and recognizing members for contributing.

What’s a Community Moderator?
Moderators help ensure the success of your community by monitoring user activity and flagged items.

Access Community Management
Community administrators and managers use Community Management to monitor community activity, and set up other important management features.
Manage Your Community

Community Management is your one-stop shop for setting up and monitoring your community. Administrators can manage basic setup information including membership and branding. Community managers can view dashboards about groups, members, feed activity, and license usage, and manage the community’s reputation system. Moderators can see which items have been flagged for review.

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

**Important:** The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to Administration > Preferences and enable Show all settings in Community Management.

### Home
- View your community’s home page dashboard. If your home page still displays a message to install the Salesforce Communities Management, your administrator hasn’t mapped a dashboard yet.
- Preview the community or access your community’s settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header.

### Engagement
Monitor recent activity and take immediate action without leaving Community Management.

Insights are set up by the administrator. If the Engagement section doesn’t appear, the administrator hasn’t mapped any Insights for your community.

### Dashboards
View dashboards and monitor information about groups, members, feed activity, moderation, topics, and license usage for this community.

Dashboards are set up by the administrator. If the Dashboards section doesn’t appear, the administrator hasn’t mapped any dashboards for your community.

### Moderation
View reports for flagged posts, comments, messages, and files. You can also see a report of all posts that are pending review and set up moderation rules for your community.

Moderation is set up by the administrator.

### Topics
Create a navigation menu and showcase popular topics in your community.

Navigational topics and featured topics are set up by the administrator or in the case of self-service templates, they are enabled by default. If the Topics section doesn’t appear, your community is not using topics.

### Recommendations
Recommendations can help drive engagement in a community. They can be set up to encourage users to watch videos, take trainings, and more.

Recommendations are set up by the administrator. If the Recommendations section doesn’t appear, the administrator hasn’t set up any.
Reputation
Set up reputation levels and points to reward members for activity in the community feed.

Reputation is set up by the administrator. If the Reputation section doesn’t appear, the administrator hasn’t enabled it.

Administration
On the Administration page, you can update basic setup for the community, including:

- **Members**—Add or remove members based on profiles or permission sets.
- **Tabs**—Select the tabs you want community members to see. Tabs are also used to determine community navigation in Salesforce1. Tab settings aren’t used if your community was created with one of the Self-Service templates.
- **Branding**—Select an out-of-box branding theme. This branding is only used if your community uses the Salesforce tabs + Visualforce template.
- **Login & Registration**—Select the default community login page and set up self-registration.
- **Emails**—You can customize email sender information, Chatter email branding, and templates in your community emails.
- **Pages**—Configure page assignments for your community and access the Force.com and Site.com settings for your community.
- **Preferences**—Update important settings such as flagging content, nickname display, public access to Chatter, and file limits.
- **Settings**—Edit your community name, description, and URL. You can also manage the status of your community and change your community template.

Lookups in Community Management initially return the items you most recently viewed from within the community. If an object you’re looking for isn’t in the Recently Viewed Documents list, try typing all or part of the object name and searching again.

**Important:** If you’re an administrator and accidentally remove yourself from a community, you won’t be able to access the Administration settings in Community Management. To add yourself back to the community or make other membership updates, use the API.

SEE ALSO:
- What’s a Community Manager?
- What’s a Community Moderator?

What’s a Community Manager?

Every community needs someone to take an active role in making sure that the community thrives. Community managers spend time every day encouraging member participation, keeping conversations going, and recognizing members for contributing.

Community managers must be employees of your organization; external community members can’t be community managers.

A community manager is a member of the community that takes on the extra responsibility of monitoring community engagement. Community managers need access to reports and dashboards that show trends in activity and membership. They also need to be aware if members aren’t logging in as frequently as they should be. By monitoring community membership and activity, community managers can figure out how to engage community members and ensure that they participate.

A powerful tool for a community manager is the ability to recognize individual members for their participation, because community managers know that recognition and a little friendly competition usually lead to more active members. Community managers can set up a point system and reputation levels that reward members with points when they perform certain actions. Once members reach the top of the level’s point threshold, they move up a level.
Assign a Community Manager

To assign a user as a community manager, simply give them the “Manage Communities” permission. Community managers must be employees of your organization; external community members can’t be community managers. To assign a user as a community manager, give them the “Manage Communities” permission. With this permission, they can access the Community Management page.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets, then click New.
2. Create a permission set that includes the “Manage Communities” permissions.
3. From Setup, enter Users in the Quick Find box, then select Users.
4. Find the user you want to be a community manager and add the permission set to their Permission Set Assignments related list.

The user can now manage the community through Community Management.

What’s a Community Moderator?

Moderators help ensure the success of your community by monitoring user activity and flagged items.

In a successful community, members are actively engaged and communicating with one another. A community moderator facilitates knowledge sharing within a community to help members benefit and derive value from their participation. The moderator also helps ensure that all communications and content in the community are appropriate.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the community feed. This person should be accustomed to interfacing with customers and can spend time regularly monitoring the community.

A moderator can:
• Review and act on the list of flagged posts and comments in the community
• Review and act on the list of flagged files in the community
• Remove flags directly in the community
• Delete inappropriate posts, comments, messages, and files

A moderator can also help drive the success of a community in many other ways.
• Sharing relevant and useful information in community posts
• Encouraging members to post and comment on each other’s posts
• Setting an example by their activity in the community
• Keeping discussions focused, spam-free, and non-controversial
• Redirecting email conversations to communities when it can benefit other community members
• Establishing the community as a reliable source of information and a forum for transparent discussions

You can choose to designate more than one moderator for a community, especially if the community has a large number of members.

Note: Although they share some similar capabilities, a community moderator is different from a Chatter moderator.
Which users can moderate?
There are multiple types of users who can moderate a community when flagging is enabled.

Assign a Community Moderator
Make one or more people moderators in your community so they can keep an eye on its content.

Which users can moderate?
There are multiple types of users who can moderate a community when flagging is enabled.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the community feed. Moderators can continue to flag items even if flagging is disabled for community members, although group owners and group managers can only moderate when flagging is enabled.

Who can moderate items in a community depends on permissions or if the user is a group manager or owner. This table shows who can moderate and what actions they can take in the user interface.

<table>
<thead>
<tr>
<th>Action</th>
<th>User with “Moderate Communities Feeds”</th>
<th>User with “Moderate Communities Files”</th>
<th>Group Owner or Manager (on items in groups they own or manage)*</th>
</tr>
</thead>
<tbody>
<tr>
<td>Remove flags on a post or comment</td>
<td>✅</td>
<td>✅</td>
<td></td>
</tr>
<tr>
<td>Delete a post or comment</td>
<td>✅</td>
<td>✅</td>
<td></td>
</tr>
<tr>
<td>Remove flags on a file</td>
<td>✅</td>
<td>✅</td>
<td></td>
</tr>
<tr>
<td>Delete a file</td>
<td>✅</td>
<td>✅</td>
<td></td>
</tr>
</tbody>
</table>

*To allow group owners and managers to moderate, the Allow members to flag content option must be enabled.

Assign a Community Moderator
Make one or more people moderators in your community so they can keep an eye on its content.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the community feed.

You can assign moderators by assigning a permission set that includes one or more of following moderation permissions.

<table>
<thead>
<tr>
<th>Permission</th>
<th>Allows Users To</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moderate Communities Feeds</td>
<td>Review flagged posts and comments and take action, such as removing flags or deleting the post or comment. Moderator options for feed content are available in the community feed and in Community Management.</td>
</tr>
<tr>
<td>Moderate Communities Files</td>
<td>Review flagged files they have access to and take action, such as removing flags or deleting the file. Moderator options for</td>
</tr>
<tr>
<td>Permission</td>
<td>Allows Users To</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allows Users To</td>
<td>files are available on a file's detail page and in Community Management.</td>
</tr>
<tr>
<td>Moderate Communities Chatter Messages</td>
<td>Review flagged messages and take action, such as removing a flag or deleting a message. This permission allows users access to only flagged messages in communities they're a member of.</td>
</tr>
<tr>
<td>Can Approve Feed Post</td>
<td>Approve, delete, or edit posts that are pending review.</td>
</tr>
<tr>
<td>Moderate Community Users</td>
<td>Freeze external users who are members of the community. Moderators can freeze members on their user profile page or from an Insights report.</td>
</tr>
<tr>
<td>Manage Communities</td>
<td>Moderate community content in Community Management.</td>
</tr>
</tbody>
</table>

You can also add these permissions to a profile. These permissions are valid for all communities the user is a member of, but don’t apply in your internal organization.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets, then click New.
2. Create a permission set that includes the appropriate permissions.
3. From Setup, enter Users in the Quick Find box, then select Users.
4. Find the user you want to be a community moderator and add the permission set to their Permission Set Assignments related list.

After you grant moderator permissions to a user, keep these things in mind:

- The user can now moderate any items they have access to in all communities they’re a member of.
- The user can flag items even if Allow members to flag content is disabled in a community.
- Moderators can receive an email notification when a post, comment, or file is flagged by selecting the Flag an item as inappropriate email notification.

Access to moderator functionality is slightly different depending on user permissions:

- In the community feed: Both internal and external users with the “Moderate Communities Feeds” permission can view flag indicators directly in the community feed for posts and comments and decide to either remove the flags or delete the content.
- In Community Management: Only internal users with the “Manage Communities” or “Create and Set Up Communities” permission can access the Moderation area in Community Management.
Access Community Management

Community administrators and managers use Community Management to monitor community activity, and set up other important management features.

1. Access Community Management in one of the following ways.
   - From the community:
     - In Salesforce Tabs + Visualforce communities, click ☰ in the global header.
     - In Community Builder-based communities, use the drop-down menu next to your name and click Community Management.
   - From Setup, enter All Communities in the Quick Find box, then select All Communities and click the Manage link next to a community. To access this page, you need the Create and Set Up Communities permission.
   - From Community Builder, in the header, use the drop-down menu next to the name of your template and click Community Management.

2. Choose the part of the community you want to manage:
   - Preview the community or access your community’s settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header.
   - In Engagement, you can view Insights reports and take action on activity in your community.
   - In Dashboards, you can view community dashboards and reports.
   - In Moderation, you can set up moderation rules and monitor flagged feed items.
   - In Topics, you can manage navigational and featured topics.
   - In Recommendations, you can set up custom recommendations to appear in your community.
   - In Reputation, you can set up reputation levels and points.
   - In Administration, you can customize your community properties, such as name, description, URL, status, and template. You can also update your community settings, such as members, tabs, branding, login and registration, and emails.

⚠️ Important: The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to Administration > Preferences and enable Show all settings in Community Management.
Measure Community Success with Dashboards

Use Community Management dashboards to view your community’s analytics, such as metrics and trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement, providing you with a high-level view into the health of your community. Dashboards also help you monitor return on investment (ROI) and key performance indicators (KPI).

Enable and Map Dashboards for Community Managers

Community managers can use dashboards to measure the success of their communities. You can even map a dashboard to the Community Management Home page. You can map custom dashboards or use ones provided in an AppExchange package. Each community can have its own dashboards.

Create a Dashboard to Display in Community Management

While you can show any dashboard in Community Management, we recommend creating them based on the custom report types available for communities.

View Dashboards in Community Management

Use the dashboards in Community Management to monitor the health of your community.

What’s the difference between Insights and dashboards?

Insights let you take immediate action on recent activity in your community, and dashboards let you see trends.

Enable and Map Dashboards for Community Managers

Community managers can use dashboards to measure the success of their communities. You can even map a dashboard to the Community Management Home page. You can map custom dashboards or use ones provided in an AppExchange package. Each community can have its own dashboards.

You can choose to map any dashboard you have access to, but ensure that your community managers have access as well.

All dashboards in Community Management display as Lightning dashboards, regardless of what types of dashboard you’re using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard in Community Management. Remember that although dashboards render in a Lightning view in Community Management, the Communities product isn’t supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you’re using a supported browser.

Tip: Keep in mind that you can get preconfigured dashboards in the Salesforce Communities Management package available for download on the AppExchange.

If the Salesforce Communities Management package is installed in your organization, each of the dashboard pages has a default mapping to a dashboard from the package. You can overwrite these values as needed.

Use the following steps to map or update your dashboards in Community Management:

1. Open Community Management.
2. Click Dashboards > Settings.
3. For each of the pages, select the dashboard you want to show to community managers.

   The dashboard you map to Home displays on your Community Management Home page.
4. Click **Save**.

Dashboards are visible to community managers when they expand the **Dashboards** section or visit the home page in Community Management.

Verify the dashboard mappings by clicking **Dashboards** and then clicking each page name. If you mapped a dashboard to the **Home** page, check that out too.

- Create a Dashboard to Display in Community Management
- View Dashboards in Community Management

### Create a Dashboard to Display in Community Management

While you can show any dashboard in Community Management, we recommend creating them based on the custom report types available for communities.

**Tip:** Keep in mind that you can get preconfigured dashboards in the **Salesforce Communities Management package** available for download on the AppExchange.

All dashboards in Community Management display as Lightning dashboards, regardless of what types of dashboard you’re using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard in Community Management. Remember that although dashboards render in a Lightning view in Community Management, the Communities product isn’t supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you’re using a supported browser.

Use the following process to create dashboards to display in Community Management:

1. Create custom report types based on the Networks object.

   Only reports that are based on the Networks object show community-specific information in Community Management.

   **Note:** You can create reports based on other objects and expose them in Community Management. Just keep in mind that they show data from across your organization, not just for the community in which you’re viewing them.

   - Select Networks as the primary object.
   - Select a child object:
     - Chatter Messages
     - Feed Revisions
     - Groups
     - Network Audits
     - Network Activity Daily Metrics
     - Network Feed Revisions
     - Network Members
     - Network Membership Daily Metrics
     - Network Moderations
     - Network Public Usage Daily Metrics
2. Use the custom report type to create a report.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

3. Create a dashboard with components. Select the report as your source type.
   • Add a component for each report you want to include in your dashboard.
   • Find your report on the Data Sources tab and add it to the component.

In order for a Salesforce Classic dashboard to optimally render in the Lightning view used in Community Management, make sure that your dashboard meets the following requirements:
   • Includes only up to 20 reports arranged within three columns
   • Doesn’t include unsupported charts, such as funnel, scatter, table, multi-metric, pie, and gauge

For a list of dashboard features not supported in the Lightning view, see Reports and Dashboards: Lightning Experience Limitations.

Note: Metrics are supported in the Lightning view, but they display as large tiles. We recommended that you don’t include metrics in your dashboards.

4. Share the folder that you save your dashboard in with your community managers.

5. In Community Management, click Dashboards > Settings to map your dashboard.

When a community manager accesses Community Management, the dashboard appears under Dashboards. If you mapped a dashboard to the Home page, the dashboard appears there.

Dashboards in Community Management are automatically refreshed every 24 hours. To see the latest data, click Refresh. If you access the dashboard after it has been recently refreshed, the dashboard displays the globally cached data from the last refresh. If the dashboard hasn’t been refreshed in 24 hours, it’s refreshed automatically when you access it in Community Management. All role-based external users in your community can refresh dashboards set up with “Run as specified user” and “Run as logged-in user” up to 1,000 times daily per org. Scheduled and automatic refreshes don’t count against the limit. There is no refresh limit for internal users.

Remember that you can customize your dashboards at any time. To edit your dashboard, go to the Dashboards > Settings page in Community Management and click Edit dashboard to open the dashboard in your internal Salesforce org. If you’re using a dashboard that was created in Lightning Experience, the edit link won’t work.

View Dashboards in Community Management

Use the dashboards in Community Management to monitor the health of your community.

All dashboards in Community Management display as Lightning dashboards, regardless of what types of dashboard you’re using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard in Community Management. Remember that although dashboards render in a Lightning view in Community Management, the Communities product isn’t supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you’re using a supported browser.

1. Open Community Management.
2. Click Dashboards.
   
   Note: Your administrator maps the dashboards. If the Dashboards section isn’t visible, they haven’t been mapped for your community.

   Pages that have dashboards mapped to them appear in the Dashboards section or on the Home page.
3. Click the dashboard page you want to view.
   The dashboard appears. For an immediate refresh of dashboard data, click Refresh.

   Dashboards in Community Management are automatically refreshed every 24 hours. To see the latest data, click Refresh. If you access the dashboard after it has been recently refreshed, the dashboard displays the globally cached data from the last refresh. If the dashboard hasn’t been refreshed in 24 hours, it’s refreshed automatically when you access it in Community Management. All role-based external users in your community can refresh dashboards set up with "Run as specified user” and “Run as logged-in user” up to 1,000 times daily per org. Scheduled and automatic refreshes don’t count against the limit. There is no refresh limit for internal users.

   Remember that the dashboards are configured to display community-specific data.

   Remember that you can customize your dashboard at any time. To edit your dashboard, go to the Dashboards > Settings page in Community Management and click Edit dashboard to open the dashboard in your internal Salesforce org. If you’re using a dashboard that was created in Lightning Experience, the edit link won’t work.

What’s the difference between Insights and dashboards?

What’s the difference between Insights and dashboards?

Insights let you take immediate action on recent activity in your community, and dashboards let you see trends.

Use Engagement to view, monitor, and act on your community’s activity. Insights give you a detailed look at a specific area of your community.

Use Dashboards to view your community’s metrics, such as trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement in your community. They help you...
monitor return on investment (ROI) and key performance indicators (KPI).

For example, you can visit the **Engagement > Adoption** page to view a report about new members in your community that have received the most likes on their posts and comments. This Insights report helps you identify and engage with your active new members that are receiving positive feedback from other community members.

### Insights for Community Engagement

Insights are reports that help your community managers monitor activity and take action on that activity. Insights make it easier to manage day-to-day moderation tasks, encourage community engagement, and drive member adoption. You can set up Insights to monitor new members, unanswered questions, newly created groups, trending topics, and even recent Chatter contributions.

**Example:** With an Insights report set up to track new members, community managers can quickly navigate to a new member’s profile to send them a welcome message.

---

**EDITIONS**

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions
They can also access other reports about members directly from the Insights page using the drop-down menu.

**Tip:** Let us do the setup work for you! Get out-of-the-box Insights in the Salesforce Communities Management package available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

Insight reports provided in the package are 100% customizable. You can change the default Insights page names, report folder mappings, and even the Insights report columns and filters at any time. So don’t be afraid to customize or change what you get in the package. You won’t hurt our feelings.

Enable and Map Insights for Community Managers
Community managers can use Insights reports to monitor recent activity and take action on that activity. To get up and running quickly, use preconfigured Insights from an AppExchange package. You can also create and map your own. Each community can have their own Insights.

Create Insights to Display in Community Management
You can create your own Insights to display in Community Management. We recommend that you create your Insights reports based on custom report types available for communities.

Create Custom Actions for Community Management Insights
Do more with community Insights reports with custom actions. Say a spammer attacks your community. You can create and use a custom action to remove all the spammer’s posts and comments with just one click. Custom Insights actions work with standard objects and custom objects.

Use Insights in Community Management to monitor recent community activity and immediately take action. Insights help you manage day-to-day moderation tasks and keep up on adoption and engagement in your community.
Enable and Map Insights for Community Managers

Community managers can use Insights reports to monitor recent activity and take action on that activity. To get up and running quickly, use preconfigured Insights from an AppExchange package. You can also create and map your own. Each community can have their own Insights.

Insights pages map to report folders in your internal org. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal org updates the Insights page in Community Management. On the Insights page, links are automatically created for report fields such as Created By or Group Name. For posts, comments, and messages, you can even see the contents directly on the page.

Tip: Get out-of-the-box Insights in the Salesforce Communities Management package available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

When you install the package, report folders are automatically installed in your internal org. If you have no previous Insights mapped, the package automatically maps them for you. You can change the default mappings at any time.

Use the following steps to map or update your Insights in Community Management:

1. Open Community Management.
2. Click Engagement > Settings.
3. Provide a name for each Insights page and then select the report folder you want to map to the page.
   
   You can have up to 10 Insights pages mapped in Community Management.
   
   Make sure that you have shared the mapped report folder with your community managers or they won’t be able to view the Insights reports.

4. Click Save.

   Insights pages are visible to community managers when they expand the Engagement section of Community Management.

Go check out your changes. Click Engagement and then click each Insights page name. Use the drop-down menu to verify the reports mapped to each page.

If you installed the Salesforce Communities Management package, moderation-related Insights reports are also mapped to pages in the Moderation section of Community Management. Unlike the page names in the Engagement section, the page names in the Moderation section can’t be renamed or unmapped.

   Share a Report or Dashboard Folder
Create Insights to Display in Community Management

You can create your own Insights to display in Community Management. We recommend that you create your Insights reports based on custom report types available for communities.

Tip: Get out-of-the-box Insights in the Salesforce Communities Management package available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

Use the following process to create Insights to display in Community Management:

1. Create custom report types based on the Networks object.

   Only reports that are based on the Networks object show community-specific information in Community Management.

   Note: You can create reports based on other objects and expose them in Community Management. Just keep in mind that they show data from across your organization, not just for the community in which you're viewing them.
   - Select Networks as the primary object.
   - Select a child object:
     - Chatter Messages
     - Feed Revisions
     - Groups
     - Network Audits
     - Network Activity Daily Metrics
     - Network Feed Revisions
     - Network Members
     - Network Membership Daily Metrics
     - Network Moderations
     - Network Public Usage Daily Metrics
     - Network Unique Contributor Daily Metrics
     - Recommendation Metric
     - Topic Assignments
     - Topics
     - Unpublished Feed Entities

2. Use the custom report type to create an Insights report.

   Insights reports are just like any other report, except they must also meet the following requirements:
   - The report can only be a tabular-based report.
   - The report can't include pagination.
   - We recommended that your report only return 2,000 rows or less because only the first 2,000 rows are displayed in Community Management.

   Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.
3. Save the report to a new report folder that you'll use for mapping in Community Management.

   We recommend that you create a separate report folder for each of your Insights pages. For example, create one report folder called **Insights Members** and another called **Insights Moderation**.

   Insights pages map to report folders in your internal org. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal org updates the Insights page in Community Management.

4. Share your Insights report folder with your community managers.

5. In Community Management, click **Engagement > Settings** to map Insights pages to your report folder.

When a community manager accesses Community Management, the Insights reports appear in the drop-down menu on the mapped **Engagement** page.

- Create Custom Actions for Community Management Insights

### Create Custom Actions for Community Management Insights

Do more with community Insights reports with custom actions. Say a spammer attacks your community. You can create and use a custom action to remove all the spammer’s posts and comments with just one click. Custom Insights actions work with standard objects and custom objects.

When you click an Insights action in the report, behind the scenes a Visualforce page drives the action. The Visualforce page links to standard or custom objects using standard controllers or standard list controllers.

Here are the high-level steps of how to create a custom Insights action:

1. Create a Visualforce page.
   
   There are a few options you can use:
   
   - Use a standard controller
     
     Choose this option to create a Visualforce page that contains the same functionality and logic used in standard Salesforce pages. For example, if you use the standard Accounts controller, clicking a **Save** button in a Visualforce page results in the same behavior as clicking **Save** on a standard Account edit page.
   
   - Use a standard list controller
     
     Choose this option to create a Visualforce page that can display or act on a set of records. Examples of existing Salesforce pages that work with a set of records include: list pages, related lists, and mass action pages.
   
   - Use a controller extension that uses Apex
     
     Choose this option if you want to expose new functionality, customize the navigation through an application, use callouts or Web services, or if you need finer control for how information is accessed for your page.
All options work with standard objects and custom objects.

For detailed information about these options, see the Visualforce Developer Guide.

2. Add your custom action to the Insights report.

Actions are displayed based on the data returned in the report. Make sure that you have a report that is currently returning the data your action needs.

   a. In Community Management, navigate to the Insights report that you want to apply your new custom action to.
   b. On the report, click 📊 and then add your custom action from the picklist.

3. Ensure that your users have the correct permissions to complete your custom action.

Depending on how you set up your custom action, after the action is executed, the user either stays on the Insights page or is redirected to a page in your internal org. Unlike our standard Insights actions, users don’t receive the standard success or failure message for custom actions.

Example: Here’s an example of a custom action to delete all activity from a community member. This custom action is great for cleaning up the community after a spam attack.

Create a custom controller extension using an Apex class and use it in your Visualforce page. The following `DeleteAllActivityControllerExtension` class is an example of a custom controller extension.

```java
public with sharing class DeleteAllActivityControllerExtension {
    private List<Id> ids;
    private String retURL;
    private Database.DeleteResult[] deleteResult = null;
    private Map<String, String> resultMap;
    private String success = 'success';
    private String failure = 'failure';

    public DeleteAllActivityControllerExtension(ApexPages.StandardController controller) {
        resultMap = new Map<String, String>();
        /* The IDs you select on the Insights page are stored in a comma separated string of IDs.
        This string is passed in a parameter called "idsList" */
        String idsList = ApexPages.currentPage().getParameters().get('idsList');
        //The return URL to the Insights page is passed in a parameter called "retURL"
        retURL = ApexPages.currentPage().getParameters().get('retURL');
        ids = idsList.split(',');
    }

    public PageReference deleteAllActivity() {
        deleteFeedPosts();
        deleteFeedComments();
        //Include these two lines of code to be redirected to the Insights page after you click the action.
        PageReference retPage = new PageReference(retURL);
        retPage.setRedirect(true);
        Integer failureCount = calculateFailureCount();
        Integer successCount = ids.size() - failureCount;
        retPage.getParameters().put(success, String.valueOf(successCount));
    }
}
```
private void deleteFeedPosts() {
    List<FeedItem> feedItems = [Select Id, CreatedById FROM FeedItem WHERE CreatedById IN :ids];
    deleteResult = Database.delete(feedItems, false);
    //Update the resultMap with failures to calculate the failureCount
    if(deleteResult != null) {
        for(Integer i=0;i < deleteResult.size();i++) {
            if (!deleteResult.get(i).isSuccess()) {
                for(Database.Error error : deleteResult.get(i).getErrors()) {
                    resultMap.put(string.valueOf(feedItems.get(i).CreatedBy_Id), failure);
                }
            }
        }
    }
}

private void deleteFeedComments() {
    List<FeedComment> feedComments = [Select Id, CreatedById FROM FeedComment WHERE CreatedById IN :ids];
    deleteResult = Database.delete(feedComments, false);
    //Update the resultMap with failures to calculate the failureCount
    if(deleteResult != null) {
        for(Integer i=0;i < deleteResult.size();i++) {
            if (!deleteResult.get(i).isSuccess()) {
                for(Database.Error error : deleteResult.get(i).getErrors()) {
                    resultMap.put(string.valueOf(feedComments.get(i).CreatedBy_Id), failure);
                }
            }
        }
    }
}

private Integer calculateFailureCount() {
    Integer failureCount = 0;
    for (String result : resultMap.values()) {
        if (failure == result) {
            failureCount++;
        }
    }
    return failureCount;
}
View and Customize Insights in Community Management

Use Insights in Community Management to monitor recent community activity and immediately take action. Insights help you manage day-to-day moderation tasks and keep up on adoption and engagement in your community.

Each Insights page includes multiple Insights reports. You can access these reports using the drop-down menu on the page. On the Insights page, links are automatically created for report fields such as Created By or Group Name. For posts, comments, and messages, you can even see the contents directly on the page.

Insights are powerful tools that you can use to perform mass-actions. For example, if a spammer attacks your community, you can select all the offending posts and click Delete Post.

**Important:** Some Insights actions require special permissions. If you can’t perform an action, let your admin know.

1. Open Community Management.
2. Click Engagement or Moderation.

**Note:** Your admin maps Insights pages. If the Engagement section isn’t visible or the Moderation section doesn’t include any Insights pages, your admin hasn’t mapped them yet.

Pages with mapped report folders appear when you expand the sections.

3. Click the Insights page you want to view.
   - To access other Insights reports, use the drop-down menu.

---

**EDITIONS**
Available in: Salesforce Classic
Available in: Enterprise, Performance, Unlimited, and Developer Editions

**USER PERMISSIONS**
To view Insights in Community Management:
- “Manage Communities” OR “Create and Set Up Communities”
  AND
  Is a member of the community whose Community Management page they’re trying to access

To customize Insights reports:
- “Create and Customize Reports”
• Take action! Only the first two actions are displayed on the page. To see more actions, click next to the displayed actions. You can select up to 100 rows at a time.
• To filter the report by relative and custom date ranges, use the drop-down date filter. Select one of the following relative date ranges: All Time, This Week, This Month, Last Month, Today, Yesterday, Last 7 Days, and Last 30 Days. You can also enter your own custom date range.
• To sort the report by a specific column, click the column heading. An arrow on the column indicates whether the report is sorted by ascending or descending order.
• To edit or customize the report, click to open the report in your internal org. From there you can customize the report to fit your community needs, such as adding or removing columns and updating the report filters.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

• To edit the actions assigned to a page, click to open the Edit Insights Actions page. Actions that appear on the Insights report are displayed based on the data returned in the report. For example, if the report returns data about a user, the Freeze Member and Unfreeze Member actions are displayed. If the report stops returning data, actions aren’t removed. However, when you go to update the actions, we let you know that some are no longer appropriate.

Each Insights report can have its own actions. You can edit these actions at any time, but keep in mind that an Insights report must have at least one action. Actions displayed in the picklist on the Edit Insights Actions page are all the available and appropriate actions for your report, including custom actions.

Insights reports in Community Management are automatically refreshed when you access them. You can also force an update.

What’s the difference between Insights and dashboards?

Community Moderation Strategies and Tools

Community moderation allows you to empower members of your community to monitor content and ensure that it’s appropriate and relevant. Set up rules to automate moderation and do the heavy lifting for you.

Moderation is crucial for a community to thrive. You need active moderators who are willing to spend time ensuring that the members and content in your community are appropriate and helpful. You also need to empower members to speak up when they view something as inappropriate or offensive.

With Communities moderation, you can:
• Designate specific users as moderators so that they can closely monitor the community
• Allow members to flag posts, comments, files, and messages that are inappropriate
• Allow moderators to review and act on flagged items, such as deleting a post, comment, or file
• Allow group owners and managers to moderate within their groups
• Create rules and criteria to automatically block, flag, replace keywords in member-generated content, such as posts or comments
• Create rules to review and approve content from specific members
• Track flagging and moderation activity within your community.

To limit the size and types of files allowed in your community, go to the Administration > Preferences page.

To report on moderation activity in your communities, you can use the preconfigured Audit Trail Insights report provided in Salesforce Communities Management package. You can also query the flagged content or activity using the API, or create a custom report type using Networks as the primary object. For more information about the Salesforce Communities Management package, see Report on Communities with the Dashboards and Insights Package.

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don’t require you to allow your members to flag content.

If your org is using Transaction Security, community moderation offers some of the same functionality. Transaction Security and communities moderation can be used at the same time.

Enable Members to Flag Items in Your Community

Turn on flagging for your community to empower members to flag posts, comments, files, and messages that they deem inappropriate.

Community Moderation Criteria

Create criteria that define keywords or groups of members. Criteria are used in rules to moderate member-generated content, such as posts and comments.

Community Moderation Rules

Create and modify rules for your community to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your community from spammers, bots, and offensive or inappropriate content.

Review and Approve Posts in Your Community (Beta)

Pre-moderation rules to review and approve content ensure that non-compliant and inappropriate content isn’t immediately visible to everyone in your community. Posts pending review aren’t displayed in the community feed; only the author and community moderators can see pending posts in the feed. After you set up the rules, moderators can approve content in two places: directly in the community feed or in Community Management.

Moderate Flagged Posts and Comments in Your Community

Community moderators can review a list of posts and comments that members of the community have flagged as inappropriate and take action. Group owners or group managers, can view flags and take action on items in their groups.

Moderate Flagged Files in Your Community

Community moderators can review a list of files that members of the community have flagged as inappropriate and take action. Group owners or group managers can view flags and take action on files in their groups.

Moderate Flagged Private Messages in Your Community

Community moderators can review and act on a list of Chatter messages that members of the community have flagged as inappropriate or as spam.

Set Up Apex Triggers for Flagging Items

Use triggers to create custom advanced moderation logic that automatically flags items in your community.

SEE ALSO:

Assign a Community Moderator
Assign a Community Manager
Enable Members to Flag Items in Your Community

Turn on flagging for your community to empower members to flag posts, comments, files, and messages that they deem inappropriate.

Community moderation must be enabled for your organization before you can allow members to flag content in the user interface. If you don’t see the option to allow flagged content, contact your administrator.

This setting isn’t required to flag or moderate items using the API.

Once an item is flagged, your community moderator can review it and take action. Remember that moderators can continue to flag items even if flagging is disabled for community members.

1. Open Community Management.
2. Click Administration > Preferences, then select Allow members to flag content.
3. Click Save.

With this setting enabled in a community:

- Members can flag posts, comments, and files using the Flag as inappropriate option.
- Members can flag messages from within the community on their My Messages page in Chatter. If a member has turned on email notification for messages, they can also flag the message directly from their email. Members can only flag messages that are sent from communities they are members of.

Note: Messages can’t be flagged in partner or customer portals, your internal organization, or from Salesforce1.

- Group owners and managers can moderate groups they own or manage.

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don’t require you to allow your members to flag content.

SEE ALSO:
Assign a Community Moderator

Community Moderation Criteria

Create criteria that define keywords or groups of members. Criteria are used in rules to moderate member-generated content, such as posts and comments.

Plan Your Use-Cases

Before creating your member criteria, think about what you want to do.

- Do you want to protect your community from bots and spammers? Most spammers attack shortly after they’ve joined. Set up member criteria based on a user’s creation date.
- Do you want to review members’ first posts? Set up member criteria that targets users without community contributions.
- Do you want to moderate your internal users’ activity in your community? Set up member criteria to include only your internal users.
- Do you want to be notified when a partner contributes for the first time? Set up member criteria to include only your partner users that don’t have community contributions.

Before creating content criteria, think about what you want to moderate.
• Do you want to moderate profanities and slang? Set up separate keyword lists for each group of related words.
• Do you want to replace competitor product names with asterisks? Create a keyword list just for your competitor products.
• Do you want to monitor content for HIPAA compliance? Create a keyword list that alerts of possible HIPAA violations.

Create Content Criteria to Moderate Your Community

Create and modify content criteria that define offensive language or inappropriate content that you don’t want in your community. Content criteria are used in rules to moderate member-generated content, such as posts and comments.

You can also use the Metadata API or Tooling API to set up keyword lists.

Some things to keep in mind:
• Your org can have up to 30 keyword list criteria. This limit is per org, not per community.
• A keyword list can have up to 2,000 keywords.
• Capitalization and trailing punctuation are ignored when matching your keywords to user-generated content. For example, if your criteria includes *BadWord*, it’s matched when a user types *BADWORD* or *badword*.

Set up content criteria to use in your moderation rules:

1. Open Community Management.
2. Click **Moderation > Content Criteria**, then click **New**.
3. Enter a name, unique name, and description for your criteria.
4. Click **Save**.
5. Update the keywords in your criteria.

To add keywords, click **Add**.
• Keywords can only be up to 100 characters and can include letters, numbers, spaces, and special characters.
• Wildcard characters aren’t supported.
• Separate keywords with commas or line breaks.
• When adding keywords, you can copy and paste up to 32,000 characters at a time.

**Tip:** To cover different variations of the same word, you can use special characters and spaces. For example:

- `bad-word`
- `b@dword`
- `bad word`
To delete keywords, select the keywords you want to remove, then click **Delete**.

A message indicates how many keywords were added or failed to add, and the number of duplicates that were ignored. If your entire entry failed to save, review the keyword requirements and then submit again. Don’t worry about adding duplicates because they’re ignored.

To delete criteria, click Del from the **Content Criteria** page. If criteria is being used by a rule, you can’t delete it.

---

**Create Member Criteria to Moderate Your Community**

Create and modify member criteria to use in community moderation rules. Target specific groups of members based on their user profile, user type, user creation date, or whether they’ve posted or previously commented in the community. Use member criteria in your rules to help pin-point specific use-cases, like reviewing posts only from your customer users who were created in the last 7 days.

Some things to keep in mind:

- Your org can have up to 100 member criteria. This limit is per org, not per community.
- Each member criteria can include up to 100 user conditions.

You can create criteria that includes only user types and user profiles, or just filters. Or if you want it all, your criteria can include user types, user profiles, and filters. Let’s get started.

1. **Open Community Management**.
2. **Click Moderation > Member Criteria**, then click **New**.
3. Enter a name, unique name, and description for your criteria.
4. Select the types of user types or user profiles to include in your criteria.
   - You can select any combination of types and profiles. Members are included when they belong to any one of your selections.
   - If you delete a profile in your internal org, the profile is also removed from your member criteria.
5. Select to filter your members by:
   - **None**—Select this option if you don’t want to filter the criteria using the other options. None is the default selection.
   - **User creation date**—Select this option to include only users that were created within a specific time frame. Enter the number of days since the user was created.

   **Note:** A user’s creation date might not be the same date they became a member of the community. For example, you can have an internal user that was created 120 days ago who became a member of the community 5 days ago. For users that self-register, their creation date is the date they become a member of the community.

   - **Members without community contributions**—Select this option to include only members that haven’t posted or commented in the community. Posts that are pending review don’t count as community contributions until they are approved.

   If you selected user types or user profiles, and you also select filter conditions, members are included only if they belong to one of the selected user types or profiles and the filter condition.
6. **Click Save** to apply your changes.

**Example:** Let’s look at the following conditions:

- **User Types**: Partner

---

**EDITIONS**

Available in: Salesforce Classic
Enterprise, Performance, Unlimited, and Developer Editions

**USER PERMISSIONS**

To view, create, edit, and delete criteria:

- “Manage Communities” OR “Create and Set Up Communities”
  AND
  Is a member of the community whose Community Management page they’re trying to access.
User Profiles: Customer Community Plus Login User, Customer Community Plus User, and Customer Community User

Filter By: User creation date is set to 7 days since the user was created

This member criteria applies to:
- Partner users created in the last 7 days
- Customer Community Plus Login User created in the last 7 days
- Customer Community Plus User created in the last 7 days
- Customer Community User created in the last 7 days

You can use this member criteria in a rule to:
- Review and approve their posts
- Be notified of their contributions
- Flag all their contributions

To delete criteria, click Del from the Member Criteria page. If criteria is being used by a rule, you can’t delete it.

Community Moderation Rules

Create and modify rules for your community to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your community from spammers, bots, and offensive or inappropriate content.

Create Content Rules to Moderate Your Community
Create and modify rules for your community to moderate member-generated content. Content rules protect your community from offensive language and inappropriate content created by spammers or malicious members. You can create content rules that block, replace, flag, or allow you to review and approve member-generated content.

Create Rate Limit Rules to Moderate Your Community
Create and modify rate rules to monitor and limit how frequently member-generated content is created in your community. Rate rules protect your community against spammers and bots that attack your community by posting the same message multiple times in a row. You can create rate rules to notify your moderators of suspicious spammer-like behavior or freeze a member on the spot.

How and when do community moderation rules execute?
Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content.
Create Content Rules to Moderate Your Community

Create and modify rules for your community to moderate member-generated content. Content rules protect your community from offensive language and inappropriate content created by spammers or malicious members. You can create content rules that block, replace, flag, or allow you to review and approve member-generated content.

If your community is using the Napili template, moderation rules apply to questions and group posts created by your community members.

You can also use the Metadata API or Tooling API to set up content rules.

Some things to keep in mind:

• Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
• Each content rule can have up to three keyword criteria and 10 member criteria.
• Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content. If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don’t run when the content also applies to a review rule—we want community managers to review the original content.

Tip: Before creating a rule, we recommend you create criteria to use in the rule.

1. Open Community Management.
2. Click Moderation > Rules, then click New and select Content Rule.
3. Complete the following fields:
   • Name—Enter a name for your rule.
   • Unique Name—Enter a unique name for your rule. The unique name used by the API.
   • Description—Optionally, enter a description.
   • Activate Rule—If selected, the rule is activated.
   • Applies To—Specify which types of member-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles. All feed types, such as polls and links, are supported.
   • Moderation Action—Specify what you want to happen when the criteria is matched.
     - Block prevents the content from being published.
     - Review allows users with the “Can Approve Feed Post” permission to approve the content before it’s published.
     - Note: The Summer ’16 release contains a beta version of the pre-moderation feature, which means it’s a high-quality feature with known limitations. This feature isn’t generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can’t guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for this feature in the Community Implementation group in the Success Community.
     - Replace publishes the content with the keywords replaced as asterisks. For example, BadWord becomes ******.
     - Flag publishes the content and then automatically flags the content as inappropriate.
   • Message for Member—Specify the message that your member sees when their content is blocked. If you don’t specify a message, the member sees the standard message: “You can’t use %BLOCKED_KEYWORD% or other inappropriate words in
this community. Review your content and try again." The \%BLOCKED_KEYWORD\% variable displays up to five blocked words. You can also use this variable in your own custom message.

**Tip:** For international communities, you can translate this message. From Setup, enter *Translate* in the Quick Find box, then select *Translate*. To provide a translation for the message, select the Moderation Rule setup component and expand the community the rule belongs to.

- **Member Criteria**—Specify member criteria to enforce this rule. Ask yourself, who should this rule apply to?
- **Content Criteria**—Specify the content criteria to enforce this rule. Ask yourself, what specific keywords should this rule apply to?

**Important:** Keep the following things in mind:

- If you activate a content rule without specifying member criteria, the rule applies to all members.
- If you activate a content rule without specifying content criteria, the rule either:
  - Prevents members from creating posts and comments entirely
  - Sends all posts for review
  - Flags all posts and comments

Yikes! Be careful.

- If you select member criteria and content criteria, the rule applies only when both criteria are met.
- Specifying criteria is optional. However, we recommend that you include criteria in your rules to target specific members and content.

4. Click **Save** to apply your changes.

Create Rate Limit Rules to Moderate Your Community

Create and modify rate rules to monitor and limit how frequently member-generated content is created in your community. Rate rules protect your community against spammers and bots that attack your community by posting the same message multiple times in a row. You can create rate rules to notify your moderators of suspicious spammer-like behavior or freeze a member on the spot.

Each rate rule controls two actions: notification and freeze. You can set up your rate rule for both actions or just one. You can apply the rule to: posts, comments, files, and private messages. In Napili-based communities, this includes questions and answers.

Some things to keep in mind:

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
- Each rate rule can have up to 10 member criteria.

Tip: Before creating a rule, we recommend you create member criteria to use in the rule.

1. Open Community Management.
2. Click Moderation > Rules, then click New and select Rate Rule.
3. Complete the following fields:
   - Name—Enter a name for your rule.
   - Unique Name—Enter a unique name for your rule. The unique name used by the API.
   - Description—Optionally, enter a description.
   - Activate Rule—If selected, the rule is activated.
   - Applies To—Specify which types of member-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles.
   - Member Criteria—Specify the member criteria to enforce this rule. Ask yourself, who do I want this rule to apply to? Spammers are typically new members. We recommend creating member criteria that only includes customer users that were created in the last 7 days.

   Note:
   - Rate rules don’t apply to internal users. You can use member criteria that includes internal users, but the rules just don’t apply to them.
   - If you activate a rate rule without specifying member criteria, the rule applies to all external users.

   - Content Creation Time Frame—Select the time frame you want to use.
   - Notify Moderators—Enter a number. Moderators are sent an email when a member creates this much content in your set time frame.
   - Freeze Members—Enter a number. Members are frozen when they create this much content in your set time frame.

   Important: When members are frozen, they’re frozen in all communities that they’re a member of.

   Emails are sent to users with the “Moderate Community Users” permission. Make sure that you assign your moderators this permission. Emails are sent even if a user has turned off Chatter emails.

4. Click Save to apply your changes.
**Example:** Let’s use the following rate rule as an example.

- **Applies To:** Posts and private messages
- **Member Criteria:** Customer users created in the past 7 days
- **Content Creation Time Frame:** 3 minutes
- **Notify Moderators:** 6
- **Freeze Members:** 10

With this rate rule, here’s what happens when a member reaches your limits.

<table>
<thead>
<tr>
<th>In the span of 3 minutes, a member creates...</th>
<th>Is the moderator notified?</th>
<th>Is the member frozen?</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 posts and 2 private messages</td>
<td>✓</td>
<td>✗</td>
</tr>
<tr>
<td>6 posts</td>
<td>✓</td>
<td>✗</td>
</tr>
<tr>
<td>6 comments</td>
<td>✗</td>
<td>✗</td>
</tr>
<tr>
<td>8 posts and 2 private messages</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>10 posts</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>10 comments</td>
<td>✗</td>
<td>✗</td>
</tr>
</tbody>
</table>

A rate rule like this protects the community from spammers and bots but also allows you to help your new members. Maybe a non-threatening member posted a question over and over hoping to get it answered faster. Rate rules do more than protect—they help you reach out to members in need.

Here’s a rule set up just for private messages.

- **Applies To:** Private messages
- **Member Criteria:** Customer users created in the past 3 days
- **Content Creation Time Frame:** 15 minutes
- **Notify Moderators:** 1
- **Freeze Members:** 3

This rate rule protects the community from spammers that attack via private messages.

**My rate rule didn’t do anything. What’s going on?**

Give it time. Rate limit rules might not seem exact, but they are. Trust us. For example, say you set up a rate rule to freeze members when they create content 10 times in 3 minutes. It’s possible for a member to create 9 items towards the end of the first 3-minute time frame. In this case, the member isn’t frozen until they post another 10 items in the second 3-minute time frame.

Check the member criteria you’re using. For example, let’s say you have a rate rule that uses member criteria to filter for members without community contributions. After a member’s first post or comment, the rule doesn’t apply to the member anymore, so the member doesn’t reach the freeze limit you set.

**SEE ALSO:**

- *Create Member Criteria to Moderate Your Community*
How and when do community moderation rules execute?

Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content.

If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don’t run when the content also applies to a review rule—we want community managers to review the original content. On the server, Salesforce executes community rules within the standard order of execution.

Rules that block content execute during system validation. Rules that block content ignore changes made by before triggers. For example, if a before trigger changes a feed post, a moderation rule that blocks content isn’t aware of the changed content and executes on the original content.

Rules to review and approve content execute before database saves. These rules execute before rules that replace content.

Rules that replace content execute before database saves.

Rules that flag content execute after workflow rules.

*Apex Developer Guide: Triggers and Order of Execution*
**Review and Approve Posts in Your Community (Beta)**

Pre-moderation rules to review and approve content ensure that non-compliant and inappropriate content isn’t immediately visible to everyone in your community. Posts pending review aren’t displayed in the community feed; only the author and community moderators can see pending posts in the feed. After you set up the rules, moderators can approve content in two places: directly in the community feed or in Community Management.

To set up a moderation rule to review and approve posts, go to **Moderation > Rules** and create a content rule that uses the **Review** action. Here are some ways that you can use rules to review content:

**Self-Service Community**
- Does your community allow members to self-register? You can set up a rule to review and approve questions from all your self-registering users. Use member criteria that includes only your guest user profile and filters for members who were created in the past seven days.
- Have spammers ever attacked your community? Use member criteria that includes only your guest user profile and filters for members that have never contributed to the community.

**Partner Community**
- Want to ensure that your partners aren’t discussing a recent acquisition or other sensitive transactions? You can set up a rule to review posts that include keywords such as “acquisition” or “merger.”

**Employee Community**
- Does your community require HIPAA compliance? Set up your rules to review posts from all your employees.

**Note:** The Summer ’16 release contains a beta version of the pre-moderation feature, which means it’s a high-quality feature with known limitations. This feature isn’t generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can’t guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for this feature in the **Community Implementation** group in the Success Community.

**Pending Review** is displayed in the header of the post until it’s approved. Remember that while a post is pending approval, the author of the post can still edit or delete it, however they can’t comment on it. To prevent the author from editing the post, you can disable feed post editing for certain users.

There are two ways to review and approve posts in your community:
- **Use a preconfigured Insights report in Community Management.**
  - Use the Pending Insights report provided in the Salesforce Communities Management package. This report lets you see all the posts that are pending review in your community. The Insights report displays the contents of posts so you can quickly assess whether a post is spam or harmless. You can then approve or delete a post directly from the report. You can also perform mass-action and approve multiple posts at once.
  - To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see **Report on Communities with the Dashboards and Insights Package.**
- **Approve posts directly in the community feed.**
  - In the community feed, users with the “Can Approve Feed Post” permission see an extra action in the drop-down menu of the post to **Approve** the content. If the post is inappropriate, they can delete it. If the post has a typo, they can edit it.
After the post is approved, the author of the post receives an email that lets them know the post is approved and provides a link to the post in the community. Email notifications, such as @mentions notifications, are only sent after the post is approved.

- Create Content Rules to Moderate Your Community
- Feed Post and Comments Editing Overview

**Moderate Flagged Posts and Comments in Your Community**

Community moderators can review a list of posts and comments that members of the community have flagged as inappropriate and take action. Group owners or group managers, can view flags and take action on items in their groups.

Flagged posts and comments have a small orange flag next to the post or comment date. The number next to the flag indicates how many people have flagged the item. The moderator can review each item and decide whether to take action.

A few things to keep in mind:

- Moderators can only view and act on items they have access to.
- Within a group in a community, group owners or managers can moderate items in their groups, including viewing or removing flags and deleting posts, comments, or files if necessary.
- If Allow members to flag content is disabled in a community, only moderators can flag items and view flagged items.

There are a few ways you can moderate flagged posts and comments:

- **Use a preconfigured Insights report in Community Management.** Use the Flagged Posts and Flagged Comments reports provided in the Salesforce Communities Management package. These reports let you quickly manage your community’s flagged posts and comments. You can see the content of the post or comment and then remove the flag or delete it. You can also select multiple items at once.

  To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see Report on Communities with the Dashboards and Insights Package.

- **Use the flagged feed in Chatter.** If you’re using a Salesforce Tabs + Visualforce community, you can see a list of flagged posts and comments using the Chatter menu in your community. The Allow members to flag content preference must be enabled to see the Flagged feed.
• Moderate using a custom list. You can expose a list of flagged posts and comments using the Chatter REST API or ConnectApi in Apex.

• Moderate directly within context of the community by removing flags or deleting content in the feed.

Tip: To receive an email each time an item in your community is flagged, select the Flags an item as inappropriate checkbox on your Email Settings page.

  Chatter REST API Developer Guide
  Apex Developer Guide

Moderate Flagged Files in Your Community

Community moderators can review a list of files that members of the community have flagged as inappropriate and take action. Group owners or group managers can view flags and take action on files in their groups.

Members of your community may post files that aren’t appropriate because they contain sensitive information or offensive content. Other members of the community can flag these files for review. Flagged files have a small orange flag. The number next to the flag indicates how many people have flagged the item.

A few things to keep in mind:

• Moderators can only view and act on items they have access to.

• Within a group in a community, group owners and managers can review and remove flags on files in the groups they own and manage if Allow members to flag content is enabled for their community.

• If Allow members to flag content is disabled in a community, only moderators can flag items and view flagged items.

There are a few ways you can moderate flagged files:

• Use a preconfigured Insights report in Community Management.
  Use the Flagged Files report provided in the Salesforce Communities Management package. This report lets you see the name of the flagged file, who created it, who flagged it, and how many flags the file has. You can click a link to open the file and review the content. Then you can remove the flag or delete the file. You can also select multiple items at once.
  To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see Report on Communities with the Dashboards and Insights Package.

• Moderate using a custom list. You can expose a list of flagged files using the Chatter REST API or ConnectApi in Apex.

• Moderate directly within context of the community by removing flags or deleting content on the file detail page.

Tip: To receive an email each time an item in your community is flagged, select the Flags an item as inappropriate checkbox on your Email Settings page.
To limit the size and types of files allowed in your community, go to the Administration > Preferences page.

- Chatter REST API Developer Guide
- Apex Developer Guide

**Moderate Flagged Private Messages in Your Community**

Community moderators can review and act on a list of Chatter messages that members of the community have flagged as inappropriate or as spam.

The “Moderate Communities Chatter Messages” permission allows users to see the contents of messages, remove flags, and delete messages only in communities they're a member of. With this permission, only flagged messages can be deleted. The “Modify All Data” permission allows moderators to remove flags or delete a message in the SOAP API.

Ensure that your moderators are assigned the “Moderate Communities Chatter Messages” permission, *not* the “Manage Chatter Messages” permission. The “Manage Chatter Messages” permission allows users to see all the messages in your entire Salesforce org. Avoid security and privacy concerns; double-check that your moderators and managers have the right permission.

⚠️ **Important**: Keep these limitations in mind:

- Community members can’t flag messages sent from communities that they aren’t a member of or that haven’t turned on flagging for their users.
- Users can’t flag messages in your internal organization, in Salesforce1, or in partner and customer portals.

There are a few ways to monitor and manage flagged messages in your communities:

- **Use a preconfigured Insights report in Community Management.**  
  Use the Flagged Private Messages report provided in the Salesforce Communities Management package. This report lets you track trends and stay on top of message spamming attacks in your community. You can view who sent the message, the contents of the message, when it was sent, and who flagged the message. You can use this report to unflag messages and delete messages.
  
  To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see Report on Communities with the Dashboards and Insights Package.

- **Create your own report.**  
  First, create a custom report type using Networks as the primary object and Network Audits as the secondary object. Then create a report using your new custom report type and add a field filter for Audited Object Type set to equal Chatter Message. Use the API to delete flagged messages.

- **Directly query the flagged messages from the API and then delete them.**

⚠️ **Tip**: If you want to receive an email each time a message in your community is flagged, select the Flags an item as inappropriate option on the Email Settings page. To receive emails, you must have the “Moderate Communities Chatter Messages” and “Moderate...
Communities Feeds’ permissions. To set your email preferences, go to your profile page within a community, click the drop-down button ( • ) in the upper-right corner and select My Settings, then click Email Settings.

Guidelines for Deleting Your Users’ Chatter Messages
SOAP API Developer Guide: ChatterMessage
Apex Developer Guide: Moderate Chatter Private Messages with Triggers

Set Up Apex Triggers for Flagging Items

Use triggers to create custom advanced moderation logic that automatically flags items in your community.

Tip: Did you know you can do this in the UI? Most communities don’t need custom moderation triggers. You can create moderation rules and criteria directly in Community Management. For more information, see Community Moderation Rules.

Using triggers to automatically flag items allows you to moderate your community behind the scenes. These flags are only visible to moderators. You can view flags in Community Management, query for them in the API, or use custom report types to create reports on flagged items, people whose items are flagged most, and more.

Consider the following when creating triggers:

- Create Apex after insert triggers on either FeedItem, FeedComment, ChatterMessage, or ContentDocument.
- Define criteria that when met creates a NetworkModeration (flag) record, with the FeedComment, FeedItem, ChatterMessage, or ContentDocument as the parent.

Example: This trigger automatically flags posts in your community that contain BadWord.

```java
trigger autoflagBadWord on FeedItem (after insert) {
    for (FeedItem rec : trigger.new) {
        if (!<CommunityId>.equals(rec.networkScope))
            continue;

        if (rec.body.indexOf('BadWord') >= 0) {
            NetworkModeration nm = new NetworkModeration(entityId=rec.id,
                visibility='ModeratorsOnly');
            insert(nm);
        }
    }
}
```

A similar trigger on comments would look like this.

```java
trigger autoflagBadWord on FeedComment (after insert) {
    for (FeedComment rec : trigger.new) {
        if (!<CommunityId>.equals(rec.networkScope))
            continue;

        if (rec.commentBody.indexOf('BadWord') >= 0) {
            NetworkModeration nm = new NetworkModeration(entityId=rec.id,
```
Organize Self-Service Communities with Topics

Topics are a fantastic way to organize content in any community. Community members can add topics to posts and discussions, and structure content organically. When you set up a self-service community with the Napili template, you can use the Community Management page to quickly guide members to key navigational and featured topics.

On the Community Management page, you choose navigational topics and subtopics to provide a consistent map of your community, and featured topics to highlight current, popular conversations. In the community itself, member-created topics let users organize information for each other, creating a personalized experience that boosts community engagement.

In a self-service community, the Napili template specifies the layout and design of navigational, featured, and member-created topics. Below are visual examples of each type in an active community.

Tip: To add navigational and featured topics to other types of communities, Apex developers can use the ConnectApi.ManagedTopics class in a Visualforce page.

Navigational topics

On every page of a self-service community, navigational topics are available from the Topics menu at upper left. Community members can also see all the community’s navigational topics and subtopics in one place in the topic catalog.

When visitors choose a navigational topic, the banner image you selected for it appears at the top of the page.
Featured topics

Featured topics are accessible from the body of your community home page. Thumbnail images you select for featured topics uniquely identify them. (These unique thumbnails appear only on the home page; at the top of all featured topic pages, the default banner image specified in Community Builder appears.)
Member-created topics

When posting questions, community members create topics by using hashtags in body text, or typing in the topic suggestions box below. (In Setup, the “Assign Topics” and “Create Topics” permissions must be enabled for community users.)

If any suggested topics are poor matches for the post, members can simply click to delete them.

⚠️ Tip: Member-created topics can be accessed via search, or highlighted as featured topics on the Community Management page.

Manage Topics in Communities
As the number of topics in a community grows, curate them to improve usability. In Community Management, you can create, merge, rename, and delete topics in one convenient location.

Set Up Featured Topics
Featured topics highlight current, popular community conversations. Change them regularly to keep community members up-to-date and engaged.

Set Up Navigational Topics
Structure your community’s content and help your users find what they need with navigational topics. If your organization uses data categories, community managers can link current Salesforce Knowledge articles associated with those categories to each navigational topic. (If data categories aren’t enabled, administrators can add articles to each topic using the Chatter REST API.)

See Your Community’s Topics and Subtopics in One Place
You’ve gone through the exhaustive task of adding topics and various levels of subtopics to your community’s content. Now you want your community members to see all the organized topics in one place, so they can navigate to any subject their hearts desire. Fear not! They can see everything in your community’s topic catalog.

Add Topics to Articles or Remove Them
Easily add multiple topics of any type to specific articles, or quickly remove them as community needs change.

Translate Topics Names and Descriptions for International Communities
Use the Translation Workbench to translate navigational and featured topics, and topic descriptions, in international communities.
Manage Topics in Communities

**USER PERMISSIONS**

| To access the Community Management page: | “Manage Communities”  
| OR | “Create and Set Up Communities” |

| To create topics: | “Create Topics” |
| To merge topics: | “Merge Topics” |
| To delete topics: | “Delete Topics” |
| To rename topics: | “Edit Topics” |

**EDITIONS**

Available in: Salesforce Classic  
Available in: Enterprise, Performance, Unlimited, and Developer Editions

As the number of topics in a community grows, curate them to improve usability. In Community Management, you can create, merge, rename, and delete topics in one convenient location.

1. Open Community Management.
2. Click **Topics > Topic Management**
3. Do any of the following:
   • To create a topic (often with a plan to merge existing ones into it), click **New**. Add a name and a topic description, which will boost SEO.
   • To combine existing topics, click **Merge**. Merging a topic automatically redirects existing hashtags in posts. If you merge a navigational or featured topic, the topic type, image, and any subtopic relationships are discarded.
   • To rename or delete an existing topic, or add a description to it, click **笔**. If you don’t see a topic you want to rename or delete, either search for it or click **Show More** below the topic list.

**Tip:** For communities with a global audience, you can translate names and descriptions of navigational and featured topics. From Setup, search for and select **Translate**. Then select the Managed Topic setup component, and expand a community to see its master topic names.

**SEE ALSO:**
- Set Up Navigational Topics
- Set Up Featured Topics
Set Up Featured Topics

Featured topics highlight current, popular community conversations. Change them regularly to keep community members up-to-date and engaged.

1. Open Community Management.
2. Click Topics > Featured Topics.
3. Select a navigational or member-created topic you want to feature from the dropdown menu. Up to 1000 topics load in the drop down menu when you are choosing a topic. Then click Add.
   
   Tip: Using the Chatter REST API, you can create unique featured topics, separate from navigational, or member-created ones.

4. Hover over a topic name, and click 📩. Then click Upload thumbnail image, and select an image that represents the featured topic on the community home page.

   (Thumbnail images are scaled to 250 x 250 pixels. To prevent distortion, create files with those dimensions.)

5. Repeat steps 3 and 4 to create several featured topics for your community, up to a maximum of 25. Then click Save.

To quickly edit existing featured topics, simply hover over a topic name, and do any of following:

- To move topics up or down, click the arrows at left.
- To rename or delete topics, or change their thumbnail images, click 📩.

---

To access the Community Management page:

- "Manage Communities"
  OR
- "Create and Set Up Communities"
  AND
  Is a member of the community whose Community Management page they’re trying to access.

To set up featured topics:

- "Edit Topics"
Set Up Navigational Topics

Structure your community’s content and help your users find what they need with navigational topics. If your organization uses data categories, community managers can link current Salesforce Knowledge articles associated with those categories to each navigational topic. (If data categories aren’t enabled, administrators can add articles to each topic using the Chatter REST API.)

1. From Setup, enter Topics for Objects in the Quick Find box, then select Topics for Objects, and enable topics for all the article types you want to include.
   
   Note: Enabling topics disables public tags on articles. Personal tags aren’t affected.

2. Open Community Management.

3. Click Topics > Navigational Topics.

4. In the text box at right, enter a topic name, and click Add. Want to add subtopics? After you add a topic, choose your topic from the drop down menu (under Show the subtopics of). To add a subtopic, add another topic and click Add. You can add up to two levels of subtopics for each parent topic.

5. If your organization uses data categories, hover over the navigational topic name, and click Add Articles & Close Window. Select a Data Category Group, then select the categories you want to add to the topic, and click Add Articles & Close Window.

   Important: This process adds only current articles to a topic. To add new articles, return to Community Management and repeat the step above.

6. Hover over a topic name, and click Edit. Then click Upload banner image, and select an image that appears across the top of the topic page.

   (Banner images are scaled to 1400 x 180 pixels. To prevent distortion, create image files with those dimensions.)

7. Repeat steps 4-6 to create several navigational topics for your community. Then click Save.

8. Use subtopics to further categorize your content. Associate articles for each set of subtopics for a more granular organization.

   The following is the maximum number of navigational topics and subtopics you can have in a Napili community template.

<table>
<thead>
<tr>
<th>Level</th>
<th>Maximum Number of Entries</th>
</tr>
</thead>
<tbody>
<tr>
<td>One (parent)</td>
<td>25</td>
</tr>
<tr>
<td>Two (subtopic)</td>
<td>10</td>
</tr>
<tr>
<td>Three (subtopic)</td>
<td>10</td>
</tr>
</tbody>
</table>

Tip: To quickly edit existing navigational topics, simply hover over a topic name, and do any of following:

- To move a topic up or down, click the arrows at left.
To rename or remove a topic, change its banner image, or remove assigned articles, click 📝.

See Your Community’s Topics and Subtopics in One Place

You’ve gone through the exhaustive task of adding topics and various levels of subtopics to your community’s content. Now you want your community members to see all the organized topics in one place, so they can navigate to any subject their hearts desire. Fear not! They can see everything in your community’s topic catalog.

The topic catalog shows the community’s hierarchy of navigational topics you have created. It is only visible once you have set up navigational topics, and it is accessed from the navigation menu.

How can the topic catalog be useful to your community members?

• New and returning users look at all the organized topics in one place, getting a lay of the land before diving deeper into a specific topic.
• Any community user can use the topic catalog as a jumping point to go from topic to topic.

To set up the topic catalog, select the Add the “More Topics...” link when editing the navigation menu on the home page.

Example:

SEE ALSO:
Set Up Navigational Topics
Add Topics to Articles or Remove Them

Easily add multiple topics of any type to specific articles, or quickly remove them as community needs change.

1. Open Community Management.
2. Click Topics > Article Management.
3. Use the search bar to look for articles. Filter your search by selecting a data category group, followed by a specific category.
4. Click an article, and then type to assign topics, or click existing ones to remove them.

Translate Topics Names and Descriptions for International Communities

Use the Translation Workbench to translate navigational and featured topics, and topic descriptions, in international communities.

1. From Setup, enter Translate in the Quick Find box, then select Translate.
2. Select the Language you’re translating into.
3. For Setup Component, select Managed Topic.
4. For Aspect, select Field Label to change the topic name, and Description to change the topic description.
5. In the Community Name column, expand a community to see its master topic names.
6. To enter language-specific names for navigational and featured topics, double-click in the Topic Name Translation column.

Consider the following when you’re using the Translation Workbench:

- There is no Metadata API support for translated topic names or descriptions.
- While topic name uniqueness is guaranteed in English, the translator must ensure the uniqueness of topic names in the translated language.
- Modifying topic names from Community Management only changes the English community. All translated topic name and description changes must be made using the Translation Workbench.
- If a translated topic name is entered when the community is in English mode, the translated name can appear twice in the translated community.
When topics names are translated with the Translation Workbench, hashtags in the translated communities also change. For example, #help shows as #aiuto in Italian. If the community member then reverts to English from Italian, clicking the #aiuto hashtag gives an error message rather than showing the topic detail page of #help.

Customize Recommendations in Communities

Create recommendations to drive engagement for your community, encouraging users to watch videos, take trainings, and more. Edit these recommendations in Community Management, where you can target specific audiences and use channels to specify locations for the recommendations.

1. Open Community Management.
2. Select Recommendations > Recommendations.
3. Select Default Channel or one of the custom channels.

A channel is a way to group recommendations together so you can determine where they show up in the community.

Default Channel

Recommendations in the default channel appear in predefined locations, such as directly in the feed in the Salesforce 1 mobile browser app and on the Home and Question Detail pages in communities using the Summer ‘15 or later version of the Napili template.

Custom Channel

You choose the pages where you want these recommendations to appear. In Community Builder, add the Recommendations component to the page where you want the recommendation to appear. Use the Property Editor to specify the custom channel with the recommendation.

Using a custom channel, you could surface a recommendation to review specific knowledge articles on a product description page to guide customers to more information.

If you want to change the channel of a recommendation, delete the recommendation and recreate it in a different channel.

4. Click New.
5. Complete the following fields:

- Name—Enter a name for the recommendation in Community Management. This name doesn’t appear in the community.
- Image—Click Upload Image to include an image with your recommendation.
- Title—Optionally, enter header text that appears above the image.
- Description—Enter detailed text that suggests what users can do.
- Button text—Enter a label for the button in the recommendation.
- https://—Enter the URL that the button opens.
- Audience—Select an audience for the recommendation. If you don’t select an audience, all members of the community see the recommendation.

Tip: To create an audience that appears in this drop-down list, in Community Management select Recommendations > Audiences and click New.

- Enabled—if checked, this recommendation is active and appears in communities.
When disabled, recommendations that exist in feeds in the Salesforce1 mobile browser app are not removed, but no new recommendations appear. In communities using the Summer ’15 or later version of the Napili template, disabled recommendations no longer appear.

6. Click Save.

Tip: To remove a recommendation, in Community Management, select Recommendations > Recommendations, and click the recommendation name. At the bottom of the recommendation details, click Delete.

Target Community Member Audiences for Your Recommendations

Create audiences of new community members, or use the API to manage customized lists of audience members.

SEE ALSO:
Update Your Community’s Template in Community Builder

Target Community Member Audiences for Your Recommendations

Create audiences of new community members, or use the API to manage customized lists of audience members.

1. Open Community Management.
2. Select Recommendations > Audiences.
3. Click New.
4. Complete the following fields.
   - Name—Enter a name for the audience in Community Management.
   - Audience Type
     - Select New Members to create an audience based on how long users have been community members.
     - Enter the number of days since registration for audience members.
     - Select Custom List to create an audience based on any criteria you want.
     - Note: You can’t manage audience membership for custom lists through the UI. Add and remove members through the API.
5. Click Save.

Audiences you create appear in the Audience drop-down list when you create a recommendation.

Tip: To remove an audience, in Community Management, select Recommendations > Audiences, and click the audience name. At the bottom of the audience details, click Delete. If you remove an audience that is associated with a recommendation, the recommendation is disabled and the audience is set to the default (All community members).

Reputation Overview

Your reputation in the community directly corresponds to how active you are. The more you post, comment, and share, the higher your reputation level will be.

Your reputation level appears on your profile page and when any user hovers over your name. It’s visible to other community members so that they know how influential you are. When you start out in the community, you are at the lowest level. As you become more active in the community, you gain points and your reputation level increases. Increases in reputation levels are posted to your feed. In other words, as people see you participating and sharing your knowledge, your credibility and influence grows.

Your administrator defines the activities that help you gain points. They also set the number of points for each action.

These are the default actions that increase your reputation level:

You increase your reputation by:

- Posting
- Commenting
- Liking a post or comment
- Sharing a post
- People sharing your posts
- People commenting on your posts
- People liking your posts or comments
- Mentioning someone
- Being mentioned
- Asking a question
- Answering a question
- Receiving an answer
- Marking an answer as best
- People marking your answer as best
- Endorsing someone for knowledge on a topic
- Being endorsed for knowledge on a topic

Enable Reputation in Your Community
Enable reputation in your community so that members are recognized and rewarded for participating.

Set Up Reputation Levels
Update the default reputation levels to meet your community’s needs and help motivate your members.

Set Up Reputation Points
Set up a point system to reward users for participating in the community.

How is my community reputation calculated?
The reputation level on your profile is calculated based on your total points.
Enable Reputation in Your Community

Enable reputation in your community so that members are recognized and rewarded for participating.

A powerful tool for a community manager is the ability to recognize individual members for their participation, because community managers know that recognition and a little friendly competition usually lead to more active members. Enabling reputation turns on a default point system and set of reputation levels in the community. A community manager can personalize labels and point values from the Community Management page.

Members start to accrue points by performing the actions that have assigned point values. Once the member exceeds the top of the level’s point threshold, they move up a level. They, and other members of the community, see their reputation level on their profile and when hovering over their name. Total points also show on member’s profiles.

Note: When you enable Reputation, Chatter influence is removed from the Contribution section on the profile page.

1. Open Community Management.
2. Click Administration > Preferences.
3. Select Enable setup and display of reputation levels, then click Save.

After you enabled reputation, a default point system and set of reputation levels is available on the Community Management page. The default reputation points are as follows:

<table>
<thead>
<tr>
<th>Action</th>
<th>Points</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Community Engagement</strong></td>
<td></td>
</tr>
<tr>
<td>Write a post</td>
<td>1</td>

- Set Up Reputation Levels
- Set Up Reputation Points
- How is my community reputation calculated?

### Set Up Reputation Levels

Update the default reputation levels to meet your community’s needs and help motivate your members.

When reputation is enabled for a community, 10 default levels are added. You can add or remove levels, give each level a name, and update the point range and image for each level.

**Note:** A community must have at least three reputation levels and can have up to 50.

1. Open Community Management.
2. Click Reputation > Reputation Levels.
   
   From here you can:
   - Upload your own image for each reputation level. Click the default image to browse to an image file and upload a new image.
     **Note:** You can’t revert to the default reputation level images from the Salesforce user interface. Use the Salesforce Chatter REST API to do this.
   - Give each level a name, such as “Beginner,” “Intermediate,” and “Expert.” If you don’t assign a name, the default is used. For example, “Level 1,” “Level 2,” “Level 3.”
   - Edit the point range for a level.
     When you update the higher value of a level’s point range, the lower value for the next level is automatically adjusted when you save.
   - Add more levels by clicking **Add a level**, located underneath the list of levels.
   - Remove a level by clicking **x** next to the level.
3. Click **Save** to apply your changes.
You can now update the point system for the community. The point system determines how many points a user gets when they perform certain actions or when others recognize their contributions by commenting, liking, or sharing their posts. Reputation level increases are posted to member feeds.

You can translate reputation level names so that international community members can view their reputation levels in the appropriate language. In Translation Workbench, select the Reputation Level setup component and then expand the node next to your community.

SEE ALSO:
- Set Up Reputation Points

## Set Up Reputation Points

Set up a point system to reward users for participating in the community.

When reputation is enabled for a community, there is a default point system set up. When users perform the actions with assigned point values, their total points increase and they start to move towards the next reputation level.

**Note:** Only active users accrue points. For example, if an active user likes the post of an inactive user, the active user gets 1 point, but the inactive user does not get points.

The table shows the default events and points.

<table>
<thead>
<tr>
<th>Action</th>
<th>Points</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Community Engagement</strong></td>
<td></td>
</tr>
<tr>
<td>Write a post</td>
<td>1</td>
</tr>
<tr>
<td>Write a comment</td>
<td>1</td>
</tr>
<tr>
<td>Receive a comment</td>
<td>5</td>
</tr>
<tr>
<td>Like something</td>
<td>1</td>
</tr>
<tr>
<td>Receive a like</td>
<td>5</td>
</tr>
<tr>
<td>Share a post</td>
<td>1</td>
</tr>
<tr>
<td>Someone shares your post</td>
<td>5</td>
</tr>
<tr>
<td>Mention someone</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Questions and Answers</strong></td>
<td></td>
</tr>
<tr>
<td>Ask a question</td>
<td>1</td>
</tr>
<tr>
<td>Answer a question</td>
<td>5</td>
</tr>
<tr>
<td>Receive an answer</td>
<td>5</td>
</tr>
<tr>
<td>Mark an answer as best</td>
<td>5</td>
</tr>
</tbody>
</table>
Questions and answers in the community feed are not to be confused with the Chatter Answers functionality.

Note: In organizations with reputation enabled prior to the Winter ’15 release, actions associated with questions and answers will be available at the time of the release and their default point values will be set to 0. Existing user reputation points will not be affected by the release, and users won’t accrue points from these actions until you configure point values for them.

1. Open Community Management.
2. Click Reputation > Reputation Points.
3. Update the points for each action. If you don’t want users to accrue points for a certain action, set the Points to 0.
4. Click Save.

Point totals show up on profile pages beneath the photo. Point totals are visible to anyone in the community.

Tip: You can directly update reputation points for a community member via the Salesforce API. You can also use Apex triggers to send custom notifications based on changes to reputation points.

SEE ALSO:
Set Up Reputation Levels

How is my community reputation calculated?

The reputation level on your profile is calculated based on your total points. Points are accrued when you perform activities that your community manager has assigned point values. You could also potentially gain points if your posts or comments draw reaction from other community members. For example, your community manager may have decided that writing a post earns you 5 points. If someone else shares your post, your community manager may decide that you should earn 10 points because your post is influencing others to contribute.

Note: Only active users accrue points. For example, if an active user likes the post of an inactive user, the active user gets 1 point, but the inactive user does not get points.

Default point values are as follows. Keep in mind that your community manager may have customized these values. For more information, contact your community manager.

<table>
<thead>
<tr>

Set Up Report Management for External Users—Create and Edit Reports

Community partner and customer users can create and edit reports in their own personal folder or in a privately shared folder if they have sufficient permissions. You can grant partner and customer users permissions to create and edit reports through their profiles or by using permission sets. After you grant the required permissions, they can use the drag-and-drop Report Builder tool.

Track Community Activity

Create custom reports to track usage, moderation, and other community activity.

Report on Communities with the Dashboards and Insights Package

The Salesforce Communities Management package gives community managers an essential starter set of dashboards and reports to keep tabs on activity and engagement directly in Community Management.

Use the Salesforce Communities Management package to:

- View the latest metrics and rapidly spot trends
- Determine how fast your community is growing
- Find out who your most engaged members are
- Discover which discussions people and groups are most excited about
- Identify areas in your community that need attention
- Take immediate action on recent activity with Insights reports

**Note:** To use the preconfigured Insights reports, your community must use Chatter.

Install one of the following versions from the AppExchange:

- Salesforce Communities Management (for Communities with Chatter)
- Salesforce Communities Management (for Communities without Chatter)

**Tip:** For installation instructions, detailed information about the reports, and upgrade instructions, see Get Started with the Communities Management AppExchange Package.

During installation, dashboard and report folders are automatically installed in your internal org. You’ll also have the option to give your community managers access to the package contents so you don’t have to share the dashboard and report folders with them later. If you have no previous Insights or dashboards mapped in Community Management, they are automatically mapped for you during installation.

After the package is installed, you can access your new dashboards and reports alongside all your other Salesforce dashboards and reports. When you view the dashboards in Community Management, community-specific data is displayed. After installation, here’s what you see in Community Management.

<table>

</tr>
</tbody>
</table>

The dashboards and reports provided in the package are 100% customizable. Don’t be afraid to customize and change what you get in the package. You won’t hurt our feelings. As newer versions of the package become available, you can upgrade your package by reinstalling it. If you customized any of the reports and dashboards, fear not; your customizations are retained during upgrade.

- What’s the difference between Insights and dashboards?
Set Up Report Management for External Users—Create and Edit Reports

Community partner and customer users can create and edit reports in their own personal folder or in a privately shared folder if they have sufficient permissions. You can grant partner and customer users permissions to create and edit reports through their profiles or by using permission sets. After you grant the required permissions, they can use the drag-and-drop Report Builder tool.

**Important:** If your organization existed before the Summer ’13 release, you must first turn on enhanced sharing for reports and dashboards before granting external users permissions. See Analytics Folder Sharing.

To create, customize, and delete reports, external users must use the Report Builder tool.

Data visibility is based on two main things: the user role the partner or customer belongs to and your organization’s sharing rules. Your organization’s field-level security is respected, meaning that if a field is not visible for external users, a partner or customer user won’t see it in Report Builder.

1. To allow external users to create and edit reports, turn on the “Create and Customize Reports,” “Report Builder,” and “Edit My Reports” permissions through custom profiles or permission sets. If you want external users to export report data, also assign them “Export Reports” permission.

In Setup, enter Permission Sets in the Quick Find box, then select Permission Sets or Profiles. Assign the following permissions:

**External User Permissions Needed to Create and Edit Reports**

<table>
<thead>
<tr>
<th>Permission</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>To create, customize, and delete</td>
<td>“Create and Customize Reports” AND “Report Builder”</td>
</tr>
<tr>
<td>reports in a personal folder:</td>
<td></td>
</tr>
<tr>
<td>To create, customize and delete</td>
<td>“Edit My Reports” AND “Report Builder”</td>
</tr>
<tr>
<td>their own reports in a privately</td>
<td></td>
</tr>
<tr>
<td>shared folder with Viewer access:</td>
<td></td>
</tr>
<tr>
<td>To export report data</td>
<td>“Export Reports”</td>
</tr>
</tbody>
</table>

You can give permission to create and edit reports to all role-based external users with licenses such as Customer Community Plus and Partner Community. You can also give permission to all legacy role-based portal licenses such as Customer Portal and Gold Partner.

**Note:**
- These permissions aren’t available to high-volume user licenses, such as Customer Community, High Volume Customer Portal, Service Cloud Portal, and Authenticated Website.
- External users with legacy portal licenses can create and edit reports in communities, but not in portals.

2. If you want your external users to create or edit reports in a privately shared folder, grant them “Viewer” access on the folder.

On the Reports tab in the Folders view, click next to the folder you want to share, then select Share.

**Note:** Partner and customer users can’t create, edit, or view reports in the Unfiled Public Reports folder.
Depending on what objects, fields, and categories your external users have access to, they might see custom report types in the UI when creating a report. Custom report types are visible if a user has read access on any fields or objects included in the custom report type.

SEE ALSO:
- Share a Report or Dashboard Folder
- Compare Access Levels for Report and Dashboard Folders
- Communities Report and Dashboard Limitations

### Track Community Activity

Create custom reports to track usage, moderation, and other community activity.

**Tip:** Keep in mind that you can get preconfigured dashboards in the Salesforce Communities Management package available for download on the AppExchange.

To monitor the health of your community, you can create custom report types and then create a report using that custom report type. If you want your community managers to see your report in Community Management, you can create or edit a dashboard to include your report and then map the updated dashboard in Community Management. To change the mapping of a dashboard, click Dashboards > Settings.

**Note:** Only reports that are based on the Networks object show community-specific information on the Community Management page. Using reports based on the Networks object, means you can create one custom report and use it across all your communities.

Use the following table to get started with reporting for communities:

<table>
<thead>
<tr>
<th>High-level usage</th>
<th>Primary Object &gt; B (Child Object) &gt; C (Child Object, If Applicable)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chatter Usage</td>
<td>Networks &gt; Chatter Messages</td>
<td>Create reports on the private message activity in your community.</td>
</tr>
<tr>
<td>Chatter Usage</td>
<td>Networks &gt; Feed Revisions</td>
<td>Create reports on posts and comments that your members have edited.</td>
</tr>
<tr>

<td>User Activity</td>
<td>Networks &gt; Network Activity Daily Metrics</td>
<td>Create reports on the daily number of posts and comments by member type.</td>
</tr>
<tr>
<td>User Activity</td>
<td>Networks &gt; Network Members &gt; Login History</td>
<td>Create reports on the login activity in your community. To report only on external user logins, filter the report by Status (on the Login History object) to equal 0.</td>
</tr>
<tr>
<td>User Activity</td>
<td>Networks &gt; Network Membership Daily Metrics</td>
<td>Create reports on the daily count of total active members, new members added, and external member logins by member type.</td>
</tr>
</tbody>
</table>
High-level usage | Primary Object > B (Child Object) > C (Child Object, If Applicable) | Description
---|---|---
User Activity | Networks > Network Unique Contributor Daily Metrics | Create reports on the unique daily contributors in your community. A member is counted as a contributor if they posted or commented on a group or a user profile.

User Profile Photos | Networks > Network Members | To report on user profiles with or without photos, filter the report by Has Profile Photo (on the Network Members object) to equal True or False.

1To report on Chatter Messages, you must have the "Moderate Communities Chatter Messages" permission.

Note: You can create reports based on other objects and expose them in Community Management. Just keep in mind that they show data from across your organization, not just for the community in which you’re viewing them.

Educate Your Users About Communities

Share Personal Contact Information Within Communities

Users can specify which information from their profile is visible to external users, such as customers and partners, and guests viewing publicly accessible pages that don’t require login.

When interacting with other community members, it’s important to balance being visible and accessible with protecting your personal contact information. You may not want to show your job title, phone numbers, and other contact details outside of your internal organization. Your customers and partners may not want other customers and partners viewing all their contact information.

Use either the user interface or API to control visibility. You can choose to expose fields to employees only, members of the community from outside your company, or guest users who aren’t required to log in. Some fields are always visible to everyone accessing the community. Some fields allow up to three levels of visibility, while others allow fewer.

- Employees—Only members from the internal organization can view.
- External—Members from the internal organization and external members, such as customers and partners, can view. External users are users with Community, Customer Portal, or partner portal licenses.
- Public—Anyone can view, including guest users viewing publicly accessible pages that don’t require login. Guest users can access public pages in communities via the Guest User license associated with each site or community.

In the API, setting a field to true on the User object makes it visible to the type of user indicated in the field name (external or guest users).

Consider these tips about the visibility of your contact information.

- Your chosen settings apply to every community you’re a member of.
When a user is restricted from viewing a contact information field, there are differences in what’s displayed in the user interface versus the API.

- In the user interface, the restricted field is hidden from your profile everywhere that it usually displays in a community. If your organization displays your profile information on custom Visualforce pages, the field still displays, but with the value #N/A.
- In the API, a field set to false returns the value #N/A.

Information in hidden fields on a profile is not searchable by other partners and customers in the community, but is searchable by users in the company’s internal organization.

**Default Visibility Settings for Contact Information**

This table summarizes the default visibility settings for contact information and your options for restricting visibility.

Navigate to Your Communities

You can easily switch between working in your internal organization and collaborating with customers or partners in communities. The global header is not available by default, the administrator for your organization must enable it for community members.

Note: Organizations who enabled Communities before Winter ‘14 see the new global header by default when they turn on Communities.

The menu on the left side lets you switch between communities and your internal organization.

- To access communities from within your organization, click next to Organization Name in the drop-down and select the community you want to switch to. The drop-down shows Active communities that you're a member of. If you have the “Create and Set Up Communities” permission, you also see Preview communities that you're a member of.
- To return to your internal organization, click next to Community Name in the drop-down and select your organization name.

Internal users who aren’t members of any community only see the company name. External users see the drop-down menu only if they belong to more than one active community.

Note: If an external user who is only a member of one Active community is given the URL for a Preview community, they don’t see the drop-down menu in the Preview community.

You can work in more than one community at a time if you open each one in a different browser tab.

Switching between your internal organization and your communities doesn’t have to disrupt your workflow. We automatically return you to the page where you were last working, so you can pick up right where you left off.

Note: If your organization is setting up My Domain but hasn’t finished deployment of the new custom domain, switching from a community to your internal organization directs you to the Salesforce login page instead. This can happen when you’ve logged in using a My Domain URL that has been registered but not yet deployed. Once your domain is deployed, selecting your organization in the drop-down directs you to the internal organization as expected.

The Your Name menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the Switch to Lightning Experience link in the Your Name menu. Communities aren’t supported in Lightning Experience, so to create, manage, or access communities from the global header, you’ll have to switch back to Salesforce Classic.

Salesforce Communities Overview
Search Behavior in Communities

Search capabilities in communities can make or break a member’s experience. Search in communities is different depending on whether your community is using a Community Builder-based template or a Salesforce Tabs + Visualforce template. In general, searches within a community return results specific to that community.

For all communities:

Search behavior in communities is different from searches in the internal org:

- In general, searches within a community return matches from within the community. To find items from a different community, members must leave the current community and search from within the other community.

- In search results in a community, members can see what they have access to through their profiles or permission sets in addition to what is explicitly shared with them in the community. This can include internal company content and records not explicitly shared in the community. For example, if the user’s profile allows access to account information, and the accounts tab isn’t made visible in the community, the member is able to access account information from their search results.

- For user searches performed by external community members, global search and enhanced lookup search (with the All Fields option selected) query the following limited set of fields:
  - Name
  - Username
  - User ID
  - Body
  - Email
  - Phone
  - Custom fields

  For example, if an external community member searches for a user, John Doe, by his alias jdoe, and that term isn’t contained in any of the searchable fields, the user John Doe isn’t included in search results.

- Search results for records and files are not limited to data made visible within the community. Record search results include all the records a user has access to across all community, including the internal org’s records if they have access. In file searches, users can see:
  - Files they own
  - Files shared with them directly
  - Files they have access to in a library
  - Files that are posted to a record they have access to
  - Files that are posted to groups or shared with that community

- The admin must enable search result filters for an object in the internal org for it to be searchable in a community. To make custom objects searchable, the object must be associated to a tab in the internal org.

For communities using Community Builder-based templates Koa and Kokua:

- The Featured Search component lets community members search for articles within a specific data category.
- The Article List component shows the search results based on the search term entered in Featured Search.

For communities using the Community Builder-based template Napili:

- The Search Publisher component lets community members enter search terms in the community.
- The Search Results component shows a list of search results limited to articles and discussions.
Note: Only articles that have a topic associated to them in Community Management populate in the Search Results component.

- The Global Search Results component lets members see search results in one tab (All), or in separate tabs for cases, accounts, contacts, and any other object exposed in the community (including custom objects) to which they have access.

Note: Admins must associate a tab to a custom object in order to make it searchable in global search.

For communities using Salesforce Tabs + Visualforce:

- If Chatter is enabled in your org, global search and contextual feed search are enabled by default in all communities.
  - With global search, members can search for records, files, people, groups, topics, and feed posts and comments.
  - Feed search (🔍) is helpful when members want to look for information in a specific feed context, such as in groups, on a user’s profile, in a record feed, or in the community feed.
- If Chatter isn’t enabled, sidebar search is enabled in all communities.
  - Sidebar search doesn’t support searches for items specific to Chatter, such as feeds, groups, files, topics, and user profiles.

Manage Your Community Email Notifications

Use email notifications to keep up with important updates in communities.

You can choose to receive email notifications whenever someone posts on your profile, comments after you on a post you’ve commented on, posts to a group you belong to, and more. Email notification preferences are set by community.

To set your email preferences, go to your profile page within a community, click the drop-down button (▼) in the upper-right corner and select My Settings, then click Email Settings. You can turn individual notifications on or off.

Your chosen settings apply to the current community. If you don’t belong to any groups yet, you won’t see the option to set groups on this page until after you join your first group. You can also set your group email preferences using the Email Me... drop-down on each group’s page. You can choose to receive a daily or weekly digest email or an email every time someone posts. This option is visible if you’re a group member.

Your email options are similar to the Chatter email settings in your internal organization under your personal settings (Your Name > My Settings > Email Settings for Chatter Free users). Within communities, however, note the following differences.

- The default notification frequency for new groups you join can’t be set via the user interface. It can be set only via Salesforce APIs (SOAP API and REST API).
- Personal digests aren’t currently available.
- If your community has Chatter messages enabled, you’re notified of file shares in a message. If Chatter messages aren’t enabled, you’ll continue to be notified of file shares by email.
- If flagging is enabled in the community, the Flags an item as inappropriate option appears for all members of the community, but only sends notifications if:
  - You’re a group owner or manager and a member flags a post, comment, or file in your group.
  - You’re a moderator and a member flags a post, comment, or file you have access to. Depending on the type of notification you want to receive, you also need following permissions:
Email Notifications About | Required Permission
---|---
Flagged posts and comments | "Moderate Communities Feeds"
Flagged files | "Moderate Communities Files"
Flagged Chatter messages | "Moderate Communities Feeds" and "Moderate Communities Chatter Messages"

If the Flag as Inappropriate link doesn’t work in your email, try flagging the message from the UI.

### Search Visibility

*Search behavior in communities* varies slightly from the search in the internal organization. Search results respect sharing rules for all items by default. The following table describes what each type of user in a community can see in search results.

<table>
<thead>
<tr>
<th>Search Results For</th>
<th>Administrator</th>
<th>Salesforce Community Member</th>
<th>External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)</th>
</tr>
</thead>
<tbody>
<tr>
<td>People</td>
<td>People specific to the current community.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| Users              | • Information in hidden fields on a profile is not searchable by other partners and customers in the community, but is searchable by users in the company’s internal organization.  
• Portal users can’t search for users in the community when sidebar search is enabled.  
• When external community members search for users, global search and enhanced user lookups (with the All Fields option selected) query the following limited set of fields on user records:  
  – Name  
  – Username  
  – User ID  
  – Body  
  – Email  
  – Phone  
  – Custom fields | |
| Groups             | Groups specific to the current community. | | |
| Files              | Visibility in the current community:  
• Owned files  
• Files shared with the user in a public or private group  
• Files shared with the entire community | Visibility in the current community:  
• Owned files  
• Files shared with the user in a public or private group  
• Files shared with the entire community | |

Salesforce Communities Overview
Welcome, Collaboration Tool Administrators

This documentation contains everything you need to help your users collaborate with each other, or even with people outside your organization. Learn how to set up and extend Chatter, or enable users to create, package and send files outside your organization using Salesforce CRM Content. For help with basic Salesforce administration, see Set Up Your Organization.

Salesforce Chatter

Chatter

Chatter is a Salesforce collaboration application that connects, engages, and motivates users to work efficiently across the organization regardless of role or location. Chatter lets users collaborate on sales opportunities, service cases, campaigns, and projects with embedded apps and custom actions.

Salesforce organizations created after June 22, 2010 have Chatter already enabled for all users by default. However, if you only want certain parts of your organization to use Chatter, you can do a profile-based rollout of Chatter instead. With a profile-based rollout, only the users that have been assigned the required user profile or permission sets have access to Chatter. Profile-based rollout of Chatter is useful for larger companies and companies or government agencies with regulatory constraints. It allows them to plan a controlled rollout and deploy Chatter on a department-by-department basis.

We recommend rolling out Chatter for all users in your organization, unless your company doesn’t want all users to have full access to Chatter. Chatter is secure and works in accordance with all the security and permission settings in your Salesforce organization.

SEE ALSO:
Profile-Based Chatter Rollout Overview

Profile-Based Chatter Rollout Overview

Profile-based rollout of Chatter enables Chatter for a subset of users instead of all users in the organization.

Profile-based rollout of Chatter makes Chatter available for a part of your organization, but not for all users. Once profile-based rollout of Chatter is enabled for your organization, you can turn on Chatter for the users with the required user profile or permission sets. All other users in your organization don’t have access to Chatter.

Example: Let’s say you assign a profile or permission set that excludes Chatter access to a subset of users. These users still have access to Salesforce objects, but they don’t see the record feed and they can’t make posts.
Get Ready for Profile-Based Rollout of Chatter

If you’re rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

Control Chatter Access Through User Profiles

Modify existing custom user profiles to allow or deny access to Chatter.

Control Chatter Access Through Permission Sets

Handle Chatter access by modifying existing or creating new permission sets.

Profile-Based Rollout Considerations

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permissions sets, and the interaction between users with and users without Chatter access.

Get Ready for Profile-Based Rollout of Chatter

If you’re rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

From a high-level perspective, a profile-based rollout of Chatter consists of these steps:

1. Salesforce enables the profile-based rollout of Chatter feature for your organization.
2. You determine who gets access to Chatter.
3. You review and modify existing custom user profiles and permissions sets.
4. Verify that the Enable Chatter permission in a custom user profile or permission set has the desired setting.
5. To allow or restrict Chatter access, assign the associated profile or permission set to users.
6. You turn on Chatter for your organization.

**Note:** Perform step 6 as a separate, final step. If step 6 is combined with another step or performed out of order, unpredictable and undesirable results can occur.

SEE ALSO:

- Profile-Based Chatter Rollout Overview
- Control Chatter Access Through User Profiles
- Control Chatter Access Through Permission Sets
Control Chatter Access Through User Profiles

Modify existing custom user profiles to allow or deny access to Chatter.

When Salesforce turns on profile-based rollout of Chatter for your organization, the Enable Chatter permission is added to all of your existing user profiles and permissions sets. This permission is automatically enabled for all standard profiles. It is also automatically enabled for all custom profiles, if any of the following user-level permissions were already enabled, either manually or as part of a license:

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
- “Create and Share Content Deliveries for Chatter Files” (ChatterFileLink)
- “Invite Customers To Chatter” (ChatterInviteExternalUsers)
- “Manage Chatter Messages” (ManageChatterMessages)
- “Moderate Chatter” (ModerateChatter)
- “Moderate Chatter Feeds” (ModerateNetworkFeeds)
- “Use Case Feed” (ViewCaseInteraction)
- “View All Data” (ViewAllData)

Modify your existing custom profiles with the desired permissions to control access to Chatter and create new custom profiles, if required.

1. Log in as a Salesforce administrator.
2. From Setup, enter Profiles in the Quick Find box, then select Profiles.

3. For each of your existing custom user profiles:
   a. Click Edit.
   b. In the Administrative Permissions section, select or deselect Enable Chatter, depending on whether you want users with this profile to have Chatter access or not.
The Enable Chatter permission is only available if profile-based rollout of Chatter is enabled for your organization.

c. Save your changes.

4. If applicable, create new custom user profiles with the desired permissions and assign them to users.

⚠️ **Note:** Selecting the Enable Chatter permission in a person’s user profile doesn’t automatically turn on Chatter for that person. People can’t use Chatter until actually you turn on Chatter for your organization.

SEE ALSO:
- Get Ready for Profile-Based Rollout of Chatter
- Control Chatter Access Through Permission Sets
- Chatter Settings
- Profile-Based Rollout Considerations
Control Chatter Access Through Permission Sets

Handle Chatter access by modifying existing or creating new permission sets.

When you enable or disable Chatter through permission sets, consider that:

- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn’t enabled in their user profile.
- Permission sets don’t persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both the person’s user profile and permission set.

For your existing permission sets, verify that they include the correct and required Chatter permissions for the desired subset of users.

1. Navigate to Permission Sets.
2. For each existing user-level permission set:
   a. In the System section, click System Permissions.
   b. Click Edit and select Enable Chatter. This permission is available only after profile-based rollout of Chatter is enabled for your org.
   c. Save your changes.

To enable Chatter:
- “Customize Application”
3. If applicable, create new permission sets with the desired permissions and assign them to users. By default, all permissions in a new permission set are disabled. Enable the following Chatter permissions in the new permission set so users have these permissions.

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
- “Create and Share Content Deliveries for Chatter Files” (ChatterFileLink)
- “Invite Customers To Chatter” (ChatterInviteExternalUsers)
- “Manage Chatter Messages” (ManageChatterMessages)
- “Moderate Chatter” (ModerateChatter)
- “Moderate Chatter Feeds” (ModerateNetworkFeeds)
- “Use Case Feed” (ViewCaseInteraction)
- “View All Data” (ViewAllData)

**Note:** Selecting the Enable Chatter permission in a person’s permission set doesn’t automatically turn on Chatter for that person. People can’t use Chatter until you turn on Chatter for your organization.

SEE ALSO:
- Get Ready for Profile-Based Rollout of Chatter
- Control Chatter Access Through User Profiles
- Chatter Settings
- Profile-Based Rollout Considerations

**Profile-Based Rollout Considerations**

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permissions sets, and the interaction between users with and users without Chatter access.

- The Enable Chatter option isn’t available unless profile-based rollout of Chatter has been enabled for the organization.
- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn’t enabled in their user profile.
- Permission sets don’t persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both the person’s user profile and permission set.
- Selecting the Enable Chatter permission in a person’s user profile or permission set doesn’t automatically turn on Chatter for the organization. Turn on Chatter for your organization after you modified user profiles and permission sets.
- Standard Salesforce user profiles have Chatter enabled by default. You can’t disable Chatter for these standard profiles.
- Don’t deselect Enable Chatter permission on a cloned Chatter External user profile. The user sees an error message and can’t log in.
- Don’t deselect the Enable Chatter permission on a cloned Chatter Free or Chatter Moderator profile. You get an error message and can’t save the profile.
- Enabling profile-based rollout of Chatter and Chatter for an organization also enables a set of dependent Chatter user permissions. If Chatter is disabled for the organization, these permissions are also disabled at the same time. However, if Chatter is then enabled again, these permissions aren’t automatically re-enabled and the administrator must enable them explicitly.
- When profile-based rollout of Chatter is enabled for an organization, Chatter is automatically enabled for standard profiles. For all custom profiles and permission sets, Chatter is automatically enabled, if any of the following user-level permissions were already enabled, either manually or as part of a license:
Set Up and Maintain Collaboration Tools

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
- “Create and Share Links to Chatter Files” (ChatterFileLink)
- “Invite Customers To Chatter” (ChatterInviteExternalUsers)
- “Manage Chatter Messages” (ManageChatterMessages)
- “Moderate Chatter” (ModerateChatter)
- “Moderate Chatter Feeds” (ModerateNetworkFeeds)
- “Use Case Feed” (ViewCaseInteraction)
- “View All Data” (ViewAllData)

- In organizations that have Work.com enabled, users with access to Chatter can’t thank users who don’t have access to Chatter.
- If your organization already has Chatter enabled and switches to profile-based rollout of Chatter, manually enable Chatter in all existing custom profiles and permission sets. Otherwise, users that are assigned these custom profiles and permission sets lose access to Chatter.

### Chatter Settings

Chatter is enabled by default in Salesforce and the Salesforce1 app. Configure various Chatter features and customize the Chatter experience for your users on the Chatter Settings page in Setup.

- To access the Chatter Settings page, enter Chatter in the Quick Find box and select Chatter Settings.
- To disable Chatter for your entire organization, deselect Enable in the Chatter Settings section.

#### Chatter Group Settings

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates and ask questions.

**Enable Emoticons in the Feed**

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

**Customer Invitations**

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company’s email domains. They have limited Chatter access and can only see groups they’re invited to and interact with members of those groups.

**Coworker Invitations**

Allow Salesforce users to invite coworkers without Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can’t see record data unless they have a Salesforce license.

**Enable Actions in the Publisher**

To add global actions to the publisher, you must first enable the Actions in the Publisher feature in Chatter Settings. Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

**Feed Post and Comments Editing Overview**

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

SEE ALSO:

Chatter
Chatter Group Settings

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates and ask questions.

Chatter Group Archiving

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

Enable Records in Chatter Groups

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

Enable Unlisted Chatter Groups

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter.

Unlisted Group Limitations

Consider the limitations of unlisted groups before you decide to enable them in your organization.

Chatter Group Archiving

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

Mentioning a group doesn’t count as feed activity and doesn’t delay group archiving. Archived groups count toward your organization’s group limits (30,000), but not toward a user’s group membership limits (300).

There are more group archiving settings on the group settings page. That’s where group owners and managers can archive, activate, or edit the automatic archiving settings. To change the archiving settings for multiple groups at once, use the Salesforce API.

If your organization doesn’t want to use group archiving, disable this feature in Setup. Enter Chatter in the Quick Find box, select Chatter Settings, and deselect Allow Group Archiving in the Groups section.

Note: To allow group owners and managers to archive, activate, or disable automatic archiving in the Salesforce1 apps and in the Lightning Experience, customize the group layout and add the necessary fields.

SEE ALSO:

Group Layouts
Enable Records in Chatter Groups

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

The Add Record action on the group publisher lets users add account, contact, lead, opportunity, contract, campaign, case, and custom object records to groups. The Add Record action isn’t available by default, so you must configure the group publisher to include this action.

Walk Through It: Allow Users to Add Records to Chatter Groups

We recommend that you also customize object layouts to include the Groups related list on record detail pages. Customize the layout of all the standard and custom objects in your organization that support group-record relationships. The Groups related list shows users the list of groups associated with the record.

Walk Through It: Add the Groups Related List to Records

If you don’t want to users to add records to groups, enter Chatter in the Quick Find box in Setup, then select Chatter Settings, and deselect Allow records in groups in the Groups section. Disabling the feature hides the Group Records list on the group detail page and the Add Record action in the group publisher.

SEE ALSO:

Customize the Chatter Group Layout and Publisher

Enable Unlisted Chatter Groups

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter. Unlisted groups offer more privacy for compared to private groups. Only group members and users with the “Manage Unlisted Groups” permission can access unlisted groups in list views, feeds, and search results. By default, unlisted groups aren’t enabled for your organization. Review the limitations of unlisted groups, before you enable this feature in your organization.

1. From Setup, enter Chatter in the Quick Find box, then select Chatter Settings.
2. Click Edit.
3. Select Enable Unlisted Groups.
   A message displays with important information about enabling unlisted groups in your organization.
4. In the highlighted message, select the checkbox next to I want to enable unlisted groups and understand that I may need to update Apex/Visualforce code in my organization.
5. Click Save.

Any user can create an unlisted group. Unlike private groups, users with the “View All Data” or “Modify All Data permission” can’t view or update unlisted groups unless they’re members. To allow
non-members to view and modify unlisted groups, assign the “Manage Unlisted Groups” permission to them via their profile or a permission set.

SEE ALSO:

Unlisted Group Limitations
Unlisted Groups Overview

Unlisted Group Limitations
Consider the limitations of unlisted groups before you decide to enable them in your organization.

For Administrators

• Only users with the “Manage Unlisted Groups” permission can access or modify unlisted groups and its files and feed content without membership.
• Users with the “Modify All Data” permission can’t delete feed content from unlisted groups, unless they are group members.
• Users with the “Data Export” permission can export all Chatter data and view the exported posts and comments from any group, regardless of whether they have the “Manage Unlisted Groups” permission.
• You can’t grant the “Manage Unlisted Groups” permission to users with these profiles Chatter External, High Volume Portal, or High Volume Customer Portal.
• Unlisted groups count toward a user’s group limit, but they don’t appear in the Groups list on a user’s profile page unless the person who’s viewing the list is a member of those groups or has permission to manage unlisted groups. When unlisted groups are hidden, the count that’s shown next to the Groups list might not be accurate, depending on the permissions of the person viewing the list.

For Developers

Apex code runs in system mode, which means that the permissions of the current user aren’t taken into account. This limitation has implications for pages that are written in Apex.

• Visualforce pages that display groups might expose unlisted groups to users who aren’t members.
• Because system mode disregards the user’s permissions, all users who are accessing a Visualforce page that’s showing an unlisted group can act as an owner of that group.
• AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren’t members.

To limit and manage access to the unlisted groups in your organization:

• Explicitly filter out unlisted groups from SOQL queries in all Apex code.
• Use permission sets, profile-level permissions, and sharing checks in your code to further limit unlisted group access.
• Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of unlisted groups. In Setup, enter Group Triggers in the Quick Find box, then select Group Triggers to add triggers.

SEE ALSO:

Enable Unlisted Chatter Groups
Unlisted Groups Overview
Enable Emoticons in the Feed

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

Emoticons aren’t supported in Salesforce1.

1. From Setup, enter Chatter Settings in the Quick Find box, then select Chatter Settings.
2. In the Emoticons in Feed section, select Allow Emoticons.

Salesforce supports these character combinations in posts and comments.

<table>
<thead>

Customer Invitations

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company's email domains. They have limited Chatter access and can only see groups they're invited to and interact with members of those groups.

Customer invitations don't support custom domains created using My Domain, single sign-on, and IP restrictions. To allow customer invitations with these features enabled, we recommend one of the following approaches:

- Customize the single sign-on page for your organization with an extra link redirecting users to https://yourDomain.my.salesforce.com/.
- Enable single sign-on for your customers.

Customer invitations are enabled by default. To disable customer invitations, enter Chatter in the Quick Find box in Setup, select Chatter Settings, and deselect Allow Customer Invitations in the Chatter Settings section. Disabling this feature doesn't delete existing customers or groups that allow customers.

SEE ALSO:

Coworker Invitations

Can I connect multiple Salesforce organizations using Chatter?

Coworker Invitations

Allow Salesforce users to invite coworkers without Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

Coworker invitations are automatically enabled for new Salesforce organizations. The email domain of the first Salesforce user that is added to the organization is used as the company domain in the Company Email Domains field. Invitations aren't turned on if the user's domain is a free public email provider such as yahoo.com or gmail.com.

You can add up to 200 domains. Enter the domains that are used in email addresses for your company. We recommend that you don't enter public email domains such as hotmail.com, yahoo.com, or gmail.com. If invited, anyone with an email address in these domains can join and see user profiles, feeds, and Chatter groups.

To disable coworker invitations, enter Chatter in the Quick Find box in Setup, select Chatter Settings, and deselect Allow Coworker Invitations in the Coworker Invitations section. If you deselect this feature, users can't accept outstanding invitations. Similarly, if you remove an email domain, users can't accept outstanding invitations from that domain.

Publisher Actions and Layouts

Feed Post and Comments Editing Overview

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

A Chatter Settings option and two user permissions control the feed post editing feature.

The Allow users to edit posts and comments option in Chatter Settings enables or disables the Edit Feed Post feature for your organization. This option is enabled by default in existing and new organizations. All users that are assigned a standard profile can edit their own posts and comments immediately, except for Chatter Free, Chatter External, and Customer Portal users. For users that are assigned custom profiles, administrators must specifically enable the permissions in the users’ custom profiles or permission sets.

The “Edit My Own Posts” permission allows users to edit their own posts. This permission is available and automatically enabled on standard profiles, except Chatter External, Chatter Free, and Customer Portal User profiles. To allow Chatter External, Chatter Free, or Custom Portal users to edit their own posts, clone the profiles and enable the “Edit My Own Posts” permission in the cloned profiles. Assign the cloned profiles to the users.

The “Edit Posts on Records I Own” permission allows users to edit posts and comments on records they own, including other people’s posts and comments. For example, a group owner or manager can edit all posts on the group’s feed. A manager for a particular record type can edit all posts on the record. This permission is available on standard and custom profiles, but it is disabled by default.

This table summarizes the permissions and their default settings.

<table>
<thead>
<tr>
<th>User Permission</th>
<th>Description</th>
<th>Available in</th>
<th>Default Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit My Own Posts</td>
<td>Allows users to edit their own posts</td>
<td>Standard profiles, except</td>

<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• High Volume Customer Portal User</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Partner Community User Profile</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Custom profiles</td>
<td>Disabled in all new and existing organizations</td>
</tr>
<tr>
<td>Edit Posts on Records I Own</td>
<td>Allows record owners to modify their own posts and</td>
<td>Custom profiles</td>
<td>Disabled in all new and existing organizations</td>
</tr>
</tbody>
</table>
However, Chatter moderators, community moderators, and users with “Modify All Data” permission can always edit all posts and comments.

The Allow users to edit posts and comments option in Chatter Settings is enabled by default. For users that have the required permissions, the Edit option is available from the drop-down menu on posts, comments, questions, and answers. It opens a separate Edit window, where users can modify the text.

After users saved their edited version of the post, it shows an Edited time stamp to indicate that the original post was modified.

If users edit a post or comment and mention new people or groups, those people and groups receive email notifications. People and groups who were mentioned in the original post or comment don’t receive a new email notification. Email notifications for edited posts or comments show the Edited time stamp.

For community users, feed post editing is only available, if the community was created using Salesforce Tabs + Visualforce or the Napili template. The Edit option isn’t available on system-generated posts like feed tracked record updates.

Enable Feed Post Editing in User Profiles or Permission Sets
By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

Disable Feed Post Editing for All Users
By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.
Enable Feed Post Editing in User Profiles or Permission Sets

By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

Here’s how you enable the permissions in a permission set.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets.
2. Click an existing permission set or create one.
3. In the System Permissions section, click Edit.
4. Select the edit feed post permissions you want to enable.
   - Select Edit My Own Posts to allow users that are assigned this custom profile to edit their own posts and comments.
   - Select Edit Posts on Records I Own to allow users that are assigned this custom profile to edit posts and comments on records they own, including posts and comments made by other users.
5. Click Save.
6. Assign the permission set to the users who need the permissions.

Example: Walk Through It: Assign a Permission Set

Disable Feed Post Editing for All Users

By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.

1. From Setup, enter Chatter Settings in the Quick Find box, then select Chatter Settings.
2. Click Edit.
3. In the Post and Comment Modification section, deselect Allow users to edit posts and comments.
4. Click Save.

The feed post editing feature is disabled for your entire organization. Users can no longer edit posts and comments.
Publisher Actions and Layouts

Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

Actions are all about productivity. Actions let users accomplish things with fewer clicks, fewer fields, and ultimately less time spent. Actions are especially useful in Salesforce1, because it makes it easy to create and edit records with a simple, mobile-optimized interface. By default, the Chatter publisher includes the standard actions Post, File, Link, Poll, and Question.

In Salesforce1, actions appear in the action bar, its associated action menu, and as list-item actions.

There are several categories of actions, like standard actions, nonstandard actions, default actions, mobile smart actions, custom actions, and productivity actions.
- **Standard actions**: Standard actions are actions that are automatically added to the publisher when Chatter is enabled—such as Post, File, Link, and Poll. You can customize the order in which these actions appear in the publisher, but you can’t edit their properties.

- **Nonstandard actions**: Nonstandard actions are actions that you create and customize yourself.

- **Default actions**: Default actions are predefined actions provided by Salesforce. Add them to the publisher layout to make them available to your users.

- **Mobile smart actions**: Mobile smart actions are a set of preconfigured actions, just like default actions. In Salesforce1, mobile smart actions let users create records directly in the feed.

- **Custom actions**: Custom actions are Visualforce pages or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5000 characters.

- **Productivity actions**: Productivity actions are predefined by Salesforce and are attached to account, contact, event, lead, user, and user profile objects. You can’t edit or delete productivity actions.

To customize the publisher with more actions or change the order of the actions, first enable actions in the publisher on the Chatter Settings page in Setup.

Create Global Publisher Layouts

Global publisher layouts determine the global actions that appear in the various Salesforce interfaces. In Salesforce Classic, these layouts customize the actions in Chatter publishers on global pages (like the Home page) and on the Chatter page. Lightning Experience uses these layouts to populate the Global Actions menu with Log A Call actions and Create a Record quick actions that point to the Events, Notes, and Tasks objects. And in Salesforce1, these layouts drive the actions that appear in the action bar on the Feed and People pages. Global publisher layouts can include global actions only.

1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select *Publisher Layouts*.
2. To create a new global publisher layout, click *New*.
3. To clone a publisher layout, select one from the Existing Global Publisher Layout drop-down list.
4. Enter a name for the new global publisher layout.
5. Click *Save*.

**SEE ALSO:**
- Assign Global Publisher Layouts to User Profiles
- Global Publisher Layouts
Add Actions to Global Publisher Layouts

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Arrange the actions so that the frequently used actions appear first in each list. All other actions appear in the publisher drop-down menu.

Walk Through It: Customizing Global Publisher Layouts

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in Salesforce Classic.

Salesforce1 and Lightning Experience Actions

This section can contain actions only from the Salesforce1 Actions category in the palette. On object page layouts, the Salesforce1 Actions category contains all available types of actions for the object, including quick actions, productivity actions, and standard and custom buttons. Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

1. From Setup, enter Publisher Layouts in the Quick Find box, then select Publisher Layouts.

2. To add or remove actions, drag them to and from the palette. To reorder actions, select an action and drag it to a new position.

In the Quick Actions in the Salesforce Classic Publisher section, the first three actions on the left appear in the Chatter publisher. All other actions appear in the More drop-down menu.

3. Click Save when you’re done, or click Quick Save to save your changes and continue working on the layout.

If you navigate away without saving, you lose your changes.

Example: Let’s add the New Account action to the publisher, so users can create an account directly from the publisher. Just drag the New Account action to the Quick Actions in the Publisher section and save your changes.

Go to the Chatter tab. Now the New Account action shows up in the publisher.
Feed Tracking

Feed tracking tracks changes to objects and fields and posts them as updates in Chatter. Users who follow a record, see the feed updates in their Chatter feed.

Feed tracking is available for objects and fields. You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

Sharing rules and field-level security determine visibility of record changes in Chatter feeds. To see changes to that record in their feeds, users must have access to the record.

These objects and fields are tracked by default:

- **Account**: Account Name, Account Owner
- **Case**: Case Owner, Priority, Status
- **Chatter Group**: Allow Customers, Description, Group Access, Information Body, Information Title, Name, Owner Name
- **Contact**: Account Name, Contact Owner, Name
- **Lead**: Lead Owner, Lead Status, Name
- **Opportunity**: Amount, Close Date, Opportunity Name, Opportunity Owner, Stage
- **Topic**: Description
- **User**: About Me, Address, Email, Manager, Phone, Title

Tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the tracking field audit history is still available.

**Customize Chatter Feed Tracking**

Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.
Enable Feed Updates for Related Records
Show feed updates on a record’s detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

SEE ALSO:
Chatter Settings

Customize Chatter Feed Tracking
Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.

You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

1. From Setup, enter Feed Tracking in the Quick Find box, then select Feed Tracking.
2. Select an object.
3. Select Enable Feed Tracking.
You must have the required user permissions to see this checkbox.
4. Select up to 20 fields to track.
You can’t select fields for external objects or article types. The following standard field types can’t be tracked:
   • Auto-number, formula, and roll-up summary fields
   • Encrypted and read-only system fields
   • The Expected Revenue field on opportunities
   • The Solution Title and Solution Details fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled
5. If you have actions in the publisher enabled, you see the All Related Objects option. Select this checkbox to show feed items when related objects are created.
6. Save your changes.

SEE ALSO:
Feed Tracking
Enable Feed Updates for Related Records

Show feed updates on a record's detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

1. From Setup, enter Feed Tracking in the Quick Find box, then select Feed Tracking.
2. Click the object for which you want to enable feed updates for related records.
3. Click All Related Objects.
   If you don’t see this option, make sure that actions in the publisher are enabled. The All Related Objects option is available only on these objects:
   - Account
   - Campaign
   - Case
   - Contact
   - Custom objects
   - Group
   - Lead
   - Opportunity
4. Save your changes.

Example: If you enable feed updates for related records on accounts, the account feed includes:
   - Feed updates for all activity on the account
   - Updates for related tasks, events, and contacts

Chatter Email Settings and Branding

Chatter email settings let you control whether users receive email notifications about new posts, comments, and other changes. You can also change the format of the emails, like add your company’s logo and sender information.

If Chatter is enabled, email notifications are enabled by default. However, your users can configure their own email settings. They control whether they want to receive emails, for which changes, and how often. It is important that you teach your users how they can control the amount of email they receive. Too many email notifications are a pain point for many Chatter users and a common barrier to adoption.

Configure the general Chatter email settings and branding from Setup. Enter Email Settings in the Quick Find box, then select Email Settings. This table describes the settings.
## Setting Description

### General Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow Emails</td>
<td>Enables or disables email notifications for your entire company. If you deselect this option, all email notifications are disabled and your users don’t receive any notifications.</td>
</tr>
<tr>
<td>Allow Email Replies</td>
<td>If selected, users can reply to email notifications about messages and comments via email instead of navigating to the comment or message in Chatter.</td>
</tr>
<tr>
<td>Allow Posts via Email</td>
<td>If selected, users can post to groups using email.</td>
</tr>
<tr>
<td>Allow Attachments via Email</td>
<td>If selected, users can include attachments in posts to groups using email.</td>
</tr>
<tr>
<td>Show Salesforce 1 mobile app download badges</td>
<td>Show App Store and Google Play download badges for Salesforce 1 in all Chatter email notifications from your internal org. Badges don’t appear in email notifications from communities. A recipient’s language setting affects whether badges appear: if a badge isn’t translated in the set language, it doesn’t appear in the email. The option to show badges is selected by default.</td>
</tr>
<tr>
<td>Allow API-only Chatter Digests</td>
<td><strong>Note:</strong> This setting appears only if API-only Chatter Digests are enabled for your company. To enable this feature, contact Salesforce. If selected, daily and weekly scheduled digests are disabled for your entire company. You must call the API to receive digests for your users.</td>
</tr>
</tbody>
</table>

### Sender

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Name</td>
<td>The name that appears as the sender’s name in the email notification. For example, add your company’s name.</td>
</tr>
<tr>
<td>Email Address</td>
<td>The email address of the sender. For example, add your company’s email address.</td>
</tr>
</tbody>
</table>

### Branding

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logo</td>
<td>A logo that appears in the email notification. Upload a different logo to replace the default Chatter logo.</td>
</tr>
<tr>
<td>Footer Text</td>
<td>The text that appears in the footer of the notification email. We strongly recommend including your company’s physical address to comply with applicable anti-spam laws.</td>
</tr>
</tbody>
</table>

---

**Customize Branding for Email Notifications**

Customize your company’s Chatter email notifications to display sender information, footer text, and a footer logo that is personalized for your organization.
Customize Branding for Email Notifications

Customize your company’s Chatter email notifications to display sender information, footer text, and a footer logo that is personalized for your organization.

1. From Setup, enter Email Settings in the Quick Find box, then select Email Settings.
2. Enter custom values for the email sender’s name and address to replace the default values.

   **Note:** If you change the sender’s email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn’t take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

   If you enter a custom value for the sender’s address and you have enabled mail relay, your Chatter emails will use the relay.

3. Customize what displays in the footer of Chatter emails.

   **Note:**
   - All Chatter emails display the Chatter logo and Salesforce information unless you replace them with your organization’s own logo and information.
   - If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to null.

   a. Choose a logo to replace the default Chatter logo.
      The logo must be an existing document in the Documents tab and must be marked Externally Available Image. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

   b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.
      The default text includes Salesforce’s name and physical address. We strongly recommend including your organization’s physical address to comply with applicable anti-spam laws.

4. Click Save.

SEE ALSO:
Chatter Email Settings and Branding

Chatter Post Actions and Layouts

Actions on posts and comments appear in the drop-down menu on a post or comment. Users can edit, bookmark, mute, and delete posts, add topics, and create tasks from posts.

The standard Bookmark, Delete, Mute, and Add Topic actions on posts are available by default and you can’t modify them. However, you can add more actions like the Edit and Create New Task actions.

Enable Create New Tasks on Posts
Enhance the feed with an action that lets users create tasks directly from a post.
Enable Create New Tasks on Posts

Enhance the feed with an action that lets users create tasks directly from a post. Actions in the Publisher and feed tracking for task objects must be enabled.

1. From Setup, enter Feed Item in the Quick Find box, then select Feed Item Layouts.
2. Click Edit next to Feed Item Layout.
3. In the Feed Item Layout, click Quick Actions.
4. Select the Create New Task action and drag it to the Actions in the Publisher section.

If you don’t see the Create New Task action, verify that the Actions in the Publisher feature is enabled in the Chatter Settings in Setup.

5. Save your changes.

The Create New Task action displays on the drop-down menu on text and content posts. When a user creates a task from a post, the task shows up in the My Task list on the user’s Home page. The Create New Task action on posts

- Is available on text and content posts, but not on system-generated posts like tracked feed updates
- Can be partly customized. You can’t change the fields, but you can change the layout of the fields.
- Generates an update that displays in the user’s feed

SEE ALSO: Set Up Actions with Chatter Enabled

Group Layouts

The group layout lets you customize which fields, buttons, actions, a lists appear in Chatter groups. Changes to the group layout affect all groups in your organization, but they only show up on the group pages in Salesforce1. Changes to the group publisher show up in the full Salesforce site and the Salesforce1 app.

Changes you make to the group layout and the publisher affect all groups in your organization. You can’t customize the layout for an individual group.
Customize the Chatter Group Layout and Publisher
Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

Add Actions to the Group Publisher
Customize the group publisher with quick actions and Salesforce1 actions.

Customize the Chatter Group Layout and Publisher
Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

1. From Setup, enter Group Layouts in the Quick Find box, then select Group Layouts.
2. Click Edit next to the group layout you want to customize, or click New to create a layout.
3. From the palette on the top of the page, drag and drop fields, buttons, and other user interface elements to the different sections to add them to the group layout. Drag and drop them back to the palette to remove them from the layout. To make sure this works in Salesforce1 and Lightning Experience, be sure the following are in your group layout:
   - Post
   - Announcement
   - File
   - Poll
   - Edit Group
   - New Group Member
   - Manage Notifications
   - Delete Group
   - Leave Group

All group layout changes affect Salesforce1 and Lightning Experience. Group publisher changes appear everywhere. For example, if you delete the Files related list or a field in the Group Details section, those changes show up only in Salesforce1 and Lightning Experience, but not in Salesforce Classic.

All group layout changes affect Salesforce1 and Lightning Experience. Group publisher changes appear everywhere. For example, if you delete the Files related list or a field in the Group Details section, those changes show up only in Salesforce1 and Lightning Experience, but not in Salesforce Classic.

4. Click Save to save the layout.

Example: To allow group owners and managers to archive and activate groups from Salesforce1 and Lightning Experience, drag the Archive field to the Group Detail section.
To assign group layouts by user profiles, click **Page Layout Assignment** on the group layout list view.

SEE ALSO:
- Customize Page Layouts with the Enhanced Page Layout Editor
- Customize Actions with the Enhanced Page Layout Editor
- Assigning Page Layouts
- Add Actions to Global Publisher Layouts

### Add Actions to the Group Publisher

Customize the group publisher with quick actions and Salesforce1 actions.

By default, Chatter groups display standard actions that are part of the global publisher layout, like Post, File, Link, and Poll. Override the global publisher layout with a customized group publisher layout.

1. From Setup, enter **Groups** in the Quick Find box, then select **Group Layouts**.
2. Click **Edit** next to the group layout you want to customize, or click **New** to create a layout.
3. Click **override the global publisher layout** or 🗓️ in the Quick Actions in the Publisher or Actions in the Salesforce1 Action Bar section. Drag and drop actions between the palette and the publisher layout to add, remove, and reorder actions.

Changes to the Quick Actions in the Publisher section appear in the full Salesforce site. Changes to the Actions in the Salesforce1 Action Bar section appear in Salesforce1. In groups that allow customers, the publisher only shows standard actions.

**Example**: Add the Announcement, Add Record, and Add Member actions to the group publisher.

---

**EDITIONS**

Available in: Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer Editions

**USER PERMISSIONS**

To customize Chatter group layouts:
- “Customize Application”
Now users can select these actions directly from the publisher.

Topics on Objects

Topics on objects is one of the most powerful ways to crowdsource your company’s key themes and issues.

Your employees can attach topics to object records based on what they’re seeing in the field and from working with customers, giving your business insight into the voice of your customer. And because topics can cross objects, they can provide connections across people, conversations, and records.

Users can also add topics to posts. Topics on posts help users organize posts and increase their visibility. Topics are great for discussing a particular issue, theme, or subject, that isn’t limited to a particular group of people. For example, if your company has created a year-long goal around volunteering with local schools, create a topic to allow your entire company to share posts, photos, and updates related to the company goal. Groups, on the other hand, are good for conversation with a specific gathering of people. Collaboration within a group can cover any number of subjects, but always involves the same key team members. For example, if your company is planning a holiday party, a private group for the party committee lets them plan the event without the rest of the company learning the details in advance.
Enable and Configure Topics for Objects
Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

Delete Topics
People with appropriate permissions can delete topics directly from topic detail pages.

Topics Privacy
Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

Enable and Configure Topics for Objects
Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

Administrators can enable topics for accounts, assets, campaigns, cases, contacts, contracts, files, leads, opportunities, orders, solutions, custom objects, and English articles. For each object type, administrators specify which fields to use for topic suggestions.

Note: Topics are only supported on English Knowledge articles.

Warning: When topics are enabled for an object, public tags are disabled for records of that object type.

1. From Setup, enter Topics for Objects in the Quick Find box, then select Topics for Objects.
2. Select an object.
3. At the right, select Enable Topics.
4. Select the text fields that you want to use for topic suggestions. (From a combination of the selected fields, up to 3 suggestions are made from the first 2,000 characters.)
5. Click Save to save changes for all objects.

Now, users with access to the enabled objects and appropriate topics permissions can:
- See topic assignments and suggestions on records of that object type
- Add and remove topics from records of that object type
- Use topics on records of that object type to filter their list views

Additionally, if your organization uses Chatter, users can click any topic assigned to a record to go directly to a topic page. There, they'll find other records on the topic, people who are knowledgeable about the topic, and other related information.

SEE ALSO:
- Topics on Records
- Add Topics to Records
- Topics on Records
- Add Topics to Records
- Enable Topics for Articles
Delete Topics

People with appropriate permissions can delete topics directly from topic detail pages.

Because topic names and descriptions are not private, administrators might want to delete topics for compliance reasons or to remove inappropriate content. When deleting topics, consider these points:

- Topics are permanently deleted. They aren’t sent to the Recycle Bin.
- Deleted topics are removed from search results, the topics list, all posts and records, Recently Talked About topics, Related Topics, and your users’ favorites. Deleted topics are removed from Trending Topics after the next calculation.
- Users can reintroduce a topic after it’s been deleted.

To delete a topic:
1. Navigate to the topic detail page.
2. In the upper-right, click [ ] , and choose Delete.

Topics Privacy

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

This table explains where you can see all topics and where you can’t see topics used solely in private groups or on records.

<table>
<thead>

</tbody>
</table>
### User interface element | Shows all topics | Doesn't show topics used solely in private groups and on records
---|---|---
Recently Talked About topics on group detail pages | ![Checkmark] | ![Checkmark] |
Recently Talked About topics on profiles | ![Checkmark] | ![Checkmark] |
Trending Topics on the Chatter page | ![Checkmark] | ![Checkmark] |
Topic suggestions when adding topics to a post | ![Checkmark] | ![Checkmark] |
People talking number in the topics list and in topic suggestions when adding topics to a post | ![Checkmark] | ![Checkmark] |

**Note:** You can’t use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn’t created, and the link won’t work.

### Customize Chatter Influence

Customize activity thresholds for posts, comments, and likes to improve the Chatter influence calculation.

Chatter activity statistics include how many posts and comments users made, how many comments they received, and how many people liked their posts and comments.

1. From Setup, enter *Influence* in the Quick Find box, then select *Influence*.
2. Change the minimum activity thresholds.
   All minimum activity thresholds default to zero. If you set higher thresholds, users who don’t meet all three minimums are considered observers who aren’t counted when calculating influence rank. Users who do meet all three minimums but have relatively low activity are also considered observers, but they’re counted when calculating influence.
3. Click *Save*.
   Chatter influence is recalculated when you save these values.

**Warning:** Use caution when setting new thresholds because users’ influence levels can change immediately.

**SEE ALSO:**

Available in: Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer Editions

**USER PERMISSIONS**

To customize Chatter influence:

- “Customize Application”
Guidelines for Deleting Your Users’ Chatter Messages

Salesforce administrators with the “Manage Chatter Messages” permission can access all users’ private messages via the SOAP API. You can view and delete any message (such as for compliance purposes).

When you delete private Chatter messages, consider these guidelines.

- Messages are hard deleted. They aren’t sent to the recycle bin.
- Deleted messages aren’t included in message search results.
- Deleting a message that resulted from sharing a file with someone does not delete the file itself.
- If all messages in a conversation are deleted, the conversation isn’t shown in My Messages and can’t be retrieved via the Chatter REST API.
- If replies via email are enabled and a user replies to a deleted message, Chatter returns an error notification and doesn’t process the reply message.

Report on Chatter with the Dashboards Package

The Salesforce Chatter Dashboards package packs a punch! You get multiple dashboards, over 100 reports, and even custom report types that you can use to monitor and manage Chatter adoption and engagement in your organization.

Use the Salesforce Chatter Dashboards package to:

- View overall Chatter adoption with detailed metrics and monthly trends
- Monitor group adoption with membership and engagement metrics, such as the number of posts, comments, likes, and the top contributors
- Monitor content creation and user engagement, such as the top files, trending content, and the top contributors
- View topic taxonomy and monitor topic assignments, including the most assigned topics and the top assigners
- Create customized reports using out-of-the-box groupings such as department, country, role, or profile

You can install the Salesforce Chatter Dashboards from AppExchange.

Tip: For installation instructions, detailed information about the reports, and upgrade instructions, see Get Started with Chatter Dashboards.

Once the package is installed, you can access your new dashboards, reports, and custom report types alongside all your other Salesforce dashboards and reports.

As newer versions of the package become available, you can upgrade your package by reinstalling the package. If you customized any of the reports and dashboards, fear not; your customizations are retained during upgrade.

### Chatter Administration FAQs

**Can I connect multiple Salesforce organizations using Chatter?**

Chatter is only available on a per-organization basis. Only users within the same Salesforce organization can communicate with each other using Chatter. However, you can add people outside of your company’s email domains to use Chatter in your organization as a customer in groups you own or manage.

**Can portal users use Chatter?**

Chatter is not available to portal users in partner portals or Customer Portals. Chatter is available to customer users and partner users in Communities.

**Can I take control of the Chatter Expert user?**

As an administrator, you can either deactivate or take over the Chatter Expert user and provide posts to your company. By default, the Chatter Expert posts when a new user chooses to start one of the groups suggested by Chatter on the Groups you can join page.

**Note:** This only applies to organizations created after Summer ’11.

To deactivate the Chatter Expert:

1. Click **People > Find People.**
2. Search for Chatter Expert.
3. Click **Manage User > Deactivate User.**

To take control of the Chatter Expert so that you can send and receive posts:

1. Click **People > Find People.**
2. Search for Chatter Expert.
3. Change the email address to your own.
Can I Stop a User From Creating Chatter Groups?

If there are users that shouldn’t be able to create groups, you can prevent them from doing so. The ability to create groups (public, private, or unlisted) is controlled by the permission “Create and Own New Chatter Groups.” The permission is enabled by default and administrators can disable it on the appropriate users’ profiles. After an administrator disables this permission, a user can no longer create or be assigned as owner of new Chatter groups. If the user was already the owner of any groups, that ownership is not revoked.

SEE ALSO:
- Edit Profiles in the Original Profile Interface

Can I change the location of Chatter feeds using the page layout editor?

Currently, you can’t change the location of Chatter feeds. However, users can click the Hide Chatter link in a Chatter feed to hide the feed, and the Show Chatter link to show the feed.

Can I prevent certain words from being used in Chatter posts?

No, not using the standard Chatter interface. However, there are third-party apps like Chatter Blacklist. This app lets you create a “blacklist” of words, phrases, or custom expressions (for example, credit card numbers) that are prohibited in Chatter posts and comments. These words can prevent a post, be substituted with approved words or phrases, or be recorded for audit purposes. Salesforce Support doesn’t provide troubleshooting for third-party applications/packages unless specifically stated in the provider information of the application.

Do Chatter posts and files count toward my storage use?

Chatter feed posts, tracked changes, and comments don’t count toward your data storage. However, any files and photos you upload are counted against file storage. Files uploaded on the Files tab are also counted against file storage.

Salesforce Files

Add the Files Related List to Page Layouts

Add the Files related list to your page layouts for accounts, opportunities, leads, cases, and other objects so users can attach files to records while leveraging the rich features and flexibility of Salesforce Files. Use files instead of attachments to make the files available outside of the context of the individual record. The file owner or admin still decides sharing settings for the file.

You can customize page layouts to include the Files related list. This allows users to add files to a record and see a list of files associated with the record such as a lead or a case.

1. From Setup, enter Object Manager in the Quick Find box, then select the name of the object you want to add the Files related list to (such as Opportunity).
2. Click Page Layouts.
3. Click the page layout you want to customize.
4. In the list of available items in the left pane, click Related Lists.
5. Drag Files to the Related Lists section.
6. Click Save.

Prevent Users from Attaching Salesforce Files

You can disable the Select Files from Salesforce administrative permission in user profiles. Disabling this permission prevents users with that profile from selecting Salesforce files when attaching files to feed posts, records, or other objects. Another option is to apply the permission in a permission set. Users who have this permission disabled are still able to upload files from their local drive.

Disable or enable the user permission in Setup. Enter User Profiles in the Quick Find box, then select Profiles. Click Edit next to the user profile you want. In the Administrative Permissions section, enable or disable the Select Files from Salesforce checkbox. Click Save.

To apply the permission in a permission set, from Setup enter Permission Sets in the QuickFind box, then select Permission Sets. Edit the permission set and apply the Select Files from Salesforce permission.

Salesforce Files Sync

Enable Salesforce Files Sync

Enable Salesforce Files Sync to allow users to sync files between their devices and Salesforce.

1. From Setup, enter Salesforce Files in the Quick Find box.
2. Under Settings, select General Settings.
3. At the bottom of the Salesforce Files Sync Settings page, click Edit.
4. Select Enable Files Sync.
5. Click Save.

Salesforce Files Sync is now enabled for your organization.

Next, grant users access to Salesforce Files Sync.

Grant Users Access to Salesforce Files Sync

After enabling Salesforce Files Sync, grant your users access by either creating and assigning a permission set or by granting permission on profiles.

Grant Access to Salesforce Files Sync Using a Permission Set

Permission sets are an easy way to enable Salesforce Files Sync for users.

Enable Salesforce Files Sync for Profiles

Enable Salesforce Files Sync for all users with particular standard profiles, or for custom profiles specific to your Salesforce organization.
Grant Access to Salesforce Files Sync Using a Permission Set

Permission sets are an easy way to enable Salesforce Files Sync for users.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets.
2. Click New.
3. Fill out the required fields.
   - **Label**: The unique label for the permission set. For example, you might call this permission set “Salesforce Files Sync Enabled”.
   - **API Name**: The unique name used by the Force.com API.
   - **Description**: A description of this permission set. For example, “Enables Salesforce Files Sync for assigned users. Salesforce Files Sync allows users to automatically sync files across devices.”
4. Select a user license option.
   - **Note**: If you plan to assign this permission set to users with both Salesforce and Chatter Only licenses, select — None —.
5. Click Save.
   - The overview page for your new permission set appears.
6. Under System, click System Permissions.
7. At the top of the System Permissions list, click Edit.
8. Select Sync Files.
9. Click Save.
   - Assign the permission set to users who should have access to Salesforce Files Sync.

SEE ALSO:
- Permission Set Licenses

Enable Salesforce Files Sync for Profiles

Enable Salesforce Files Sync for all users with particular standard profiles, or for custom profiles specific to your Salesforce organization.

1. From Setup, enter Profiles in the Quick Find box, then select Profiles.
2. Select the profile that will have the Salesforce Files Sync permission.
3. On the profile detail page, click Edit.
4. Under Administrative Permissions, select Sync Files.
5. Click Save.

Install Salesforce Files Sync

To sync files between their computers and Salesforce, users must install the Salesforce Files Sync client, which is available for desktops and laptops. Users can also access synced files from Salesforce1.

To use Salesforce Files Sync, we recommend:

<table>
<thead>
<tr>
<th>System Requirement</th>
<th>Windows</th>
<th>Mac</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported operating systems</td>
<td>Microsoft® Windows® 7 and later</td>
<td>Apple® Mac OS X 10.8 Mountain Lion and later</td>
</tr>
<tr>
<td>Processors</td>
<td>2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices</td>
<td>Intel® Core™ Duo 1.83 GHz or faster processor</td>
</tr>
<tr>
<td>Memory</td>
<td>512 MB of RAM (1 GB recommended)</td>
<td>512 MB of RAM (1 GB recommended)</td>
</tr>
<tr>
<td>Hard drive</td>
<td>4 GB of free space recommended for sync operations</td>
<td>4 GB of free space recommended for sync operations</td>
</tr>
</tbody>
</table>

Users can download Salesforce Files Sync from Chatter.

1. From your personal settings, enter Files Sync in the Quick Find box, then select Salesforce Files Sync. Multiple results? Select the one under Personal Setup.
2. Click the Download button.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.

- Personalize Your Salesforce Experience

Configure File Upload and Download Security Settings

For security reasons, your organization may want to configure the way some file types are handled during upload and download.

To manage file upload and download settings:

1. From Setup, enter File Upload and Download Security in the Quick Find box, then select File Upload and Download Security.
2. Click Edit.
3. To prevent users from uploading files that may pose a security risk, select Don’t allow HTML uploads as attachments or document records. This setting blocks upload of these MIME file types: .html, .htt, .mht, .svg, .swf, .thtml, and .xhtml.
Warning: Keep the following in mind when selecting this option:

- If your organization uses the partner portal to give your partner users access to Salesforce, we don’t recommend enabling this setting. Enabling this setting prevents your organization from customizing the appearance of your partner portal.
- HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.
- After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.

4. Set download behavior for each file type:
   a. Download (recommended): The file, regardless of file type, is always downloaded.
   b. Execute in Browser: The file, regardless of file type, is displayed and executed automatically when accessed in a browser or through an HTTP request.
   c. Hybrid: Salesforce Files are downloaded. Attachments and documents execute in the browser.

5. Click Save.

Tips and Best Practices for Administering Salesforce Files Sync

After you’ve enabled Salesforce Files Sync for your users, you have access to administrator tools that help you monitor usage and access.

View When and How Salesforce Files Sync is Being Used

Once Salesforce Files Sync has been enabled for users, you may want to review how often the application is being accessed from the desktop, or how files are being shared.

- Logins to the Salesforce Files Sync desktop application are noted in the Login History page under the Application column as “Salesforce Files”. To view these logins, you can either export your organization’s login history to a CSV file, or create a custom list view with the Application column displayed prominently.
- An individual user’s login history is available on their User detail page in the Login History related list.

Revoke Access to Salesforce Files Sync

Things happen—users have their laptops stolen, people leave the company. When these inconveniences arise, you have a few courses of action to revoke access to Salesforce Files Sync.

- On mobile devices, synced files are included in the Salesforce1 application, and therefore, if mobile security has been compromised, you should revoke that user’s access to the Salesforce1 application.
- On desktop and laptop computers, Salesforce Files Sync is an installed application that syncs files in a folder called “Salesforce Files Sync” with Salesforce. When you disable the “Sync Files” permission for an individual user, the files in the user’s Salesforce Files Sync folder will remain on their computer, but will no longer sync with Salesforce.

To make disabling Salesforce Files Sync for individual users easier, we recommend enabling Salesforce Files Sync using a permission set on the user record rather than enabling the feature for profiles.

Monitor Login History
Regenerate a Content or File Preview

If content or a file doesn’t have a preview or the preview quality is poor, try to regenerate the preview.

The file is added to a queue while the regeneration is in progress. The existing preview is deleted immediately and users don’t have a preview while the file is in the queue.

You can’t regenerate a preview for encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB.

1. From Setup, enter Regenerate Previews in the Quick Find box, then select Regenerate Previews.
2. Specify either the Content Document ID or the Content Version ID.
   If you specify the Content Document ID but don’t specify the Version Number, the latest version is used.

To see whether the preview regenerated successfully, navigate to the file’s detail page.

Salesforce Files Connect

The Files Connect Setup Process

With Files Connect, Salesforce users can access, share, and search external data from systems like Google Drive, SharePoint, or Box. The setup process differs for cloud-based and on-premises external data sources.

Tip: For detailed visuals, tips, and troubleshooting, see the Files Connect Setup Guide and User Guide.

First, enable Files Connect, and let users access related external data sources

1. Enable Salesforce Files Connect for Your Organization.
2. Let Users and Administrators Access Files Connect Data Sources.

For cloud-based data sources, create an authentication provider, and then define the source

If you use Google Drive:
1. Create an Authentication Provider for Google Drive.
2. Define an External Data Source for Google Drive.

If you use Microsoft’s cloud systems:
1. Create an Authentication Provider for SharePoint Online or OneDrive for Business.
2. Define an External Data Source for SharePoint Online or OneDrive for Business.
If you use Box:

1. Create an Authentication Provider for Box
2. Define an External Data Source for Box

For on-premises data sources, set up a Secure Agent, and then define the source

- **Note:** This process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, see Salesforce Help.

1. Set Up a Secure Agent for SharePoint 2010 or 2013 on a Linux or Windows server to securely connect Salesforce to data stored behind your firewall.
2. Define an External Data Source for SharePoint 2010 or 2013.

Include the external data in global search

To let users access external data in global Salesforce searches, you’ll need to create an external object and give users access to its fields. This is an optional step, but highly recommended to best integrate external data with Salesforce.

For per-user data sources, have users authenticate in Salesforce

If you specified per-user authentication for a data source and exposed it through profiles or permission sets, ask authorized users to provide their data source credentials.

Start accessing, sharing, and searching external files!

Now users can access and share external files via the Files tab and feed, and search for them right alongside their Salesforce content.
Enable Salesforce Files Connect for Your Organization

Let users search and share files from external systems like Google Drive and SharePoint. To complete the process, Chatter must be enabled for both the organization and the profile of the administrator who performs these steps.

1. From Setup, enter *Files Connect Settings* in the Quick Find box, then select *Files Connect Settings*.

2. Click *Edit*, and then select *Enable Files Connect*.

3. For File Sharing, select one of the following:
   - **Copy** stores a copy of external files in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system.
   - **Reference** points to external files stored outside Salesforce. No previews are available in Chatter, and file downloads require user access to the external system. (Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup).

   **Tip:** Choose the Copy mode if your organization shares files with external customers or partners. Choose the Reference mode to reflect access restrictions from the external system in Salesforce.

Regardless of sharing mode, Chatter doesn't reflect file revisions in external systems. However, Reference mode points to the latest versions in those systems.

- The Files Connect Setup Process
- Let Users and Administrators Access Files Connect Data Sources

---

**EDITIONS**

**Available in:** both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited, and Developer** Editions

**USER PERMISSIONS**

To enable Salesforce Files Connect:
- **“Customize Application”**
Let Users and Administrators Access Files Connect Data Sources

After you enable Files Connect, give users and administrators permission to access specific external data sources from Salesforce.

Tip: Though you can provide access to data sources via permission sets or profiles, permission sets let you more quickly adjust access for several types of users. Regardless of which method you choose, be sure to give administrators access so they can configure data sources.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets or enter Profiles in the Quick Find box, then select Profiles.

2. Create a new permission set or profile, or click an existing one.
   If you use a permission set, User License must be set to the default option, “None.”

3. For a permission set, click System Permissions, then click Edit.
   For a profile, click Edit, and scroll down to the Administrative Permissions section.

4. Do either of the following, and then click Save.
   • To access cloud-based data sources like SharePoint Online, select Files Connect Cloud.
   • To access on-premises data sources like SharePoint 2010 or 2013, select Files Connect On-premises.

   Note: The on-premises permission is available with a paid permission set license, "Files Connect for on-premises external data sources." To enable the license for your organization, see these brief instructions in Salesforce Help.

5. For a permission set, click Manage Assignments in the toolbar at the top of the page. Then click Add Assignments, select users for the permission set, and click Assign.
   Important: Include any administrators who need to configure external data sources.

6. If you haven’t already, define the external data sources for your organization:
   • Define an External Data Source for SharePoint Online or OneDrive for Business
   • Define an External Data Source for SharePoint 2010 or 2013
   • Define an External Data Source for Google Drive
   • Define an External Data Source for Box

   Note: If you select an identity type of Named Principal for the data source, skip the steps below. But if you select Per User, read on.

7. In Setup, return to the detail page for the permission set or profile. Then do either of the following:
   • For a permission set, in the Apps section, click External Data Source Access.
   • For a profile, go to the Enabled External Data Source Access related list.

8. Click Edit, add specific data sources to the Enabled External Data Sources list, and click Save.
Create an Authentication Provider for Box

To use Box as an external data source, you must create an authentication provider for it in Salesforce.

Create an Authentication Provider in Salesforce

1. In Setup, enter Auth. Providers in the Quick Find box, then select Auth. Providers.
2. Click New.
3. For Provider Type, select Open ID Connect, and then set the following options:
   - Name—Enter the name you want to appear in Salesforce.
   - URL Suffix—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the Name entry.
   - Consumer Key—Enter any placeholder value. You will fill this in after you create the Box application in Step 5.
   - Consumer Secret—Enter any placeholder value. You will fill this in after you create the Box application in Step 5.
   - Authorize Endpoint URL—Enter https://app.box.com/api/oauth2/authorize
   - Token Endpoint URL—Enter https://app.box.com/api/oauth2/token
   - User Info Endpoint URL—Leave empty.
   - Default Scopes—Leave empty.
4. Click Save. Then, at the bottom of the Auth. Provider detail page, copy the Callback URL entry to a text file. (You’ll use this when creating the Box application.)
5. Create a Box application. Then return to step 6.
6. When you have created the Box application, edit the Salesforce Auth Provider and replace the following values with those from the Box app.
   - Consumer.Key: the Box client_id.
   - Consumer.Secret: the Box client_secret.
7. Click Save. Your Box authentication provider is now ready to be used.
Create a Box Application

1. Using the credentials of your Box admin account, log in to https://app.box.com/developers/services.
2. Click Create a Box Application.
3. Enter a project name, select Box content, and click Create Application.
4. Click Configure your application.
5. In the redirect_uri field, paste the Salesforce callback URL specified in the OAuth2 specification.
6. Copy the client_id and client_secret values to a text file. Enter these values at step 6 of Create an Authentication Provider in Salesforce.

Define an External Data Source for Box

Let users access their Box content from Files home, feed posts, and search.

1. From Setup in Salesforce Classic, enter External Data Sources in the Quick Find box, then select External Data Sources.
2. Click New External Data Source. Then set the following options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>A user-friendly name for the data source displayed in the Salesforce user interface.</td>
</tr>
<tr>
<td>Name</td>
<td>A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Type</td>
<td>Choose Files Connect: Box</td>
</tr>
<tr>
<td>Identity Type</td>
<td>The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)</td>
</tr>
<tr>
<td>Authentication Protocol</td>
<td>The protocol used to access Google Drive. Select OAuth 2.0.</td>
</tr>
<tr>
<td>Authentication Provider</td>
<td>Enter the Box Authentication Provider.</td>
</tr>
<tr>
<td>Scope</td>
<td>Leave blank.</td>
</tr>
</tbody>
</table>
Create an Authentication Provider for Google Drive

To use Google Drive as an external data source, you must create an authentication provider for it in Salesforce. The process begins with creating a related project in the Google Developers console.

Create a Project in the Google Developers Console

1. Using the credentials of your Google App for Work admin account, log in to [https://console.developers.google.com/project](https://console.developers.google.com/project).
2. Click Create Project.
3. Enter a project name, and click Create.
4. In the project dashboard, click Enable and manage APIs to access the API manager.
5. In the API manager, go to the Google APIs tab and search for Drive API.
6. Click Drive API in the search results, then click Enable API.
7. Click Credentials, located in the left-hand menu.
8. In the OAuth Consent Screen tab, enter a valid email address and product name. Then click Save.
9. In the Credentials tab, click Add credentials and select OAuth 2.0 client ID.
10. Select Web application and click Create.
11. Copy the client ID and client secret values to a text file. You’ll use these values when creating an authentication provider in Salesforce.

Create an Authentication Provider in Salesforce

1. In Setup, enter Auth. Providers in the Quick Find box, then select Auth. Providers.
2. Click New.
3. For Provider Type, select Open ID Connect, and then set the following options:
   - Name—Enter the name you want to appear in Salesforce.
   - URL Suffix—Enter the suffix at the end of the URL path. For example, in the path, https://login.salesforce.com/services/authcallback/00Dx00000000001/MyGoogleProvider, the suffix is “MyGoogleProvider”
   - Consumer Key—Enter the client ID you copied when creating the Google project.
   - Consumer Secret—Enter the client secret you copied when creating the Google project.
   - Authorize Endpoint URL—Enter https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force
   - Token Endpoint URL—Enter https://accounts.google.com/o/oauth2/token
   - Default Scopes—Enter openid email profile https://www.googleapis.com/auth/drive
4. Click Save. Then, at the bottom of the Auth. Provider detail page, copy the Callback URL entry to a text file. (You’ll use this when editing the Google project.)

Edit the Project in the Google Developer Console

1. In the API Manager, click Credentials, located in the left-hand menu.
2. Click on the previously created Web application.
3. In the Authorized Redirect URIs section, add the Callback URL you copied when creating the authentication provider in Salesforce.
4. Click Save.

Define an External Data Source for Google Drive

Let Chatter users access their Google Drive content from the Files tab, feed posts, and search. Salesforce supports Google documents, spreadsheets, presentations, and drawings.

1. From Setup, enter External Data Sources in the Quick Find box, then select External Data Sources.
2. Click New External Data Source. Then set the following options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>A user-friendly name for the data source displayed in the Salesforce user interface.</td>
</tr>
<tr>
<td>Name</td>
<td>A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Type</td>
<td>Choose Files Connect: Google Drive</td>
</tr>
<tr>
<td>Identity Type</td>
<td>The identity type used to authenticate to the external data source.</td>
</tr>
<tr>
<td></td>
<td>Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)</td>
</tr>
<tr>
<td></td>
<td>Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.</td>
</tr>
<tr>
<td>Authentication Protocol</td>
<td>The protocol used to access Google Drive.</td>
</tr>
<tr>
<td></td>
<td>Select OAuth 2.0.</td>
</tr>
</tbody>
</table>
Create an Authentication Provider for SharePoint Online or OneDrive for Business

To use one of Microsoft’s cloud-based external data sources, you must create an authentication provider for it in Salesforce and register that provider in an Office 365 app.

To fully configure an authentication provider, complete these steps:

1. **Create an Authentication Provider Using Placeholder Values**
2. **Register an Office 365 app**
3. **Edit the Authentication Provider**

### Create an Authentication Provider Using Placeholder Values

1. In Setup, enter **Auth. Providers** in the Quick Find box, then select **Auth. Providers**.
2. Click **New**.
3. For **Provider Type**, select **Microsoft Access Control Service**, and then set the following options:
   - **Name**—Enter the name you want to appear in Salesforce.
   - **URL Suffix**—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the Name entry.
   - **Consumer Key**—Enter a placeholder value.
   - **Consumer Secret**—Enter a placeholder value.
   - **Authorize Endpoint URL**—Enter a placeholder that begins with `https`.
   - **Token Endpoint URL**—Enter a placeholder that begins with `https`.
   - **Default Scopes**—Leave empty.
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the **Callback URL** entry to a text file. (You’ll use this when registering an Office 365 app.)

### Register an Office 365 app

1. Log in to your Office365 account as an administrator, and go to one of the following URLs:
   - **SharePoint Online**
     ```
     https://[your company name].sharepoint.com/[site collection path]/_layouts/15/appregnew.aspx
     ```
OneDrive for Business
https://[your company name]-my.sharepoint.com/_layouts/15/appregnew.aspx

2. Set the following options:
   • App Type—Select An app running on a web server.
   • Client Id—Click Generate, and copy the generated value to a text file.
   • Client Secret—Click Generate, and copy the generated value to a text file.
   • Title—Enter a name for the app.
   • App Domain—Enter the domain name of your Salesforce organization.
   • Redirect URL—Enter the Callback URL you copied when creating the Authentication Provider in Salesforce.

3. Click Create.
Now you’ll configure the newly created app to access SharePoint resources.

4. Go to one of the following URLs:
   SharePoint Online
   https://[your company name].sharepoint.com/[site collection path]/_layouts/15/appinv.aspx
   OneDrive for Business
   https://[your company name]-my.sharepoint.com/_layouts/15/appinv.aspx

5. Set the following options:
   • App Id—Enter the Client Id you copied to a text file, then click Lookup.
   • Title—Keep the default value.
   • App Domain—Keep the default value.
   • Redirect URL—Keep the default value.
   • Permission Request XML—Enter a string with this format:

     **SharePoint Online**

     ```xml
     <AppPermissionRequests>
     <AppPermissionRequest Scope="[SCOPE]" Right="[PLACEHOLDER]"/>
     </AppPermissionRequests>
     ```

     **OneDrive for Business**

     ```xml
     <AppPermissionRequests>
     <AppPermissionRequest Scope="http://sharepoint/content/tenant" Right="[PLACEHOLDER]"/>
     <AppPermissionRequest Scope="http://sharepoint/social/tenant" Right="Read"/>
     </AppPermissionRequests>
     ```

6. For SharePoint Online, replace [SCOPE] with one of these values:

   **Important:** Office 365 recognizes only these scope URLs; copy them exactly, without changes.
   • http://sharepoint/content/sitecollection/web to let users access a single site (but not its subsites).
   • http://sharepoint/content/sitecollection to let users access a single site collection (including all subsites).
   • http://sharepoint/content/tenant to let users access all site collections.
7. Replace [PLACEHOLDER] with one of these values:
   - Read
   - Write
   - Manage
   - Full Control
   For details about the differences between permission levels above, see the Microsoft website.

8. Click Create.

**Edit the Authentication Provider**

In Salesforce, you'll now replace the original placeholder values with the correct ones from the Office 365 app.

1. In Setup, enter Auth. Providers in the Quick Find box, then select Auth. Providers.

2. Click Edit next to the authentication provider you created previously.

3. Change the following values:
   - Consumer Key—Enter the Client Id you copied to a text file.
   - Consumer Secret—Enter the Client Secret you copied to a text file.
   - Authorize Endpoint URL—Enter the URL of the OAuthAuthorize.aspx page in Office 365. The URL format is as follows:
     - **SharePoint Online**
       https://[your company name].sharepoint.com/[site collection path]/_layouts/15/OauthAuthorize.aspx
     - **OneDrive for Business**
       https://[your company name]-my.sharepoint.com/_layouts/15/OauthAuthorize.aspx
   - Token Endpoint URL—Enter a URL in the following format:
     - **SharePoint Online**
       https://accounts.accesscontrol.windows.net/[your company name].onmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/[your company name].sharepoint.com@[your company name].onmicrosoft.com
     - **OneDrive for Business**
       https://accounts.accesscontrol.windows.net/[your company name].onmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/[your company name]-my.sharepoint.com@[your company name].onmicrosoft.com

4. Click Save. Your authentication provider is now ready for use.

SEE ALSO:
   - The Files Connect Setup Process
Define an External Data Source for SharePoint Online or OneDrive for Business

With Files Connect and Chatter, Salesforce can access content from Microsoft’s cloud-based systems.

1. From Setup, enter *External Data Sources* in the Quick Find box, then select *External Data Sources*.

2. Click **New External Data Source**. Then set the following options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>
<td>A user-friendly name for the data source displayed in the Salesforce user interface.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>A unique identifier used to refer to this external data source definition through the API. The <strong>Name</strong> field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Choose <strong>Files Connect: Microsoft SharePoint Online</strong> or <strong>Files Connect: Microsoft OneDrive for Business</strong>.</td>
</tr>
<tr>
<td><strong>Site URL</strong></td>
<td>The URL of your SharePoint site, site collection, or web app. <strong>Important:</strong> The URL must begin with <strong>https</strong> and end with the site name. (Don’t copy the URL seen in the browser when accessing SharePoint.)</td>
</tr>
<tr>
<td><strong>Exclude Other Site Collections</strong></td>
<td>Accesses only the collection specified by the URL, ignoring any related collections.</td>
</tr>
<tr>
<td><strong>Identity Type</strong></td>
<td>The identity type used to authenticate to the external data source. Select <strong>Per User</strong> to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.) Select <strong>Named Principal</strong> to use the same set of credentials for every user who accesses the data source from Salesforce.</td>
</tr>
<tr>
<td><strong>Authentication Protocol</strong></td>
<td>The protocol used to access SharePoint Online. Select <strong>OAuth 2.0</strong>.</td>
</tr>
</tbody>
</table>
Set Up a Secure Agent for SharePoint 2010 or 2013

A Secure Agent provides secure communication between Salesforce and on-premises data in SharePoint 2010 or 2013.

**Note:** The Secure Agent setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, see Salesforce Help.

To fully configure a Secure Agent, complete these steps:

1. Create a Connected App for the Secure Agent
2. Create a Profile and User Specific to the Secure Agent
3. Create the Agent in Salesforce, and Download the Installer to Your Server
4. Install and Run the Agent on a Windows Server or a Linux Server
5. Install Secure Agent Plug-ins for Your On-premises Data Source
6. Update Previously Installed Plug-ins
7. Import Any Required Certificates
8. Track and Troubleshoot Secure Agent Activity

**Tip:** For a visual walk-through, see this video tutorial of Secure Agent setup.

### Create a Connected App for the Secure Agent

1. In Setup, enter *Apps* in the Quick Find box, then select *Apps.*
2. In the Connected Apps section, click *New.*
3. In the Basic Information section, enter the following settings:
   - **Connected App Name**—Enter a distinctive name like “Secure Agent App.”
   - **API Name**—Leave the default value.
   - **Contact Email**—Enter your administrator’s address.
4. In the API section, select *Enable OAuth Settings,* and enter the following settings:
Set Up and Maintain Collaboration Tools

Set Up a Secure Agent for SharePoint 2010 or 2013

- **Callback URL**—Enter https://login.salesforce.com for a production instance, or https://test.salesforce.com for a sandbox.
- **Use Digital Signatures**—Deselect this option.
- **Selected OAuth Scopes**—Add “Access and manage your data (api)” and “Perform requests on your behalf at any time (refresh_token, offline_access).”

5. Click **Save**.
6. In Setup, enter **Connected Apps** in the **Quick Find** box, then select the option for managing connected apps.
7. Next to the new app, click **Edit**, and then enter the following settings:
   - **Permitted Users**—Select “Admin approved users are pre-authorized.”
   - **IP Relaxation**—Select “Relax IP restrictions.”
8. Click **Save**.

**Create a Profile and User Specific to the Secure Agent**

1. In Setup, enter **Profiles** in the **Quick Find** box, then select **Profiles**.
2. Next to the Standard User profile, click **Clone**.
3. For **Profile Name**, enter a distinctive name like “Secure Agent profile.”
4. Click **Save**.
5. Next to the new profile, click **Edit**.
6. In the Connected App Access section, select the connected app you created for the agent.
7. In the Administrative Permissions section, select **Modify Secure Agents**.
8. Click **Save**.
9. In Setup, enter **Users** in the **Quick Find** box, then select **Users**.
10. Click **New User**.
11. For **Profile**, select the profile you created for the agent. Then complete the remaining required fields, and click **Save**.
   
   **Important**: Be sure to deselect “Generate new password and notify user immediately.”

**Create the Agent in Salesforce, and Download the Installer to Your Server**

1. In Setup, enter **Secure Agents** in the **Quick Find** box, then select **Secure Agents**.
2. Click **New Secure Agent**.
3. Enter a **Label** for the user interface and **Name** for the API.
   
   **Note**: Choose the label carefully, because you can’t change it. Salesforce relies on a consistent label to remain connected to the agent.
4. For **Proxy User**, enter the user you created for the Secure Agent.
5. Click **Save**.
6. On the details page, click **Download Installer**, and then choose **Linux Agent** or **Windows Agent**.
7. In Setup, enter Apps in the Quick Find box, then select Apps, and click the name of the connected app you created. Then, in the API section, copy the Consumer Key value to a text file.

8. To your server, copy the text file and the downloaded installer file (sfdc-agent.zip for Windows, or sfdc-agent.run for Linux).

   **Important:** Make sure the server can access both Salesforce and your on-premises data source, and has Java 6.x or 7.x installed.

### Install and Run the Agent on a Windows Server

1. Extract the files in sfdc-agent.zip. Then double-click SecureAgentInstaller.exe

2. Click Next, and enter an installation folder. Click Next again, and finish initial installation.

3. When the configuration window appears, enter proxy settings used to connect to Salesforce.

   **Tip:** To change proxy settings after installation (due to a new password for example), enter the `agent:proxyconfig` command in the agent interface.

4. For Login Server Type, choose Production or Sandbox.

   **Tip:** To later change this and following configuration settings, you must uninstall and reinstall the agent.

5. For Oauth Client Key, enter the Consumer Key value you copied to the text file.

6. For Encryption Settings, select one of the following:

   - **Generate** to randomly generate a 1,024-bit public/private key pair. See the Re-use existing certificate setting if you need another key size. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.

   - **Re-use existing keystore** to reuse a key pair from a previous agent installation. The keystore is in this location: `[agent installation folder]\etc\auth.jks`.

      **Note:** If you select an existing keystore, skip to step 10.

   - **Re-use existing certificate** to select your own certificate and private key. This option enables you to use a different key size. Contact Salesforce for more information.

7. In Salesforce, from Setup, enter Apps in the Quick Find box, then select Apps.

8. Click Edit next to the connect app, and select Use Digital Signatures.

9. Click Choose File, and select the *.509 certificate. Then click Save.

10. Return to the agent installer, and click Next to complete the installation.

11. Click Install Agent as Service to start the “Salesforce Secure Agent” service on your server.

   **Tip:** To access services in Windows, choose Start > Administrative Tools > Services.

### Install and Run the Agent on a Linux Server

1. Run the installer using one of these commands:

   - Production instance:

     ```bash
     ./sfdc-agent.run
     ```
Set Up and Maintain Collaboration Tools

• Sandbox instance:
  
  ```bash
  ./sfdc-agent.run -l https://test.salesforce.com
  ```

• Production instance with your own public/private key pair:
  
  ```bash
  ```

• Production instance with a keystore generated during a previous installation:
  
  ```bash
  ```

  You’ll find the *.jks file here: [agent installation folder]/etc/auth.jks

2. Follow the on-screen instructions to enter an installation folder and proxy settings.

   **Tip:** To change proxy settings after installation, enter the `agent:proxyconfig` command in the agent interface.

3. When the installer prompts you for an Oauth Client Key, enter the Consumer Key value you copied to the text file.

   **Note:** If you specified a keystore generated during a previous installation, skip to step 8.

4. If prompted, generate a random 1,024-bit public/private key pair. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.

   **Note:** Contact Salesforce if you need to use a different key size.

5. In Salesforce, from Setup, enter `Apps` in the Quick Find box, then select `Apps`.

6. Click `Edit` next to the connect app, and select `Use Digital Signatures`.

7. Click `Choose File`, and select the *.509 certificate. Then click `Save`.

8. Return to the agent installer, and press Enter to complete the installation.

9. Start the agent with this command:

   `[agent installation folder]/bin/start`

Install Secure Agent Plug-ins for Your On-premises Data Source

To connect a Secure Agent to an external data source in Salesforce, you need to install the necessary plug-ins.

1. In Setup, enter `Secure Agents` in the Quick Find box, then select `Secure Agents`.

2. Click an agent name to access its details page.

3. In the Secure Agent Plugins list, click `New`.

   For SharePoint 2010 or 2013, you’ll need to install the following plug-ins:

   • Files Connect SharePoint
   • Files Connect Remote Connector Service
   • Secure Transport Client Service

4. To install a plug-in, select it from the Type menu, enter a distinctive name, and click `Save`. Repeat the process for each required plug-in.
Update Previously Installed Plug-ins

When plug-in updates are available, administrators receive weekly email notifications.

1. In Setup, enter Secure Agents in the Quick Find box, then select Secure Agents.
2. In the Secure Agent Plugins list, if the Update Available column states “Yes,” click Edit for that plug-in.
3. Select Update to the recommended version on save, and click Save.

Import Any Required Certificates

In the agent interface, you can press the TAB key to access a variety of commands. If your SharePoint server requires a self-signed certificate, or a certificated signed by an unofficial authority, you must use the rcs:importcert command. Then enter the path to import the self-signed certificate, or the root certificate of the authority, into the Secure Agent trust store.

The rcs:listcert command lists all certificates currently in the trust store, while rcs:deletecert deletes the specified certificate from the store.

Track and Troubleshoot Secure Agent Activity

Download log files to precisely monitor agent events.

1. In Setup, enter Secure Agents in the Quick Find box, then select Secure Agents.
2. Click the name of a previously created Secure Agent to open its detail page.
3. Click either of the following:
   - Download Logs to download a compressed .zip file containing text logs.
   - Download Diagnostics to see the current agent state, including the list of installed plug-ins and Java virtual machine status.

Ensure Access with Secure Agent Clusters

Secure Agent clusters provide failover protection, ensuring that Salesforce users can always access on-premises external data sources like SharePoint 2010 or 2013.

Note: The Secure Agent setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, see Salesforce Help.

Create the Secure Agent Cluster

1. Create multiple Secure Agents on different servers by repeating this process: Set Up a Secure Agent.
2. From Setup, enter Secure Agent Clusters in the Quick Find box, then select Secure Agent Clusters.
3. Click New Secure Agent Cluster.
4. Enter a Label for the user interface and Name for the API.
5. To add available agents to the cluster, select them, and click Add.

Change the priority order in which agents are used by moving them up or down in the Selected Secure Agents list. The accessible agent with highest priority is used first.
6. Click **Save**.

**Check Cluster Status**

1. From Setup, enter **Secure Agent Clusters** in the Quick Find box, then select **Secure Agents Clusters**.
2. Click a cluster name to access its details page.
3. Note the overall status for the cluster. Green indicates that all agents are accessible, yellow that some are, and red that none are.
4. Note the status of individual agents and these additional details:
   - The Priority column shows the order in which agents are used. To change priority, click **Edit**, and move agents up or down in the Selected Secure Agents list.
   - The Active column indicates which agent is currently in use.

**Define an External Data Source for SharePoint 2010 or 2013**

Let Salesforce access data in your on-premises system. Files Connect and Chatter make it possible.

**Note:** This setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, see Salesforce Help.

1. From Setup, enter **External Data Sources** in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

<table>
<thead>
<tr>
<th><strong>Field</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Label</strong></td>
<td>A user-friendly name for the data source displayed in the Salesforce user interface.</td>
</tr>
<tr>
<td><strong>Name</strong></td>
<td>A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td><strong>Type</strong></td>
<td>Choose <strong>Files Connect: Microsoft SharePoint</strong></td>
</tr>
<tr>
<td><strong>Secure Agent</strong></td>
<td>A service running on a Linux or Windows server on your intranet that lets you securely connect Salesforce to your on-premises SharePoint server. See <strong>Set Up a Secure Agent for SharePoint 2010 or 2013</strong>.</td>
</tr>
<tr>
<td><strong>Site URL</strong></td>
<td>The URL of your SharePoint site, site collection, or web app.</td>
</tr>
</tbody>
</table>

**Important:** The URL must begin with **https** and end with the site name.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identity Type</td>
<td>The identity type used to authenticate to the external data source. Select <strong>Per User</strong> to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.) Select <strong>Named Principal</strong> to use the same set of credentials for every user who accesses the data source from Salesforce.</td>
</tr>
<tr>
<td>Authentication Protocol</td>
<td>The protocol required to access SharePoint. Select <strong>Password Authentication</strong>. (This option supports HTTP Basic and NTLM authentication.)</td>
</tr>
<tr>
<td>Administration Username</td>
<td>The username Salesforce uses to test the connection to SharePoint. You don’t need to enter a SharePoint administrator’s username. However, ensure that the credentials you use have adequate privileges to access the data source, perform searches, and return information.</td>
</tr>
<tr>
<td>Administration Password</td>
<td>The password Salesforce uses to test the connection to SharePoint.</td>
</tr>
</tbody>
</table>

**Note:** Salesforce users can’t access SharePoint 2010 if anonymous access is enabled for the web application.

SEE ALSO:

- The Files Connect Setup Process
Include a Files Connect Data Source in Global Search

Combine searches for Salesforce data with external data from Google Drive, SharePoint, or OneDrive for Business. Via the API, developers can automate the process with supported SOQL or SOSL queries.

To include external data in global searches or API queries, first create a related external object. External objects behave similarly to custom objects, but map to data stored outside Salesforce in an external system like SharePoint. Each external object maps to a data table, and the object fields map to accessible table columns.

Tip: External objects support lookup relationships similar to custom objects, letting you integrate external data into related lists and other areas throughout Salesforce. For details, see External Object Relationships.

To fully configure global search, complete these steps:

1. Choose the Layout for Global Search Results
2. Create an External Object from an External Data Source
3. Give Users Access to the External Object Fields

To automate search with SOQL or SOSL, review the supported queries for your data source:

- SOQL and SOSL Support for SharePoint and OneDrive External Objects
- SOQL and SOSL Support for Google Drive External Objects

Choose the Layout for Global Search Results

By default, Files Connect external objects use the standard search results layout for Chatter and the Files tab. If you want to display customized search layouts for these objects, complete these quick steps.

1. From Setup, enter Files Connect Settings in the Quick Find box, then select Files Connect Settings.

2. Select Use External Object Search Layout.

Create an External Object from an External Data Source

1. Define an external data source that supports search:
   - SharePoint Online or OneDrive for Business
   - SharePoint 2010 or 2013
   - Google Drive
   - Box

2. In Setup, enter External Data Sources in the Quick Find box, then select External Data Sources.

3. Click the data source name to access the details page.

4. Click Validate and Sync.

   Note: Note: If the Validate and Sync button is disabled, edit the Authentication Settings for External Systems on page 4859 to enable the Start Authentication Flow on Save checkbox.

5. Select the table named "items_[data source]." Then click Sync to create an external object that maps to the entire source.
Now you deploy the object to make the data it contains available to users.

6. Choose **Build > Develop > External Objects**.
7. Click **Edit** next to the new external object.
8. At the bottom of the page, click **Deployed**, and then click **Save**.

**Give Users Access to the External Object Fields**

1. In Setup, enter **Permission Sets** in the Quick Find box, then select **Permission Sets**.
2. Click a permission set in which you enabled Files Connect.
3. In the Apps section, click **Object Settings**.
4. Click the name of the external object.
5. Click **Edit**, and enable the necessary Read permissions (for the object itself, and all fields you want to reveal in Salesforce).
6. Click **Save**.

**SOQL and SOSL Support for SharePoint and OneDrive External Objects**

SharePoint and OneDrive external objects support these standard fields and any custom fields you enable.

Note: Queries on specific fields return only documents that the external data source indexed.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Queryable</th>
<th>Sortable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Author</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Comment</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>ContentLength</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>CreationDate</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>DisplayUrl</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>DownloadUrl</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>ExternalId</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>IsFolder</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>MimeType</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>Name</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>UpdateDate</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td>UpdatedBy</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Note: Not supported for SharePoint 2010 or 2013.
Note: You can also use `ParentId__c` as query criteria to retrieve the list of documents in a folder. However, that field isn't displayed in query results unless your query specifies a `ParentId__c` value.

### SOQL and SOSL Support for Google Drive External Objects

Files Connect supports all standard Google Drive properties, but not custom properties. The following properties have different field names in Salesforce external objects:

<table>
<thead>
<tr>
<th>Google Property</th>
<th>Salesforce Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>alternateLink</td>
<td>DisplayUrl</td>
</tr>
<tr>
<td>createDate</td>
<td>CreationDate</td>
</tr>
<tr>
<td>description</td>
<td>Comment</td>
</tr>
<tr>
<td>downloadURL</td>
<td>contentStreamUri</td>
</tr>
<tr>
<td>editable</td>
<td>readOnly</td>
</tr>
<tr>
<td>fileSize</td>
<td>ContentLength</td>
</tr>
<tr>
<td>id</td>
<td>ExternalId</td>
</tr>
<tr>
<td>lastModifyingUserName</td>
<td>UpdatedBy</td>
</tr>
<tr>
<td>mimeType</td>
<td>MimeType</td>
</tr>
<tr>
<td>modifiedDate</td>
<td>UpdateDate</td>
</tr>
<tr>
<td>ownerNames</td>
<td>Author</td>
</tr>
<tr>
<td>originalFilename</td>
<td>contentStreamFileName</td>
</tr>
<tr>
<td>title</td>
<td>Name</td>
</tr>
</tbody>
</table>

This subset of fields supports SOQL and SOSL queries. (None are sortable, reflecting limitations in the Google Drive API.)

- `CreationDate`
- `lastViewedByMeDate`
- `MimeType`
- `Name`

Note: Google Drive queries on the `Name` field support only one wildcard, `%`. Searches using this wildcard match only name prefixes. For example, the title "HelloWorld" would be returned with the query `Name LIKE "Hello%"` but not `Name LIKE "%World"`.

- `sharedWithMe`

Note: Queries on the `sharedWithMe` field with a value of "false" are not supported, protecting confidential data.

- `starred`
Include SharePoint Custom Properties in Search, SOQL, and SOSL Queries

After you create an external object for a SharePoint data source, some special steps are needed to search or query any custom properties it contains.

Configuring Custom Properties in SharePoint

External objects in Salesforce let you select and filter on these custom properties from SharePoint:

- Custom columns defined in a Custom Content Type
- Metadata from Microsoft Word, Excel, and other Office documents

To search on these custom properties in Salesforce, a corresponding Managed Property must be created by a SharePoint administrator.

- To display these properties in external object fields, or use them in SOQL or SOSL SELECT queries, set the corresponding Managed Property to \texttt{Retrievable}. (In SharePoint 2010, this option is labeled, “Allow this property to be used in scopes.”)
- To filter on these properties in external objects, or use them as query criteria in a SOQL or SOSL WHERE clause, set the corresponding Managed Property to \texttt{Queryable}.

Querying Resulting Fields in Salesforce

In the examples below, \texttt{CustomProperty} stands for the Custom column name defined in the Custom Content Type, or the Office document metadata name. \texttt{ManagedCustomProperty} stands for the corresponding Managed Property name.

**SharePoint 2010**

Use \texttt{CustomProperty} in the SELECT clause and \texttt{ManagedCustomProperty} in the WHERE clause. Two corresponding fields must exist for the external object in Salesforce: one for selecting, the other for filtering.

Here’s a SOQL example:

\[
\text{SELECT CustomProperty FROM items_sp2010_x WHERE ManagedCustomProperty=...}
\]

**SharePoint 2013 and Online**

In most cases, \texttt{ManagedCustomProperty} can be used for both the SELECT and WHERE clause.

Here’s a SOQL example:

\[
\text{SELECT ManagedCustomProperty FROM items_sp2013_x WHERE ManagedCustomProperty=...}
\]
However, for file types SharePoint doesn’t index for search, such as .jpg, .png, and .pdf files, you must use CustomProperty in the SELECT clause and ManagedCustomProperty in the WHERE clause. As a workaround, you can define an alias on the Managed Property in SharePoint and format queries like this:

```sql
SELECT Alias FROM items_sp2013/Online WHERE Alias=...
```

Tip: Normally, custom properties aren’t displayed on external object detail pages—defining an alias also addresses this issue.

### Boolean Custom Properties

When using boolean (Yes/No) custom properties with a corresponding Managed Property set to the Text type, the corresponding external object field must be set to the Text type as well. In filters, the values “0” and “1” equal false and true, respectively. For example:

```sql
WHERE customBooleanWithTextManagedProperty="1"
```

“0” and “1” are also displayed as results, however, so boolean custom properties should use a Managed Property type of YesNo. Set the corresponding external object field to Checkbox to query it with standard true or false values. For example:

```sql
WHERE customBooleanWithYesNoManagedProperty=true
```

### Metadata in Microsoft Office Documents

The SharePoint Search service returns all metadata from Office documents as strings, so corresponding external object fields must be set to the Text type.

Dates are returned in the format, MM/DD/YYYY hh:mm:ss AM/PM, (for example, “3/31/2015 9:59:00 PM”). To query on fields using the Date type, the external object must include a corresponding Date field for filtering, and a Text field for selecting.

### Limitations for Specific SharePoint Property Types in Salesforce

**All versions**

- Number, Currency, and Choice multiple properties can’t be selected for file types SharePoint doesn’t index for search. By default, this includes image, video, and .pdf files, although .pdf files are natively indexed starting with SharePoint 2013.

**SharePoint 2010**

- Number, Choice multiple, and Currency properties can’t be selected.
- Date properties can be selected but results are unlikely to be formatted in UTC (Coordinated Universal Time), so values may reflect a different time zone than expected.

**SharePoint 2013**

- Multiple Line of Text, URL, Date, and Choice Dropdown properties aren’t queryable.
- Choice Dropdown, Choice multiple, URL, and Date properties can’t be selected.

**SharePoint Online**

- Multiple Line of Text, URL, and Date properties aren’t queryable.
- Choice multiple and URL properties can’t be selected.

**SEE ALSO:**

Include a Files Connect Data Source in Global Search
Define a Simple URL External Data Source

If Chatter is enabled for your organization, Salesforce can access data hosted on another Web domain for use in the Files tab and feed.

1. From Setup, enter External Data Sources in the Quick Find box, then select External Data Sources.
2. Click New External Data Source. Then set the following options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>A user-friendly name for the data source displayed in the Salesforce user interface.</td>
</tr>
<tr>
<td>Name</td>
<td>A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Type</td>
<td>Choose Simple URL.</td>
</tr>
<tr>
<td>URL</td>
<td>The URL of the server hosting data outside of Salesforce, which must begin with http:// or https/.</td>
</tr>
<tr>
<td>Default External Repository</td>
<td>Used for SharePoint® Online®. If metadata is not accessible, use this field to create tables and default table fields.</td>
</tr>
<tr>
<td>Large Icon</td>
<td>Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources.</td>
</tr>
<tr>
<td>Small Icon</td>
<td>Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources.</td>
</tr>
<tr>
<td>Identity Type</td>
<td>The identity type used to authenticate to the external data source. Select Anonymous, which doesn’t require users to provide credentials when accessing the data source.</td>
</tr>
</tbody>
</table>
Chatter Desktop Set Up and Maintain Collaboration Tools

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication Protocol</td>
<td>The protocol required to access the data source. Select <strong>No Authentication</strong>.</td>
</tr>
</tbody>
</table>

**Note:** Simple URL data sources can’t be included in global search, so the “Validate and Sync” option isn’t supported.

**Chatter Desktop**

**Control Access to Chatter Desktop**

Chatter Desktop is enabled for most organizations, but administrators can control access to Chatter Desktop.

1. From Setup, enter *Chatter Desktop Settings* in the Quick Find box, then select *Chatter Desktop Settings*.
2. Select *Enable Chatter Desktop* to allow users to access Chatter data from Chatter Desktop.
   Deselect this option to block access to the Chatter Desktop self-installation page and prevent all instances of Chatter Desktop from accessing Chatter data.
3. Select *Allow Chatter Desktop Managed Installations Only* to prevent non-administrators from installing Chatter Desktop.
   For example, select this option if your IT department plans to deploy Chatter Desktop to your organization.
4. Save your changes.

Install Chatter Desktop Managed Version

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- **Windows**
  - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
  - 512MB of RAM (1GB recommended)

- **Mac**
  - Intel® Core™ Duo 1.83GHz or faster processor
  - Mac OS X v 10.5, 10.6, or v10.7
  - 512MB of RAM (1GB recommended)

**Important:** Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The managed version of Chatter Desktop is ideal for enterprises deploying Chatter Desktop to users who don’t have administrator privileges on their machines. The managed version:

- Doesn’t automatically install AIR—you’re IT department must obtain a redistribution agreement from Adobe Systems Incorporated and deploy the required version of AIR before deploying Chatter Desktop
- Requires your IT department to accept the Chatter Desktop managed version end user license agreement on behalf of the users to which Chatter Desktop is deployed
- Doesn’t automatically post to Chatter the first time Chatter Desktop launches
- Doesn’t regularly check Salesforce for new versions

To install the managed version:

1. Deploy Adobe® Integrated Runtime (AIR®) version 2.6 or later (the latest version is recommended) to the machines on which you plan to deploy Chatter Desktop.

AIR is Adobe’s cross-platform runtime environment for desktop applications, and is a prerequisite for Chatter Desktop.

**Tip:** Visit these links before deploying AIR:

- AIR® overview: [http://www.adobe.com/devnet/air/articles/distributing_air_in_enterprise.html](http://www.adobe.com/devnet/air/articles/distributing_air_in_enterprise.html)
2. From Setup, enter Chatter Desktop Settings in the Quick Find box, then select Chatter Desktop Settings.
3. Click the link to download the managed version.

**Important:** Chatter Desktop uses Adobe Acrobat Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from Adobe’s website, install it, and open it at least once to complete the installation.

- Control Access to Chatter Desktop
- Configure Chatter Desktop Managed Version

## Configure Chatter Desktop Managed Version

Control Chatter Desktop settings by deploying an XML-based configuration file to each user’s machine. The configuration in the file overrides the user’s settings.

1. Create a file named `.chatterdesktop`, add a `chatterdesktop` parent element with two child elements, `config` and `servers`.
2. Inside the `config` element, create the child elements listed in this table and add an `default` and an `editable` attribute. Both attributes can have the value true or false. To make a child element the default setting, set the element’s `default` attribute to true. To allow users to change a default setting through the user interface, set the element’s `editable` attribute to true.

<table>
<thead>
<tr>
<th>Child Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>launchOnStartup</td>
<td>Launches the application on startup.</td>
</tr>
<tr>
<td>minimizeOnClose</td>
<td>Minimizes the application on close.</td>
</tr>
<tr>
<td>notifications</td>
<td>Enables popup notifications.</td>
</tr>
<tr>
<td>criticalAlerts</td>
<td>Enables alerts for new feed posts and comments by highlighting the taskbar icon (Windows) or causing the dock icon to bounce (Mac OS).</td>
</tr>
<tr>
<td>bringToForeground</td>
<td>Brings Chatter Desktop to the foreground for new feed posts and comments.</td>
</tr>
<tr>
<td>alwaysOnTop</td>
<td>Enables Chatter Desktop to always display in the foreground.</td>
</tr>
<tr>
<td>chatWindowToForeground</td>
<td>Enables the chat window to display in the foreground when a new chat is received (Mac only).</td>
</tr>
<tr>
<td>chatSoundEnabled</td>
<td>Enables sounds for new chats received.</td>
</tr>
<tr>
<td>playSoundForEveryMessage</td>
<td>Enables sounds for all chats received.</td>
</tr>
</tbody>
</table>

**EDITIONS**

Available in: Salesforce Classic

Available in: Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer, and Database.com Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in Database.com.
3. If your organization uses instances of Salesforce other than Production and Sandbox, specify the servers that host those instances in separate server elements inside the servers element. Inside each server element, include the following attributes:

- **label** — The name of the connection as you want it to appear in the user interface.
- **serverUrl** — The URL you use to log in to the instance. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection `Europe`.
- **defaultServer** — Set to TRUE to make this server the default instance to which Chatter Desktop connects.

4. Test the `.chatterdesktop` configuration file.

   **a.** Copy the `.chatterdesktop` configuration file to the user directory on your machine. The user directories are:

   - **Windows** — `c:\Documents and Settings\<username>` (Windows XP) or `C:\Users\<username>` (Windows 7)
   - **Mac OS** — `/Users/<username>
   - **Linux** — `/home/<username>

   **b.** Launch Chatter Desktop and verify that it functions correctly. See Chatter Desktop Troubleshooting Tips if there are problems.

5. Copy the `.chatterdesktop` file to the user directory on every machine running Chatter Desktop in your organization.

   **Example:** The following is a sample configuration file:

   ```xml
   <chatterdesktop>
   <config>
     <launchOnStartup default="false" editable="false"/>
     <minimizeOnClose default="false" editable="true"/>
     <notifications default="true" editable="true"/>
     <criticalAlerts default="false" editable="true"/>
     <bringToForeground default="false" editable="true"/>
     <alwaysOnTop default="false" editable="false"/>
     <chatWindowToForeground default="false" editable="false"/>
     <chatSoundEnabled default="true" editable="true"/>
     <playSoundForEveryMessage default="true" editable="true"/>
   </config>
   </chatterdesktop>
   ```

**Chatter Licenses**

**Chatter User Licenses**

All standard Salesforce licenses allow free Chatter access for everyone in your organization. Salesforce also offers Chatter-specific licenses: Chatter External, Chatter Free, and Chatter Only (also known as Chatter Plus).

**Chatter External**

This license is for users who are outside of your company’s email domain. These external users, also called customers, can be invited to Chatter groups that allow customers. Customers can access information and interact with users only in the groups they’re invited to. They have no access to Chatter objects or data.

**Chatter Free**

The Chatter Free license is for users who don’t have Salesforce licenses but need access to Chatter. These users can access standard Chatter items such as people, profiles, groups, and files, but they can’t access any Salesforce objects or data. Chatter Free users can also be Chatter moderators. Chatter Free users don’t see tabs like other Salesforce users. Chatter Free users access feeds, people, groups, and files using the links in the sidebar of the page.

Salesforce administrators can upgrade a Chatter Free license to a standard Salesforce or Chatter Only license at any time. You can’t convert a standard Salesforce or Chatter Only license to a Chatter Free license.
Chatter Only (Chatter Plus)

The Chatter Only license is also known as the Chatter Plus license. It is for users that don’t have Salesforce licenses but need access to some Salesforce objects in addition to Chatter. Chatter Plus users can be Chatter moderators and have access to standard Chatter people, profiles, groups, and files pages. They also can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects
- Add records to groups

By default, the tabs for standard Salesforce objects are hidden from Chatter Plus users. Expose these tabs, if you want to make them available to Chatter Plus users. For more information on Chatter Plus users, see Chatter Plus Frequently Asked Questions

Chatter License Overview

This table shows the list of features that are available for Chatter External, Chatter Free, and Chatter Only licenses.

### Salesforce CRM Content

#### Set Up Salesforce CRM Content

**USER PERMISSIONS**

To create, edit, or delete library permissions:
- "Manage Content Permissions"
- "Manage Salesforce CRM Content"

To create, edit, or delete page layouts and record types:
- "Manage record types and layouts for Files"
- "Manage Salesforce CRM Content"

To create content fields:
- "Manage Content Properties"
- "Manage Salesforce CRM Content"

**EDITIONS**

Available in: both Salesforce Classic and Lightning Experience

Available in: Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions
Set up Salesforce CRM Content to enable the use of content libraries in your org. Salesforce CRM Content is only available in Salesforce Classic, but files from content libraries are available in Lightning Experience if Salesforce CRM Content is enabled for your org.

**Tip:** For more detailed information about setting up Salesforce CRM Content, refer to the Salesforce CRM Content Implementation Guide.

You can also enable Salesforce CRM Content in the Salesforce Classic Mobile app by adding the Content tab to the desired mobile configuration data sets.

To set up Salesforce CRM Content for your organization:

1. Enable Salesforce CRM Content from Setup by entering Salesforce CRM Content in the Quick Find box, selecting Salesforce CRM Content, and then selecting Enable Salesforce CRM Content.

2. Give users access to Salesforce CRM Content by assigning feature licenses in one of the following ways:
   - To assign feature licenses to users automatically, from Setup, enter Salesforce CRM Content in the Quick Find box, select Salesforce CRM Content, and then select Autoassign feature licenses to existing and new users.
   - To assign feature licenses to users manually, from Setup, enter Users in the Quick Find box, then select Users and click Edit next to the user's name. Select the Salesforce CRM Content User checkbox and click Save.

3. Verify that the Salesforce CRM Content users have the Salesforce CRM Content user permissions enabled. The user permissions include “Manage Salesforce CRM Content,” “Create Libraries,” “Manage Content Permissions,” “Manage record types and layouts for Files,” and “Deliver Uploaded Files and Personal Content.”

   **Note:** Users with the “Deliver Uploaded Files and Personal Content” user permission can create content deliveries from personal libraries. This user permission does not affect the ability to deliver content from shared libraries.

4. Optionally, create a public group with a set of Salesforce CRM Content users. You can save time later by assigning the group to a library rather than assigning several users to the same library individually.

5. Optionally, create one or more library permissions. Library permissions are the groups of privileges that determine user access within a library. Every user must be assigned a library permission before he or she can use a library. All new organizations contain three library permissions: library administrator, author, and viewer.

6. Use the New Library Wizard to create a library, add members to the library, and assign library permissions to the members.

7. Categorize and define your content:
   - a. Create content fields. These are custom fields that you assign to page layouts. The default fields are Description, Tags, and Title. If you want to create a field named, for example, Reviewed By, your custom content field would be a picklist with the names of possible reviewers.
   - b. Create a custom page layout or modify the default page layout. Page layouts are the containers for custom fields; they determine which fields are available during the publishing process and how the fields display on the content details page. You can create multiple page layouts and record types and assign a content field to any or all page layouts. For example, if sales and marketing
users need to record different information about their content, you can create Sales and Marketing page layouts and record types. If you create a Related Campaign lookup field and add it to the Marketing page layout and record type only, users who select the Sales record type during the upload process will not have the option to choose a campaign.

8. Optionally, enable the Add Google Doc to Salesforce service so library members can contribute Google docs to Salesforce CRM Content.

Implementation Tips

• Before creating libraries, review the files you plan to store in Salesforce CRM Content to determine how many libraries you need and what content belongs in each library. Users are given access to content based on library.

• If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.

• To enable Salesforce CRM Content functionality for leads, accounts, contacts, opportunities, cases, products, or custom objects, add the Related Content related list to the appropriate page layout.

• To send web-formatted content to colleagues, leads, or contacts and associate it with Salesforce records, add the Content Deliveries related list to the page layout for leads, accounts, contacts, opportunities, cases, campaigns, or custom objects.

• To allow users to publish, edit, and search in any of the Salesforce-supported languages, from Setup, enter Salesforce CRM Content in the Quick Find box, select Salesforce CRM Content, and then click Enable multilanguage search and contribute.

• To associate Google docs with a library, the Add Google Doc to Salesforce service must be activated for your organization.

• Salesforce CRM Content is available via the Customer Portal and partner portal.

• All Salesforce CRM Content items display as primary tabs in the Salesforce Console.

Best Practices

• If you are using the Related Content related list on Salesforce objects, align your custom content fields with the standard and custom fields on the object to increase the accuracy of a “Find Content” search. Clicking the Find Content button on the related list matches content to the fields on the record and displays search results containing the related content.

• To ensure that content is classified consistently, define consistent tag names with your contributors. For example, by establishing tag names at the outset, you can avoid having tags such as “channel” and “channels” in the same library.

• Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.

• You can’t change or delete tag names. You can remove tags from a document, but that doesn’t delete the tag.

• Tags are case insensitive. You can’t have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

• To highlight valuable content and make it easier to find, mark it as “featured” on the content details page. Featured content receives a higher priority than similar content in search results, and appears on the Libraries tab for easy access. To feature content, users must have the Feature Content option checked in their library permission.
• If your organization uses Google Docs, encourage library members to add their Google docs to a library. Including Google docs in Salesforce CRM Content allows users to access all types of content from a single location and apply Salesforce CRM Content functionality, such as votes, comments, and subscriptions, to Google docs.

Content Customization

Customize Salesforce CRM Content

From Setup, enter Salesforce CRM Content in the Quick Find box, then select Salesforce CRM Content to access the following options for customizing Salesforce CRM Content:

Tip: To perform the initial set up of Salesforce CRM Content for your organization, see Set Up Salesforce CRM Content on page 3276.

• Content Fields—Create, edit, or delete custom content fields. Custom fields allow users to categorize and define content during the publishing process.

• Validation Rules—Create, edit, or delete validation rules. Validation rules verify that the data a user enters when publishing content meets the standards you specify before the user can save the content.

• Library Permissions—Create, edit, or delete library permissions. A library permission determines user privileges within a library.

• Settings—Modify Salesforce CRM Content default settings for multi-language support, PDF downloads, content pack creation, or the enhanced document viewer.

SEE ALSO:
  Set Up Salesforce CRM Content
Customizing Content Fields

To create, modify, and delete Salesforce CRM Content custom fields for categorizing and defining your content, go to the object management settings for content. If you’re using Lightning Experience, go to the Object Manager, select **Content Version**, then scroll to the fields area. If you’re using **Salesforce Classic**, enter **Salesforce Files** in the Quick Find box, then select **Fields**. The data assigned to these fields during upload is available on the content details page for the life of the file. After creating custom content fields, you must assign them to a page layout. The page layout determines which fields appear when a user uploads or revises files in Salesforce CRM Content.

**To create a custom content field:**

1. Click **New**.
2. Choose the type of field to create, and click **Next**.
3. For relationship fields, associate an object with the field and click **Next**.
4. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Ensure the custom field name is not identical to any standard field name for that object.
5. Choose the page layout that should display the field as an editable field.

Click **Edit** or **Del** in the Content Custom Fields & Relationships related list to edit or delete a custom content field. You cannot edit or delete the standard content fields. Deleted custom fields and their data are stored until your org permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data.

**SEE ALSO:**
- Customize Salesforce CRM Content
- Find Object Management Settings
Libraries

Create Libraries

Store, share, and manage your files in content libraries so you can decide who has access to files in each library and what permissions they have. Each org can have up to 2,000 libraries.

Step 1: Create a New Library
2. Enter a unique library name.
3. If you want, add a description.
4. Click Save and Add Members or, if you want to add members later, click the Save and Close button.

Step 2: Add Library Members
1. On the Libraries tab, click the library name if the library isn’t already open.
2. In the Members section, click Add Members.
3. If the member you want to add isn’t listed, start to enter their first name in the search box and click Find.
4. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.
   Tip: If you have many Salesforce CRM Content users, create a public group and add it to a library rather than adding users to the library individually.
5. Click Add to add the members to the library.
6. Click Next.

Step 3: Assigning Library Permissions to Members
Select a library permission for each user or public group and click Save. For more information, see Manage Library Permissions on page 3282.
Manage Library Permissions

To manage library permissions, from Setup, enter Content Permissions in the Quick Find box, then select Content Permissions. A library permission is a group of privileges assigned to each Salesforce CRM Content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

Note: If your Salesforce CRM Content organization was created after the Spring ’09 release, your organization already has three library permissions: Library Administrator, Author, and Viewer.

To create a custom library permission, click the Add Library Permissions button. To edit a library permission, click Edit next to the library permission name. To delete a library permission, click Del next to the library permission name.

Note: Library permissions do not apply to personal libraries. All Salesforce CRM Content users can save files in their personal libraries.

SEE ALSO:
Create Libraries

Creating Library Permissions

To create a library permission in Salesforce CRM Content, from Setup, enter Content Permissions in the Quick Find box, then select Content Permissions. Next, click Add Library Permissions.

Tip: If your Salesforce CRM Content organization was created after the Spring ’09 release, your organization already has Viewer, Author, and Library Administrator library permissions. If not, consider creating them. These three library permissions provide the different levels of library access required for most organizations. For the “Viewer” library permission, select the View Comments and Add Comments library privileges. For the “Author” library permission, select the Add Content, Add Content on Behalf of Others, Archive Content, Add Comment, and Tag Content library privileges. For the “Library Administrator” permission, select the Manage Library privilege.

1. Assign a name to the library permission.
2. Optionally, enter a description of the library permission. If your organization has several library permissions, consider describing each by its function or with a summary of its privileges. For example, for a “Marketing Reviewer” permission you might include a description that reads, “Reviews all content used in outbound marketing campaigns” or “This user can view and comment on documents.”
3. In the Permissions section, select the checkboxes that correspond to the privileges you want to grant to users with this library permission.
<table>
<thead>
<tr>

<td>Edit or delete comments made to any content in the library.</td>
</tr>
</tbody>
</table>
Library Privilege | Description
--- | ---
Tag Content | Add tags when publishing content or editing content details in the library.
Deliver Content | Create a content delivery using any files in the library.
Attach or Share Content within Chatter | Make content from this library accessible in Chatter. Within Chatter, select a file from the library and attach it to a post or share it.

4. Click **Save**.

SEE ALSO:
- Create Libraries
- Manage Library Permissions
- Deleting Library Permissions

**Deleting Library Permissions**

To delete a customized library permission for Salesforce CRM Content:

1. From Setup, enter **Content Permissions** in the Quick Find box, then select **Content Permissions**.
2. Click **Del** next to the appropriate permission.
3. Review the list of affected users. The delete page shows all Salesforce CRM Content users who are assigned to the library permission in a particular library. If you delete the library permission, the user will lose access to that library.
4. Click **Delete Permission** to confirm.

- Create Libraries
Assigning Library Tagging Rules

In Salesforce CRM Content, tags are descriptive labels that help classify and organize content. Contributors can assign tags to their files, content packs, Google docs, or Web links, thus enabling all library members to browse for content by tag. The tagging rule in a library determines how contributors can tag content; for example, the restricted-tagging rule does not allow contributors to create new tags. Library tagging rules are optional. By default, library contributors can enter any tag.

To assign a tagging rule to a library:

1. On the Libraries tab, select a library from the My Libraries area.
2. Click Tagging Rules and choose one of the following options:

<table>
<thead>
<tr>
<th>Library Tagging Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open Tagging</td>
<td>This rule places no restrictions on tagging. Contributors can enter any tag when publishing or editing content. While a tag is typed, Salesforce CRM Content autosuggests tags based on the contributor's recently used tags and the Popular Tags list.</td>
</tr>
<tr>
<td>Guided Tagging</td>
<td>This rule also enables contributors to enter any tag when publishing or editing content, but contributors are also offered a list of suggested tags. If you select Guided Tagging, the next step prompts you to enter the suggested tags that you want to recommend to library contributors.</td>
</tr>
<tr>
<td>Restricted Tagging</td>
<td>This rule requires contributors to choose from the list of suggested tags. If you select Restricted Tagging, the next step prompts you to enter the list of suggested tags.</td>
</tr>
</tbody>
</table>

3. If you chose Guided Tagging or Restricted Tagging, click the link for auto-populating the Suggested Tags field and then edit, add, or remove tags as needed. If you do not auto-populate the Suggested Tags field, any new tags you enter in the field are added to the existing list of suggested tags in the library.
4. Click Save.

Notes on Library Tagging Rules

- Open Tagging is the default tagging rule.
- If you publish, share, or move content to a library that uses restricted tags, you will receive an error if your content contains unsupported tags.
- When you share content from one library to another, the most restrictive tagging rule applies. For example:
  - When content is shared between a restricted-tagging library and a guided- or restricted-tagging library, you can only choose tags that are common to both libraries.
- When content is shared between an open tagging library and a restricted-tagging library, you can only choose tags suggested in the restricted-tagging library.

- If a restricted tagging rule is applied after content has already been published in the library and the existing content contains tags that are no longer permitted by the rule, the tags remain assigned to the content until it is edited or revised. For example, if the Q3Forecast document has a `market indicators` tag and `market indicators` is not a suggested tag according to the new restricted-tagging rule, `market indicators` is removed from Q3Forecast only when a user publishes a new version of the file or edits the file’s tags on the content details page.

- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.

- You can’t change or delete tag names. You can remove tags from a document, but that doesn’t delete the tag.

- Tags are case insensitive. You can’t have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

SEE ALSO:
Create Libraries

Restrict Record Types in a Library

Library administrators can choose which record types are available in a library. They can also set the default record type for publishing content to the library.

To restrict the record types allowed in a library:

1. On the Libraries tab, select a library from the My Libraries area.
2. Click Record Types.
3. Optionally, change the default record type for the library.
4. Select the Restrict the record types available in the library checkbox.
5. Select one or both of the following options:
   - Allow content with any record type to be linked to this library—Select this option if you want to enable content published in other libraries to be shared to the library where you have restricted record types. The content in other libraries can be shared regardless of the record types used.
   - Do not apply record type restrictions to existing content—Select this option if you do not want to receive warnings regarding existing content in the library. You will not be alerted if existing content uses record types that you exclude from the library. This option refers to notifications only; existing content is not affected by restricted record types.
6. For each record type that you want to allow in the library, move it from the Available Record Types list to the Selected Record Types list.
7. Click Save.
Notes on Restricting Record Types

- If the library already contains published content, selecting the **Restrict the record types available in the library** option automatically moves all the record types used by the published content to the Selected Record Types list.
- Deselecting the **Restrict the record types available in the library** option automatically moves any record types in the Selected Record Types list to the Available record Types list.
- When changing a file’s managing library, the file’s record type must be permitted in the new managing library.
- When sharing a file with a library, the file’s record type must be permitted in the shared library unless the **Allow content with any record type to be linked to this library** option is selected for the shared library.
- When the default record type for a user’s profile differs from the default record type for a library, the user profile default takes priority when a user with that profile shares a file with the library. **General** is used as the default record type when no default is set for the user profile.
- When there are no record types in common between a user profile and a library, the default record type for a library is available to users with that user profile who are sharing files with the library.

Content Settings

Customize Content Settings

From Setup, enter *Salesforce CRM Content* in the Quick Find box, then select *Salesforce CRM Content* to modify the defaults for your Salesforce CRM Content organization:

Enable Salesforce CRM Content

If this option is checked, Salesforce CRM Content is enabled for your organization.

Autoassign feature licenses to existing and new users

If this option is checked, Salesforce automatically attempts to assign Salesforce CRM Content feature licenses to all existing users. If there aren’t enough licenses available, no licenses are assigned. Contact Salesforce to request additional feature licenses. When a new user is created, a Salesforce CRM Content feature license is automatically assigned as long as licenses are available. A feature license corresponds to the Salesforce CRM Content User checkbox on the user detail page.

Enable multilanguage search and contribute

If this option is checked, a **Language** drop-down list is available when users publish, edit, or search for content. The **Language** drop-down list contains all languages that Salesforce supports.

If a user does not choose a language when publishing content, that content is associated with the user’s personal language by default. If the user’s personal language setting is different from the organization’s language, content published by that user is associated with the user’s language, not the organization’s language.

Enable content pack creation

If this option is checked, the **Create New > Content Pack** option displays on the Libraries tab and users can create content packs from any documents or files in their Salesforce CRM Content private or public libraries.

If this option is not checked after users in your organization have already created content packs, those packs are not deleted and users can continue to modify metadata such as description, title, and custom fields. However, once content pack creation is no longer enabled, users cannot customize or modify existing packs. Specifically, the **Clone & Customize** button and the **Edit > Edit Content Pack** option on the content details page are unavailable.
Enable enhanced document viewer

If this option is checked, an enhanced set of navigation and customization options are available for the document viewer. The document viewer allows users to preview a document without downloading, whether the document be a content delivery sent to a lead, prospect, or colleague, a document viewed internally in Salesforce CRM Content, or a file in Salesforce Files. The document viewer has three modes: the Preview tab on the content details page (preview mode), the content delivery URL (delivery mode), and full screen mode, which displays when you click the full-screen option on the content details page or in a content delivery. In Chatter, users can preview files in feeds, on file lists, and on the Files tab. The **Enhanced document viewer** setting provides the following capabilities to users who are viewing documents:

- In addition to using the next page ( accuses page ( ), previous page ( ), first page ( ), and last page ( ) icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**. The right-click menu is not available in preview mode.
- You can jump directly to a page by entering the page number and clicking Enter. This option is not available in full-screen mode.
- From the right-click menu you can choose the **Fit Width** option to expand the width of the document or the **Fit Full Page** option to view the whole page of the document. The fit width icon ( ) and fit full page icon ( ) are also available on the toolbar.
- From the right-click menu you can choose the **Full Screen** option to view the document in full screen mode or the **Exit** option to exit full screen mode. The full screen icon ( ) and exit icon ( ) are also available on the toolbar.
- From the right-click menu you can use the **Zoom In** or **Zoom Out**. The zoom-in icon ( ) and zoom-out icon ( ) are also available on the toolbar.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
  - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
  - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
  - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
  - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Navigating with keyboard-arrow keys is not available in preview mode.

Enable Office 2007 previews in Content—Pilot

If this option is checked, Microsoft Office 2007 files, including PowerPoint, Word, and Excel can be previewed in their entirety in Salesforce CRM Content and Chatter. In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

You can also preview files in Chatter feeds, from the Files tab, from a file detail page, and from group and profile file lists.

**Note:** If this option is unchecked after Office 2007 previews have been generated, those previews will no longer be available.

Show Salesforce Files in Salesforce CRM Content

If this option is enabled, searches in Salesforce CRM Content include Salesforce Files. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Files, Shared with Company, My Groups, and My Libraries.**
If this option is not checked, searches in Salesforce CRM Content don’t include Salesforce Files. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include All Libraries, Private Library, and any shared libraries the user is a member of.

SEE ALSO:
- Customize Salesforce CRM Content
- Allow Content Previews in Link Posts

**Allow Content Previews in Link Posts**

Salesforce provides rich media support for over 400 URL domains. When you attach a link to a post, supported links are converted into embedded videos, images, and rich article previews.

You must enable Chatter before you can enable link previews.

The rich media content is provided by Embed.ly, a third-party service. We don’t share any content, user, organization, or account data with Embed.ly. We only share the URLs that are on the domain whitelist. Also all our URL requests pass through a Salesforce proxy. Embed.ly never receives calls directly from the client and therefore doesn’t have information about who’s making the URL request.

1. From Setup, enter Chatter Settings in the Quick Find box, then select Chatter Settings.
2. Click Edit.
4. Click Save.

Post with links to rich media content are rendered as a preview, including thumbnails, descriptions, and video players for video URLs. If a post doesn’t render a link as a rich preview in the feed, the URL domain for that link either isn’t supported or Embed.ly was unable to return the preview content for the URL.

Rich media previews are enabled by default. If you disable rich media previews, users can only preview videos from the YouTube community.

Note: For a look-up list of supported URL domains, see “URL Domains for Rich Link Previews in Feeds.”

Content Deliveries

Set Up Content Deliveries

A content delivery allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the delivery is available to viewers and whether a viewer can download a file or see it online only. By default, a content delivery shows the most recent version of the file being delivered.

Create content deliveries from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

1. From Setup, enter Content Deliveries in the Quick Find box, then select Content Deliveries and enable Enable Creation of Content Deliveries for Salesforce Files. If you don’t have access to the Content Deliveries feature, contact Salesforce Customer Support to activate it.

2. Choose a default option for content-delivery passwords. Because content-delivery URLs can be sent to leads, customers, or any unauthenticated user, Salesforce recommends requiring password protection if your users will send confidential documents via content delivery. The options below allow you to select an organization-wide default for content-delivery password protection.

   • **Password protection is optional and defaults to OFF**—If this option is selected, users can choose to require a password when they create a content delivery, but the Require Password to Access Content field on the create-delivery wizard is not checked by default.

   • **Password protection is optional and defaults to ON**—If this option is selected, the Require Password to Access Content field on the create delivery wizard is checked by default. Users can uncheck the option if they do not want to require a password.

   • **Password protection is required**—If this option is selected, a password is generated each time a content delivery is created. Users cannot opt out of the password requirement.

   **Note:**

   • If you choose to require a password, users who create a content delivery will receive a password when the delivery is generated; users must send the password and the delivery URL to delivery recipients. Delivery recipients are prompted for the password when they click the content delivery URL.

   • Content delivery passwords display with the content-delivery URL when the delivery is created. You can also access the password on the delivery detail page for the life of the content delivery.

When content delivery is enabled, all users should add the Content Deliveries related list to their page layouts for leads, business accounts, contacts, opportunities, cases, campaigns, or custom objects. All Salesforce CRM Content users will see a Deliver Content option on each content details page.
Implementation Tips

- To ensure quality of service, the total number of content-delivery views allowed within a 24-hour period is limited to 20,000. Also, the amount of bandwidth allocated to content deliveries is limited to 10 GB within a 24-hour period. If a recipient tries to view a delivery when a rate limit has been exceeded, a notification displays that asks the viewer to try again later. Salesforce may be able to increase rate limits on an exception basis. For more information, contact your sales representative.

- When you create a content delivery, Salesforce copies the original file and creates a new version of that file specifically for online viewing. Note the following information concerning supported file types:
  - Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files are supported for online views.
  - Adobe® PDF files are supported for online views, but copy-protected PDFs are not.
  - JPG, BMP, GIF, and PNG are supported for online views.
  - Any document over 25 MB is not supported for online views.

You can create a content delivery with any file type, but if the file type is not supported for online viewing, your recipient can only download the document in its original file format.

- Always preview your content delivery before sending the URL to recipients. In some cases, formatting in the original file, such as colors and non-standard fonts, may not display properly in the online version. If you are not happy with the quality of the online version, the content delivery wizard gives you the option of making your content available for download in its original file format.

- Content deliveries require Adobe Flash version 9.0.115. If a recipient does not have Flash installed, a download option displays.

- Customer Portal and partner portal users cannot create content deliveries.

- Only the creator of a content delivery can delete the delivery record or edit details such as the expiration date.

- Each time a content delivery’s URL is clicked, Salesforce records the click as one view and distinguishes between internal and external views. An internal view is a view by a Salesforce user, for example, clicking the delivery URL on the delivery detail page or the View option on the Content Deliveries related list is an internal view. The Content Deliveries related list provides a count of all views for each delivery. Open the delivery details page to see information about a specific view.

  Note: For password-protected content deliveries, a view is recorded when the recipient clicks on the delivery URL regardless of whether he or she enters the password and views the delivery.

- Salesforce CRM Content users can deliver content from shared libraries or a personal library.

Best Practices

- After creating a content delivery, always preview it before sending the URL to your recipients to ensure that the formatting in the original file displays properly in the online version. For example, colors and non-standard fonts may not display properly in the preview player. If you are not happy with the quality of the online version, click Previous and choose to make your content available in its original file format or as a PDF file only. Your recipients will be able to download the file, and you can track whether the file was downloaded on the delivery detail page.

- Animation and timings in PowerPoint files are not supported in the content delivery’s online version. Hyperlinks in all file types are also unsupported. See the implementation tips for a complete list of supported file types.

- If you are a Salesforce CRM Content user and want recipients of your content delivery to always see the latest version of a file rather than the version available on the delivery-creation date, open the delivery detail page and click Edit. Select the Content Delivery Opens Latest Version checkbox.

- If you select Notify Me of First View or Download, you will receive an email when the content delivery is viewed for the first time.
Storage Implications

In Salesforce CRM Content, file storage is consumed when content is published to shared libraries or saved to a private library. Creating content deliveries does not have an additional affect on storage limits, but users who frequently upload files to their personal libraries for the purpose of content delivery should consider their organization’s file-storage limits. Administrators can use reporting to identify which users are consuming the most storage and which files are largest in size.

For non-Salesforce CRM Content users, file storage is consumed each time a content delivery is created. Once uploaded to Salesforce, a file cannot be reused for multiple content deliveries. Creating multiple content deliveries with the same file requires uploading the file each time. Deleting a content delivery deletes the source file in Salesforce, thus increasing file-storage space.

  - Set Up Salesforce CRM Content
  - Content Delivery Fields

Content Delivery Fields

The following table provides a description of the fields (in alphabetical order) that make up a content delivery. These fields are located on the create-delivery wizard, the Content Deliveries related list, or the delivery details page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow Recipient to View in the Browser</td>
<td>If checked, the content delivery can be viewed online in a custom Web page. On the delivery details page, this field is labeled Allow View in the Browser.</td>
</tr>
<tr>
<td>Allow Recipient to Download as PDF</td>
<td>If checked, the content delivery converts Microsoft® Word, Excel, and PowerPoint files into PDF files and gives the recipient the option of downloading the PDF. If the file you uploaded was not a PDF, Word, Excel, or PowerPoint file, this option does not appear in the create-delivery wizard. On the delivery details page, this field is labeled Allow Download as PDF.</td>
</tr>
<tr>
<td>Allow Download in Original Format</td>
<td>If checked, the content delivery allows recipients to download the original file. In the create-delivery wizard, this field is called Allow Recipient to Download as [file type] where [file type] is the original file’s file type, such as .ppt, .pdf, or .doc.</td>
</tr>
<tr>
<td>Author</td>
<td>For Salesforce CRM Content files, the user who published the file. (Read only)</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Content Delivery Name</td>
<td>The name assigned to the content delivery. By default, the Content Delivery Name includes the file name and the creation date.</td>
</tr>
<tr>
<td>Content Delivery Opens Latest Version</td>
<td>For Salesforce CRM Content files, this flag indicates that the recipient of a content delivery sees the most current version of a file. For example, if a file is updated between the delivery-creation date and today's date, a recipient who views the delivery today sees the newest version.</td>
</tr>
<tr>
<td>Content Delivery Expires</td>
<td>A flag that indicates whether access to the content delivery will expire on the expiration date. In the create-delivery wizard, this flag corresponds to the checkbox next to the Remove access to content on field.</td>
</tr>
<tr>
<td>Created By</td>
<td>The user who created the content delivery, including creation date and time. (Read only)</td>
</tr>
<tr>
<td>Description</td>
<td>For Salesforce CRM Content files, the description provided when the file was published. (Read only)</td>
</tr>
<tr>
<td>Expiration Date</td>
<td>The date on which the content delivery can no longer be viewed. In the create-delivery wizard, this is the date entered in the Remove Access to Content on field.</td>
</tr>
<tr>
<td>File Downloaded</td>
<td>A flag that indicates whether a file in the content delivery was downloaded. For example, if a content delivery includes options to view the content in the browser, download the content in its original file format, and download the content as a PDF file, this flag is checked if the recipient downloads the original file or the PDF file. (Read only)</td>
</tr>
<tr>
<td>Internal View</td>
<td>A flag that indicates whether a Salesforce user viewed the content delivery. A view is considered internal if the user opens the delivery URL from within Salesforce, for example by clicking View on the Content Deliveries related list or clicking the delivery URL on the delivery detail page. If the user copies the URL and pastes it into his or her browser, the view is considered external. (Read only)</td>
</tr>
<tr>
<td>Last Modified By</td>
<td>The user who last modified the content delivery, including modification date and time. (Read only)</td>
</tr>
<tr>
<td>Last Viewed</td>
<td>The date and time on which the content delivery was last viewed. A view is one click of the content-delivery URL. (Read only)</td>
</tr>
<tr>
<td>Notify Me of First View or Download</td>
<td>If checked, the user who created the content delivery receives an email notification the first time the content delivery URL is clicked.</td>
</tr>
<tr>
<td>Owner Name</td>
<td>The user who owns the content delivery. (Read only)</td>
</tr>
</tbody>
</table>
### Setting Up Salesforce CRM Content for Salesforce Classic Mobile

Note the following about how Salesforce CRM Content is implemented in Salesforce Classic Mobile:

- **Content record information is synchronized to the device; however, the files associated with the content records are not.** This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- **Users can't search for a specific piece of content in the app.** They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- **Users can't view a list of their subscribed content in the app.** They also can't filter the list of records on the Content tab based on a particular library.
- **While users can preview and share content from the app, they can’t update the file associated with a content record.** If they have the required permissions, they can edit the fields on the content detail page.
- **Users must have a data connection to preview and deliver content.** Without a data connection, they can only view the content detail page.
- **Content in Salesforce Classic Mobile is only supported on iPhone devices.**
- **You can’t block mobile permissions for the content object.** Currently, the content object in Salesforce Classic Mobile is read-only.
- **You can’t edit the mobile page layout for the content object.** The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Classic Mobile configuration:

1. From Setup, enter **Salesforce Classic Configurations** in the Quick Find box, then select **Salesforce Classic Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.

SEE ALSO:
- [Set Up Content Deliveries](#)
3. Click Add...

4. In the popup window, select Content, then click OK.

5. Use field filters to specify which content records are synchronized.

   Because users can’t search for content in the Salesforce Classic Mobile app, it’s essential to set up filters that make important content available on the device. You can’t create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

   - **Date:** Filter on the Last Modified Date, Content Modified Date, or Created Date fields. Use special date values like LAST 90 DAYS or LAST 180 DAYS to ensure that recently updated content records are synchronized.
   - **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
   - **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
   - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a Functional Use field with picklist values, you could set up a filter condition where Functional Use equals Sales.

6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.

7. Click Done.

Google Apps

Getting Started with Salesforce and Google Apps

Google Apps is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. If your organization has a Google Apps account, Salesforce administrators can enable Google Docs, Gmail, and a host of Google-related AppExchange apps—customized for use within Salesforce.

Step 1: Creating a Google Apps Account

Create a Google Apps account for your organization using one of the following methods:

- From Setup, enter Google Apps in the Quick Find box, select Google Apps Settings, and click Sign Up to launch the account-creation page on the Google website. You are prompted to register your organization’s domain name or purchase a new domain name from Google. A domain is the portion of a website’s URL that follows the “www.” Follow Google’s steps to configure your new or existing domain and set up your Google Apps account.

- If your organization purchased the Salesforce and Google Apps Supported feature, from Setup, enter Premier Setup in the Quick Find box, then select Premier Setup to create a new Google Apps Premier Edition account or upgrade your existing Standard Edition account to Premier Edition. For details, see Getting Started With Salesforce and Google Apps Supported.

Note: Google Apps in Salesforce supports Google Apps business accounts but not consumer accounts. You can identify a consumer account by the “gmail.com” domain in an email address; for example, myname@gmail.com is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, mycompany.com is a business rather than consumer account.

Step 2: Configuring Google Apps Domain Settings

1. On the Google Apps Settings page in Salesforce, click Edit.

2. Choose a user for the Google Apps Administrative Contact field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization’s Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.

3. Enter the Google Apps Domain that you registered with Google. For example, if your company’s URL is http://www.acme.com and you created a Google Apps account for the acme.com domain, enter acme.com in the Google Apps Domain field.

4. Click Save.

Step 3: Activating Google Apps Services

1. In the Activate Google Apps Services section on the Google Apps Settings page, locate the Google Apps service(s) that you want to activate.
2. Click **Edit** or **Install** to activate a service. In the Action column, **Edit** corresponds to Google Apps services that are already integrated in Salesforce, and **Install** corresponds to uninstalled Force.com AppExchange apps. Integrated Google Apps services include:

- Add Google Docs to Salesforce
- Gmail to Salesforce
- Gmail Buttons and Links
- Google Talk Sidebar Component

**Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see the Google Talk online help.

**Step 4: Creating Google Apps Users**

Activating Google Apps services in Salesforce makes the services visible to all users in your organization, but a user cannot access a service unless he or she has a Google Apps account on your organization’s domain. The Google Apps administrator registered with Google can create these additional accounts. For more information, see Creating Google Apps Accounts.

- Set Up Google Apps in Salesforce
- Activate Google Docs in Salesforce
- Gmail™ in Salesforce
Getting Started With Salesforce and Google Apps Supported

The Salesforce and Google Apps Supported feature includes a Google Apps Premier Edition account for your organization. In Salesforce, you can create that account or upgrade from an existing Google Apps Standard Edition account to Google Apps Premier Edition.

After you create a new Google Apps Premier Edition account or upgrade your existing Google Apps Standard Edition account in Salesforce, the Premier Setup page displays your organization’s domain name, the number of Google Apps Premier Edition licenses available to your organization, and, if applicable, the status of your upgrade.

Creating a New Google Apps Premier Edition Account

If your organization does not have a Google Apps account, complete the following steps to register a Google Apps Premier Edition account and enable Salesforce and Google Apps:

1. From Setup, enter Premier Setup in the Quick Find box, then select Premier Setup.
2. Complete the fields in Column A:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain Name</td>
<td>Enter the domain that you want to register as your organization’s Google Apps account. For example, if your company’s URL is <a href="http://www.acme.com">http://www.acme.com</a>, enter acme.com as your Domain Name.</td>
</tr>
<tr>
<td>User Name</td>
<td>This value is used to create the Google Apps administrator for your organization’s account. For example, if your Google Apps administrator will be <a href="mailto:jsmith@acme.com">jsmith@acme.com</a>, enter jsmith. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.</td>
</tr>
<tr>
<td>First Name</td>
<td>This value is used to create the Google Apps administrator for your organization’s account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.</td>
</tr>
<tr>
<td>Last Name</td>
<td>This value is used to create the Google Apps administrator for your organization’s account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.</td>
</tr>
<tr>
<td>Email Address</td>
<td>This email address receives a confirmation notice when your Google Apps Premier</td>
</tr>
</tbody>
</table>
### Set Up and Maintain Collaboration Tools

Complete the following steps to upgrade your organization’s existing Google Apps Standard Edition account to a Google Apps Premier Edition account.

1. From Setup, enter Premier Setup in the Quick Find box, then select Premier Setup.

2. Complete the fields in Column B:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain Name</td>
<td>The domain that you want to register as your organization’s Google Apps Premier Edition account. If you already enabled Salesforce and Google Apps, this field is prepopulated with your organization’s domain name.</td>
</tr>
<tr>
<td>Google Apps Token</td>
<td>The 16-digit token required to upgrade from Google Apps Standard Edition to Google Apps Premier Edition. Your organization’s Google Apps administrator can access this information on the Google website. For more information, click Retrieve Google Apps Token in Column B.</td>
</tr>
</tbody>
</table>

### Upgrading to a Google Apps Premier Edition Account

Complete the following steps to upgrade your organization’s existing Google Apps Standard Edition account to a Google Apps Premier Edition account.

1. From Setup, enter Premier Setup in the Quick Find box, then select Premier Setup.

2. Complete the fields in Column B:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Domain Name</td>
<td>The domain that you want to register as your organization’s Google Apps Premier Edition account. If you already enabled Salesforce and Google Apps, this field is prepopulated with your organization’s domain name.</td>
</tr>
<tr>
<td>Google Apps Token</td>
<td>The 16-digit token required to upgrade from Google Apps Standard Edition to Google Apps Premier Edition. Your organization’s Google Apps administrator can access this information on the Google website. For more information, click Retrieve Google Apps Token in Column B.</td>
</tr>
</tbody>
</table>
3. Click **Upgrade Existing Account to Premier**.

4. To enable Salesforce and Google Apps, from Setup, enter **Google Apps Settings** in the Quick Find box, then select **Google Apps Settings**.

5. As needed, edit the **Google Apps Administrative Contact** field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization’s Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.

6. Verify that the **Google Apps Domain** field contains the domain name you registered with Google.

7. As necessary, activate Google Apps services in Salesforce. For more information, see **Activating Google Apps Services**.

8. As necessary, create users for your organization’s Google Apps account. For more information, see **Creating Google Apps Accounts**.

   ![Note](image)

   - The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

**SEE ALSO:**
- **Getting Started with Salesforce and Google Apps**

### Set Up Google Apps in Salesforce

From Setup, enter **Google Apps Settings** in the Quick Find box, then select **Google Apps Settings** to edit your Google Apps domain settings, activate or deactivate Google Apps services in Salesforce, or install or uninstall Google-related Force.com AppExchange packages.

**Important:** You cannot use Salesforce and Google Apps until a Google Apps account has been created for your organization and your Google Apps domain settings are configured in Salesforce. For instructions on creating an account and configuring your domain settings, see **Getting Started with Salesforce and Google Apps** on page 3297.

### Editing Google Apps Domain Settings

Domain settings consist of two values: the user chosen to administer your organization’s Google Apps account and the domain your organization registered with Google. Both fields are required to enable Google Apps in Salesforce. To edit your domain settings:

1. In the Configure Google Apps Domain section, click **Edit**.

2. Optionally, choose a new user for the **Google Apps Administrative Contact** field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization’s Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.

3. Optionally, modify the **Google Apps Domain** that is registered with Google for your organization’s Google Apps account. Your Google Apps Domain is typically your company’s domain; for example, acme.com.
Modifying Google Apps Services

This section lists Google Apps services that are integrated with Salesforce and also provides links to several Google-related Force.com AppExchange apps that can be easily installed from AppExchange.

To activate or deactivate an integrated service, click **Edit** next to the service name. These services include:

- Add Google Docs to Salesforce
- Gmail to Salesforce
- Gmail Buttons and Links
- Google Talk Sidebar Component

**Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see the Google Talk online help.

To install or uninstall an AppExchange app, click **Install** or **Uninstall** next to the appropriate name. To view all Google-related AppExchange offerings, visit [http://sites.force.com/appexchange](http://sites.force.com/appexchange).

Implementation Tips

- For detailed information about Google Apps, refer to Google's online help.
- Google Apps in Salesforce is available for Google business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname@gmail.com* is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany.com* is a business rather than consumer account.
- After creating a Google Apps account for your organization, create Google Apps accounts for your Salesforce users. From Setup, enter *Users* in the Quick Find box, select *Users*, and then click **Export to Google Apps**.
- Notify users of their Google Apps usernames and passwords.
- Notify users about the changes they will see in Salesforce when Google Apps services are activated.
- To view all the Google apps available on Force.com AppExchange, visit [http://sites.force.com/appexchange](http://sites.force.com/appexchange).
- By default, Google Apps users on your organization's domain can share Google docs with Google Apps accounts outside your domain. The control panel for your Google Apps account contains sharing settings that enable you to restrict document sharing to within your domain.
- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Reactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- Customer Portal and partner portal users with access to the Contribute tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.
- Customer Portal and partner portal users cannot access Gmail Buttons and Links.
- If your organization purchased the Salesforce for Google Apps Supported feature, see *Getting Started With Salesforce and Google Apps Supported* on page 3299.
Best Practices

- Test your Google Apps integration using a sandbox or Developer Edition organization.
- Manage Google Apps users as you would Salesforce users. For example, if you deactivate a Salesforce user, also deactivate his or her Google Apps account in the control panel for your organization’s Google Apps account. For information about administering your organization’s Google Apps account, refer to Google’s online help.
- To locate a Google doc quickly in Salesforce, search for the doc using search.

SEE ALSO:
- Getting Started with Salesforce and Google Apps

Creating Google Apps Accounts

After creating a Google Apps account for your organization and enabling Google Apps in Salesforce, you can create Google Apps accounts for individual users. To access the Google Apps services that are enabled in Salesforce, each user needs a Google Apps account on the domain your organization registered with Google. An account includes a username and password that allow the user to log into all Google Apps services.

**Note:** If your organization purchased Salesforce and Google Apps Supported, the number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased.

To export a list of users to Google and create Google Apps accounts for each user:

1. From Setup, enter *Users* in the Quick Find box, then select *Users*.
2. In the View drop-down list, choose a list of users.
3. Click **Export to Google Apps** to export all the users in the list. To export certain users only, select those users in the Action column.

**Note:** If Google Apps is not enabled for your organization, the **Export to Google Apps** button does not display. To enable Google Apps in Salesforce, see **Getting Started with Salesforce and Google Apps** on page 3297.

4. On the Export Users to Google Apps page, click the export file link that is labeled as Step 1. The name of the link depends on the list view you chose to export; for example, if you were viewing the All Users list, the link on the Export Users to Google Apps page is **All Users Export File**.

5. In the CSV spreadsheet that displays when you click the export link, provide a temporary password for each user. You can modify the username, last name, and first name fields for any user as needed. Google creates account names by adding your domain to the usernames in the spreadsheet; for example, if your domain is acme.com and the spreadsheet contains john.doe and jane.doe usernames, the Google Apps usernames are john.doe@acme.com and jane.doe@acme.com.

6. Save the spreadsheet to your computer.

7. Click the **Google Apps Bulk User Import Tool** link to launch the Bulk Account Update page for your organization’s Google Apps account. If prompted, log in with your Google Apps administrator username. Only the user who is registered with Google as the administrator of your organization’s account can create additional Google Apps accounts on your organization’s domain.

8. Follow Google’s instructions to import the data in the spreadsheet. The Google Apps administrator receives a confirmation report, and the user for each successfully created account receives a notification email at his or her new Gmail account.
9. Notify users of their usernames and passwords. They will need this information to use any Google Apps service that is enabled in Salesforce.

Getting Started with Salesforce and Google Apps

Activate Google Docs in Salesforce

**Important:** After you activate a Google Apps service in Salesforce, it’s visible to all your Salesforce users. To use these services, your users need Google Apps accounts on your domain. For more information, see Getting Started with Salesforce and Google Apps.

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators.

To activate or deactivate the Add Google Docs to Salesforce service:

1. From Setup, enter Google Apps Settings in the Quick Find box, then select Google Apps Settings.
2. Click Edit next to the Add Google Docs to Salesforce option in the Activate Google Apps Services list.
3. Select Activate.
4. Read and indicate whether you agree to the Terms of Use.
5. Click Save.

When the Add Google Docs to Salesforce service is enabled, the following changes allow users to create, edit, or view Google docs and associate them with Salesforce records:

- The Notes & Attachments related list on accounts, assets, contacts, contracts, leads, opportunities, products, and custom objects is renamed to Google Docs, Notes, & Attachments.
- The Attachments related list on cases, solutions, and campaigns is renamed to Google Docs & Attachments.
- If Salesforce CRM Content is enabled, the Libraries tab has an Add Google Doc drop-down list.

Users can also install the Add Google Doc to Salesforce browser button, which allows them to associate a Google doc to several Salesforce records or a Salesforce CRM Content library without being logged into Salesforce.

Implementation Tips

- For information about Google Docs, refer to Google's online help.
- By default, Google Docs users on your domain can share their Google docs with Google Apps accounts outside your domain. The control panel in your Google Apps account contains sharing settings that enable you to restrict document sharing to users within your organization's domain.
- Customer Portal and partner portal users with access to the Contribute tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the Add Google Doc to Salesforce browser button.
- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users’ Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google
Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.

- The Add Google Docs to Salesforce service cannot be disabled for your organization if Google docs are referenced in Apex.
- Google docs count against data storage. For each Google doc associated with a record or library in Salesforce, two Kb of storage is used.

Gmail™ in Salesforce

Integrate Gmail with Salesforce.

Gmail to Salesforce available in: both Salesforce Classic and Lightning Experience
Gmail Buttons and Links available in: Salesforce Classic
Available in: All Editions except Database.com

USER PERMISSIONS
Activating Gmail in Salesforce:
- “Customize Application”

Important: After you activate a Google Apps service in Salesforce, it’s visible to all your Salesforce users. To use these services, your users need Google Apps accounts on your domain. For more information, see Getting Started with Salesforce and Google Apps.

Integrate Gmail with Salesforce in two ways
- Gmail to Salesforce
- Gmail Buttons and Links

Gmail to Salesforce

Gmail to Salesforce lets you log emails automatically. It also lets you log chats you send from your Gmail account as activities on leads, contacts, opportunities, and other records that support activity history. It’s important to know that after you activate Gmail to Salesforce, you can’t deactivate it.

To activate Gmail to Salesforce:
1. From Setup, enter Email to Salesforce in the Quick Find box, then select Email to Salesforce. Confirm that it’s activated.
2. From Setup, enter Google Apps Settings in the Quick Find box, then select Google Apps Settings.
3. Set a Google Apps Administrative Contact and Google Apps Domain, then save your changes.

Gmail Buttons and Links

Gmail Buttons and Links adds Gmail links next to email fields on all records and adds Compose Gmail buttons in Activity History on leads and contacts. When you select a Gmail link or Compose Gmail, Salesforce automatically logs you in to your Gmail account and automatically populates the To field. If Gmail to Salesforce is activated, Salesforce also populates the BCC field with your Email to Salesforce address.
To activate Gmail Buttons and Links:

1. From Setup, enter Google Apps in the Quick Find box, then select Google Apps Settings.
2. In the Activate Google Apps Services list, click Edit next to Gmail Buttons and Links.
3. To activate Gmail Buttons and Links, select Active.
4. To add Gmail links next to all email fields (except email fields on pages under Setup), select Gmail Links.
5. To add Compose Gmail buttons in Activity History on leads and contacts, select Gmail Buttons.
6. Read and indicate whether you agree to the Terms of Use.
7. Click Save.

Implementation Notes

If enable Gmail Buttons and Links without Gmail to Salesforce, you can still use the Gmail links on contacts and leads. But keep in mind that Salesforce doesn’t log emails you send from your Gmail account. Salesforce also doesn’t automatically populate the BCC field on the Compose Mail window with an Email to Salesforce address.

Using Google Talk in Salesforce

Important: Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see the Google Talk online help.

Deactivating Google Talk

To deactivate Google Talk in Salesforce:

1. From Setup, enter Google Apps in the Quick Find box, then select Google Apps Settings.
2. Click Edit next to the Google Talk Sidebar Component option in the Activate Google Apps Services list.
3. Deselect the Active checkbox.
4. Click Save.

Wave Analytics

Salesforce Wave Analytics is a cloud-based platform for connecting data from multiple sources, creating interactive views of that data, and sharing those views in dashboards. It’s a better way to distribute insight to business users so they can understand and take action on changing information.

Learn Wave Analytics with Trailhead

Trailhead is the fun and free way to learn Salesforce. Now you can get acquainted with Wave Analytics through Trailhead, using a special Wave-enabled Developer Edition org.

For the Wave Analytics trails, you can’t use an old Developer Edition org. You must sign up for the special Developer Edition that comes with a limited Analytics Cloud Wave Platform license and contains sample data required for the Wave trails.

To access all of the Wave Analytics trails, start here: https://developer.salesforce.com/trailhead/trail/wave_analytics_explorer. You’ll find the sign up for the special Developer Edition org in the Wave Analytics Basics trail.

- Wave Analytics Limits
Wave Analytics Glossary

Familiarize yourself with common Wave Analytics terminology.

**App**
An app contains dashboards, lenses, and datasets in any combination that makes sense for sharing your data analyses with colleagues. Apps are like folders. They allow users to organize their data projects—private and shared—and to control sharing.

**Dashboard**
A dashboard is a curated set of charts, metrics, and tables based on the data in one or more lenses.

**Dashboard JSON file**
A dashboard JSON file defines the components that a dashboard contains and describes how they're connected.

**Data monitor**
The data monitor tool allows you to monitor dataflow and system jobs. You can also use it to start, stop, reschedule, download, and upload dataflows.

**Dataflow**
A dataflow is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying.

**Dataflow definition file**
A dataflow definition file is a JSON file that contains transformations that represent the dataflow logic.

**Dataflow job**
A dataflow job processes the logic in a dataflow.

**Dataset**
A dataset contains a set of source data, specially formatted and optimized for interactive exploration.

**Dataset builder**
The dataset builder is a point-and-click user interface that allows you to easily select and extract data from related Salesforce objects to create a single dataset.

**Date**
A date can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

**Designer**
Designer is the interface where you create dashboards.

**Dimension**
A dimension is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions.

**Explorer**
Explorer is the interface where you explore datasets and lenses.

**Extended metadata (XMD)**
Extended metadata (XMD) allows you to customize the formatting of many dashboard elements in Wave Analytics.

**External data**
External data is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.

**External Data API**
Use External Data API to upload external data files to Wave Analytics to create datasets.

**Lens**
A lens is a particular view into a dataset's data. It's where you do exploratory analysis and visualization.
Measure
A measure is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

Metadata file
A metadata file is a JSON file that describes the structure of an external data file.

Predicate
A predicate is a filter condition that defines row-level access to records in a dataset.

Salesforce Analytics Query Language (SAQL)
Use SAQL to access and analyze data in Wave Analytics datasets.

Transformation
A transformation refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

Visualization
A visualization is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

Wave Platform Setup
To set up your organization to use the Salesforce Wave Analytics platform, learn about Wave Analytics platform licenses and permissions. Then follow the same basic process you use to set up other Salesforce products.

Important: If you purchased a Wave Analytics Platform license before October 20, 2015 with Analytics Cloud Builder or Analytics Cloud Explorer permission set licenses, read Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015. If you’re migrating users from Builder or Explorer licenses to the new Analytics Cloud - Wave Analytics Platform license, see Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses before you start the setup process for those users.

Note: Sales Wave app users should see The Sales Wave Analytics App to get started with the app.

Each Analytics Cloud - Wave Analytics Platform license is a single-user license that provides access to the Salesforce Wave Analytics cloud. It includes a single Analytics Cloud - Sales Wave Analytics App single-user license. The table shows data storage limits for each license. If you require more data, you can purchase Analytics Cloud - Additional Data Rows, which entitles you to an additional 100 million rows.

<table>
<thead>
<tr>
<th>License</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analytics Cloud - Wave Analytics Platform</td>
<td>100 million rows</td>
</tr>
<tr>
<td>Analytics Cloud - Sales Wave Analytics App</td>
<td>25 million rows when used without Analytics Cloud - Wave Analytics Platform license. Use of Sales Wave app license does not increase data limit for platform license</td>
</tr>
<tr>
<td>Analytics Cloud - Additional Data Rows</td>
<td>100 million rows</td>
</tr>
</tbody>
</table>
Important: Wave Analytics license data storage limits are contractual, not technical. Licensee agrees to strictly monitor its total number of data rows.

Wave Platform Setup Process

Enable Wave and assign permission set licenses to users. The first step when you set up Wave is simply to enable it. Then, you assign an Analytics Cloud - Wave Analytics Platform permission set license to each user. Each permission set license can be assigned to only one user. Also, the user license that’s associated with the user profile must support the Analytics Cloud - Wave Analytics Platform permission set license. Not all user licenses support the Wave platform permission set license.

Define user types and create and assign permission sets. Next, define the main user types in your organization and create permission sets to group related user permissions according to each user type’s needs. After you create permission sets, assign them to users. Although you can assign a permission set to an individual user, for efficiency, you can also assign it to groups of users. You can assign multiple permission sets to a user.

Walk Through It: create, edit, and assign a permission set

You can assign a Wave permission set license along with any of the following Salesforce user licenses:

- Force.com (app subscription)
- Force.com (one app)
- Full CRM
- Salesforce Platform
- Salesforce Platform One

Note: If you disable Wave Analytics, user permissions are removed from each defined permission set. If you re-enable Wave Analytics later, you must define the permission sets again.

Tip: For best results, follow the steps for setting up the Wave Analytics platform in the order shown here.

1. Learn About Analytics Cloud Permission Set Licenses and User Permissions
   Wave Analytics permission set licenses enable the user permissions to explore data with and manage the Salesforce Wave Analytics platform and let Salesforce Community users view Wave dashboards.

2. Identify Wave Analytics Platform User Types
   Identifying types of Wave users and the tasks they need to perform helps assure that the setup process meets the majority of your team members’ analytics needs.

3. Enable Wave Analytics and Select Analytics Cloud - Wave Analytics Platform Permission Set License
   After Salesforce provisions you with the Wave Analytics platform license, you need to enable Wave and select the Wave Analytics permission set license and assign it to users.

4. Create Wave Analytics Permission Sets
   To give users in your organization access to Wave features, create and assign one or more permission sets based on the level of analytics capabilities they need.

5. Assign Wave Analytics Permission Sets to Users
   Assign permission sets to one or more users—either one at a time, or in bulk—to give them access to the Wave functionality.
6. **Complete Setting up the Wave Analytics Platform**  
   Enhance the Wave platform user experience and fine-tune Wave access to Salesforce data with optional setup procedures.

**SEE ALSO:**  
- Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015  
- Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses

### Learn About Analytics Cloud Permission Set Licenses and User Permissions

Wave Analytics permission set licenses enable the user permissions to explore data with and manage the Salesforce Wave Analytics platform and let Salesforce Community users view Wave dashboards.

- Each Wave platform user needs an Analytics Cloud - Wave Analytics Platform permission set license to use Wave.
- Community users need an Analytics Cloud - Wave Community Users permission set license to view Wave apps shared via dashboards embedded in Visualforce pages.

The Analytics Cloud - Wave Analytics Platform permission set license enables the following permissions.

<table>
<thead>
<tr>
<th>User Permission</th>
<th>What It Enables</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Create and Edit Wave Analytics Dashboards&quot;</td>
<td>Creating, editing, and deleting Wave Analytics dashboards.</td>
</tr>
<tr>
<td>&quot;Create Wave Analytics Apps&quot;</td>
<td>Creating, editing, deleting, and sharing Wave Analytics applications.</td>
</tr>
<tr>
<td>&quot;Upload External Data to Wave Analytics&quot;</td>
<td>Uploading external data to Wave Analytics to create a dataset. Monitoring dataflow and system jobs in the data monitor.</td>
</tr>
<tr>
<td>&quot;Edit Wave Analytics Dataflows&quot;</td>
<td>Editing, starting, stopping, and rescheduling the dataflow. Monitoring dataflow and system jobs in the data monitor. Use discretion when assigning this user permission because it enables the user to access all Salesforce object data to which the Integration User has access. For more information see Salesforce Data Access in Wave Analytics.</td>
</tr>
<tr>
<td>&quot;Manage Wave Analytics&quot;</td>
<td>Accessing all Wave Analytics features. Provides Wave administrator-level capabilities.</td>
</tr>
<tr>
<td>&quot;Download Wave Analytics Data&quot;</td>
<td>Downloading screenshots and data in tabular format through the Wave Analytics user interface.</td>
</tr>
</tbody>
</table>

**Note:** When you create permission sets for Wave users, selecting any Wave Analytics permission automatically enables the "Use Wave Analytics" permission as well. Also, the type of access granted on an app controls the actions a user can perform on its datasets, lenses, and dashboards. For example, if a user has the "Use Wave Analytics" permission, the user must also have Viewer access on an app to view its datasets, lenses, and dashboards.

The Analytics Cloud - Wave Community Users permission set license enables the "View Wave Analytics on Communities Pages" permission. That permission enables external users to view Wave dashboards embedded in Visualforce pages in their communities.
Identify Wave Analytics Platform User Types

Identifying types of Wave users and the tasks they need to perform helps assure that the setup process meets the majority of your team members’ analytics needs.

The Wave Analytics Platform license includes the permissions users in your organization need to administer Wave as well as to import, work with, and explore data. To set up Wave in the most useful way, think through the different ways people need to access Wave features and categorize them into user types. Here are a few examples:

In most cases, you’ll need to set up Wave to meet the needs of two basic types of people on your team:

- Users, who need to be able to view Wave dashboards, lenses, and datasets and occasionally import data to Wave.
- Administrators or managers, who need access to all of Wave functionality to create apps, dashboards, lenses, and datasets, edit data, and otherwise customize the Wave experience.

Accordingly, when you set up the Wave platform, creating two basic permission sets can probably meet the needs of most users in your organization:

- A “view” permission set that contains the permissions needed by most basic-level users when they access Wave.
- A “manage” permission set that’s reserved for a select few administrators and managers and contains permissions to use all Wave features.

You can set up Wave Analytics however you want, defining other user types and permissions sets based on the needs of users in your organization. For example, you may need to create a “superuser” permission set who need capabilities to create and share apps and dashboards or a “data wizard” permission set for users who want to work closely with datasets.

We focus on two main types of people on your team -- users and administrators -- in the example permission sets we show you how to create and assign in our detailed setup instructions.

Enable Wave Analytics and Select Analytics Cloud - Wave Analytics Platform Permission Set License

After Salesforce provisions you with the Wave Analytics platform license, you need to enable Wave and select the Wave Analytics permission set license and assign it to users.

1. In the Salesforce Setup menu, under administer, click Analytics Cloud | Getting Started.
2. Click Enable Analytics.
3. In the Setup menu, click Manage Users | Users.
4. Click the name of a user you want to access Wave. You might want to start with User, Admin, or whatever name has been given to the system administrator.
5. Position the cursor over Permission Set License Assignments and click Edit Assignments.
6. Select the Analytics Cloud - Wave Analytics Platform permission set license and click Save.
7. Repeat the above steps for all users in your organization who require access to Wave.

Note: No data is available for queries until you load data into Wave Analytics.
Create Wave Analytics Permission Sets

To give users in your organization access to Wave features, create and assign one or more permission sets based on the level of analytics capabilities they need.

After assigning permission set licenses to users, the next step in the setup process is to create permission sets made up of Wave user permissions and assign them to users. You can create any permission sets you need to meet the needs of your users. We show you how to create two permission sets:

- **Manage Wave Analytics** permission set, for users who administer and manage Wave Analytics and need access to all Wave Analytics features.
- **View Wave Analytics** permission set, for users who explore data and occasionally upload new data to Wave Analytics and need access to a limited set of Wave Analytics features.

**Note:** Customers who purchased Wave before October 20, 2015: See Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015 before following the instructions here.

**Walk Through It: create, edit, and assign a permission set**

1. **Note:** The Manage Wave Analytics permission set enables the equivalent functionality provided by the previous Wave Analytics Builder license (purchased before October 20, 2015). If you have a Builder license or you’re migrating to the new Wave Analytics platform license, follow these steps to create a permission set with the same functionality.

Create Manage Wave Analytics permission set, which gives users access to all Wave features.

a. In the Setup menu, under administer, click Manage Users | Permission Sets and then click New.

b. Enter Manage Wave Analytics in the Label field. This automatically creates the API name, as well, which you can change if you’d like. Note that the API name can’t include spaces, end with an underscore, or have two consecutive underscores.

c. **Warning:** Follow this step precisely or some users in your organization may not be able to access Wave.

In the User License field, keep the default value --None--. Do not select a user license.

d. Click Save. The permission set details page shows the new permission set. Now add user permissions to the set.

e. Scroll to the bottom of the permission set details page, and click System Permissions. Then click Edit.

f. Select “Manage Wave Analytics” user permissions and click Save. You’ve successfully created a permission set that enables a user to access all Wave features. You can now assign it to users, which is covered in Assign Permission Sets to Users. You should assign this permission set sparingly because it provides access to all Wave features, many of which are inappropriate for most analytics users.

2. **Note:** The View Wave Analytics permission set enables the equivalent functionality provided by the previous Wave Analytics Explorer license (purchased before October 20, 2015). If you have an Explorer license or you’re migrating to the new Wave Analytics platform license, follow these steps to create a permission set with the same functionality.

Create View Wave Analytics permission set, which enables users to view Wave lenses, dashboards, and datasets and import data to Wave.

a. In the Setup menu, under administer, click Manage Users | Permission Sets and then click New.

b. Enter View Wave Analytics in the Label field. This automatically creates the API name, as well, which you can change if you’d like. Note that the API name can’t include spaces, end with an underscore, or have two consecutive underscores.

c. **Warning:** Follow this step precisely or some users in your organization may not be able to access Wave.
In the User License field, keep the default value —None—. Do not select a user license.

d. Click Save. The permission set details page shows the new permission set. Now add user permissions to the set.
e. Scroll to the bottom of the permission set details page, and click System Permissions. Then click Edit.
f. Select “Use Wave Analytics Cloud” and “Upload External Data to Wave Analytics” user permissions and click Save. You’ve successfully created a permission set that enables a user to view the Wave datasets, lenses, and dashboards that they have permission to view upload data files from outside Salesforce. You can now assign it to users, which is covered in Assign Permission Sets to Users.

Assign Wave Analytics Permission Sets to Users

Assign permission sets to one or more users—either one at a time, or in bulk—to give them access to the Wave functionality.

1. Walk Through It: assign a permission set

2. In the Setup menu, under administer, click Manage Users | Permission Sets.

3. Warning: Assign the Manage Wave Analytics permission set sparingly, since it provides access to all Wave features. It should only be assigned to users who administer or manage the Wave platform.

   Click the permission set you want to assign to users. If you’ve followed the instructions in Create Wave Analytics Permission Sets on page 3315, select either the Manage Wave Analytics or View Wave Analytics permission sets.

4. Click Manage Assignments and click Add Assignments.

5. Select the users who need access to Wave, and click Done.

Complete Setting up the Wave Analytics Platform

Enhance the Wave platform user experience and fine-tune Wave access to Salesforce data with optional setup procedures.

Enable Preview Thumbnails for All Lenses and Dashboards

Make it easier for users to find their lenses and dashboards on the home page and on app pages. Replace the generic icons with preview thumbnails of the contents of all lenses and dashboards, including those assets that have row-level security restrictions.

Enable Wave Analytics for Communities

Securely share Wave Analytics apps with community partner and customer users.

Enable Downloading from Wave Analytics

Enable users to download the results from lens explorations and dashboard widgets as images (.png), Microsoft® Excel® (.xls), or comma-separated values (.csv) files.

Grant Users Access to the Flex Dashboard Designer

To grant users access to the flex dashboard designer, enable the feature and assign the “Create and Edit Wave Analytics Dashboards” user permission to the users. If you assign the permission but don’t enable the feature, the users can’t access the new designer, but they can access the old one.

Enable Annotations on Dashboard Widgets

Annotate dashboard widgets with comments posted in the dashboard and in Chatter.
Enable the Wave REST API
You can access Wave Analytics datasets and lenses programmatically using the Wave REST API. Selecting this option overrides the "APIEnabled" permission for individual users and gives all Wave users (including Community users) access to the Wave API.

Connected App for Wave Analytics for iOS
Install the Analytics for iOS Connected App to allow your mobile clients to easily connect to your org. The Connected App gives you control over who’s logging in and how your mobile clients share images and links.

Wave Analytics Security Implementation Guide
Wave Analytics has different levels of security that your organization can implement to ensure that the right user has access to the right data.

Salesforce Data Access in Wave Analytics
Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Wave Analytics gains access to Salesforce data based on permissions of two internal Wave Analytics users: Integration User and Security User.

Enable Preview Thumbnails for All Lenses and Dashboards
Make it easier for users to find their lenses and dashboards on the home page and on app pages. Replace the generic icons with preview thumbnails of the contents of all lenses and dashboards, including those assets that have row-level security restrictions.

If no security predicate is defined for a dataset, then preview thumbnails always appear. If a security predicate is defined, then preview thumbnails don’t show unless this setting is enabled. With the setting enabled, preview thumbnails appear for all assets.

⚠️ Important: Even if row-level security applies to the dataset used by a lens or dashboard, the preview thumbnail could expose data from restricted rows. Row-level security restrictions take effect only after you’ve clicked through to the lens or dashboard.

1. From Setup, enter Wave Analytics in the Quick Find box, then select Settings.
2. Select Show preview thumbnails for lenses and dashboards with row level-security enabled.
3. Click Save.
Enable Wave Analytics for Communities

Securely share Wave Analytics apps with community partner and customer users.

Note: Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

To set up Wave Analytics for sharing with Communities, complete the following steps.

1. From Setup, enter Wave Analytics in the Quick Find box, then select Settings. Select Enable Wave Analytics for Communities.
2. Assign your community members the Analytics Cloud - Wave Community Users permission set license.
3. Create a permission set that includes the “View Wave Analytics on Communities Pages” permission and assign it to your community members.

Enable Downloading from Wave Analytics

Enable users to download the results from lens explorations and dashboard widgets as images (.png), Microsoft® Excel® (.xls), or comma-separated values (.csv) files.

Note: This feature isn’t supported for flex dashboards (beta).

To set up users to download data from Wave, complete the following steps.

1. From Setup, enter Permission Sets in the Quick Find box, and then select Permission Sets under Manage Users.
2. Select the Analytics Cloud Permission Set where you want to add the permission, and then select System Permissions.
3. Select Download Wave Analytics Data.
4. Click Save.

SEE ALSO:
Download Images and Filtered Data
Grant Users Access to the Flex Dashboard Designer

To grant users access to the flex dashboard designer, enable the feature and assign the “Create and Edit Wave Analytics Dashboards” user permission to the users. If you assign the permission but don’t enable the feature, the users can’t access the new designer, but they can access the old one.

1. From Setup, enter Wave Analytics in the Quick Find box, then select Settings.
2. Select Enable Flex Dashboard Designer (Beta), and then click Save.
3. For each user that builds dashboards, assign the “Create and Edit Wave Analytics Dashboards” user permission to them.
   Each user has a choice whether to use the old or new designer for each dashboard.

SEE ALSO:
- Quickly Build Responsive Grid-Based Dashboards with Flex Dashboard Designer (Beta)

Enable Annotations on Dashboard Widgets

Annotate dashboard widgets with comments posted in the dashboard and in Chatter.

Note: Annotations are supported only in flex dashboards (beta).

To enable annotations, complete the following steps.
1. From Setup, enter Feed Tracking in the Quick Find box, and then select Feed Tracking under Chatter.
2. Scroll down and select Wave Asset.
3. Select Enable Feed Tracking.
4. Click Save.

SEE ALSO:
- Collaborate with Dashboard Annotations
Enable the Wave REST API

You can access Wave Analytics datasets and lenses programmatically using the Wave REST API. Selecting this option overrides the "APIEnabled" permission for individual users and gives all Wave users (including Community users) access to the Wave API.

1. From Setup, enter Wave Analytics in the Quick Find box, then select Settings.
2. Select Enable the Wave API for all Wave users.
3. Click Save.

Connected App for Wave Analytics for iOS

Install the Analytics for iOS Connected App to allow your mobile clients to easily connect to your org. The Connected App gives you control over who’s logging in and how your mobile clients share images and links.

1. While logged in as an admin, navigate to https://login.salesforce.com/packaging/installPackage.apexp?p0=04tB0000000DKTA.
2. Select Install for All Users.
   
   If you install the Connected App only for certain roles, then only those clients are subject to your policies.

3. After clicking Done, open the Salesforce Insights for iOS package.
4. To configure policies and other settings, click Edit. When you are finished, save your changes. For more information about Connected App settings, see Edit a Connected App.
5. If you want to disable sharing options for mobile users, click New in the Custom Attributes section.

All sharing options are enabled by default. To disable an option, add its attribute key and enter “false” for the attribute value. See the table for the supported attribute keys.

<table>
<thead>
<tr>
<th>Attribute Key</th>
<th>Mobile clients can share</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHARE_IMAGE_AIRDROP</td>
<td>Images via AirDrop</td>
</tr>
<tr>
<td>SHARE_IMAGE_CAMERAROLL</td>
<td>Images from Camera Roll</td>
</tr>
<tr>
<td>SHARE_IMAGE_OPEN</td>
<td>The image that’s currently open on the mobile device</td>
</tr>
<tr>
<td>SHARE_IMAGE_S1</td>
<td>Images in Salesforce1</td>
</tr>
</tbody>
</table>

For more information about Connected App settings, see Edit a Connected App.
<table>
<thead>
<tr>
<th>Attribute Key</th>
<th>Mobile clients can share</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHARE_IMAGE_EMAIL</td>
<td>Images via email</td>
</tr>
<tr>
<td>SHARE_LINK_AIRDROP</td>
<td>Links via AirDrop</td>
</tr>
<tr>
<td>SHARE_LINK_CLIPBOARD</td>
<td>The link that’s currently in the clipboard of the mobile device</td>
</tr>
<tr>
<td>SHARE_LINK_S1</td>
<td>Links in Salesforce1</td>
</tr>
<tr>
<td>SHARE_LINK_EMAIL</td>
<td>Links via email</td>
</tr>
<tr>
<td>SPOTLIGHT_SEARCH</td>
<td>Mobile clients can see Wave Analytics assets in Spotlight search results</td>
</tr>
</tbody>
</table>

**Note:** To apply custom attributes to connected users, you can revoke them and ask them to reconnect.

### 6. To view and control how mobile clients connect to your Wave-enabled org

From Setup, enter Connected Apps in the Quick Find box, then select Connect Apps OAuth Usage.

You can block user sessions, revoke individual users, and drill in to user details. For more information, see Monitoring Usage for a Connected App.

**Note:** For certificate-based authentication, users must set their desktop browsers to allow cookies.

### Wave Analytics Security Implementation Guide

Wave Analytics has different levels of security that your organization can implement to ensure that the right user has access to the right data.

- The administrator can implement object-level and field-level security to control access to Salesforce data. For example, the administrator can restrict access to prevent the dataflow from loading sensitive Salesforce data into datasets. This document describes how Wave Analytics uses object-level and field-level security on Salesforce data and how to configure permissions on Salesforce objects and fields.
- Dataset owners can implement row-level security on each dataset that they create to restrict access to it’s records. If a dataset does not have row-level security, users who have access to the dataset can view all records. This document describes how to configure row-level security on datasets and provides some sample implementations based on datasets created from Salesforce data and external data.
App owners, administrators, and users granted manager access to an app control access to datasets, lenses, and dashboards within apps. This document describes the different levels of access for apps and how to share datasets, lenses, dashboards in an app with other users.

Note: Wave Analytics doesn’t synchronize with sharing that’s configured in Salesforce. Instead, you configure security separately in Wave Analytics. Wave Analytics provides a robust row-level security feature that enables you to model many different types of access controls on datasets.

For complete information about implementing Wave Analytics security, see Wave Analytics Security Implementation Guide.

Salesforce Data Access in Wave Analytics

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Wave Analytics gains access to Salesforce data based on permissions of two internal Wave Analytics users: Integration User and Security User.

Wave Analytics uses the permissions of the Integration User to extract data from Salesforce objects and fields when a dataflow job runs. Because the Integration User has View All Data access, consider restricting access to particular objects and fields that contain sensitive data. If the dataflow is configured to extract data from an object or field on which the Integration User does not have permission, the dataflow job fails.

When you query a dataset that has row-level security based on the User object, Wave Analytics uses the permissions of the Security User to access the User object and its fields. The Security User must have at least read permission on each User object field included in a predicate. A predicate is a filter condition that defines row-level security for a dataset. By default, the Security User has read permission on all standard fields of the User object. If the predicate is based on a custom field, then grant the Security User read access on the field. If the Security User does not have read access on all User object fields included in a predicate expression, an error appears when you try to query the dataset using that predicate.

Control Access to Salesforce Objects and Fields

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Configure the permissions of the Integration User on Salesforce objects and fields to control the dataflow’s access to Salesforce data. Configure the permissions of the Security User to enable row-level security based on custom fields of the User object.

SEE ALSO:
Control Access to Salesforce Objects and Fields

Control Access to Salesforce Objects and Fields

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Configure the permissions of the Integration User on Salesforce objects and fields to control the dataflow’s access to Salesforce data. Configure the permissions of the Security User to enable row-level security based on custom fields of the User object.

When configuring permissions for the Integration User or Security User, make changes to a cloned version of the user profile.

1. From Setup, enter Profiles in the Quick Find box, then select Profiles, and then select the user profile.
   - For the Integration User, select the Analytics Cloud Integration User profile. For the Security User, select the Analytics Cloud Security User profile.

2. Click Clone to clone the user profile.

USER PERMISSIONS

To clone a user profile:
- “Manage Profiles and Permission Sets”

To edit object permissions:
- “Manage Profiles and Permission Sets”
  AND
  “Customize Application”
3. Name and save the cloned user profile.

4. Click **Object Settings**.

5. Click the name of the Salesforce object.

6. Click **Edit**
   a. To enable permission on the object, select **Read** in the Object Permissions section.
   b. To enable permission on a field of the object, select **Read** for the field in the Field Permissions section.

   ✋ **Note:** You can’t change the permissions on standard fields of the User object.

7. Save the object settings.

8. Assign the cloned user profile to the Integration User or Security User.
   a. From Setup, enter **Users** in the Quick Find box, then select **Users**.
   b. Select the user to which you want to assign the user profile.
   c. Click **Edit**.
   d. In the Profile field, select the user profile.
   e. Click **Save**.

9. Verify that the Integration User or Security User has the right permissions on fields of the objects.

---

### Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015

If you purchased Wave Analytics Builder or Explorer licenses before October 20, 2015, you can continue to use your licenses to set up the Wave platform for users in your organization or you can migrate to the new single-user Wave Analytics platform license.

✭ **Note:** This information applies only to customers who purchased Wave Analytics licenses before October 20, 2015, and continue to use the Analytics Cloud Builder or Analytics Cloud Explorer permission set licenses after that without migrating to the new Analytics Cloud Wave Platform license. If you purchased Wave on or after October 20, 2015, go to **Wave Platform Setup**.

⚠ **Important:** If you’re migrating from the previous Analytics Cloud Builder or Analytics Cloud Explorer platform licenses to the single-user Wave Analytics platform license, read **Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses**.

### The Analytics Cloud Wave Platform License

Analytics Cloud Wave Platform license purchased before October 20, 2015, enable you to turn on Wave Analytics for your organization. Each previous Wave Platform license is contractually limited to a maximum of 400 users. If you need more than 400 users, you can purchase additional Wave Platform licenses.

Each previous Wave Platform license enables you to:

- Store up to 250,000,000 rows in your final registered datasets.
- Run up to 50 concurrent queries in Wave Analytics.
The Analytics Cloud Permission Set Licenses

Each user needs an Analytics Cloud permission set license to use the product. The permission set license defines what user permissions can be assigned to the user. The administrator assigns permission set licenses to users.

As part of Wave Analytics platform licenses sold before October 20, 2015, Salesforce provides the following permission set licenses:

- Analytics Cloud Builder permission set license enables users to access all Wave Analytics features.
- Analytics Cloud Explorer permission set license enables users to upload external data to Wave Analytics and explore data.

Here are Wave Analytics user permissions included with each permission set license.

<table>
<thead>
<tr>
<th>User Permission</th>
<th>Included in Explorer or Builder Permission Set License?</th>
<th>What It Enables</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Create and Edit Wave Analytics Dashboards”</td>
<td>Builder only</td>
<td>Creating and editing Wave Analytics dashboards.</td>
</tr>
<tr>
<td>“Create Wave Analytics Apps”</td>
<td>Builder only</td>
<td>Creating and sharing Wave Analytics applications.</td>
</tr>
<tr>
<td>“Edit Wave Analytics Dataflows”</td>
<td>Builder only</td>
<td>Downloading, uploading, starting, stopping, and rescheduling the dataflow. Viewing dataflow and system jobs in the data monitor.</td>
</tr>
<tr>
<td>“Manage Wave Analytics”</td>
<td>Builder only</td>
<td>Accessing all Wave Analytics features. Provides Wave administrator-level capabilities.</td>
</tr>
<tr>
<td>“Upload External Data to Wave Analytics”</td>
<td>Builder and Explorer</td>
<td>Uploading external data to Wave Analytics to create a dataset. Viewing dataflow and system jobs in the data monitor.</td>
</tr>
<tr>
<td>“Use Wave Analytics”</td>
<td>Builder and Explorer</td>
<td>Using Wave Analytics, and viewing the datasets, lenses, and dashboards that the user has permission to view. Automatically enabled when you select any other Wave permission.</td>
</tr>
</tbody>
</table>

Note: When you create permission sets for Wave users, selecting any of the other Wave Analytics permissions automatically enables the “Wave Analytics” permission.

You can assign previous Wave Analytics permission set licenses along with any of the following Salesforce user licenses:

- Force.com (app subscription)
- Force.com (one app)
- Full CRM
- Salesforce Platform
Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses

To complete migration from previous Analytics Cloud Builder and Analytics Cloud Explorer licenses purchased before October 20, 2015, to the new Analytics Cloud - Wave Analytics Platform license, you may need to set up Wave users in your organization with new permission sets.

When Salesforce provisions your organization with the new Analytics Cloud - Wave Analytics Platform license, you may have to set up some users with the new license.

- **Builder license users.** Users who access Wave with the Analytics Cloud Builder permission set license should be able to continue to use the Wave Analytics platform without any additional setup. The Builder license is simply renamed Analytics Cloud - Wave Analytics Platform, and you’ll see that permission set license in Salesforce Setup.

- **Explorer license users.** During the new license provisioning process, Salesforce may remove the Analytics Cloud Explorer license from your org. If that’s the case, you’ll see the new Analytics Cloud - Wave Platform license instead of the Explorer license and you have to set up users with that license. If the Explorer permission set license is still visible, you do not have to repeat the setup process for Explorer users.

If users in your organization require you to set them up with the new Analytics Cloud - Wave Platform license—even if they used Wave with a previous license—follow the steps in Wave Platform Setup on page 3311. You need to assign them the new permission set license, create one or more new permission sets, and assign the permission sets to users.

Update the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota (Target) Dataset

If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, you need to update the Sales Wave Quota dataset so the app includes quotas data for your team.

When you create the Sales Wave app, a Quota (Target) dataset is created along with the app. To explore how team members are tracking to their monthly, quarterly, or annual quotas in Sales Wave, you need to update the Quota dataset by completing the following steps. You can also watch the video 🎥 Create the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow, which covers the steps described here.

**Note:** When you work with .CSV files you want to import to Sales Wave, create and open them using only a UTF-8-compliant text editor. Opening them in Microsoft Excel or other spreadsheet software reformats .CSV files and makes them unusable in Sales Wave.

**Note:** If your business doesn’t track quotas at the user level, you can skip this step. You only need to complete this if you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level.
1. Create a .CSV file to include the following fields, in this order: QuotaAmount, StartDate (in yyyy-mm-dd format), OwnerName, and Username. Field names are case sensitive and must appear in your file exactly as shown here. For an example, see Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Example .CSV File.

2. Save the file to a location that you can easily remember.

3. In Salesforce, go to the Wave Analytics home page and find the Quota (Target) dataset.

4. Hover over the dataset, then click **Edit**.

5. Salesforce displays the dataset editing screen for the Quota dataset. From the Update Data section, select **Select file or drag file here**.

6. In the dialog box that opens, navigate to the .CSV file you created in Step 1, and double-click it.

7. Click **Update Dataset**.

8. If your fiscal period is different than calendar period, that is if it starts another date besides January 1, you also need to update the Quota Metadata file.
   a. Copy the JSON from Sales Wave Quota Dataset JSON File and paste it into a text editor of your choice.
   b. Change the value of "fiscalMonthOffset" from 4 to a number that represents the month your fiscal period starts. In Sales Wave metadata, the numeral "0" stands for January, "1" stands for February, and so on up to "11," which stands for December.
   c. Save the file to your desktop and upload it to Sales Wave by dragging it to **Select file or drag file here**... in the Add Metadata File (JSON) section of the dataset editing screen.
   d. Click **Update Dataset**.

9. After uploading your quota data, re-run the dataflow to update the dashboards.
   a. Click the Gear menu at the upper right of the Sales Wave screen and select Data Monitor.
b. Select Dataflow view from the menu at the top left of the Data Monitor screen.

c. Find your app; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name, and click it. The dataflow assures that Sales Wave has your company's latest sales data. You can learn more about dataflows from Schedule the Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Daily Dataflow.
Sales Wave AppService Wave Analytics app Service Wave Analytics App
Service Wave app Service Wave Service Wave App Example .CSV File

Here’s an example of the .CSV file you create to update the Sales Wave app Quota (Target) dataset.

**Note:** This file is for example purposes only. Create a unique .CSV file with quota data for members of your team including the following fields:

- QuotaAmount
- StartDate
- OwnerName
- Username

Create the file using a UTF-8 compliant text editor, and do not open the file with Microsoft Excel or another spreadsheet application. Field names are case sensitive and must appear in your file exactly as shown here.

See Update the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota (Target) Dataset on page 3526.

**Example:**

<table>
<thead>
<tr>
<th>QuotaAmount,StartDate,OwnerName,Username</th>
</tr>
</thead>
<tbody>
<tr>
<td>5000000,2014-01-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-02-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-03-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-04-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-05-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-06-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-07-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-08-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-09-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-10-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-11-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2014-12-01,Priya Anand,user9.kthjbnrxfyoyourDomain.com</td>
</tr>
<tr>
<td>5000000,2015-01-01,Nathan Sinha,user18.esm4ndicvycgourDomain.com</td>
</tr>
<tr>
<td>5000000,2015-02-01,Nathan Sinha,user18.esm4ndicvycgourDomain.com</td>
</tr>
<tr>
<td>5000000,2015-03-01,Nathan Sinha,user18.esm4ndicvycgourDomain.com</td>
</tr>
<tr>
<td>5000000,2015-04-01,Nathan Sinha,user18.esm4ndicvycgourDomain.com</td>
</tr>
<tr>
<td>5000000,2015-05-01,Nathan Sinha,user18.esm4ndicvycgourDomain.com</td>
</tr>
<tr>
<td>5000000,2015-06-01,Nathan Sinha,user18.esm4ndicvycgourDomain.com</td>
</tr>
</tbody>
</table>

Sales Wave Quota Dataset JSON File

Use this file to update the Sales Wave Quota dataset with your fiscal year start date if it’s not January 1.

Copy the contents of this file into an editor of your choice and change the “fiscalMonthOffset” value (shown in **bold**) to the month your fiscal period begins. In Sales Wave metadata, the numeral “0” stands for January, “1” stands for February, and so on up to
“11,” which stands for December. In the code below, the number is set to “4,” which stands for May. Use the number that represents the month your fiscal period begins. Then save the file and upload it to Sales Wave following the instructions in Update the Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota (Target) Dataset.

```json
{
    "objects": [
        {
            "connector": "CSV",
            "fullyQualifiedName": "Quota_csv",
            "label": "Quota.csv",
            "name": "Quota_csv",
            "fields": [
                {
                    "fullyQualifiedName": "QuotaAmount",
                    "name": "QuotaAmount",
                    "type": "Numeric",
                    "label": "QuotaAmount",
                    "precision": 18,
                    "defaultValue": "0",
                    "scale": 0
                },
                {
                    "fullyQualifiedName": "StartDate",
                    "name": "StartDate",
                    "type": "Date",
                    "label": "StartDate",
                    "format": "yyyy-MM-dd",
                    "fiscalMonthOffset": 4,
                    "isYearEndFiscalYear": true
                },
                {
                    "fullyQualifiedName": "OwnerName",
                    "name": "OwnerName",
                    "type": "Text",
                    "label": "OwnerName"
                },
                {
                    "fullyQualifiedName": "Username",
                    "name": "Username",
                    "type": "Text",
                    "label": "Username"
                }
            ]
        }
    ]
}
```

Data Integration

You can integrate Salesforce data and external data into Wave Analytics to enable users to explore and visualize the data with explorer and designer. *External data* is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.
When you load data into Wave Analytics, you load it into datasets. A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form.

You can use the following methods to create datasets in Wave Analytics.

<table>
<thead>
<tr>
<th></th>
<th>Dataflow JSON</th>
<th>Dataset Builder</th>
<th>Upload User Interface</th>
<th>External Data API</th>
<th>Wave Connector</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data source</td>
<td>Salesforce objects; existing datasets</td>
<td>Salesforce objects</td>
<td>External data</td>
<td>External data</td>
<td>Microsoft Excel</td>
</tr>
<tr>
<td>Can join external and Salesforce data?</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Graphical user interface?</td>
<td>No (JSON)</td>
<td>Yes</td>
<td>Yes</td>
<td>No (programmatic access)</td>
<td>Yes</td>
</tr>
<tr>
<td>Can create multiple datasets at once?</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Supports incremental extraction?</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>Can filter records?</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Can generate new columns when creating datasets?</td>
<td>Yes (delta and dimension columns)</td>
<td>No</td>
<td>No</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>Can override metadata?</td>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

Datasets
A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

Create Datasets with a Dataflow
You can use a dataflow to create one or more datasets based on data from Salesforce objects or existing datasets.

Transformations for Wave Dataflows
A **transformation** refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

Create a Dataset with the Dataset Builder
You can use the dataset builder to create a single dataset based on data from one or more Salesforce objects. The dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs. You can also edit the dataflow definition file to add transformations that manipulate the dataset.
Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

Create a Dataset with External Data

You can either upload external data through the user interface or through the External Data API to create a dataset. When you upload an external data file (in .csv, .gz, or .zip format), you can also provide a metadata file. A metadata file contains metadata attributes that describe the structure of the data in the external data file. If you upload a .csv from the user interface, Wave Analytics automatically generates the metadata file, which you can preview and change. If you do not provide a metadata file, Wave Analytics imports all external data file columns as dimensions.

Edit a Dataset

You can edit a dataset to change the dataset name, app, security predicate, or extended metadata (XMD) file associated with the dataset. For datasets created from an external data file, you can also upload a new external data file or metadata file to update the data or metadata.

Delete a Dataset

Delete unnecessary datasets from your My Private App or in shared apps on which you have at least Editor access. Removing datasets reduces clutter and helps you avoid reaching your org’s limit for rows across registered datasets.

Row-Level Security for Datasets

If a Wave Analytics user has access to a dataset, they have access to all records in the dataset, by default. However, you can implement row-level security on a dataset to restrict access to records. Some records might contain sensitive data that shouldn’t be accessible by everyone.

Predicate Expression Syntax for Datasets

You must use valid syntax when defining the predicate expression.

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

Wave Analytics applies one of the following types to each dataset field:

**Date**

A date can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

**Dimension**

A dimension is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can’t perform math on dimensions. To increase query performance, Wave Analytics indexes all dimension fields in datasets.

**Measure**

A measure is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

For each dataset that you create, you can apply row-level security to restrict access to records in the dataset.

⚠️ **Attention**: Before you create a dataset, verify that the source data contains at least one value in each column. Columns with all null values won’t be created in datasets and can’t be referenced in dataflows, lenses, or dashboards. Consider providing a default value for null values, like “n/a” or "empty."

**Numeric-Value Handling in Datasets**

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number “3,200.99” with a scale of “2” as “320099”. The user interface converts the stored value back to decimal notation to display the number as “3200.99.”
**Date Handling in Datasets**

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

**Dataflow JSON**

You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

**Dataset Builder**

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

**Wave Connector for Excel Data**

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

**Upload External Data from the User Interface**

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.

**External Data API**

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

**Numeric-Value Handling in Datasets**

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number “3,200.99” with a scale of “2” as “320099”. The user interface converts the stored value back to decimal notation to display the number as “3200.99.”

The maximum numeric value that can be stored in a dataset is 36,028,797,018,963,967 and the minimum numeric value is -36,028,797,018,963,968.

**Warning:** If a numeric value is not within this range, you might receive unexpected results. For example, if you try to load the value 3.7E-16 with a scale of 16 into a dataset, Wave Analytics tries to store the value as 37000000000000000. However, because this value exceeds the maximum, Wave Analytics fails to load the entire record. In addition, if you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum, the value overflows and Wave Analytics returns an incorrect result.

**Date Handling in Datasets**

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

Wave Analytics generates the following date fields.
You can set metadata attributes to control how dates are loaded into datasets and to enable Wave Analytics to generate fiscal date fields. You set the metadata attributes in the sfdcDigest transformation parameters for Salesforce data or in the metadata file for external data.

**Important:** Before loading dates from an external data file, ensure that you review the date format requirements here. Also, ensure that the column names in the external data file do not conflict with the generated date field names. For example, if you load a CSV with column `Create_Date`, Wave Analytics generates the `Create_Date_Year` field in the dataset. If the CSV also had a field named `Create_Date_Year`, Wave Analytics would throw an error because the names conflict.

### Fiscal Periods in Wave Analytics

If the calendar and fiscal year differ, you can enable Wave Analytics to generate the fiscal date fields in the dataset in addition to calendar date fields. To enable Wave Analytics to generate fiscal date fields, set the `fiscalMonthOffset` attribute to a value other than '0'. You set this attribute for each date column for which you want to generate fiscal date fields. If you set the offset to '0' or you do not specify a value, Wave Analytics does not generate any fiscal date fields.

Additionally, to configure the fiscal periods, set the following metadata attributes for each date column:

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Field Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;date field name&gt;_Second</code></td>
<td>Text</td>
<td>Number of seconds. If the date contains no seconds, value is '0.'</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Minute</code></td>
<td>Text</td>
<td>Number of minutes. If the date contains no minutes, value is '0.'</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Hour</code></td>
<td>Text</td>
<td>Number of hours. If the date contains no hours, value is '0.'</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Day</code></td>
<td>Text</td>
<td>Day of the month.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Week</code></td>
<td>Text</td>
<td>Week number in calendar year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Month</code></td>
<td>Text</td>
<td>Month number in calendar year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Quarter</code></td>
<td>Text</td>
<td>Quarter number in calendar year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Year</code></td>
<td>Text</td>
<td>Calendar year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Week_Fiscal</code></td>
<td>Text</td>
<td>Week number in fiscal year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Month_Fiscal</code></td>
<td>Text</td>
<td>Month number in fiscal year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Quarter_Fiscal</code></td>
<td>Text</td>
<td>Quarter number in fiscal year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_Year_Fiscal</code></td>
<td>Text</td>
<td>Fiscal year.</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_sec_epoch</code></td>
<td>Numeric</td>
<td>Number of seconds that have elapsed since January 1, 1970 (midnight UTC).</td>
</tr>
<tr>
<td><code>&lt;date field name&gt;_day_epoch</code></td>
<td>Numeric</td>
<td>Number of days that have elapsed since January 1, 1970 (midnight UTC).</td>
</tr>
</tbody>
</table>
**fiscalMonthOffset**
In addition to enabling the generation of fiscal date fields, this attribute also determines the first month of the fiscal year. You specify the difference between the first month of the fiscal year and first month of the calendar year (January) in `fiscalMonthOffset`. For example, if your fiscal year begins in April, set `fiscalMonthOffset` to '3'.

**isYearEndFiscalYear**
Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year. The `isYearEndFiscalYear` attribute indicates whether the fiscal year is the year in which the fiscal year ends or begins.

To see how this works, let's look at a couple of examples. If `isYearEndFiscalYear = true` (or you do not specify this attribute), then the fiscal year is the year in which the fiscal year ends. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2016 because the fiscal year ends in 2016.

If `isYearEndFiscalYear = false`, then the fiscal year is the year in which the fiscal year begins. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2015 because the fiscal year begins in 2015.

**Week Numbering in Wave Analytics**
For each date loaded into a dataset, Wave Analytics generates the corresponding week number for the calendar year and, if applicable, fiscal year. Similar to the SOQL function `WEEK_IN_YEAR`, week 1 in Wave Analytics is January 1 - January 7. (This is different from the UTC `week()` calculation.)

If needed, you can configure the week to start on a particular day of the week by setting the `firstDayOfWeek` attribute. For example, if January 1 is a Saturday and you configure the week to start on a Monday, then week 1 is January 1 - 2. Week 2 starts on Monday, January 3. Week 3 starts January 10, the following Monday. Notice that week 1 can be a short week to ensure that the subsequent weeks start on the specified day of the week.

**Dataflow JSON**
You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A dataflow is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

Wave Analytics provides a default dataflow that contains some sample transformation logic. This dataflow is just a sample that you must configure before running it.
To configure the dataflow, you add transformations to the dataflow definition file. A dataflow definition file is a JSON file that contains transformations that represent the dataflow logic. You can add transformations to determine what data to extract, how to transform datasets, and which datasets to register to make available for queries.

After you configure the dataflow, you upload the new dataflow definition file to Wave Analytics.

By default, the dataflow doesn’t run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule. The dataflow runs on a daily schedule to capture the latest changes to Salesforce data and changes in the dataflow logic.

You can also stop, reschedule, and monitor dataflow jobs.

SEE ALSO:
Create Datasets with a Dataflow

Dataset Builder

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

After you select the data to include in the dataset, the dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs.

Create a Dataset with the Dataset Builder

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization’s private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

Install the Wave Connector Excel App

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics.

Upload External Data from the User Interface

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.
When Wave Analytics loads any data into a dataset, it also adds metadata about each column of data. For example, metadata can include the field type, precision, scale, and default value.

For external data, Wave Analytics infers metadata about each column of data in the external data file unless you specify different metadata attributes in a metadata file. A metadata file is a JSON file that describes the structure of an external data file. For example, you can use a metadata file to explicitly set the field type and default value for a specific column of external data. If no metadata file is provided when you upload external data, Wave Analytics treats every column as a dimension and sets the field type to 'Text.' This impacts the type of queries that can be placed on the dataset because you can’t perform mathematical calculations on dataset columns with a Text field type. You can only perform mathematical calculations on dataset columns with a Numeric field type.

After you create a dataset based on an external data file, you can edit the dataset to apply a new metadata file. This enables you to change the metadata attributes of each column.

**Note:** Wave temporarily stores the uploaded CSV and metadata files for processing only. After a dataset is created, Wave purges the files.

SEE ALSO:
- Create a Dataset with External Data

**External Data API**

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

For more information about the External Data API, see the *Wave Analytics External Data API Developer Guide*.

**Create Datasets with a Dataflow**

You can use a dataflow to create one or more datasets based on data from Salesforce objects or existing datasets.

1. **Design the Dataflow**
   Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

2. **Configure the Dataflow**
   Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

3. **Start and Stop a Dataflow**
   You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it’s running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

4. **Monitor a Dataflow Job**
   Use the data monitor to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

5. **Reschedule and Unschedule a Dataflow**
   After you run a dataflow job for the first time, it runs on a daily schedule, by default. You can change the time of the daily schedule or schedule it to run on an hourly interval. You might change the schedule to ensure that the data is available by a particular time or to run the job during non-business hours. You can also unschedule a dataflow.
Design the Dataflow

Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

To illustrate some key design decisions, let’s consider an example. In this example, the goal is to create a dataset called “Won Opportunities.” The dataset will contain opportunity details, including the account name for each opportunity.

To create this dataset, you design the following dataflow:

The dataflow extracts opportunity data from the Opportunity object and extracts the account name from the Account object. For each extracted object, the dataflow creates a new dataset.

The dataflow then transforms the datasets created from the extracted data. First, the dataflow joins the opportunity and account data into a new dataset. Next, the dataflow filters the records based on the opportunity stage so that the dataset contains only won opportunities. Each time the dataflow transforms a dataset, it creates a new dataset.

Finally, because you want users to be able to query won opportunities only, you configure the dataflow to register the final dataset only. However, if you wanted, you could register any dataset created by the dataflow and register as many datasets as you like.

Carefully choose which datasets to register because:

- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.
Configure the Dataflow

Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

A dataflow definition file is a JSON file that contains transformations that represent the dataflow logic. The dataflow definition file must be saved with UTF-8 encoding.

Before you can configure a dataflow to process external data, you must upload the external data to Wave Analytics.

1. In Wave Analytics, click the gear icon (⚙️) and then click Data Monitor to open the data monitor.
   The Jobs view of the data monitor appears by default.
2. Select Dataflow View.
3. To download the dataflow definition file, click Download in the actions list (1).
4. Make a backup copy of the dataflow definition file before you modify it.
   Wave Analytics doesn’t retain previous versions of the file. If you make a mistake, you can upload the previous version to roll back your changes.
5. Add transformations to the dataflow definition file.
   For example, based on the design in the previous step, you can add the following transformations:

   ```json
   "Extract Opportunities": {
     "action": "sfdcDigest",
     "parameters": {
       "object": "Opportunity",
       "fields": [
         { "name": "Id" },
         { "name": "Name" },
         { "name": "Amount" },
         { "name": "StageName" },
         { "name": "CloseDate" },
         { "name": "AccountId" },
         { "name": "OwnerId" }
       ]
     }
   }
   ```
Note: The JSON keys and values are case-sensitive. Each bolded key in the previous example JSON contains one action, which identifies the transformation type. The order in which you add the transformations to the dataflow definition file doesn’t matter. Wave Analytics determines the order in which to process the transformations by traversing the dataflow to determine the dependencies among them.

6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid. An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.

7. Save the dataflow definition file with UTF-8 encoding, and then close the file.

8. In the Dataflow view of the data monitor, click Upload from the action list (1) to upload the updated dataflow definition file.
Note: Uploading the dataflow definition file does not affect any running dataflow jobs and does not automatically start the dataflow job.

You can now start the dataflow on demand or wait for it to run on the schedule. Users cannot query the registered datasets until the dataflow runs.

Start and Stop a Dataflow

You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it’s running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

Note: By default, the dataflow doesn’t run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule.

1. In Wave Analytics, click the gear icon (⚙️) and then click Data Monitor to open the data monitor.
   The Jobs view of the data monitor appears by default.

2. Select Dataflow View.

3. Click Start in the actions list (1) to start the dataflow job.
   The dataflow job is added to the job queue. The Start button is greyed out while the dataflow job runs.

4. After the job completes, Wave Analytics sends an email notification to the user who last modified the dataflow definition file.
   The email notification indicates whether the job completed successfully. It also shows job details like start time, end time, duration, and number of processed rows. If the job failed, the notification shows the reason for the failure.

5. To stop a dataflow job that is currently running, click ✗ next to the job status.
   If you click Start to restart a stopped dataflow, the job starts over—the dataflow job does not resume from the point at which it was stopped.

You can monitor the dataflow job in the data monitor to determine when dataflow completes. After the dataflow completes successfully, refresh the Home page to view the registered datasets.
Monitor a Dataflow Job

Use the data monitor to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

The Dataflow view of the data monitor shows the status, start time, and duration of the last 10 dataflow jobs and retains the last 7 days of history. To help you troubleshoot a failed job, you can view error messages about the job and view the run-time details about every transformation that is processed.

1. In Wave Analytics, click the gear button (⚙️), and then click Data Monitor to open the data monitor. The Jobs view shows by default.
2. Select Dataflow View (1).
3. Click the Refresh Jobs button ( ⬠ ) to see the latest status of a job.

Each job can have one of the following statuses:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Running</td>
<td>The job is running.</td>
</tr>
<tr>
<td>Status</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>Failed</td>
<td>The job failed.</td>
</tr>
<tr>
<td>Successful</td>
<td>The job completed successfully.</td>
</tr>
</tbody>
</table>

4. If the dataflow job fails, expand the job node (3) and review the run-time details for every transformation that was processed.
5. If there’s a problem with the dataflow logic, edit the dataflow definition file, upload it, and then run the dataflow again.

Reschedule and Unschedule a Dataflow

After you run a dataflow job for the first time, it runs on a daily schedule, by default. You can change the time of the daily schedule or schedule it to run on an hourly interval. You might change the schedule to ensure that the data is available by a particular time or to run the job during non-business hours. You can also unschedule a dataflow.

1. In Wave Analytics, click the gear icon (⚙️) and then click Data Monitor to open the data monitor. The Jobs view shows by default.
2. Select Dataflow View.
3. Click Schedule in the actions list (1) to reschedule the dataflow job. The default daily schedule and start time appears.
4. To continue running it once per day, select the time that you’d like to start the dataflow job.
5. To run it on an hourly basis, select Hour(s) and then specify the interval details. Minute offset is the number of minutes past the hour to run the dataflow.
Hourly scheduled dataflows run relative to a fixed base time (00:00 UTC). For example, if you schedule a dataflow to run every 6 hours with a 15-minute offset, the dataflow is scheduled to run at 00:15 UTC, 06:15 UTC, 12:15 UTC, and 18:15 UTC, each day. The first dataflow run occurs at the next scheduled time. So, if you change the schedule at 04:00 UTC, the dataflow runs at the next scheduled time (06:15 UTC), and then every 6 hours thereafter. To keep things simple, the scheduler specifies the time of the first dataflow run (in your time zone), after you save the schedule.

6. Click **Save**.
   The Dataflow Schedule pop-up box specifies the next time, in your local time zone, that the dataflow runs.

7. Click **Done**.

8. To stop a dataflow from running on a schedule, select **Unschedule** in the action list (1).

### Transformations for Wave Dataflows

A **transformation** refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

For example, you can use transformations to join data from two related datasets and then register the resulting dataset to make it available for queries.

**append Transformation**

The append transformation combines records from multiple datasets into a single dataset.

**augment Transformation**

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

**computeExpression Transformation**

The computeExpression transformation enables you to add derived fields to a dataset. The values for derived fields aren’t extracted from the input data source. Instead, Wave generates the values using a SAQL expression, which can be based on one or more fields from the input data or other derived fields. For example, you can use an expression to assign a value to a field, concatenate text fields, or perform mathematical calculations on numeric fields.
**computeRelative Transformation**

You can use the computeRelative transformation to analyze trends in your data by adding derived fields to a dataset based on values in other rows. For example, to analyze sales pipeline trends, create derived fields that calculate the number of days an opportunity remains in each stage. You can also calculate the changes to the opportunity amount throughout the stages of the opportunity.

**delta Transformation**

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

**dim2mea Transformation**

The dim2mea transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don’t break if they use the dimension.

**edgemart Transformation**

The edgemart transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that it’s data can be used in subsequent transformations in the dataflow. You can use this transformation and the Augment transformation together to join an existing dataset with a new dataset.

**filter Transformation**

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

**flatten Transformation**

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

**sfdcDigest Transformation**

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren’t relevant for analysis.

**sfdcRegister Transformation**

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

**update Transformation**

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we’ll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

**Overriding Metadata Generated by a Transformation**

Optionally, you can override the metadata that is generated by a transformation. You can override object and field attributes. For example, you can change a field name that is extracted from a Salesforce object so that it appears differently in the dataset. To override the metadata, add the overrides to the Schema section of the transformation in the dataflow definition file.

SEE ALSO:

Create Datasets with a Dataflow
append Transformation

The append transformation combines records from multiple datasets into a single dataset.

Consider the following rules when using this transformation.

- This transformation does not remove duplicate records.
- All input datasets must have the same structure—the corresponding columns must be in the same order and have the same name and field type.

**Example:** Let’s look at an example. Each month, you create a dataset that contains the month’s sales targets. Now, you want a holistic view of sales targets for all months. To do that, you create the following dataflow definition file to merge the existing datasets into a single dataset.

```json
{
   "Extract_SalesTargets_2014Jan": {
      "action": "edgemart",
      "parameters": { "alias": "SalesTargets_2014Jan" }
   },
   "Extract_SalesTargets_2014Feb": {
      "action": "edgemart",
      "parameters": { "alias": "SalesTargets_2014Feb" }
   },
   "Extract_SalesTargets_2014Mar": {
      "action": "edgemart",
      "parameters": { "alias": "SalesTargets_2014Mar" }
   },
   "Append_SalesTargets_2014Quarter1": {
      "action": "append",
      "parameters": {
         "sources": [
            "Extract_SalesTargets_2014Jan",
            "Extract_SalesTargets_2014Feb",
            "Extract_SalesTargets_2014Mar"
         ]
      }
   },
   "Register_AllSalesTargets": {
      "action": "sfdcRegister",
      "parameters": {
         "alias": "AllSalesTargets",
         "name": "AllSalesTargets",
         "source": "Append_SalesTargets_2014Quarter1"
      }
   }
}
```

After you create the single dataset, you can use date filters to analyze the sales targets by month, quarter, or year.
append Parameters

When you define an append transformation, you set the action attribute to `append` and specify the parameters.

The following table describes the input parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>sources</td>
<td>Yes</td>
<td>Nodes in the dataflow definition file that identify the datasets that you want to merge.</td>
</tr>
</tbody>
</table>

SEE ALSO: append Transformation

augment Transformation

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

When you create the transformation, you identify each input dataset as the left or right dataset and specify the relationship between them. Wave Analytics combines all the columns of the left dataset with only the specified columns from the right dataset. (Keep in mind that each dataset can’t have more than 5,000 columns.) Wave Analytics adds the relationship to column names from the right dataset, which is useful when the left and right datasets have columns with the same names.

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. To match related records, the augment transformation uses a match condition. You specify the match condition based on a key from each dataset. For example:

```
"left_key": [ "Id" ],"right_key": [ "Prod_ID" ]
```

A key can be a single-column key or a composite key. For a match condition based on a composite key, the keys for both datasets must have the same number of columns, specified in the same order.

⚠️ Tip: To augment more than two datasets, augment two datasets at a time. For example, to augment three datasets, augment the first two datasets, and then augment the resulting dataset with the third dataset.

🔍 Example: Let’s look at an example of the augment transformation. In this example, you want to extract data from the Opportunity and Accounts objects, and then match the data based on the account ID field.
You create the following dataflow definition file.

```json
{
    "Extract_Opportunity": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
                { "name": "Id" },
                { "name": "Name" },
                { "name": "Amount" },
                { "name": "StageName" },
                { "name": "CloseDate" },
                { "name": "AccountId" },
                { "name": "OwnerId" }
            ]
        }
    },
    "Extract_AccountDetails": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Account",
            "fields": [
                { "name": "Id" },
                { "name": "Name" }
            ]
        }
    },
    "Augment_OpportunitiesWithAccountDetails": {
        "action": "augment",
        "parameters": {
            "operation": "LookupSingleValue",
            "left": "Extract_Opportunity",
            "left_key": [ "AccountId" ],
            "relationship": "OpptyAcct",
            "right": "Extract_AccountDetails",
            "right_key": [ "Id" ],
            "right_select": [ "Name" ]
        }
    }
}
```
After you run the dataflow, Wave Analytics creates and registers the Opportunity_Account dataset. It also adds the relationship as a prefix to all columns from the right dataset.

### Special Cases for Matching Records with the augment Transformation

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. However, it’s critical that you understand how the augment transformation handles special cases when matching records.

### augment Parameters

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

#### Handling Null Keys

When a record in the left dataset contains a null key, Wave Analytics doesn’t perform a lookup to match the record. Instead, Wave Analytics appends the right columns and inserts null for dimensions (including dates) and ‘0’ for measures.

Let’s look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.
Wave Analytics doesn’t match the last record because the product ID is null. Instead, Wave Analytics inserts a null for the Price.Pricebook dimension and ‘0’ for the Price.UnitPrice measure. Here’s the resulting dataset after the augment.

```
[ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
[ "id":null, "Name":"Bench", "Price.Pricebook":null, "Price.UnitPrice":0 }
```

Handling Empty Keys

Wave Analytics matches empty-value left keys and empty-value right keys.

Let’s look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the Id and ProdId fields.

Wave Analytics matches the last record in the Product dataset with the third record in the Price dataset because they both have empty values (""). Here’s the resulting dataset after the augment.

```
[ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
[ "id":null, "Name":"Bench", "Price.Pricebook":null, "Price.UnitPrice":800 }
```

Handling Non-Unique Keys

Although it’s recommended, the left key doesn’t have to be unique. If multiple records have the same left key, Wave Analytics creates the same values for the appended columns.

Let’s look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the Id and ProdId fields.
Wave Analytics matches the records in the Product dataset with records in the Price dataset. Here's the resulting dataset after the augment.

Handling No Match

If left key doesn't have a match in the right dataset, Wave Analytics appends the right columns and inserts null for dimensions (including dates) and '0' for measures.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the Id and ProdId fields.

Because no keys match, Wave Analytics doesn't match any records in the Product dataset with records in the Price dataset. Here's the resulting dataset after the augment.

Handling Multiple Matches

If the left dataset has a one-to-many relationship with the right dataset, Wave Analytics might find multiple matches for a left record. What Wave Analytics does with multiple matches depends on the specified augment operation. You can specify one of the following operations to handle the multiple-match case:

**LookupSingleValue**

The augment transformation returns results from a single row. Wave Analytics randomly selects one row from the list of matched rows.

*Note:* Each time you run the dataflow, Wave Analytics can return different results depending on the returned row.
Let’s look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to LookupSingleValue, and match the records based on the Id and ProdId fields.

<table>
<thead>
<tr>
<th>Product</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Id</td>
</tr>
<tr>
<td>Prod1</td>
<td></td>
</tr>
<tr>
<td>Prod2</td>
<td></td>
</tr>
<tr>
<td>Prod3</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Although there are multiple rows for Prod3 in the Price dataset, Wave Analytics randomly chooses one matching row and returns values based on that row. Here’s the resulting dataset after the augment if Wave Analytics chooses the first Prod3 row:

```
[ { "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
  { "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
  { "id":"Prod3", "Name":"Bench", "Price.Pricebook":"Custom", "Price.UnitPrice":300 }]
```

### LookupMultiValue

Wave Analytics returns results from all matched rows.

Let’s look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to LookupMultiValue, and match the records based on the Id and ProdId fields.

<table>
<thead>
<tr>
<th>Product</th>
<th>Price</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Id</td>
</tr>
<tr>
<td>Prod1</td>
<td></td>
</tr>
<tr>
<td>Prod2</td>
<td></td>
</tr>
<tr>
<td>Prod3</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Because the lookup returns multiple rows for Prod3, the dimension Price.Pricebook field in the resulting dataset becomes a multi-value field, showing all dimension values. The measure field Price.UnitPrice contains 1500, which is the sum of 800 and 700. Here’s the resulting dataset after the augment:

```
[ { "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
  { "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
```

**SEE ALSO:**

- augment Transformation
- augment Parameters

**augment Parameters**

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

The following table describes the input parameters.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
</table>
| operation    | No        | Indicates what the transformation does if it matches multiple rows in the right dataset with a row in the left. Valid values:  
|              |           | • LookupSingleValue. Returns values from one of the matched rows. If you don’t specify the operation parameter, the transformation uses this operation.  
|              |           | • LookupMultiValue. Returns values from all matched rows.  
|              |           | For more information about each operation, see Special Cases for Matching Records with the augment Transformation.                                                                                   |
| left         | Yes       | Node in the dataflow definition file that identifies the left dataset. This is one of two input sources for this transformation.                                                                      |
| left_key     | Yes       | Key column in the left dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order. For a composite key, use the following syntax:  
|              |           | [ "Key Column1", "Key Column2", …, "Key ColumnN" ]  
|              |           | ☢️ Note: The left or right key can’t be a multi-value field.                                                                                                                                       |
| right        | Yes       | Node in the dataflow definition file that identifies the right dataset. This is one of two input sources for this transformation.                                                                      |
| relationship | Yes       | Relationship between the left and right datasets. The dataflow adds the relationship to the beginning of the right column names in the output dataset to make the column names unique and descriptive. |
| right_select | Yes       | An array of column names from the right dataset that you want to include in the output dataset. The dataflow adds the relationship as a prefix to the column name to determine the name of the right column in the output dataset. |
**Value Required? Parameter**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>right_key</td>
<td>Yes</td>
<td>Key column in the right dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order.</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- augment Transformation

**computeExpression Transformation**

The computeExpression transformation enables you to add derived fields to a dataset. The values for derived fields aren’t extracted from the input data source. Instead, Wave generates the values using a SAQL expression, which can be based on one or more fields from the input data or other derived fields. For example, you can use an expression to assign a value to a field, concatenate text fields, or perform mathematical calculations on numeric fields.

**Note:** The computeExpression and computeRelative transformations are similar, but they have a key difference. The computeExpression transformation performs calculations based on other fields within the same row. The computeRelative transformation performs calculations based on the previous and next values of the same field in other rows.

Consider the following guidelines when creating a computeExpression transformation:

- You can include only the following SAQL operators and functions in the expression:
  - Arithmetic operators
  - Case operator
  - String operator
  - Date functions
- The values of the derived field must match its specified type. For example, set the type of the derived field to Text if the values are strings.
- Wave calculates the values of derived fields in the order in which they are listed in the JSON. Thus, if you create a derived field based on other derived fields in the same computeExpression transformation, the input derived fields must be listed first. For example, Derived_A must be listed before Derived_B in the following computeExpression transformation JSON snippet:

```json
"CreateDerivedFields": {
  "action": "computeExpression",
  "parameters": {
    "source": "sourceNode",
    "mergeWithSource": false,
    "computedFields": [
      {
        "name": "Derived_A",
        "type": "Text",
        "label": "Derived Field A",
        "saqlExpression": ""hello \"
      },
      {
        "name": "Derived_B",
        "type": "Text",
        "label": "Derived Field B Dependent on Field A",
```

3353
You can choose whether the resulting dataset includes only the derived fields, or includes the input and derived fields.

**Example**: Let’s look at an example. You want to create a dataset based on Salesforce opportunity data. You create a dataflow that extracts the Id and Amount fields from the Opportunity object. In addition, you also want to add the following derived fields to the dataset: ModifiedId, SalesTax, FinalPrice, and ValueCategory. For the derived fields, you will:

- Append “SFDC” to each opportunity Id to get a new modified Id.
- Calculate the sales tax based on an 8% tax rate.
- Calculate the final price by adding the amount and sales tax.
- Categorize opportunities into low-, medium-, and high-value buckets based on the calculated final price.

You create the following dataflow definition.

```json
{
  "salesData": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        {"name": "Amount"},
        {"name": "Id"}]
    }
  },
  "Derived_Fields": {
    "action": "computeExpression",
    "parameters": {
      "source": "salesData",
      "mergeWithSource": true,
      "computedFields": [
        {
          "name": "ModifiedId",
          "type": "Text",
          "saqlExpression": "\"SFDC\" + Id"},
        {
          "name": "SalesTax",
          "type": "Numeric",
          "precision": 18,
          "defaultValue": "0",
          "scale": 5,
          "saqlExpression": "Amount * 0.08"},
        {
          "name": "FinalPrice",
          "type": "Numeric",
          "precision": 18,
          "defaultValue": "0",
          "scale": 5,
          "saqlExpression": "Amount + SalesTax"},
        {
          "name": "ValueCategory",
          "type": "Text",
          "saqlExpression": ""
      ]
    }
  }
}
```
**computeExpression Parameters**

When you define a computeExpression transformation, you set the action attribute to `computeExpression`. You also specify the parameters for the input source and the expression used to generate the values.

**Parameters**

The following table describes the parameters in the `parameters` section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Yes</td>
<td>Node in the dataflow definition file that identifies the input source for this transformation.</td>
</tr>
<tr>
<td>mergeWithSource</td>
<td>No</td>
<td>Indicates whether the input fields are included with the derived fields in the resulting dataset. When true, the resulting dataset contains all input fields from the source and the newly generated derived fields. When false, the resulting dataset contains the derived fields only. Default is true.</td>
</tr>
<tr>
<td>computedFields</td>
<td>Yes</td>
<td>Attributes and expression used to generate derived fields in the dataset. See <code>computedFields</code>.</td>
</tr>
</tbody>
</table>
computedFields

The following table describes the attributes in the `computedFields` section. It also describes optional attributes that you can provide to override the field metadata to make the data appear differently in a dataset. For example, Wave can replace null values in a field with a default value.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Yes</td>
<td>API name of the generated field.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: The API names must be unique. Otherwise, the dataflow fails to run.</td>
</tr>
<tr>
<td>type</td>
<td>Yes</td>
<td>Wave Analytics field type associated with the field. Valid types are Text, Numeric, or Date.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;type&quot;: &quot;Text&quot;</td>
</tr>
<tr>
<td>label</td>
<td>No</td>
<td>The display name of the generated field that appears in the Wave user interface. Can be up to 255 characters. Defaults to input field name if not specified.</td>
</tr>
<tr>
<td>saqlExpression</td>
<td>Yes</td>
<td>SAQL expression used to calculate the value for the derived field. The expression can be based on input fields or other derived fields in the transformation.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;saqlExpression&quot;: &quot;toDate(birth_day, &quot;yyyy-M-d&quot;)&quot;</td>
</tr>
<tr>
<td>format</td>
<td>Yes (for Date fields only)</td>
<td>Format of the derived date field. For information about formats, see the External Data Format Reference.</td>
</tr>
<tr>
<td>precision</td>
<td>Yes (for Numeric fields only)</td>
<td>The maximum number of digits in a numeric value, or the length of a text value. For numeric values: Includes all numbers to the left and to the right of the decimal point (but excludes the decimal point character). Value must be between 1 and 18, inclusive. For text values: Value defaults to 255 characters, and must be between 1 and 32,000 characters, inclusive.</td>
</tr>
</tbody>
</table>
### Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
</table>
| precision | Yes (for Numeric fields only) | Example: 
"precision": 10 |
| scale     | Yes (for Numeric fields only) | The number of digits to the right of the decimal point in a numeric value. Must be less than the precision value. Value must be between 0 and 17 characters, inclusive. Example: 
"scale": 2 |
| defaultValue | No | For text and numeric fields that can be null. Default value that replaces a null value for the specified field. |

- [computeExpression Transformation](#)
- [computeRelative Transformation](#)

### computeRelative Transformation

You can use the computeRelative transformation to analyze trends in your data by adding derived fields to a dataset based on values in other rows. For example, to analyze sales pipeline trends, create derived fields that calculate the number of days an opportunity remains in each stage. You can also calculate the changes to the opportunity amount throughout the stages of the opportunity.

**Note:** The computeExpression and computeRelative transformations are similar, but the computeExpression transformation performs calculations based on fields within the same row. The computeRelative transformation performs calculations based on the same field in other rows—particularly the current, first, previous, or next rows.

When you define a computeRelative transformation, you specify an sfdcDigest transformation as the input, partition the records, and sort the records within each partition. For example, you can use sfdcDigest to extract opportunity history records, and then use computeRelative to calculate changes in each opportunity over time. You can partition opportunity records by opportunity ID, and then chronologically sort records within each partition to correctly identify the previous and next values.

Wave processes the computeRelative transformation differently than other transformations. Wave merges the logic from this transformation into the associated sfdcDigest transformation. As a result, you don’t have to register the computeRelative transformation to add the derived fields to the final dataset. Instead, register only sfdcDigest—the registered dataset has fields from both transformations. For example, the sfdcDigest transformation extracts data from three fields (Id, CloseDate, and Amount). The computeRelative transformation generates two derived fields (PreviousCloseDate and PreviousAmount). The resulting dataset contains all five columns.

Consider the following guidelines when creating a computeRelative transformation.

- This transformation supports only the sfdcDigest node as input—you can’t use any other transformation node as input.
- Specify this transformation directly after the associated input sfdcDigest transformation in the dataflow JSON.
- You can use this transformation to analyze trends in Salesforce data, not external data.
- You can use this transformation in a replication dataflow. For more information about replication, see [Getting Started with Wave Replication Tipsheet](#).
Example: Let’s look at an example. To perform trending analysis on the sales pipeline, create a dataflow that contains the following transformations.

**sfdcDigest transformation**
Extracts the following data from the OpportunityHistory object.

<table>
<thead>
<tr>
<th>OpportunityHistory Object</th>
</tr>
</thead>
<tbody>
<tr>
<td>OpportunityId</td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>00500000003ahkAM</td>
</tr>
<tr>
<td>006000000009jaAD</td>
</tr>
<tr>
<td>006000000009jaAD</td>
</tr>
<tr>
<td>006000000009jaAD</td>
</tr>
<tr>
<td>006000000009jaAD</td>
</tr>
<tr>
<td>006000000009jaAD</td>
</tr>
<tr>
<td>006000000009jaAD</td>
</tr>
<tr>
<td>006000000009jaAD</td>
</tr>
</tbody>
</table>

**computeRelative transformation**
Performs the following tasks:

- Partitions the extracted records by opportunity ID.
- Within each partition, sorts the extracted records by CreatedDate in ascending order. Sorting by CreatedDate ensures that the changes that occur for each opportunity are listed in chronological order.
- Adds the following derived fields to the final dataset.

  - **OpportunityCreatedDate**
    Determines the date that the opportunity was first created. You can use this date with the actual close date to determine the number of days required to close the sale. The goal is to shorten the sales cycle to recognize revenue.

  - **ValidToDate**
    Determines the date to which the state of the opportunity is valid. You can use this field to determine the time period for which the opportunity details are valid in each record.

  - **AmountPrev**
    Determines the previous amount of the opportunity. You can use this field to determine if the values of opportunities are increasing or decreasing, which can affect whether you hit your sales targets.

  - **CloseDatePrev**
    Determines the previous expected close date for the opportunity. You can use this field to analyze how the expected close date changes over the sales cycle of the opportunity. If the expected close date keeps getting pushed out, identify the issues that are causing the longer sales cycle.

**sfdcRegister transformation**
Registers the final dataset that contains the extracted fields from the sfdcDigest transformation and the derived fields from computeRelative transformation. You apply sfdcRegister on sfdcDigest to get the fields from both transformations.

You create the following dataflow definition.

```json
{
  "extractOppHistory": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityHistory",
      "fields": [  
```
{"name": "OpportunityId"},
{"name": "CreatedDate"},
{"name": "StageName"},
{"name": "Amount"},
{"name": "CloseDate"}
]
}
"computeTrending": {
"action": "computeRelative",
"parameters": {
"partitionBy": "OpportunityId",
"orderBy": [
{
"name": "CreatedDate",
"direction": "asc"
}
],
"computedFields": [
{"name": "OpportunityCreatedDate", "expression": {
"sourceField": "CreatedDate",
"offset": "first()",
"default": "current()"
}
},
{"name": "ValidToDate", "expression": {
"sourceField": "CreatedDate",
"offset": "next()",
"default": "3000-01-01T00:00:00.000Z"
}
},
{"name": "AmountPrev", "expression": {
"sourceField": "Amount",
"offset": "previous()",
"default": "0"
}
},
{"name": "CloseDatePrev", "expression": {
"sourceField": "CloseDate",
"offset": "previous()",
"default": "01/01/1970"
}
}
],
"source": "extractOppHistory"}
The dataflow runs and creates the following dataset.

Notice that Wave partitions the records by opportunity ID and then sorts the records in ascending order based on the CreatedDate field within each partition. Wave can now use the previous and next rows within each partition to determine changes in field values in the dataset.

**computeRelative Parameters**

When you define a computeRelative transformation, you set the action attribute to `computeRelative`. You also specify the parameters for the input source, partition-by field, sort field, and derived field definitions.

**computeRelative Parameters**

When you define a computeRelative transformation, you set the action attribute to `computeRelative`. You also specify the parameters for the input source, partition-by field, sort field, and derived field definitions.

You can specify parameters in the following sections of the computeRelative node.

**Parameters**

The following table describes the parameters in the `parameters` section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>source</td>
<td>Yes</td>
<td>sfdcDigest node in the dataflow definition file that identifies the input source for this transformation.</td>
</tr>
<tr>
<td>partitionBy</td>
<td>Yes</td>
<td>API name of the field used to partition the records in the dataset. Specify one and only one partition-by field.</td>
</tr>
</tbody>
</table>
### orderBy

Field used to sort the records within each partition and the sort order: ascending (**asc**) or descending (**dsc**). Specify one and only one sort field.

**Example:**

```json
"orderBy": [
  {
    "name": "CreatedDate",
    "direction": "asc"
  }
]
```

### computedFields

A list of definitions for derived fields.

**Example:**

```json
"computedFields": [
  {
    "name": "OpportunityCreatedDate",
    "expression": {
      "sourceField": "CreatedDate",
      "offset": "first()",
      "default": "current()"
    }
  },
  {
    "name": "AmountPrev",
    "expression": {
      "sourceField": "Amount",
      "offset": "previous()",
      "default": "0"
    }
  }
]
```

See computedFields.

### computedFields

The following table describes the attributes in the `computedFields` section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Yes</td>
<td>API name of the derived field to add to the dataset. The name must be unique in the dataset.</td>
</tr>
</tbody>
</table>

**Note:** If the name is not unique, the dataflow fails to run.
### ValueRequired?Parameter

Expression attributes used to calculate the value for the derived field. The expression can be based on input fields or other derived fields in the transformation.

Example:

```json
"expression": {
  "sourceField": "CloseDate",
  "offset": "previous()",
  "default": "01/01/1970"
}
```

See expression.

### expression

The following table describes the attributes in the expression section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>sourceField</td>
<td>Yes</td>
<td>API name of the input field from the sfdcDigest transformation that’s used in the expression.</td>
</tr>
<tr>
<td>offset</td>
<td>Yes</td>
<td>The function used in the expression. You can use the following functions:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>current()</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Gets the value from the current record.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;offset&quot;: &quot;current()&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>first()</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Gets the value from the first record in the partition, like the first CreateDate for an opportunity.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;offset&quot;: &quot;first()&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>next()</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Gets the value from the next record.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;offset&quot;: &quot;next()&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>previous()</strong></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Gets the value from the previous record.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;offset&quot;: &quot;previous()&quot;</td>
</tr>
</tbody>
</table>
**Value**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong>: Derived fields are computed in the order that they're defined. The calculation of a derived field can be based on the value from another derived field as long as it has already been defined. For example, <code>next()</code> can't access the value of a derived field in the next row.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Tip</strong>: To get the correct results when using the <code>previous()</code> and <code>next()</code> functions, the <code>computeRelative</code> transformation requires you to sort the records.</td>
</tr>
</tbody>
</table>
| default   | Yes (for numeric fields only) | The default value if one can't be calculated. For example, you can specify a default value when no previous or next value exists. You can insert a constant value or `current()` as a default value.  
Examples:  
```json"default": "3000-01-01T00:00:00.000Z"```
```json"default": "current()"``` |

**delta Transformation**

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

The delta transformation calculates each delta value by comparing the value in each record with the value in the previous record. Because records might not be sorted, the delta transformation orders the records before computing the delta values. To do this, the transformation sorts the data by the specified dimension, and then by the specified epoch date column.

**Note**: When Wave Analytics processes dates, it creates the following epoch date columns for each date processed:

<table>
<thead>
<tr>
<th>Epoch Time Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;date_column_name&gt;_sec_epoch</code></td>
<td>For example, if the date column is CloseDate, the generated epoch second column is CloseDate_sec_epoch. This column provides the number of seconds that have elapsed since January 1, 1970 (midnight UTC/GMT).</td>
</tr>
<tr>
<td><code>&lt;date_column_name&gt;_day_epoch</code></td>
<td>For example, if the date column is CloseDate, the generated epoch day column is CloseDate_day_epoch. This column provides the number of days that have elapsed since January 1, 1970 (midnight UTC/GMT).</td>
</tr>
</tbody>
</table>

**Example**: Let's look at an example. You want to create an OppHistoryDelta dataset that contains opportunity history from the OpportunityHistory object and also calculates the deltas for opportunity amounts.

The OpportunityHistory object contains the following data.
### Opportunity History

<table>
<thead>
<tr>
<th>OpportunityId</th>
<th>CloseDate</th>
<th>StageName</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/1/2014</td>
<td>New</td>
<td>100</td>
</tr>
<tr>
<td>2</td>
<td>1/1/2014</td>
<td>New</td>
<td>100</td>
</tr>
<tr>
<td>2</td>
<td>2/1/2014</td>
<td>ClosedWon</td>
<td>200</td>
</tr>
<tr>
<td>1</td>
<td>3/1/2014</td>
<td>ClosedWon</td>
<td>100</td>
</tr>
</tbody>
</table>

You create the following dataflow definition.

```json

{
    "Extract_Opportunities": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "OpportunityHistory",
            "fields": [
                { "name": "OpportunityId" },
                { "name": "CloseDate" },
                { "name": "StageName" },
                { "name": "Amount" }
            ]
        }
    },
    "Calculate_Delta": {
        "action": "delta",
        "parameters": {
            "dimension": "OpportunityId",
            "epoch": "CloseDate_day_epoch",
            "inputMeasure": "Amount",
            "outputMeasure": "DeltaAmount",
            "source": "Extract_Opportunities"
        }
    },
    "Register_Dataset": {
        "action": "sfdcRegister",
        "parameters": {
            "alias": "OppHistoryDelta",
            "name": "OppHistoryDelta",
            "source": "Calculate_Delta"
        }
    }
}
```

To calculate the delta values for each opportunity amount, the delta transformation sorts the records by the dimension (OpportunityId) first, and then by time (CloseDate_day_epoch) as shown here.

<table>
<thead>
<tr>
<th>OpportunityId</th>
<th>CloseDate</th>
<th>StageName</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/1/2014</td>
<td>New</td>
<td>100</td>
</tr>
<tr>
<td>1</td>
<td>3/1/2014</td>
<td>ClosedWon</td>
<td>100</td>
</tr>
</tbody>
</table>
After the records are sorted, for each dimension (OpportunityId), the transformation compares the previous value to the next value to determine the delta for each record. The transformation creates the following dataset.

<table>
<thead>
<tr>
<th>OpportunityId</th>
<th>CloseDate</th>
<th>StageName</th>
<th>Amount</th>
<th>DeltaAmount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/1/2014</td>
<td>New</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>3/1/2014</td>
<td>ClosedWon</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>1/1/2014</td>
<td>New</td>
<td>100</td>
<td>0</td>
</tr>
<tr>
<td>2</td>
<td>2/1/2014</td>
<td>ClosedWon</td>
<td>200</td>
<td>100</td>
</tr>
</tbody>
</table>

For the first record of each dimension, the transformation inserts '0' for the delta value.

Note: If an opportunity contains multiple changes on the same day, you must sort the records on a shorter time interval. In this case, sort on CloseDate_sec_epoch column. Otherwise, records might not be sorted correctly, which means delta values will be incorrect.

**delta Parameters**

When you define a delta transformation, you set the action attribute to `delta` and specify the parameters.

The following table describes the input parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension</td>
<td>Yes</td>
<td>Dimension column in the dataset used to sort records when calculating the delta values.</td>
</tr>
<tr>
<td>epoch</td>
<td>Yes</td>
<td>Epoch date column in the dataset used to sort records within each dimension when calculating delta values.</td>
</tr>
<tr>
<td>inputMeasure</td>
<td>Yes</td>
<td>Measure column on which you want to calculate the delta.</td>
</tr>
<tr>
<td>outputMeasure</td>
<td>Yes</td>
<td>Name of the output column that contains the delta value.</td>
</tr>
</tbody>
</table>
Value Required? Parameter
Node in the dataflow definition file that contains the dataset to which you want to add the delta column.

SEE ALSO:
- delta Transformation
- dim2mea Transformation

The `dim2mea` transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don’t break if they use the dimension.

If the transformation cannot create a measure from a dimension, the transformation populates the measure with the specified default value. If no default value is provided, the transformation inserts ‘0’.

Example: Let’s look at an example. Your Opportunity object contains a custom text field called `StageVal__c`, which contains the opportunity amount at a particular stage. Because this is a text field, Wave Analytics loads this data as a dimension. However, you’d like to create a measure from this dimension to enable users to perform calculations on stage amount.

You create the following dataflow definition.

```json
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "StageVal__c" }
      ]
    }
  },
  "Create_Measure_From_Dimension": {
    "action": "dim2mea",
    "parameters": {
      "dimension": "StageVal__c",
      "measure": "StageValue",
      "measureDefault": "0",
      "measureType": "long",
      "source": "Extract_Opportunities"
    }
  },
  "Register_The_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
```
dim2mea Parameters
When you define a dim2mea transformation, you set the action attribute to dim2mea and specify the parameters.

The following table describes the input parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>dimension</td>
<td>Yes</td>
<td>Dimension column in the dataset from which you want to create the measure.</td>
</tr>
<tr>
<td>measure</td>
<td>Yes</td>
<td>Name of the output measure. This column name must be unique within the dataset. Do not use the same name as the dimension because the transformation preserves the dimension in the dataset.</td>
</tr>
<tr>
<td>measureDefault</td>
<td>Yes</td>
<td>Default value for the measure if the transformation is unable to create a measure from a dimension.</td>
</tr>
<tr>
<td>measureType</td>
<td>Yes</td>
<td>Type of measure. Valid value: &quot;long&quot;</td>
</tr>
<tr>
<td>source</td>
<td>Yes</td>
<td>Node in the dataflow definition file that contains the dataset to which you want to add the measure.</td>
</tr>
</tbody>
</table>

- dim2mea Transformation
- edgemart Transformation

edgemart Transformation
The edgemart transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that it’s data can be used in subsequent transformations in the dataflow. You can use this transformation and the Augment transformation together to join an existing dataset with a new dataset.
Example: Let’s look at an example. You would like to compare the final sales amount against the opportunity amount to determine if heavy discounts were offered to close deals. You previously created and registered the FinalSales dataset. The FinalSales dataset contains the final sale amount of each opportunity that was closed and won.

Table 49: FinalSales Dataset

<table>
<thead>
<tr>
<th>OppID</th>
<th>UpdateDate</th>
<th>StageName</th>
<th>SaleAmount</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1/1/2014</td>
<td>ClosedWon</td>
<td>100,000</td>
</tr>
<tr>
<td>2</td>
<td>11/1/2013</td>
<td>ClosedWon</td>
<td>150,000</td>
</tr>
<tr>
<td>3</td>
<td>2/1/2014</td>
<td>ClosedWon</td>
<td>200,000</td>
</tr>
</tbody>
</table>

You would now like to create a dataset that contains opportunity information from the Opportunity object. Then, you would like to join the data from the existing FinalSales dataset with the Opportunity dataset.

You create the following dataflow definition.

```json
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" }
      ]
    }
  },
  "Extract_Final_Sales_Data": {
    "action": "edgemart",
    "parameters": { "alias": "FinalSales" }
  },
  "Combine_Opportunities_FinalSales": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunities",
      "left_key": [ "Id" ],
      "relationship": "Opportunity",
      "right": "Extract_Final_Sales_Data",
      "right_key": [ "OppID" ],
      "right_select": [ "SaleAmount" ]
    }
  },
  "Register_Opportunity_FinalSales_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OpportunityVersusFinalSales",
      "name": "OpportunityVersusFinalSales",
      "source": "Combine_Opportunities_FinalSales"
    }
  }
}
```
edgemart Parameters

When you define an edgemart transformation, you set the action attribute to `edgemart` and specify the parameters.

The following table describes the input parameter:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Yes</td>
<td>API name of the dataset from which you want to extract data. To determine the API name of a dataset, edit the dataset and view the system name.</td>
</tr>
</tbody>
</table>

SEE ALSO:

edgemart Transformation

filter Transformation

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

Example: Let’s look at an example. You would like to create a dataset that contains only opportunities that were Closed Won. First, you extract all opportunities from the Opportunity object. Next, you filter the records so that you only include opportunities with a Closed Won stage name.

You create the following dataflow definition.

```json
{
    "Extract_Opportunities": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
            { "name": "Id" },
            { "name": "Name" },
            { "name": "Amount" },
            { "name": "StageName" },
            { "name": "CloseDate" },
            { "name": "AccountId" },
            { "name": "OwnerId" }
            ]
        }
    },
    "Filter_Opportunities": {
        "action": "filter",
        "parameters": {
            "filter": "StageName:EQ:Closed Won",
            "source": "Extract_Opportunities"
        }
    }
}
```
"Register_My_Won_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "MyWonOpportunities",
    "name": "MyWonOpportunities",
    "source": "Filter_Opportunities"
  }
}

filter Parameters
When you define a filter transformation, you set the action attribute to filter and specify the parameters.

filter Expression Syntax
You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

filter Parameters
When you define a filter transformation, you set the action attribute to filter and specify the parameters.

The following table describes the input parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>filter</td>
<td>Yes</td>
<td>Filter expression that specifies which records to include in the new dataset. See filter Expression Syntax.</td>
</tr>
<tr>
<td>source</td>
<td>Yes</td>
<td>Node in the dataflow definition file that contains the dataset that you want to filter.</td>
</tr>
</tbody>
</table>

SEE ALSO:
filter Transformation

filter Expression Syntax
You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

Note: String comparisons in a filter expression are case-sensitive.

You can use the following types of filter expressions:

<table>
<thead>
<tr>
<th>Filter Expression Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dim:EQ:value</td>
<td>True if the dimension and value are equal. Example: &quot;filter&quot;: &quot;StageName:EQ:Closed Won&quot;</td>
</tr>
<tr>
<td>dim:R:val0:val1</td>
<td>True if the left dimension falls within the specified range between val0 and val1.</td>
</tr>
<tr>
<td>Filter Expression Syntax</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>**dim:**R:val</td>
<td>True if the dimension is greater than or equal to the value based on binary sort order. For example, this is true when the dimension is 'City' and the value is 'Anderson' because 'City' &gt; 'Anderson'). Example: &quot;filter&quot;: &quot;EmployeeId:R:100:1000&quot;</td>
</tr>
<tr>
<td>**dim:**R:val</td>
<td>True if the dimension is less than or equal to the value based on binary sort order. Example: &quot;filter&quot;: &quot;LastName:R::Levy&quot;</td>
</tr>
<tr>
<td>**dim:**N:val</td>
<td>True if the dimension and value are not equal. Example: &quot;filter&quot;: &quot;RoleName:N:Manager&quot;</td>
</tr>
<tr>
<td>**dim:**EQ:val1</td>
<td>val2</td>
</tr>
<tr>
<td>**dim1:**EQ:val1, **dim2:**EQ:val2</td>
<td>True if dimension dim1 equals value val1 and dimension dim2 equals value val2. This filter expression uses the logical AND operator ( , ). You can compare more than two dimensions. For example, to compare three dimensions, use the following syntax: dim1:EQ:val1,dim2:EQ:val2,dim3:EQ:val3. Example: &quot;filter&quot;: &quot;Lead Status:EQ:Qualified,Rating:EQ:Hot&quot;</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- filter Transformation
- flatten Transformation

**flatten Transformation**

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

When you configure the flatten transformation to flatten a hierarchy, you specify the field that contains every node in the hierarchy and the field that contains their corresponding parent based on the hierarchy. The flatten transformation generates one record for each hierarchy node, which we refer to as the “self ID.” Each record contains two generated columns that store the hierarchy for each self ID node. One column contains a comma-separated list of all ancestors for each node in the hierarchy. The other column contains the hierarchy path.
See the Roles and RolePath columns in the following flattened dataset to see how ancestors are stored.

<table>
<thead>
<tr>
<th>Role ID (Self ID)</th>
<th>Role Name</th>
<th>Parent Role ID</th>
<th>Roles</th>
<th>RolePath</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Salesperson 1</td>
<td>10</td>
<td>10, 20, 30</td>
<td>\10\20\30</td>
</tr>
<tr>
<td>2</td>
<td>Salesperson 2</td>
<td>10</td>
<td>10, 20, 30</td>
<td>\10\20\30</td>
</tr>
<tr>
<td>3</td>
<td>Salesperson 3</td>
<td>11</td>
<td>11, 20, 30</td>
<td>\11\20\30</td>
</tr>
<tr>
<td>10</td>
<td>Regional Manager 1</td>
<td>20</td>
<td>20, 30</td>
<td>\20\30</td>
</tr>
<tr>
<td>11</td>
<td>Regional Manager 2</td>
<td>20</td>
<td>20, 30</td>
<td>\20\30</td>
</tr>
<tr>
<td>20</td>
<td>Vice President 1</td>
<td>30</td>
<td>30</td>
<td>\30</td>
</tr>
<tr>
<td>21</td>
<td>Vice President 2</td>
<td>30</td>
<td>30</td>
<td>\30</td>
</tr>
<tr>
<td>30</td>
<td>CEO</td>
<td>Not applicable</td>
<td>Not applicable</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

You can also configure the flatten transformation to include the self ID node in the generated hierarchy columns. The following dataset shows the self ID in bold.

<table>
<thead>
<tr>
<th>Role ID (Self ID)</th>
<th>Role Name</th>
<th>Parent Role ID</th>
<th>Roles</th>
<th>RolePath</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Salesperson 1</td>
<td>10</td>
<td><strong>1, 10, 20, 30</strong></td>
<td><strong>\11\10\20\30</strong></td>
</tr>
<tr>
<td>2</td>
<td>Salesperson 2</td>
<td>10</td>
<td><strong>2,10, 20, 30</strong></td>
<td><strong>\21\10\20\30</strong></td>
</tr>
<tr>
<td>3</td>
<td>Salesperson 3</td>
<td>11</td>
<td><strong>3,11, 20, 30</strong></td>
<td><strong>\31\11\20\30</strong></td>
</tr>
<tr>
<td>10</td>
<td>Regional Manager 1</td>
<td>20</td>
<td><strong>10,20, 30</strong></td>
<td><strong>\10\20\30</strong></td>
</tr>
<tr>
<td>11</td>
<td>Regional Manager 2</td>
<td>20</td>
<td><strong>11,20, 30</strong></td>
<td><strong>\11\20\30</strong></td>
</tr>
<tr>
<td>20</td>
<td>Vice President 1</td>
<td>30</td>
<td><strong>20,30</strong></td>
<td><strong>\20\30</strong></td>
</tr>
<tr>
<td>21</td>
<td>Vice President 2</td>
<td>30</td>
<td><strong>21,30</strong></td>
<td><strong>\21\30</strong></td>
</tr>
<tr>
<td>30</td>
<td>CEO</td>
<td>Not applicable</td>
<td><strong>30</strong></td>
<td><strong>30</strong></td>
</tr>
</tbody>
</table>

**Example**: Let’s look at an example. You want to create a dataset that contains all opportunities. For each opportunity, you want to include user and role information about the opportunity owner. Also, to implement row-level security based on the role hierarchy, each opportunity record must also contain a list of all ancestors above each opportunity owner based on the role hierarchy. To generate the list of ancestors, use the flatten transformation to flatten the role hierarchy.

You create the following dataflow definition file:

```json
{
    "Extract_Opportunity": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
```
To flatten the Salesforce role hierarchy, the flatten transformation uses the following input fields from the UserRole object.

**Id**

Id identifies each node in the Salesforce role hierarchy.

**ParentRoleId**

ParentRoleId identifies the parent as defined in the role hierarchy.

After traversing through each parent-child relationship in the UserRole object, the flatten transformation generates one record for each role ID. Each record contains all ancestor roles for each role in the hierarchy. The flatten transformation generates two output columns—Roles and RolePath—to store all ancestor roles for each role.

**flatten Parameters**

When you define a flatten transformation, you set the action attribute to `flatten` and specify the parameters.
The following table describes the input parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>include_self_id</td>
<td>No</td>
<td>Indicates whether to include the self ID node in the generated multi_field and path_field columns. Valid values are false (default) and true.</td>
</tr>
<tr>
<td>self_field</td>
<td>Yes</td>
<td>Name of the input field that identifies each node in the hierarchy.</td>
</tr>
<tr>
<td>parent_field</td>
<td>Yes</td>
<td>Name of the input field that identifies the direct parent of each node in the hierarchy. For example, the Regional Manager 1 role is the parent of the Salesperson 1 role in a role hierarchy.</td>
</tr>
<tr>
<td>multi_field</td>
<td>Yes</td>
<td>Name of the multi-value output field that contains a list of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the list of ancestors for each node in the hierarchy. For example, for Salesperson 1 role, the hierarchy of ancestors is: Sales Manager 1, Regional Manager 1, Vice President 1, CEO.</td>
</tr>
<tr>
<td>path_field</td>
<td>Yes</td>
<td>A string representation of the multi-field field, separated by backslashes. This output field contains the hierarchical path of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the ancestry path for each node in the hierarchy. For example, for a salesperson role in a role hierarchy, the value is: Sales Manager 1\Regional Manager 1\Vice President 1\CEO.</td>
</tr>
<tr>
<td>source</td>
<td>Yes</td>
<td>Node in the dataflow definition file that contains the hierarchical data that you want to flatten. This node is the input source for this transformation and it must contain the input fields mapped to self_field and parent_field.</td>
</tr>
</tbody>
</table>

**Note:** By default, the multi_field and path_field fields are created as system fields, which aren’t visible in the user interface. To make the fields appear in the user interface, set the IsSystemField metadata attribute to false for each field in the flatten transformation. For more information about metadata attributes, see Overriding Metadata Generated by a Transformation.

SEE ALSO:
- flatten Transformation
- sfdcDigest Transformation

**sfdcDigest Transformation**

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren’t relevant for analysis.
When you upload the dataflow definition file, Wave Analytics validates access to Salesforce objects and fields based on the user profile of the user who uploads the file. If the user profile does not have read access to a field or object, the upload fails.

At run time, Wave Analytics runs the dataflow as the Integration User. Wave Analytics validates access to Salesforce objects and fields based on the user profile of the Integration User. For example, if the dataflow tries to extract data from a custom field on which the Integration User does not have read access, the dataflow job fails.

Note: The Integration User is a preconfigured user that is created when Wave Analytics is enabled in your organization. If you or the Integration User need permission on a Salesforce object or field, ask the administrator to grant access.

For more information about preconfigured users in Wave Analytics, see the *Wave Analytics Security Implementation Guide*.

Example: Let’s look at an example. You would like to create a dataset that contains all opportunities from the Opportunity object. You create the following dataflow definition.

```json
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" },
        { "name": "OpportunitySupportTeamMembers__c" }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}
```

Tips for Using the sfdcDigest Transformation

- Be selective when choosing fields because a dataset can contain a maximum of 5,000 fields.
- To extract data from a Salesforce object, the sfdcDigest transformation runs a SOQL query. The length of the SOQL query cannot exceed 20,000 characters. No results are returned if the SOQL query exceeds the maximum. To reduce the SOQL query length, break up the extract into two or more sfdcDigest transformations and then use the augment transformation to combine the results. For example, you might create one sfdcDigest transformation to extract the half of the fields and create another sfdcDigest transformation to extract the remaining fields.
Extracting Incremental Changes to Data (Pilot)
You can configure the sfcdDigest transformation to extract only records that changed in a Salesforce object since the last dataflow run. Use incremental extraction to decrease the time required to extract the data.

Filtering Records Extracted from a Salesforce Object
Add a filter to the sfcdDigest transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.

Overriding Salesforce Field Metadata
You can override the field metadata that the sfcdDigest transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

Unsupported Salesforce Objects and Fields in Wave
The sfcdDigest transformation can’t extract data from all Salesforce objects and fields. Consider these limitations before configuring the extraction of Salesforce objects.

sfcdDigest Parameters
When you define an sfcdDigest transformation, you set the action attribute to sfcdDigest and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

Extracting Incremental Changes to Data (Pilot)
You can configure the sfcdDigest transformation to extract only records that changed in a Salesforce object since the last dataflow run. Use incremental extraction to decrease the time required to extract the data.

Note: Incremental extraction with the sfcdDigest transformation is currently available through a pilot program. Any unreleased services or features referenced in this or other press releases or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.

There are two types of extractions: full and incremental. With a full extraction, the sfcdDigest transformation extracts all records from the Salesforce object. With incremental extraction, the transformation extracts only records that have changed since the last dataflow run. Unless configured otherwise, the sfcdDigest transformation runs full extractions.

When you enable incremental extraction, the sfcdDigest transformation performs different actions on the dataset based the types of record changes in the Salesforce object since the last dataflow run:

<table>
<thead>
<tr>
<th>Record Change in Salesforce Object</th>
<th>Change to Dataset</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deleted record</td>
<td>Deletes corresponding record in the dataset.</td>
</tr>
<tr>
<td>New record</td>
<td>Inserts the new record into the dataset.</td>
</tr>
<tr>
<td>Updated record</td>
<td>Updates the corresponding record in the dataset.</td>
</tr>
</tbody>
</table>

Consider the following guidelines when enabling incremental extraction for an sfcdDigest transformation:

- Use incremental extraction for as many instances of the sfcdDigest transformation in the dataflow as possible.
- If necessary, when the sfcdDigest transformation is configured to run an incremental extraction, you can use the fullRefreshToken parameter to run a one-time, full extraction. You might use this option if the data in the Salesforce object and dataset become out of sync.
• The sfDCDigest transformation extracts all records from the object if you enable incremental extraction and it's the first time running the dataflow.

• You must use a full extraction in the following cases because incremental extraction is not supported:
  – The Salesforce object contains a formula field that references an external data object.
  – The Salesforce object fields or field types changed since the last dataflow run.
  – The filter in the sfDCDigest transformation changed since the last dataflow run.
  – The Salesforce object is one of the following objects:
    • CallCenter
    • CaseTeamMember
    • CategoryNode
    • CollaborationGroup
    • CollaborationGroupMember
    • CollaborationGroupMemberRequest
    • Division
    • Domain
    • DomainSite
    • Group
    • GroupMember
    • Profile
    • Site
    • Territory
    • Topic
    • User
    • UserRole
    • UserTerritory

Example: Let's consider an example. You'd like to incrementally extract data from the Opportunity object. As a result, you configure the following dataflow definition:

```json
{
  "Export_Opportunities": {
    "action": "sfDCDigest",
    "parameters": {
      "object": "Opportunity",
      "incremental": true,
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
}
```
Later, you realize that one of the opportunity records is missing. You decide to run a one-time full extraction by adding the fullRefreshToken parameter as shown in the following dataflow definition.

```json
{
    "Extract_Opportunities": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "incremental": true,
            "fullRefreshToken": "bb",
            "fields": [
                { "name": "Id" },
                { "name": "Name" },
                { "name": "StageName" },
                { "name": "CloseDate" },
                { "name": "AccountId" },
                { "name": "OwnerId" }
            ]
        }
    },
    "Register_Opportunities_Dataset": {
        "action": "sfdcRegister",
        "parameters": {
            "alias": "Opportunities",
            "name": "Opportunities",
            "source": "Extract_Opportunities"
        }
    }
}
```

After the full extraction, the dataflow performs an incremental extraction each time thereafter even though the fullRefreshToken parameter is included in the dataflow definition. To run a full extraction again, change the value of the fullRefreshToken parameter to a different value.

- **sfdcDigest Transformation**

**Filtering Records Extracted from a Salesforce Object**

Add a filter to the sfdcDigest transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.
A filter consists of one or more filter conditions, where each filter condition compares a field value to a value. For example, \( \text{Amount} \geq 1000000 \). You can also apply SOQL functions on the field value in a filter condition, like \( \text{CALENDAR\_YEAR(CreatedDate)} = 2011 \). You can add multiple filter conditions using logical operators AND, OR, and NOT. You can also use a backslash (\) to escape double quotes included in strings.

The sfdcDigest transformation extracts all records for which the filter is true. If you configured the sfdcDigest transformation for incremental extraction, the filter applies to data extracted during the incremental run only—Wave Analytics doesn’t apply the filter to records that were previously loaded into the dataset. If you add an invalid filter, the dataflow fails at run time.

For each instance of sfdcDigest, you can use one of the following types of filters:

- Structured filter
- Advanced filter

Tip: Are you trying to decide whether to use a filter in the sfdcDigest transformation or use a filter transformation? Use a filter transformation to filter records at any point in the dataflow. For example, you can add it after the dataflow joins two datasets. However, to reduce the number of rows processed in the dataflow and optimize dataflow performance, add the filter closest to the point at which records are extracted—when possible, add the filter in the sfdcDigest transformation.

Structured Filter in sfdcDigest Transformation
You define a structured filter using JSON syntax.

Advanced Filter in sfdcDigest Transformation
You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.

SEE ALSO:
sfdcDigest Transformation

Structured Filter in sfdcDigest Transformation
You define a structured filter using JSON syntax.

A structured filter uses the following JSON syntax for each filter condition.

```json
{
  "field": "<field name>",
  "operator": "<operator>",
  "value": "<value>"|"[<value 1>, "<value 2>"]",
  "isQuoted": true|false
}
```

The value can be a number, date, string, list of strings, or date literal. Wave Analytics automatically quotes strings unless you set \( \text{isQuoted} \) to true, which indicates that the string is already quoted.

You can use one of the following operators in a filter condition.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>=</td>
<td>Filter condition is true if the value in the field equals the specified value. String comparisons using the equals operator are case-insensitive.</td>
</tr>
<tr>
<td>Operator</td>
<td>Comment</td>
</tr>
<tr>
<td>----------</td>
<td>---------</td>
</tr>
<tr>
<td>Example:</td>
<td>&quot;filterConditions&quot;: [</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>!=</td>
<td>Filter condition is true if the value in the field does not equal the specified value. Example (using backslashes to escape double quotes in a string value):</td>
</tr>
<tr>
<td></td>
<td>&quot;filterConditions&quot;: [</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td>&gt;=</td>
<td>Filter condition is true if the value in the field is greater than or equal to the specified value. Example:</td>
</tr>
</tbody>
</table>

```json
"filterConditions": [ 
  { 
    "field": "Amount", 
    "operator": ">=", 
    "value": "100000"
  }
]
```

| <=       | Filter condition is true if the value in the field is less than or equal to the specified value. Example (using a SOQL function): |

```json
"filterConditions": [ 
  { 
    "field": "CALENDAR_YEAR (CreatedDate)", 
    "operator": "<=", 
    "value": "2015", 
    "isQuoted": true
  }
]
```

| LIKE     | Filter condition is true if the value in the field matches the specified value. The LIKE operator is similar to the LIKE operator in SQL; it provides a mechanism for matching partial text strings and supports wildcards. |

- The % and _ wildcards are supported for the LIKE operator.
- The % wildcard matches zero or more characters.
- The _ wildcard matches exactly one character.
- The LIKE operator is supported for string fields only.
- The LIKE operator performs a case-insensitive match.
- The LIKE operator supports escaping of special characters %. Use a backslash (\) to escape special characters. Example: |

```json
"filterConditions": [ 
  { 
    "field": "FirstName", 
    "operator": "LIKE", 
    "value": "Chris%"
  }
]
```
<table>
<thead>
<tr>
<th>Operator</th>
<th>Comment</th>
</tr>
</thead>
</table>
| **IN** | Filter condition is true if the value in the field equals any one of the values in the specified list. You can specify a quoted or non-quoted list of values. If the list is quoted, set `isQuoted` to true.  
Example: |
| | "filterConditions": [  
| |   {  
| |     "field": "StageName",  
| |     "operator": "IN",  
| |     "value": ["Closed Won", "Closed Lost"]  
| | }  
| | ] |
| **NOT IN** | Filter condition is true if the value in the field does not equal any of the values in the specified list.  
Example: |
| | "filterConditions": [  
| |   {  
| |     "field": "BillingState",  
| |     "operator": "NOT IN",  
| |     "value": ["California", "New York"]  
| | }  
| | ] |
| **INCLUDES** | For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field includes the specified value.  
Example: |
| | "filterConditions": [  
| |   {  
| |     "field": "BillingState",  
| |     "operator": "INCLUDES",  
| |     "value": ["California"]  
| | }  
| | ] |
| **EXCLUDES** | For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field excludes the specified value.  
Example: |
| | "filterConditions": [  
| |   {  
| |     "field": "BillingState",  
| |     "operator": "EXCLUDES",  
| |     "value": ["California", "New York"]  
| | }  
| | ] |
Let's look at a few examples of structured filters.

**Example:** Let's look at an example with a basic structured filter. To perform pipeline analysis on opportunities in fiscal quarter 2 of fiscal year 2015, you create this dataflow definition file to create the relevant dataset.

```json
{
    "Extract_Filtered_Opportunities": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
                { "name": "Id" },
                { "name": "Name" },
                { "name": "AccountId" },
                { "name": "Amount" },
                { "name": "StageName" },
                { "name": "CloseDate" },
                { "name": "OwnerId" },
                { "name": "FiscalYear" },
                { "name": "FiscalQuarter" },
                { "name": "SystemModstamp" }
            ],
            "filterConditions": [
                { "field": "FiscalYear",
                  "operator": "=",
                  "value": "2015"
                },
                { "field": "FiscalQuarter",
                  "operator": "=",
                  "value": "2"
                }
            ]
        }
    },
    "Register_Opportunities_Dataset": {
        "action": "sfdcRegister",
        "parameters": {
            "alias": "Opportunities_2015Q2",
            "name": "Opportunities_2015Q2",
            "source": "Extract_Filtered_Opportunities"
        }
    }
}
```

**Note:** If you do not specify a logical operator for multiple filter conditions—as is the case in this example—Wave Analytics applies AND between the conditions.

**Example:** Let's look at an example of a structured filter with a logical operator. To help forecast expected revenue, you create this dataflow to view all opportunities that have either closed or have greater than 90% probability of closing.

```json
{
    "Extract_Opportunities": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
                { "name": "Id" },
                { "name": "Name" },
                { "name": "AccountId" },
                { "name": "Amount" },
                { "name": "StageName" },
                { "name": "CloseDate" },
                { "name": "OwnerId" },
                { "name": "FiscalYear" },
                { "name": "FiscalQuarter" },
                { "name": "SystemModstamp" }
            ],
            "filterConditions": [
                { "field": "CloseDate",
                  "operator": "=",
                  "value": "Closed"
                },
                { "field": "Probability__c",
                  "operator": ">",
                  "value": "90"
                }
            ]
        }
    }
}
```
"parameters": { 
  "object": "Opportunity",
  "fields": [
    { "name": "Id" },
    { "name": "Name" },
    { "name": "AccountId" },
    { "name": "Amount" },
    { "name": "StageName" },
    { "name": "CloseDate" },
    { "name": "OwnerId" },
    { "name": "Probability" },
    { "name": "FiscalYear" },
    { "name": "FiscalQuarter" }
  ],
  "filterConditions": [
    { "operator": "OR",
      "conditions": [
        { "field": "StageName",
          "operator": "=",
          "value": "Closed Won"
        },
        { "field": "Probability",
          "operator": ">=",
          "value": "90"
        }
      ]
    }
  ]
},

"Register_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OpportunitiesExpectedToWin",
    "name": "OpportunitiesExpectedToWin",
    "source": "Extract_Opportunities"
  }
}

---

**Example:** Finally, let’s look at an example of a structured filter with nested logical operators. You create this dataflow to view all opportunities that closed in the current fiscal quarter and are owned by either one of your two direct reports.

```json
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" }
      ]
    }
  }
}
```
Advanced Filter in sfdcDigest Transformation

You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.
Example: Let’s look at an example of an advanced filter. You want to extract only opportunity records that are owned by a specific user and that have either high value or a high probability of closing. You create this dataflow.

```json
{
  "Extract_Filtered_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "Probability" },
        { "name": "OwnerId" }
      ],
      "complexFilterConditions": "OwnerId = '00540000000HfUz' AND (Amount > 100000 OR Probability > 75)"
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "FilteredOpportunities",
      "name": "FilteredOpportunities",
      "source": "Extract_Filtered_Opportunities"
    }
  }
}
```

### Overriding Salesforce Field Metadata

You can override the field metadata that the sfdcDigest transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

You can add the following field parameters to the sfdcDigest transformation to override the field metadata:

- `defaultValue`
- `type`
- `fiscalMonthOffset`
- `isYearEndFiscalYear`
- `firstDayOfWeek`
- `isMultiValue`
- `multiValueSeparator`
- `precision`
- `scale`

For a description of each of these field parameters, see Field Parameters. For information about using metadata attributes to configure dates, see Date Handling in Datasets.
Example: Let’s look at an example. You would like to override metadata extracted from the Opportunity object. You add the bold text in the following dataflow definition to override field metadata from the Opportunity object.

```
{
    "Extract_Opportunities": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
                { "name": "Id" },
                { "name": "Name" },
                { "name": "Amount",
                  "defaultValue": 0,
                  "precision": 18,
                  "scale": 2
                },
                { "name": "StageName" },
                { "name": "CloseDate",
                  "fiscalMonthOffset": 9,
                  "firstDayOfWeek": "2",
                  "isYearEndFiscalYear": true
                },
                { "name": "AccountId" },
                { "name": "OwnerId" },
                { "name": "OpportunitySupportTeamMembers__c",
                  "type": "Text",
                  "isMultiValue": true,
                  "multiValueSeparator": ",",
                  "precision": 255
                }
            ]
        }
    },
    "Register_Opportunities_Dataset": {
        "action": "sfdcRegister",
        "parameters": {
            "alias": "Opportunities",
            "name": "Opportunities",
            "source": "Extract_Opportunities"
        }
    }
}
```

SEE ALSO:

sfdcDigest Transformation
Unsupported Salesforce Objects and Fields in Wave

The sfdcDigest transformation can’t extract data from all Salesforce objects and fields. Consider these limitations before configuring the extraction of Salesforce objects.

For information about all Salesforce objects and fields, see the Object Reference for Salesforce and Force.com.

Unsupported Objects

The sfdcDigest transformation can’t extract data from these Salesforce objects.

-AuthProvider
-BrandTemplate
-ChatterConversation
-ChatterConversationMember
-ChatterMessage
-ConnectedApplication
-ContentFolderLink
-ContentWorkspace
-ContentWorkspaceDoc
-CorsWhitelistEntry
-CustomNotDeployed__OwnerSharingRule
-EmailDomainKey
-EmailServicesAddress
-EmailServicesFunction
-EmailStreamMessage
-EmailStreamShareOption
-EmailStreamShareOptionHistory
-EmailStreamShareOptionOwnerSharingRule
-EmailStreamShareOptionShare
-EmailTemplate
-EventType
-EventTypeParameter
-EnvironmentHub
-EnvironmentHubInvitation
-EnvironmentHubMemberRel
-FeedPollChoice
-FeedPollVote
-KnowledgeArticleVersion
-LoginGeo
-LoginHistory
-NetworkActivityAudit
-NewsArticleFeed
-NetworkModeration
The sfdcDigest transformation cannot extract data from external objects created in Salesforce. External objects are similar to custom objects, except that they map to data located outside Salesforce.

If you include an unsupported or inaccessible object in the sfdcDigest transformation, the dataflow fails at run time with an error message.
Unsupported Fields

The sfdcDigest transformation cannot extract data from these fields:

<table>

</table>

If you include a field with an unsupported field in the sfdcDigest transformation, the dataflow ignores the field.

In addition, Salesforce recommends that you do not extract data from the MayEdit field of the Account object. Extracting data from this field significantly decreases performance and can cause the dataflow to fail.

Unsupported Field Types
The sfdcDigest transformation can’t extract data from fields with these field types.

- base64
- composite (like address and location)
- data category group reference
- encrypted string

If you include a field with an unsupported field type in the sfdcDigest transformation, the dataflow ignores the field.

SEE ALSO:
  - sfdcDigest Transformation
sfdcDigest Parameters

When you define an sfdcDigest transformation, you set the action attribute to sfdcDigest and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

You can specify parameters in the following sections of the sfdcDigest node: parameters, fields, and filterConditions.

Parameters

The following table describes the parameters in the parameters section.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>Yes</td>
<td>API name of the Salesforce object from which you want to extract data. This object is the input source for this transformation. The sfdcDigest transformation doesn’t support extraction from all Salesforce objects.</td>
</tr>
<tr>
<td>incremental</td>
<td>No</td>
<td>Performs an incremental extraction, which extracts only changes to the Salesforce object since the last dataflow run. Valid values: true or false.</td>
</tr>
<tr>
<td>fullRefreshToken</td>
<td>No</td>
<td>Performs a one-time full extraction to synchronize the data in the dataset with data in the Salesforce object. Specify any value for this parameter. After the full extraction, the dataflow performs an incremental extraction each time thereafter even though the fullRefreshToken parameter is included in the dataflow definition. To run a full extraction again, change the value of the fullRefreshToken parameter to a different value.</td>
</tr>
<tr>
<td>fields</td>
<td>Yes</td>
<td>An array of names of all fields from which you want to extract data from the specified Salesforce object. The sfdcDigest transformation doesn’t support extraction from all field types. See Field Attributes.</td>
</tr>
<tr>
<td>filterConditions</td>
<td>No</td>
<td>A filter that restricts the records extracted from the specified Salesforce object. The sfdcDigest transformation extracts all records from the Salesforce object for which...</td>
</tr>
</tbody>
</table>
ValueRequired?Parameter
the filter is true. You can specify a structured or advanced filter.
See Filter Conditions Parameters.

complexFilterConditions No For advanced filters only. A SOQL WHERE clause used to filter records extracted from the specified Salesforce object.

Field Attributes
The following table describes the attributes in the fields section. It also describes optional attributes that you can provide to override the field metadata. You can override the metadata that the sfdcDigest transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field. If you don’t override the values, Wave Analytics gets the values from Salesforce.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Yes</td>
<td>API name of the field in the Salesforce object that you want to include in the dataset. You can specify multiple fields.</td>
</tr>
<tr>
<td>defaultValue</td>
<td>No</td>
<td>For text and numeric fields that can be null. Default value that replaces a null value for the specified field.</td>
</tr>
</tbody>
</table>
| type              | No        | Wave Analytics field type associated with the specified field. Valid types are Text, Numeric, or Date. Any value, including numeric values, can be Text. For example, by default, fiscal quarter from Salesforce objects is Number. However, you can change it to Text. Specify a type to override the type determined by Wave Analytics. Example: 

```
"type": "Text"
```

| fiscalMonthOffset | No        | For date fields only. The difference, in months, between the first month of the fiscal year and the first month of the calendar year (January). For example, if the fiscal year starts in January, the offset is 0. If the fiscal year starts in October, the offset is 9. Example: 

```
"fiscalMonthOffset": 9
```
### Attribute: IsYearEndFiscalYear

*Required?: No*

- For date fields only. Indicates whether the fiscal year is the year in which the fiscal year ends or begins. Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year.
- If true, then the fiscal year is the year in which the fiscal year ends. The default is true.
- If false, then the fiscal year is the year in which the fiscal year begins.

**Example:**

```json
"isYearEndFiscalYear": true
```

This field is relevant only when `fiscalMonthOffset` is greater than 0.

For more information, see [Date Handling in Datasets](#).

### Attribute: FirstDayOfWeek

*Required?: No*

- For date fields only. The first day of the week for the calendar year and, if applicable, fiscal year. Use 0 to set the first day to be Sunday, 1 to set the first day to be Monday, and so on. Use -1 to set the first day to be on January 1. The default is -1.

**Example:**

```json
"firstDayOfWeek": "0"
```

For more information, see [Date Handling in Datasets](#).

### Attribute: IsMultiValue

*Required?: No*

- For text fields only. Indicates whether the specified field has multiple values.
### Attribute | Required? | Value
--- | --- | ---
Example: 
"isMultiValue": false

multiValueSeparator | No | For text fields only. Character used to separate multiple values in the specified field when isMultiValue equals true. This value defaults to a semicolon (;) if you do not specify a value and isMultiValue equals true. Set to null when isMultiValue equals false.
Example: 
"multiValueSeparator": ";"

precision | No | The maximum number of digits in a numeric value, or the length of a text value. For numeric values: Includes all numbers to the left and to the right of the decimal point (but excludes the decimal point character). Value must be between 1 and 18, inclusive. For text values: Value defaults to 255 characters, and must be between 1 and 32,000 characters, inclusive.
Example: 
"precision": 10

scale | No | The number of digits to the right of the decimal point in a numeric value. Must be less than the precision value. Value must be between 0 and 17 characters, inclusive.
Example: 
"scale": 2

### Filter Conditions Parameters
The following table describes the structured filter parameters in the `filterConditions` section. These parameters do not apply to advanced filters.

| Parameter | Required? | Value |
--- | --- | --- |
field | No | The field in the Salesforce object on which you want to apply a filter condition. Each |
Filter condition in a structured filter uses the following syntax:

```
{
  "field": "<field name>",
  "operator": "<operator>",
  "value": "<value>",
  "isQuoted": true|false
}
```

The purpose depends on the context.

- **operator** can be used as a comparison operator—like =, <, and IN—that compares the field value against a constant value.
- **operator** can also be used as a logical operator (AND, OR, or NOT) that links multiple filter conditions together.

In the example below, the bold operator is the logical operator. The other instances of operator are comparison operators.

```
"filterConditions": [
  {
    "operator": "OR",
    "conditions": [
      {
        "field": "StageName",
        "operator": "=",
        "value": "Closed Won"
      },
      {
        "field": "Probability",
        "operator": ">=",
        "value": "90"
      }
    ]
  }
]
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>operator</td>
<td>No</td>
<td>The purpose depends on the context. <strong>operator</strong> can be used as a comparison operator—like =, &lt;, and IN—that compares the field value against a constant value. <strong>operator</strong> can also be used as a logical operator (AND, OR, or NOT) that links multiple filter conditions together. In the example below, the bold operator is the logical operator. The other instances of operator are comparison operators.</td>
</tr>
<tr>
<td>value</td>
<td>No</td>
<td>The value used in a filter condition.</td>
</tr>
<tr>
<td>isQuoted</td>
<td>No</td>
<td>Indicates whether you quoted the string value in a filter condition.</td>
</tr>
</tbody>
</table>
### ValueRequired?Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Example with quoted values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;filterConditions&quot;: [</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;field&quot;: &quot;StageName&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;operator&quot;: &quot;IN&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;value&quot;: &quot;('Closed Won', 'Closed Lost')&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;isQuoted&quot;: true</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example with non-quoted values:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;filterConditions&quot;: [</td>
</tr>
<tr>
<td></td>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;field&quot;: &quot;StageName&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;operator&quot;: &quot;IN&quot;,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;value&quot;: [&quot;Closed Won&quot;, &quot;Closed Lost&quot;],</td>
</tr>
<tr>
<td></td>
<td></td>
<td>&quot;isQuoted&quot;: false</td>
</tr>
<tr>
<td></td>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td></td>
<td>If you don’t include isQuoted for a filter on a string value, Wave Analytics assumes that the string value is not quoted and adds the quotes for you.</td>
</tr>
<tr>
<td></td>
<td>No</td>
<td>Use to specify a logical operator to link multiple filter conditions together.</td>
</tr>
</tbody>
</table>

### sfdcRegister Transformation

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

You don’t need to register all datasets. For example, you don’t need to register an intermediate dataset that is used to build another dataset and does not need to be queried. In addition, you don’t need to register datasets that are created when you upload external data because Wave Analytics automatically registers these datasets for you.

Carefully choose which datasets to register because:
- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.
Example: Let's look at an example. You create a dataflow that extracts opportunities from the Opportunity object. To register the dataset, name it "Opportunities," and apply row-level security on it, you add the sfdcRegister transformation as shown in the following dataflow definition file.

```json
{
    "Extract_Opportunities": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
                { "name": "Id" },
                { "name": "Name" },
                { "name": "Amount" },
                { "name": "StageName" },
                { "name": "CloseDate" },
                { "name": "AccountId" },
                { "name": "OwnerId" }
            ]
        }
    },
    "Register_Opportunities_Dataset": {
        "action": "sfdcRegister",
        "parameters": {
            "alias": "Opportunities",
            "name": "Opportunities",
            "source": "Extract_Opportunities",
            "rowLevelSecurityFilter": "'OwnerId' == "$User.Id"
        }
    }
}
```

**sfdcRegister Parameters**

When you define an sfdcRegister transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

**sfdcRegister Parameters**

When you define an sfdcRegister transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

The following table describes the input parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>Yes</td>
<td>API name of the registered dataset. This name can contain only underscores and alphanumeric characters, and must be unique among other dataset aliases in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. It also cannot exceed 80 characters.</td>
</tr>
</tbody>
</table>
### Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>Yes</td>
<td>Display name of the registered dataset. The name cannot exceed 80 characters.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> To change the name after you create the dataset, you must edit the dataset.</td>
</tr>
<tr>
<td>source</td>
<td>Yes</td>
<td>Node in the dataflow definition file that identifies the dataset that you want to register. This is the input source for this transformation.</td>
</tr>
</tbody>
</table>
| rowLevelSecurityFilter     | No        | The predicate used to apply row-level security on the dataset when the dataset is first created.  
Example: "rowLevelSecurityFilter": "OwnerId == "$User.Id""  
**Note:** To change the predicate after you create the dataset, you must edit the dataset.  
When entering the predicate in the Register transformation of the dataflow JSON, you must escape the double quotes around string values.  
After the dataset is created, Wave Analytics ignores its security predicate setting in the dataflow. To change the security predicate for an existing dataset, edit the dataset in the user interface. |

### SEE ALSO:
- sfdcRegister Transformation
- update Transformation

**update Transformation**

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we’ll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

When you create the transformation, you specify the keys that are used to match records between the two datasets. To dictate which field in the lookup dataset updates the field in the source dataset, you also map the corresponding fields from both datasets.
Example: Let’s look at an example. You have an existing Accounts dataset that contains account information—Id, Name, and AnnualRevenue. Unfortunately, some of the account names in the dataset are now incorrect because of a series of mergers and acquisitions. To quickly update the account names in the dataset, you perform the following tasks.

1. Create a .csv file that contains the new account names and associated account IDs for accounts that have name changes.
2. Upload the .csv file to create a dataset called UpdatedAccountNames.
3. Create a dataflow definition file to update account names in the Accounts dataset by looking up the new account names in the UpdatedAccountNames dataset.

You create the following dataflow definition file.

```json
{
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": [ "Id" ],
      "right_key": [ "AccountID" ],
      "update_columns": { "Name": "NewAccountName" }
    }
  },
  "Register_UpdatedAccountRecords": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Accounts",
      "name": "Accounts",
      "source": "Update_AccountRecords"
    }
  }
}
```
**Example:** Let's look at another example, where a composite key is used to match records between both datasets. In this case, you match records using the account ID and account name fields.

You create the following dataflow definition file.

```json
{
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": ["Id","Name"],
      "right_key": ["AccountId","NewAccountName"],
      "update_columns": {
        "Name": "NewAccountName",
        "CreatedDate": "NewCreatedDate",
        "AnnualRevenue": "NewAnnualRevenue"
      }
    }
  },
  "Register_UpdatedAccountRecords": {
    "action": "sfdcRegister",
    "parameters": { "alias": "Accounts", "name": "Accounts", "source": "Update_AccountRecords" }
  }
}
```

**update Parameters**

When you define an update transformation, you set the action attribute to `update` and specify the parameters.
The following table describes the input parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>left</td>
<td>Yes</td>
<td>Node in the dataflow definition file that identifies the dataset that contains the records that you want to update.</td>
</tr>
<tr>
<td>right</td>
<td>Yes</td>
<td>Node in the dataflow definition file that identifies the lookup dataset that contains the new values.</td>
</tr>
<tr>
<td>left_key</td>
<td>Yes</td>
<td>Key column in the left dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order. For an example, see update Transformation on page 3400.</td>
</tr>
<tr>
<td>right_key</td>
<td>Yes</td>
<td>Key column in the right dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order.</td>
</tr>
<tr>
<td>update_columns</td>
<td>No</td>
<td>An array of corresponding columns between the left and right datasets. Use the following syntax: &quot;update_columns&quot;: { &quot;LeftColumn1&quot;: &quot;RightColumn1&quot;, &quot;LeftColumn2&quot;: &quot;RightColumn2&quot;,... &quot;LeftColumnN&quot;: &quot;RightColumnN&quot; }. The value from right column replaces the value from the corresponding left column. The field types of the left and right column must match.</td>
</tr>
</tbody>
</table>

**Note:** If you specify a column name that does not exist, the dataflow fails.

If you do not specify this parameter, the transformation updates the left dataset by matching all columns in the right dataset with those in the left. In this case, the right column names must match exactly with the
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Required?</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>left column names. Otherwise, an error might occur.</td>
</tr>
</tbody>
</table>

SEE ALSO:
update Transformation

Overriding Metadata Generated by a Transformation

Optionally, you can override the metadata that is generated by a transformation. You can override object and field attributes. For example, you can change a field name that is extracted from a Salesforce object so that it appears differently in the dataset. To override the metadata, add the overrides to the Schema section of the transformation in the dataflow definition file.

In the Schema section, you can override the metadata attributes for one object only.

The Schema section in this sample sfdcDigest transformation contains metadata overrides:

```json
"Extract_Opportunities": {
  "action": "sfdcDigest",
  "parameters": {
    "object": "Opportunity",
    "fields": [
      { "name": "Name" },
      { "name": "Amount" }
    ]
  },
  "schema": {
    "objects": [
      {
        "label":"Sales Opportunities",
        "fields": [
          { "name": "Amount",
            "label": "Opportunity Amount"
          }
        ]
      }
    ]
  }
}
```

Object Attributes

You can override the following object attributes.
### Object Attribute

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| label     | String  | The display name for the object. Can be up to 40 characters.  
Example:  
"label": "Sales Data" |
| description | String  | The description of the object. Must be less than 1,000 characters.  
Add a description to annotate an object in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface.  
Example:  
"description": "The SalesData object tracks basic sales data." |
| fields    | Array   | The array of fields for this object. |

### Field Attributes

You can override attributes of each specified dataset field.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
</table>
| name      | String  | Name of the field in the dataset. Identifies the field that you want to override.  
Examples:  
"name": "Amount"  
"name": "Role.Name" |
| label     | String  | The display name for the field. Can be up to 255 characters.  
Example:  
"label": "Opportunity Amount" |
| description | String  | The description of the field. Must be less than 1,000 characters.  
Add a description to annotate a field in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface.  
Example:  
"description": "The Amount field contains the opportunity amount." |
| isSystemField | Boolean | Indicates whether this field is a system field to be excluded from query results.  
Example:  
"isSystemField": "false" |
| format    | String  | The display format of the numeric value.  
Examples:  
"format": "number"  
"format": "money" |

3405
Numeric Formats

An example of a typical numeric value is $1,000,000.99, which is represented as $#,##0.00. You are required to specify the precision and scale of the number. The format is specified by using the following symbols:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>One digit</td>
</tr>
<tr>
<td>#</td>
<td>Zero or 1 digit</td>
</tr>
<tr>
<td>.</td>
<td>This symbol is the default decimal separator. Use the decimalSeparator field to set the decimal separator to a different symbol.</td>
</tr>
<tr>
<td>-</td>
<td>Minus sign</td>
</tr>
<tr>
<td>,</td>
<td>Grouping separator</td>
</tr>
<tr>
<td>$</td>
<td>Currency sign</td>
</tr>
</tbody>
</table>

Note: The format for numeric values isn’t used in data ingestion. It is used only to specify how numeric values are formatted when displayed in the UI. Also, you can’t override date formats.

Example: Let’s consider an example where you want to override the following object and field attributes that the sfdcDigest transformation extracts from the Opportunity object.

<table>
<thead>
<tr>
<th>Object/Field</th>
<th>Attribute Changes</th>
</tr>
</thead>
</table>
| Opportunity object | • Change the object label to "Sales Opportunities"  
|                   | • Add an object description |
| Id field      | • Change the field label to "Opportunity Id"  
|               | • Hide the field from queries |
| Amount field  | • Change the field label to "Opportunity Amount"  
|               | • Change the format to $#,##0.00 |
| CloseDate field | • Change the field label to "Closing Date" |
To override the attributes, you add the Schema section with the override values to sfdcDigest in the dataflow definition file.

```json
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    },
    "schema": {
      "objects": [
        {
          "label": "Sales Opportunities",
          "description": "These are all sales opportunities."
        }
      ]
    }
  },
  "Register_Dataset_Opportunities": {
    "action": "sfdcRegister",
    "parameters": {
      "source": "Extract_Opportunities",
      "alias": "Opportunities",
      "name": "Opportunities"
    }
  }
}
```
Create a Dataset with the Dataset Builder

You can use the dataset builder to create a single dataset based on data from one or more Salesforce objects. The dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs. You can also edit the dataflow definition file to add transformations that manipulate the dataset.

1. On the home page or on an app page, click **Create > Dataset**.

2. Click **Salesforce**.
   The dataset builder opens on the Dataset Builder tab.

3. Select the root object.
   The root object is the lowest level child object that you can add to the canvas. After you select the root object, you can add only parent objects of the root object—you can’t add its children objects. To change the root object, refresh the page and start over.

4. Hover over the root object, and then click **+**.
   The Select Fields dialog box appears. By default, the Fields tab appears and shows all available object fields from which you can extract data.
5. In the Fields tab, select the fields from which you want to extract data.
   To locate fields more quickly, you can search for them or sort them by name or type.
   ! **Important:** You must select at least one field for each object that you add to the canvas. If you add an object and don’t add any of its fields, the dataflow fails at run time.

6. In the Relationships tab, click **Join** to add the related objects to the canvas.
   When you add a related object, the related object appears in the canvas.
7. To remove a related object, click **Delete**.

   **Warning:** When you delete a related object, you also delete all objects that descend from the related object in the diagram. For example, if you delete Account shown below, you delete the branch that contains Account and User.

8. For each related object, select the fields from which you want to extract data.

9. To move the entire diagram, select a white space in the canvas and drag it. You might need to move the diagram to view a different section of the diagram.

10. To view all objects included in the canvas, click **Selected Objects**. The Selected Objects dialog box shows a tree structure of all objects included in the canvas. The root object appears at the top of the tree.

   If you select one of the objects, the dataset builder focuses on the object by placing the object in the center of the canvas.

11. To view the associated JSON, click **Selected Objects**. When you create the dataset, the dataset builder appends the JSON to the dataflow definition file.
12. Click **Create Dataset**.

13. Enter the name of the dataset, and select the app that will contain the dataset if it’s not already selected.

   **Note:** If you enter a dataset name that is already used, when you create the dataset, the dataset builder appends a number to the dataset name. For example, if you entered MyOpportunities, the dataset builder creates MyOpportunities1. The dataset name cannot exceed 80 characters.

14. Click **Create**.

   The dataset builder appends the underlying JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. You can manually run the dataflow to immediately create the dataset.

### Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization’s private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

**Install the Wave Connector Excel App**

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics.

**USER PERMISSIONS**

To import data from Excel 2013 to Wave Analytics:

- Upload External Data to Wave Analytics
If you use Excel 2013 on the desktop or Office 365, the Office Online version of Excel, the Wave Connector gives you a great way to get your data into Salesforce Wave Analytics. After installing the Connector, you just select data from Excel, click Submit, and the Connector does the work for you, importing the data to Wave Analytics and creating a dataset.

Here's how to install the Connector:

1. Open Excel, either on your desktop or in Office Online.
2. Open the Insert tab.
3. Click Apps for Office.
4. Search for the Wave Connector, and click to install it.
5. Enter your Salesforce credentials to open the Connector.

Once you've installed the Connector, follow the instructions in the Connector window to create datasets based on Excel data. Opening the Connector automatically logs you in to Salesforce Wave Analytics. Click the Connector Help icon for complete information about using the app.
Create a Dataset with External Data

You can either upload external data through the user interface or through the External Data API to create a dataset. When you upload an external data file (in .csv, .gz, or .zip format), you can also provide a metadata file. A metadata file contains metadata attributes that describe the structure of the data in the external data file. If you upload a .csv from the user interface, Wave Analytics automatically generates the metadata file, which you can preview and change. If you do not provide a metadata file, Wave Analytics imports all external data file columns as dimensions.

Tip: Wave temporarily stores the uploaded CSV and metadata files for processing only. After the datasets are created, Wave purges the files. If you want to use the files again later, keep a copy.

Before uploading external data files, review the format requirements and examples of the .csv and metadata files in the External Data Format Reference.

Note: You can also use the the External Data API to upload external data files. Use the API to take advantage of additional features, like performing incremental extracts and performing append, delete, and upsert operations. For more information about the External Data API, see the External Data API Developer’s Guide.

1. On the home or app page, click Create > Dataset.

2. Type the name of your dataset in the Dataset Name field.
   The name cannot exceed 80 characters.

3. If you want to create the dataset in a different app, change the app in the App drop-down list.

4. Click .CSV

5. Add the .csv file.
   After you add the .csv file, Wave Analytics automatically generates and adds the corresponding metadata file.
Note: Instead of using the generated metadata file, if you want, you can upload a different metadata file that you created from scratch. If you upload your own metadata file, the Preview Data button is disabled.

6. Perform the following tasks to change the metadata attributes in the generated metadata file.
   a. Click Preview Data to view and change the required metadata attributes.
   b. Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.
c. Click the column header to change other attributes for the column.

d. To apply the changes to all other columns of the same data type, click Apply to All <data type> Columns.

e. Click Submit to save the metadata changes to the metadata file.

   Note: If there are errors, the Submit button is grayed out.

f. Click OK to close the confirmation message.

g. To change optional metadata attributes, click to download the metadata file, edit the file, and then upload it.

7. Click Create Dataset
   Your data files are scheduled for upload. It might take some time to process the data upload job; you can monitor its status in the data monitor. If upload is successful, the new dataset is available from the home or app page.

8. Click Continue to dismiss the confirmation message.
Rules for Automatic Generation of a Metadata File

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

Monitor an External Data Upload

When you upload an external data file, Wave Analytics kicks off a job that uploads the data into the specified dataset. You can use the data monitor to monitor and troubleshoot the upload job.

Rules for Automatic Generation of a Metadata File

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

To enable Wave Analytics to generate the metadata file, a CSV file must meet the following requirements.

- The file type must be .csv, not .gz or .zip.
- The file must contain one row for the column header and at least one record.
- The CSV file must meet all Wave Analytics requirements as mentioned in the External Data Format Reference.

Wave Analytics generates the metadata attributes for each CSV column based on the first 100 rows in the CSV file. Wave Analytics uses the following rules to convert the CSV column names to field labels.

- Replaces special characters and spaces with underscores. For example, "Stage Name" becomes "Stage_Name."
- Replaces consecutive underscores with one underscore, except when column name ends with "__c." For example, "stage__name" becomes "stage_name."
- Prefixes the field label with "X" when the first character of the column name is numeric. For example, "30Day" becomes "X30Day."
- Replaces the field name with "Column" + column number when all characters in the column name are not alphanumeric. For example, the fourth column name "*^(&*(&*" becomes "Column4."
- Deletes underscores at the beginning and end of the field label to ensure that it doesn’t start or end with an underscore.
- Increments the derived field label if the label is the same as an existing label. For example, if "X2" already exists, uses "X21," "X22," "X23."

Tip: You can download the generated metadata file to change the metadata settings, and then upload it to apply the changes. You can download the metadata file when you create or edit a dataset.
Monitor an External Data Upload

When you upload an external data file, Wave Analytics kicks off a job that uploads the data into the specified dataset. You can use the data monitor to monitor and troubleshoot the upload job.

The Jobs view (1) of the data monitor shows the status, start time, and duration of each dataflow job and external data upload job. It shows jobs for the last 7 days and keeps the logs for 30 days.

1. In Wave Analytics, click the gear button (⚙️) and then click Data Monitor to open the data monitor. The Jobs view appears by default. The Jobs view displays dataflow and upload jobs. The Jobs view displays each upload job name as <dataset_name upload flow>. You can hover a job to view the entire name.

Note: To view external data upload jobs in the Jobs view, Show in the File Uploads field (2) must be selected. It's selected by default.

The Jobs view (1) of the data monitor shows the status, start time, and duration of each dataflow job and external data upload job. It shows jobs for the last 7 days and keeps the logs for 30 days.

Editions

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

User Permissions

To access the data monitor:

• “Edit Wave Analytics Dataflows,” “Upload External Data to Wave Analytics,” or “Manage Wave Analytics”
2. To see the latest status of a job, click the Refresh Jobs button.

   Each job can have one of the following statuses.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Queued</td>
<td>The job is in queue to start.</td>
</tr>
<tr>
<td>Running</td>
<td>The job is running.</td>
</tr>
<tr>
<td>Failed</td>
<td>The job failed.</td>
</tr>
<tr>
<td>Successful</td>
<td>The job completed successfully.</td>
</tr>
<tr>
<td>Warning</td>
<td>The job completed successfully, but some rows failed.</td>
</tr>
</tbody>
</table>

3. To view the run-time details for a job, expand the job node.

   The run-time details display under the job. In the run-time details section, scroll to the right to view information about the rows that were processed.

4. To troubleshoot a job that has failed rows, view the error message. Also, click the download button in the run-time details section to download the error log.

   **Note:** Only the user who uploaded the external data file can see the download button.

   The error log contains a list of failed rows.
5. To troubleshoot a failed job, view the error message and the run-time details.

Edit a Dataset

You can edit a dataset to change the dataset name, app, security predicate, or extended metadata (XMD) file associated with the dataset. For datasets created from an external data file, you can also upload a new external data file or metadata file to update the data or metadata.

If you add an external data file, Wave Analytics generates and adds the corresponding metadata file. To make further changes to the metadata, you can click Preview Data or download and edit the generated metadata file. You can also upload your own metadata file to overwrite the generated file.

1. On the home or app page, click the Datasets tab.
2. Hover over the dataset that you want to edit, and then click Edit.
3. Configure the following options if applicable.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dataset Name</td>
<td>Enter a new name if you’d like to change the name of the dataset. The name cannot exceed 80 characters.</td>
</tr>
<tr>
<td>App</td>
<td>Select a new app if you’d like to move the dataset to a different app.</td>
</tr>
<tr>
<td>Add Extended Metadata File (JSON)</td>
<td>Specify an extended metadata file if you’d like to customize the formatting of dashboards associated with the dataset. Refer to Extended Metadata (XMD) Reference for information about extended metadata files.</td>
</tr>
<tr>
<td>Add External Data File (CSV)</td>
<td>Specify an external data file if you’d like to replace the existing data in the dataset with data from the external data file. Maximum file size is 500 MB. You can upload a .CSV, .GZ, or .ZIP file. Refer to External Data Format Reference for information about external data files and metadata files.</td>
</tr>
<tr>
<td>Add Metadata File (JSON)</td>
<td>Specify a metadata file if you’d like to redefine the structure of the external data file. If you upload a new metadata file, you must also upload the corresponding external data file. Refer to External Data Format Reference for information about metadata files.</td>
</tr>
</tbody>
</table>

Editions

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

User Permissions

To edit a dataset:
- “Edit Wave Analytics Dataflows”
4. If you uploaded a new .csv file, click **Preview Data** to view and change the required metadata attributes. You can change the optional metadata later.

   Note: The **Preview Data** button is disabled if you uploaded your own metadata file.

   After you click **Preview Data**, the preview page appears.

   ![Preview Data](image)

5. For each column:
   a. Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.

   ![Column Name](image)

   b. Click the column header to change other required attributes for the column.
You can change the attributes for measure and date columns only.

c. To apply the changes to all other columns of the same data type, click **Apply to All <data type> Columns**.

6. Click **Submit** to save the metadata changes in the preview page to the metadata file.

   **Note:** The **Submit** button is grayed out if there are errors.

7. Click **OK** to close the confirmation message.

8. To change optional metadata attributes—which are not visible in the preview page—click **Download** to download the metadata file, edit the file, and then upload it.

9. Click **Update Dataset**.

10. Click **Continue** to dismiss the confirmation message.
Delete a Dataset

Delete unnecessary datasets from your My Private App or in shared apps on which you have at least Editor access. Removing datasets reduces clutter and helps you avoid reaching your org’s limit for rows across registered datasets.

When you delete a dataset, Wave Analytics permanently deletes the dataset and doesn’t delete the corresponding lenses or dashboards that reference the dataset. Lenses and dashboards that reference a deleted dataset will no longer be available. As a result, Salesforce.com recommends that you remove the associated lenses and dashboards before you delete a dataset.

If a dataflow transformation —like edgemart or sfdcRegister— references the dataset, you must remove the reference before you can delete the dataset. For example, to delete the “Opportunities” dataset, you must remove the sfdcRegister transformation from the dataflow snippet shown below.

```json
{
  ...
  "Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  },
  ...
}
```

⚠️ Warning: You can’t recover a deleted dataset.

1. On the home or app page, click the Datasets tab.
2. Hover over the dataset that you want to delete, and then click Edit.
3. Click Delete Dataset.
   - If applicable, Wave Analytics shows a list of all lenses and dashboards that reference the dataset and that you have access to view. After you delete the dataset, any lens or dashboard that reference the dataset will become unusable.
4. Click Delete Permanently and confirm.

Row-Level Security for Datasets

If a Wave Analytics user has access to a dataset, they have access to all records in the dataset, by default. However, you can implement row-level security on a dataset to restrict access to records. Some records might contain sensitive data that shouldn’t be accessible by everyone.

To implement row-level security, define a predicate for each dataset on which you want to restrict access to records. A predicate is a filter condition that defines row-level access to records in a dataset.
When a user submits a query against a dataset that has a predicate, Wave Analytics checks the predicate to determine which records the user has access to. If the user doesn’t have access to a record, Wave Analytics does not return that record.

The predicate is flexible and can model different types of security policies. For example, you can create predicates based on:

- **Record ownership.** Enables each user to view only records that they own.
- **Management visibility.** Enables each user to view records owned or shared by their subordinates based on a role hierarchy.
- **Team or account collaboration.** Enables all members of a team, like an opportunity team, to view records shared with the team.
- **Combination of different security requirements.** For example, you might need to define a predicate based on the Salesforce role hierarchy, teams, and record ownership.

The type of security policy you implement depends on how you want to restrict access to records in the dataset.

⚠️ **Warning:** If row-level security isn’t applied to a dataset, any user that has access to the dataset can view all records in the dataset.

### Considerations when Defining a Predicate for a Dataset

Applying a predicate to a dataset is more than just defining the predicate expression. You also need to consider how the predicate is dependent on the information in the dataset and where to define the predicate expression.

**Row-Level Security Example based on Record Ownership**

Let’s look at an example where you create a dataset based on a CSV file and then implement row-level security based on record ownership. In this example, you will create a dataset that contains sales targets for account owners. To restrict access on each record in the dataset, you will create a security policy where each user can view only sales targets for accounts that they own. This process requires multiple steps that are described in the sections that follow.

**Row-Level Security Example based on Opportunity Teams**

Let’s look at an example where you create a dataset based on Salesforce data and then implement row-level security based on an opportunity team. In this example, you will create a dataset that contains only opportunities associated with an opportunity team. To restrict access on each record in the dataset, you will create a security policy where only opportunity members can view their opportunity. This process requires multiple steps that are described in the sections that follow.

**Row-Level Security Example based on Role Hierarchy and Record Ownership**

Let’s look at an example where you create a dataset based on Salesforce data and then implement row-level security based on the Salesforce role hierarchy and record ownership. In this example, you will create a dataset that contains all opportunities. To restrict access on each record in the dataset, you will create a security policy where each user can view only opportunities that they own or that are owned by their subordinates based on the Salesforce role hierarchy. This process requires multiple steps that are described in the sections that follow.

- `sfdcRegister Parameters`

### Considerations when Defining a Predicate for a Dataset

Applying a predicate to a dataset is more than just defining the predicate expression. You also need to consider how the predicate is dependent on the information in the dataset and where to define the predicate expression.

You can create a predicate expression based on information in the dataset. For example, to enable each user to view only dataset records that they own, you can create a predicate based on a dataset column that contains the owner for each record. If needed, you can load additional data into a dataset required by the predicate.

The location where you define the predicate varies.
To apply a predicate on a dataset created from a dataflow, add the predicate in the `rowLevelSecurityFilter` field of the Register transformation. The next time the dataflow runs, Wave Analytics will apply the predicate.

To apply a predicate on a dataset created from an external data file, define the predicate in the `rowLevelSecurityFilter` field in the metadata file associated with the external data file. Wave Analytics applies the predicate when you upload the metadata file and external data file. If you already created the dataset from an external data file, you can edit the dataset to apply or change the predicate.

**Row-Level Security Example based on Record Ownership**

Let’s look at an example where you create a dataset based on a CSV file and then implement row-level security based on record ownership. In this example, you will create a dataset that contains sales targets for account owners. To restrict access on each record in the dataset, you will create a security policy where each user can view only sales targets for accounts that they own. This process requires multiple steps that are described in the sections that follow.

**Note:** Although this example is about applying a predicate to a dataset created from a CSV file, this procedure can also be applied to a dataset that is created from Salesforce data.

1. **Determine Which Data to Include in the Dataset**
   First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

2. **Determine Row-Level Security for Dataset**
   Now it’s time to think about row-level security. How will you restrict access to each record in this dataset?

3. **Add the Predicate to the Metadata File**
   For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

4. **Create the Dataset**
   Now that you updated the metadata file with the predicate, you can create the dataset.

5. **Test Row-Level Security for the Dataset**
   You must verify that the predicate is applied properly and that each user can see their own sales targets.

**Determine Which Data to Include in the Dataset**

First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

You will obtain sales targets from the CSV file shown below.

<table>
<thead>
<tr>
<th>AccountOwner</th>
<th>Region</th>
<th>Target</th>
<th>TargetDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tony Santos</td>
<td>Midwest</td>
<td>10000</td>
<td>1/1/2011</td>
</tr>
<tr>
<td>Lucy Timmer</td>
<td>Northeast</td>
<td>50000</td>
<td>1/1/2011</td>
</tr>
<tr>
<td>Lucy Timmer</td>
<td>Northeast</td>
<td>0</td>
<td>12/1/2013</td>
</tr>
<tr>
<td>Bill Rolley</td>
<td>Midwest</td>
<td>15000</td>
<td>1/1/2011</td>
</tr>
<tr>
<td>Keith Laz</td>
<td>Southwest</td>
<td>35000</td>
<td>1/1/2011</td>
</tr>
<tr>
<td>Lucy Timmer</td>
<td>Southeast</td>
<td>40000</td>
<td>1/1/2011</td>
</tr>
</tbody>
</table>
If you were to create the dataset without implementing row-level security, any user that had access to the dataset would be able to see the sales targets for all account owners. For example, as shown below, Keith would be able to view the sales targets for all account owners.

You need to apply row-level security to restrict access to records in this dataset.

**Determine Row-Level Security for Dataset**

Now it’s time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

'AccountOwner' == "$User.Name"

**Note:** All predicate examples in this document escape the double quotes because it’s required when you enter the predicate in the Register transformation or metadata file. This predicate implements row-level security based on record ownership. Based on the predicate, Wave Analytics returns a sales target record when the user who submits the query on the dataset is the account owner.

Let’s take a deeper look into the predicate expression:

- AccountOwner refers to the dataset column that stores the full name of the account owner for each sales target.
- $User.Name refers to the Name column of the User object that stores the full name of each user. Wave Analytics performs a lookup to get the full name of the user who submits each query.

**Note:** The lookup returns a match when the names in AccountOwner and $User.Name match exactly—they must have the same case.

**Add the Predicate to the Metadata File**

For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

You must escape the double quotes around string values when entering a predicate in the metadata file.
In this example, you add the predicate to the metadata file shown below.

```json
{
    "fileFormat": {
        "charsetName": "UTF-8",
        "fieldsDelimitedBy": ",",
        "fieldsEnclosedBy": "\\",
        "numberOfLinesToIgnore": 1
    },
    "objects": [
        {
            "name": "Targets",
            "fullyQualifiedName": "Targets",
            "label": "Targets",
            "rowLevelSecurityFilter": "'AccountOwner' == \$User.Name\",
            "fields": [
                {
                    "name": "AccountOwner",
                    "fullyQualifiedName": "Targets.AccountOwner",
                    "label": "Account Owner",
                    "type": "Text"
                },
                {
                    "name": "Region",
                    "fullyQualifiedName": "Targets.Region",
                    "label": "Region",
                    "type": "Text"
                },
                {
                    "name": "Target",
                    "fullyQualifiedName": "Targets.Target",
                    "label": "Target",
                    "type": "Numeric",
                    "precision": 16,
                    "scale": 0,
                    "defaultValue": "0",
                    "format": null
                },
                {
                    "name": "TargetDate",
                    "fullyQualifiedName": "Targets.TargetDate",
                    "label": "TargetDate",
                    "description": "",
                    "type": "Date",
                    "format": "dd/MM/yy HH:mm:ss",
                    "isSystemField": false,
                    "fiscalMonthOffset": 0
                }
            ]
        }
    ]
}
```
Create the Dataset

Now that you updated the metadata file with the predicate, you can create the dataset.

⚠️ **Warning**: If you wish to perform the steps in this sample implementation, perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created.

To create the dataset, perform the following steps.

1. In Wave Analytics, go to the home page.
2. Click **Create > Dataset**
3. Click **CSV**.

   The following screen appears.

4. Select the CSV file and metadata (schema) file.
5. In the **Dataset Name** field, enter “SalesTarget” as the name of the dataset.
6. Optionally, choose a different app where you want to store the dataset.
7. Click **Create Dataset**

   Wave Analytics confirms that the upload is successful and then creates a job to create the dataset. You can view the SalesTarget dataset after the job completes successfully.
8. To verify that the job completes successfully, perform the following steps:
a. Click the gear icon (⚙️) and then select **Data Monitor** to open the data monitor. By default, the Jobs View of the data monitor appears. It shows the statuses of dataflow and external data upload jobs.

b. Click the Refresh Jobs button (🔄) to view the latest statuses of the jobs.

**Test Row-Level Security for the Dataset**

You must verify that the predicate is applied properly and that each user can see their own sales targets.

1. Log in to Wave Analytics as Keith.

2. Open the SalesTargets dataset. As shown in the following lens, notice that Keith can see only his sales target.

**Row-Level Security Example based on Opportunity Teams**

Let’s look at an example where you create a dataset based on Salesforce data and then implement row-level security based on an opportunity team. In this example, you will create a dataset that contains only opportunities associated with an opportunity team. To restrict access on each record in the dataset, you will create a security policy where only opportunity members can view their opportunity. This process requires multiple steps that are described in the sections that follow.

1. **Determine Which Data to Include in the Dataset**
   First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.

2. **Design the Dataflow to Load the Data**
   Now it’s time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.
3. **Determine Row-Level Security for the Dataset**
   Now it’s time to think about row-level security. How will you restrict access to each record in this dataset?

4. **Modify the Dataflow Based on Row-Level Security**
   It’s now time to add the predicate in the dataflow definition file.

5. **Create the Dataset**
   Now that you have the final dataflow definition file, you can create the dataset.

6. **Test Row-Level Security for the Dataset**
   You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

**Determine Which Data to Include in the Dataset**

First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.

You will obtain opportunities from the Opportunity object and the opportunity teams from the OpportunityTeamMember object. Both are Salesforce objects.

In this example, your Salesforce organization has the following opportunity team and users.

Your organization also contains the following opportunities, most of which are owned by Keith.

Acc - 1000 Widgets is the only opportunity shared by an opportunity team. Bill is the Sales Manager for this opportunity. Tony is the opportunity owner.
Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.

The dataflow will extract data from the Opportunity and OpportunityTeamMember objects, join the data, and then load it into the OppTeamMember dataset.

Now let's implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```json
{
  "Extract_OpportunityTeamMember": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OpportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
      "left": "Extract_OpportunityTeamMember",
      "left_key": [ "OpportunityId" ],
      "relationship": "TeamMember",
    }
  }
}
```
If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to see the opportunity shared by the opportunity team.

For example, as shown below, Lucy would be able to view the opportunity that belongs to an opportunity team of which she is not a member.

You need to apply row-level security to restrict access to records in this dataset.
Determine Row-Level Security for the Dataset

Now it’s time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

\[ 'UserId' == '\$User.Id' \]

This predicate compares the UserId column in the dataset against the ID of the user running a query against the dataset. The UserId column in the dataset contains the user ID of the team member associated with each opportunity. To determine the ID of the user running the query, Wave Analytics looks up the ID of the user making the query in the User object.

For each match, Wave Analytics returns the record to the user.

Modify the Dataflow Based on Row-Level Security

It’s now time to add the predicate in the dataflow definition file.

You add the predicate to the Register transformation that registers the OppTeamMember dataset as shown below.

```json
{
  "Extract_OpportunityTeamMember": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OpportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Name" },
        { "name": "OpportunityId" }
      ]
    }
  }
}
```
"object": "Opportunity",
"fields": [
    { "name": "Id" },
    { "name": "Name" },
    { "name": "Amount" },
    { "name": "StageName" },
    { "name": "AccountId" },
    { "name": "OwnerId" }
]
},

"Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
        "left": "Extract_OpportunityTeamMember",
        "left_key": [
            "OpportunityId"
        ],
        "relationship": "TeamMember",
        "right": "Extract_Opportunity",
        "right_key": [
            "Id"
        ],
        "right_select": [
            "Name","Amount"
        ]
    }
},

"Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
        "alias": "OppTeamMember",
        "name": "OppTeamMember",
        "source": "105_Augment_OpportunityTeamMember_Opportunity",
        "rowLevelSecurityFilter": "'UserId' == "$User.Id""
    }
}
Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

**Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon (⚙️) and then select Data Monitor to open the data monitor. The Jobs view of the data monitor appears by default.
2. Select Dataflow View.
3. Click the actions list (1) for the dataflow and then select Download to download the existing dataflow definition file.
4. Open the dataflow definition file in a JSON or text editor.
5. Add the JSON determined in the previous step.
6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid. An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save and close the dataflow definition file.
8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select Upload.
9. Select the updated dataflow definition file and click Upload.
10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select Run to run the dataflow job.
11. Click the Refresh Jobs button (🔄) to view the latest status of the dataflow job.

You can view the OppTeamMember dataset after the dataflow job completes successfully.

**Note:** If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.
Test Row-Level Security for the Dataset
You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

1. Log in to Wave Analytics as Lucy.
2. Open the OppTeamMember opportunity. Notice that Lucy can’t view the opportunity associated with the opportunity team anymore because she is not a member of the team.

3. Log out and now log in as Bill. Bill can view the opportunity that is shared by the opportunity team of which he is a member.
Row-Level Security Example based on Role Hierarchy and Record Ownership

Let’s look at an example where you create a dataset based on Salesforce data and then implement row-level security based on the Salesforce role hierarchy and record ownership. In this example, you will create a dataset that contains all opportunities. To restrict access on each record in the dataset, you will create a security policy where each user can view only opportunities that they own or that are owned by their subordinates based on the Salesforce role hierarchy. This process requires multiple steps that are described in the sections that follow.

1. Determine Which Data to Include in the Dataset
   First, determine what data you want to include in the dataset. For this example, you will create the OppRoles dataset that contains all opportunities as well as user details about each opportunity owner, such as their full name, division, and title.

2. Design the Dataflow to Load the Data
   Now it’s time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

3. Determine Row-Level Security for the Dataset
   Now it’s time to think about row-level security. How will you restrict access to each record in this dataset?

4. Modify the Dataflow Based on Row-Level Security
   Now it’s time to modify the dataflow definition file to account for the predicate.

5. Create the Dataset
   Now that you have the final dataflow definition file, you can create the dataset.

6. Test Row-Level Security for the Dataset
   You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

flatten Parameters

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create the OppRoles dataset that contains all opportunities as well as user details about each opportunity owner, such as their full name, division, and title.

You will obtain opportunities from the Opportunity object and user details from the User object. Both are objects in Salesforce.

In this example, your Salesforce organization has the following role hierarchy and users.

[Diagram of role hierarchy]

- VP_Sales
  - East_Sales
    - NJ_Sales
    - NY_Sales
  - West_Sales
    - CA_Sales
    - WA_Sales

- Tony
- Joe
- John
- Mary

Available in Salesforce Classic and Lightning Experience.
Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.
Also, your organization contains the following opportunities, most of which are owned by Keith.

Design the Dataflow to Load the Data

Now it’s time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

![Diagram of dataflow]

The dataflow will extract data from the Opportunity and User objects, join the data, and then load it into the OppRoles dataset.

Now let’s implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```json
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  }
}
```
If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to view all opportunities. For example, as shown below, Bill would be able to view all opportunities, including those owned by his manager Keith.
You need to apply row-level security to restrict access to records in this dataset.

**Determine Row-Level Security for the Dataset**

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'ParentRoleIDs' == "$User.UserRoleId" || 'OwnerId' == "$User.Id"
```

**Note:** The current dataflow doesn't contain logic to create a dataset column named “ParentRoleIDs.” ParentRoleIDs is a placeholder for the name of a column that will contain this information. In the next step, you will modify the dataflow to add this column to the dataset. This column name will change based on how you configure the dataflow.

Based on the predicate, Wave Analytics returns an opportunity record if:

- The user who submits the query is a parent of the opportunity owner based on the Salesforce role hierarchy. Wave Analytics determines this based on their role IDs and the role hierarchy.
- Or, the user who submits the query on the dataset is the opportunity owner.

Let’s examine both parts of this predicate.
### Predicate Part

<table>
<thead>
<tr>
<th>Predicate Part</th>
<th>Description</th>
</tr>
</thead>
</table>
| 'ParentRoleIDs' == "$User.UserRoleId"              | • ParentRoleIDs refers to a dataset column that contains a comma-separated list of role IDs of all users above the opportunity owner based on the role hierarchy. You will create this dataset column in the next section.  
• $User.UserRoleId refers to the UserRoleId column of the User object. Wave Analytics looks up the user role ID of the user who submits the query from the User object. |
| 'OwnerId' == "$User.Id"                             | • OwnerId refers to the dataset column that contains the user ID of the owner of each opportunity.  
• $User.Id refers to the Id column of the User object. Wave Analytics looks up the user ID of the user who submits the query from the User object. |

### Modify the Dataflow Based on Row-Level Security

Now it’s time to modify the dataflow definition file to account for the predicate.

In this scenario, you have to make changes to the dataflow based on the predicate.

- Add a column in the dataset that stores a comma-separated list of the role IDs of all parents for each opportunity owner. When you defined the predicate in the previous step, you temporarily referred to this column as “ParentRoleIDs.” To add the column, you redesign the dataflow as shown in the following diagram:

The new dataflow design contains the following changes:

- Extracts the role IDs from the UserRole object.
- Uses the Flatten transformation to generate a column that stores a comma-separated list of the role IDs of all parents of each user. When you determined the predicate in the previous step, you temporarily referred to this column as “ParentRoleIDs.”
- Link the new column to the OppRoles dataset.
• Add the predicate to the Register transformation that registers the OppRoles dataset.

You modify the dataflow as shown below.

```json
{
    "Extract_Opportunity": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "Opportunity",
            "fields": [
                { "name": "Id" },
                { "name": "Name" },
                { "name": "Amount" },
                { "name": "StageName" },
                { "name": "AccountId" },
                { "name": "OwnerId" }
            ]
        }
    },
    "Extract_User": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "User",
            "fields": [
                { "name": "Id" },
                { "name": "Username" },
                { "name": "LastName" },
                { "name": "FirstName" },
                { "name": "Name" },
                { "name": "CompanyName" },
                { "name": "Division" },
                { "name": "Department" },
                { "name": "Title" },
                { "name": "Alias" },
                { "name": "CommunityNickname" },
                { "name": "UserType" },
                { "name": "UserRoleId" }
            ]
        }
    },
    "Extract_UserRole": {
        "action": "sfdcDigest",
        "parameters": {
            "object": "UserRole",
            "fields": [
                { "name": "Id" },
                { "name": "ParentRoleId" },
                { "name": "RollupDescription" },
                { "name": "OpportunityAccessForAccountOwner" },
                { "name": "CaseAccessForAccountOwner" },
                { "name": "ContactAccessForAccountOwner" },
                { "name": "ForecastUserId" },
                { "name": "MayForecastManagerShare" },
                { "name": "LastModifiedDate" },
                { "name": "LastModifiedById" }
            ]
        }
    }
}
```

  }
}
Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

**Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon (.Imp) and then select Data Monitor to open the data monitor. The Jobs View of the data monitor appears by default.

2. Select Dataflow View.

3. Click the actions list (1) for the dataflow and then select Download to download the existing dataflow definition file.

4. Open the dataflow definition file in a JSON or text editor.

5. Add the JSON determined in the previous step.
6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid. An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.

7. Save and close the dataflow definition file.

8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Upload**.

9. Select the updated dataflow definition file and click **Upload**.

10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Run** to run the dataflow job.

11. Click the **Refresh Jobs** button (ERSIST) to view the latest status of the dataflow job. You can view the OppRoles dataset after the dataflow job completes successfully.

   **Note:** If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.

**Test Row-Level Security for the Dataset**

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

1. Log in to Wave Analytics as Bill.

2. Open the OppRoles opportunity. Notice that Bill can’t see his manager Keith’s opportunities anymore. Now, he can see only his opportunity and his subordinate Tony’s opportunity.

3. Log out and now log in as Keith.
As expected, Keith can still see all opportunities.

### Predicate Expression Syntax for Datasets

You must use valid syntax when defining the predicate expression.

The predicate expression must have the following syntax:

`<dataset column> <operator> <value>`

For example, you can define the following predicate expression for a dataset:

```
'UserId' == "$User.Id"
```

You can create more complex predicate expressions such as:

```
('Expected_Revenue' > 4000 || 'Stage Name' == "Closed Won") && 'isDeleted' != "False"
```

Consider the following requirements for the predicate expression:

- The expression is case-sensitive.
- The expression cannot exceed 1,000 characters.
- There must be at least one space between the dataset column and the operator, between the operator and the value, and before and after logical operators. This expression is not valid: `'Revenue' > 100`. It must have spaces like this: `'Revenue' > 100`.

If you try to apply a predicate to a dataset and the predicate is not valid, an error appears when any user tries to query the dataset.
Dataset Columns in a Predicate Expression
You include at least one dataset column as part of the predicate expression.

Values in a Predicate Expression
The value in the predicate expression can be a string literal or number literal. It can also be a field value from the User object in Salesforce.

Escape Sequences
You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

Character Set Support
Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (.Schedule Icon). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

Special Characters
Certain characters have a special meaning in Wave Analytics.

Operators
You can use comparison operators and logical operators in predicate expressions.

Sample Predicate Expressions for Datasets
Review the samples to see how to structure a predicate expression.

<table>
<thead>
<tr>
<th>Value Type</th>
<th>Requirements</th>
<th>Predicate Expression Examples</th>
</tr>
</thead>
</table>
| string literal | Enclose in double quotes and escape the double quotes. | • 'Owner' == "Amber"
               |                                                   | • 'Stage Name' == "Closed Won"
| number literal | Can be a float or long datatype. Do not enclose in quotes. | • 'Expected_Revenue' >= 2000.00
                                                          |                                                   | • 'NetLoss' < -10000

Note: A set of characters in double quotes is treated as a string rather than a column name.
<table>
<thead>
<tr>
<th>Value Type</th>
<th>Requirements</th>
<th>Predicate Expression Examples</th>
</tr>
</thead>
</table>
| field value     | When referencing a field from the User object, use the $User.[field] syntax. Use the API name for the field. You can specify standard or custom fields. When you define a predicate for a dataset, you must have read access on all User object fields used to create the predicate expression. However, when a user queries a dataset that has a predicate based on the User object, Wave Analytics uses the access permissions of the Insights Security User to evaluate the predicate expression based on the User object. **Note:** By default, the Security User does not have access permission on custom fields of the User object. To grant the Security User read access on a field, set field-level security on the field in the user profile of the Security User. | • 'Owner.Role' == "$User.UserRoleId"  
  • 'GroupID' == "$User.UserGroupId__c" |

**Escape Sequences**

You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

You can use the \ escape sequence to escape a single quote in a column name. For example:

`'Team\'s Name' == "West Region Accounts"`

You can use the following escape sequences for special characters in string values.

<table>
<thead>
<tr>
<th>Sequence</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\b</td>
<td>One backspace character</td>
</tr>
<tr>
<td>\n</td>
<td>New line</td>
</tr>
<tr>
<td>\r</td>
<td>Carriage return</td>
</tr>
<tr>
<td>\t</td>
<td>Tab</td>
</tr>
<tr>
<td>\Z</td>
<td>CTRL+Z (ASCII 26)</td>
</tr>
<tr>
<td>&quot;</td>
<td>One double-quote character</td>
</tr>
<tr>
<td>\</td>
<td>One backslash character</td>
</tr>
<tr>
<td>\0</td>
<td>One ASCII null character</td>
</tr>
</tbody>
</table>
## Character Set Support

Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (François). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

## Special Characters

Certain characters have a special meaning in Wave Analytics.

<table>
<thead>
<tr>
<th>Character</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'</td>
<td>Single quote</td>
<td>Encloses a dataset column name in a predicate expression.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'Expected_Revenue' &gt;= 2000.00</td>
</tr>
<tr>
<td>&quot;</td>
<td>Double quote</td>
<td>Encloses a string value or field value in a predicate expression.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'OpportunityOwner' == &quot;Michael Vesti&quot;</td>
</tr>
<tr>
<td>()</td>
<td>Parentheses</td>
<td>Enforces the order in which to evaluate a predicate expression.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>('Expected_Revenue' &gt; 4000</td>
</tr>
<tr>
<td>$</td>
<td>Dollar sign</td>
<td>Identifies the Salesforce object in a predicate expression.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> You can only use the User object in a predicate expression.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'Owner.Role' == &quot;$User.UserRoleId&quot;</td>
</tr>
<tr>
<td>.</td>
<td>Period</td>
<td>Separates the object name and field name in a predicate expression.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'Owner' == &quot;$User.UserID&quot;</td>
</tr>
</tbody>
</table>
Operators

You can use comparison operators and logical operators in predicate expressions.

Comparison Operators
Comparison operators return true or false.

Logical Operators
Logical operators return true or false.

Comparison Operators

Comparison operators return true or false.

Wave Analytics supports the following comparison operators.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>==</td>
<td>Equals</td>
<td>True if the operands are equal. String comparisons that use the equals operator are case-sensitive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expressions:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'Stage Name' == &quot;Closed Won&quot;</td>
</tr>
<tr>
<td>!=</td>
<td>Not equals</td>
<td>True if the operands are not equal. String comparisons that use the not equals operator are case-sensitive.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'isDeleted' != &quot;False&quot;</td>
</tr>
<tr>
<td>&lt;</td>
<td>Less than</td>
<td>True if the left operand is less than the right operand.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'Revenue' &lt; 100</td>
</tr>
<tr>
<td>&lt;=</td>
<td>Less or equal</td>
<td>True if the left operand is less than or equal to the right operand.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Greater than</td>
<td>True if the left operand is greater than the right operand.</td>
</tr>
<tr>
<td>&gt;=</td>
<td>Greater or equal</td>
<td>True if the left operand is greater than or equal to the right operand.</td>
</tr>
<tr>
<td>in</td>
<td>Multi-value list filter</td>
<td>True if the left operand exists in the list of strings substituted for a multi-value picklist (field value).</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Example predicate expression:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>'Demog' in ['$User.Demographic__c']</td>
</tr>
<tr>
<td></td>
<td></td>
<td>In this example, Demographic__c is of type multiPicklistField. During evaluation,</td>
</tr>
<tr>
<td></td>
<td></td>
<td>the multi-value picklist field is substituted by a list of strings, with 1 string per user-selected item.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> Comma-separated lists are not supported within the square-bracket construct.</td>
</tr>
</tbody>
</table>

You can use the <, <=, >, and >= operators with measure columns only.
Logical Operators

Logical operators return true or false.

Wave Analytics supports the following logical operators.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp;&amp;</td>
<td>Logical AND</td>
<td>True if both operands are true. Example predicate expression: 'Stage Name' == &quot;Closed Won&quot; &amp;&amp; 'isDeleted' != &quot;False&quot;</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Sample Predicate Expressions for Datasets

Review the samples to see how to structure a predicate expression.

The samples are based on the following Opportunity dataset.

<table>
<thead>
<tr>
<th>Opportunity</th>
<th>Expected_Rev</th>
<th>Owner</th>
<th>OwnerRoleID</th>
<th>Stage_Name</th>
<th>IsDeleted</th>
</tr>
</thead>
<tbody>
<tr>
<td>OppA</td>
<td>2000.00</td>
<td>Bill</td>
<td>20</td>
<td>Prospecting</td>
<td>True</td>
</tr>
<tr>
<td>OppB</td>
<td>3000.00</td>
<td>Joe</td>
<td>22</td>
<td>Closed Won</td>
<td>False</td>
</tr>
<tr>
<td>OppC</td>
<td>1000.00</td>
<td>可爱的花</td>
<td>36</td>
<td>Closed Won</td>
<td>False</td>
</tr>
<tr>
<td>OppD</td>
<td>5000.00</td>
<td>O'Fallon</td>
<td>18</td>
<td>Prospecting</td>
<td>True</td>
</tr>
<tr>
<td>OppE</td>
<td></td>
<td>Joe</td>
<td>22</td>
<td>Closed Won</td>
<td>True</td>
</tr>
</tbody>
</table>

Let’s take a look at some examples to understand how to construct a predicate expression.

<table>
<thead>
<tr>
<th>Predicate Expression</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>'OwnerRoleID' == &quot;$User.UserRoleId&quot;</td>
<td>Checks column values in the User object.</td>
</tr>
<tr>
<td>'Expected_Rev' &gt; 1000 &amp;&amp; 'Expected_Rev' &lt;= 3000</td>
<td></td>
</tr>
<tr>
<td>'Owner' = &quot;Joe&quot;</td>
<td></td>
</tr>
<tr>
<td>('Expected_Rev' &gt; 4000</td>
<td></td>
</tr>
</tbody>
</table>
Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. There are multiple ways to create datasets. You can also edit datasets after they’ve been created.

⚠️ Tip: To ensure that you do not reach the limit (250 million) for the maximum number of rows in all registered datasets, deleted unused datasets.

SEE ALSO:

- Create a Dataset with External Data
- Edit a Dataset
- Delete a Dataset

Data Monitor

The data monitor provides options for you to manage jobs.

SEE ALSO:

- Start and Stop a Dataflow
- Reschedule and Unschedule a Dataflow
- Monitor a Dataflow Job
- Monitor an External Data Upload

External Data

You can integrate external data into Wave Analytics to make the data available for queries from explorer and designer.

The External Data API enables you to upload external data files to Wave Analytics. The External Data API can upload .csv files, and you can optionally specify the structure of your data by defining metadata in JSON format.
The External Data API is available in API version 31 and later.

The high-level steps for uploading external data by using the API are:

1. Prepare your data in CSV format, and then create a metadata file to specify the structure of the data.
2. Connect programmatically to your Salesforce organization.
3. Configure the upload by inserting a row into the InsightsExternalData object, and then set input values such as the name of the dataset, the format of the data, and the operation to perform on the data.
4. Split your data into 10-MB chunks, and then upload the chunks to InsightsExternalDataPart objects.
5. Start the upload by updating the Action field in the InsightsExternalData object.
6. Monitor the InsightsExternalData object for status updates, and then verify that the file upload was successful.

Explore and Visualize Your Data

When sifting through an overwhelming amount of business data, sometimes you know exactly what you’re looking for. Other times you don’t, but you recognize it when you see it. Salesforce Wave Analytics gives you a fast, fluid way to discover the compelling stories within your data and to create the right visuals to tell your story.

After your data is uploaded, explore freely. Drill through the data by using interactive visualizations. Surface unexpected insights that can transform your business. Then let Wave Analytics do the work of producing dynamic charts that look sharp and communicate volumes.

Exploring and Visualizing Your Data Interactively

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

Get Oriented in Wave Analytics

Go to Wave Analytics by opening the Force.com app menu in the Salesforce header and then clicking Wave Analytics.

Collections of Data in Wave Analytics

Several kinds of data collections are available from the home page. Datasets, lenses, dashboards, and apps represent levels of data refinement—everything from raw data that’s uploaded from your source systems to highly curated, packaged views of your data.

Data Exploration Concepts

As you learn how to explore and visualize your data, it’s helpful to review key concepts such as visualization, measure, and dimension.

Explore Your Data

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

Clone a Visualization

Build upon a visualization by cloning it to a new tab where you can continue exploring while saving the original in its own tab.

Save a Visualization

Save your visualization as a lens.

Share a Visualization

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, downloading a screenshot of it, or downloading its filtered data. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that’s presented. To share without giving access to the asset, use the download options.

Export a Visualization as an Image

Export your current visualization so that you can save it as an image file.
Exploring and Visualizing Your Data Interactively

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

- **View**—View the data set.
- **Explore**—Get to know the boundaries and shape of your data. Play with different views, zoom in and zoom out, and see what you get with different charting options.
- **Refine**—Narrow your view to the most important data. Decide the level of detail and categorization that’s easiest for your colleagues to understand. Choose the most appropriate chart visualization.
- **Save**—Save your work.
- **Share**—Share your view with others. For a more packaged presentation, use your visualization to build a dashboard.

Get Oriented in Wave Analytics

Go to Wave Analytics by opening the Force.com app menu in the Salesforce header and then clicking **Wave Analytics**.

1. Open Wave Analytics.

   The home page is your home base for exploring all the data that you have access to.

Collections of Data in Wave Analytics

Several kinds of data collections are available from the home page. Datasets, lenses, dashboards, and apps represent levels of data refinement—everything from raw data that’s uploaded from your source systems to highly curated, packaged views of your data.
• A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.

• A *lens* is a particular view into a dataset’s data. It’s where you do exploratory analysis and visualization.

• A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.

• An *app* contains dashboards, lenses, and datasets in any combination that makes sense for sharing your data analyses with colleagues. Apps are like folders: They allow users to organize their data projects—private and shared—and to control sharing.

**Data Exploration Concepts**

As you learn how to explore and visualize your data, it’s helpful to review key concepts such as visualization, measure, and dimension.

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate. Measures have names (revenue) and values ($1,000,000). When you’re viewing a chart visualization in Wave Analytics, it’s important to remember:

• The chart either shows a slice of your data based on the number of or amount of something, or it shows tabular data.

• A measure is typically *aggregated* in some way, which means that it’s displayed with some math already applied to it. For example, when you first view a dataset, you often see a simple aggregation such as the count of the number of rows. You typically aggregate by a different method—sum, average, maximum, and so on—as you explore and change or add measures, but you always specify how you want to aggregate at the time when you select the measure.

• You can identify measures by their position (the far left items in the top left corner of a lens) and by the text that indicates the aggregation method (such as Sum of Revenue).

⚠️ **Warning:** If you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum for a numeric field (36,028,797,018,963,967), the value overflows and Wave Analytics returns an incorrect result.

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can’t perform math on dimensions. Like measures, dimensions also have names (region) and values (northeast). Time is usually considered a dimension rather than a measure.

**Explore Your Data**

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

**View Your Data in a Lens**

When you look at data in an exploratory mode, you do so in a *lens*. A lens has several aspects: it’s how you view data in a dataset, it’s the place where you explore the data graphically, and it’s the basis for building any dashboard.

**Group Your Data into Categories**

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

**Filter Your Data**

Apply filters in a lens to unclutter your chart and focus on the subset of data that’s most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.
Change the Sort Order
Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

Change the Chart Type
Switch between chart types to see which visualization options tell the most compelling story for your data.

Change Measures
Your choice of measure defines your entire visualization and determines the scope of your exploration. For example, change the measure and the aggregation method from “Count of Opportunities” to “Sum of Amount.” Then add a second measure to see two visualizations side by side.

Change the Chart Scale
Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

Create Calculated Columns Using the Compare Table
Use the Compare Table to define custom formulas with columns of data. View measures side by side, and perform math across the table’s columns and rows.

Return to a Previous View by Using History
Exploring your data can lead you down many paths. Not all of them will be fruitful, and that’s OK. Explorer keeps a full history of your activity in a lens. If you’ve changed your lens in undesired ways, or just want to see those nifty animations again, use history to backtrack quickly to a previous state in your visualization.

Apply Groups and Filters by Copying and Pasting Using Your Browser’s Clipboard
Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer’s copy and paste tools to replicate specific groupings and filters from one tab to another.

View the Query Behind Your Lens
Wave Analytics uses Salesforce Analytics Query Language (SAQL) behind the scenes in lenses and dashboards to gather data for visualizations. Open the SAQL viewer to watch the underlying SAQL query being written as you explore or to copy it for use elsewhere.

View Your Data in a Lens
When you look at data in an exploratory mode, you do so in a lens. A lens has several aspects: it’s how you view data in a dataset, it’s the place where you explore the data graphically, and it’s the basis for building any dashboard.

1. From the home page, click a dataset or a lens.
   A lens opens in a new tab. For example, this lens opens as a bar chart that shows the number of rows in an opportunity dataset.
Group Your Data into Categories

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

1. Click the **Group** button.

2. Using the search box, type the first few letters of the dimension that you want to group by, such as Close Date.
   The dimensions in your data determine which categories you can group by.

3. Hover over the Close Date line. Click the **Scale** button that appears at the right.

4. In the Calendar Date Scale list, click Month.
To add a secondary grouping, also called a stacked grouping, click the Group button. Using the search box, find the StageName dimension, and then select it.

At this point, we're just adding a group. If you had clicked the Filter button, a group and a filter would have been added.
Filter Your Data

Apply filters in a lens to unclutter your chart and focus on the subset of data that’s most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.

1. Click Filter.

In the Add a Filter dialog box, measures are listed at the top, followed by dimensions.

2. Select the FiscalYear dimension.
   The values for FiscalYear appear.
3. Select 2012 and 2013, and then click **Add**. If you use the search box to find values to filter by, be aware that this search is case-sensitive. The filter that you’ve applied is displayed next to the **Filter** button.

The chart visualization changes to show data for fiscal years 2012 and 2013.
Change the Sort Order

Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

1. Click the Options button.

2. In the dialog box, choose Asc (sorted ascending), Dsc (sorted descending), or Off (unsorted).

Change the Chart Type

Switch between chart types to see which visualization options tell the most compelling story for your data.

1. Click the Change Chart Type button.

A gallery of chart types that are available for this lens is displayed.

2. Hover over a chart type to see how many measures and dimensions that type of visualization requires.
For example, a donut chart can have one measure and one or two dimensions.

3. Click a chart type, such as Stacked Bar. The chart visualization changes.

Change Measures

Your choice of measure defines your entire visualization and determines the scope of your exploration. For example, change the measure and the aggregation method from “Count of Opportunities” to “Sum of Amount.” Then add a second measure to see two visualizations side by side.

1. Click the aggregation Sum, and then click the Amount (monthly rec, USD) measure. The visualization changes to show the Sum of Amount.
2. To add a second measure, click the Measure button.

3. Click the aggregation Average, and then click the Open Duration (days) measure.

The new measure is displayed on the right.

4. To move the new measure to the left, click Avg of Open Duration (days), and then click < Move Left.
The two visualizations swap positions.

To add additional measures, click the Measure button again.

You can have a maximum of four measures in a lens.
Change the Chart Scale

Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

1. Click the Options button.

2. In the dialog box, choose a scale.

Create Calculated Columns Using the Compare Table

Use the Compare Table to define custom formulas with columns of data. View measures side by side, and perform math across the table’s columns and rows.

1. Select Compare Table from the chart type gallery.

2. Add dimensions by clicking Group.

3. Change the first measure by clicking the cells selection (“Count of Rows”). Add more measures by clicking the arrow in the measure column header and then selecting add a column.
With the new column selected, click the **cells** selection to change the measure. You can also apply a filter by clicking the header of a measure column to select it and then clicking **Filter**.

Notice that dimension columns are on the left and measure columns are on the right. The measure columns are identified in formulas as A, B, C, and so on, with A being the far left measure column.

4. Add a measure column to hold a custom formula, and then select **edit formula and format** from the drop-down menu.
In the **formula** field, create formulas using operators from this table.

**Note:** Measure columns are identified by uppercase letters from left to right.

<table>
<thead>
<tr>
<th>Symbol</th>

<td>A-B, A-100</td>
<td>Subtraction, applied per row.</td>
</tr>
<tr>
<td>/</td>
<td>A/B, A/100</td>
<td>Division, applied per row.</td>
</tr>
<tr>
<td>*</td>
<td>A<em>B, A</em>100</td>
<td>Multiplication, applied per row.</td>
</tr>
<tr>
<td>( )</td>
<td>(B-A)/(A*100)</td>
<td>Parentheses for grouping operations.</td>
</tr>
</tbody>
</table>

**Tip:** Use Compare Tables for simple, ad hoc calculations. If a particular calculated value is needed frequently or is more complex, consider performing the calculation at the source data level.
Return to a Previous View by Using History

Exploring your data can lead you down many paths. Not all of them will be fruitful, and that's OK. Explorer keeps a full history of your activity in a lens. If you’ve changed your lens in undesired ways, or just want to see those nifty animations again, use history to backtrack quickly to a previous state in your visualization.

1. Click the View History button in the header. A sidebar lists a history of all the actions that you’ve taken in the lens.

![History](image)

   - groups changed to Close Date (month)
   - groups changed to StageName
   - filter on FiscalYear added: 2013
   - filter removed: FiscalYear

2. Select any item in the list to go to that point. Or use the buttons to Step Backward and Step Forward through the list.

Apply Groups and Filters by Copying and Pasting Using Your Browser’s Clipboard

Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer's copy and paste tools to replicate specific groupings and filters from one tab to another.

From the home page, each time you click a dataset, it opens in a new tab. The copy and paste tools in explorer are designed to be used when you have the same dataset in multiple tabs.

1. If the chart type that you’re viewing allows you to select a subset of data, make your selection by clicking or by clicking and dragging within the chart. Everything except your selected data is unavailable.

2. Click the Actions button.

3. Copy the selection to your browser’s clipboard. Click Copy to capture the selected items in the clipboard. You can decide later whether to paste your selection as a group or as a filter. Click Focus to both capture the selected items in the clipboard and apply them as a filter to the current chart.

4. Switch to a different Wave Analytics tab that has the same dataset.

5. Click the Actions button.
6. Apply the selection from the clipboard to the current chart. Click **Paste as Group** to make the data display grouped by the selected dimensions. Click **Paste as Filter** to make the data display with your selection applied as a filter.

To restore a chart to the full dataset, remove your selection by clicking and then **Clear**.

**View the Query Behind Your Lens**

Wave Analytics uses Salesforce Analytics Query Language (SAQL) behind the scenes in lenses and dashboards to gather data for visualizations. Open the SAQL viewer to watch the underlying SAQL query being written as you explore or to copy it for use elsewhere.

1. Open the Options menu ( ) to access the **Show SAQL** control.

![Show SAQL](image)

2. Select **On**.

   The SAQL Query pane opens. Continue exploring and see your work expressed in SAQL.

For more information about SAQL, see the **Wave Analytics SAQL Reference**.

---

**EDITIONS**

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

**USER PERMISSIONS**

To view visualizations:

- “Use Wave Analytics”
Clone a Visualization

Build upon a visualization by cloning it to a new tab where you can continue exploring while saving the original in its own tab.

1. Click the Clone in New Tab icon.

2. Continue exploring in the new tab, building upon the visualization. When you reach the next view that you want to keep, click Save and then Clone in New Tab again.

Save a Visualization

Save your visualization as a lens.

1. Click the Save icon.

2. Enter a title and a description for your lens, and select the app to save it in.

3. Click Save.
Share a Visualization

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, downloading a screenshot of it, or downloading its filtered data. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that's presented. To share without giving access to the asset, use the download options.

1. Click Share.

2. Click the tab for the sharing method that you want:
   a. Post to Feed posts to Chatter an image and the link to the lens, dashboard, or app. Select User or Group feed, enter the name, and then type your comment. You can also remove the image from your post by hovering over it and clicking the x. Note that posted images are public.
   b. Get URL provides a unique URL to the asset. Copy the link and then paste it wherever you want to share it.
   c. Download gives you options to share a visualization without giving access to it. You can download it as an image (.png) or as filtered data in Microsoft® Excel® (.xls) or comma-separated values (.csv) format.

3. If applicable, click Give Access to set the level of sharing access.

4. Click Done.

   **Note:** To share a visualization, you must give access to the app that contains it. Lenses, datasets, and dashboards within the default Shared App are accessible to all Wave Analytics users, unless administrators have restricted access. All other apps are private unless someone with Manager access to the app has shared it with a specific user, group, or role.

Export a Visualization as an Image

Export your current visualization so that you can save it as an image file.

1. Click the Actions button.

2. Click Export as Image.
   A new browser window opens with the visualization in a .png image file.

3. Right-click the image, and then choose Save Image As....

4. Type a file name, and then click Save.
Key Elements of a Wave Dashboard

A dashboard isn’t just for reading. It’s for carrying on a conversation based on one or more datasets that matter to your company. Don’t just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around and explore!

You read a Salesforce Wave dashboard interactively by clicking its displayed elements. Every element is a picture of a live, filtered database query.

Selectors
A selector lets you filter down to a particular value that matters to you. For example, you can set the maximum and minimum sliders in a range selector to make the dashboard show only the amounts that fall within a specific range. Watch the charts and numbers on the page change when you set the sliders. Selectors are often tied to each other in sequence so that you can progressively drill deeper. For example, you can use one selector to look at sales of a product, then use the next selector to filter sales by region, and then use the next selector to filter sales regions by account. There are different types of selectors, such as list, selectors, toggle, date, and range selectors.

Key Performance Indicators
Some information is best represented by a single number. Some number elements can be affected by filtering actions that you take on charts or selectors. For example, in a bar chart that shows individual salespeople’s pipelines, clicking a specific bar can cause a number element to change to reflect the specific bar’s value instead of the total value.

Charts
A rich variety of charts shows you data from multiple angles. Many parts of a chart are interactive. For example, click a bar in a bar chart and watch what happens. Clicking a bar filters the query that the bar chart represents. Your revision changes other values in this chart, values in other charts, and number displays.
Build Wave Dashboards

You’ve explored your data, picking out the useful themes and patterns. You’ve created one or more lenses. Now you can design a dashboard to help your audience turn data into decisions.

Here’s what a dashboard can look like when it’s fully fleshed out. We’ll show you step by step some of the basic concepts to get started creating dashboards, along with some best practices and design tips.

No two dashboards are quite the same—every dashboard tells a unique story. The universe of stuff that you can show in a dashboard is infinite, so we won’t try to tell you exactly what to do.

Tip: Although steps are laid out in order, you don’t have to follow the sequences exactly, and some steps are optional.

1. **Plan Your Dashboard**
   Building a dashboard that delivers real, ongoing value requires planning and making choices. Plan your dashboard to help narrow your audience’s focus to a manageable set of questions for basing actions upon, and to support ongoing updates so that your audience can see a coherent picture over time.

2. **Sketch Your Dashboard**
   It’s usually a good idea to sketch your dashboard on paper or a whiteboard before you start building. Doing so helps you anticipate ways that your audience might use the dashboard and address potential gaps.
3. **Construct the Dashboard**
   When you’ve thought through the purpose and design of your dashboard, you’re ready to create the dashboard and assemble its pieces.

**Plan Your Dashboard**

Building a dashboard that delivers real, ongoing value requires planning and making choices. Plan your dashboard to help narrow your audience’s focus to a manageable set of questions for basing actions upon, and to support ongoing updates so that your audience can see a coherent picture over time.

It’s a good idea to start with a written plan for the dashboard. Use your plan to define the dashboard’s focus up front, and then stick to the plan. Identify the specific question, business process, or user group that the dashboard will support, and eliminate anything that doesn’t support those.

1. **Who is the audience?**
   Will the dashboard be used by the executive team, the marketing team, a sales team, or another group? It’s important to ensure that each dashboard presents data that’s specific to a single audience.
   For example, for a sales manager planning a dashboard for a weekly sales team meeting, the audience is the attendees of that meeting.

2. **What does the audience need to measure?**
   What questions does the audience need to answer to meet its goals? Continuing our sales manager example, let’s assume that the audience wants to know what each salesperson’s pipeline looks like and how the overall pipeline is doing.

3. **How often does the audience need to update its knowledge?**
   Does the executive team need quarterly financials? Does the marketing team want to monitor daily lead generation numbers?
   To understand some of the key tasks involved in creating a dashboard, in the next sections, we’ll create a dashboard for a sales team that meets weekly to go over its sales pipeline status.

**SEE ALSO:**
- What Kind of Dashboard Should I Create?

**Sketch Your Dashboard**

It’s usually a good idea to sketch your dashboard on paper or a whiteboard before you start building. Doing so helps you anticipate ways that your audience might use the dashboard and address potential gaps.

Keep in mind that a chart in Wave Analytics is primarily a way to ask questions, not a way to illustrate a conclusion. A good dashboard invites the audience to drill down and seek ever more focused and useful information.

Consider these widely accepted best practices as you sketch out your own dashboard.

1. **Prioritize elements, top left to bottom right.**
With languages that are read left to right, people start by looking at the top left corner and working their way down. Consider the audience's language and design for it. If your audience has limited time or attention, place important elements where they will be noticed.

a. Place more general, actionable information in charts near the top left, and place charts with supporting information lower.
b. Group filters together at the top or left so that they are quickly noticeable.
c. Place information that can be read at a glance high and to the left, and place the details lower.

For example, place numbers that display a single measure, such as revenue for the current quarter, high and to the left.

Highlight facts that the audience wants to know at a glance.

2. Choose chart types based on the characteristics of the data, not for look or variety.
   For example, if most of your charts display value changes over time, it's OK if they're all line graphs.

3. Use containers to frame and organize related elements in the dashboard.

4. Apply labels to sections and charts to annotate the dashboard.

5. Use colors to define sections.
6. Don’t overload the dashboard—leave some empty space.
   If a chart seems to need a lengthy caption or title, reconsider whether the chart is doing its job. Well-chosen data often speaks for itself.

**Construct the Dashboard**

When you’ve thought through the purpose and design of your dashboard, you’re ready to create the dashboard and assemble its pieces.

A Wave dashboard is a collection of widgets that work together to tell a data story from multiple angles. Widgets are the units that contain the information that you want to show to your audience. There are different types of widgets, such as visualizations based on queries, tables, filters, or images.

In the next sections, we’ll take a look at an example that illustrates how to build a sales pipeline dashboard with different types of widgets.

1. **Create the Dashboard**
   When you create a dashboard, you can apply a prepackaged layout or start with a blank canvas to create your own layout. To build the dashboard, you can use the original dashboard designer or, if your org has enabled it, the new flex dashboard designer. In our example, we’ll use the original designer.

2. **Add Key Performance Indicators to the Dashboard**
   Sometimes, a single number can provide a quick and critical measurement of the business. For example, the total number of open support cases and number of new support cases open this week are key metrics that a service manager would find very useful. Add Number widgets to provide key indicators to a dashboard.

3. **Add Visualizations to the Dashboard**
   Add charts to visualize and interact with the data to tell a story about it. Each chart is based on the underlying query in a lens.

4. **Facet Widgets to See Data from Multiple Angles**
   Widgets that come from the same dataset are faceted by default. Faceting means that when you filter one widget, all the related widgets are filtered in the same way. You can turn faceting on or off for each widget.

5. **Add Images to the Dashboard**
   Add images to your dashboard to help your audience with context and to make the dashboard more fun to read. For example, if your dashboard is designed to help track sales of multiple products, consider distinguishing the products by their logos.

6. **Link to Lenses and Other Dashboards**
   Use links to tie a dashboard to related lenses and dashboards. This widget is useful when you want to break up analysis across multiple assets, rather than cramming it all into a single dashboard. It’s also useful for creating pathways to analyze your data.

7. **Refine the Dashboard**
   Use visual groupings, colors, labels, and links to clean up your dashboard and focus your audience’s attention.

8. **See Details About a Widget’s Lens**
   To ensure that a widget is showing the right data, review details about the widget’s lens.
9. **Filter or Remove Clipped Lenses from the Dashboard**

Curate the clipped lenses in a dashboard to reduce clutter. You can filter the list of clipped lenses to see which ones aren’t used and then remove them from your dashboard.

**SEE ALSO:**

*Wave Keyboard Shortcuts*

---

**Create the Dashboard**

When you create a dashboard, you can apply a prepackaged layout or start with a blank canvas to create your own layout. To build the dashboard, you can use the original dashboard designer or, if your org has enabled it, the new flex dashboard designer. In our example, we’ll use the original designer.

This topic is about creating dashboards in Wave Analytics. For information on creating dashboards for reports, review the article *Create a Salesforce Classic Dashboard.*

**Note:** To learn about differences between the original designer and the new flex dashboard designer, see the Spring ’16 Release Notes.

1. From the home page, click `Create` > `Dashboard`.
   
The layout templates appear.

2. Choose a layout template, or select an option to create a blank dashboard in the original or new dashboard designer. In this case, we’ll create a blank dashboard using the original designer.

3. Select `Blank Dashboard in the Dashboard Designer`, and then click `Continue`.
   
   If you haven’t previously declined to use the flex dashboard designer, the Ready for Flex Dashboard Designer (Beta)? pop-up appears.

4. Select `Not Now`.
   
The designer opens.
5. Click the Save button ( ) to save the dashboard to an app.

6. Click Save.

Add Key Performance Indicators to the Dashboard

Sometimes, a single number can provide a quick and critical measurement of the business. For example, the total number of open support cases and number of new support cases open this week are key metrics that a service manager would find very useful. Add Number widgets to provide key indicators to a dashboard.

1. Open the Opportunities dataset, and click to calculate the total value of all opportunities in the pipeline.
   a. In the measure picker, select Sum from the left column.
   b. Pick a dataset field from the right column that you would like to sum. In this case, select Amount.
Note: Don’t add any groupings. A number, by definition, consists of just one group. Later, you will add a chart that shows the value for different groupings.

2. While we’re here, let’s add another kind of measure to bring more context to the story that we’re telling with this dashboard. For example, you can select **Count of isWon** to get the number of successfully closed deals.

3. Click to clip this lens to the designer.

   **Tip:** If you have multiple dashboards, the lens is clipped to whichever dashboard you had open last.

4. In the dashboard designer, click the number widget (123) to create an empty number widget, and then select the first clipped lens that contains a sum of amount.

   The number that appears in the number widget is the first measure (on the far left) that you specified in the lens.

5. To choose a different measure from the lens or configure other useful properties, select the Number widget and set the properties in the Widget Properties section.

   a. Give the widget a title. The default title, which is taken from the field name, is sometimes too cryptic for the audience.

   b. For a large number, select **Shorten number** to reduce the length of the display. Doing so turns a number such as 2,148,352 into the more readable 2M.

6. Using the same procedure, add another number widget based on the second clipped lens that provides a count of won deals.

   Your dashboard now contains the two number widgets.
Add Visualizations to the Dashboard

Add charts to visualize and interact with the data to tell a story about it. Each chart is based on the underlying query in a lens.

In the next steps, we’ll create two interactive charts that let the audience analyze the sales pipeline. The first will analyze the pipeline by account owner. The second will analyze it by stage. Both charts are based on an Opportunities lens, which contains a count of the number of opportunities and no groupings.

1. Verify that the Sales Pipeline dashboard is open.
   You must have the dashboard open to clip lenses to it.
   
   Note: If no dashboard is open, Wave creates a new dashboard.

2. From the home page, open the Opportunities lens.

3. Group the data by Account Owner.

4. Click to clip the lens to the dashboard.

5. Change the Account Owner grouping to a Stage Name grouping.
   To change a grouping, click the grouping and then select the new grouping.

6. Clip the lens to the designer.
   Now that you have both lenses clipped to the dashboard, let’s build charts based on them.

7. View the Sales Pipeline dashboard in the designer.
8. In the dashboard designer, click the chart widget, and then select the first clipped lens that contains number of opportunities grouped by account owner. The chart shows the results from the underlying query in the clipped lens.

9. Create another chart based on the other clipped lens—the one grouped by stage name. The new chart widget shows how many opportunities are in each stage.

10. Click to view the dashboard in presentation mode.

Now you’re looking at the audience’s view of your dashboard, and you’re ready to ask some questions.
Facet Widgets to See Data from Multiple Angles

Widgets that come from the same dataset are faceted by default. Faceting means that when you filter one widget, all the related widgets are filtered in the same way. You can turn faceting on or off for each widget.

Now we will look at how faceting works with the number and chart widgets that we added to our dashboard.

1. In the Sales Pipeline dashboard, click the first bar in the chart that shows the number of opportunities grouped by account owner.
   Notice that first bar is now highlighted and the results of the other widgets changed. Because of faceting, the number widgets and the other chart now show the results for the selected account owner only. Each of your widgets shows the same set of data from a different angle. Widgets created from the same dataset are faceted, by default.
2. Click the first bar again to remove the filter based on the account owner.
   Notice that the results are now shown for all account owners.

3. In the chart that shows the number of opportunities grouped by stage name, click the first bar.
   The Account Owners chart changes to show the values of the deals that each salesperson has in the selected stage. Because Mark
   is the only one that has deals in this stage, only he appears in the Account Owners chart.

4. To disable faceting for a particular widget, clear the Facet this lens option in the lens properties.
   Tip: You can use bindings to facet widgets created from different datasets. For more information, see the Wave Analytics Dashboard
   JSON Guide.

Add Images to the Dashboard

Add images to your dashboard to help your audience with context and to make the dashboard
more fun to read. For example, if your dashboard is designed to help track sales of multiple products,
consider distinguishing the products by their logos.

1. Upload the image that you want to use to Documents and select the “Externally Available
   Image” option.
   If you don’t select the option, the image will not appear in the dashboard.

2. Copy the record ID for the document in the URL in the address bar.

3. In the dashboard, click the box widget and paste the record ID into the Image Document ID
   field in widget properties.

   Note: You can also use the box widget to shade a section of the dashboard or add a
   background color to the dashboard. For example, you can use colored areas to highlight key
   metrics and filters.
To do this, don’t include an image and set the background color in the Background Color field of the widget properties.

SEE ALSO:
Uploading and Replacing Documents

Link to Lenses and Other Dashboards
Use links to tie a dashboard to related lenses and dashboards. This widget is useful when you want to break up analysis across multiple assets, rather than cramming it all into a single dashboard. It’s also useful for creating pathways to analyze your data.

1. In the dashboard, click the link icon.
2. In the widget properties, specify the link properties, such as the ones listed here.

- **Destination Type**
  Specify whether the link widget leads to a saved lens, saved dashboard, or new lens.

- **Destination**
  Specify the lens or dashboard asset to link to.

  **Note:** If you try to create a Link widget in a dashboard that has not been saved in Spring ‘16 and you don’t see the asset in the picklist, open the asset first, and then look for the asset in the picklist.

- **Include Dashboard State**
  When enabled, the selections made in widgets with faceted steps are transferred to the linked lens or dashboard. When transferring dashboard states, Wave Analytics verifies that the destination has lenses that are compatible with the lenses from the source dashboard.

  **Note:** Wave doesn’t transfer a dashboard state in the following cases.
  - The source lens isn’t faceted.
  - The destination lens uses a different dataset than the source lens.
  - When linking to another dashboard, the destination lens uses different groupings than the source lens. If the link destination is a lens, then groupings don’t prevent dashboard state from being transferred.

- **Text**
  The link label that you click to access the linked asset.
Refine the Dashboard

Use visual groupings, colors, labels, and links to clean up your dashboard and focus your audience’s attention.

Use the following tips to enhance the design of your dashboard:

- Use the box widget in the original designer or the container widget in the flex dashboard designer to add background colors and banners, or to add your company logo to the dashboard. You can also use a border to group related widgets in a dashboard.
- Use text widgets to clearly annotate the dashboard, like labeling charts, sections, and filters.

See Details About a Widget’s Lens

To ensure that a widget is showing the right data, review details about the widget’s lens.

1. When viewing the dashboard in presentation mode, not edit mode, hover over a widget and click  

![Lens Details](image)

Lens details display.

2. Review the dataset and applied dimensions, measures, filters, and other details about the widget’s lens.
Filter or Remove Clipped Lenses from the Dashboard

Curate the clipped lenses in a dashboard to reduce clutter. You can filter the list of clipped lenses to see which ones aren’t used and then remove them from your dashboard.

1. From the clipped lens menu, filter by All Lenses, Active Lenses, or Unused Lenses.

2. Optionally, if a lens isn’t used, then you can remove it from your dashboard by clicking .

If the lens is saved to Wave Analytics, then it’s still available and can be opened from Lenses after being removed from your dashboard.

Quickly Build Responsive Grid-Based Dashboards with Flex Dashboard Designer (Beta)

The new flex dashboard designer offers unique features, such as drag-and-drop and snap-to-grid, that allow you to quickly create visually aesthetic dashboards.
Use snap-to-grid to quickly and easily align widgets in a dashboard. Use drag-and-drop to position widgets on the designer canvas. To increase your workspace, you can also hide lenses and property panels while editing a dashboard. When resizing the browser, column widths automatically adjust, while maintaining their relative sizes to each other.

After the admin enables flex dashboard designer and grants you access, you can choose to use the new designer when creating or editing dashboards. You can convert dashboards built in the original designer to the new designer. You can also use the integrated tools to create lenses within the new designer.

SEE ALSO:
- Convert Your Dashboard to the Flex Designer (Beta)
- Build Wave Dashboards
- Grant Users Access to the Flex Dashboard Designer
- Key Differences Between the Original and the Flex Designer (Beta)
- Create Steps in the Flex Designer

**Key Differences Between the Original and the Flex Designer (Beta)**

Consider the following features in the flex dashboard designer that aren’t available in the original designer.

- To add a query (also known as a step) to a dashboard in the flex designer, click the **Create Step** button in a dashboard. For more information, see [Create Steps in the Flex Designer](#).
- The flex designer uses snap-to-grid, letting you quickly align and resize widgets.
- The flex designer allows you to hide steps and properties to give you more workspace when designing a dashboard.
- To add a widget in the flex designer, drag it onto the canvas, and then drop the step on top. You can also drag a step directly to the canvas—the widget uses the chart type specified for the step.
- The Container widget in the flex designer replaces the Box widget. The Container widget extends the behavior of the Box widget by letting you group widgets within the container and move them all at once. If you open an existing dashboard in the flex designer, the Box widget is removed from the dashboard. If needed, you can add a Container widget.

SEE ALSO:
- [Quickly Build Responsive Grid-Based Dashboards with Flex Dashboard Designer (Beta)](#)

**Considerations Before Converting to the Flex Designer (Beta)**

The Flex Dashboard Designer is Beta. Consider the following limitations before you decide to convert a dashboard to Flex Designer (Beta).

- The Flex Designer uses a grid, which limits the number of widgets that you can add across a dashboard. The length of the dashboard is not restricted.
- The YouTube widget and Box widget are deprecated in the Flex Designer. If you open an existing dashboard in Flex Designer, these widgets are removed from the dashboard. If needed, you can use a Link widget to link to a YouTube video. You can use a Container widget to replace the Box widget.
- No widgets in the Flex Designer can overlap, except for a widget inside a Container widget. If you open an existing dashboard in the Flex Designer, the widgets can shift a bit, which you can easily fix using the snap-to-grid feature.
- The following chart type widgets are not supported in the Beta release of the Flex Designer: Calendar Heat Map, Heat Map, Parallel Coordinates, Horizontal Dot Plot, Vertical Dot Plot, Matrix, and Pivot Table. You can drag a lens with an unsupported chart to the canvas. However, the chart converts to a Horizontal Bar Chart, except for the Pivot Table which converts to a Compare Table.
The Flex Dashboard Designer (Beta) doesn’t support mobile layouts. Wave Analytics for iOS has Beta support for dashboards created or saved in the Flex Dashboard Designer.

SEE ALSO:

Convert Your Dashboard to the Flex Designer (Beta)

Convert Your Dashboard to the Flex Designer (Beta)

You can convert existing dashboards to the flex dashboard designer to take advantage of its new features.

Note: Your admin must enable the feature and grant you access before you can use the flex dashboard designer.

When editing the dashboard, click the Flex Dashboard Designer (Beta) button to convert it to the new designer.

The first time you open an existing dashboard in the new designer, Wave makes a copy of the dashboard. Before you delete the original version of the dashboard, know that you can’t open the new version in the original designer. Any changes that you make in the new designer can’t be converted back to the original designer.

SEE ALSO:

Considerations Before Converting to the Flex Designer (Beta)
Quickly Build Responsive Grid-Based Dashboards with Flex Dashboard Designer (Beta)

Create Steps in the Flex Designer

With the flex dashboard designer (beta), you can build queries (also known as steps) within the designer. Convert the calculated columns of compare tables into visualizations, or customize your queries in the SAQL editor. Both approaches provide an easy way to set up your charts by specifying which measures to show and in what order.

Note: A dashboard widget consists of a step plus a visualization. The step is often a query that dynamically runs to show you different views of your data. The step can also be static values pulled from your data. Either way, it’s different from a lens. A lens stands alone, while a step is only available in the dashboard designer. When you clip a lens for use in a dashboard, you’re sending the step part to the designer.
There are two ways to create steps in the flex designer:

Build a new step

Clone an existing step and then modify the clone

To clone, click the step in the steps panel.

Modify the clone in the explorer, and save it with the steps available for use in that dashboard. If the step was created using SAQL, the clone opens in the SAQL editor instead of the explorer.

⚠️ **Note:** Two types of steps can’t be cloned: a static step and a Compare Table that has a SAQL query for one or more of its columns.

To build a new step, do the following:

1. Click **Show Steps ( 🔄 )** to open the steps panel.
2. Click **Create Step**.
3. Select a dataset. Datasets appear in most recently used order. Type in the search box if your dataset isn’t easy to find.
4. Explore and create visualizations.

From here, you have three choices.

a. If your step is not a Compare Table, you can simply click **Save** and the step is added to the designer’s available steps.

b. To use formula fields, select the Compare Table (Chart) from the charts gallery and create calculated columns.

When you save, you’re prompted to confirm or change how you’d like the columns with measures to appear in the visualization.
Slide the measures to change their order. You can also click a measure to hide or show it. The order affects how a measure is used in a visualization. For example, in a Scatter Plot, the first measure is used as the x-axis, the second as the y-axis, and the third as the size of the bubble.

From there, Save adds the step to the designer’s available steps.

c. To refine your query, select Show SAQL in the Options menu ( ), and click the Edit icon ( ).

The SAQL editor provides contextually smart auto-completion suggestions. When you make changes in the SAQL editor, the **Next** button is disabled until you select **Run Query** and the editor verifies that the query is valid.
**Next** takes you to the drag-and-drop dialog box to confirm or change how you’d like the groups and measures to appear in the visualization. From there, **Save** adds the step to the designer’s available steps.

**Note:** In some cases, if you clone a step and edit its query’s SAQL, the resulting JSON does not reflect the actual function applied to measures. Once you run and save the SAQL, the function is changed to `count`. For example, if the original step contained this measures array:

```json
"query": {
  "measures": [
    ["max","DailyActiveUsers"]
  ]
}
```

and the SAQL was edited, run, and saved, then the updated JSON contains this measures array instead:

```json
"query": {
  "measures": [
    ["count","","max_DailyActiveUsers"]
  ]
}
```

This discrepancy should have no effect on the data viewed in the dashboard.

Background Information about Dashboards

Here’s some general information about Wave Analytics dashboards to supplement the instructions for planning, sketching, and building dashboards.

**What Is a Dashboard?**
A dashboard is a vehicle for telling a specific, focused story about a dataset that your audience can act on. It consists of a curated set of charts, metrics, and tables based on the data in a lens.

**What Kind of Dashboard Should I Create?**
Dashboards can support many kinds of knowledge seeking: operational, strategic, or analytical. Sometimes a dashboard serves a combination of purposes, but it’s a good idea to keep your dashboard focused on a single purpose.

**Wave Keyboard Shortcuts**
You can do some basic actions from your keyboard. The dashboard designer shortcuts vary based on whether you are using the original or flex dashboard designer.

**What Is a Dashboard?**
A dashboard is a vehicle for telling a specific, focused story about a dataset that your audience can act on. It consists of a curated set of charts, metrics, and tables based on the data in a lens.

When you share Wave Analytics data via a dashboard, you’re setting up your audience members to do some exploring of their own, without turning them loose on the whole data set.

One use of a dashboard is to provide a focus for your audience. A dataset can contain vast amounts of data. Some of that data is relevant to specific questions that your audience has; some of that data is irrelevant noise. Data that’s critical to one set of questions is sometimes noise in relation to another set of questions.

Keep in mind that even though we call it a dashboard, we’re actually doing much more with this interface than we do with a traditional dashboard in a car. This dashboard doesn’t just tell us what’s changed; it invites us to dig deeper into the underlying data. It’s like using the speedometer in a car to tell us not just how fast we’re going but how our speed has changed at various points in our trip, how traffic conditions ahead of us are changing, and how those changes affect our arrival time.

SEE ALSO:  
Build Wave Dashboards

**What Kind of Dashboard Should I Create?**
Dashboards can support many kinds of knowledge seeking: operational, strategic, or analytical. Sometimes a dashboard serves a combination of purposes, but it’s a good idea to keep your dashboard focused on a single purpose.

Tip: Whatever their purpose, the best dashboards are self-contained and present a full picture so that the audience does not have to scroll or click to other resources.

**Operational Dashboards**
An operational dashboard is for keeping track of fast-changing data that can make a difference in day-to-day operations. An operational dashboard is consulted 24/7. Its audience expects real-time or near-real-time data.

For example, to monitor server uptime and utilization or to track the number of support cases that your call center takes each week, an operational dashboard provides the best solution.
Strategic Dashboard
A strategic dashboard presents an overview of business developments. Executives can use it to track key performance indicators and support decisions about overall direction. The audience expects a strategic dashboard to expose problems and opportunities, not to list issues for immediate resolution.

For example, a strategic dashboard for sales executives can show total sales figures grouped by region, total revenue for the quarter, or headcount grouped by department.

Analytical Dashboards
An analytical dashboard supports diving deep into operational or strategic data to find trends and make predictions. The audience wants to look at massive amounts of data, run what-if scenarios, and discover new questions that it hasn’t thought of yet.

The audience typically works with an analytical dashboard on a monthly, quarterly, or even annual basis. Access to day-to-day updates isn’t as important here as it is for operational or strategic dashboards.

Construct the Dashboard

Organize Wave Assets

Create Wave apps to organize your data projects and control asset sharing.

Wave Analytics apps are folders that contain datasets, lenses, and dashboards. You create them to help keep your Wave assets organized and to share them with other people in your organization.

Examples of Wave apps are the prebuilt Salesforce apps such as the Sales Wave Analytics app and Service Wave Analytics app. Like the apps you create yourself, these are collections of Wave assets—in both cases, the apps include dashboards and datasets. The difference is that Salesforce has created the assets to provide a ready-made path through Salesforce data to help users get started fast with Wave. Your own apps contain assets that you create yourself.

App-Level Sharing

Wave Analytics apps are like folders, allowing users to organize their own data projects—both private and shared—and control sharing of datasets, lenses, and dashboards.
Create an App
Create an app to organize and contain any combination of lenses, dashboards, and datasets.

Share an App
To enable others to see a lens, dashboard, or dataset, one way to share is by sharing the app it’s in.

Delete an App
If you have Manager access to an app, you can delete it. Deleting an app permanently removes all of its lenses, dashboards, and datasets from Wave Analytics.

App-Level Sharing
Wave Analytics apps are like folders, allowing users to organize their own data projects—both private and shared—and control sharing of datasets, lenses, and dashboards.

All Wave Analytics users start off with Viewer access to the default Shared App that’s available out of the box; administrators can change this default setting to restrict or extend access. Each user also has access to a default app out of the box, called My Private App, intended for personal projects in progress. The contents of each user’s My Private App aren’t visible to administrators, but dashboards and lenses in My Private App can be shared.

All other apps created by individual users are private, by default; the app owner and administrators have Manager access and can extend access to other users, groups, or roles.

Here’s a summary of what users can do with Viewer, Editor, and Manager access.

<table>
<thead>
<tr>
<th>Action</th>
<th>Viewer</th>
<th>Editor</th>
<th>Manager</th>
</tr>
</thead>
<tbody>
<tr>
<td>View dashboards, lenses, and datasets in the app</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>See who has access to the app</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>Save contents of the app to another app that the user has Editor or Manager access to</td>
<td>X</td>
<td>X</td>
<td>X</td>
</tr>
<tr>
<td>Save changes to existing dashboards, lenses, and datasets in the app (saving dashboards requires the appropriate permission set license and permission)</td>
<td>X</td>
<td>X</td>
<td></td>
</tr>
<tr>
<td>Change the app’s sharing settings</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Rename the app</td>
<td></td>
<td></td>
<td>X</td>
</tr>
<tr>
<td>Delete the app</td>
<td></td>
<td></td>
<td>X</td>
</tr>
</tbody>
</table>
Create an App

Create an app to organize and contain any combination of lenses, dashboards, and datasets.

1. On the home page, click **Create**.
2. Click **App**.
3. Type the name of your app.
4. Click **Create**.
   
   Your app is created and displayed in a new tab. You can now put lenses, dashboards, and datasets in it.
5. Add a description of the app’s purpose and contents so that your colleagues understand how to use the data.
   a. Click in the description box under the app’s name.
   b. Type a description.
   c. Click the check mark to save.
6. Optionally, change the app’s default icon to make it easier to distinguish from other apps.
   a. Hover over the default icon.
   b. Click **Change Icon**.
   c. Click an icon from the gallery.

Share an App

To enable others to see a lens, dashboard, or dataset, one way to share is by sharing the app it’s in.

1. On the app page, click the **Share** button.
2. On the Give Access tab:
   a. Choose whether you’re sharing the app with a user, group, or role.
   b. Start typing the name and select from the suggested matches.
   c. Choose the level of sharing access: Viewer, Editor, or Manager.
   d. Click **Add**.
   e. Click **Save**, then click **Done**.
Delete an App

If you have Manager access to an app, you can delete it. Deleting an app permanently removes all of its lenses, dashboards, and datasets from Wave Analytics.

1. Open the app, and then click **Delete**.

   **Warning:** You can’t recover a deleted app.

   If applicable, Wave Analytics lists the lenses and dashboards outside of your app that will be affected. When the datasets belonging to your app are deleted, any lens or dashboard that references those datasets becomes unusable.

   ![Image showing deletion process]

   **Important:** Only lenses and dashboards to which you have access appear in the list. If you don’t have access to them, lenses and dashboards aren’t listed even though they have references to datasets in your app.

2. Click **Delete Asset(s)**.

Extend Wave Everywhere

Incorporate Wave Analytics throughout your business. The Wave Analytics visualizations you’ve built are more powerful when you share them across your Salesforce experience by integrating them into custom pages, Visualforce pages, community sites, and more. More ways to share include packaging assets, presentation mode, annotations, and downloading filtered data from Wave. In addition, custom menus in lenses and dashboards allow you to perform common Salesforce actions directly from Wave.

- **Embed Dashboards Everywhere**
  Embed Wave dashboards in every Salesforce experience. From embedded dashboards, users can explore and click to linked assets. If you set them up with a Share icon, embedded dashboards offer Post to Feed and Download sharing options.

- **Wave Migration, Packaging, and Distribution**
  You can migrate Wave assets using change sets, bundle them together in managed packages, distribute and track packages through AppExchange and the License Management App, and use the metadata API to manage customizations for your org.

- **Collaborate with Dashboard Annotations**
  Annotate dashboard widgets with comments posted in the dashboard and in Chatter. With annotations, you can hold conversations about your data and how it’s visualized, with the dashboard right there for reference.

- **Present Live Dashboards and Lenses**
  Run meetings directly from Wave with the new full-screen presentation mode. By presenting Wave assets instead of slides with static images, you have real-time access to your data, and you can showcase dynamic visualizations.
Enable Actions and Links With Custom Actions Menus in Lenses and Dashboards
Custom menus in Wave Analytics lenses and dashboards let users take advantage of Salesforce actions and open records from Salesforce or other websites.

Download Images and Filtered Data
Download filtered data from lens explorations and dashboard widgets. Download formats include image (`.png`), Microsoft® Excel® (`.xls`), and comma-separated values (`.csv`) files. This feature downloads the results of a displayed query (or step).

Incorporate Visualizations through Chatter Posts and Sharing Links
Share a visualization with your colleagues by posting to Chatter, or by getting its unique URL. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill in and explore the information that’s presented.

Embed Dashboards Everywhere
Embed Wave dashboards in every Salesforce experience. From embedded dashboards, users can explore and click to linked assets. If you set them up with a Share icon, embedded dashboards offer Post to Feed and Download sharing options.

Compare the options for embedding dashboards.

<table>
<thead>
<tr>
<th>User Interface</th>
<th>Where</th>
<th>How</th>
<th>Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lightning Experience and Salesforce Classic</td>
<td>Any page</td>
<td>Visualforce component</td>
<td>wave:dashboard</td>
</tr>
<tr>
<td>Lightning Experience only</td>
<td>Record page</td>
<td>Component in the Lightning app builder</td>
<td>Wave Dashboard</td>
</tr>
<tr>
<td>Salesforce Classic only</td>
<td>Detail page</td>
<td>Component in the enhanced page layout editor</td>
<td>Wave Analytics Assets</td>
</tr>
<tr>
<td>Communities</td>
<td>Visualforce page</td>
<td>Visualforce component on a Force.com community page</td>

</tr>
</tbody>
</table>

Embed Wave Dashboards in Lightning Pages
Add a Wave Analytics dashboard component to a Lightning record page to provide an interactive visualization of your data. Users can drill in and explore the dashboard within the frame on the Lightning page or in a Wave Analytics window.

Embed Wave Dashboards in Salesforce Classic Pages
Add a Wave Analytics dashboard to a detail page layout. On an account detail page, for example, you can include a dashboard of service issues associated with the account. Users can drill in, apply filters, and explore in the dashboard as if they were viewing it in a Wave Analytics window.

Add a Wave Analytics Dashboard to a Visualforce Page
By embedding a Wave dashboard into a Visualforce page, you can provide an interactive presentation of your data. Users can drill in and explore the dashboard within the frame on the Visualforce page or in a new window in Wave Analytics.

Share Wave with Communities
With Wave Analytics for Communities, external users can view apps shared with them via Wave dashboards embedded in Visualforce pages in their community.
Embed Wave Dashboards in Lightning Pages

Add a Wave Analytics dashboard component to a Lightning record page to provide an interactive visualization of your data. Users can drill in and explore the dashboard within the frame on the Lightning page or in a Wave Analytics window.

To add a dashboard to your Lightning page, follow these steps.

1. Select the **Wave Dashboard** component in the Lightning App Builder.
2. From the Dashboard drop-down menu, select the dashboard to display.

3. Configure the attributes of the embedded Wave Analytics dashboard:
   - The **Show Sharing Icon** option lets you include the Share icon on the dashboard. If the icon is present, users can click to open the Share dialog, where they can post to Chatter and download images and data.
   - The **Show Title** checkbox gives you control over the visibility of the dashboard title.
   - With the **Open Links in New Windows** attribute, you can specify where links from the dashboard to other assets are opened.
- The **Hide On Error** checkbox gives you control over whether the Wave Analytics dashboard appears if there is an error (such as the dashboard can’t be found).

- With the **Filter** attribute, you can use JSON to filter dataset fields at run time. For example:

  ```json
  {datasetSystemName1:{field1:[value]},datasetSystemName1:{field1:[value1,value2],field2:["value3, with comma"]}}
  ```

Refer to the table to understand the building blocks for filters.

<table>
<thead>
<tr>
<th>Building Block</th>
<th>What It Is</th>
<th>Where To Find It</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dataset System Name</td>
<td>Wave dataset</td>
<td>On the Wave home page, select Edit on the dataset. The System Name is in the left panel of the edit page for the dataset. (If your org has namespaces, include the namespace prefix and two underscores before the dataset system name.)</td>
</tr>
<tr>
<td>Field</td>
<td>Dimension in the Wave dataset</td>
<td>Click the Explore icon to open the widget. Then select <strong>Show SAQL</strong> from the Options menu. Look for dimension names in the “group by” statements.</td>
</tr>
<tr>
<td>Value</td>
<td>Field in the Salesforce object, or a specific value</td>
<td>In Setup, find the object you want, and select Fields. Use the <strong>Field Name</strong> (also known as the API name).</td>
</tr>
</tbody>
</table>

**Note:** To filter by a dimension, be sure to create a list widget on the dashboard for the dimension. Only dimensions that have a list selector on the dashboard can be included in the **Filter** attribute JSON.

For information about working with the Lightning App Builder, see [Configure Lightning Experience Record Pages Using the Lightning App Builder](#).
Embed Wave Dashboards in Salesforce Classic Pages

Add a Wave Analytics dashboard to a detail page layout. On an account detail page, for example, you can include a dashboard of service issues associated with the account. Users can drill in, apply filters, and explore in the dashboard as if they were viewing it in a Wave Analytics window.

1. In the enhanced page layout editor, select Wave Analytics Assets in the left column of the palette.

2. Drag an item from the list of available dashboards to a detail section on the page layout.

3. After the dashboard is positioned in the layout, you can change properties such as height by double-clicking the element or clicking the wrench icon next to it ( ).

To set up the dashboard to show only the data that’s relevant for the record being viewed, use field mapping. Field mapping links data fields in the dashboard to the object’s fields. Refer to the table to understand the building blocks for field mapping.

<table>
<thead>
<tr>
<th>Building Block</th>
<th>What It Is</th>
<th>Where To Find It</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dataset System Name</td>
<td>Wave dataset</td>
<td>On the Wave home page, select Edit on the dataset. The System Name is in the left panel of the edit page for the dataset. (If your org has namespaces, include the namespace prefix and two underscores before the dataset name.)</td>
</tr>
<tr>
<td>Field</td>
<td>Dimension in the Wave dataset</td>
<td>Click the Explore icon to open the widget. Then select Show SAQL from the Options menu. Look for dimension names in the “group by” statements.</td>
</tr>
</tbody>
</table>

**Editions**

Available in Salesforce Classic.

Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

**User Permissions**

To customize page layouts:
- “Customize Application”

To view embedded Wave dashboards:
- Analytics Cloud - Wave Analytics Platform permission set license with “Use Wave Analytics” permission
**Building Block** | **What It Is** | **Where To Find It**
--- | --- | ---
Value | Field in the Salesforce object, or a specific value | In Setup, find the object you want, and select Fields. Use the **Field Name** (also known as the API name).

The JSON field mapping follows this format:

```json
{
    "dataset1_system_name": {
        "field1": ["$value1"],
        "field2": ["$value2"]
    },
    "dataset2_system_name": {
        "field1": ["$value1"],
        "field2": ["$value2"]
    }
}
```

For example, if the dashboard shows data from a dataset named Service, with the dimensions Account and Industry, the field mapping would be defined as:

```json
{
    "service": {
        "account": ["$Name"],
        "industry": ["$Industry"]
    }
}
```

**Note:** To filter by a dimension, be sure to create a list widget on the dashboard for the dimension. Only dimensions that have a list selector on the dashboard can be included in the **Field Mapping** JSON.

Additional properties of Wave Analytics Assets:
- The **Show title** checkbox gives you control over the visibility of the dashboard title.
- The **Show Sharing Icon** option lets you include the Share icon on the dashboard. If the icon is present, users can click to open the Share dialog, where they can post to Chatter and download images and data.
- The **Hide on error** checkbox gives you control over whether the Wave Analytics asset appears if there is an error (such as the dashboard can’t be found).
- Dashboards include the date and time when they were last refreshed.

Be aware of these limits and limitations:
- You can add one dashboard per page layout.
- Wave Analytics dashboards aren’t supported in the original page layout editor. If you open and then save a layout with a Wave dashboard in the original page layout editor, the dashboard is deleted.

For information about working with the enhanced page layout editor, see Customizing Page Layouts with the Enhanced Page Layout Editor.

**SEE ALSO:**
* Trailhead: Place Dashboards Where Users Are Looking
Add a Wave Analytics Dashboard to a Visualforce Page

By embedding a Wave dashboard into a Visualforce page, you can provide an interactive presentation of your data. Users can drill in and explore the dashboard within the frame on the Visualforce page or in a new window in Wave Analytics.

To add a dashboard to your Visualforce page, configure the `<wave:dashboard>` component. You can add one dashboard per Visualforce page. However, the dashboard can include links to other dashboards or Wave Analytics assets.

Here are two examples. Note that the dashboard is identified by the `dashboardId`, which is an 18-character code beginning with 0FK. You can find the dashboardId at the end of the URL when viewing a dashboard.

```xml
<apex:page sidebar="true" standardController="account">

<wave:dashboard dashboardId="0FKB00000006Y7OAI"
  showTitle="true"
  height="475px"
  openLinksInNewWindow="true"
  filter="{'opportunities': {'Id': [{'Account.Id']}}}" />

</apex:page>

<apex:page sidebar="true" standardController="account">

<wave:dashboard dashboardId="0FKB00000006Y7OAI"
  showTitle="true"
  showSharing="true"
  height="1500px"
  openLinksInNewWindow="false"
  hideOnError="true"
  filter="{'service': {'account': [('{{Account.Name}'), 'industry': ['{{Account.Name}')]}}}" />

</apex:page>
```
• The `showTitle` attribute gives you control over the visibility of the dashboard title.

• The `showSharing` attribute lets you include the Share icon on the dashboard. If the icon is present, users can click to open the Share dialog, where they can post to Chatter and download images and data.

• With the `openLinksInNewWindow` attribute, you can specify where links from the dashboard to other assets are opened.

• The `hideOnError` attribute gives you control over whether a Wave Analytics asset appears if there is an error (such as the dashboard can’t be found).

• Dashboards include the date and time when they were last refreshed.

• With the `filter` attribute, you can use JSON to filter dataset fields at run time. Filters are configured with JSON strings, for example:

```json
filter="{"datasetSystemName1": {"field1": ["value1"]}, "datasetSystemName2": {"field1": ["value1", "value2"], "field2": ["value3"]}}"
```

Refer to the table to understand the filter building blocks.

<table>
<thead>
<tr>
<th>Building Block</th>
<th>What It Is</th>
<th>Where To Find It</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dataset System Name</td>
<td>Wave dataset</td>
<td>On the Wave home page, select Edit on the dataset. The System Name is in the left panel of the edit page for the dataset. (If your org has namespaces, include the namespace prefix and two underscores before the dataset system name.)</td>
</tr>
<tr>
<td>Field</td>
<td>Dimension in the Wave dataset</td>
<td>Click the Explore icon to open the widget. Then select <strong>Show SAQL</strong> from the Options menu. Look for dimension names in the “group by” statements.</td>
</tr>
<tr>
<td>Value</td>
<td>Field in the Salesforce object, or a specific value</td>
<td>In Setup, find the object you want, and select Fields. Use the <strong>Field Name</strong> (also known as the API name).</td>
</tr>
</tbody>
</table>

**Note**: To filter by a dimension, be sure to create a list widget on the dashboard for the dimension. Only dimensions that have a list selector on the dashboard can be included in the `filter` attribute JSON.

For more information about embedding Wave Analytics, see the `wave:dashboard` component in the Visualforce Developer Guide Standard Component Reference.

**SEE ALSO:**

Share Wave with Communities

With Wave Analytics for Communities, external users can view apps shared with them via Wave dashboards embedded in Visualforce pages in their community.

**Note:** Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

Community users can view dashboards embedded in Visualforce pages in their community, and they can explore lenses, facets, and links in the embedded dashboards. Community users can’t access the Wave Analytics home page or create, update, or delete any Wave asset. They also can’t upload data. This table summarizes differences between internal Wave users and external Community users.

<table>

<td>✓</td>
</tr>
<tr>
<td>Access Wave from Mobile Devices</td>
<td>✓</td>
</tr>
</tbody>
</table>

To set up Wave Analytics for Communities, complete the following steps.

1. Enable Wave Analytics for Communities and set up community members. See [Enable Wave Analytics for Communities](#).
2. Create Wave dashboards and save them in a Wave app that you can share with your community.
3. Embed your Wave dashboards in Visualforce pages in your community. For more information, see [Add a Wave Analytics Dashboard to a Visualforce Page](#). If you embed a dashboard in a new Visualforce page, create a tab for the page and add the tab to your community.
4. From the Wave app containing your dashboards, give access to community members by selecting Share.
5. In the Share dialog, select Enable sharing with Communities.
When an app is enabled for sharing with external users, a message appears to let you know at a glance. You can easily check and change the sharing status of apps.

6. Invite community partners and customers to share the app by entering their names and clicking Add. Community members in the sharing list are highlighted in orange to distinguish them as external users, and Viewer is the only access available for them. For information about building Communities, see Getting Started With Communities.

Wave Migration, Packaging, and Distribution

You can migrate Wave assets using change sets, bundle them together in managed packages, distribute and track packages through AppExchange and the License Management App, and use the metadata API to manage customizations for your org.

Migrate Wave Assets with Change Sets
Use change sets to move customized Wave assets between orgs that have a deployment connection. For example, create a Wave app containing dashboards, lenses, datasets, dataflows in your Sandbox org, then migrate it to your production org once testing is complete.

Package Wave Assets in Managed Packages
You can create managed packages of Wave assets, including Wave apps, dashboards, lenses, datasets, and dataflows. Use packages to distribute those assets to other users or organizations, including those outside your company.

Distribute Wave Assets Through AppExchange
Once your managed package is certified through our security review, you can make it available to your customers by uploading it to AppExchange. You can specify your package release type, control major and minor version numbers, and specify licensing options through the Licensing Management Application.
Use the Metadata API for Wave Assets

Wave provides full support for the Metadata API, which can be used to retrieve, deploy, create, update, or delete customizations for your organization.

Migrate Wave Assets with Change Sets

Use change sets to move customized Wave assets between orgs that have a deployment connection. For example, create a Wave app containing dashboards, lenses, datasets, dataflows in your Sandbox org, then migrate it to your production org once testing is complete.

To migrate Wave assets:

1. Create and test your Wave assets in your source org, such as Sandbox.
2. From Setup in your source org, select Outbound Change Sets on page 5243 and create a new one.
3. Click Add in the Change Set Components section, then use the Component Type drop-down list to select and add your Wave assets to the change set. Note that you must add dependent dataflows manually. That is, if you add a dataset to a change set, the associated dataflows are not automatically picked up.

Important: Wave Analytics components include Wave apps, dashboards, dataflows, datasets, and lenses. As you package Wave components, keep these tips and best practices in mind:

- Wave Admin permissions are required to create a package, but not for deployment, which requires only Salesforce admin permissions.
- There is no spidering between datasets and dataflows, meaning there is no dependency following. When packaging both, they must be added manually. If they are not, an error appears during deployment. The same is true for change sets—when packaging both datasets and dataflows, add them manually.
- Images don’t render when deploying a dashboard that uses an image widget that references an image file not available on the target org. You must manually upload the image, and the document ID of the image file in the image widget must...
be updated. The user can’t save the dashboard in the target with an invalid document ID, but they can still view and edit it.

- If a dashboard you’re deploying has a link widget pointing to another dashboard that exists in the target org, you must manually update the link reference to point to the right one. If the linked dashboard doesn’t exist in the target org, you’ll see an error message. Either deploy the linked dashboard too, or re-create the linked dashboard in the target org. Update the link widget to point to the linked dashboard.

- Take care when packaging dataflows. Invalid schema overrides, and unsupported or illegal parameters will be removed (for example, `Type = dim` is no longer supported, it’s now `Type = text`). Comments in JSON will be removed. Nodes might appear in a different order.

4. Click **View/Add Dependencies** to ensure all dependent assets and appropriate **permission sets and profile settings** on page 5289 are added.

5. Click **Upload** and select your target org, such as Production. Make sure that the target org allows inbound connections. The inbound and outbound orgs must have a deployment connection.

6. From **Setup** in your target org, select **Inbound Change Sets** on page 5240 and find the one you uploaded from your source org.

7. Validate and deploy the change set, making sure to assign the right users to any permission sets and profiles you included. Your Wave assets will be available in the target org.

For details on using change sets to migrate configuration changes between orgs, view the **Release Management: Deploying Changes Using Change Sets** video.

- Inbound Change Sets

**Package Wave Assets in Managed Packages**

You can create managed packages of Wave assets, including Wave apps, dashboards, lenses, datasets, and dataflows. Use packages to distribute those assets to other users or organizations, including those outside your company.

A package is a container for something as small as an individual component or as large as a set of related apps. Packages can be distributed to other Salesforce users and organizations, including those outside your company. While packages come in two forms—unmanaged and managed—Wave supports only managed packages, which must be created from a Developer Edition organization.

Why only managed packages? There are some key advantages, especially around licensing and managing licenses. Using the AppExchange and the License Management Application (LMA), partners, ISVs, and developers can sell and manage user-based licenses for the app. Managed packages are also upgradeable, meaning you don’t have to start over; you can incrementally upgrade.

To package Wave assets:

1. From Setup in your Developer Edition org, select **Packages** and click **New** to create a managed package on page 5260.

2. Click **Add** in the Components tab, then use the **Component Type** drop-down list to select and add your Wave assets to the package. Note that you must add dependent dataflows manually. That is, if you add a dataset to a package, the associated dataflows are not automatically picked up.
Important: Wave Analytics components include Wave apps, dashboards, dataflows, datasets, and lenses. As you package Wave components, keep these tips and best practices in mind.

- Wave Admin permissions are required to create a package, but not for deployment, which requires only Salesforce admin permissions.
- There is no spidering between datasets and dataflows, meaning there is no dependency following. When packaging both, they must be added manually. If they are not, an error appears during deployment. The same is true for change sets—when packaging both datasets and dataflows, add them manually.
- Images don’t render when deploying a dashboard that uses an image widget that references an image file not available on the target org. You must manually upload the image, and the document ID of the image file in the image widget must be updated. The user can’t save the dashboard in the target with an invalid document ID, but they can still view and edit it.
- If a dashboard you’re deploying has a link widget pointing to another dashboard that exists in the target org, you must manually update the link reference to point to the right one. If the linked dashboard doesn’t exist in the target org, you’ll see an error message. Either deploy the linked dashboard too, or re-create the linked dashboard in the target org. Update the link widget to point to the linked dashboard.
- Take care when packaging dataflows. Invalid schema overrides, and unsupported or illegal parameters will be removed (for example, `Type = dim` is no longer supported, it’s now `Type = text`). Comments in JSON will be removed. Nodes might appear in a different order.

3. Click **View Dependencies** to ensure all dependent assets and appropriate permission sets and profile settings on page 5289 are added.

4. Once packaged, prepare your apps for distribution on page 5325.

SEE ALSO:
Packaging and Distribution Overview

**Distribute Wave Assets Through AppExchange**

Once your managed package is certified through our security review, you can make it available to your customers by uploading it to AppExchange. You can specify your package release type, control major and minor version numbers, and specify licensing options through the Licensing Management Application.

To distribute a Wave managed package:

1. Submit your package for a security review.

   Before a package can be listed on AppExchange, it must meet established standards. Since packages containing Wave assets can potentially contain standard Salesforce objects too, they are subject to the same security requirements as all other AppExchange listings.

2. When your package is ready, click **Upload**, then fill in the required information.

3. Add version specifics, including the name (usually a description and date) and the version number.

4. Choose the release type—**Managed - Beta** or **Managed - Released**—and an appropriate version number.

   The **Managed - Beta** type is for testing, usually with a subset of customers, and allows changes that the **Managed - Released** type does not.

5. Add a description for your AppExchange listing.

6. Optionally, add URLs for release notes and instructions, a password (if you wish to keep the package private), and any other objects required.
7. Click **Upload**.

   **Note:** Deployment requires Salesforce admin permissions.

Use the AppExchange and the License Management Application (LMA) to manage user-based licenses. You can request the application through your partner community site.

- Security Review Overview

**Use the Metadata API for Wave Assets**

Wave provides full support for the Metadata API, which can be used to retrieve, deploy, create, update, or delete customizations for your organization.

Every time your Salesforce organization is customized, its metadata is modified. Editing page layouts, creating a custom field, or adding a Wave dataflow are all metadata updates. Metadata is the information that describes the configuration of your organization and of your Wave assets. It’s data about your data. For example, the metadata type **WaveLens** includes properties that describe the lens—what dataset it uses, the label of the dashboard, what visualization widget type it uses (pivottable, stackvbar, heatmap, and so on).

You can create your own custom metadata types, which enable you to create your own setup objects whose records are metadata rather than data. Rather than building apps from data records in custom objects or custom settings, you can create custom metadata types and add metadata records, with all the manageability that comes with metadata: package, deploy, and upgrade.

While the Metadata API is the foundation on which change sets and packaging is built, developers can use the Metadata API to manipulate their Wave assets too. For example, your application could retrieve metadata about your dashboards and back it up to (and restore from) some repository, effectively providing version control.

The following Wave metadata types are supported in the Metadata API:

- WaveApplication
- WaveDashboard
- WaveDataflow
- WaveDataset
- WaveLens
- WaveTemplateBundle

**SEE ALSO:**
- Understanding Metadata API
Collaborate with Dashboard Annotations

Annotate dashboard widgets with comments posted in the dashboard and in Chatter. With annotations, you can hold conversations about your data and how it’s visualized, with the dashboard right there for reference.

**Note:** Annotations are supported only in flex dashboards (beta).

The annotations icon (💬) appears when you hover over the upper-right corner of a widget. Click the icon to annotate a widget. Widgets with annotations show a blue square with the number of open annotations.

Alternatively, click the speech bubble icon in the dashboard control bar to open the Annotations panel.

Wave saves both open and resolved annotations. And if you delete a widget, its open annotations are saved as detached annotations. You can access detached annotations from the blue circle at the bottom of the dashboard.

Click an annotation to open it for comments.
Wave dashboard annotations are also natively integrated with Chatter, so users are automatically notified when they receive comments. Click in Chatter and go straight to the dashboard in Wave. Although you can @mention anyone in your org, the security you have set up controls access to the dashboard.

SEE ALSO:
Enable Annotations on Dashboard Widgets

**Present Live Dashboards and Lenses**

Run meetings directly from Wave with the new full-screen presentation mode. By presenting Wave assets instead of slides with static images, you have real-time access to your data, and you can showcase dynamic visualizations.

Start a presentation by clicking **Present** in an app, and setting the dashboard or lens to present first.

Or you can start presenting directly from a dashboard or lens.

During the presentation, you can use all of the Wave functionality, such as filtering, faceting, and linking to other assets. The presentation control bar appears when you hover at the upper edge of the window.
Select the next asset to present from the drop-down menu in the center of the control bar.

The Full Screen toggle ( ) changes the window size without exiting the presentation.

Enable Actions and Links With Custom Actions Menus in Lenses and Dashboards

Custom menus in Wave Analytics lenses and dashboards let users take advantage of Salesforce actions and open records from Salesforce or other websites.

Custom actions menus in Wave lenses and dashboards let your team use quick actions on Salesforce objects as well as open records from Salesforce or elsewhere on the web. Developers or administrators edit the Extended Metadata (XMD) file for a dataset to create menus that are part of the following Wave chart and table interface elements:

**EDITIONS**

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

**USER PERMISSIONS**

To view visualizations:
- “Use Wave Analytics”

To edit a dataset's extended metadata (XMD) file:
- “Edit Wave Analytics Dataflows”
- Value labels on charts (such as “Opportunity for Sanders” in the image above).

- Legend value labels in table cells.

- Values in table cells.
Hovering over the labels shows if an actions menu is available. Clicking the value, cell, or legend displays the menu, and the user can then select from the available actions or open a record.

**Actions in the Actions Menu**

The actions come from object-specific actions and/or global actions that you’ve previously added to Salesforce objects. Salesforce actions let users create records that have automatic relationships to other records, make changes and updates to specific records, and interact with records in ways you define. For example, you can add actions that let users create new cases, events, accounts, groups, and so on. See the section “Actions Menu Support for Objects and Actions” below for more details about the Salesforce objects and actions supported in the current release.

**Open Record Link in a Quick Actions Menu**

Links can pass specific bits of data, such as Salesforce account IDs, from the lenses or dashboards to records. For example, a link from an account name in a dashboard could be configured to pass the related account ID to Salesforce; when a user clicks an open record link, the appropriate account record opens in a new tab. Custom links can also look up records for employees in Workday® or expense reports in Concur®. Any website can be linked to as long as it uses HTTP or HTTPS protocols.

**Actions Menu Support for Objects and Actions**

The current actions menu implementation provides limited support for Salesforce objects and actions.

You can currently create Wave quick actions menus for custom objects, sObjects, as well as the following standard Salesforce objects:

- Account
- Cases
- Lead
- Opportunity

Actions on Contacts, User, or User Profile page layouts are not supported.

The current implementation of action menus supports Chatter actions (Post, File, Thanks, Link, Poll, and Question), object-specific actions, and global actions. It does not support Salesforce1 actions.

Other objects and actions will be supported in future releases.

**Developing Action Menus**

Your development team creates actions menus by editing a dataset’s extended metadata (XMD) file. For more information, see Dimensions Section in the Extended Metadata (XMD) Reference.

To create an open record link in an action menu for a dataset with records from multiple Salesforce org instances, you have to add an organizations section to the XMD file. The organizations section lets you map from org IDs to the URLs for each org instance referred to in the dataset. See Organizations Section in the Extended Metadata (XMD) Reference.
Download Images and Filtered Data

Download filtered data from lens explorations and dashboard widgets. Download formats include image (.png), Microsoft® Excel® (.xls), and comma-separated values (.csv) files. This feature downloads the results of a displayed query (or step).

**Note:** This feature isn’t supported for flex dashboards (beta).

Select Download from the drop-down menu on a dashboard widget.

Or, from a lens, select Share and then Download.

SEE ALSO:

Enable Downloading from Wave Analytics

---

**EDITIONS**

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

**USER PERMISSIONS**

To download screenshots and data in tabular format through the Wave Analytics user interface:

- “Download Wave Analytics Data”
Incorporate Visualizations through Chatter Posts and Sharing Links

Share a visualization with your colleagues by posting to Chatter, or by getting its unique URL. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill in and explore the information that’s presented.

1. Click Share.

2. Click the tab for the sharing method that you want: Post to Feed, which posts to Chatter an image and link to the lens, dashboard, or app; or Get URL, which is a unique URL to the asset.
   a. If you’re posting to Chatter, select User or Group feed, enter the name, and then type your comment. You can also remove the image from your post by hovering over it and clicking the x. Note that posted images are public.
   b. If you’re getting the unique URL, copy the link, and then paste it wherever you want to share it.

3. If applicable, click Give Access to set the level of sharing access.

4. Click Done.

Note: To share a visualization, you must give access to the app that contains it. Lenses, datasets, and dashboards within the default Shared App are accessible to all Wave Analytics users, unless administrators have restricted access. All other apps are private unless someone with Manager access to the app has shared it with a specific user, group, or role.

The Sales Wave Analytics App

The Sales Wave app—the first ready-made Wave app from Salesforce—gets you started fast with Wave Analytics and provides a clear path through your Sales Cloud data on any device. You get everything you need in one place to uncover key insights to help you grow your business.

Tip: Follow these steps in order to get started with Sales Wave. If you haven’t used Wave before, learn more about it from the Wave Analytics Library.

1. About the Sales Wave App
   Learn the benefits of Sales Wave before you create and use the app to explore your Sales Cloud data.

2. Sales Wave Prebuilt Dashboards and Datasets
   The Sales Wave app includes prebuilt dashboards and datasets to accelerate your Sales Wave data exploration.

3. Set Up Salesforce Permissions for the Sales Wave Analytics App
   Select the Sales Wave permission set license and create and assign permission sets to enable administrators and users to access the Sales Wave app.

4. Create and Share the Sales Wave Analytics App
   Use the Sales Wave app’s configurator to create the app and start uncovering the value of your Sales Wave data—fast.
5. Personalize Sales Wave with the Configuration Wizard
   The Sales Wave configuration wizard lets you create the Sales Wave app so it reflects how your company views its data.

6. Update the Sales Wave Quota Dataset
   If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, you need to update the Sales Wave Quota dataset so the app includes quotas data for your team.

7. Schedule the Sales Wave Daily Dataflow
   Before you start exploring with Sales Wave, reschedule your daily dataflow to a time outside standard business hours.

8. Integrate Sales Wave With Salesforce
   Make Sales Wave more usable by performing a variety of optional integrations and customizations.

9. Understand Sales Wave Analytics App Limitations
   Sales Wave provides the following support for Salesforce objects and data.

10. Get to Know Sales Wave App
    To create and manage Wave apps:
    • “Manage Wave Analytics Templated Apps”
    • “Edit Wave Analytics Dataflows”

About the Sales Wave App
Salesforce created the Sales Wave app to make it easy for you to analyze your Sales Cloud data.

EDITIONS
Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

USER PERMISSIONS
To use Wave templated apps:
• “Use Wave Analytics Templated Apps”

To use Sales Wave:
• “Access Sales Cloud Analytics Templates and Apps”

To create and manage Wave apps:
• “Manage Wave Analytics Templated Apps”
• “Edit Wave Analytics Dataflows”
App creation is easy: using a built-in configurator, answer a few questions about how you prefer to view data, and Wave takes care of the rest. Once you’ve created the app, use its prebuilt datasets, dashboards, and lenses to explore Sales Cloud data from any device that supports Wave.

You get actionable insights fast from your sales data using the intuitive Wave interface. And you can drill deeper into key aspects of your business by customizing Sales Wave around your business needs.

Note: Your organization can use the Sales Wave app with or without Salesforce Wave Analytics platform by purchasing a Sales Wave license.

Sales Wave Prebuilt Dashboards and Datasets

The Sales Wave app includes prebuilt dashboards and datasets to accelerate your Sales Wave data exploration.

Note: The dashboards and datasets included in your instance of Sales Wave may differ, depending on how you answer configuration wizard questions when you create the app.

Sales Wave Dashboards

The prebuilt dashboards in the Sales Wave app contain best practices that help you get value from your Salesforce data—fast. The dashboards let you manage pipeline and forecast and understand key business performance drivers, visualize trends, assign actions. They also help you get fast answers to questions you have about business results.

USER PERMISSIONS

To use Wave apps:
- “Use Wave Analytics Templated Apps”

To use Sales Wave:
- “Access Sales Cloud Analytics Templates and Apps”

To create and manage Wave apps:
- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”
The following table guides you through Sales Wave dashboards, which give you an immediate picture of how your business is doing. You can also explore further on your own at any point. To learn more about exploring data in Wave, see Explore and Visualize Your Data on page 3452.

Note: Sales Wave uses the Salesforce role hierarchy to determine the security level of the data users can access. Users can see only data at their role level and all the roles below that level. The role hierarchy is also used to determine the manager roll-up structure on some Sales Wave dashboards. For example, if you want to drill down on your hierarchy to see how other teams and individuals are performing, use the “Owner Role View as” picklist.

</table>
Set Up Salesforce Permissions for the Sales Wave Analytics App

Select the Sales Wave permission set license and create and assign permission sets to enable administrators and users to access the Sales Wave app.

Your organization can use the Sales Wave app without the Salesforce Wave Analytics platform by purchasing a Sales Wave license. A Sales Wave license is included with the Salesforce Wave Analytics platform license. Sales Wave license enables the following permissions:

- “Use Wave Analytics Templated Apps” enables access to all Wave templated apps. Sales Wave is the first such app.
- “Access Sales Cloud Analytics Templates and Apps” provides specific access to Sales Wave as well as the data and prebuilt dashboards included with it.
- “Manage Wave Analytics Templated Apps” gives administrators the ability to create Wave apps for users in their organizations, in this case the Sales Wave app.
- “Edit Wave Analytics Dataflows” enables administrators to upload and download JSON for existing dataflows.

You create permission sets using these permissions the same way that you work with any Salesforce permission set. Select a permission set license, create permission sets based on the permissions enabled by that license, and then assign permission sets to users. You can follow the same process you’d use to set up Wave Analytics platform permissions, except you use the permissions enabled by the Sales Wave Analytics App permission set license. See Wave Platform Setup on page 3311. Typically, create two types of Sales Wave permission sets, one for users and another for administrators.

1. **Select the Sales Wave Analytics App permission set license.** All Sales Wave users in your organization need the Sales Analytics Apps permission set license, which you select and assign to users just as you would other Salesforce permission set licenses.

2. **Create and assign a permission set that gives access to the Sales Wave app.** Most users in your organization require only the ability to view the Sales Wave app. For those users, create a permission set that includes the first two permissions listed above, that is “Use Wave Analytics Templated Apps” and “Access Sales Cloud Analytics Templates and Apps”. With these permissions, users can view everything in Sales Wave, and create and edit dashboards. After you create the permission set, you can assign it to users.

3. **Create and assign a permission set that enables administrators and some users to access and manage the Sales Wave app.** Administrators and some users in your organization require the ability to create the Sales Wave app and share it with others. Create a permission set that includes all the permissions included with the Sales Wave license and assign it to them. With these permissions, users can not only view everything in Sales Wave and create and edit dashboards, but they can also create, share, and delete the app, schedule and work with dataflows, and upload external data (including the CSV file required to update the Quotas dataset). Users with these permissions can edit and create dashboards and lenses, edit and create datasets with any Salesforce data (including custom objects), and upload a CSV file for the Quota dataset.

Create and Share the Sales Wave Analytics App

Use the Sales Wave app’s configurator to create the app and start uncovering the value of your Sales Wave data—fast.

Follow these steps to create the Sales Wave app. If you’re not happy with the result, you can delete the app and create it again quickly. You can also watch the video CREATE THE SALES WAVE APP SERVICE WAVE ANALYTICS APP, PART 1: USING THE CONFIGURATION WIZARD, which covers the steps described here.

1. **Log in to Salesforce.**

2. **Select Wave Analytics** from the Force.com menu (top right of the Salesforce window).
3. Click **Create**, select **App**, select **Sales Wave**, and then click **Continue**

4. Salesforce opens the Sales Wave configuration wizard, which helps you personalize your app experience. The wizard presents a series of screens, each with a set of questions and their possible answers in pull-down menus. Answer the questions according to how your company prefers to view data. For more information about how to answer these questions, see *Personalize Sales Wave with the Configuration Wizard*. Sales Wave saves the answers you select in the Personalize Sales Wave Analytics dashboard, which is created along with your app.

5. Give your app a name that’s easily recognizable to others in your company.

6. Click **Create**. That starts a dataflow that creates the app and its assets (which include a dataflow definition file, datasets, and dashboards).

7. The app creation process can take a few minutes. You can check the status of the dataflow: Open the Wave Home page, click the gear menu at the upper right of the page, and select Data Monitor. Then select Dataflow View in the pulldown at the upper left and look for your app.

8. You can also delete your app and start the app creation process all over again. To delete, position your cursor over the icon for the app you just created and click **Delete**. Then click Yes to confirm deletion of all the assets associated with the app. Before you delete the app, take a screen shot of the Personalize Sales Wave Analytics dashboard so you can review your previous selections when you create the app again.

9. Now that you’ve created the app, share it with users in your organization. You can only share it with users who have the “Use Wave Analytics Templated Apps” and “Access Sales Cloud Analytics Templates and Apps” permissions enabled. (For more about Sales Wave app permissions, see *Set Up Salesforce Permissions for the Sales Wave App*). To share the app, roll your cursor over the icon for the app and click **Share**. Next, type in the names of team members, click **Add**, and click **Save**.

If your business tracks quotas at the user level, update the Quota (Target) dataset that’s created along with the app before you start exploring your data. See *Update the Sales Wave App Service Wave Analytics App Service Wave Analytics App Service Wave Service Wave App Quota (Target) Dataset*.
When you first create the app, Sales Wave dashboards show the number associated with role name in the hierarchy. To see the name of the person responsible for that role, you can update the role value by editing the corresponding dataset’s Extended Metadata (XMD) file. See Integrate Sales Wave With Salesforce for details.

SEE ALSO:
Personalize Sales Wave with the Configuration Wizard

Personalize Sales Wave with the Configuration Wizard

The Sales Wave configuration wizard lets you create the Sales Wave app so it reflects how your company views its data.

When you create the Sales Wave app, the built-in configuration wizard asks you a series of questions. Your answers determine how users view your sales data in Sales Wave’s dashboards. Answer these questions according to the way your organization uses Sales Cloud data so the dashboards are as meaningful and useful as possible.

For example, you’re asked to specify both the primary and secondary fields you use to view customers according to their geographic locations. Perhaps you first want to see customers according to their country and then by their state. You’d select Country as the primary field to view by geography and State/Province for the secondary field. Or perhaps you want to sort by Region first, then by Country, so you’d select Region for the primary field and Country for secondary. Once you create Sales Wave, its dashboards provide a switch that toggles between the primary and secondary fields you select. You’re asked to make similar choices about how to view data by customer, source, product, and other ways you track business with Salesforce.

USER PERMISSIONS
To create and manage Wave apps:
- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”

![Personalize Sales Wave - Accounts (1 of 3)](image-url)
Sales Wave saves your answers in the Personalize Sales Wave Analytics dashboard, which is created along with the other dashboards in the app. It’s recommended that you save a screen shot of this dashboard for future reference if you create the app again.

Think through your answers to these questions. Your answers affect both the number and contents of the Sales Wave dashboards and how users view sales data in the app. You can further customize dashboards after you create the app. If you decide you didn’t like your first answers, you can delete Sales Wave and quickly create it again.

SEE ALSO:
Create and Share the Sales Wave Analytics App

Update the Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota (Target) Dataset

If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, you need to update the Sales Wave Quota dataset so the app includes quotas data for your team.

When you create the Sales Wave app, a Quota (Target) dataset is created along with the app. To explore how team members are tracking to their monthly, quarterly, or annual quotas in Sales Wave, you need to update the Quota dataset by completing the following steps. You can also watch the video Create the Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow, which covers the steps described here.

Note: When you work with .CSV files you want to import to Sales Wave, create and open them using only a UTF-8-compliant text editor. Opening them in Microsoft Excel or other spreadsheet software reformats .CSV files and makes them unusable in Sales Wave.

Note: If your business doesn’t track quotas at the user level, you can skip this step. You only need to complete this if you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level.

1. Create a .CSV file to include the following fields, in this order: QuotaAmount, StartDate (in yyyy-mm-dd format), OwnerName, and Username. Field names are case sensitive and must appear in your file exactly as shown here. For an example, see Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Example .CSV File.

2. Save the file to a location that you can easily remember.

3. In Salesforce, go to the Wave Analytics home page and find the Quota (Target) dataset.

4. Hover over the dataset, then click Edit.
5. Salesforce displays the dataset editing screen for the Quota dataset. From the Update Data section, select **Select file or drag file**

6. In the dialog box that opens, navigate to the .CSV file you created in Step 1, and double-click it.

7. Click **Update Dataset**

8. If your fiscal period is different than calendar period, that is if it starts another date besides January 1, you also need to update the Quota Metadata file.
   a. Copy the JSON from Sales Wave Quota Dataset JSON File and paste it into a text editor of your choice.
   b. Change the value of "fiscalMonthOffset" from 4 to a number that represents the month your fiscal period starts. In Sales Wave metadata, the numeral "0" stands for January, "1" stands for February, and so on up to "11," which stands for December.
   c. Save the file to your desktop and upload it to Sales Wave by dragging it to **Select file or drag file here...** in the Add Metadata File (JSON) section of the dataset editing screen.
   d. Click **Update Dataset**

9. After uploading your quota data, re-run the dataflow to update the dashboards.
   a. Click the Gear menu at the upper right of the Sales Wave screen and select Data Monitor.
b. Select Dataflow view from the menu at the top left of the Data Monitor screen.

![Dataflow View](image)

---

c. Find your app; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name, and click

![Menu Options](image)

The dataflow assures that Sales Wave has your company’s latest sales data. You can learn more about dataflows from Schedule the Sales Wave Daily Dataflow.

Schedule the Sales Wave Daily Dataflow

Before you start exploring with Sales Wave, reschedule your daily dataflow to a time outside standard business hours.

When you create Sales Wave, the creation process includes a dataflow, which is repeated every day at the time the app was created. This assures you that you’re looking at the latest Salesforce data. Reschedule the dataflow to take place sometime outside normal business hours so the dataflow doesn’t interrupt your use of the app.

You can also watch the video [Create the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow](video), which covers the steps described here.

---

**USER PERMISSIONS**

To create and manage Wave apps:
- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”
1. Go to **Wave Analytics** in the Force.com menu (top right of the Salesforce window) if you’re not already there. Click the gear icon at the upper right of the screen to open the Data Monitor.

![Data Monitor](image1)

2. Select Dataflow view from the menu at the top left of the Data Monitor screen.

![Dataflow View](image2)

3. Find the app you created; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name. Select **Schedule**, and set a time for the dataflow. Select a time outside normal work hours so the dataflow doesn’t interrupt business activities. Click **Save**.
Integrate Sales Wave With Salesforce

**EDITIONS**

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

Make Sales Wave more usable by performing a variety of optional integrations and customizations.

Overriding role names in datasets, embedding the “Sales Wave - Account Overview” dashboard in your Salesforce Accounts page, and expose Sales Wave as a tab in Salesforce Classic can make it easier for your team to use the app.

**Add Actions to Sales Wave Dashboards**

Sales Wave dashboards use actions that are enabled on the Account and Opportunity page layouts. To add actions, you edit the page layout for those objects.

In Salesforce, go to the Accounts or Opportunities tab, open the page for an account or opportunity, and click the **Edit Layout link** at the top right of the page.

In the Quick Actions in the Publisher section, click the **override the global publisher layout link**. If you or someone else in your org has already done this, you won’t see the link. Note that this section may be called something slightly different in the org you use, for example “Quick Actions in the Salesforce Classic Publisher.”

In the Account Layout or Opportunity Layout panel (depending on which object you’re adding actions to) at the top of the page, click **Quick Actions** on the left. Drag the action(s) that begin with the word “New” (for example, New Task, New Note) to the Quick Actions in the Publisher section.

Click **Save** to save your changes. The actions you added to the layout will now be available from charts and tables in Sales Wave dashboards.
Override Role Name in Datasets

Sales Wave uses Salesforce Role Hierarchy to help you to understand your company’s sales performance. When you first create the app, Sales Wave dashboards show the number associated with role name in the hierarchy—not the most useful way to view the role. To see the name of the person responsible for that role, you can update the role value by editing the corresponding dataset’s Extended Metadata (XMD) file.

Let’s say your role hierarchy is the following:

- **CEO** (Manager: Paul)
  - Sales_WW (Manager: Yves)
    - Sales.WEST
    - Sales.EAST

To have the manager’s name appear in Sales Wave dashboards, update the Opportunity dataset XMD file with the following:

```json
{"labels": {  "keys": {    "RoleName": {      "CEO": "Paul",      "Sales_WW": "Yves"    }  } } }
```

For more information, see [Wave Analytics Extended Metadata (XMD) Reference](#).

Embed the Account Overview Dashboard in Account Page Layout

We’ve optimized the “Sales Wave – Account Overview” dashboard to be embedded in the Salesforce Account page layout. You can do that by following the instructions in Embed Your Dashboard in a Salesforce Page.

To be able to filter the dashboard based on the account that you’re viewing, use this string as filter:

```json
{  "opportunity1": {    "AccountId": ["$Id"]  } }
```

`opportunity1` corresponds to the system name of the Opportunity dataset. Its name can be different in your organization.

Make Sales Wave Available in a Salesforce Classic Tab

You can access Sales Wave by going to Wave Analytics in the Force.com menu and selecting the app from the Wave home page. To make it easier for your team to reach the app, you can expose it as a tab in Salesforce Classic. To do so, create a new tab that points to a Visualforce page that includes the “Sales Wave - Overview” dashboard. Complete instructions are available in [Add a Wave Analytics Dashboard to a Visualforce Page](#).

Understand Sales Wave Analytics App Limitations

Sales Wave provides the following support for Salesforce objects and data.
Sales Wave Support for Salesforce Objects and Fields

Sales Wave supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields.

Sales Wave creates a dataflow that exposes selected fields from the following standard Salesforce objects:

- Accounts
- Users
- Roles
- Opportunities
- Products (Opportunities line item)
- Tasks
- Events

Sales Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

Note: Sales Wave limits custom objects support to no more than ten custom objects for each org that implements Sales Wave. This is a contractual, not a technical, limitation.

To add custom objects or additional fields not included when you first create the app, you need to update the Sales Wave dataflow. For details see Create Datasets with a Dataflow.

Sales Wave Support for Non-Salesforce Data

Sales Wave does not support external data sources except a CSV file that contains quota data at the user level. Importing other external data requires an additional license. See your Salesforce representative for details.

Note: To include data about quotas in Sales Wave, you need to upload a CSV file with the details. For more information, see Update the Sales Wave App Quota (Target) Dataset.

Get to Know Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Data Terminology

To make the best use of the Sales Wave app, it’s helpful to understand the metrics and terms used in the app.

<table>

Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Example .CSV File

Here’s an example of the .CSV file you create to update the Sales Wave app Quota (Target) dataset.

**Note:** This file is for example purposes only. Create a unique .CSV file with quota data for members of your team including the following fields:

- QuotaAmount
Create the file using a UTF-8 compliant text editor, and do not open the file with Microsoft Excel or another spreadsheet application. Field names are case sensitive and must appear in your file exactly as shown here.

See Update the Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota (Target) Dataset on page 3526.

Example:

<table>
<thead>
<tr>
<th>QuotaAmount,StartDate,OwnerName,Username</th>
</tr>
</thead>
<tbody>
<tr>
<td>5000000,2014-01-01,Priya Anand,<a href="mailto:user9.kthjbnrxifyo@yourDomain.com">user9.kthjbnrxifyo@yourDomain.com</a></td>
</tr>
<tr>
<td>5000000,2014-02-01,Priya Anand,<a href="mailto:user9.kthjbnrxifyo@yourDomain.com">user9.kthjbnrxifyo@yourDomain.com</a></td>

Sales Wave Quota Dataset JSON File

Use this file to update the Sales Wave Quota dataset with your fiscal year start date if it's not January 1.

Copy the contents of this file into an editor of your choice and change the “fiscalMonthOffset” value (shown in bold) to the month your fiscal period begins. In Sales Wave metadata, the numeral “0” stands for January, “1” stands for February, and so on up to “11,” which stands for December. In the code below, the number is set to “4”, which stands for May. Use the number that represents the month your fiscal period begins. Then save the file and upload it to Sales Wave following the instructions in Update the Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota (Target) Dataset.

```json
{
  "objects": [
    {
      "connector": "CSV",
      "fullyQualifiedName": "Quota_csv",
      "label": "Quota.csv",
    }
  ]
}
```
"name": "Quota_csv",
"fields": [

The Service Wave Analytics App

The Service Wave app gets you started fast with Wave Analytics and provides a clear path through your Service Cloud data on any device. Whether you're a service manager or agent, you get everything you need in one place to uncover key data insights to help you grow your business.

Tip: Follow these steps in order to get started with Service Wave. If you haven’t used Wave before, learn more about it from the Wave Analytics Library.

1. About the Service Wave App
   Salesforce created the Service Wave Analytics app to make it easy for service managers and agents to use data to drive the success of your service business. Learn the app's benefits before you create and use the app to explore your Service Cloud data.
2. **Service Wave Prebuilt Dashboards and Datasets**
   The Service Wave app includes prebuilt dashboards and datasets to accelerate Service Wave data exploration for both service managers and agents.

3. **Set Up Salesforce Permissions for the Service Wave Analytics App**
   Select the Service Wave permission set license and create and assign permission sets to enable administrators and users to access the Service Wave app.

4. **Create and Share the Service Wave App**
   Use the Service Wave app’s simple configurator to create the app and start uncovering the value of your Salesforce data—fast.

5. **Personalize Service Wave with the Configuration Wizard**
   The Service Wave configuration wizard lets you create the Service Wave app so it reflects how your company stores and views its Service Cloud data.

6. **Schedule the Service Wave Daily Dataflow**
   Before you start exploring with Service Wave, reschedule your daily dataflow to a time outside standard business hours.

7. **Embed Service Wave Sidebar Dashboards in a Salesforce Page**
   Add Service Wave dashboards to Salesforce pages so your service team can get a complete view of their cases and take appropriate action.

8. **Understand Service Wave Analytics App Limitations**
   Service Wave requires that Service Cloud include specific data, initially supports a limited set of Salesforce objects, and has other miscellaneous limitations.
About the Service Wave App

Salesforce created the Service Wave Analytics app to make it easy for service managers and agents to use data to drive the success of your service business. Learn the app’s benefits before you create and use the app to explore your Service Cloud data.

EDITIONS
Available in Salesforce Classic and Lightning Experience.
Available for an extra cost in Enterprise, Performance, and Unlimited Editions. Also available in Developer Edition.

USER PERMISSIONS
To use Wave templated apps:
- “Use Wave Analytics Templated Apps”
To use Service Wave:
- “Access Service Cloud Analytics Templates and Apps”
To create and manage Wave apps:
- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”
Service Wave gives you best-practice key performance indicators (KPIs) about your Salesforce service data in a single place. We’ve based the app’s dashboards on learnings from many years of helping businesses manage customer relationships. The goal is to provide the right amount of information at the right time to help both managers and agents make the right decision.

Service managers get a complete view of service customer data that includes trending as well as historical and peer benchmarks. Agents can quickly view a snapshot of each case and customer to help them make quick decisions about their next customer interactions.

We’ve done a lot of the hard work: Our team has built complex queries, formulas, and ratios that draw from your service and sales data and assembled them into easy-to-read visualizations. You just create the app: using a built-in configurator, answer a few questions about the data and fields you’d like to see, and Wave takes care of the rest. Once you’ve created the app, use its prebuilt datasets and dashboards to explore Service Cloud data from any device that supports Wave.

You get actionable insights fast from your sales data using the intuitive Wave interface. And you can drill deeper into key aspects of your business by customizing Service Wave around your needs.

Note: Your organization can use Service Wave without Salesforce Wave Analytics platform by purchasing a Service Wave license. A Service Wave license is included with the Wave platform license.

Service Wave Prebuilt Dashboards and Datasets

The Service Wave app includes prebuilt dashboards and datasets to accelerate Service Wave data exploration for both service managers and agents.

Note: The dashboards and datasets included in your instance of Service Wave may differ, depending on how you answer configuration wizard questions when you create the app.

Service Wave Dashboards

The prebuilt dashboards in the Service Wave app contain best practices that help you get value from your Salesforce data—fast. The dashboards let you manage pipeline and forecast and understand key business performance drivers, visualize trends, assign actions. They also help you get fast answers to questions you have about business results.
Dashboards available from the app provide a complete view of service customer data that includes all your key service performance indicators in one place. Managers can quickly view average case closing times, customer satisfaction, trending, historical and peer benchmarks, use of knowledge to resolve cases, and other data so they can quickly take appropriate action.

Another set of dashboards -- called sidebars -- are specifically for service agents. Embed sidebars in a Salesforce page, such as the service console, to make them more accessible to agents during their day-to-day work. For a given case, an agent can view customer history, number of cases, and CSAT. Agents can also see previous customer actions and their result so they can find out what worked. The goal is to provide agents the right amount of information at the right time to help them take the right action.

The following table guides you through Service Wave dashboards. You can also explore further on your own at any point. To learn more about exploring data in Wave, see Explore and Visualize Your Data on page 3452.

<table>
<thead>
<tr>
<th>Dashboard Name</th>
<th>Contents</th>
<th>Target User</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overview</td>
<td>Start here. Summarizes key performance indicators (KPIs) from your Service Cloud to help you gauge health of the business and</td>
<td>Service manager</td>

</table>

### Service Wave Datasets

The table lists all the possible standard datasets that become part of Service Wave when you create the app.

#### Table 54: Service Wave Datasets

<table>
<thead>
<tr>
<th>Dataset Name</th>
<th>Contents</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Case</td>
<td>Data about cases, including duration, last modified date, and customer satisfaction measure.</td>
</tr>
<tr>
<td>Service Case History</td>
<td>Data about case history, including owner, type, and creation date.</td>
</tr>
<tr>
<td>Service Knowledge</td>
<td>Data about use of knowledge articles in cases, such as number of views, ratings, last referenced dates, and case associations.</td>
</tr>
</tbody>
</table>
## Dataset Name | Contents
--- | ---
Service Knowledge Attached | Data about attachment of knowledge articles to cases including whether articles are shared by email, article version number, and case type.
Service Opportunities | Data about opportunities so you can filter cases by opportunity for prioritization and appropriate action.
Service Event | Data about events associated with cases, including last modified date and case duration. (Your Service Cloud data must include at least one event for Service Wave dashboards to function correctly.)
Service Task | Data about tasks associated with cases, including last modified date and case duration. (Your Service Cloud data must include at least one task for Service Wave dashboards to function correctly.)

### Set Up Salesforce Permissions for the Service Wave Analytics App

Select the Service Wave permission set license and create and assign permission sets to enable administrators and users to access the Service Wave app.

Your organization can use the Service Wave Analytics app without the Salesforce Wave Analytics platform by purchasing a Service Wave license. A Service Wave license is included with the Salesforce Wave Analytics platform license. The Service Wave license enables the following permissions:

- "Use Wave Analytics Templated Apps" enables access to all Wave templated apps.
- "Access Service Cloud Analytics Templates and Apps" provides specific access to Service Wave as well as the data and prebuilt dashboards included with it.
- "Manage Wave Analytics Templated Apps" gives administrators the ability to create Wave apps for users in their organizations, in this case the Service Wave app.
- "Edit Wave Analytics Dataflows" enables administrators to upload and download JSON for existing dataflows.

You create permission sets using these permissions the same way that you work with any Salesforce permission set. Select a permission set license, create permission sets based on the permissions enabled by that license, and then assign permission sets to users. You can follow the same process you’d use to set up Wave Analytics platform permissions, except you use the permissions enabled by the Service Wave Analytics App permission set license. See Wave Platform Setup on page 3311. Typically, create two types of Service Wave permission sets, one for users and another for administrators.

1. **Select the Service Wave Analytics App permission set license.** All Service Wave users in your organization need the Sales Analytics Apps permission set license, which you select and assign to users just as you would other Salesforce permission set licenses.

2. **Create and assign a permission set that gives access to Service Wave.** Most users in your organization require only the ability to view the Service Wave app. For those users, create a permission set that includes the first two permissions listed above, that is "Use Wave Analytics Templated Apps" and "Access Service Cloud Analytics Templates and Apps". With these permissions, users can view everything in Service Wave, and create and edit dashboards. After you create the permission set, you can assign it to users.

3. **Create and assign a permission set that enables administrators and some users to access and manage the Service Wave app.** Administrators and some users in your organization require the ability to create the Service Wave app and share it with others. Create a permission set that includes all the permissions included with the Service Wave license and assign it to them. With these permissions, users can not only view everything in Service Wave and create and edit dashboards, but they can also create, share, and delete the app, schedule and work with dataflows. Users with these permissions can edit and create dashboards and lenses, and edit and create datasets with any Salesforce data (including custom objects).
Create and Share the Service Wave App

Use the Service Wave app's simple configurator to create the app and start uncovering the value of your Salesforce data—fast.

Follow these steps to create the Service Wave app.

1. Log in to Salesforce.
2. Select Wave Analytics from the Force.com menu (top right of the Salesforce window).
3. Click Create, select App, select Service Wave, and then click Continue.
4. Salesforce opens the Service Wave configuration wizard, which helps you personalize your app experience. The wizard presents a series of screens, each with a set of questions and their possible answers in pull-down menus. Answer the questions according to how your company prefers to view data. For more information about how to answer these questions, see Personalize Service Wave with the Configuration Wizard. Service Wave remembers the answers you select and if you create the app again, it gives you the choice of using those answers or selecting new answers.
5. Give your app a name that’s easily recognizable to others in your company.
6. Click Create. That starts a dataflow that creates the app and its assets (which include a dataflow definition file, datasets, and dashboards).
7. The app creation process can take a few minutes. You can check the status of the dataflow: Open the Wave Home page, click the gear menu at the upper right of the page, and select Data Monitor. Then select Dataflow View in the pulldown at the upper left and look for your app.

Note: To create new datasets with just the Service Wave app license, use the Wave dataset builder. Wave associates new datasets created using the builder with the Wave default dataflow. If you editing the dataflow for the Service Wave app to register new datasets, you won’t be able to access the resulting datasets.
8. **Note:** If you delete your app, Wave doesn’t retain the answers you selected when you created that version of the app, and you have to start the configuration wizard process all over again. If you wish to reuse the answers you selected, keep the app until you’ve completed recreating the app and then delete it.

You can also delete your app and start the app creation process all over again. To delete, position your cursor over the icon for the app you just created and click Delete. Then click Yes to confirm deletion of all the assets associated with the app.

9. Now that you’ve created the app, share it with users in your organization. You can only share it with users who have the “Use Wave Analytics Templated Apps” and “Access Service Cloud Analytics Templates and Apps” permissions enabled. (For more about Service Wave app permissions, see Set Up Salesforce Permissions for the Service Wave Analytics App). To share the app, roll your cursor over the icon for the app and click Share. Next, type in the names of team members, click Add, and click Save.

Taking a few extra steps can make Service Wave better serve the needs of your organization:

- **Embed the sidebar dashboards** on page 3548 in a Salesforce page of your choice, such as the service console. This step provides a seamless analytics experience for service agents. Embedding sidebars in pages used regularly by agents gives them access to key metrics as part of their regular work to help take the most effective customer action.

- **Add datasets to the app based on Salesforce data using the Wave dataset builder** on page 3408. Service Wave includes a default set of datasets based on your Salesforce data. Creating additional datasets lets your service managers and view other Salesforce data through the app.

  **Note:** Service Wave does not support data sources external to Salesforce or registering new datasets from the app-generated dataflow.

- **Add objects, fields, and filters to Service Wave.** **Edit the app’s dataflow** on page 3338 to include standard and custom objects and fields from Salesforce. For complete instructions about adding data to Wave, see Wave Analytics Data Integration.

  **Note:** To create new datasets with just the Service Wave app license, use the Wave dataset builder. Wave associates new datasets created using the builder with the Wave default dataflow. If you edit the dataflow for the Service Wave app to register new datasets, you can’t access the resulting datasets.

### Personalize Service Wave with the Configuration Wizard

The Service Wave configuration wizard lets you create the Service Wave app so it reflects how your company stores and views its Service Cloud data.

When you create the Service Wave app, the built-in configuration wizard asks you a series of questions. Start with three basic pages that contain mostly required questions. Depending on how you answer them, you then see one or two optional pages. Your answers let Service Wave know how you want users to view your Service Cloud data in the apps dashboards. Answer these questions according to the way your organization uses Service Cloud data so the dashboards are as meaningful and useful as possible.

The wizard presents answers to each question in a pick list, most of them showing a list of fields. You can select a field only once; after you select it, that field is no longer available as an answer to other questions. Other questions are yes/no (Boolean) or require you to type in object names. Questions marked with an asterisk (*) require answers, while the others are optional.

While the questions are accompanied by explanations to help you choose appropriate answers, here are a few tips for how to use the wizard. Read the following carefully to assure a succesful result the first time.
Page 1: Determine How Service Wave Displays Case Metrics

Choose the metrics that are important to your organization about the duration of cases, how quickly they're resolved, if they're resolved within the bounds of any service level agreement (SLA), and so on. All are mandatory and allow you to make only a single selection, except the following:

- Question 1, optional: Asks you to indicate the primary field you use in Salesforce to track case duration, if any. If you don't track case duration, Service Wave uses its own formula to calculate case duration based on the date a case was opened and closed. If the case is still open, it uses today's date as part of the calculation. Allows only a single selection.
- Question 2, optional: Asks if you use other (secondary) fields related to case duration. You can select multiple fields, for example, \textit{Duration with customer} or \textit{Duration with agent}.

Page 2: Control How the App Drills Into Your Data

Tell Service Wave how you prefer to drill down into data about the status, severity, owner, reason, and type of cases. Also choose how Service Wave displays data about service cases' channels of origin, if they're resolved at first contact, and other aspects. All questions are mandatory and all allow you to make only a single selection, except the following:

- Question 11: Asks if you use queues to assign case ownership. Answer Yes only if you have a queue in your Service Cloud org and have at least one case attached to the queue.
  
  \textbf{Important:} If you answer Yes and you do not have queues and a case attached to the queue, Service Wave creation fails.

- Question 12, optional: Lets you select multiple measure fields from the Cases object not addressed in previous questions so your dashboards can drill into measures that are important to your organization. Measures are quantitative values like case resolution time, number of open and closed cases, and revenue.

- Question 13, optional: Lets you select dimension fields from the Cases object not addressed in previous questions so your dashboards can drill into dimensions that are important to your organization. Dimensions are qualitative values, such as date, region, and product name.

Page 3: Select Report Areas

Choose the areas of your service data you want Service Wave dashboards to report on, such as customer satisfaction (CSAT), use of knowledge resources and telephony, and whether cases are attached to sales opportunities. All are mandatory and allow you to make only a single selection.

- Question 1: Asks if you track CSAT score. If you answer Yes, the wizard presents a page of questions about how you track CSAT. See Page Four: Set Up CSAT Metrics, below.

- Question 2: Asks if you use knowledge resources in the support process. If you answer Yes, the wizard presents a page of questions about how you use knowledge. See Page Five: Set Up Knowledge Data, below.
  
  \textbf{Important:} If your Service Cloud org does not use knowledge and you answer Yes, Service Wave creation fails.

- Question 3: Asks about use of telephony in the support process. If you answer Yes, Service Wave creates a dashboard related to telephony.
  
  \textbf{Important:} Your org must track telephone usage data on the Task object for Service Wave to successfully create a telephony dashboard. For example, your org might have telephony data in standard activity fields on the Task object, such as call duration, call object identifier, call result, and call type. If your Service Cloud org does not track telephone usage data and you answer Yes, dashboard creation fails.
Page 4: Set Up CSAT Metrics (Optional)

Tell Service Wave how you track CSAT so that information is surfaced correctly in dashboards. You see this page, and need to answer its questions, only if you answer Yes to Question 1 on Page 3. Slow down and follow these instructions carefully to assure success:

- Question 1: Asks if you use the Cases object to track CSAT.
  - If you answer Yes, answer only Question 2, and do not answer the other questions on the page.
  - If you answer No, you must also answer questions 3-6 and do not answer Question 2.

  **Important:** If you answer Yes to question 1 and also answer questions 3 through 6, dashboards with CSAT data will fail.

- Question 2, optional: Asks you to select the field from the Cases object you use to track CSAT. Only select an answer if you answered Yes to Question 1.

- Question 3, optional: Asks you to select the object you use to track CSAT, if you don’t use the Cases object. Only select an answer if you answer No to Question 1.

- Question 4, optional: Asks you to fill in the developer name of the field you use from the object selected in Question 3 to track CSAT. Only fill in an answer if you answer No to Question 1 and Yes to Question 3.

  **Important:** Be sure to fill in the correct developer name for the field or app creation will fail.

- Questions 5 and 6, optional: If you use an object other than the Cases object to track CSAT, Service Wave has to create a join between that object and the Cases object. In question 5, fill in the developer name of the Cases object field to use for the join. In Question 6, fill in the developer name from the other object field to use for the join. Only fill in an answer if you answer No to Question 1 and Yes to Question 3.

  **Important:** Be sure to fill in the correct developer name for the field or app creation will fail.

Page 5: Set Up Knowledge Data (Optional)

Tell Service Wave how to surface data about knowledge articles in dashboards. You see this page, and need to answer its questions, only if you answer Yes to Question 2 on Page 3.

- Question 1, optional: Asks about the article type you want to see data about in Service Wave dashboards. Choose only a single article type.

Schedule the Service Wave Daily Dataflow

Before you start exploring with Service Wave, reschedule your daily dataflow to a time outside standard business hours.

When you create Service Wave, the creation process includes a dataflow, which is repeated every day at the time the app was created. This assures you that you’re looking at the latest Salesforce data. Reschedule the dataflow to take place sometime outside normal business hours so the dataflow doesn’t interrupt your use of the app.

1. Go to Wave Analytics in the Force.com menu (top right of the Salesforce window) if you’re not already there. Click the gear icon at the upper right of the screen to open the Data Monitor.

USER PERMISSIONS

To create and manage Wave apps:
- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”
2. Select Dataflow view from the menu at the top left of the Data Monitor screen.

3. Find the app you created; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name. Select **Schedule**, and set a time for the dataflow. Select a time outside normal work hours so the dataflow doesn’t interrupt business activities. Click **Save**.
Embed Service Wave Sidebar Dashboards in a Salesforce Page

**USER PERMISSIONS**

- To use Wave templated apps: “Use Wave Analytics Templated Apps”
- To use Service Wave: “Access Service Cloud Analytics Templates and Apps”
- To create and manage Wave apps: “Manage Wave Analytics Templated Apps”
- To edit a dataset’s extended metadata (XMD) file: “Edit Wave Analytics Dataflows”
- To create a Visualforce page: “Customize Application”

**EDITIONS**

- Available in Salesforce Classic and Lightning Experience.
- Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

Add Service Wave dashboards to Salesforce pages so your service team can get a complete view of their cases and take appropriate action.

Service Wave includes three specialized dashboards—called sidebars—to give service agents instant access to visualizations of data about their cases.

- The By Customer sidebar gives agents a snapshot of their customers, including products, case reasons and priority, and CSAT.
• The By Similarity sidebar shows data about previous cases so agents can guide customer interactions based on what they did in similar cases.

• The By Case History sidebar provides a quick view of the lifecycle of a case so agents can be informed during customer conversations. Administrators can embed them in a Salesforce page so agents can access Service Wave seamlessly while they carry out their normal case work. For example, if your Salesforce makes the Service Cloud available through a service console, that’s an ideal place to embed the sidebar dashboards. Here’s how.

1. Create a VisualForce page for each sidebar. Go to Setup and enter Visualforce Pages in the Quick Find box, then select Visualforce Pages, and click New. Enter a label with the name of the sidebar and, optionally, a description.

2. Replace the text that appears when you open the editor with the following: `<apex:page standardController="case"> <wave:dashboard dashboardId="Your_dashboard_id" height="1000px" showTitle="false" filter="Filter_condition" /></apex:page>`
   a. Replace `Your_dashboard_ID` with the dashboard ID for the sidebar. You can find the dashboard ID by opening the sidebar in Service Wave; the ID is the last 15 characters of the URL for the sidebar.

3. If you’re creating a page for the By Customer sidebar, replace `filter="Filter_condition"` with the following filter: `filter="{'ServiceCase1': {'AccountId': ['{!case.AccountId}' ]}}"`.
   a. ‘ServiceCase1’ is a placeholder for the name of the Service Case dataset. To find the name, open a dashboard, hit Command+e to view the JSON for the dashboard, and search for ServiceCase. The name of the dataset is appended with a numeral that’s incremented each time you create the app, such as ‘ServiceCase2’. Enter the entire dataset name including the numeral.

4. If you’re creating a page for the By Similarity sidebar, replace `filter="Filter_condition"` with the following filter: `filter="{'ServiceCase': {'Reason': ['{!case.Reason}' ],'Product__c': ['{!case.Product__c}' ]}}"`.
   a. ‘ServiceCase1’ is a placeholder for the name of the Service Case dataset. See Step 4 to learn how to find the name.
   b. ‘Product__c’ is a placeholder for the name of the custom field you use to track products. This field is the answer you selected in the configuration wizard, Page 2, Question 4. You can also find the name of this field by going to Setup and typing Cases in the Quick Find box. Then click Fields and review your custom field names to find the field you use for products. Look for the API name of the field, and use that in place of ‘Product__c’ in both places in the query.

5. If you’re creating a page for the By Case History sidebar, replace `filter="Filter_condition"` with the following filter: `filter="{'ServiceCase1': {'Id': ['{!case.Id}' ], 'OwnerId' : ['{!case.OwnerId}' ], 'Product__c' : ['{!case.Product__c}' ], 'Reason' : ['{!case.Reason}' ]}}"`.
   a. ‘ServiceCase1’ is a placeholder for the name of the Service Case dataset. See Step 4 to learn how to find the name.
   b. ‘Product__c’ is a placeholder for the name of the custom field you use to track product family. See Step 4 to learn how to find the name of that field.
   c. ‘Reason’ is a placeholder for the name of the field you use to track the case reason. This field is the answer you selected in the configuration wizard, Page 2, Question 5. You can also find the name of this field by going to Setup and typing Cases in the Quick Find box. Then click Fields and review your custom field names to find the field you use for case reason. Look for the API name of the field, and use that in place of ‘Reason’ in the query.

6. Save the page, and open it in preview mode to be sure it shows the dashboard.

7. Add the page to the console or whatever page you prefer in Salesforce. Through Setup, find the specific page layout you want to include the sidebar. For example, some customers use a page layout for information from the Cases object. In that case, enter Cases in the QuickFind box in Setup, then open Page Layouts under Cases, and look for the page layout you want to edit.
8. Click Edit Layout and select the Custom Console Components tab near the top. Go to the Right Sidebar section and select one of the pages you just created.

9. Set the width to 450px and save the layout. The sidebar should appear embedded in the page you just edited.

10. Repeat this step with the other two sidebars, as needed.

Make Service Wave Available in a Salesforce Classic Tab

One way to access Service Wave is by going to Wave Analytics in the Force.com menu and selecting the app from the Wave home page. To make it easier for your team to reach the app, you can also expose it as a tab in Salesforce Classic. To do so, create a new tab that points to a Visualforce page that includes the Service Wave - Overview dashboard. Complete instructions are available in Add a Wave Analytics Dashboard to a Visualforce Page.

Understand Service Wave Analytics App Limitations

Service Wave requires that Service Cloud include specific data, initially supports a limited set of Salesforce objects, and has other miscellaneous limitations.

Service Wave Data Requirements

Service Cloud data must include at least one each of the following for Service Wave dashboards to function correctly:

- Events
- Tasks
- Closed cases
- Published articles attached to a case or an opportunity

Custom formula fields on the Cases object need to exist or be created for the following:

- SLA missed (text field)
- FCR (Boolean)

Service Wave Support for Salesforce Objects and Fields

Service Wave supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields. The app creates a dataflow that exposes selected fields from the following Salesforce objects:

- Account
- Cases
- Contact
- Events
- User
- UserRole
- Task

Service Wave may also use fields from the following options depending on the answers you select in the configuration wizard:

- CaseArticle
- CaseHistory
- CSAT (custom object)
- Group
- A single Knowledge Article Type (custom object)
Service Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

Note: Service Wave limits custom objects support to no more than ten custom objects for each org that implements Service Wave. This is a contractual, not a technical, limitation.

To add custom objects or additional fields not included when you first create the app, you need to update the Service Wave dataflow. For details see Create Datasets with a Dataflow.

Additional Service Wave Limitations

Service Wave does not support external data sources or registering new datasets from the app-generated dataflow.

Including CSAT score in dashboards/dataflow is optional. The app configuration wizard lets you associate CSAT from a custom case field or Custom Object associated to the Cases object.

You need to manually add any security predicates or other dataset filters to the app dataflow.

The app does not support multi-hierarchy (team/manager) when you create it. You need to manually add that functionality.

The Knowledge Usage dashboard currently reports on a single Article Type, which you select when you use the configuration wizard.

The Event Monitoring Wave App

The Event Monitoring Wave App integrates with event monitoring and setup audit trail data to give you insights into your user and org behavior.

Note: As part of Event Monitoring, you also get the Event Monitoring Wave App. Use this app to upload and access only the data provided to you as part of your subscription. Please prevent your users from using the app to upload or access any other data. Salesforce sometimes monitors such usage. The Event Monitoring Wave App is available in English only.

The Event Monitoring Wave App is the first built-in way to explore your monitoring data in Salesforce. App creation is easy and with its prebuilt dashboards and datasets, you can start exploring right away. This app helps you drill into your org’s data and swiftly identify suspicious behavior, slow page performance, and poor user adoption.

Set Up Salesforce Permissions for the Event Monitoring Wave App
Select licenses and create and assign permission sets to enable admins and users to access the Event Monitoring Wave App.

Create and Share the Event Monitoring Wave App
Once you’ve enabled the correct permissions, the setup for the Event Monitoring Wave App is simple.

Learn About Event Monitoring Wave App Prebuilt Dashboards
The Event Monitoring Wave App comes with a set of prebuilt dashboards so you can start exploring your data right away. Data from your org is automatically loaded into your Event Monitoring Wave App datasets when it’s generated.

To use the Event Monitoring Wave App:
- “Use Wave Analytics Templated Apps”
- “Access Event Monitoring Wave Templates and Apps”

To create and manage Wave apps:
- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”
Get to Know Event Monitoring Wave App Terminology
To make the best use of the Event Monitoring Wave App, it’s helpful to understand the metrics and terms used in the app.

Set Up Salesforce Permissions for the Event Monitoring Wave App
Select licenses and create and assign permission sets to enable admins and users to access the Event Monitoring Wave App.

Note: As part of Event Monitoring, you also get the Event Monitoring Wave App. Use this app to upload and access only the data provided to you as part of your subscription. Please prevent your users from using the app to upload or access any other data. Salesforce sometimes monitors such usage. The Event Monitoring Wave App is available in English only.

<table>
<thead>
<tr>
<th>Permission</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Use Wave Analytics Templated Apps”</td>
<td>Enables access to all Wave templated apps.</td>
</tr>
<tr>
<td>“Access Event Monitoring Wave Templates and Apps”</td>
<td>Provides specific access to the Event Monitoring Wave App as well as the data and prebuilt dashboards included with it.</td>
</tr>
<tr>
<td>“Manage Wave Analytics Templated Apps”</td>
<td>Gives admins the ability to create Wave apps for users in their orgs, in this case the Event Monitoring Wave App.</td>
</tr>
<tr>
<td>“Edit Wave Analytics Dataflows”</td>
<td>Enables admins to upload and download JSON for existing data flows.</td>
</tr>
</tbody>
</table>

Create permission sets using these permissions the same way that you do for any Salesforce permission set. Select a permission set license, create permission sets based on the permissions enabled by that license, and then assign these permission sets to users or profiles. Typically you’ll create two types of permission sets, one for users and one for admins.

1. Select the Event Monitoring Wave App permission set license. All Event Monitoring Wave App users in your org need the Event Monitoring Wave App permission set license. Select and assign this license to users just as you would other Salesforce permission set licenses.

2. Create and assign a permission set that enables users to access the Event Monitoring Wave App. Most users in your org only need to view the Event Monitoring Wave App. For those users, create a permission set that includes “Use Wave Analytics Templated Apps” and “Access Event Monitoring Wave Templates and Apps”. These permissions let users view anything in Event Monitoring Wave and create and edit dashboards. Assign this permission set to the appropriate users or profiles.

3. Create and assign a permission set that enables admins and some users to access and manage the Event Monitoring Wave App. Admins and some users need to create the Event Monitoring Wave App and share it with others. Create a permission set with the Event Monitoring Wave license and assign it to these admins and users. With these permissions, users can view everything in Event Monitoring Wave and create and edit dashboards. But they can also create, share, and delete the app, schedule and work with data flows, upload external data, and more.
Create and Share the Event Monitoring Wave App

Once you’ve enabled the correct permissions, the setup for the Event Monitoring Wave App is simple.

Note: Because event log files have a 24-hour generation period, you won’t see your data in the app for the first day after you create it. The app includes some sample data so you can preview your dashboards in the meantime.

1. Log in to Salesforce.
2. Select Wave Analytics from the App Picker.
3. Click App, select Event Monitoring Wave App, and then click Continue.
4. Give your app a name.
5. Click Create. The app creation process can take a while. You can check the progress by selecting Data Monitor from the gear menu at the top of the page. If any part of your app creation fails, you’ll need to recreate the app.
6. Once your app is ready to go, you can share it with other users in your org. Remember that only users with the “Manage Wave Analytics Templated Apps” and “Access Event Monitoring Wave Templates and Apps” permissions can see the app. To share your app, mouse over the app tile on the Wave Analytics home screen and click Share. You can also share from the app itself.

Learn About Event Monitoring Wave App Prebuilt Dashboards

The Event Monitoring Wave App comes with a set of prebuilt dashboards so you can start exploring your data right away. Data from your org is automatically loaded into your Event Monitoring Wave App datasets when it’s generated.

Most of the dashboards represent a single event type on the EventLogFile object. The EventLogFile object reference contains detailed information about each event type. Two of the dashboards, My Trust and Setup Audit Trail, don’t correspond to event types. Let’s get a quick idea about what each dashboard does.

Apex Executions
Corresponds to the Apex Execution event type. This dashboard lets you track trends in Apex code executions and performance.

API
Corresponds to the API Event event type. The API dashboard gives you information about both your users’ API usage and API performance in your org. You can see how often each object is being used, how fast each object is being processed, and what methods are being invoked on that object.

Dashboard
Corresponds to the Dashboard event type. The Dashboard dashboard helps you track dashboard adoption and performance.

Visualforce Requests
Corresponds to the Visualforce Request event type. Here you can see trends in Visualforce adoption and page performance.

Files
Corresponds to the Content Transfer event type. When users in your org perform content transfers (downloads, uploads, or previews), they show up on this dashboard. You can also track file adoption.

Lightning
Corresponds to the UI Tracking event type. This dashboard shows you which pages users are accessing in Lightning Experience or Salesforce1.
Login-As
Corresponds to the Login As event type. This dashboard lets you see which admins are using the login-as feature and on which user accounts.

My Trust
The My Trust dashboard gives you an overall idea of what kind of events are taking place in your org over time. It also shows the average speed of these transactions.

Page Views (URLs)
Corresponds to the URI event type. The Page Views dashboard lets you see which pages users are accessing in the Salesforce Classic desktop app.

Report Downloads
Corresponds to the Report Export event type. This dashboard lets you see which users are downloading your reports and where they're downloading them from.

Report
Corresponds to the Report event type. The Reports dashboard shows you trends in reporting as well as which users are running specific reports. You can also find out which reports are having performance issues.

Rest API
Corresponds to the REST API event type. This dashboard shows you trends in REST API usage and which endpoints are seeing the most traffic. You can also view information about the IP ranges issuing the requests and which methods are being called.

Setup Audit Trail
Corresponds to the Setup Audit Trail page in Setup. See what kinds of changes your users are making in the Setup area.

User Logins
Corresponds to the Login event type. The User Logins dashboard shows login trends by user and information about where and how users are accessing your org.

Get to Know Event Monitoring Wave App Terminology
To make the best use of the Event Monitoring Wave App, it’s helpful to understand the metrics and terms used in the app.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>APT</td>
<td>Average page time. An aggregate metric across multiple transactions.</td>
</tr>
<tr>
<td>EPT</td>
<td>Experienced page time. The timing of a page transaction as seen by the user.</td>
</tr>
<tr>
<td>Event</td>
<td>A user-initiated interaction in Salesforce. For example, a login, the firing of an API call, or the download of a report. Events are related to the EventLogfile sObject.</td>
</tr>
</tbody>
</table>

Wave Analytics Limits
This section describes Wave Analytics limits.
The following limits apply to all supported editions. Contact salesforce.com to extend the limits.
### API Call Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum concurrent Wave Analytics API calls per organization</td>
<td>100</td>
</tr>
<tr>
<td>Maximum Wave Analytics API calls per user per hour</td>
<td>5,000</td>
</tr>
</tbody>
</table>

### Wave Analytics License Data Storage Limits

**Note:** The data limits shown in the following table apply *only* to Analytics Cloud - Wave Analytics Platform and Analytics Cloud - Sales Wave Analytics App and Service Wave Analytics app licenses purchased on or after October 20, 2015.

<table>
<thead>
<tr>
<th>License</th>
<th>Limit. Wave Analytics license data storage limits are contractual, not technical. Licensee agrees to strictly monitor its total number of data rows.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Analytics Cloud - Wave Analytics Platform</td>
<td>100 million rows</td>
</tr>
<tr>
<td>Sales Wave and Service Wave apps</td>
<td>25 million rows when used without Analytics Cloud - Wave Analytics Platform license. Use of Sales Wave and Service Wave app licenses does not increase data limit for platform license</td>
</tr>
<tr>
<td>Analytics Cloud - Additional Data Rows</td>
<td>100 million rows</td>
</tr>
</tbody>
</table>

### Dataset Storage Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of rows for all registered datasets combined.</td>
<td>250 million per platform license purchased before October 20, 2015.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> For best performance, we recommend datasets to be in the range of 100M records. Several items, such as the size of the records, and cardinality of measures, can significantly or adversely affect performance.</td>
</tr>
<tr>
<td>Maximum number of fields in a dataset</td>
<td>5,000 (including up to 1,000 date fields)</td>
</tr>
<tr>
<td>Maximum value for each numeric field in a dataset</td>
<td>36,028,797,018,963,967</td>
</tr>
<tr>
<td>Minimum value for each numeric field in a dataset</td>
<td>-36,028,797,018,963,968</td>
</tr>
</tbody>
</table>

### Dataflow Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of dataflow runs in a rolling 24-hour period</td>
<td>24</td>
</tr>
</tbody>
</table>
Note: Wave uses the bulk API, which counts towards your Salesforce bulk API limits. The dataflow submits a separate bulk API call to extract data from each Salesforce object. The dataflow uses a batch size of 100K to 250K, depending on whether the dataflow or the bulk API chunks the data. As a result, to extract 1 million rows from an object, the dataflow creates 4-10 batches.

Sales Wave App Limits
Sales Wave limits custom object support to no more than ten custom objects and one dataflow for each org that implements the app. These are contractual, not technical, limits.

External Data Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum file size per external data upload</td>
<td>If you use the External Data API: 40 GB.</td>
</tr>
<tr>
<td></td>
<td>If you use the user interface: 512 MB.</td>
</tr>
<tr>
<td>Maximum file size for all external data uploads in a rolling 24-hour period</td>
<td>50 GB</td>
</tr>
<tr>
<td>Maximum number of external data files that can be uploaded in a rolling 24-hour period</td>
<td>50</td>
</tr>
<tr>
<td>Maximum number of characters in a field</td>
<td>32,000</td>
</tr>
<tr>
<td>Maximum number of fields in a record</td>
<td>5,000 (including up to 1,000 date fields)</td>
</tr>
<tr>
<td>Maximum number of characters for all fields in a record</td>
<td>400,000</td>
</tr>
</tbody>
</table>

Query Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum concurrent queries per organization</td>
<td>50 per platform license</td>
</tr>
<tr>
<td>Maximum concurrent queries per user</td>
<td>10</td>
</tr>
<tr>
<td>Maximum number of rows returned per query</td>
<td>10,000</td>
</tr>
<tr>
<td>10,000 is the default value. To set a different value, use the SAQL limit statement.</td>
<td></td>
</tr>
<tr>
<td>Query timeout</td>
<td>2 minutes</td>
</tr>
</tbody>
</table>

The following limits apply to the Wave-enabled Developer Edition.

Developer Edition Limits

<table>
<thead>
<tr>
<th>Limit</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum number of data rows</td>
<td>250,000</td>
</tr>
<tr>
<td>Maximum concurrent queries</td>
<td>5</td>
</tr>
</tbody>
</table>
Wave Analytics Limitations

Wave Analytics differs from other Salesforce features in some ways.

Releases Aren’t Staggered

All customers receive Wave Analytics updates on the same schedule, regardless of instance. Related core updates happen by instance on a staggered schedule.

Localization

Wave Analytics has been localized with the following exceptions.

- We do not support right-to-left languages, such as Arabic and Hebrew.
- A subset of error messages may only be available in English.
- The mobile iOS app includes only English versions of sample datasets and dashboards.

Limited Internationalization Support

Wave Analytics provides internationalization support with the following limitations.

- You must set both locale and language to see translated labels.
- Actual data within datasets is not localized.
- Each dataset may have a single locale specified in the metadata. The metadata locale is not overridden by individual users’ locale settings. All users see the same date, time, and number formats, as well as dimension names, regardless of their own locale and language settings.
- Search in filters is both case-sensitive and accent-sensitive. For example, using the filter “Andre” does not return “André” in the results.
- Multicurrency is not supported. When Wave Analytics extracts your organization’s default currency, it uses the currency for monetary values and doesn’t convert to another currency.
- Sorting data within datasets may not work as expected.

Accessibility Features Aren’t Supported

Accessibility features haven’t been incorporated into Wave Analytics.

Limited Field-Level Security

Field-Level security isn’t available for external data that’s uploaded via files. Field-level security that was implemented in the original database or Salesforce object isn’t preserved when the data is loaded into a Wave Analytics dataset. For more information, see the Wave Analytics Security Implementation Guide.
Sales Wave Support for Salesforce Objects and Fields

Sales Wave supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields.

Sales Wave creates a dataflow that exposes selected fields from the following standard Salesforce objects:

- Accounts
- Users
- Roles
- Opportunities
- Products (Opportunities line item)
- Tasks
- Events

Sales Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

**Note:** Sales Wave limits custom objects support to no more than ten custom objects for each org that implements Sales Wave. This is a contractual, not a technical, limitation.

To add custom objects or additional fields not included when you first create the app, you need to update the Sales Wave dataflow. For details see Create Datasets with a Dataflow.

Sales Wave Support for Non-Salesforce Data

Sales Wave does not support external data sources except a CSV file that contains quota data at the user level. Importing other external data requires an additional license. See your Salesforce representative for details.

**Note:** To include data about quotas in Sales Wave, you need to upload a CSV file with the details. For more information, see Update the Sales Wave App Quota (Target) Dataset.

Service Wave Data Requirements

Service Cloud data must include at least one each of the following for Service Wave dashboards to function correctly:

- Events
- Tasks
- Closed cases
- Published articles attached to a case or an opportunity

Custom formula fields on the Cases object need to exist or be created for the following:

- SLA missed (text field)
- FCR (Boolean)

Service Wave Support for Salesforce Objects and Fields

Service Wave supports all Salesforce standard and custom objects and data. However, when you first create the app by default it includes only a predefined set of objects and fields. The app creates a dataflow that exposes selected fields from the following Salesforce objects:

- Account
- Cases
Service Wave may also use fields from the following options depending on the answers you select in the configuration wizard:

- CaseArticle
- CaseHistory
- CSAT (custom object)
- Group
- A single Knowledge Article Type (custom object)
- RecordType
- Opportunity

Service Wave supports standard and custom fields on standard Salesforce objects. The fields provided are determined by the answers you provide when you create the app using the built-in configuration wizard.

**Note:** Service Wave limits custom objects support to no more than ten custom objects for each org that implements Service Wave. This is a contractual, not a technical, limitation.

To add custom objects or additional fields not included when you first create the app, you need to update the Service Wave dataflow. For details see Create Datasets with a Dataflow.

### Additional Service Wave Limitations

Service Wave does not support external data sources or registering new datasets from the app-generated dataflow.

Including CSAT score in dashboards/dataflow is optional. The app configuration wizard lets you associate CSAT from a custom case field or Custom Object associated to the Cases object.

You need to manually add any security predicates or other dataset filters to the app dataflow.

The app does not support multi-hierarchy (team/manager) when you create it. You need to manually add that functionality.

The Knowledge Usage dashboard currently reports on a single Article Type, which you select when you use the configuration wizard.

### Actions Menu Support for Objects and Actions

The current actions menu implementation provides limited support for Salesforce objects and actions.

You can currently create Wave quick actions menus for custom objects, sObjects, as well as the following standard Salesforce objects:

- Account
- Cases
- Lead
- Opportunity

Actions on Contacts, User, or User Profile page layouts are not supported.

The current implementation of action menus supports Chatter actions (Post, File, Thanks, Link, Poll, and Question), object-specific actions, and global actions. It does not support Salesforce1 actions.
Salesforce offers a powerful suite of reporting tools that work together to help you understand and act on your data.

**Gather Data with Reports**

Reports give you access to the data your organization has accumulated over time, enabling you to make informed decisions. You can examine your organization’s data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others via dashboards.

**Share Insights with Dashboards**

Dashboards help you visually understand changing business conditions so you can make decisions based on the real-time data you have gathered with reports. Use dashboards to help users identify trends, sort out quantities, and measure the impact of their activities.

---

**Reports and Dashboards**

**Reports**

Learn about Reports

Reports give you access to your Salesforce data. Before building, reading, and sharing reports, review these reporting basics.

As you prepare to report on your Salesforce data, keep these tips in mind:

- Well-designed reports run faster.
- Before building your report, consider writing down each of the questions your report must answer. This way, your report is sure to return all the data you need.
- Reports are shared via folders. Whomever has permission to the folder your report is saved in also has access to your report. Ensure that you save your report in an appropriate folder.

Before building your first report, familiarize yourself with these features and concepts.

**Report Builder**

The report builder is a visual, drag-and-drop tool which you use to create reports and edit existing ones. The report builder is where you choose a report type, report format, and the fields that make up your report.

To launch the report builder, click New Report.

**Fields**

One or more fields describe each report result. If you imagine that your report is a table of information, then each row is a result and each column is a field.

For example, a human resources manager creates a report about employees. Each result is an employee, and each field is a different piece of information about the employee: first name, last name, job title, start date, and so forth.
When you create or edit a report, you choose which fields you want to include in your report. To ensure your reports run quickly, it’s a good idea to include only the fields that you need.

**Filters**

Limit the data that your report returns by using filters. Filters are useful for many reasons, such as focusing your report on specific data, or ensuring that your report runs quickly.

For example, say your report returns all the Cases in your company, but you only want to see Cases which are open and assigned to you. Filter the report on the Owner field and Status field.

Add filters in the Report Builder. In Lightning Experience, you can add, edit, or remove filters while reading a report, too.

**Report Types**

The report type governs which fields are available in your report. For example, File and Content reports have fields like File ID, File Name, and Total Downloads. Accounts reports have fields like Account ID, Account Name, and Phone.

The first thing you do when creating a report is choose a report type.

**Report Format**

The report format specifies how your report results are laid out. Possible formats are tabular, summary, matrix, or joined. Joined reports aren’t available in Lightning Experience.

---

**Build a Report**

When you have questions about your Salesforce data, build a report to get the answers.

1. **Build a New Report**
   
   Report Builder is a drag-and-drop tool for accessing your data quickly and comprehensively. Use it to set up new reports and edit existing ones.

2. **Report on Historical Changes**
   
   On top of the standard up-to-the-minute reporting on the current state of your business, you can analyze day-to-day and week-to-week changes in opportunities, cases, forecasts, and custom objects.

3. **Report on Historical Data with Reporting Snapshots**
   
   A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object’s fields with the report’s data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

4. **Categorize Data Quickly with Buckets**
   
   **Bucketing** lets you quickly categorize report records without creating a formula or a custom field. When you create a bucket field, you define multiple categories (buckets) used to group report values.

5. **Combine Different Types of Information in a Joined Report**
   
   The joined report format lets you view different types of information in a single report. A joined report can contain data from multiple standard or custom report types.

6. **Show Report Data Graphically**
   
   To help readers understand your data quickly and easily, show the data in chart form. Charts appear just above the report table. They can help users get a feel for the data before they delve into the details. Use line charts to track changes over time, or a bar or pie chart to compare values at a point in time. Charts can also appear in dashboard components.
7. **Show Report Data in Tables**
   To help readers scan for data easily, try hiding details and ranges, limiting the number of results shown, and highlighting with color. You can also show your table in a dashboard component.

8. **Report on Salesforce Data with Excel**
   Connect for Office includes an Excel add-in that enables you to securely access your Salesforce reports with Microsoft Excel. You create the reports you need in Salesforce, then pull them into an Excel worksheet, and use Excel’s formulas, charts, and pivot tables to customize and analyze your data. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

9. **Upgrade the Report Wizard**
   Report builder, a powerful drag-and-drop editor, is the standard tool for creating and editing reports. If your organization is still using the old report wizard, you should upgrade to report builder.

---

**Build a New Report**

Report Builder is a drag-and-drop tool for accessing your data quickly and comprehensively. Use it to set up new reports and edit existing ones.

Watch a Demo: [Getting Started with Report Builder](#)  
To customize an existing report using report builder, click the name of a report and click **Customize**.  
To optimize screen real estate, report builder uses a compressed page header. To view your application tabs, simply close the builder or click the Salesforce logo.

1. **Choose a Report Type**
   A report type is a set of rules that determine which records and fields appear in a report. You can start with one of the available standard report types or use a custom report type provided by your administrator.

2. **Choose a Report Format**
   A report can use the tabular, summary, matrix, or joined format. Choose a format that’s complex enough to capture the data you want to show, but simple enough to communicate it effectively.

3. **Create a Report**
   Create a report to get an up-to-the-minute view of an aspect of your business, such as the status of customers, opportunities, support cases, and so on.

4. **Creating a Custom Report**
   You can customize standard reports, or you can build custom reports from scratch to suit the exact needs of your organization.

5. **Create a Custom Report in Accessibility Mode**

6. **Group Your Report Data**
   Group data in columns or rows in summary, matrix, and joined reports to display meaningful information. For example, group opportunities by Close Date to see closed opportunities or group cases by product to see the number of cases for each product. You can have groupings inside groupings.

7. **Keep Working While Your Report Preview Loads**
   For most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

8. **Customizing Reports**
   *Report builder* is a visual editor for reports. The report builder screen lets you work with report fields and filters, and shows you a preview of your report with just some of the data.
9. **Report Fields**
   The Fields pane displays fields from the selected report type, organized by folder. It also lists custom summary formulas, which you can create, edit, and delete.

10. **Summarize Your Report Data**
    A summary field contains numeric values for which you want to know the sum, the average, or the highest or lowest. Summary fields show at all grouping levels. In summary and matrix reports, they also appear at the grand total level.

11. **Subtotal Report Results**
    Subtotaling your reports gives you a tool to analyze trends in the data. You can group sets of information, sort the groupings, and compare subtotals for each set against the overall total. In summary and joined reports, you can also subtotal by multiple fields to give you cascading sets of information.

12. **Smart Totaling in Reports**
    “Smart” totaling means that duplicate data is counted only once in any subtotal or total. Salesforce uses “smart” totaling when you run reports that include duplicate data in any of the columns chosen for summing or averaging.

13. **Work with Formulas in Reports**
    Formulas let you create custom summaries based on calculated values using report data. These formulas can then be used as columns in your report.

14. **Save Your Report**
    Click **Save** to update an existing report with recent changes, or **Save As** to clone the original report without changing it. In Lightning Experience, click **Clone** to clone the report.

Choose a Report Type

A report type is a set of rules that determine which records and fields appear in a report. You can start with one of the available standard report types or use a custom report type provided by your administrator.

Choosing the right report type is one of the most important steps in creating a report.

1. From the Reports tab, click New Report.
2. Select the report type, and then click Create.

Note: You can’t change the report type after the report is created.

For more information, review information about standard and custom report types.

Standard Report Types
Salesforce provides a rich collection of standard report types that you can tailor to your unique requirements. You rarely need to create a brand-new report.

Pre-Designed Custom Report Types
Some Salesforce features come with custom report types that are designed for you in advance, so you don’t have to create a new report.

SEE ALSO:
Set Up a Custom Report Type
Why doesn’t my report return the data I expect?
Standard Report Types

Salesforce provides a rich collection of standard report types that you can tailor to your unique requirements. You rarely need to create a brand-new report.

⚠ Tip: You may not see some of these folders if your administrator has customized the visibility of the Report tab folders.

If you can’t find a report to customize for your own needs, you can also create a new custom report to access exactly the right information.

1. Account and Contact Reports
   Use account and contact reports to learn about active, neglected, or new accounts, as well as accounts by account owner or partner. The two standard contact reports let you create a mailing list of contacts or track opportunities by contact role.

2. Activity Reports
   Activity reports are useful for gathering information about open activities, completed activities, multi-person events, or pending approval requests for which you are a delegated approver.

3. Administrative Reports
   Administrative reports help you analyze your Salesforce users, documents, and pending approval requests. You can report on the active Salesforce users and see who has been logging in.

4. Campaign Reports
   Use campaign reports to analyze your marketing efforts. You can report on the ROI of your campaigns, track who you targeted with your campaigns and who has responded, or analyze which opportunities resulted from your campaigns.

5. File and Content Reports
   Run File and Content reports to analyze how users are engaging with files and Salesforce CRM Content.

6. Forecast Reports
   Forecast reports give you information about your customizable forecast data.

7. Lead Reports
   Use lead reports to show information about the source and status of leads, how long it takes to respond to leads, neglected leads, and the history of lead fields.

8. Opportunity Reports
   Opportunity reports provide information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize a report to view other information, such as primary campaign source, forecast category, and synced quote.

9. Product and Asset Reports
   Use product and asset reports to view information about the products your users currently have installed. Find out what assets your customers have, list the cases filed for a particular asset, or identify assets that aren’t associated with a product.

10. Self-Service Reports
    Self-Service reports help you analyze the effectiveness of your Self-Service portal. Find out how many cases are being viewed, how many customers are logging in, or what customers think of the solutions you’re offering.
11. Reporting on Support Activity

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

SEE ALSO:
- Find a Report
- The Report Run Page
- Creating a Custom Report
- Reports Give You Access to Your Data

Account and Contact Reports

Use account and contact reports to learn about active, neglected, or new accounts, as well as accounts by account owner or partner. The two standard contact reports let you create a mailing list of contacts or track opportunities by contact role.

**Standard Report: Field History**

If your organization tracks field history on accounts or contacts, you can report on that information using the account history or contact history report.

**Standard Report: Person Accounts**

If your organization uses person accounts, fields specific to person accounts are available and prefixed with `Person Account:` in account reports. In addition, you can include the `Is Person Account` field in both account and contact reports. Your administrator may have given a different label to `Person Account`.

**Mass Mail Merge**

You can also create a report of your contact information, export that data to Microsoft® Excel®, and then do a mass mail merge using Microsoft® Word®.

**Last Activity**

The last activity date is either the due date of the most recently logged event against the record or the most recently closed task associated with the record. The Last Activity date can show up in activities related lists and reports, as well as on record details pages (such as accounts, contacts, and leads).

**View Filter for Account Reports**

The standard `View` filter for account reports allows you to limit your account data according to the following options. These options vary depending on your organization’s edition and setup.

- My accounts: Shows accounts that you own.
- My account team accounts: Shows accounts where you are on the account team.
- My account team and my accounts: Shows accounts you own and those where you are on the account team.
- My team’s accounts: Shows your accounts and accounts owned by all of your subordinates in the role hierarchy.
- My territories: For organizations that use territory management, this option shows accounts that belong to the territories to which you are assigned.
- My territory team’s accounts: For organizations that use territory management, this option shows accounts that belong to your territories and your territories’ descendants.
- My team’s account team and their own accounts: For users who report to you in the role hierarchy, shows accounts they own or for which they are on the account team.
- All visible accounts: Shows all accounts that you can view, as determined by your sharing model.
• Territories: For organizations that use territory management, the additional Territories filter can be set to All, Multiple Territories, or Missing Territory. In custom report types, when using the Territories filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.

• Customer Portal: If your organization uses a Salesforce Customer Portal, add the Customer Portal Account field to your account reports to view which accounts have contacts enabled to use the portal.

SEE ALSO:
- The Report Run Page
- Limit Report Results

**Activity Reports**

Activity reports are useful for gathering information about open activities, completed activities, multi-person events, or pending approval requests for which you are a delegated approver.

Standard activity reports allow you to select the date range and status of the activities you want included. The standard activity reports list your tasks and appointments for a selected date range or events with all invitees.

You can also create custom reports for activities by clicking the Reports tab, **New Report**, and choosing **Activities** as the type of data on which to report.

**Note:** Click **Show Hierarchy** to see your organization’s role hierarchy above the report results. You can use the role hierarchy to share report data with people at different levels in the hierarchy. For example, if you see **CEO > VP of Global Sales > Sales Operations Director**, you’re viewing data for the Sales Operations Director role. Click any role name to see and share the data that’s visible to people in that role.

Special Features of Activity Reports

Consider the following when running activity reports:

**Standard Reports**

- Choose the HTML Email Status report if you have the HTML email tracking enabled. This reports on anything in the HTML Email Status related list of your leads and contacts.
- Choose the Events with Invitees report to include only multi-person events in your report. The standard filters for events with invitees are:
  - Assigned to...—Shows only multi-person events that you own.
  - Assigned to the team of...—Shows multi-person events that anyone in your team owns.
  - Invitee is...—Shows only multi-person events that list you as an invitee.
  - Invitee is in the team of...—Shows the multi-person events that show anyone on your team as an invitee.
- The My Delegated Approval Requests report lists all the approval requests for which you are the approval proxy. Note that the All Pending Approval Requests report is listed in the Activity Reports folder.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, to show the activities for users who report to you, use the **Hierarchy** links in the Tasks and Appointments report. Note that you can view only your own activities and activities owned by users below you in the role hierarchy.
- If your organization uses Shared Activities, reports (including custom report types and Tasks and Events reports) display different results depending on your permissions. Say you’re reporting on events, and your report results include an event that is related to two or more contacts and also has invitees. If you’re an administrator, your report results show an event for the primary contact...
plus a separate event for each invitee. If you're not an administrator, your report results show just one event, for the primary contact.

**Report Types**
- Using report builder, you can create activity reports that show activities related to another type of record. For example, a custom Activities with Leads report shows activities associated with leads.
- Activities with Leads reports do not display data for the Address Line 1, Address Line 2, and Address Line 3 fields.

**Tips for Activity Reports**
- Set a search criteria of "Event Invitation equals 0" to filter out events that are meeting invites sent to users for a multi-person event.
- Archived activities aren't included in reports. Events and closed tasks older than a year are archived. However, open tasks aren't archived. You can still see archived activities for a record by selecting View All in the Activity History section of a record's detail page.
- Activities for private contacts are displayed only in reports for the contact owner.
- The standard filters for activity reports allow you to limit your report results using the following options. Some of these options will not be visible depending on your edition.
  - My Activities—Shows activities that you own.
  - My Delegated Activities—Shows activities that you created but are owned by someone else in the same role as you, and below your role, in the role hierarchy.
  - My Team's Activities—Shows activities owned by users who report to you in the role hierarchy.
  - All Activities—Shows all activities that you can view, as determined by your sharing model.
- If you receive an error message that your activity report has too many results, customize the report to include a filter on a picklist, text, or date field. Alternatively, rerun the report using a different activity data type such as "Activities with Accounts" or "Activities with Opportunities."

</tbody>
</table>
Create and Customize Reports

<table>
<thead>
<tr>
<th>To create, edit, save, and delete document reports:</th>
<th>“Create and Customize Reports”</th>
</tr>
</thead>
<tbody>
<tr>
<td>To run pending approval request reports:</td>
<td>“Run Reports” AND “View All Data”</td>
</tr>
</tbody>
</table>

Administrative reports help you analyze your Salesforce users, documents, and pending approval requests. You can report on the active Salesforce users and see who has been logging in.

Note: You can see the Administrative Reports folder on the Reports tab only if you have the “View Setup and Configuration” permission. You don’t need this permission to view the Administrative Reports report type—all users can view it and manage any document reports associated with that type. To view other types of reports associated with that type, such as user and approval request reports, you must have the permission.

Special Features of Administrative Reports

Consider the following when running administrative reports:

Standard Reports

- The All Active Users report lists the active users in your organization and when they last logged in.
- The Users Logged in This Week report lists all of the users who have logged in to Salesforce in the past seven days. If Communities is enabled, you can add a Community column so that you can see which communities users have logged in to as well.
- The Documents report lists the documents within each document folder.
- The All Pending Approval Requests report lists the approval requests awaiting approval for each approval process. Note that the My Delegated Approval Requests report is listed in the Activity Reports folder.
- If your organization uses territories, the User Territory Report in the Territory Reports folder summarizes the territories to which users have been assigned.

Report Types

- Create a custom report that lists your organization’s reports and the last time each report was used. Choose Administrative Reports and select Reports as the report type.
- If your organization uses Communities, you can report on login history for external members of your communities:
  1. Create a custom report.
  2. Choose Administrative Reports.
  3. Select Users as the report type.
  4. Add Community to your report columns.
  5. Add a filter that includes profiles of community users.
- If your organization uses a Salesforce Customer Portal, you can report on Customer Portal users:
  1. Create a custom report.
  2. Choose Administrative Reports.
  3. Select Users as the report type.
  4. Add License Type, Profile, and Role to your report columns. You can’t report on roles for high-volume portal users because they don’t have roles.

  Note: Permission sets aren’t supported.
You can also add the Customer Portal Account field to your account reports to view which accounts have contacts enabled to use the portal.

- You can create custom report types from which users can report on your organization's reports and dashboards. When defining a custom report type, select Reports or Dashboards from the Primary Object drop-down list on the New Custom Report Type page.

**Tips for Administrative Reports**

- Users with the “Manage Internal Users” permission can create a custom user report that lists the details of users’ login attempts. The relevant fields—such as Login Date/Time, Source IP Address, and Login Status—are grouped in the Login History section of the Select Columns step. Note that the Client Type field shows whether the user logged in via a Web browser or an alternate interface such as Connect for Lotus Notes or a partner portal. You can also see which users have never logged in by setting report criteria: choose the Login Date/Time field and the “equals” operator and leave the third value blank.

- The Report Run Page
- Limit Report Results

**Campaign Reports**

Use campaign reports to analyze your marketing efforts. You can report on the ROI of your campaigns, track who you targeted with your campaigns and who has responded, or analyze which opportunities resulted from your campaigns.

**Special Features of Campaign Reports**

Consider the following when running Campaign Reports:

**Standard Reports**

- On the Campaign Detail custom report and the Campaign ROI Analysis report, you can include campaign-hierarchy statistics that provide aggregate values for a parent campaign and all the campaigns below it in the campaign hierarchy. If your campaigns include a custom picklist that indicates hierarchy level (for example, “tactic,” “program,” and “initiative”), you can run a report that summarizes data at any hierarchy level across all campaigns.

- Use the Campaign Leads or Campaign Contacts reports to list the leads or contacts associated with your campaigns.

- Use the Campaign Member Report for a list of campaign members by campaign.

- Use the Campaign Member Analysis report to summarize information about who has responded to campaigns.

- Use the Campaign Revenue Report to analyze which opportunities have resulted from your campaigns. In Enterprise, Unlimited, Performance, and Developer Editions, you can also analyze products, quantity schedules, and revenue schedules in this report.

- The Campaign ROI Analysis Report calculates the return on investment (ROI) and average costs for your campaigns. The ROI is calculated as the net gain \((\text{Total Value Won Opps} - \text{Actual Cost})\) divided by the Actual Cost. The ROI result is expressed as a percentage.

- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

**Note:** The Campaigns with Influenced Opportunities report respects sharing rules on accounts, contacts, and campaigns. Objects with sharing rules set to private will not display in the report.
Report Types

- Use the Campaigns with Campaign Members custom report type to create a report that contains information about the leads and contacts on multiple campaigns. Use the Campaign Call Down report to see contacts and leads for a specific campaign. These reports are only available to users that have the “Read” permission on both contacts and leads.
- Use the Campaigns with Leads and Converted Lead Information report to view lead lifetime information sorted by a campaign or campaigns.
- Use the Campaigns with Influenced Opportunities report to view opportunities that have been influenced by multiple campaigns.

Tips for Campaign Reports

- Some reports allow you to limit the data to one campaign by using the lookup icon to select a campaign. If the user running a report no longer has access to view the selected campaign, the report does not show any results. This report behavior is similar to what happens when a campaign is deleted.
- Member Status is the status of a lead or contact in reference to the campaign. The campaign owner can create up to 50 member status values. Sample Member Status values include, “Planned,” “Sent,” or “Attended.” Additionally, you can now add the Member First Associated, Responded, and Member First Responded fields to campaign reports. These fields allow you to see the date the member was added to the campaign, whether the member responded to the campaign, and the date the member initially responded to the campaign.
- The Last Activity of a campaign is the most recent due date of an activity on the record. The following past or future activities set this date:
  - Any event
  - Closed tasks

File and Content Reports
Run File and Content reports to analyze how users are engaging with files and Salesforce CRM Content.

Standard File and Content Reports
Run these prebuilt reports about files and content.

Content Authors
View how many files, content packs, Google Docs, and Web links each author has published in Salesforce CRM Content.

Content Publication Time Frame
Determine how many files, content packs, Google Docs, and Web links were published in a library during a given time frame.

File and Content Downloads
See which users downloaded what files, and when they downloaded the files.

File and Content Engagement
See the number of times a file has been downloaded, shared, liked, and commented on.
**File and Content Links**
See which files users are sharing using content deliveries or Share via link. See when each link was created, when it expires, when it was last accessed, whether it is password protected, and the total number of times the link has been accessed. Each of the links in this report can be accessed by users outside of your organization.

**Library Administrators**
View the number of files, content packs, Google Docs, and Web links in each library as well as the total amount of file storage used by each library.

**Library Content**
View the number of files, content packs, Google Docs, and Web links in each library as well as the total amount of file storage used by each library.

**Most Content Downloads**
Determine which files and content packs are downloaded most frequently and which Web links and Google Docs are opened most frequently.

**Most Content Subscriptions**
Determine which files, content packs, Google Docs, and Web links have the most subscribers.

**Stale Content**
Determine which files have not been downloaded or revised recently.

**File and Content Report Types**
Build standard reports about files and content.

**Content Report**
Generate a report about Salesforce CRM Content.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archived</td>
<td>Flag that indicates whether a file has been archived. Archiving a file removes it from its library but does not permanently delete the file from Salesforce CRM Content. Archived files can be restored as needed.</td>

### File and Content Report
Generate a report about files uploaded to your organization.
Flag that indicates whether or not a file has been archived. Archiving a file removes it from its library but does not permanently delete the file from Salesforce CRM Content. Archived files can be restored as needed.

Title

Title of a file, content pack, Google doc, or Web link.

Created By

User who uploaded the file, content pack, Google Doc, or Web link.

Download Date

Date of the first file download.

Downloaded By

User who downloaded the file.

Download User Type

Profile type of the user who download the file.

File Type

MIME type of the uploaded file.

ID

Identifier that enables you to group by file rather than version. The Title is not guaranteed to be unique because multiple versions of the same file can have different titles.

Last Revised By

Last user to edit or upload a new version of the file.

Last Revised Date

Date of last file revision.

Likes

Number of times file posts have been liked. This number doesn’t count likes applied to comments on the file post.

Links

Number of external file links that have been generated. External links are generated when a user shares a file using Share via link or when a user shares content from a library using a content delivery.

Post Comments

Number of comments made on file posts in feeds.

Posts

Number of times the file has been posted to a feed. This number doesn’t count the number of times the file has been attached to comments on posts.

Published Date

Date a file, content pack, Google Doc, or Web link was first published or uploaded.

Shares

Number of times the file has been posted to a user’s feed, shared using Share with people, and shared using Share with groups.

Size (MB)

Size of the most recent file version in megabytes.

Total Downloads

Number of times the file has been downloaded.

Total Size (MB)

Combined Size of all uploaded file versions.

Versions

Number of uploaded file versions.

Tips for Using File and Content Reports

- Salesforce CRM Content users who have the Manage Content option checked in their library permission can sort report data by the library they have access to (“My Libraries”) or by all the libraries in an organization (“All Libraries”). Users without the Manage Content option can only sort data by the libraries they have access to.

- Sort custom reports by Library Name to view data for individual files as well as library summaries, such as total storage used and total number of downloads.
Sort according to the Content ID to view data for a particular document.

If you have Customer Portal or partner portal users with the "Create Libraries" user permission, run the Library Administrators report to determine which new libraries have been created by portal users.

Forecast Reports
Forecast reports give you information about your customizable forecast data.

**Note:** This information applies to Customizable Forecasting and not Collaborative Forecasts.

**Note:** If you don’t see the Forecast Reports folder, your organization may not have customizable forecasting enabled. Customizable Forecasting includes five standard report types. You can’t create custom report types with Customizable Forecasting.

Special Features of Customizable Forecast Reports
Consider the following when running customizable forecast reports:

**Standard Reports**
Create a forecast history report if you want the report to include information about forecasts you already submitted. Select All Forecasts to show the state of the forecasts after each update. Choose Latest Forecasts to display only the current state of the forecasts.

**Report Types**
- When creating a custom forecast report, choose the Customizable Forecast: Opportunity Forecasts report type if you want to include information about the opportunities that contribute to your forecast.
- You can include custom user fields in custom opportunity forecast reports as columns and as column values. Custom user fields are available as either opportunity owner or account owner custom information. The custom field label will be used for both opportunity owner or account owner information, which can cause confusion if they are both on the same report and have similar field labels.
- If you have the “View All Forecasts” permission, forecast summary and forecast history reports include all users’ data for the chosen forecast hierarchy, including users in branches of the forecast hierarchy that have no forecast manager.

**Tips on Customizable Forecasting Reports**
- You must specify a reporting interval by fiscal year or by date.
- Forecast reports include private opportunities.
- Opportunity amounts are included in forecast reports if the opportunity is set to close within the forecast period.
- Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
- Create a forecast summary report if you want to view information about the amounts in your forecast without details of the opportunities that contribute to that amount.
- If your organization uses territories, you can create custom forecast reports that summarize information by territory name.
- You can view an opportunity forecast report based on the forecast hierarchy by drilling down in your forecast hierarchy.
  1. Select the desired role or territory from the Hierarchy links.
2. Choose the appropriate forecast users or teams from the Show Opportunities Owned By or Show Forecasts Owned By scopes at the top of the report.

3. Click Run Report again to refresh the report data for your chosen parameters.

For example, to see your opportunity information, including your overrides on opportunity amounts or quantities and overrides from users below you in the forecast hierarchy, set the Hierarchy link to your forecast role. To see the opportunity information of someone beneath you in the forecasting hierarchy, drill down into that role.

⚠️ Warning: The My Team view shows forecasts across multiple hierarchy levels. Consequently, values may be included in a subordinate’s forecast total and a forecast manager’s forecast total. This may lead to larger than expected values in the column total because subordinate amounts are included multiple times in the total.

🔍 Note: Click Show Hierarchy to see your organization’s role hierarchy above the report results. You can use the role hierarchy to share report data with people at different levels in the hierarchy. For example, if you see CEO > VP of Global Sales > Sales Operations Director, you’re viewing data for the Sales Operations Director role. Click any role name to see and share the data that’s visible to people in that role.

SEE ALSO:
- The Report Run Page
- Limit Report Results

**Lead Reports**

Use lead reports to show information about the source and status of leads, how long it takes to respond to leads, neglected leads, and the history of lead fields.

**Special Features of Lead Reports**

Consider the following when running lead reports:

**Standard Reports**

Choose the Lead History report type to track the history of standard and custom fields on leads where field histories are set to tracked. Use this report to see tracked fields’ old and new values.

⚠️ Tip: If you have the “Create and Customize Reports” permission, you can use the View drop-down on a Lead History Report to view lead history data by My Leads, My Team’s Leads, User Owned Leads, Queue Owned Leads, and All Leads.

**Tips for Lead Reports**

- Limit your report view to “My team’s leads” to see leads owned by users who report to you in the role hierarchy.
- Lead reports can show all leads, both converted and unconverted. To limit your report to just unconverted leads, enter filter criteria of “Converted equals 0.”
- The Last Activity of a lead is the most recent due date of an activity on the record. The following past or future activities set this date:
  - Any event
  - Closed tasks
- You can create a report of your lead information, export that data to Excel, and then do a mass mail merge using Microsoft® Word.

**Lead Report Limitations**

- You can’t use filter conditions to search the results of the Old Value and New Value fields.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions
• You can’t use filter logic if you are filtering by Field/Event.

Limit Report Results

Opportunity Reports
Opportunity reports provide information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize a report to view other information, such as primary campaign source, forecast category, and synced quote.

1. Tips for Working with Opportunity Reports
   Opportunity reports can include all opportunity fields plus some extra columns for additional detail.

2. Standard Opportunity Reports
   Standard opportunity reports help you report on your opportunity pipeline and history, opportunity sources, opportunity types, and more.

3. Opportunity Report Types
   Report types provide a report template that you can customize to capture the unique data you’re after without creating a report from scratch. Many of the opportunities custom report types include information from associated objects, such as products, partners, and quotes.

SEE ALSO:
The Report Run Page
Limit Report Results

Tips for Working with Opportunity Reports
Opportunity reports can include all opportunity fields plus some extra columns for additional detail.

• You can use the following columns to provide additional detail:
  – Age—For an open opportunity, the number of days since the opportunity was created. For a closed opportunity, the number of days between the creation date and the closed date.
  – Stage Duration—The number of days the opportunity was in the stage listed in the Stage column. You can run the Opportunity Stage Duration report to see how much time an opportunity spent at different stages.
  – Last Activity—The most recent due date of an activity on the opportunity record, including any opportunity event or closed task.

• If your organization uses Forecasts or Customizable Forecasts, you’ll see forecast report options paired with opportunity report options in the standard reports folders and the custom reports wizard. Opportunities owned by users who do not have a role in your organization’s hierarchy are omitted from opportunity, forecast, and sales reports. This restriction does not apply to Personal or Group Edition organizations, which do not have a role hierarchy. For reports that include the Partner column (except for the Partner Opportunities report), only the primary partner of the opportunity is displayed.
• Not all Opportunity Product fields are available in report filters. For example, the Product Family field is not available in Opportunity Product report filters because it is related to that object through the Pricebook Entry object. To make the Product Family field available in Opportunity Product report filters—for cross-sell or upsell reporting—create a custom formula field to store its contents and use that formula field in your filter. From the object management settings for opportunities, go to the fields area, then create a custom field of type Formula, making sure to use Text for your formula return type and `TEXT(PricebookEntry.Product2.Family)` for your formula.

• In Professional, Enterprise, Unlimited, Performance, and Developer edition organizations, the Hierarchy links let you browse report results based on the role or territory hierarchies.

• If your organization uses territory management, the Hierarchy filter on opportunity reports lets you view data according to either the role or territory hierarchies. In addition, the Territories filter lets you display either opportunities from all territories or opportunities that lack an associated territory.

• You can include the Primary Campaign Source field on all standard opportunity reports. This field is controlled by field-level security.

• Use the View filter to limit your opportunity report results. View options vary depending on your organization’s Edition and setup.
  – My opportunities—Shows only your opportunities.
  – My team-selling opportunities—Shows opportunities for which you are on the opportunity team.
  – My team-selling and my opportunities—Shows your opportunities and opportunities for which you are on the opportunity team.
  – My team’s opportunities—Shows your opportunities and opportunities owned by all of your subordinates in the role hierarchy. If your organization uses territory management, the effect of this option depends on the value of the Hierarchy filter above. If you select Role, you see your opportunities and opportunities owned by all of your subordinates in the role hierarchy. If you select Territory, you see opportunities that you own and any opportunities owned by your territories’ descendants.
  – My team’s team-selling and their opportunities—for users who report to you in the role hierarchy, shows opportunities they own or for which they are on the opportunity team.
  – My territories—for organizations that use territory management, this option shows opportunities that belong to the territories to which you are assigned.
  – All opportunities—Shows all opportunities you can view.

  Opportunity Reports
  Opportunity Report Types
  Standard Opportunity Reports

Standard Opportunity Reports
Standard opportunity reports help you report on your opportunity pipeline and history, opportunity sources, opportunity types, and more.

1. In the **Folders** pane on the Reports tab, select **Opportunity Reports**.
2. Click the report you want.

### Report Name | Description
--- | ---
Closed Opportunities | Won opportunities
Opportunities by Type | Types of available opportunities.
Opportunity Field History | Field history on opportunities. Available only if your organization tracks this information.
Opportunity History | Status changes on opportunities. Available only if your organization tracks this information.
Opportunity Pipeline Trend | A historical snapshot of your opportunities; opportunity amounts are grouped by historical stage for specified months. This report is available in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations only.
Opportunity Pipeline | Opportunities by stage.
Opportunity Pipeline with Splits | Opportunities summarized by split information such as assigned user and percentage.
Opportunity Product | Opportunities by month and product.
Opportunity Product Report with Splits | Split assignments and percentages for each product. You can also summarize information by these fields:
- **Split Total Price**—Split percentage multiplied by Total Price.
- **Split Expected Product Amount**—Split Total Price multiplied by Probability.
Opportunity Schedule Report with Splits | Opportunities by month, including split percentages for the opportunity team. To access this report, product scheduling must be enabled for your organization.
You can also summarize information by these fields:
- **Split Total Price**—Split percentage multiplied by Total Price.
<table>
<thead>

Report types provide a report template that you can customize to capture the unique data you’re after without creating a report from scratch. Many of the opportunities custom report types include information from associated objects, such as products, partners, and quotes.

**Opportunities Reports**
View standard information about your opportunities, including owners, accounts, stages, amounts, and more. The default settings show you the most commonly used information from each object, but you can customize the report to view other information, such as primary campaign source, forecast category, and synced quote.

**Opportunities with Contact Roles Report**
View information about the contacts associated with your opportunities, including name, title, and role.

**Opportunities with Contact Roles and Products Report**
View information about the contacts and opportunities associated with a selected product. You must select a product to filter results by when you run the report.

**Opportunities with Competitors Report**
View information about your company’s competitors for opportunities, including their strengths and weaknesses.

**Opportunities with Historical Trending Report**
The Opportunities with Historical Trending report is a custom report type designed to help you analyze historical trends in your sales pipeline.

**Opportunity Field History Report**
View information about the change history of key opportunity fields, including old and new values and the dates edits were made.

**Opportunity History Report**
View information about the history of your opportunities, including stages and close date.

**Opportunities with Opportunity Teams Report**
View information about the members of your opportunity team and their roles, organized by opportunity.

**Opportunities with Opportunity Teams and Products Report**
View information about your opportunity team members and their products, organized by opportunity. You must specify either a product or an opportunity team member to filter results by when you run the report.

**Opportunities with Partners Report**
View information about the partners you team with on your opportunities, including opportunity name, amount, and partner role.

**Opportunities with Products Report**
View information about the products associated with your opportunities, including product name and opportunity stage.

**Opportunity Trends Report**
View information about trends shared by the opportunities in your pipeline.

**Opportunities with Quotes and Quote PDFs Report**
View details about the quote PDFs created for each quote associated to an opportunity. The default settings show you the most commonly used information from each object, but you can customize the report to view other information, such as who created or last modified each listed quote PDF.
Opportunities with Quotes and Quote Line Items Report

View details about the quotes associated with opportunities, and the line items for each quote. The default settings provide the most commonly used information from each object, but you can customize the report to see any opportunity, quote, or quote line item field.

- Opportunity Reports

**Opportunities with Historical Trending Report**

The Opportunities with Historical Trending report is a custom report type designed to help you analyze historical trends in your sales pipeline.

We’ve selected some of the most useful Opportunity fields for you in the default report:

- **Amount**
  - Estimated total sale amount. For organizations using multiple currencies, the amount is shown in your personal currency by default. Change the Opportunity Currency picklist to track the amount in another currency.

- **Close Date**
  - Date when you plan to close the opportunity. You can enter a date, or choose a date from the calendar that displays when you put your cursor in the field.

- **Stage**
  - Current stage of opportunity based on selections you make from a predefined list, for example, Prospect or Proposal.

- **Probability**
  - Percentage of estimated confidence in closing the opportunity.
Forecast Category
Forecast category name that is displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. The setting for an opportunity is tied to its Stage.

Note: If you edit this report type, it is no longer automatically updated. If you remove this report type, it will not be regenerated.

Opportunity Field History Report
View information about the change history of key opportunity fields, including old and new values and the dates edits were made.

Note: You must enable and set up field history tracking and select fields in order to use the Field History Tracking report.

Opportunity Reports

**Product and Asset Reports**

Use product and asset reports to view information about the products your users currently have installed. Find out what assets your customers have, list the cases filed for a particular asset, or identify assets that aren’t associated with a product.

Special Features of Product and Asset Reports

Consider the following when running product and asset reports:

**Standard Reports**

Use the Assets without Products report, available from the “Products and Asset Reports” folder to list the assets that are not associated with a product. Depending on how you use assets, these assets can represent your competitor’s products.

**Report Types**

- To create a custom report showing what assets your customers have, click New Report from the Reports tab and choose the Accounts with Assets or Contacts with Assets report type from the Accounts & Contacts report type category.
To view a list of the cases filed for a particular asset, click **New Report** from the Reports tab and choose the Assets with Cases report type from the Price Books, Products and Assets option.

**SEE ALSO:**
- The Report Run Page
- Limit Report Results

### Self-Service Reports
Self-Service reports help you analyze the effectiveness of your Self-Service portal. Find out how many cases are being viewed, how many customers are logging in, or what customers think of the solutions you’re offering.

**Note:** Starting with Spring ’12, the Self-Service portal isn’t available for new orgs. Existing orgs continue to have access to the Self-Service portal.

### Standard Reports
- The Self-Service Usage Report gives you information on how many cases are viewed and logged, the number of comments that have been added, and the number of searches Self-Service users have performed.
- The Self-Service User Report provides information about the customers who are logging into your Self-Service portal, including the associated account and last login date. You can also include Self-Service fields in any custom contact report.
- The Helpful Solutions report displays statistics from Self-Service portals that display solutions. On each Self-Service solution page, customers can indicate whether the solution is helpful. You can use the results of this survey when choosing the top five solutions for your Self-Service Home page and to verify that customers are able to find the solutions they need.

**SEE ALSO:**
- The Report Run Page
- Limit Report Results

### Reporting on Support Activity
Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

1. **Fields Available for Case Reports**
   - You can report on a number of key case fields in addition to the ones that are included in the standard and custom report types.
2. **Fields Available for Solution Reports**
   You can report on a number of key solution fields in addition to the standard and custom fields.

</tr>
<tr>
<td>Has Attachment</td>
<td>A checkbox showing a case with emails has attachments. (Cases with Emails Report)</td>
</tr>
<tr>
<td>Old Value</td>
<td>The value in a tracked case or solution field before it was changed. (Case History Report and Solution History Report)</td>
</tr>
<tr>
<td>New Value</td>
<td>The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)</td>
</tr>
<tr>
<td>Business Hours</td>
<td>The number of business hours that have elapsed since a case was last updated. Note that holidays are not taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)</td>
</tr>
<tr>
<td>Business Hours Since Similar Change</td>
<td>The number of hours that elapsed since the same field on a case was last updated. Note that holidays are not taken into account for this field. Holidays suspend business hours during specified dates and times. (Case History Report)</td>
</tr>
<tr>
<td>History ID</td>
<td>The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)</td>
</tr>
<tr>
<td>Contact Account Name</td>
<td>The account associated with the contact on the case. View together with the Account Name field to see if the account on the case is different from the account on the contact.</td>
</tr>
<tr>
<td>Parent Case ID</td>
<td>The ID of a parent case, which can be used to access a parent case via the API.</td>
</tr>
</tbody>
</table>

Fields Available for Solution Reports
You can report on a number of key solution fields in addition to the standard and custom fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td># Solution Searches</td>
<td>The number of solution searches performed by Self-Service users via the Self-Service portal. (Self-Service Usage Report)</td>
</tr>
<tr>
<td>Self-Service Access Count</td>
<td>The number of times a solution was viewed in the Self-Service portal.</td>
</tr>
<tr>
<td>Self-Service Answer Count</td>
<td>The number of times the survey question “Does this Solution help you answer your question?” is answered, either positively or negatively, on a solution in the Self-Service portal.</td>
</tr>
<tr>
<td>Self-Service Positive Count</td>
<td>The number of times the survey question “Does this Solution help you answer your question?” is answered positively on a solution in the Self-Service portal.</td>
</tr>
<tr>
<td>Author</td>
<td>The name of the user who originally created the solution.</td>
</tr>
<tr>
<td>Num Related Cases</td>
<td>The number of cases associated with the solution.</td>

<tr>
<td>New Value</td>
<td>The value in a tracked case or solution field after it was changed. (Case History Report and Solution History Report)</td>
</tr>
<tr>
<td>History ID</td>
<td>The unique identifier for each change tracked on a specified case or solution field. (Case History Report and Solution History Report)</td>
</tr>
<tr>
<td>Language</td>
<td>The language in which the master solution is written.</td>
</tr>
<tr>
<td>Translation Language</td>
<td>The language in which the translated solution is written. (Translated Solutions report)</td>
</tr>
<tr>
<td>Solution ID</td>
<td>The unique identifier for each solution. (Translated Solutions report)</td>
</tr>
<tr>
<td>Out of Date</td>
<td>Checkbox that indicates that the translated solution may need translating to match its master solution. (Translated Solutions report)</td>
</tr>
<tr>
<td>Master Solution Title</td>
<td>The title of the master solution. Displays up to 250 characters. (Translated Solutions report)</td>
</tr>
</tbody>
</table>
Pre-Designed Custom Report Types

Some Salesforce features come with custom report types that are designed for you in advance, so you don’t have to create a new report.

Note: Pre-designed custom report types are not the same as standard report types.

1. Territory Reports
   Use territory reports to analyze your sales territories. Identify which users have been assigned to which territories, which users have been assigned more than one territory, or which users have no territories.

2. Reports for Answers
   Create custom report types so users can analyze questions, replies, and votes.

3. Salesforce CRM Call Center Reports
   Call Center reports help you analyze the Salesforce CRM Call Center phone calls that were handled by you and your team.

4. Create a Custom Report Type for Approval History
   Before you can run reports on executed and in-progress approval processes and their steps, you need to create a custom report type for approval process instances.

5. Reports That You Can Run on Activities
   Run standard or custom reports that display details about your tasks or events and their related contacts, accounts, opportunities, and other associated records.

6. Report on Sales Reps’ Meetings with Customers
   Get insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

7. Create a Forecasting Custom Report Type

8. Forecasting Custom Report Types
   A report type defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

9. Idea Reports
   Create custom report types so users can create reports about ideas, idea comments, and votes.

10. Report on Salesforce Knowledge Articles
    Use Salesforce Knowledge custom reports to track how articles are created, maintained, and delivered.

11. Live Agent Session Reports
    Use Live Agent Session reports to consolidate data about agents’ activities while they chat with customers—for example, how long agents are online or how many chat requests are assigned to them.
12. **Report on Partners**
   Some opportunities involve partner relationships. Use this report to identify and analyze those relationships.

13. **Report on Relationship Groups**
   You can report on relationship groups and relationship group members if your administrator has enabled custom report types for those custom objects.

14. **Enable the Account Owner Report**
   The Account Owner report lists all accounts and who owns them.

15. **Report on File Search Activity**
   Use a report to determine the top 300 search term queries for file searches and to identify which content is missing or needs to be renamed based on users’ search terms and the click-rank.

**Territory Reports**

Use territory reports to analyze your sales territories. Identify which users have been assigned to which territories, which users have been assigned more than one territory, or which users have no territories.

**Special Features of Territory Reports**

Consider the following when running territory reports:

**Standard Reports**

- The territory report lists all territories in your organization. Select **No Users** in the **Users** drop-down list and click **Run Report** to see the territories in your organization that do not have any assigned users.
- The User Territory report, User Multiple Territory report, and User Missing Territory report summarize the users who have been assigned to any territories, more than one territory, or no territories, respectively.
- The Account Territory report, Account Multiple Territory report, and Account Missing Territory report summarize the accounts that have been assigned to any territories, more than one territory, or no territories, respectively.
- The Opportunity Territory report summarizes the opportunities that are in territories. To see opportunities owned by users who are not currently active in the opportunity’s territory, customize the Opportunity Territory report with the following advanced filter: **Active in Territory** equals “False.” The Opportunity Missing Territory report summarizes the opportunities that are associated with accounts that do not have a territory.
- Reports run from custom report types that include territories may display results differently than standard reports that include territories. This is because reports run from custom report types only display results **with** territories, such as accounts with territories, whereas standard reports that include territories may display results **without** territories. For example, if you select the Account Territory Report, results display accounts without territories. In custom report types, when using the Territories filter that includes territories, Multiple Territories or Missing Territories are not shown in the report results.

**Tips for Territory Reports**

- Standard and custom territory fields are available in territory reports. They are also available in account reports, activity reports that include accounts, opportunity reports, and user reports.

**SEE ALSO:**

- The Report Run Page
- Limit Report Results
Reports for Answers

Create custom report types so users can analyze questions, replies, and votes.

Note: Starting with Summer '13, Answers isn't available in new orgs. Instead, you can use Chatter Questions, a Q&A feature that's seamlessly integrated into Chatter. With Chatter Questions, users can ask questions and find answers without ever needing to leave Chatter. Existing orgs will continue to have access to Answers if it was enabled before the Summer '13 release.

As an administrator, you can create custom report types so users can create reports about questions, replies, and votes. Custom report types are the only way to make reports about your answers community available for your users—Salesforce does not provide sample answers reports or a standard report folder for answers.

To create a folder of answers reports for your users:

1. Set up a custom report type for answers.
   - The primary object for your report is Questions.
   - There isn't a specific report category for answers, so you probably want to store your report in the Other Reports or Administrative Reports category.
   - When setting up object relationships, Questions can have a relationship with Replies, and Replies can have a relationship with Votes.

2. Create a new public folder for answers reports. This step requires the “Manage Public Reports” permission.

3. Using your custom report type, create one or more new custom reports for answers. Assign the reports to the new answers reports folder you created.

After completing these steps, a folder of answers reports is available to your users on the Reports home page.

SEE ALSO:

Reports Give You Access to Your Data
Salesforce CRM Call Center Reports

Call Center reports help you analyze the Salesforce CRM Call Center phone calls that were handled by you and your team.

Special Features of Call Center Reports

Consider the following when running call center reports:

**Standard Reports**

- The My Team's Calls This Week gives you information about the calls that were handled by the call center users on your team during the past week, including associated records and the result of each call.
- The My Calls Today report gives you information about the calls that you initiated or received during the past day, including associated records and the result of each call.
- The My Calls This Week report gives you information about the calls that you initiated or received during the past week, including associated records and the result of each call.

Create a Custom Report Type for Approval History

Before you can run reports on executed and in-progress approval processes and their steps, you need to create a custom report type for approval process instances.

1. From Setup, enter Report Types in the Quick Find box, then select Report Types.
2. Click New Custom Report Type.
3. Fill out the fields.

<table>
<thead>
<tr>
<th>For this field...</th>
<th>Do this...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Object</td>
<td>Select Process Instance. A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.</td>
</tr>
<tr>
<td>Report Type Label</td>
<td>Enter a label. Users see this label when they create reports. Example: Approval Process Instances</td>
</tr>
<tr>
<td>Report Type Name</td>
<td>Enter a unique name for the report type.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description. Users see this label when they create reports.</td>
</tr>
</tbody>
</table>
| Store in Category| Select Administrative Reports. If you like, you may select a different category. This determines in which folder your users
For this field... | Do this...
---|---
| | find the custom report type when they create approval history reports.

Deployment Status | When you’re ready to let all users access the report type, select Deployed.

4. Click **Next**.

5. Click the box under the primary object.

6. Select **Process Instance Node**.

   A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn’t meet the step criteria or if the approval process instance is otherwise completed without entering the step.

7. For the A to B relationship, select one of these options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Each &quot;A&quot; record must have at least one related &quot;B&quot; record.</td>
<td>The report includes only process instances that enter at least one approval step to create a process instance node. The report excludes process instances for records that were submitted for approval but that didn’t meet any step criteria.</td>
</tr>
<tr>
<td>&quot;A&quot; records may or may not have related &quot;B&quot; records.</td>
<td>The report includes all process instances.</td>
</tr>
</tbody>
</table>

8. Click **Save**.

After the report type is deployed, notify the relevant users with the names of the category folder and the custom report type, so that they can start creating and running approval history reports.

**Reports That You Can Run on Activities**

Run standard or custom reports that display details about your tasks or events and their related contacts, accounts, opportunities, and other associated records.

<table>
<thead>
<tr>
<th>To View This Information</th>
<th>Use This Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Activities related to another record type, such as opportunities</td>
<td>Click <strong>Create New Custom Report</strong> on the Reports tab and select the Activities report type.</td>
</tr>
<tr>
<td>Number of contacts related to an activity</td>
<td>Activity reports. Add the <strong>Relation Count</strong> column to your reports. For example, you have a task with five contacts. When you run the Tasks and Events report, it displays &quot;5&quot; to indicate the number of contacts related to the task.</td>
</tr>
</tbody>
</table>
## To View This Information

### One row per contact for each activity

The Activities with Contacts report. Select at least one field from the Contact object.

For example, your report includes a task with five contacts. If you include the `Last Name` field from the contact object on the report, you see five rows (one row for each contact) related to this activity. If you don’t add fields from the contact object, you see only one row for the activity.

The Activities with Contacts report is the only report that:

- Displays all contacts on an activity
- Can be filtered using attributes of contacts other than the primary contact

Other reports show the primary contact and the total number of contacts on an activity, but they don’t show details of the other contacts.

The Activities with Contacts report doesn’t indicate which contacts are primary or secondary.

### An activity’s primary contact in two different reports: Tasks and Events, and Activities with Cases

Either the Tasks and Events report or the Activities with Cases report.

For example, if the primary contact for a task is Ron Dean, these reports display that name in the `Contact` field.

The primary contact also appears in the `Name` field on the task detail page or event detail page.
Report on Sales Reps’ Meetings with Customers

Get insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

1. Create a custom report type.
   a. For Primary Object, choose Users.
   b. Complete the remaining required fields: label, description, and category.
   c. Click Next.

2. Define a relationship between activities and users.
   a. Relate the Activity Relationships object to the Users object.
   b. Click Save.

3. Define the fields that appear in this report type.
   a. In the Fields Available for Reports section, click Edit Layout.
   b. Add the following Activity Relationships fields to the layout: Date, Subject, Name, Related To, Relation Count.
   c. Change the label for the Name field to Contact and for the Related To field to Opportunity.
   d. For each field, select the option to display the field by default.
   e. Click Save.

4. Create a report.
   a. In the Reports tab, select the report type that you created in steps 1–3.
   b. Choose Summary Format, and create a grouping by Full Name.
   c. Run and save the report.

You now have a report that you can use to help your sales teams optimize the time that they spend with customers.

Note: If Shared Activities isn’t enabled, custom reports based on activity relationships don’t include event organizers along with invitees, and they don’t show events to which no one has been invited.

Creating a Custom Report
Create a Forecasting Custom Report Type

Note: This information applies to Collaborative Forecasts and not Customizable Forecasts. You must enable Collaborative Forecasts to create a forecasting custom report type.

To make a forecasting report available to users, administrators must create a custom report type. A **report type** defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

1. Start creating a custom report type from Setup by entering **Report Types** in the Quick Find box, then selecting **Report Types** and **New Custom Report Type**.
2. For Primary Object, select a Forecasting object, such as Forecasting Items or Forecasting Quotas.
3. For Store in Category, select Forecasts.

After deploying the report types, let your users know their locations and names.

Forecasting Custom Report Types

A **report type** defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

Note: This information applies to Collaborative Forecasts and not Customizable Forecasts. You must enable Collaborative Forecasts to create a forecasting custom report type.

Use the table to understand the forecasting custom report types that you can create.

<table>
<thead>
<tr>
<th>Primary Object</th>
<th>Use to create a report for...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forecasting Items</td>
<td>Viewing information about forecasting amounts, including adjustment amount information. As a best practice, if you use a forecast type based on revenue, use these default fields in the report type:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Owner Only Amount</strong>—The sum of all of a person’s revenue opportunities, without adjustments. For example, if you own two opportunities, each worth $10,000, the Owner Only Amount is $20,000.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Amount Without Adjustments</strong>—The sum of all of a person’s owned revenue opportunities and also his or her subordinates’ opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy. For example, if the sum of the...</td>
</tr>
</tbody>
</table>
Primary Object | Use to create a report for...
---|---
| amount of all opportunities owned by you is $20,000 and the sum of the amount of your subordinates’ opportunities is $55,000, the Amount Without Adjustments is $75,000.

- **Amount Without Manager Adjustments**—The forecast number as seen by the forecast owner. This is the sum of the owner’s revenue opportunities and his or her subordinates’ opportunities, including adjustments made by the forecast owner on her or her own or subordinates’ forecasts. *It doesn’t include adjustments made by forecast managers above the owner in the forecast hierarchy.* For example, say Anne has an Amount Without Adjustments of $75,000, made up of $20,000 of her own opportunities and $55,000 of opportunities owned by her subordinate Ben. Additionally, she adjusted Ben’s amount to $65,000 for a total of $85,000. If you adjust Anne’s number from $85,000 to $100,000, then you see $85,000 in **Amount Without Manager Adjustments** because this is what Anne sees (and Anne can’t see your adjustments as you’re her manager). To see the amount that includes your adjustment to $100,000, look at **Forecast Amount**.

- **Forecast Amount**—The revenue forecast from the forecast manager’s perspective and the sum of the owner’s and subordinates’ opportunities, including all forecast adjustments. For example, say you’re a forecast manager and have another forecast manager reporting to you who has an Amount Without Manager Adjustment totaling $85,000. If you adjust the forecast to $100,000, the Forecast Amount is $100,000.

If you use a forecast type based on quantity, use these default fields in the report type instead:

- **Owner Only Quantity**, **Quantity Without Adjustments**, **Quantity Without Manager Adjustments**, and **Forecast Quantity**

No matter whether you forecast based on revenue or quantity, add these fields:

- **Has Adjustment**—A checkbox that indicates if a manager adjustment has been made on a forecast owner’s amount.

- **Has Owner Adjustment**—A checkbox that indicates if a forecast user has made an adjustment to their own forecast amount.

If your organization uses cumulative forecast rollups, add this field to your report:

- **ForecastingItemCategory**—This field indicates which rollup each forecast amount is for: Open Pipeline, Best Case Forecast, Commit Forecast, Closed Only, Pipeline, Best Case, Commit, or Closed. If your organization has changed the forecast category names, those changes also appear in the **ForecastingItemCategory** values.

<table>
<thead>
<tr>
<th>Forecasting Items with Opportunities as a related object</th>
<th>Viewing opportunity information for specific forecasting line items. For example, you might want to create a summary report for each of your subordinates that includes the opportunity names and last activity dates for their forecasting items, alongside adjustment information and final forecast amounts.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Note:</strong> For opportunities with no opportunity products specified, this report type includes 2 forecasting items — one for the Opportunity-Revenue forecast type, and one for the Product Family forecast type. These product family forecasting items roll up into the Products Not Specified row of the Product Family forecast.</td>
<td></td>
</tr>
</tbody>
</table>

<p>| Forecasting Items with Opportunity Splits as a related object | Viewing opportunity split information for specific forecasting line items. For example, you might want to create a summary report for each of your subordinates that includes the opportunity split amounts and percentages for their forecasting items, alongside adjustment information and final forecast amounts. |</p>
<table>
<thead>
<tr>
<th>Primary Object</th>
<th>Use to create a report for...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Forecasting Items with Opportunity Product as a related object</td>
<td>Viewing product family information for specific forecasting line items. For example, you might want to create a summary report for each of your subordinates that includes the product families and total price for their forecasting items, alongside adjustment information and final forecast amounts. <strong>Note:</strong> This report type only shows forecasting items for the Product Family—Revenue and Product Family—Quantity forecast types. It includes opportunities both with and without opportunity products specified.</td>
</tr>
<tr>
<td>Forecasting Quotas with Forecasting Items as a related object</td>
<td>Viewing data about individual or team quotas. As a best practice, include all the default fields in the report type. For example, you can include lookup fields, such as the full name of the owner. When running the report, you can filter by your own name to see quotas you created and their related accounts and owners.</td>
</tr>
<tr>
<td>Forecasting Quotas</td>
<td>Viewing quota attainment. For example, you can use both Forecasting Quotas and Forecasting Items to create the custom report type. Then, when you create the report, include a team’s quotas and forecasted revenue for closed forecasts and create a formula field to display the quota percentage attained.</td>
</tr>
</tbody>
</table>

**Idea Reports**
Create custom report types so users can create reports about ideas, idea comments, and votes.

As an administrator, you can create custom report types so users can analyze what happens to ideas. Custom report types are the only way to make idea reports available for your users—Salesforce does not provide sample idea reports or a standard report folder for ideas.

To create a folder of idea reports for your users:

1. Create a custom report type for ideas.
   
   If you create a custom report type that uses Ideas as the primary object and Votes as the secondary object, child (merged) ideas will not appear in the report unless you select "A" records may or may not have related "B" records. Child ideas have no votes because their votes are transferred to the master idea. This means child ideas do not appear in a report if the Votes object is required.

2. Create a new public folder for idea reports. This step requires the “Manage Public Reports” permission.

3. Using your custom report type, create one or more new custom reports for ideas. Assign the reports to the new idea reports folder you created.

After completing these steps, a folder of idea reports will be available to your users on the Reports home page.
Report on Salesforce Knowledge Articles

Use Salesforce Knowledge custom reports to track how articles are created, maintained, and delivered.

As an administrator, you can create custom report types so agents can create reports on Salesforce Knowledge articles. Custom report types are the only way to make reports about articles available for your readers. Salesforce does not provide sample article reports or a standard report folder for articles.

Tip: The Knowledge Base Dashboards and Reports AppExchange package provides over two dozen reports that help you monitor the knowledge base and analyze usage metrics.

1. **Create a Folder for Article Reports**
   Create a public folder where you can store article reports for your users.

2. **Article Reports**
   Create a custom report type to report on Salesforce Knowledge article data.

3. **Create an Article Report**
   Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.

4. **Fields Available on Salesforce Knowledge Reports**
   The fields you can use in a knowledge report depend on the type of information you are reporting on.

Create a Folder for Article Reports
Create a public folder where you can store article reports for your users.

1. In the Report Folder section of the Reports tab, click **Create New Folder**.
2. Enter **Article Reports** in the Folder Label field.
3. Optionally, modify the Group Unique Name.
4. Choose a Public Folder Access option.
   - Select read/write if you want users to be able to add and remove reports.
5. Choose a folder visibility option.
6. Click **Save**.

Reports you store in this folder are available on the Reports tab.

**Editions**

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

**User Permissions**

To create or update custom report types:
- “Manage Custom Report Types”

To create a public reports folder:
- “Manage Public Reports”

Article Reports
Create a custom report type to report on Salesforce Knowledge article data.

To create a custom report:

1. From Setup, enter Report Types in the Quick Find box, then select Report Types and click New Custom Report Type. See Create a Custom Report Type on page 418

2. In the Primary Object drop-down menu, select the article-related object you want to report on:

<table>
<thead>
<tr>
<th>Primary Object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Article types</td>
<td>Compare information such as creation dates, published channels, and number of associated cases for your custom article type, such as an FAQ. To access any history and custom fields for the custom article type, add the article type’s version as a secondary object.</td>
</tr>
<tr>
<td>Knowledge Articles</td>
<td>Compare information about individual articles, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics. In reports using the Knowledge Articles primary object, each article has five records (rows): one for each channel (All Channels, Internal App, Customer, Partner, and Public Knowledge Base).</td>
</tr>
<tr>
<td>Knowledge Article Searches</td>
<td>Analyze the number of searches per day, month, or year for each channel and role.</td>
</tr>
<tr>
<td>Knowledge Article Version</td>
<td>Compare information about individual translations, such as their creation dates, published channels, and number of associated cases. If you choose this custom report type, you can also include article view and vote statistics.</td>
</tr>
<tr>
<td>Article Version History</td>
<td>Compare information about individual article versions, such as their creation dates, published channels, and number of associated cases.</td>
</tr>
<tr>
<td>Knowledge Article Views</td>
<td>Analyze the number of views per day, month, or year for each channel and role.</td>
</tr>
<tr>
<td>Knowledge Article Votes</td>
<td>Analyze the number of votes per day, month, or year for each channel and role.</td>
</tr>
<tr>
<td>Knowledge Keyword Search</td>
<td>See which keywords users are looking for in your knowledge base.</td>
</tr>
<tr>
<td>Knowledge Search Activity</td>
<td>• Analyze the number of searches per day, month, or year for each channel and language.</td>
</tr>
<tr>
<td></td>
<td>• For each search, see the:</td>
</tr>
<tr>
<td></td>
<td>– Date</td>
</tr>
<tr>
<td></td>
<td>– ID and title of the article that was clicked</td>
</tr>
</tbody>
</table>

Salesforce Knowledge is available in Performance and Developer Editions and in Unlimited Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in Enterprise and Unlimited Editions.

**USER PERMISSIONS**

To create or update custom report types:

- “Manage Custom Report Types”

To create a public reports folder:

- “Manage Public Reports”
See which keywords users are looking for in your knowledge base.

- For each keyword, see the average number of:
  - Results
  - Articles that appear in the search results

- For each article, see the average number of:
  - Clicks
  - Unique users who clicked it

3. Complete the required fields and click **Save**.

   In the Store in Category drop-down menu, we recommend choosing **Customer Support Reports** or **Other Reports**. This is the category where users find the custom report type on the Reports tab.

<table>
<thead>
<tr>
<th>Primary Object</th>
<th>Available Secondary Objects</th>
</tr>
</thead>
<tbody>
<tr>
<td>Article types</td>
<td>Article type Versions</td>
</tr>
<tr>
<td>Knowledge Articles</td>
<td>Article View Statistics, Article Vote Statistics, Case Article</td>
</tr>
<tr>
<td>Knowledge Article Searches</td>
<td>None</td>
</tr>
<tr>
<td>Knowledge Article Version</td>
<td>Article View Statistics, Article Vote Statistics</td>
</tr>
<tr>
<td>Article Version History</td>
<td>None</td>
</tr>
<tr>
<td>Knowledge Article Views</td>
<td>None</td>
</tr>
<tr>
<td>Knowledge Article Votes</td>
<td>None</td>
</tr>
<tr>
<td>Knowledge Keyword Search</td>
<td>None</td>
</tr>
<tr>
<td>Knowledge Search Activity</td>
<td>None</td>
</tr>
</tbody>
</table>

5. Click **Save**.

6. As needed, remove and rearrange fields from your report layout.

   To learn which fields are available on each primary object, see **Fields Available on Salesforce Knowledge Reports** on page 3611.

Create an Article Report
Run your custom report on your Salesforce Knowledge articles and save them to your article reports folder.

Using your custom report types, create article reports and save them to your article reports folder.

2. Choose the category where your custom report types are stored; for example, Customer Support Reports or Other Reports.
   The Cases with Articles report is available by default in the Customer Support Reports folder.
3. Find your report type and click Create.
4. When viewing your report, click Save As and save it in the new Article Reports folder to make the report available to other users.

**Note:**
- In reports using the Knowledge Article custom report type, there are at least five rows per article (one for each channel, including “All Channels”).
- Daily values are reported independently for the last 90 days and monthly values for the last 18 months. After those time periods, use the monthly aggregate and yearly aggregate values, respectively.
- In reports using the Knowledge Article Votes, Knowledge Article Views, or Knowledge Article Searches custom report types, each row represents a day, channel, and role combination. For example, if a user with the Kingmaker role views articles in the internal app and the next day the same reader views more articles in the internal app, the Article Views report has two rows: one for each unique date.
- In reports using Knowledge Article Version (KAV), except Knowledge Article Version History, you can filter by data category. You can add up to four filters and set their logic to AT, ABOVE, BELOW, or ABOVE OR BELOW. The logic between filters is OR. You can use the same category group multiple times, however, you must use the same operator each time.
- To report on Approval Processes for Knowledge Articles, use Process Instance and Process Instance Node when creating a custom report type. Then filter the report on object type, which is the article type.

**Fields Available on Salesforce Knowledge Reports**
The fields you can use in a knowledge report depend on the type of information you are reporting on. The following tables list the available fields by primary object for Salesforce Knowledge reports.

Fields Available on Article types Reports

The Article Type primary object allows you to add a secondary object of the article type version.

### Table 55: Article Type Report Primary Object Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archived By</td>
<td>User who archived the article.</td>
</tr>
<tr>
<td>Archived Date</td>
<td>Date the article was archived.</td>
</tr>
<tr>
<td>Article Number</td>
<td>Unique number automatically assigned to the article.</td>
</tr>
<tr>
<td>Article Type ID</td>
<td>The ID associated with the article type.</td>
</tr>
<tr>
<td>Case Association Count</td>
<td>Number of cases attached to the article.</td>
</tr>
<tr>
<td>Created By</td>
<td>User who created the article.</td>
</tr>
<tr>
<td>Created Date</td>
<td>Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.</td>
</tr>
<tr>
<td>Custom fields</td>
<td>Any custom fields created on the article types. Add the article type's version as a secondary object to access any custom fields for the article type.</td>
</tr>
<tr>
<td>First Published Date</td>
<td>Date the article was originally published.</td>
</tr>
<tr>
<td>Knowledge Article Version</td>
<td>The article's version number.</td>
</tr>
<tr>
<td>Last Modified By</td>
<td>User who changed the article most recently.</td>
</tr>
<tr>
<td>Last Modified Date</td>
<td>Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is the time the article was most recently published.</td>
</tr>
<tr>
<td>Last Published Date</td>
<td>Date the article was last published.</td>
</tr>
<tr>
<td>Master Language</td>
<td>The original language of the article.</td>
</tr>
</tbody>
</table>

Note: Currently you can’t use Knowledge Article Version and Last Modified Date in the same report.
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archived By</td>
<td>User who archived the article.</td>
</tr>
<tr>
<td>Article Type</td>
<td>The article type associated with the article.</td>
</tr>
<tr>
<td>Created By</td>
<td>User who created the article.</td>
</tr>
<tr>
<td>Created Date</td>
<td>Date the current article version was created. If the article has been published more than once, this is the latest draft date. To create reports that use the original article creation date, first create a Custom Report Type that joins the Knowledge Article (__ka) and Knowledge Article Version (__kav) objects for a given article type to allow for use of the created date on the record in the Knowledge Article object, rather than the one for the Knowledge Article Version record.</td>
</tr>
<tr>
<td>Custom fields</td>
<td>Any custom fields created on the article types. Add the article type’s version as a secondary object to access any custom fields for the article type.</td>
</tr>
<tr>
<td>Is Latest Version</td>
<td>Indicates if the article is the most recent version.</td>
</tr>
<tr>
<td>Is Master Language</td>
<td>Indicates that the article is not a translation, but the original article.</td>
</tr>
<tr>
<td>Knowledge Article Version ID</td>
<td>Unique ID automatically assigned to the article translation.</td>
</tr>
<tr>
<td>Language</td>
<td>The article’s language.</td>
</tr>
<tr>
<td>Last Modified By</td>
<td>User who changed the article most recently.</td>
</tr>
<tr>
<td>Last Modified Date</td>
<td>Date the article was last changed. The last modified date of a draft article is the time the draft was saved. The last modified date of a published article is time the article was most recently published.</td>
</tr>
<tr>
<td>Out of Date</td>
<td>Indicates that the master article has been updated since this translation was published.</td>
</tr>
<tr>
<td>Publication Status</td>
<td>Indicates whether the article or translation is in progress (draft), published, or archived.</td>
</tr>
<tr>
<td>Summary</td>
<td>Description of the article provided by the author.</td>
</tr>
<tr>
<td>Title</td>
<td>The article’s title.</td>
</tr>
<tr>

**Fields Available on Knowledge Article Views Reports**

You can add up to 6 of the 8 fields below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>The channel that’s applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.</td>
</tr>
</tbody>
</table>
### Fields Available on Knowledge Article Votes Reports

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>The number of article votes applicable to the duration shown (day, month, year).</td>
</tr>
<tr>
<td>Cumulative Count</td>
<td>The total number of article votes for the history of the record.</td>
</tr>
<tr>
<td>Date</td>
<td>Last date on which an article vote took place for the record. All rows represent a date, channel, and role combination.</td>
</tr>
<tr>
<td>Duration</td>
<td>The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. If, for example, a record where the Count is 70 and the Duration is Monthly, it indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.</td>
</tr>
<tr>
<td>Related Role</td>
<td>Name of the role that applies to the record.</td>
</tr>
<tr>
<td>Score</td>
<td>Article’s average view rating. Scoresake into account a half-life calculation. Every 15 days, if an article has not been viewed its average rating moves up or down. This calculation ensures that over time, older or outdated articles don’t maintain artificially high or low ratings compared to newer, more frequently viewed articles.</td>
</tr>
<tr>
<td>Total Views</td>
<td>Number of times a published article has been viewed.</td>
</tr>
</tbody>
</table>

### Fields Available on Knowledge Keyword Search Reports

<tr>
<td>Channel</td>
<td>The channel that’s applicable to the article. Possible values are All Channels, Internal App, Customer, Partner, and Public Knowledge Base.</td>
</tr>
<tr>
<td>Count</td>
<td>The number of keyword searches applicable to the duration shown (day, month, year).</td>
</tr>
<tr>
<td>Cumulative Count</td>
<td>The total number of keyword searches for the history of the record.</td>
</tr>
<tr>
<td>Date</td>
<td>Last date on which a keyword search took place for the record. All rows represent a date, channel, and role combination.</td>
</tr>
<tr>
<td>Duration</td>
<td>The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly, it indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.</td>
</tr>
<tr>
<td>Related Role</td>
<td>Name of the role that applies to the record.</td>
</tr>
</tbody>
</table>
### Fields Available on Knowledge Search Activity Reports

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Last date on which a keyword search took place for the record. All rows represent a date, channel, and role combination.</td>
</tr>
<tr>
<td>Duration</td>
<td>The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.</td>

Create a Salesforce Knowledge Search Activity Custom Report Type: Walkthrough
This walkthrough guides you through building a custom report type that supports the Knowledge Search Activity object. This data helps knowledge managers identify ways to monitor content performance and to deliver the most relevant content to end users.

Walk through it: Knowledge Search Activity Custom Report Type

**Live Agent Session Reports**

Use Live Agent Session reports to consolidate data about agents’ activities while they chat with customers—for example, how long agents are online or how many chat requests are assigned to them.

A report type defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. You can create a custom report type for Live Agent sessions to aggregate data about your agents’ activity while they support customers. These reports include data for all of the chats that occurred during a specific Live Agent session.

Customize Live Agent session reports to include columns of information about any of the following categories, as well as any custom fields related to Live Agent sessions:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent: Full Name</td>
<td>Name of the agent associated with the session.</td>
</tr>
<tr>
<td>Assistance Flags Lowered</td>
<td>Number of times an agent lowered an assistance flag during a Live Agent Session.</td>
</tr>
<tr>
<td>(Agent)</td>
<td></td>
</tr>
<tr>
<td>Assistance Flags Lowered</td>
<td>Number of times a supervisor lowered an assistance flag during an agent’s Live Agent Session.</td>
</tr>
<tr>
<td>(Supervisor)</td>
<td></td>
</tr>
<tr>
<td>Assistance Flags Raised</td>
<td>Number of times an agent raised an assistance flag during a Live Agent Session.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Metric</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Chat Requests Assigned</td>
<td>Number of chat requests assigned to an agent.</td>
</tr>
<tr>
<td>Chat Requests Declined (Manually)</td>
<td>Number of chat requests declined manually by an agent.</td>
</tr>
<tr>
<td>Chat Requests Declined (Push Timeout)</td>
<td>Number of chat requests that timed out while assigned to an agent.</td>
</tr>
<tr>
<td>Chat Requests Engaged</td>
<td>Number of chats in which an agent was engaged during the session.</td>
</tr>
<tr>
<td>Created By: Full Name</td>
<td>Full name of the creator of the session record.</td>
</tr>
<tr>
<td>Created Date</td>
<td>Date the session record was created.</td>
</tr>
<tr>
<td>Last Modified By: Full Name</td>
<td>Full name of the person who last modified the session record.</td>
</tr>
<tr>
<td>Last Modified Date</td>
<td>Date the session record was last modified.</td>
</tr>
<tr>
<td>Live Agent Session ID</td>
<td>ID of the Live Agent session record.</td>
</tr>
<tr>
<td>Live Agent Session Name</td>
<td>Automatically generated ID of the Live Agent session.</td>
</tr>
<tr>
<td>Login Time</td>
<td>Time and date the agent logged in to the session.</td>
</tr>
<tr>
<td>Logout Time</td>
<td>Time and date the agent logged out of the session.</td>
</tr>
<tr>
<td>Time Idle</td>
<td>Total amount of time in seconds an agent was not engaged in chats during a session. The following formula indicates how an agent’s idle time is calculated: (Time Spent Online + Time Spent Away) - Time Spent in Chats = Time Idle.</td>
</tr>
<tr>
<td>Time Spent at Capacity</td>
<td>Total amount of time in seconds in which an agent’s queue was full.</td>
</tr>
<tr>
<td>Time Spent Away</td>
<td>Total amount of time in seconds an agent spent in “Away” status.</td>
</tr>
<tr>
<td>Time Spent in Chats</td>
<td>Total amount of time in seconds an agent spent engaged in chats.</td>
</tr>
<tr>
<td>Time Spent Online</td>
<td>Total amount of time in seconds an agent spent online.</td>
</tr>
</tbody>
</table>

**Report on Partners**

Some opportunities involve partner relationships. Use this report to identify and analyze those relationships.

To report on all partnerships or primary partnerships within opportunities:

1. From the Reports tab, choose the Partner Opportunities report.

2. Choose Customize to change the report and view only primary partner relationships. Add a field filter where **Primary equals 1**.

In any other opportunity report, when you customize the report to display the Partner column, only the primary partner displays.

You can also run the Partner Accounts report to analyze the partnerships of your accounts.

**EDITIONS**

Available in: Salesforce Classic

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

**USER PERMISSIONS**

To report on partners:
- “Read” on accounts or opportunities
- “Run Reports”
Report on Relationship Groups
You can report on relationship groups and relationship group members if your administrator has enabled custom report types for those custom objects.

Custom report types are the only way to make relationship group reports available for your users—Salesforce does not provide sample relationship group reports or a standard report folder for relationship groups.

Administrators can create a public folder of relationship group reports as follows:

1. Create a custom report type for relationship group objects.
   
   **Tip:** To create a report type about the members of relationship groups, select Relationship Groups as the primary report type object and add Relationship Group Members as an object relationship. Alternatively, to create a report type about the accounts that are primary on a relationship group, select Accounts as the primary report type object and add Relationship Groups (Primary Account) as an object relationship.

2. Create a new public folder for relationship group reports. This step requires the “Manage Public Reports” permission.

3. Using your custom report type, create one or more new custom reports for relationship groups. Assign the reports to the new relationship groups reports folder you created.

After completing these steps, a folder of relationship group reports will be available to users on the Reports home page.

Enable the Account Owner Report
The Account Owner report lists all accounts and who owns them.

Organizations that have their organization-wide sharing access level set to Private for accounts may want to restrict users from running the Account Owner report.

To show or hide this report:

1. From Setup, enter Account Owner Report in the Quick Find box, then select Account Owner Report. This option is available only in organizations that have a private account sharing model.

2. Select the checkbox to allow all users to run this report. If you leave the box unchecked, only administrators and users with the “View All Data” permission can run this report.

3. Click Save.
Report on File Search Activity
Use a report to determine the top 300 search term queries for file searches and to identify which content is missing or needs to be renamed based on users’ search terms and the click-rank.

### User Permissions Needed

<table>
<thead>
<tr>
<th>Permission</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To create or update custom report types:</td>
<td><em>Manage Custom Report Types</em></td>
</tr>
<tr>
<td>To create a public reports folder:</td>
<td><em>Manage Public Reports</em></td>
</tr>
<tr>
<td>To run the File Search Activity report:</td>
<td><em>Run Reports</em> AND <em>View All Data</em> OR <em>Content Administrator</em>. Users with <em>Manage Library</em> for the library don’t need the <em>View All Data</em> or <em>Content Administrator</em> permissions to run the report.</td>
</tr>
</tbody>
</table>

Custom report types are the only way to make reports about file search activity available for your users—Salesforce does not provide sample file search activity reports or a standard report folder.

**Note:** Activity totals are collected nightly and aren’t in real time.

#### Walk Through It: Report on File Search Activity

**Primary Object for File Search Activity Report**
When you create a custom report type, select **File Search Activity** for the **Primary Object**.

**Available File Search Activity Report Fields**
The following table lists the available fields for File Search Activity reports.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average Click Rank</td>
<td>The order in which the file appeared in search results when users clicked it from the list of results.</td>
</tr>
<tr>
<td>Average Number of Results</td>
<td>The number of search results that were returned for the search term. If Duration is also included, this value is aggregated based on the time period specified.</td>
</tr>
<tr>
<td>Duration</td>
<td>The time period the search count is applied to. Possible values are Daily, Monthly, and Yearly. For example, a record where the Count is 70 and the Duration is Monthly indicates that 70 searches took place over the past month. Totals are aggregated daily for the current month, monthly from the past full month through the past full year, and yearly beyond that.</td>
</tr>
<tr>
<td>Language</td>
<td>The language filter that’s applied to the user’s search.</td>
</tr>
<tr>
<td>Number of Searches</td>
<td>The number of searches for the duration that’s shown (day, month, or year).</td>
</tr>
<tr>
<td>Number of Users</td>
<td>The number of individual users who clicked the file.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
Search Date | The date of the search.
Search Terms | The first 100 characters of the search term that was used to search published files.

- Creating and Editing Folders
- Create a Custom Report Type
- Create a Report

### Choose a Report Format

A report can use the tabular, summary, matrix, or joined format. Choose a format that’s complex enough to capture the data you want to show, but simple enough to communicate it effectively.

Choose one of the following report formats using the Format menu of the report builder. Tabular format is the default.

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tabular</td>
<td>Tabular reports are the simplest and fastest way to look at data. Similar to a spreadsheet, they consist simply of an ordered set of fields in columns, with each matching record listed in a row. Tabular reports are best for creating lists of records or a list with a single grand total. They can’t be used to create groups of data or charts, and can’t be used in dashboards unless rows are limited. Examples include contact mailing lists and activity reports.</td>
</tr>
<tr>
<td>Summary</td>
<td>Summary reports are similar to tabular reports, but also allow users to group rows of data, view subtotals, and create charts. They can be used as the source report for dashboard components. Use this type for a report to show subtotals based on the value of a particular field or when you want to create a hierarchical list, such as all opportunities for your team, subtoted by Stage and Owner. Summary reports with no groupings show as tabular reports on the report run page.</td>
</tr>
<tr>
<td>Matrix</td>
<td>Matrix reports are similar to summary reports but allow you to group and summarize data by both rows and columns. They can be used as the source report for dashboard components. Use this type for comparing related totals, especially if you have large amounts of data to summarize and you need to compare values in several different fields, or you want to look at data by date and by product, person, or geography. Matrix reports without at least one row and one column grouping show as summary reports on the report run page.</td>
</tr>
<tr>
<td>Joined</td>
<td>Joined reports let you create multiple report blocks that provide different views of your data. Each block acts like a “sub-report,” with its own fields, columns,</td>
</tr>
</tbody>
</table>
Introducing Joined Reports in Salesforce

Changing the Report Format

Changing the format affects filters and groupings, as follows:

<table>
<thead>
<tr>
<th>When you change...</th>
<th>What Happens?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tabular to Summary or Matrix</td>
<td>The <code>Rows to Display</code> filter is removed.</td>
</tr>
<tr>
<td>Summary, Matrix, or Joined to Tabular</td>
<td>All groupings, charts, and custom summary formulas are removed from the report. Grouping fields are not converted to columns in the tabular report. If the joined report contained multiple blocks, the columns from only the first block are included in the tabular report.</td>
</tr>
<tr>
<td>Summary to Matrix</td>
<td>The first summary grouping becomes the first row grouping. The second becomes the first column grouping. The third becomes the second row grouping. If you’re using the report wizard, the third summary grouping is removed.</td>
</tr>
<tr>
<td>Matrix to Summary</td>
<td>The first row grouping becomes the first summary grouping. The second row grouping becomes the third summary grouping. The first column grouping becomes the second summary grouping. The second column grouping is removed. If you’re using the report wizard, both the second row grouping and second column grouping are removed.</td>
</tr>
</tbody>
</table>
| Tabular, Summary, or Matrix to Joined| The existing report becomes the first block in the joined report, and the report type becomes the principle report type for the joined report. Joined report blocks are formatted as summary reports, so if you switch from a summary to a joined report, your groupings stay the same. If you switch from a matrix to a joined report, groupings are converted the same way as when you switch from a matrix to a summary report. The following items aren’t supported in joined reports, and aren’t converted:  
  * Bucket fields  
  * Cross filters  
  * The `Rows to Display` filter |

Build a New Report
Create a Report

Create a report to get an up-to-the-minute view of an aspect of your business, such as the status of customers, opportunities, support cases, and so on.

To create a new report:

1. From the Reports tab, click **New Report**.
2. Select the report type for the report, and click **Create**.
3. Customize your report, then save or run it.

SEE ALSO:
- Customizing Reports
- Run a Report

Creating a Custom Report

You can customize standard reports, or you can build custom reports from scratch to suit the exact needs of your organization.

Users with the “Manage Custom Report Types” permission can define custom report types that extend the types of reports from which all users in their organization can create or update custom reports. A report type defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type. Salesforce provides a set of pre-defined standard report types; administrators can create custom report types as well.

Users with the “Manage Reporting Snapshots” permission can create and schedule snapshots. A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object’s fields with the report’s data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.
Create a Custom Report in Accessibility Mode

Note: This topic only applies if you’re not using report builder. Report builder is a visual editor for reports.

To create a new custom report using the custom report wizard:

1. From the Reports tab, choose the Create New Custom Report button.
2. Select the type of data for the report, and click Next.
   
   To create reports on custom objects, choose the Other Reports report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.

3. Choose the report format.
4. Follow the steps of the wizard using the Next button. For each report, customize the following:
   
   • Specify Row and Column Headers: On the Select Grouping page for summary and matrix reports, choose the fields by which you want to group and subtotal the data. In a summary report, choosing more than one sort field allows you to subsort your data. For matrix reports, select summary fields for the row labels and column headings. When grouping by a date field, you can further group the data by a specific time period such as days, weeks, or months.
     
     Note: On the Select Grouping page, if you set Group Dates By to “Calendar Month in Year” or “Calendar Day in Month,” you won’t be able to drill down to those date groupings in reports or dashboards. Users are taken to the unfiltered report instead.

   • Summarize Data: On the Select Columns to Total page, choose the types of summary information to display for numeric fields.

   • Build Custom Summary Formulas: On the Select Columns to Total page for summary and matrix reports, create custom summary formulas to calculate additional totals based on existing report summaries. A formula is an algorithm that derives its value from other fields, expressions, or values. See Build a Custom Summary Formula on page 3635.

   • Choose Fields: On the Select Columns page, choose the fields to display in the report. You can display only those fields that are visible in your page layout and field-level security settings. If you choose the Description field or any other long text field, only the first 255 characters are displayed.

   • Only the first 254 characters in a rich text area or a long text area are displayed in a report.

   • Order Columns: On the Order Columns page, select the order for displaying the chosen fields.

   • Limit Report Results: On the Select Criteria page, choose the appropriate settings from the drop-down lists, then use the filter options filter options to limit the report to records with specific data.

   The report wizard supports up to 10 filters. On reports with more than 10, additional filters are dropped and the report shows an error for any filter logic.

   Tip: To use a tabular report on a dashboard, first limit the row count, by setting the Rows to Display option, the sort column, and the order on the Select Criteria page of the report. You can’t use gauge or metric components on dashboards using tabular reports.

   • Chart Settings: On the Select the Chart Type and Report Highlights step of the report wizard, set chart properties to display your report data in a chart. Charts are available only for summary and matrix reports.

5. Click Run Report to view the report, or click Export Details to save the report as an Excel file or other format.

Tip: Customizing your reports can require running them a few times as you adjust the report criteria and options. We recommend using a filter that gives you a smaller sampling of data until you are finished customizing the report and ready to save.
Group Your Report Data

Group data in columns or rows in summary, matrix, and joined reports to display meaningful information. For example, group opportunities by Close Date to see closed opportunities or group cases by product to see the number of cases for each product. You can have groupings inside groupings.

Data for Grouping

The Fields pane displays fields from the selected report type, organized by folder. Before you group data in a summary report, drag and drop at least a few fields into the preview pane.

Add a Grouping

Add a group by dropping a field onto a drop zone.

Click Show > Drop Zones to make them visible. You can also click a column menu for a field in the report and choose Group by this Field.

Tip: If you group your report by a date field, you can click the group menu, select Group Dates By, and specify the grouping time frame: day, week, month, quarter, year, etc.

Grouping Data in Different Report Formats

Summary and joined reports can have up to three grouping levels. Matrix reports can have two row and two column groupings. For matrix reports, you can’t use the same field for both row and column groupings. For joined reports, you can use the fields from the Common Fields category in the Fields pane to group across all report blocks.

Remove a Grouping

To remove a group, click the group menu and choose Remove Group. You can also grab the group and:

- Drag it to the column bar to remove the group, but keep the field as a column in the report.
- Drag it back to the Fields pane to remove the group and the field from the report.

Change Order of a Grouping

Drag groups to change their order, or click the group menu and choose Move Group Up or Move Group Down for column groupings, or Move Group Left or Move Group Right for row groupings.

Report Fields
 Subtotal Report Results
Keep Working While Your Report Preview Loads

For most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

The data you see in the Preview panel is real data, but it’s only a subset of the data in the report, designed to show you what the report will look like when you run it. Don’t worry if rows are missing or not sorted as expected in the Preview panel.

With report builder, for most actions, you can continue working on your report while the preview loads. For example, when editing a report you can drag multiple fields into the report, then create a grouping while those columns load.

**Note:** Asynchronous loading isn’t available for matrix and joined reports.

You can continue working in the report preview while the following actions occur:

- Add, remove, or reorder fields
- Add or remove summary fields
- Add, remove, or reorder groupings
- Remove formulas

**Note:** If you remove a summary field or formula used in a chart, the chart reloads, but the report preview loads asynchronously.

You can’t work in the report preview while the following actions occur:

- Add or edit formulas
- Remove a report’s only grouping
- Remove a column used to limit the row count for a tabular report
- Sort the report by group or column
- Update standard or custom filters
- Change report format
- Show or hide report details
- Add or remove a chart
- Add or remove conditional highlighting
- Change **Group Dates By**
- Change a converted currency field
- Save the report

**SEE ALSO:**

- Build a New Report
- Report Fields
**Customizing Reports**

*Report builder* is a visual editor for reports. The report builder screen lets you work with report fields and filters, and shows you a preview of your report with just some of the data.

To optimize screen real estate, report builder uses a compressed page header. To view your application tabs, simply close the builder or click the Salesforce logo.
Fields Pane (1)
The Fields pane displays fields from the selected report type, organized by folder. Find the fields you want using the Quick Find search box and field type filters, then drag them into the Preview pane to add them to the report.

Create, view, edit, and delete custom summary formulas and bucket fields in the Fields pane as well.

In the joined report format, the Fields pane displays fields from all report types added to the report, organized by report type.

Filters Pane (2)
Set the view, time frame, and custom filters to limit the data shown in the report.
Preview Pane (3)
The dynamic preview makes it easy for you to customize your report. Add, reorder, and remove columns, summary fields, formulas, groupings, and blocks. Change the report format and display options, or add a chart.

The preview shows only a limited number of records. Run the report to see all your results.

Watch a Demo: Getting Started with Report Builder

SEE ALSO:
Dashboards Help You Visualize Complex Information
Create a Report
Build a New Report

Report Fields
The Fields pane displays fields from the selected report type, organized by folder. It also lists custom summary formulas, which you can create, edit, and delete.

Adding Field Filters
With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.

Finding Fields
Find a field by typing its name into the Quick Find search box. You can also filter the list by type:
- Click to see all field types, as well as custom summary formulas.
- Click to see just text fields.
- Click to see just number fields (numeric, percentage, or currency).
- Click to see just date fields.

Adding and Removing Fields
To add a field to a tabular, summary, or matrix report, double-click it or drag it into the Preview pane. To add a field to a joined report, drag it to the Preview pane. Press CTRL to select multiple fields. Drag an entire folder to add all its fields. If a tabular, summary, or matrix report already contains a field, you can't add it again. You can add the same field multiple times to a joined report as long as you add it to different blocks. In the preview pane, click Show > Details to see your report fields. While Show > Details is disabled, you can only add summary fields.

To remove a field, grab its column header and drag it back to the Fields pane. With tabular, summary, and matrix reports, you can click the column menu and choose Remove Column, or click Remove All Columns.

Working with More than One Field
You can select multiple fields to add, remove, or reorder. For example, you can add Created By, Type and Opportunity Name to your report at the same time.

To select multiple fields or columns, press CTRL (Windows) or Command (Mac).

Note:
- When you add multiple fields, they appear in the report in the order selected.
- For summary and tabular formats, disable Show > Details when adding multiple summarizable fields to a report. The Summarize dialog automatically appears, letting you select summaries for all the fields at once.
- Enable Show > Details when adding non-summary fields, such as text fields to a report.
• When working with a joined report, you can select multiple fields from the Common Fields category and one report type. You can’t select multiple fields from different report types.

Ordering and Sorting Fields
Reorder report columns by grabbing a column header and dragging it to a new location. Press CTRL to select multiple columns. To sort your report by a column, click its column header. You can also click the column menu and choose Sort Ascending or Sort Descending from the drop-down list. Sort is disabled when Show > Details isn’t selected.

Changing the Currency Displayed
If your organization has enabled multiple currencies, you can change the currency shown for all currency fields. Click Show > Display Currencies Using, then select an active currency to display.

SEE ALSO:
Work with Formulas in Reports
Group Your Report Data
Summarize Your Report Data
Highlight Data Ranges

Summarize Your Report Data
A summary field contains numeric values for which you want to know the sum, the average, or the highest or lowest. Summary fields show at all grouping levels. In summary and matrix reports, they also appear at the grand total level.

The Fields pane displays fields from the selected report type, organized by folder.
A summary is the Sum, Average, Max, or Min for a number field. (Use the filter to find them faster.)

To add a summary field:
• Double-click a number field in the Fields pane.
• Drag a number field into the preview. Press CTRL to select multiple fields. For matrix reports, there are drop zones before, between, and after sets of summaries. For example, the sum, average, max, and min of Annual Revenue are a set, and you can’t drop a new summary field between them.
• Choose Summarize this Field in the column menu for a field already in the report.

To change an existing summary field, or add other summaries on that same field, click next to the summary field and choose Summarize this Field.

To remove a summary field:
• Click its menu and choose Summarize this Field and deselect all options.
• Click its menu and choose Remove Summary.
• Drag the summary set back to the Fields pane. Note that all summaries for that field are removed. Press CTRL to select multiple summary fields.

Reorder sets of summary fields in matrix reports by dragging them. The summaries for each field move together when dragged. For example, if your report contains the sum and average of Annual Revenue, and the max and min of Probability, you can drag...
the Probability summaries before or after the Annual Revenue summaries, but not between. Summaries can't be placed after custom summary formulas or Record Count.

SEE ALSO:
- Report Fields
- Subtotal Report Results

**Subtotal Report Results**

Subtotaling your reports gives you a tool to analyze trends in the data. You can group sets of information, sort the groupings, and compare subtotals for each set against the overall total. In summary and joined reports, you can also subtotal by multiple fields to give you cascading sets of information.

For example, if you subtotal a summary report by Opportunity Owner, the report groups the accounts by Opportunity Owner, lists the number of opportunities owned by each user, and shows subtotals by Opportunity Owner for all the columns in the report. You could further subtotal each user's opportunities by product.

1. Click **Customize** or **Edit** from any report.
2. In the report builder, add a summary field to the report. Summaries show up at grouping levels as well as for individual rows.

SEE ALSO:
- The Report Run Page
- Build a Custom Summary Formula
- Build a New Report
- Subtotal Report Results

**Smart Totaling in Reports**

“Smart” totaling means that duplicate data is counted only once in any subtotal or total. Salesforce uses “smart” totaling when you run reports that include duplicate data in any of the columns chosen for summing or averaging.

For example, suppose an opportunity has two products, and you run the Opportunity Product Report with the total opportunity amount selected as a column to sum by. The amount appears twice in the details of the report, once for each product on the opportunity.

In this case, “smart” totaling correctly calculates any subtotals, grand totals, and averages, adding that opportunity amount only once.

Note: For dashboard components, “smart” totaling isn’t used. For example, in a dashboard table, the total displayed is simply the sum of the values listed in the table.

SEE ALSO:
- Subtotal Report Results
- Subtotal Report Results
Work with Formulas in Reports

Formulas let you create custom summaries based on calculated values using report data. These formulas can then be used as columns in your report.

The Fields pane displays fields from the selected report type, organized by folder.

To add a new formula to a summary or matrix report, double-click Add Formula. Once you define it and click OK, it’s automatically added to the preview as a column for summary reports, and a summary field for matrix reports. With joined reports, you can add either a cross-block or a standard custom summary formula. To edit a formula, hover over the name in the Fields pane and click \( \text{Edit} \). To remove a formula from the preview, grab its header and drag it back to the Fields pane, or click its menu and choose Remove Formula. Press CTRL to select multiple formulas. Removing a formula from the preview doesn’t delete it. To delete a formula, hover over the name and click Delete Formula from the field menu.

Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.

1. **Build a Custom Summary Formula**

   Create custom summary formulas for summary and matrix reports to calculate additional totals based on the numeric fields available in the report.

2. **Use a Summary Function in a Custom Summary Formula**

   Summary functions let you use grouping values in custom summary formulas for summary, matrix, and joined reports. There are two summary functions: PARENTGROUPVAL and PREVGROUPVAL.

3. **PARENTGROUPVAL and PREVGROUPVAL**

   Use PARENTGROUPVAL to calculate values relative to a parent grouping. Use PREVGROUPVAL to calculate values relative to a peer grouping.

4. **Get the Most Out of Custom Summary Formulas**

   Custom summary formulas are a powerful reporting technique, but they can be tricky. Here are some tips to keep in mind when working with them.

SEE ALSO:

- **Build a Custom Summary Formula**
- **Report Fields**
Build a Custom Summary Formula

Create custom summary formulas for summary and matrix reports to calculate additional totals based on the numeric fields available in the report.

A formula is an algorithm that derives its value from other fields, expressions, or values. Custom summary formulas can contain 3900 or fewer characters. Custom summary formulas are available for summary, matrix, and joined reports. They can’t be shared across multiple reports.

1. In report builder, click Add Formula in the Fields pane.
2. Enter a name for your formula as it will appear on the report. The label must be unique. Optionally, enter a description.
3. From the Format drop-down list, select the appropriate data type for your formula based on the output of your calculation.
4. From the Decimal Places drop-down, select the number of decimal places to display for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the Decimal Places for your currency setting apply. If you select None for Decimal Places, the effective values are:
   - For currency, displays up to 18 digits, with the default decimal-place precision for the currency
   - For percentages, displays up to 18 digits, with no decimal places
   - For numbers, displays up to 18 digits, without changing the decimal-place precision
5. Set the Where will this formula be displayed? option. The formula calculation will be displayed in the report at the level you select. To display the formula calculation at every level, including the Grand Total, select All summary levels.
6. Build your formula:
   a. Select one of the fields listed in the Summary Fields drop-down list. This field’s value is used in your formula.
   b. Select the kind of summary type to use in your formula. This option is not available for Record Count.

<table>
<thead>
<tr>
<th>Summary Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sum</td>
<td>The summary value of data in a field or grouping of fields.</td>
</tr>
<tr>
<td>Largest Value</td>
<td>The largest value of data in a field or grouping of fields.</td>
</tr>
<tr>
<td>Smallest Value</td>
<td>The smallest value of data in a field or grouping of fields.</td>
</tr>
<tr>
<td>Average</td>
<td>The average of data in a field or grouping of fields.</td>
</tr>
</tbody>
</table>

c. Click Operators to add operators to your formula.
d. Select the function category (All, Logical, Math, or Summary), choose the function you want to use in your formula, and click Insert.
e. Repeat these steps as necessary.
7. Click Check Syntax to see if your formula contains errors. Errors are highlighted by the cursor.
8. Click OK. Your formula isn’t saved until you save the report.

  - Build a New Report
  - Work with Formulas in Reports
  - Get the Most Out of Custom Summary Formulas
  - Build a Custom Summary Formula for a Joined Report

Use a Summary Function in a Custom Summary Formula

Summary functions let you use grouping values in custom summary formulas for summary, matrix, and joined reports. There are two summary functions: PARENTGROUPVAL and PREVGROUPVAL.

1. Double-click Add Formula in the Fields pane.
2. In the Custom Summary Formula dialog, under Functions, select Summary.
3. Select PARENTGROUPVAL or PREVGROUPVAL.
4. Select the grouping level and click Insert.
5. Define the formula, including where to display the formula.
6. Click OK.

SEE ALSO:

  - Work with Formulas in Reports
  - PARENTGROUPVAL and PREVGROUPVAL

PARENTGROUPVAL and PREVGROUPVAL

Use PARENTGROUPVAL to calculate values relative to a parent grouping. Use PREVGROUPVAL to calculate values relative to a peer grouping.

PARENTGROUPVAL

Use this function to calculate values relative to a parent grouping.

| Description: | This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports. |
| Use: Summary and Joined: | PARENTGROUPVAL(summary_field, grouping_level) |
| Use: Matrix: | PARENTGROUPVAL(summary_field, parent_row_grouping, parent_column_grouping) |
| Description: | Where summary_field is the summarized field value, grouping_level is the parent level for summary reports, and parent_row_level and parent_column_level are the parent levels for matrix reports. |
Example: | TOTAL_PRICE:SUM/PARENTGROUPVAL(TOTAL_PRICE:SUM, GRAND_SUMMARY) |
This formula calculates, for each product, its relative size compared to the grand total. In this example, the report is a summary of opportunities and their products, grouped by Product Name.

**PREVGROUPVAL**

Use this function to calculate values relative to a peer grouping. If there’s no previous grouping, the function returns a null value.

**Description:**

This function returns the value of a specified previous grouping. A “previous” grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.

**Use:**

```
PREVGROUPVAL(summary_field, grouping_level [, increment])
```

Where `summary_field` is the name of the grouped row or column, `grouping_level` is the summary level, and `increment` is the number of rows or columns previous.

**Example:**

```
AMOUNT:SUM - PREVGROUPVAL(AMOUNT:SUM, CLOSE_DATE)
```

This formula calculates, for each month, the difference in amount from the previous month shown in the report. In this example, the report is an opportunity matrix with columns grouped by Close Date and rows by Stage.

**Example: Three Week Moving Average**

To calculate a three-week moving average of opportunity amounts:

```
```

Get the Most Out of Custom Summary Formulas

Custom summary formulas are a powerful reporting technique, but they can be tricky. Here are some tips to keep in mind when working with them.

- A summary formula can’t reference another summary formula.
- Regardless of the summary formula data type, your summary formula can contain fields of different data types, including: number, currency, percent, and checkbox (true/false) fields.
example, a summary formula in an Opportunities with Partners report can reference opportunity Amount or Stage Duration, as well as account Annual Revenue.

- Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.
- When a field is deleted or is unavailable (for example, because of field-level security), all custom summary formulas that contain the field are removed from the report.
- The summary types Sum, Largest Value, Smallest Value, and Average are not available for use with the Record Count field.
- The Smallest Value summary type includes blank (null) or zero values in the summary formula calculation if these values are present in your report data.
- The Largest Value summary type includes the largest blank (non-null) value present in your report data.
- Percentages are represented as decimals in summary formulas. 20% is represented as 0.20.
- Operators can be used to give fields in summary formulas a negative value. For example: {!EMPLOYEES:SUM} + - {!SALES:SUM}.
- For custom summary formulas on matrix reports, Salesforce calculates results for all formulas where the Where will this formula be displayed? option is not set to All summary levels. The formula determines the value returned. If null is returned, the cell will be empty.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits. Summary fields of 21 digits will display precisely, but more than 21 digits may not be precise. If "#Too Big!" appears in report cells, check your formula for calculations that could result in more than 18 digits. Avoid multiplying large numbers, raising a large number to a power, or dividing by a very small number.
- Formulas treat blank (null) report cells as zero values.
- "#Error!" displays on report cells whenever an error occurs while calculating a formula’s value. "#Error!" also displays when formulas divide by zero. To resolve the error, check your formula and provide an alternative value.
- Cross-block custom summary formulas are available for joined reports.

Save Your Report

Click **Save** to update an existing report with recent changes, or **Save As** to clone the original report without changing it. In Lightning Experience, click **Clone** to clone the report.

1. Verify the name, description, and folder, then choose where to go next:
   - Click **Save** to save the report and go to the Reports home page
   - Click **Save & Return to Report** to save it and go back to the report run page.

   **Note:** To save your report at a specific role hierarchy drill-down level on sales, forecast, opportunity, and activity reports, select **Save Hierarchy Level**.

   **Tip:** If you add a colon to your report name, it displays in two separate lines when you view the report. Use this to categorize reports by name, or better display long names. For example, if you enter *First Line: Second Line* for Report Name, you’ll see this on the run page:

![First Line: Second Line](image)

Report on Historical Changes

On top of the standard up-to-the-minute reporting on the current state of your business, you can analyze day-to-day and week-to-week changes in opportunities, cases, forecasts, and custom objects.

**Note:** Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren’t available.

1. **Track Changes in Your Sales Pipeline**
   A historical report can help you monitor your company’s sales pipeline to make sure it contains enough activity to meet current and future sales goals. You may want to focus on deals whose value grew or shrank in the last three months, or deals that moved into or out of a given target period.

2. **See How Forecast Amounts Have Changed**
   Let’s build a historical report, in matrix format, of the amounts your team members have assigned to each forecast category. Changes in those amounts can reveal how accurately your team is forecasting.

3. **Track History for Cases**
   Monitor activity across cases and identify your case status changes in the last three months of a case’s life cycle.

4. **Learn about Historical Trend Reporting**
   Historical trend reporting uses a special custom report type designed to highlight changes between five snapshot dates, such as five business days or five business weeks. You can visually represent the data changes in charts and on dashboards.
5. Limitations on Historical Trend Reporting

Historical trending in Salesforce is subject to certain limits on the time during which data is tracked, the number of rows of data, and the fields and objects you can track. These limits are designed to restrict the data set so that reports return data quickly.

Track Changes in Your Sales Pipeline

A historical report can help you monitor your company’s sales pipeline to make sure it contains enough activity to meet current and future sales goals. You may want to focus on deals whose value grew or shrank in the last three months, or deals that moved into or out of a given target period.

You’ll probably want to compare historical and current values of key attributes of opportunities, such as dates, amounts, and status, to see how your pipeline has changed over time. For example, this summary report points out opportunity amounts and close dates that have changed since yesterday.

1. Snapshot up to five dates to track day-to-day or week-to-week trends.
2. Current and historical values are shown side by side for easy comparison.
3. Changed dates and amounts are highlighted in red or green.

1. Watch Your Pipeline Change Over Time
   Let’s say you want to know how the total value of your pipeline today compares with its value yesterday. Create a simple report to compare the two dates.

2. Identify Historical Deals Over a Given Value
   Suppose you want to focus only on deals in your pipeline worth more than $5,000, but you’re not concerned about today’s fluctuations. You’ll need a historical trending report that filters out any deal whose value was below $5,000 yesterday.

3. Find Deals that Have Been Pushed Out
   To focus on deals that are taking more time to close than expected, create a historical trending report that finds deals in your pipeline that have had their close dates moved to a later date.

4. Identify Shrinking Deals
   Historical trending analysis can help you prioritize by quickly identifying deals that may be at risk. For example, target the deals in your pipeline that have decreased in value since yesterday. You’ll need a historical trending report that gives you the deals whose value yesterday was greater than their value today.
Watch Your Pipeline Change Over Time

Let’s say you want to know how the total value of your pipeline today compares with its value yesterday. Create a simple report to compare the two dates.

1. Create an opportunity history report.
   b. Under Select Report Type > Opportunities, select Opportunities with Historical Trending.
   c. Click Create.

2. For Show, select All Opportunities.
   Note that the default value in the Historical Date Field is Yesterday, and the Amount (Historical) field shows yesterday’s date.
   Tip: “Yesterday” is a rolling date value, meaning that it points to a date that is relative to today’s date. If you run this same report tomorrow, Amount (Historical) will show today’s date.

3. Click the down arrow in the headers of the Amount (Historical) and the Amount–Today columns. Click Summarize This Field, then select Sum.
   The total amount appears at the bottom of each column.

4. Click the down arrow in the header of the Amount column and select Show Changes.

5. Click Run Report.

6. In the Change column, observe the difference between the total value of the Amount (Historical) column and that of the Amount–Today column.
   Tip: You can see changes at a glance by looking for values that are colored green or red.

You’ve created a simple historical trending report that can help you analyze your pipeline’s behavior.

   Opportunities with Historical Trending Report
Identify Historical Deals Over a Given Value

Suppose you want to focus only on deals in your pipeline worth more than $5,000, but you’re not concerned about today’s fluctuations. You’ll need a historical trending report that filters out any deal whose value was below $5,000 yesterday.

1. Create an opportunity history report.
   b. Under Select Report Type > Opportunities, select Opportunities with Historical Trending.
   c. Click Create.
2. For Show, select All Opportunities.
3. Filter for historical values over $5,000.
   a. Click Add and select Historical Field Filter.
   b. Set Amount (Historical) to Yesterday.
   c. Select greater than for the operator.
   d. Enter 5,000 in the last field.
   e. Click OK.

5. In the finished report, observe that all the deals in the Amount — Historical column are worth more than $5,000.

Tip: Values in the Amount, Close Date and Stage fields are shown in green or red to indicate the direction of change. You can reverse the colors by clicking the down arrow in the column header.

You’ve created a simple report that pulls out all the deals that have were worth more than a given amount as of a given historical snapshot date.

SEE ALSO:
Opportunities with Historical Trending Report
Find Deals that Have Been Pushed Out

To focus on deals that are taking more time to close than expected, create a historical trending report that finds deals in your pipeline that have had their close dates moved to a later date.

1. Create an opportunity history report.
   a. On the Reports tab, click **New Report**.
   b. Under **Select Report Type > Opportunities**, select **Opportunities with Historical Trending**.
   c. Click **Create**.

2. For **Show**, select **All Opportunities**.

3. Filter for close dates that are later now than they were in the past.
   a. Click **Add** and select **Historical Field Filter**.
   b. Set **Close Date (Historical)** to Feb. 1, 2013.
      
      Tip: Use the calendar under **Fixed Days** to select the date.
   c. Click **OK**.

4. Click the down arrow in the header of the **Close Date** column and select **Show Changes**.

5. Click **Run Report**.

6. For each deal in the report, compare the date in the **Close Date — Historical** column with the date in the **Close Date — Today** column.

   Tip: You can see changes at a glance by looking for values that are colored green or red.

SEE ALSO:

Opportunities with Historical Trending Report
Identify Shrinking Deals

Historical trending analysis can help you prioritize by quickly identifying deals that may be at risk. For example, target the deals in your pipeline that have decreased in value since yesterday. You’ll need a historical trending report that gives you the deals whose value yesterday was greater than their value today.

1. Create an opportunity history report.
   b. Under Select Report Type > Opportunities, select Opportunities with Historical Trending.
   c. Click Create.

2. For Show, select All Opportunities.

3. Filter out any deal that wasn’t worth more yesterday than today.
   a. Click Add and select Historical Field Filter.
   b. Set Amount (Historical) to greater than.
   c. Set the last field to Field.
      Here we’re choosing to compare the historical amount with whatever amount is in the Amount — Today column, and not with a specific amount.
   d. Click OK.

You’ve created a simple report that flags deals that have shrunk since yesterday. Note that all the results in the Amount — Today column are shown in red, to indicate decreases in value.

Tip: To change the color-coding for amount changes, click the down arrow above the Change column and click Reverse Colors.

SEE ALSO:
   Opportunities with Historical Trending Report
See How Forecast Amounts Have Changed

Let’s build a historical report, in matrix format, of the amounts your team members have assigned to each forecast category. Changes in those amounts can reveal how accurately your team is forecasting.

For this example, we’ll assume you’re about a month into the current fiscal quarter.

1. Create a forecast history report.
   a. On the Reports tab, click **New Report**.
   b. Under **Select Report Type** > **Forecasts**, select **Forecasting Items with Historical Trending**. Before you can select this report type, your organization must have enabled Historical Trending for Forecasting Items. If you do not see the report type listed, talk to your administrator.
   c. Click **Create**.

2. In the Filters area, choose **Show > All forecasting items**, then set up your filters.
   a. For **Date Field**, choose **End Date**. For **Range**, choose **Current FQ**. The **From** and **To** date fields automatically get the beginning and end dates for the current quarter.
   b. For **Historical Date**, choose **3 Months Ago**, **2 Months Ago**, then **1 Month Ago** from the dropdown menu. Each date you select is added to the field.

   ![Filter for the historical data you want.](image)

   Tip: To move **Yesterday** to the right side of the field, delete it and add it again from the dropdown menu.

3. Choose the data you want to monitor for historical changes. In this case, we’re interested in the category in which the changes were made and how the forecast amount changed.
   a. In the **Preview** pane, change **Tabular Format** to **Matrix Format**.
   b. Drag the **Owner: Full Name** field from the Field area to the Preview pane to create a row grouping.
   c. Drag the **Forecast Category** field over to the right of **Owner: Full Name** to create another row grouping.
   d. Drag the **Forecast Amount (Historical)** field to the matrix area of the Preview pane, below the yellow bar. In the **Summarize** dialog, select **Sum**.

   ![Select the fields that contain the data you want to track.](image)
Columns appear for each of the historical dates you chose in the filters area that contain records.

4. Click Run Report to see what data you’ve gathered so far. Then click Customize to keep adjusting your filters and fields if necessary.

5. Once you’ve defined the data you want to track, create a chart to show it graphically.
   a. In the Preview area, click Add Chart and select the line chart icon.
   b. On the Chart Data tab, choose Sum of Forecast Amount (historical) for the Y-Axis and Snapshot Date for the X-Axis.
   c. For Group By, choose Forecast Category, and select Cumulative.
   d. Click OK, then click Run Report again.

6. Click Save As. Choose a name and folder for the report and click Save.

Track History for Cases

Monitor activity across cases and identify your case status changes in the last three months of a case’s life cycle.

1. One way to optimize contact center operations is to observe the Status field over time, watching for cases that move backward to a previous status. This can help reveal ways to resolve cases more effectively.

2. For another example, try analyzing historical values of the Priority field to identify cases that may have been incorrectly classified when they were opened. Watching for frequent changes in priority may also lead to ways to improve the handling of complex cases.

Learn about Historical Trend Reporting

Historical trend reporting uses a special custom report type designed to highlight changes between five snapshot dates, such as five business days or five business weeks. You can visually represent the data changes in charts and on dashboards.

For organizations created in Winter ’14 and thereafter, historical trend reporting is activated by default. If your organization is older than that, you must activate historical trend reporting in the Setup menu.

Salesforce retains historical data for the previous three months, plus the current month. (The amount of historical data you can work with in practice depends on your organization’s data design and use patterns.) You can select up to five date snapshots in that span to compare, using up to four historical filters.

Longer durations than days or weeks are not recommended. They may result in reports timing out and not returning. For small organizations with fewer records, month-to-month trend reporting may work, but this is not what historical trend reporting is designed for.
Tip: You can also create and customize historical trend reporting reports via the Metadata API and the Reports and Dashboards REST API.

Limitations on Historical Trend Reporting

Historical trending in Salesforce is subject to certain limits on the time during which data is tracked, the number of rows of data, and the fields and objects you can track. These limits are designed to restrict the data set so that reports return data quickly.

- Salesforce retains historical data for the previous three months, plus the current month.
- Up to 5 million rows of historical trending data can be stored for each object. Historical data capture stops when the limit is exceeded. The admin is alerted by email when any object reaches 70 percent of the limit, and again if the limit is exceeded.
- Each historical trend report can contain up to 100 fields. In Opportunities reports, this includes the standard preselected fields, which can’t be disabled.
- Formula fields are not supported.
- You can specify up to five historical snapshot dates in each historical trend report.
- You can use up to four historical filters on each historical trend report.
- These field types are supported: Number, Currency, Date, Picklist, Lookup.
- Dated exchange rates are not supported. When you run the historical trend report, it only uses the latest dated exchange rate.
- Internet Explorer 6 is not supported.
- The Report Wizard is not supported. Historical trend reports can only be created with the Report Builder.
- Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren’t available.

Important: If a picklist field is already being used in a historical trending data filter, think hard before changing any of its values. You could make that field less useful for historical reporting in the future.

Report on Historical Data with Reporting Snapshots

A reporting snapshot lets you report on historical data. Authorized users can save tabular or summary report results to fields on a custom object, then map those fields to corresponding fields on a target object. They can then schedule when to run the report to load the custom object’s fields with the report’s data. Reporting snapshots enable you to work with report data similarly to how you work with other records in Salesforce.

After you set up a reporting snapshot, users can:

- Create and run custom reports from the target object.
- Create dashboards from the source report.
- Define list views on the target object, if it’s included on a custom object tab.

For example, a customer support manager could set up a reporting snapshot that reports on the open cases assigned to his or her team everyday at 5:00 PM, and store that data in a custom object to build a history on open cases from which he or she could spot trends via reports. Then the customer support manager could report on point-in-time or trend data stored in the custom object and use the report as a source for a dashboard component. For the total number of reporting snapshots you can create, see Salesforce Limits.

1. Prepare Reporting Snapshots

To set up a reporting snapshot, you need a source report and a target object with fields to contain the data in the source report.
2. Define a Reporting Snapshot
   After you create a source report, target object, and target object fields, you can define your reporting snapshot. You define a reporting snapshot by naming it and choosing the source report that will load report results into the target object you specify when the reporting snapshot runs.

3. Map Reporting Snapshot Fields
   After you create a source report, target object, target object fields, and define your reporting snapshot, you can map the fields on your source report to the fields on your target object. You map source report fields to target object fields so that when the report runs, it automatically loads specific target object fields with data from specific source report fields.

4. Schedule and Run a Reporting Snapshot
   After you create a source report, target object, target object fields, define your reporting snapshot, and map its fields, you can schedule when it runs. You can schedule a reporting snapshot to run daily, weekly, or monthly so that data from the source report is loaded into the target object when you need it.

5. Manage Reporting Snapshots
   After you set up a reporting snapshot, you can view details about it and edit and delete it. From Setup, enter Reporting Snapshots in the Quick Find box, then select Reporting Snapshots to display the Reporting Snapshots page, which shows the list of reporting snapshots defined for your organization.

6. Troubleshoot Reporting Snapshots
   The Run History section of a reporting snapshot detail page displays if a reporting snapshot ran successfully or not. When a reporting snapshot fails during a scheduled run, the failure is noted in the Result column. To view the details of a run, click the date and time of the run in the Run Start Time column.

SEE ALSO:
   Create a Salesforce Classic Dashboard
   Create a Custom Report in Accessibility Mode
Prepare Reporting Snapshots

To set up a reporting snapshot, you need a source report and a target object with fields to contain the data in the source report.

To set up a reporting snapshot:

1. Create a new custom report that includes the fields you want to load as records into a target object.
2. Create a new custom object in which to store the records loaded from the source report.
3. Create fields on the target object that will receive the source report’s results when the reporting snapshot runs.

Tips on Source Reports for Reporting Snapshots

- If you save a tabular source report with its details hidden, the report will not be available to include in a reporting snapshot. Furthermore, if you hide the details of a tabular source report included in a reporting snapshot, the reporting snapshot will fail when it runs. To verify that the details of the tabular source report are not hidden, view the report, click Show Details, and save the report. The Show Details button only displays if the report’s details are hidden.

- When creating the source report for your reporting snapshot, note the names of the fields you added to the report, as those field names may be useful to you when you create fields on the target object in which to store the report results.

- You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The Source Report drop-down list does not display standard reports.

- You can include up to 100 fields in your source report.

- You can delete the schedule of when a reporting snapshot runs. You can’t stop or pause a reporting snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the reporting snapshot by changing the report in the Source Report drop-down list.

- If you select Load No Data in the Fields from Source Report column, no data will load into the corresponding field in the Fields in Target Object column when the reporting snapshot runs.

- The (No fields with compatible data type) field displays in the Fields from Source Report column when a field on the target object does not match the data type of a field on the source report.

Tips on Target Objects for Reporting Snapshots

Consider the following when setting up target objects for reporting snapshots:

- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, use field-level security to make the target object’s fields visible to the appropriate users.

- You can’t delete a custom object if it’s a target object in a reporting snapshot.

- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your reporting snapshot.

- You can add up to 100 fields to the target object.

- Target objects cannot contain validation rules or be included in a workflow.

- Reporting snapshots cannot contain target objects that trigger Apexcode to run when new records are created.
When a reporting snapshot runs, it can add up to 2,000 new records to the target object. If the source report generates more than 2,000 records, an error message is displayed for the additional records in the Row Failures related list. You can access the Row Failures related list via the Run History section of a reporting snapshot detail page.

Tips on Reporting Snapshots

- Be aware of the type of license your Running User has. For example, if the Running User of a reporting snapshot has a Salesforce license, users who have Force.com Platform or Salesforce Platform One licenses will not be able to view it. Alternatively, if the Running User has a Force.com Platform or Salesforce Platform One license, users who have Salesforce licenses will be able to see the reporting snapshot. If you have users with Force.com Platform or Salesforce Platform One licenses, we recommend creating a separate reporting snapshot for them with a Running User that has a Force.com Platform or Salesforce Platform One user license.

- You can only map fields with compatible data types. For example, you can map a currency field to a number field.

- If you change the source report or target object on a reporting snapshot with existing field mappings, the field mappings are deleted when you save the reporting snapshot. You can also view Summary Fields in Source Report and Fields in Target Object to see the number of summary or target fields, respectively.

- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the reporting snapshot runs.

- When a reporting snapshot is defined, deleted, or its source report or target object is changed, it is tracked in your organization's setup audit trail history.

- The Run History section on a reporting snapshot detail page displays details on when the reporting snapshot ran. Details include:
  - The date and time at which the reporting snapshot ran
  - The name of the source report, target object, and running user
  - The time it took for the reporting snapshot to run
  - The total number of detail or summary rows in the source report, depending on the report type
  - The number of records created in the target object
  - Whether or not the reporting snapshot ran successfully

SEE ALSO:
- Report on Historical Data with Reporting Snapshots
- Create a Custom Report in Accessibility Mode
Define a Reporting Snapshot

After you create a source report, target object, and target object fields, you can define your reporting snapshot. You define a reporting snapshot by naming it and choosing the source report that will load report results into the target object you specify when the reporting snapshot runs.

1. From Setup, enter “Reporting Snapshots” in the Quick Find box, then select Reporting Snapshots.
2. Click New Reporting Snapshot.
3. Enter a name, unique name, and description for your reporting snapshot.
4. Choose a user in the Running User field by clicking the lookup icon.
   The user in the Running User field determines the source report’s level of access to data. This bypasses all security settings, giving all users who can view the results of the source report in the target object access to data they might not be able to see otherwise.
   Only users with the “Modify All Data” permission can choose running users other than themselves.
5. Select a report from the Source Report drop-down list.
   The report you choose determines the report results that will load as records into the target object when the reporting snapshot runs.
   You can choose any custom tabular or summary report as the source report, except legacy forecast reports, Quota vs Actual reports, and Leads by Source reports. The Source Report drop-down list does not display standard reports.
6. Select a custom object from the Target Object drop-down list.
   The custom object you choose will receive the source report’s results as records when the reporting snapshot runs.
   If a record used for an reporting snapshot has no record type associated with it, the record type of the running user is associated with the reporting snapshot by default.
7. Click Save to save the definition of your reporting snapshot, or click Save & Edit Field Mappings to save your reporting snapshot and map its fields.
8. Map the fields on the source report to the fields on the target object.

SEE ALSO:

Standard Report Types
**Map Reporting Snapshot Fields**

After you create a source report, target object, target object fields, and define your reporting snapshot, you can map the fields on your source report to the fields on your target object. You map source report fields to target object fields so that when the report runs, it automatically loads specific target object fields with data from specific source report fields.

1. From Setup, enter *Reporting Snapshots* in the Quick Find box, then select *Reporting Snapshots*.
2. Select the name of the reporting snapshot whose fields you want to map.
3. Click **Edit** on the Field Mappings section.
4. For summary reports, select the **Grouping Level** at which summary data is extracted from the source report. Data loaded into the target object is taken from summary fields at the grouping level you specify. The **Grand Summary** summarizes on the total for all grouping levels.
5. In the **Fields from Source Report** column, click a **Load No Data** drop-down list and select a field from the source report to map to a custom object field in the **Fields in Target Object** column. Only summary fields can be mapped for reporting snapshots based on summary reports. Note that the fields for summary reports may vary depending on the grouping level selected.
6. Click **Quick Save** to save field mappings and continue mapping fields, or click **Save** to save field mappings and return to the reporting snapshot’s detail page.
7. Next, **schedule** the reporting snapshot to run.

**Considerations for Mapping Reporting Snapshot Fields**

- You must map at least one field from the source report to one field on the target object or data will not load from the source report to the target object when the reporting snapshot runs.
- You can only map fields with compatible data types. For example, you can map a currency field to a number field.
- A custom summary formula can be mapped only if the grouping level in the reporting snapshot and the grouping level in the custom summary formula match.
- If you select Load No Data in the **Fields from Source Report** column, no data will load into the corresponding field in the **Fields in Target Object** column when the reporting snapshot runs.
- The **(No fields with compatible data type)** field displays in the **Fields from Source Report** column when a field on the target object does not match the data type of a field on the source report.
- The fields on the target object determine field mapping availability. For example, your source report may include ten fields, but if your target object includes one field, then you can only map one field in your reporting snapshot.
- You cannot map fields from the source report to the following fields on the target object: **Created By**, **Last Modified By**, **Created Date**, and **Last Modified Date**.
- When you map fields from the source report to the target object, some data may lose its context when loaded to the target object. For example, if you map a date and time field from the source report to a text field on the target object, the date and time load to the target object without the time zone.
- When executing a reporting snapshot, if the running user does not have “read” or “write” access to a mapped field in the target object, that field is dropped from the mapping, but does not cause the execution to fail. If a required field in the target object is not mapped, the execution fails. To ensure that fields are always mapped, make them required or set default values for them.
To map a field in the source report to a lookup field on the target object, you must map to the ID of the object associated with the lookup. For example, to map to an opportunity lookup field, you must map to the Opportunity ID. To get the Opportunity ID in the source report, you may need to use a custom report type to include ID and other related fields.

- Report on Historical Data with Reporting Snapshots
- Build a Custom Summary Formula

Schedule and Run a Reporting Snapshot

After you create a source report, target object, target object fields, define your reporting snapshot, and map its fields, you can schedule when it runs. You can schedule a reporting snapshot to run daily, weekly, or monthly so that data from the source report is loaded into the target object when you need it.

The number of reporting snapshots you can schedule to run is determined by your Edition. After a reporting snapshot has run, you can send an email notification to yourself and other users that includes details about the reporting snapshot run, such as the date and time it ran, whether it ran successfully, and how many records were loaded into the target object from the source report. Also, the notification includes a link to the reporting snapshot detail page in Salesforce.

1. From Setup, enter “Reporting Snapshots” in the Quick Find box, then select Reporting Snapshots.

2. Select the name of the reporting snapshot that you want to schedule to run.

   Reporting snapshots will not run as scheduled if the user in the Running User field does not have access to the folder in which the source report is stored.

   Note: If the running user becomes inactive, the report doesn’t run. Salesforce sends an email notification to either activate the user, delete the report schedule, or change the running user to an active one. Salesforce sends the notification to users with the “Manage Users,” “Modify All Data,” and “Manage Billing” permissions. If no user has these permissions, Salesforce sends the notification to users with the “Manage Users” and “Modify All Data” user permissions.

3. Click Edit on the Schedule Reporting Snapshot section.

   The Schedule Reporting Snapshot section on a reporting snapshot detail page displays details on when the reporting snapshot is scheduled to run.

4. Select a notification setting to send an email when the reporting snapshot finishes running:
   - Click Me to send an email to the email address specified on your Salesforce user record.
   - Click Others... to send an email to additional users. You can only send reporting snapshot notifications to email addresses included on Salesforce user records. Furthermore, you can only select Users and Public Groups in the Search drop-down list.

5. Schedule the reporting snapshot to run:
   - In the Frequency field, select the frequency at which the reporting snapshot runs. When you click the Daily, Weekly, or Monthly fields, more options display that allow you to refine frequency criteria.

   If you schedule a reporting snapshot to run on a specific day of every month, the reporting snapshot will only run on months that have that specific day. For example, if you schedule a reporting snapshot to run on the 31st day of every month, then the
A reporting snapshot will only run on months that have 31 days. If you want a reporting snapshot to run on the last day of every month, choose last from the On day of every month drop-down list.

- In the Start and End fields, specify the dates during which you wish to schedule the reporting snapshot to run.
- In the Preferred Start Time drop-down list, click the Find available options... link to choose a preferred start time for the reporting snapshot to run.
  - Your preferred start time may not be available if other users have already selected that time to run a reporting snapshot or your organization has reached its reporting snapshot limit.
  - Reporting snapshots run in the time zone of the user who schedules the run. For example, if the Time Zone field on your user record is set to Pacific Standard Time, and you schedule a reporting snapshot to run every day at 2:00 PM, then the reporting snapshot will run every day at 2:00 PM Pacific Standard Time.
  - If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.
  - The reporting snapshot runs within an hour of the time you select in the Preferred Start Time drop-down list. For example, if you select 2:00 PM as your preferred start time, the reporting snapshot may run any time in between 2:00 PM or 2:59 PM, depending on how many other reporting snapshots are scheduled to refresh at that time.

6. Click Save to schedule the reporting snapshot to run.

When the reporting snapshot runs, it adds new records to the target object.

Optionally, once you have scheduled a reporting snapshot to run, you can perform the following actions after you click Edit on the Schedule Reporting Snapshot section of a reporting snapshot detail page:

- Click Edit to update the notification and frequency settings of the reporting snapshot.
- Click Delete to permanently delete the existing schedule of when the reporting snapshot runs.

A reporting snapshot will fail during a scheduled run if:

- The source report includes more than 100 fields
- The source report was changed from summary to tabular
- The selected grouping level for a summary source report is no longer valid
- The running user does not have access to the source report
- The running user does not have the “Run Reports” permission
- The target object has more than 100 custom fields
- The target object contains validation rules
- The target object is included in a workflow
- The target object is a detail object in a master-detail relationship
- The target object runs an Apex trigger when new records are created on it
- The running user does not have the “Create” permission on the target object. Note that if the target object’s status is In Development, the running user must have the “Customize Applications” permission.
Manage Reporting Snapshots

After you set up a reporting snapshot, you can view details about it and edit and delete it. From Setup, enter Reporting Snapshots in the Quick Find box, then select Reporting Snapshots to display the Reporting Snapshots page, which shows the list of reporting snapshots defined for your organization.

From the Reporting Snapshots page, you can:

- Select a list view from the View drop-down list to go directly to that list page, or click Create New View to define your own custom view.
- Define a new reporting snapshot by clicking New Reporting Snapshot.
- Update the reporting snapshot name, description, running user, source report, and target object by clicking Edit next to its name. Only users with the “Modify All Data” permission can choose running users other than themselves. If you have the “Customize Application” permission, enter a unique name to be used by the API and managed packages.

If you change the source report or target object on a reporting snapshot with existing field mappings, the field mappings are deleted when you save the reporting snapshot. You can also view Summary Fields in Source Report and Fields in Target Object to see the number of summary or target fields, respectively.

- Delete a reporting snapshot by clicking Del next to its name. After the reporting snapshot is deleted, it cannot be restored from the Recycle Bin.

**Important:** When you delete a reporting snapshot, the source report and target object aren’t deleted; however, when the source report runs, it won’t load the target object with data.

You can delete the schedule of when a reporting snapshot runs. You can’t stop or pause a reporting snapshot when it is running, nor can you delete its source report. To delete the source report, you must first remove the report from the reporting snapshot by changing the report in the Source Report drop-down list.

- Display detailed information about a reporting snapshot and customize it further by clicking its name. Then you can:
  - Click links in the Identification section that redirect you to the reporting snapshot running user, source report, and target object. In addition, you can view the preferred date and time at which the reporting snapshot will approximately run next in the Next Run field, and view the date and time at which it last ran in the Last Run field.
  - Click Edit in the Field Mappings section to further customize the fields mapped from the source report to the target object.

  The Reporting Snapshot Field Mappings section displays which source report fields are mapped to the target object’s fields. You can view the number of fields in the source report available for mapping to the target object in the Columns in Source Report field. Also, you can view the number of fields available for mapping in the target object in the Fields in Target Object field.

  - Click Edit in the Schedule Reporting Snapshot section to schedule when to run the reporting snapshot.

  The Schedule Reporting Snapshot section displays details about when the reporting snapshot is currently scheduled to run.

  - The Run History section displays details about when the reporting snapshot ran. Details include:
    - The date and time at which the reporting snapshot ran
    - The name of the source report, target object, and running user
    - The time it took for the reporting snapshot to run
The total number of detail or summary rows in the source report, depending on the report type

The number of records created in the target object

Whether or not the reporting snapshot ran successfully

Up to 200 records are stored in the Run History section. After 200 records are stored, the oldest record is automatically deleted and cannot be retrieved from the Recycle Bin.

SEE ALSO:

Report on Historical Data with Reporting Snapshots

Troubleshoot Reporting Snapshots

The Run History section of a reporting snapshot detail page displays if a reporting snapshot ran successfully or not. When a reporting snapshot fails during a scheduled run, the failure is noted in the Result column. To view the details of a run, click the date and time of the run in the Run Start Time column.

Tip:

- If the Total Row Number is blank, the run failed before the report was completed (for example, the report was invalid or the running user is inactive).
- When a reporting snapshot runs, it can add up to 2000 new records to the target object. Any records over 2000 are recorded in the Row Failures related list. If the Total Row Number is blank and the run history indicates “Some rows failed,” the report likely contained more than 2000 summaries.
- The details of a failed run are available on the Row Failures related list for 14 days before they are automatically deleted. You cannot retrieve details about row failures from the Recycle Bin.
- If you have a unique field in the target object, and records in the report have more than one of the same value in the column mapped to that unique field, duplicate records are not added. The run history indicates when records are not added to the reporting snapshot.
- If field mappings failed, the snapshot still runs, but the run history shows that there was a partial error.

A reporting snapshot could fail during a scheduled run for a number of reasons. This table lists the errors a failed run may display and how the errors can help you troubleshoot the reporting snapshot so that it will run successfully.

**Running user does not have permission to run reports.**

The user in the Running User field does not have the “Run Reports” or “Create and Customize Reports” permission. Choose a user with the appropriate permissions or enable the appropriate permissions for the running user.

**Cannot run reporting snapshot because source report has been deleted.**

The report in the Source Report field was deleted and no longer available to run. Choose another source report for your reporting snapshot or restore the deleted report from the Recycle Bin.

**Running user does not have permission to access source report.**

The user in the Running User field does not have access to the folder in which the source report is stored. Choose a user with access to the source report or provide the existing running user with access to the folder in which the source report is stored.
Source report definition is obsolete.
The report in the Source Report field references a custom object that is no longer available for reports or the relationships between the objects in the report have changed.

Source report definition is invalid.
The report in the Source Report field cannot run because it contains invalid formulas or filter criteria. Update the report so that it can run without errors.

Running user does not have permission to access report type.
The user in the Running User field does not have permission to access a report type associated with the report in the Source Report field. Choose a running user that has the correct permissions or provide the existing running user with the appropriate permissions.

Source report must be tabular.
The report in the Source Report field is no longer in tabular format. Choose a new source report or update the existing source report's format to tabular.

Source report last saved with details hidden on report results.
The report in the Source Report field was saved with its details hidden. To display the details of the source report, view the report, click the Show Details button, and save the report.

Target object has been deleted or is inaccessible to running user.
The custom object in the Target Object field has been deleted or the user in the Running User field does not have permission to access the target object. Restore the deleted custom object, choose a new target object, or provide the existing running user with "Create" permissions to the custom object in the Target Object field. Note that if the custom object's status is In Development, the running user must have the "Customize Application" permission to access the target object.

Running user does not have permission to edit target object.
The user in the Running User field does not have "Create" permissions on the custom object in the Target Object field. Choose a running user that has such permissions or provide the existing running user with "Create" permissions to the custom object in the Target Object field.

Target object must not be a detail object in a master-detail relationship.
The custom object in the Target Object field is a detail object in a master-detail relationship, meaning that a master object controls certain behaviors on the target object's records. Choose a target object that is not included in a master-detail relationship.

Target object must not be included in a workflow.
The custom object in the Target Object field is included in a workflow. Choose a target object that is not included in a workflow.

Target object must not include an insert trigger.
An Apex trigger runs when new records are created for the custom object in the Target Object field. Remove the Apex trigger or choose a target object for which an Apex trigger does not run when new records are created.

Target object must not include validation rules.
The custom object in the Target Object field contains validation rules. Choose a target object that does not contain validation rules or delete validation rules from the existing target object.

Running user is inactive.
The user in the Running User field is no longer active. Choose an active user.

One or more required fields on the target object are not mapped.
One or more required fields on the target object are not mapped. Map all required fields on the target object to fields on the source report.
Source report contains too many fields, has a formula field with too many functions, or contains too many criteria.

The report in the Source Report field contains too many fields, criteria, or functions within a formula field. Remove any unnecessary fields, criteria and functions within formula fields from the source report.

Source report cannot have more than 100 selected columns.

The report in the Source Report field contains more than 100 fields. Remove any unnecessary fields from the source report.

Target object cannot have more than 100 custom fields.

The custom object in the Target Object field contains more than 100 custom fields. Remove any unnecessary fields from the target object.

Your report exceeded the time limit for processing.

The report in the Source Report field may contain too much data to process. Reduce the amount of data the report processes when running by limiting the report’s date range and remove any unnecessary fields from the source report.

This Reporting Snapshot Unique Name already exists. Please choose a unique name.

The new snapshot you are trying to create has the same unique name as that of a existing snapshot.

A summary field did not return a valid number.

A summary field in the results has not returned a valid number. For example, the field may have attempted to divide by 0. Check your formulas and test for 0 and “null” in calculations if they appear in your data.

There is a problem with this reporting snapshot. The source report format was changed from tabular to summary. The field mappings in the reporting snapshot are no longer correct. You can change the report format back to tabular or update the field mappings in the snapshot definition.

The source report format was changed from tabular to summary, which made the field mappings in the reporting snapshot incorrect. To fix this error, either change the report format back to tabular or update the field mappings in the snapshot definition. This error only applies to reporting snapshots with summary reports.

There is a problem with this reporting snapshot. Source report must be tabular or summary.

The source report format must be either tabular or summary. Matrix reports cannot be used with reporting snapshots.

The grouping level you specified in the reporting snapshot is no longer valid. The running user may no longer have access to that field, the grouping level may have been removed from the source report, or the grouping level was never set.

This error may result when the running user no longer has access to the field specified in the grouping level, or the grouping level was removed from the source report or was never set. This error only applies to reporting snapshots with summary reports. Make sure the running user has access to all necessary fields.

SEE ALSO:

Creating a Custom Report
Categorize Data Quickly with Buckets

Bucketing lets you quickly categorize report records without creating a formula or a custom field. When you create a bucket field, you define multiple categories (buckets) used to group report values.

Watch a Demo: Getting Started with Buckets

Bucketing lets you quickly categorize report records without creating a formula or a custom field. For example, create a bucket field named Size based on the # Employees field. Then, create buckets that group records into “Large,” “Medium,” or “Small” ranges that you define. Bucket fields can be used like any other field to sort, filter, and group your report.

1. Add a Bucket Field
   Create a bucket field to contain the buckets into which you want to organize your report data.

2. Edit a Bucket Field
   Set up your bucket field by specifying the buckets that it contains and the values that go in the buckets.

3. Edit a Numeric Bucket Field
   A numeric bucket helps you sort data that can be described in terms of numbers.

4. Numeric Bucketing Example: Deal Size
   To gain insight into your deals, use bucketing to group by deal size instead of looking at individual deals. This lets you concentrate on the large deals that affect your quota the most.

5. Edit a Picklist Bucket Field
   A picklist bucket field contains items that can be selected from a list.

6. Picklist Bucketing Example: Industry Types
   Use a picklist bucket field to sort your accounts by their industry.

7. Edit a Text Bucket Field
   A text bucket helps you sort out values that consist of words or phrases.

8. Enter Values for Text Buckets
   A text bucket field needs a descriptive name and two or more buckets containing text strings.

9. Text Bucketing Example: Strategic Accounts
   Use a text bucket to sort accounts into general categories that you can act on.
Add a Bucket Field

Create a bucket field to contain the buckets into which you want to organize your report data.
You can add up to five bucket fields per report, each with up to 20 buckets.

1. In the Fields pane of the report builder, double-click Add Bucket Field or drag it into the report preview. You can also click a column menu for a field in the report and select Bucket this Field.

2. Edit the bucket field according to the field type.
   - Edit a Numeric Bucket Field
   - Edit a Picklist Bucket Field
   - Edit a Text Bucket Field

Fields with other field types are not supported.

Edit a Bucket Field

Set up your bucket field by specifying the buckets that it contains and the values that go in the buckets.

1. In the report builder Fields pane under Bucket Fields, hover over a bucket field and click .
   Or in the Preview pane, click the bucket field column menu and select Edit Bucket Field.

2. Edit the bucket field according to the field type.
   - Edit a Numeric Bucket Field
   - Edit a Picklist Bucket Field
   - Edit a Text Bucket Field
Edit a Numeric Bucket Field

A numeric bucket helps you sort data that can be described in terms of numbers.

In the Edit Bucket Field overlay for a numeric field:

1. For Source Column, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.
   Since a bucket field is intended to have multiple buckets (known as "ranges" in numeric bucket fields) within it, a good name for a bucket field describes the scope of the ranges. For example, a bucket field named "Size" could have ranges of "Small," "Medium," and "Large".
3. Define your ranges by entering a number and a name. The range names appear as values in your new column.
   Each range is greater than the lower number up to and including the higher number.
   To remove all ranges and start over, click Clear All.
4. To move all empty values to the bucket containing the value zero, enable Treat empty source column values in the report as zeros.
   If this is disabled, unbucketed values appear as a dash (-) in the column.
5. Click OK.

In a report, numeric bucket columns are sorted by range values.

SEE ALSO:
Numeric Bucketing Example: Deal Size

Numeric Bucketing Example: Deal Size

To gain insight into your deals, use bucketing to group by deal size instead of looking at individual deals. This lets you concentrate on the large deals that affect your quota the most.

1. Create or edit a standard opportunity report.
2. In the Fields pane of the report builder, double-click Add Bucket Field or drag it into the report.
3. For Source Column, select Amount.
4. For Bucket Field Name, enter Deal Size.
5. Under Define Ranges, enter 1000 in the first row. This represents the maximum for a small deal. Name this range Small.
6. Click Add and enter 25000 in the second row. This represents the maximum for a medium-size deal. Name this range Medium.
7. By default, the last range is any amount over the previous range. You don’t need to enter a number for this range. Name this range Large.
8. Click OK.

With numeric bucket fields, each range is greater than the lower number, up to and including the higher number. Once you’ve set up this bucket field, amounts will be bucketed as follows:
### Bucket Amounts

<table>
<thead>
<tr>
<th>Amounts</th>
<th>Bucket</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000 or less</td>
<td>Small</td>
</tr>
<tr>
<td>1001 to 25000</td>
<td>Medium</td>
</tr>
<tr>
<td>25001 or more</td>
<td>Large</td>
</tr>
</tbody>
</table>

SEE ALSO:

- **Edit a Numeric Bucket Field**
- **Edit a Picklist Bucket Field**

### Edit a Picklist Bucket Field

A picklist bucket field contains items that can be selected from a list.

**Note:** The following picklist types can't be bucketed.

- Record types
- Divisions
- Multi-value picklists
- The Type picklist in Activity reports

In the Edit Bucket Field overlay for a picklist field:

1. For **Source Column**, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.

   Since a bucket field is intended to have multiple buckets within it, a good name for a bucket field describes the scope of the buckets. For example, a bucket field named “Priority” could have “High,” “Medium,” and “Low” buckets.
Important: Picklist bucket names must include one or more letters or symbols. If a picklist bucket field includes a bucket whose name contains only numbers, the bucket field cannot be saved.

3. To create a bucket, click New Bucket and enter a bucket name. Create multiple buckets to group your report records.

4. To find a particular value in the list of values, type the first few characters of its name in the Quick Find box. As you type, items that match your search terms appear in the menu.

5. Select values and drag them into a bucket. Alternatively, select values, click Move To, and select a bucket or enter a new bucket name.

While you’re bucketing values, use these functions as needed:
- To show all the values in the report, click All Values.
- To show the values for a particular bucket, click the bucket name.
- To remove values from a bucket, select the values and drag them to another bucket, or drag them to Unbucketed Values.

Note: You can bucket only active picklist values. Inactive picklist values aren’t shown.

6. To move all unbucketed values into a bucket named “Other”, enable Show unbucketed values as “Other”. If this is disabled, unbucketed values appear in the bucket column with the value name.

7. Click OK.

In a report, picklist bucket columns are sorted by the bucket position as shown in the Edit Bucket Field dialog box, followed by “Other” if Show unbucketed values as “Other” is enabled, or the unbucketed picklist item names if Show unbucketed values as “Other” is disabled.

SEE ALSO:
- Picklist Bucketing Example: Industry Types

Picklist Bucketing Example: Industry Types

Use a picklist bucket field to sort your accounts by their industry.

1. Create or edit a standard accounts report, making sure at least a few records appear in the report.

2. In the Fields pane of the report builder, double-click Add Bucket Field or drag it into the report.

3. For Source Column, select Industry.

4. For Bucket Field Name, enter Industry Types.

5. Click New Bucket and name the bucket IT.

6. Click New Bucket and name the bucket Bio Tech.

7. Click New Bucket and name the bucket Telecom.

8. Select values and drag them into the appropriate buckets.

9. Enable Show unbucketed values as “Other”.

10. Click OK.
SEE ALSO:

Edit a Picklist Bucket Field

Edit a Text Bucket Field

A text bucket helps you sort out values that consist of words or phrases.

**Note:** The following text types can’t be bucketed.
- Text area
- Text area—long
- Text area—rich
- Text area—encrypted
- URL
- Date
- Date/Time

In the Edit Bucket Field overlay for a text field:

1. For **Source Column**, select the field you want to bucket.
2. Enter a bucket field name. This appears as the column name in the report.
   
   Since a bucket field is intended to have multiple buckets within it, a good name for a bucket field describes the scope of the buckets. For example, a bucket field named “Region” could have “East,” “West,” and “Central” buckets.
3. To create a bucket, click **New Bucket** and enter a bucket name. Create multiple buckets to group your report records.
4. To find a particular value in the list of values, type all or part of its name in the Search for values... box and click Search, or leave the box empty and click Search. The search returns up to 200 values.

5. Select values and drag them into a bucket. Alternatively, select values, click Move To, and select a bucket or enter a new bucket name.

While you’re bucketing values, use these functions as needed:
- Use Enter Values to enter the exact name of a value you want to bucket, or to bucket values that may appear in your report later.
- To show the values for a particular bucket, click the bucket name.
- To remove values from a bucket, select the values, select Move To, and select a bucket or enter a new bucket name.

6. To move all unbucketed values into a bucket named “Other,” enable Show unbucketed values as “Other”. If this is disabled, unbucketed values appear in the bucket column with the value name.

7. Click OK.

In a report, text bucket columns are sorted in alphanumeric order.

SEE ALSO:
- Enter Values for Text Buckets
- Text Bucketing Example: Strategic Accounts

**Enter Values for Text Buckets**

A text bucket field needs a descriptive name and two or more buckets containing text strings.

If you know the exact value you want to bucket, you can use the Enter Values function to quickly bucket it without searching. This is useful if your report has a large number (such as millions) of values and searching for a value is slow. You can also use this method to enter and bucket values that may appear in your report later.

In the Edit Bucket Field overlay for a text field:

1. Click Enter Values.
2. Select the bucket where you want to move the values. If you select New Bucket, enter a name for the bucket.
3. Type one or more values in the box. Enter multiple values on separate lines.
4. Click Move.

SEE ALSO:
- Edit a Text Bucket Field
Text Bucketing Example: Strategic Accounts

Use a text bucket to sort accounts into general categories that you can act on.

1. Create or edit a standard account report, making sure at least a few records appear in the report.
2. In the Fields pane of the report builder, double-click **Add Bucket Field** or drag it into the report.
3. For Source Column, select **Account Name**.
4. For Bucket Field Name, enter **Strategic**.
5. Click **New Bucket** and name the bucket **IBM**.
6. Click **New Bucket** and name the bucket **Dell**.
7. Click **New Bucket** and name the bucket **HP**.
8. To show the available values, leave the **Search for values**... box empty and click **Search**.
9. Select values and drag them into the appropriate buckets.
10. Enable **Show unbucketed values as “Other”**.
11. Click **OK**.

**SEE ALSO:**
- Edit a Text Bucket Field
Combine Different Types of Information in a Joined Report

The joined report format lets you view different types of information in a single report. A joined report can contain data from multiple standard or custom report types.

Watch a Demo: Introducing Joined Reports in Salesforce

To get started with joined reports, create a new or edit an existing report in report builder, click the Format drop-down, and choose Joined.

Most of the things you can do with summary or matrix reports you can also do with joined reports. For example, you can find, add, and remove fields; summarize fields; and run and save reports.

Tip: You can show a joined report that includes a chart on a dashboard. Edit the joined report dashboard component and select Use chart as defined in the source report.

1. Add a Report Type to a Joined Report
   Adding a report type lets you expand the set of data available for analysis in a joined report.

2. Change the Principal Report Type
   The principal report type controls how common fields are named. A joined report must have a principal report type. You can change the principal report type at any time.

3. Build a Custom Summary Formula for a Joined Report
   You can add standard or cross-block custom summary formulas for joined reports to calculate additional totals based on the numeric fields available in the report.

4. Work with Blocks
   Blocks let you create different views of the information contained in a joined report.

5. How Joined Reports Work
   A joined report can contain data from multiple standard or custom report types. You can add report types to a joined report if they have relationships with the same object or objects. For example, if you have a joined report that contains the Opportunities report type, you can add the Cases report type as well because both have a relationship with the Accounts object.

SEE ALSO:
   Build a New Report
   How Joined Reports Work
Add a Report Type to a Joined Report

Adding a report type lets you expand the set of data available for analysis in a joined report.

1. Select Joined from the report format menu.

2. Click Add Report Type.
   The Choose an Additional Report Type overlay appears and displays the report types that you can add to the existing report.

3. Select the report type.
   The overlay displays a message that identifies the objects that are common to the selected report type and the types already included in the report.

4. Click OK.
   The additional report type is added. Notice that:
   • A new block appears in the report.
   • The Fields pane updates with a new area that contains fields unique to the report type. Fields common to all report types are in the Common Fields area.

SEE ALSO:
- Build a Custom Summary Formula for a Joined Report
- How Joined Reports Work
- Combine Different Types of Information in a Joined Report

Change the Principal Report Type

The principal report type controls how common fields are named. A joined report must have a principal report type. You can change the principal report type at any time.

By default, the first report type you add to the report is the principal.

The principal report type doesn’t affect what data is available for reporting.

Change the principal report type by removing its blocks. To remove a block, drag it to the Fields pane. If there are multiple blocks based on the principal report type, you must remove them all.

When you remove the principal report type, the way the new report type is selected depends on how many report types the report contains.
   • If the report contains only two report types, the other report type automatically becomes the principal.
   • If the report contains more than two report types, a dialog displays that prompts you to pick one of them as the new principal report type.

SEE ALSO:
- Add a Block to a Joined Report
- Add a Report Type to a Joined Report
- What Can’t I Do with Joined Reports?
- Combine Different Types of Information in a Joined Report
Build a Custom Summary Formula for a Joined Report

You can add standard or cross-block custom summary formulas for joined reports to calculate additional totals based on the numeric fields available in the report.

1. Use one of these options to access the Add Summary Formula overlay from the Fields pane.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To create a standard custom summary formula</td>
<td>Go to the report type category, and double-click Add Formula</td>
</tr>
<tr>
<td>To create a cross-block custom summary formula</td>
<td>Go to the Common category and double-click Add Cross Block Formula</td>
</tr>
</tbody>
</table>

2. Enter a name for the formula as you want it to appear in the report, and optionally a description. The name must be unique.

3. From the Format drop-down list, select the appropriate data type for your formula based on the output of your calculation.

4. From the Decimal Places drop-down, select the number of decimal places to display for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the Decimal Places for your currency setting apply.

5. Set the Where will this formula be displayed? option.
   The calculated value displays in the report block at either the Grand Total or the global grouping level, depending on which you select. To display the formula calculation at every level, including the Grand Total, select All summary levels. Optionally you can select to show the calculation at a global grouping level. You can have three global groupings in a joined report. The groupings apply across all blocks.

6. Build your formula:
   a. Select one of the fields listed in the Summary Fields drop-down list. This field’s value is used in your formula.
      When creating a cross-block formula, the fields are grouped by block. You can also use Quick Find to search for a field.
      When creating a single-report type formula, the list displays numeric fields available for the report type.
   b. Select the kind of summary type to use in your formula. This option is not available for Record Count.

<table>
<thead>
<tr>
<th>Summary Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sum</td>
<td>The summary value of data in a field or grouping of fields.</td>
</tr>
<tr>
<td>Largest Value</td>
<td>The largest value of data in a field or grouping of fields.</td>
</tr>
<tr>
<td>Smallest Value</td>
<td>The smallest value of data in a field or grouping of fields.</td>
</tr>
<tr>
<td>Average</td>
<td>The average of data in a field or grouping of fields.</td>
</tr>
</tbody>
</table>

   c. Click Operators to add operators to your formula.
   d. Select the function category (All, Logical, Math, or Summary), choose the function you want to use in your formula, and click Insert.
e. Repeat these steps as necessary.

7. Click **Check Syntax** to see if your formula contains errors. Errors are highlighted by the cursor.
8. Click **OK**. Your formula isn’t saved until you save the report.

SEE ALSO:

**Work with Blocks**

Blocks let you create different views of the information contained in a joined report.

1. **Add a Block to a Joined Report**
   Adding blocks to joined reports lets you create multiple views of the data included in a single report.

2. **Reorder Blocks**
   You can reorder blocks in a joined report. Reordering blocks affects the report’s appearance but doesn’t affect the data in the blocks.

3. **Rename a Block**
   You can rename blocks to provide more user-friendly descriptions of the information they contain.

4. **Show and Hide the Record Count for a Block**
   You can choose to show or hide the number of records, or **record count**, for each block in a joined report. By default, record count is displayed for each block in the report builder and on the run reports page.

5. **Delete a Block**
Add a Block to a Joined Report

Adding blocks to joined reports lets you create multiple views of the data included in a single report.

1. Click and hold a field from the Fields pane, then drag it to the empty area of the Preview pane.

2. Drop the field to create the block.
When you’ve added the block, notice that standard and field filters for the additional block are added to the Filters pane (1). Also, the new block appears in the Preview pane (2).

To delete a block, click in the block header, then click Remove Block. Or just drag the block to the Fields pane.

Keep the following in mind when working with blocks.

- Adding a new report type to a joined report also adds a new block.
- You must choose a field from a report type category when creating a block. You can’t use a field from the Common category. For example, if your report contains both the Opportunities and the Cases report types, choosing a field from the Opportunities category creates a new Opportunities block, while choosing a field from the Cases category creates a new Cases block.

SEE ALSO:
Add a Report Type to a Joined Report

Build a Custom Summary Formula for a Joined Report
Work with Blocks
Combine Different Types of Information in a Joined Report

Reorder Blocks
You can reorder blocks in a joined reports. Reordering blocks affects the report’s appearance but doesn’t affect the data in the blocks.

When you reorder blocks, block numbers don’t change. For example, if you have a report containing three blocks, and you move block 1 to a new position to the right of block 3, the blocks now display as block 2, block 3, and block 1. You should rename the blocks to avoid confusion.

When reordering a block, you move it to either the left or right of an existing block. You can’t drag it to an empty area in the Preview pane.

To reorder a block:
- In the Preview pane, drag the block to either the left or right side of an existing block. A blue bar beside the block indicates an acceptable drop location.

SEE ALSO:
Rename a Block
Work with Blocks
Rename a Block

You can rename blocks to provide more user-friendly descriptions of the information they contain. When you add a block to a joined report, it’s named automatically based on the report type and the number of blocks in the report. For example, if your report contains two blocks and you add a new block that’s based on the Opportunities report type, it’s named Opportunities block 3.

1. Click the block’s name.
   The name now appears in an editable text box.

2. Enter the new name.

3. Press Enter or click outside the block to apply the name.

SEE ALSO:
   Work with Blocks
   Combine Different Types of Information in a Joined Report
Show and Hide the Record Count for a Block

You can choose to show or hide the number of records, or record count, for each block in a joined report. By default, record count is displayed for each block in the report builder and on the run reports page.

You can hide or show record count two ways:

- Click the arrow in the block header (▼) to display the block menu. The check mark beside the **Record Count** menu item shows that record count is enabled for the block. Click **Record Count** to toggle between showing and hiding the count.
- When you've hidden report details, position the cursor over the Record Count column to display an arrow (▼). Click the arrow, and select **Remove Column**. To display record count again, click the arrow in the block header and select **Record Count**.

**Note:** If you haven’t summarized any rows in your report blocks and have also hidden both details for the report and row counts for all blocks, your blocks will be hidden on the run reports page. To display the blocks, choose **Show Details** from the run reports page or the report builder.

SEE ALSO:
- Show and Hide Report Details
- Use a Summary Function in a Custom Summary Formula

Delete a Block

There are two ways to delete a block from a joined report.

- Click the arrow in the block header (▼) to display the block menu, then click **Remove Block**.
- Click and hold in the block header, and drag the block to the Fields pane.

SEE ALSO:
- Work with Blocks
- Combine Different Types of Information in a Joined Report
How Joined Reports Work

A joined report can contain data from multiple standard or custom report types. You can add report types to a joined report if they have relationships with the same object or objects. For example, if you have a joined report that contains the Opportunities report type, you can add the Cases report type as well because both have a relationship with the Accounts object.

A joined report consists of up to five report blocks, which you add to the report to create multiple views of your data. For each block, you can add regular and summary fields, create standard and cross-block custom summary formulas, apply filters, and sort columns. You apply groupings across all blocks in the report, and can add up to three groupings to the blocks, the same as for the summary format. You can also add a chart to a joined report.

Each joined report has a principal report type. By default, the principal type is the first one added to the report, and is identified in the Fields pane with a small dot beside its name. For example, if you create the joined report by selecting the Opportunities report type, and then add the Cases type, the Opportunities type is the principal report type.

The principal report type controls how common fields are named. Some common fields have different names or appear in different sections in different report types. In those fields, click to see the name of the field in other report types.

When a joined report contains multiple report types, some fields are identified as common fields. A field is a common field if it's shared by all report types or if all report types share a lookup relationship to the field. These fields appear in the Common Fields area in the Fields pane, and can be used to group report blocks.

1. Joined Report Examples
   Creating a sales rep performance scorecard, reviewing support cases by status, and predicting your opportunity pipeline are some examples of what you can do with joined reports.

2. Custom Summary Formulas with Joined Reports
   Two types of custom summary formulas are available with joined reports: standard and cross-block.

3. What Can’t I Do with Joined Reports?
   Most of the things you can do with summary or matrix reports you can also do with joined reports, such as find, add, and remove fields; summarize fields; and run and save reports. However, there are some things you can’t do.

   Work with Blocks

Joined Report Examples

Creating a sales rep performance scorecard, reviewing support cases by status, and predicting your opportunity pipeline are some examples of what you can do with joined reports.

Creating a Sales Rep Performance Scorecard

A sales rep scorecard lets your sales management team understand the performance and actions of your organization’s sales reps. To create it, you need to have three separate custom report types, each of which creates a relationship between User (as the primary object) and one of the following three objects: Opportunity Owner, Opportunity Creator, and Activity Owner. Note that, in this example, we’ve named the custom report types User and Opportunity Owner Custom...

Start by creating a new custom report based on the User and Opportunity Owner custom report type, and then add the User and Opportunity Creator and User and Activity owner custom report types as two additional blocks. Then, group by Sales Rep (opportunity owner) and set the filters as described in the procedure.

To create the report:

1. Create a new report, selecting User and Opportunity Owner Custom Report as the report type.
2. Select Joined from the Format drop-down.
3. Click Add Report Type.
5. Click Add Report Type again, and choose User and Activity Owner Custom Report.
6. Group the blocks by Full Name.
7. Add additional fields and filters to the report as needed. For example, you might want to change the date filters to focus on rep performance during a particular time frame. Or, to make sure that only sales people are included as opportunity owners, create a filter on the Role: Name filter limit your results to users with “Sales” in their roles.
8. Optionally, provide names for the blocks.
9. Click Save or Run Report.

### Reviewing Support Cases by Status

You can also create a report comparing the number of support cases that are new, closed, or in-progress by priority. The report contains a single standard report type: Cases. First, create the report, add three blocks to the report, filter each block by the appropriate status, and then use the Priority field for grouping.

To create the report:

1. Create a new report, selecting Cases as the report type.
2. Select Joined from the Format drop-down.
3. Remove unwanted fields by dragging them to the Fields pane.
4. Create three blocks, each containing the Case Number and Status and, optionally, Case Owner fields.
5. For each block, filter on all cases. Then, filter each of the blocks by Status as follows:
Predicting Opportunity Pipeline

Using cross-block custom summary formulas, you can create a report that predicts future opportunity revenue based on your sales reps’ past performance. Create a report based on the Opportunities standard report type, add three blocks to the report, filter each block by the appropriate status, and then create a formula that uses fields from different blocks.

To create the report:

1. Create a new joined report, selecting Opportunities as the report type.
2. Remove unwanted fields by dragging them to the Fields pane.
3. Create three blocks, each containing the Opportunity Name, Account Name and Amount fields.
4. For each block, show All Opportunities. Then, filter each block.

<table>
<thead>
<tr>
<th>Block</th>
<th>Filters</th>
</tr>
</thead>
</table>
| Block 1 | Opportunity Status equals Closed  
Date Field equals Close Date |

6. Group the blocks by Priority.
7. Optionally, rename the blocks.
8. Click Save or Run Report.
5. Group the blocks by Opportunity Owner.

6. Rename the blocks. For example, “Closed — Won”, “Close — Lost”, and “Closing Next Month”.

7. Create a cross-block custom summary formula that predicts upcoming revenue based on past sales rep performance:

\[
\text{[Closing Next Month]} \text{AMOUNT} = \text{SUM} \times \left( \frac{\text{[Closed - Won]} \text{RowCount}}{\text{[Closed - Lost]} \text{RowCount} + \text{[Closed - Won]} \text{RowCount}} \right)
\]

8. Add the formula to one or more of the blocks.

9. Optionally, add a cross-block custom summary formula that calculates the win ratio of each sales rep:

\[
\frac{\text{[Closed - Won]} \text{RowCount}}{\text{[Closed - Lost]} \text{RowCount} + \text{[Closed - Won]} \text{RowCount}}
\]

10. Click Save or Run Report.

Adding a Chart to the Opportunity Pipeline Predictor Report

You can include a chart with a joined report to provide a visual representation of the data. For example, you can add a chart to the Opportunity Pipeline Predictor report that shows actual versus predicted revenue.
To add the chart:

1. Create the Predicting Opportunity Pipeline report.
2. Click Add Chart.
3. For the Y-axis, select Closed — Won — Sum of Amount.
4. Select Plot additional values.
5. Select Line for the Display option, and Predicted Revenue as the Value.
6. Click the Formatting tab, and enter Actual versus Predicted Revenue as the chart title.
7. Click OK.
8. Click Save or Run Report.

Add a Chart to a Report
Custom Summary Formulas with Joined Reports
How Joined Reports Work
Work with Blocks
Combine Different Types of Information in a Joined Report
Custom Summary Formulas with Joined Reports

Two types of custom summary formulas are available with joined reports: standard and cross-block.

**Standard Custom Summary Formulas**

Standard custom summary formulas apply to one report type, and can be added to blocks that are based on that report type only. For example, a summary formula created for the Cases report type can only be applied to Cases blocks. Custom summary formulas in joined reports support the same data formats, formula options, functions, and calculation display locations as they do with summary and matrix reports.

Keep the following in mind when working with custom summary formulas in joined reports.

- The formulas aren’t automatically added to the report when you create them. To add a formula, drag it to a block with the same report type.
- When you add custom summary formulas to a block, they appear to the right of the standard fields in the order in which you added them to the block. If you also add cross-block custom summary formulas, they appear to the right of the standard ones.
- The results of custom summary formulas are affected by the filter options applied to the blocks they’re included in. As a result, the same formula can yield different results in different blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each custom summary formula must have a unique name. However, standard and cross-block custom summary formulas can have the same name.
- Custom summary formula names can’t include brackets ( “[” or “]”).

**Cross-Block Custom Summary Formulas**

Cross-block custom summary formulas let you calculate values across multiple blocks in a joined report. For example, you can use a cross-block formula to calculate the ratio of open to closed opportunities for an account or the ratio of closed pipeline deals to sales targets.

Building a cross-block formula is similar to creating a standard one. The same data formats, formula options, functions, and calculation display locations are available. The formula syntax is also similar, except that block information is also included. For example, when calculating the ratio of opportunities to cases for each account, the formula also includes the block title:  

\[
\frac{\text{[Opportunities block 1]RowCount}}{\text{[Cases block 2]RowCount}}
\]

Note that if you omit block title, you see an error message when you check formula syntax or save the formula.

Keep the following in mind when working with cross-block custom summary formulas.

- You can add a cross-block formula to any block in the report.
- Cross-block formulas aren’t automatically added to the report when you create them. To add a formula, drag it to a block.
- When you add cross-block formulas to a block, they appear to the right of standard ones in the order in which you add them to the block.
- The results of cross-block formulas are affected by the filter options applied to the blocks in the report. As a result, a cross-block formula can yield different results when you change filter options.
- Each joined report can have up to 10 cross-block custom summary formulas.
- Deleting a block that’s used in a cross-block formula also deletes the formula from both the Fields pane and any remaining blocks containing it.
- Each cross block formula must have a unique name. However, standard and cross-block custom summary formulas can have the same name.
• Cross-block formula names can’t include brackets ("[" or "]").

What Can’t I Do with Joined Reports?

Most of the things you can do with summary or matrix reports you can also do with joined reports, such as find, add, and remove fields; summarize fields; and run and save reports. However, there are some things you can’t do.

Here are some things you can’t do with joined reports.
• Add bucketed fields.
• Add cross filters.
• Drag and drop filters from the Fields pane on to the Filter pane.
• Apply conditional highlighting.
• Change the hierarchy for opportunity or activity reports.
• Create reporting snapshots based on joined reports.

Note:
• For users to be able to create and edit joined reports, report builder must be enabled for your entire organization. When report builder isn’t enabled, users can run joined reports, but can’t create them.
• Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
• Internet Explorer 6 is not supported for joined reports.
• You can’t filter data on a joined report in dashboard view or add a filter to a dashboard that only has joined reports.

Standard Report Types That Can’t Be Used in Joined Reports
• Accounts and Contacts
  – Account History
  – Account Owners*
  – Contact History
• Activities
  – My Delegated Approval Requests*
• Administrative
  – All Pending Approval Requests*
  – API Usage Last 7 Days*

  - Lead All
  - Lead History
  - Lead Status*

- Opportunity
  - Opportunities with Contact Roles and Products
  - Opportunities with Opportunity Teams and Products
  - Opportunity Field History

- Price Books, Products and Assets
Note:

- You might not have access to all the report types listed here. Certain factors can affect the report types you see, such as which features your organization has enabled and how your administrator has set up report folder visibility. Check with your administrator if you think you should see a report type that you don’t.

- If your organization has renamed standard objects, the names of the standard report types will contain your organization’s names instead of the original ones. For example, if your organization has renamed the “Opportunity” object as “Deal,” the standard report type “Opportunity Field History” will be renamed “Deal Field History.”

- In this list, report types marked with an asterisk (*) aren’t available when you create a new report. Instead, you access them by customizing standard reports, which are in folders on the Reports tab.

**Show Report Data Graphically**

To help readers understand your data quickly and easily, show the data in chart form. Charts appear just above the report table. They can help users get a feel for the data before they delve into the details. Use line charts to track changes over time, or a bar or pie chart to compare values at a point in time. Charts can also appear in dashboard components.

1. **Add a Chart to a Report**
   
   Add a chart to give users a visual way to understand the data in your report.

2. **Chart Properties**
   
   You can add a chart to any standard or custom summary or matrix report. The chart properties specify the data that appears in the chart, its labels and colors, and any conditional highlighting you apply.

3. **Present Data Effectively with Charts**
   
   When you add a chart to a report, things like negative values, very large or small numbers, custom summary formulas, and field-level security can affect the charts’ appearance. Switching the report format and changing groupings and blocks also affects charts.

4. **Show Different Data Sets in One Chart**
   
   A *combination chart* plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways in a single chart.

5. **Combination Chart Examples**
   
   Use a combination chart to show multiple values against a single axis range, show two chart types together, or compare two continuous summary values.
6. Chart Formatting Options

Add a Chart to a Report

Add a chart to give users a visual way to understand the data in your report.

Note: Your report must have at least one grouping before you can add a chart.

To add or edit a chart:

1. Click Add Chart in report builder. For existing charts, click Edit Chart.
2. Select a chart type.
3. Enter the appropriate settings on the Chart Data tab for the chart type you selected.
4. Enter the appropriate settings on the Formatting tab.
5. Click OK.

SEE ALSO:

- Present Data Effectively with Charts
- Build a New Report

Chart Properties

You can add a chart to any standard or custom summary or matrix report. The chart properties specify the data that appears in the chart, its labels and colors, and any conditional highlighting you apply.

Note: This topic only applies if you’re not using report builder. Report builder is a visual editor for reports.

To customize chart properties, click Add Chart or Edit Chart in any matrix or summary report, and use the fields on the Chart Data and Formatting tabs.

See Present Data Effectively with Charts on page 3687 for limits, considerations, and tips.

Chart Data Settings

Control the data that appears in your chart with these options.
### Field | Description
--- | ---
Chart Type | Select the type of chart to use when representing the data in your report. The chart type that you choose determines which chart properties are available to set.
X-Axis and Y-Axis | Choose what values to display on the axes of your chart. Depending on the chart type, axis values can be record count, summary fields, or groupings defined in the report.

**Note:** If the Y-axis corresponds to a custom summary formula that has the Where Will this Formula Be Displayed? option set to a grouping level other than All summary levels, then the X-axis and Groupings selection must correspond to that custom summary formula’s grouping level.

Combination Chart | Select this option to plot additional values on this chart. The chart type you chose must allow combination charts.
Groupings | Choose how to group information on your chart. You can only pick from groupings defined in the report. For bar and column charts, click an icon to select the grouping display: side-by-side, stacked, or stacked to 100%. For either single or grouped line charts, you can select Cumulative.
Values | Choose what to display as values for your pie, donut, or funnel chart.
Wedges | Choose what to display as wedges for your pie or donut chart.
Segments | Choose what to display as segments for your funnel chart.

### Chart Presentation
Control the appearance and behavior of your chart using these options.

| Field | Description |
--- | ---
Chart Title | Enter a name for the chart.
Title Color | Select the color for the text of your chart title.
Title Size | Select the font size for the text of your chart title. The maximum size is 18. Larger values are shown at 18 points.
Text Color | Select a color for all the text and labels in your chart.
Text Size | Select a font size for all the text and labels in your chart. The maximum size is 18. Larger values are shown at 18 points.
Background Fade | Choose a direction for a gradient color background. Also select a Start Color and End Color for the gradient. Use white for both if you do not want a background design.
Legend Position | Choose a place to display the legend in relation to your chart.
Combine Small Groups into “Others” | Combine all groups less than or equal to 3% of the total into a single “Others” wedge or segment. Deselect to show all values individually on the chart. This only applies to pie, donut, and funnel charts. This option is on by default for pie and donut charts, and off for funnel.
<table>
<thead>
<tr>

Customizing Reports

Present Data Effectively with Charts

When you add a chart to a report, things like negative values, very large or small numbers, custom summary formulas, and field-level security can affect the charts’ appearance. Switching the report format and changing groupings and blocks also affects charts.

- You can’t have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.
- If you lose access to a field used in a chart, another field may be used in its place. If no other fields are available, record count is used.
- Decimal-place precision on charts is not customizable. Numeric and currency values round to two decimal places. Percentage values round to one decimal place.
- If numeric values are too large or too small, they are shown in scientific notation. For example, the number 5,750,000,000 is displayed as 5.75E9; -0.0000000061 is displayed as -6.1E-9.
- Negative values are displayed on all line charts and non-stacked bar and column charts. Negative values on pie, donut, funnel, and stacked charts are not displayed. Groupings containing negative values are displayed in the legend, and negative values are reflected in the calculation of all summary values, including the total for donut charts.
- When creating charts, don’t group by a field on a child object then sum by a field on the parent object. It’s not good practice. If you do this with a donut chart, the total shown may not match the sum of the wedges.
- Dashboard and report charts that display values from custom summary formulas display decimal places using your default currency setting instead of what you specified for the formula. For example, if the summary formula specifies zero decimal places, no decimal places appear in columns, but chart values show the number of decimal places specified for your default currency (usually two decimal places). This applies to currencies, numbers, and percentages.
- With joined reports, summary field names contain both the field name and the block name. For example, if you’ve summarized the Amount field in Block 1, it appears as Block 1 — Sum of Amount in the Chart Editor. A cross-block or standard custom summary formula contains the block name when the formula is included in multiple blocks.
- When a report already has a chart, changing the report format or removing blocks, groupings, or summary fields has impacts described in this table.

<table>
<thead>
<tr>
<th>When you make this change ...</th>
<th>The effect is ...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch format from summary, matrix, or joined to tabular</td>
<td>All charts are removed from the report.</td>
</tr>
<tr>
<td>Switch format from summary to matrix</td>
<td>The first summary grouping becomes the first row grouping. The second becomes the first column grouping. The third becomes the second row grouping. The chart is unchanged.</td>
</tr>
<tr>
<td>Switch format from matrix to summary</td>
<td>The first row grouping becomes the first summary grouping. The second row grouping becomes the third summary grouping. The first column grouping becomes the second</td>
</tr>
<tr>
<td>When you make this change ...</td>
<td>The effect is ...</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>summary grouping. The second column grouping is removed. If the chart used the second column grouping, that grouping is replaced by the first available summary field that's not already used in the chart.</td>
<td>Switch format from summary or matrix to joined</td>
</tr>
<tr>
<td>The existing report becomes the first block and the chart remains in the report. If the matrix report used the second column grouping, that grouping is replaced by the first available summary field that's not already used in the chart. If the summary or matrix report included a grouping from a bucket field, the grouping is replaced with the next available grouping not already used in the chart.</td>
<td>The first block becomes the report, and groupings and the chart are preserved. If the chart in the joined version contained summary fields from the first block, they remain in the chart in the summary report. Summaries from other blocks are removed from the chart.</td>
</tr>
<tr>
<td>The summary field is replaced with the next available summary field. If no additional summary fields are available, the original field is replaced with the record count from the first remaining block. Removing all blocks from a report removes the chart completely.</td>
<td>Remove a block containing a summary field from a joined report</td>
</tr>
<tr>
<td>The grouping is replaced with the next available grouping. If all groupings are removed, the chart is removed as well. Note that groupings can be removed automatically when you add a report type to a joined report or if a field becomes unavailable, for example as a result of field-level security.</td>
<td>Remove a grouping used in the chart</td>
</tr>
<tr>
<td>The summary field is replaced with the next available summary field. If no additional summary fields are available, the field is replaced with the record count for either the report or the first block. Note that summary fields can be removed automatically, for example as a result of field-level security or when the report format changes.</td>
<td>Remove a summary field used in the chart (including custom and cross-block summaries)</td>
</tr>
</tbody>

Show Different Data Sets in One Chart

A combination chart plots multiple sets of data on a single chart. Each set of data is based on a different field, so values are easy to compare. You can also combine certain chart types to present data in different ways in a single chart.

With combination charts, you can:

- Add a line to an existing line, vertical column, grouped vertical column, or stacked vertical column chart.
- Add a cumulative line to an existing line cumulative chart.
- Add up to three more columns to a vertical column chart.
- Add up to three more bars to a horizontal bar chart.

For example, as a sales manager, you wish to see “Pipeline amount” as a line and “Number of open deals” as vertical bars on the same chart.

1. Edit the chart for any summary or matrix report, or edit a dashboard component that displays a summary or matrix report.

2. Choose a chart type that allows combination charts:
   - Bar chart
   - Column chart
   - Grouped column chart
   - Stacked column chart
   - Line chart
   - Cumulative line chart

3. Select the Plot additional values checkbox. The chart preview updates as you configure your combination chart.

4. To plot on the chart, select a Value.

5. Choose a Display option. Available options differ based on your chart type and whether you’re editing a chart or a dashboard component.
   - For columns or bars, click Add Bar or Add Column links to add up to three sets.
   - When adding a line to a vertical column chart, select Use second axis to show a separate axis for the added line on the right side of the column chart. A separate axis can be useful when the two values have different ranges or units.

   **Note:** Selecting Use second axis makes more values available in the Value drop-down list. Without this option, you can only pick from values of the same type as the primary Y-axis—for example, number, currency, or percentage. This option is only available for certain combination charts.

6. Once you’ve set up your report, click Run Report or Save.

   **Note:**
   - If you lose access to a field used in a chart, another field may be used in its place. If no other fields are available, record count is used.
   - Both X-Axis and Y-Axis must not be set to Auto. If set to Auto, you can’t plot the chart.
Filtered drill-down doesn’t work for combination charts in dashboards.

Combination Chart Examples

Combination Chart Examples
Use a combination chart to show multiple values against a single axis range, show two chart types together, or compare two continuous summary values.

A combination chart plots multiple sets of data on a single chart.

Column-on-Column
Add columns to a column chart to show multiple values against a single axis range.

To create the chart in this example, choose the Vertical Column chart type, set the opportunity sum of amount as the Y-Axis, stage as the X-Axis, and use the Plot additional values option to add the sum of expected revenue as a column.

You can quickly compare the actual values against the expected values for each stage.

Line-on-Column
Add a line to a column chart to show two chart types together. Using a second axis allows you to add different types of values to the chart.

To create the chart in this example, choose the Vertical Column chart type, set the opportunity sum of amount as the Y-Axis, fiscal year as the X-Axis, and use the Plot additional values option to add the number of deals as a line. Summary values of different types won’t be available in the Values drop-down list unless you select Use second axis.

You can see both the total amount and number of deals for each year on a single chart.
Line-on-Line

Add a line to a line chart to compare two continuous summary values.

To create the chart in this example, set up a custom summary formula to calculate a three-week moving average of opportunity amounts, then choose the Line chart type, set the opportunity sum of amount as the Y-Axis, date as the X-Axis, and use the Plot additional values option to add the calculated three-week moving average as a line.

You can compare sales against the moving average over time.

The custom summary formula used in this example is shown here:

\[
\frac{\text{SUM}(\text{OppProductTrends__c.Amount__c}) + \text{PREVGROUPVAL}(\text{OppProductTrends__c.Amount__c}) + \text{PREVGROUPVAL}(\text{OppProductTrends__c.Amount__c, 2})}{3}
\]

Show Report Data in Tables

To help readers scan for data easily, try hiding details and ranges, limiting the number of results shown, and highlighting with color. You can also show your table in a dashboard component.

1. **Show and Hide Report Details**
   You can show or hide report details from either the run reports page or the report builder. When you hide details, individual records don’t display in the report. Groupings, summary formulas, and record counts remain visible.

2. **Highlight Data Ranges**
   Highlight field values on summary or matrix reports based on ranges and colors you specify. To enable conditional highlighting, your report must contain at least one summary field or custom summary formula.

3. **Use a Tabular Report in a Dashboard**
   You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.

4. **Limit Report Results**
   Set limits to the scope of your report to avoid processing too many records. The built-in choices for limiting your results vary according to the object you are reporting on.

SEE ALSO:
- Highlight Data Ranges

- Use a Tabular Report in a Dashboard

Show and Hide Report Details

You can show or hide report details from either the run reports page or the report builder. When you hide details, individual records don’t display in the report. Groupings, summary formulas, and record counts remain visible.

- From the run reports page, click **Hide Details** to hide individual records. Click **Show Details** to show all records.
- From the report builder, click **Show > Details**. A check mark beside the **Details** menu item means that details are displayed. Click **Details** to toggle between showing or hiding records.

**EDITIONS**

Available in: Salesforce Classic

Available in: All editions except Database.com

**USER PERMISSIONS**

To run reports:
- “Run Reports”

To create, edit, and delete reports:
- “Create and Customize Reports”
  AND
  “Report Builder”
Highlight Data Ranges

Highlight field values on summary or matrix reports based on ranges and colors you specify. To enable conditional highlighting, your report must contain at least one summary field or custom summary formula.

To set conditional highlighting, click Show > Conditional Highlighting in report builder, then set the breakpoint values and their range colors as follows:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Summary</td>
<td>Choose a summary field whose number ranges you want represented by colors.</td>
</tr>
<tr>
<td>Low Color</td>
<td>Select a color to represent data that falls below the Low Breakpoint value.</td>
</tr>
<tr>
<td>Low Breakpoint</td>
<td>The number that acts as the threshold between the Low Color and the Mid Color. Values that are exactly the same as the Low Breakpoint value are shown as the Mid Color.</td>
</tr>
<tr>
<td>Mid Color</td>
<td>Select a color to represent data that falls between the Low Breakpoint and High Breakpoint values.</td>
</tr>
<tr>
<td>High Breakpoint</td>
<td>The number that acts as the threshold between the Mid Color and the High Color. Values that are exactly the same as the High Breakpoint value are shown as the High Color.</td>
</tr>
<tr>
<td>High Color</td>
<td>Select a color to represent data that falls above the High Breakpoint value.</td>
</tr>
</tbody>
</table>

SEE ALSO:

Build a New Report
Use a Tabular Report in a Dashboard

You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.

1. Click Add > Row Limit.
2. Set the Row Limit to 10, 25, or Custom. If you choose Custom enter a number between one and 99.
3. Set the Sort By and sort order options. If you chose Limit Rows by this Field for a column, these options are already set.
4. Click OK.
5. Click Dashboard Settings in the toolbar.
6. Choose a Name and Value to use in dashboard tables and charts. Tables show both name and value. Charts are grouped by name.
7. Click OK. You can now use this tabular report as the source report for a dashboard component.

Tip: When you create a dashboard component to display your tabular report, you can use the dashboard component editor to override the settings you chose in Dashboard Settings.

Limit Report Results

Set limits to the scope of your report to avoid processing too many records. The built-in choices for limiting your results vary according to the object you are reporting on.

- To see a collapsed view of a report showing only the headings, subtotals, and total in report builder, deselected Show > Details.

On the report run page, click Hide Details or Show Details at the top of the report.

- To filter by a field, click Add > Field Filter. With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.
- Cross filters work like ordinary filters, but they have some special characteristics of their own. To add one, click Add > Cross Filter.
- In Professional, Enterprise, Unlimited, Performance, and Developer edition organizations, the Hierarchy links let you browse report results based on the role or territory hierarchies.
- If your organization uses divisions to segment data and you have the “Affected by Divisions” permission, use the Division drop-down list to include records in just one division or all divisions. Select Current to show records in your current working division. Reports that are already scoped (such as My Cases or My team’s accounts) include records in all divisions, and you can’t further limit them to a specific division. If you do not have the “Affected by Divisions” permission, your reports include records in all divisions.
- You can set the maximum number of records to display in a tabular report by clicking Add > Row Limit in report builder. Set the number of rows, then choose a field to sort by, and the sort order. Limiting rows on a tabular report allows you to use it as a source report for dashboard table and chart components.

The Row Limit option on tabular reports shows only fields from the primary object on reports created from custom report types where object A may or may not have object B. For example, in an accounts with or without contacts report, only fields from accounts are shown. Fields from objects after a may-or-may-not association on custom report types aren’t shown. For example, in an accounts
with contacts with or without cases report, only fields from accounts and contacts are available to use. If you change the report format, **Row Limit** settings are lost.

**Note:** Only the first 255 characters in a custom text field count for filtering purposes. For example, if you add a field filter to find opportunities where the custom text field *Customer notes* includes the word “phone,” but “phone” appears after the 255th character in the field, the filter will not find that record. In standard text fields, all characters count, regardless of the length of the field.

**Report on Salesforce Data with Excel**

Connect for Office includes an Excel add-in that enables you to securely access your Salesforce reports with Microsoft® Excel®. You create the reports you need in Salesforce, then pull them into an Excel worksheet, and use Excel’s formulas, charts, and pivot tables to customize and analyze your data. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

**Important:** When Salesforce disables TLS 1.0, we’re ending support for Connect for Office. This change means that there’s no guarantee that Connect for Office can establish a connection between Salesforce and Microsoft® Word or Excel. Even if sales reps can establish a connection, Salesforce no longer provides support or maintenance when there’s an issue.

The Excel add-in provides the same access to reports and fields that you normally experience in Salesforce. You can distribute your customized Excel worksheets via the Documents tab, allowing all users to track customized analytics in real time. You can reference data from multiple reports in one worksheet to create a single-page overview of key metrics.

Communication between Excel and Salesforce uses the same secure HTTPS protocol as when you log in via your Web browser.

1. **Install Connect for Office**
   When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

2. **Log Into Connect for Office**
   You need to log in to Salesforce before you can request data from your Salesforce reports. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

3. **Import Reports Into Excel with Connect for Office**
   Import your custom or standard Salesforce reports into Excel so you can further analyze the data using Excel’s formulas, charts, and pivot tables. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

4. **Refresh and Update Data with Connect for Office**
   Keep your Salesforce reports up to date in Excel by periodically refreshing the report data and any pivot tables you have created. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

**Install Connect for Office**

When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.
Important: When Salesforce disables TLS 1.0, we’re ending support for Connect for Office. This change means that there’s no guarantee that Connect for Office can establish a connection between Salesforce and Microsoft® Word or Excel. Even if sales reps can establish a connection, Salesforce no longer provides support or maintenance when there’s an issue.

The system requirements for Connect for Office are:

- Microsoft® Office 2007
- Microsoft® Windows Vista® (32-bit only) - Until Salesforce disables TLS 1.0.

1. Close all Microsoft® Office programs, including Word, Excel®, and Outlook®.
2. From your personal settings, enter Office in the Quick Find box, then select Connect for Office.
   Tip: If you can’t see the download page, ask your administrator for access.
3. Click Install Now.
4. Click Yes when prompted to install Connect for Office. We recommend that you install Connect for Office to the default folder suggested by the installer.
5. After the installation completes, open Excel or Word, and select the Salesforce menu to begin using Connect for Office.
6. The first time you open Word, you are prompted to enable macros from Salesforce. You must enable the macros and accept Salesforce as a macro publisher to use the Word add-in.

Note: The Connect for Office installer edits the registry on your computer. If your organization imposes security that prevents you from editing the registry, log in as the administrator of your machine before installing Connect for Office or contact your IT department for assistance.

- Personalize Your Salesforce Experience
- Log Into Connect for Office

Log Into Connect for Office

You need to log in to Salesforce before you can request data from your Salesforce reports. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

Important: When Salesforce disables TLS 1.0, we’re ending support for Connect for Office. This change means that there’s no guarantee that Connect for Office can establish a connection between Salesforce and Microsoft® Word or Excel. Even if sales reps can establish a connection, Salesforce no longer provides support or maintenance when there’s an issue.

1. Open Excel.
2. In Microsoft Office 2003 and earlier, select Log In from the Salesforce drop-down menu on the Excel toolbar. In Microsoft Office 2007, select the Salesforce tab on the Ribbon, click the Reporting drop-down menu, and then select Log In.
3. Enter your Salesforce username and password.
4. Click Login.

Note: If your organization restricts IP addresses, logins from untrusted IPs are blocked until they’re activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is mypassword, and your security token is XXXXXXXXXXX, you must enter mypasswordXXXXXXXX to log in.
Import Reports Into Excel with Connect for Office

Import your custom or standard Salesforce reports into Excel so you can further analyze the data using Excel’s formulas, charts, and pivot tables. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.

**Important:** When Salesforce disables TLS 1.0, we’re ending support for Connect for Office. This change means that there’s no guarantee that Connect for Office can establish a connection between Salesforce and Microsoft Word or Excel. Even if sales reps can establish a connection, Salesforce no longer provides support or maintenance when there’s an issue.

1. Create a custom report in Salesforce. You can also use any of the standard reports.
2. Open a blank worksheet in Excel.
3. Select the Salesforce tab on the Ribbon, click the **Reporting** drop-down menu, and then select **Import a Report...**
   
   **Note:** In Microsoft Office 2003 and earlier, select **Import a Report...** from the **Salesforce** drop-down menu on the Excel toolbar.
4. Select a report from the list of standard and custom Salesforce reports available to you.
5. Specify where you want to put the report data in your Excel file.
   a. Enter the name of your Excel worksheet in the **Destination worksheet** field.
   b. In the **Cell** field, enter the uppermost cell where you want to begin putting the data.

   If the specified worksheet and cells already contain report data, Connect for Office moves the existing data over to make room for the new report data.

   **Tip:** Avoid renaming worksheets that contain imported reports. When you do that the connection between the worksheet and your report is lost. You must import the report again to refresh the data.

6. Choose **Raw Data** to import the data without formatting, subtotals, or grand totals. Choose **Formatted** to keep the colors, fonts, subtotals, and grand totals from the Salesforce report.

   This is useful for importing large matrix reports with the data already summarized into a small table.

   **Tip:**
   - The **Raw Data** option is best if you’re importing summary or matrix reports for use with Excel formulas and pivot tables.
   - Use the **Formatted** option if you’re importing large matrix reports with the data already summarized into a small table.

7. Click **OK**.

   **Tip:** You can copy and paste data from Excel into other Office applications. Use the **Paste Special** option, rather than **Paste**, to reference the Excel data as a worksheet object. If the data then changes in Excel, you can right-click the object and update it automatically. See the Microsoft Word help for more information.

Refresh and Update Data with Connect for Office

Keep your Salesforce reports up to date in Excel by periodically refreshing the report data and any pivot tables you have created. When Salesforce disables TLS 1.0, we’re ending support for Connect for Office.
Important: When Salesforce disables TLS 1.0, we’re ending support for Connect for Office. This change means that there’s no guarantee that Connect for Office can establish a connection between Salesforce and Microsoft® Word or Excel. Even if sales reps can establish a connection, Salesforce no longer provides support or maintenance when there’s an issue.

After logging into Salesforce, select any of the following options from the Salesforce Ribbon tab (or toolbar in Office 2003 and earlier):

- **Refresh Existing Reports...** - Allows you to choose which reports you want to update in Excel.
  1. From the list of reports you have imported, select the reports to update.
  2. Optionally, select Update Pivot Tables to update any pivot tables you have created in Excel for the selected reports. The Refresh All Reports menu choice does this automatically.
  3. Click Refresh Selected to update the report data.
    To remove reports from this list, select the report names and click Delete Selected. The reports are not removed from your Excel worksheet or from Salesforce, only from the list of reports available for refreshing.

- **Refresh All Reports** - Refreshes all of the reports that you have imported into your Excel file, including the pivot tables referenced by those reports.

Tip:
- If you write a formula, select an entire column rather than a range of cells, because the number of rows in your report may change when you refresh the report data. For example, use =Sum(Sheet2!E:E) to sum column E rather than =Sum(Sheet2!E1:E200).
- If you use the VLOOKUP and HLOOKUP functions in Excel to join data across different cell ranges, these functions may make report record IDs, which are 15-character alphanumeric IDs, case-sensitive. Make sure to use the correct case when identifying report records. See the Microsoft Excel help for more information.

**Upgrade the Report Wizard**

Report builder, a powerful drag-and-drop editor, is the standard tool for creating and editing reports. If your organization is still using the old report wizard, you should upgrade to report builder.

- All profiles get access to the report builder by default. (You may continue to see the “Report Builder” permission in permission sets and profiles and the PermissionSet and Profile objects in the API, though the upgrade overrides those settings.)
- The old report wizard is available only to users in Accessibility Mode.
- Group and Professional Edition organizations can use report builder.
- You get scatter charts, a new chart type for reports.

New organizations automatically get the latest version of report builder. If you don’t see the Report Builder Upgrade section on the User Interface Settings page, the upgrade has already been enabled for your organization.

Assigning the “Report Builder” permission to all users through profiles or permission sets isn’t the same thing as enabling report builder for your entire organization. To enable report builder for your organization, follow these steps.

Important: Upgrading does not affect any of your existing reports. However, once you upgrade, you can’t return to the old report wizard.

1. From Setup, enter Reports in the Quick Find box, then select Reports and Dashboards Settings.
2. Review the Report Builder Upgrade section of the page and click Enable. If you don’t see the button, report builder has already been enabled for your entire organization.
3. Confirm your choice by clicking Yes, Enable Report Builder for All Users.

Filter Report Data

What if your report gives you more data than you need? Use filters to pare down your report until it only shows the data that you want.

In Salesforce Classic, filter your report from the report builder.

In Lightning Experience, there are two ways to filter reports: either from the Report Builder or while viewing a report. To add or edit report filters, use the Report Builder. To edit existing, unlocked report filters while you’re reading a report, run the report and then edit filters directly from the filters pane ( ). You can edit existing filters from the filters pane, but you can’t add new ones.

Note: In Lightning Experience, these filters are available in the Report Builder, but are not shown in the filter panel when viewing a report. Even though the filters are not shown, they still filter the report.

- Row limit filters
- Cross filters
- Historical field filters
- Standard filters (except for scope and date filters)

1. From the Report builder, open the Add dropdown menu and select a filter type:
   - Field Filter to filter on fields. For example, use a field filter to filter by Account Name equals Acme.
   - Filter Logic to customize how existing filters apply to your report. Each filter is assigned a number. If you’d like your report to return records that meet the criteria of Filter 1 and either Filter 2 or Filter 3, use this filter logic: Filter 1 AND (Filter 2 OR Filter 3). Filter logic requires at least one field filter.
   - Cross Filter to filter on one object’s relationship to another object. Cross filter on Accounts with Opportunities so that your report only returns Accounts that have Opportunities. Add a subfilter to a cross filter to further filter by the second object. For example, the Opportunity subfilter Amount greater than 50000 causes your report to return Accounts that have Opportunities worth more than $50,000.00.
   - Row Limit to limit the number of report results in tabular reports. To see which five Accounts have the largest annual revenue, set a row limit of Top 5 Accounts by Annual Revenue.

Standard filters, such as date filters, are applied by default to most objects. Look for them underneath the Add dropdown menu and customize them as necessary. Different objects have different standard filters.

2. Enter filter criteria.

   For help entering filter criteria, see Filter Operators Reference and Add Filter Logic.

3. Optionally, to prevent people from editing a field filter while reading your report in Lightning Experience, check locked.

4. Click Save.

5. To read your filtered report, click Run Report. In new reports, the Run Report button doesn’t appear until you save your report.
Note: In the Lightning Experience Report Builder, save your report before running it or risk losing some changes. Specifically, be sure to save after adding:

- Row limit filters
- Cross filters
- Formula fields
- Bucket fields

Example: Say that you want your team to call new leads at companies with more than 100 employees located in California, Arizona, or Nevada. You have a leads report with fields like Lead Status, Number of Employees, and State. Your report gives a complete overview of your entire company's leads. But you only want to see new leads that have more than 100 employees and are located in California. Apply these filters to your report:

1. Lead Status equals New
2. Number of Employees greater than 100
3. State includes California, Arizona, Nevada

Now your leads report returns only the leads you need.

Filters Type Reference
Several different types of filters help you scope your report data: standard filters, field filters, cross filters, and row limit filters. Each filter type filters your report in different ways. This list of filter types helps you choose the right filter types for your report.

Filter Operators Reference
The operator in a filter is like the verb in a sentence. Operators specify how filter criteria relate to one another. Refer to this list of filter operators while setting filters on list views, reports, dashboards, and some custom fields.

Add Filter Logic
Filter logic governs how and when filters apply to your report.

Notes about Filtering on Types of Fields and Values
Keep these tips in mind when filtering on text fields, date fields, numeric values, picklist values, and blank or null values.

Tips for Filtering on Multiple Currencies
Tips for filtering on currency fields when your organization uses multiple currencies.

Filters Type Reference
Several different types of filters help you scope your report data: standard filters, field filters, cross filters, and row limit filters. Each filter type filters your report in different ways. This list of filter types helps you choose the right filter types for your report.

<table>
<thead>
<tr>
<th>Filter Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Standard Filter</strong></td>
<td>Standard filters are applied by default to most objects. Different objects have different standard filters, but most objects include the standard filters Show and Date Field. Show filters the object around coming groupings (like “My accounts” or “All accounts”). Date Field filters by a field (such as Created Date or Last Activity) and a date range (such as “All Time” or “Last Month”).</td>
</tr>
</tbody>
</table>
### Filter Type

<table>
<thead>
<tr>
<th>Filter Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Filter</td>
<td>Field filters are available for reports, list views, workflow rules, and other areas of the application. For each filter, set the field, operator, and value. With tabular, summary, and matrix reports, you can drag a field from the Fields pane to the Filters pane to add a report filter.</td>
</tr>
<tr>
<td>Filter Logic</td>
<td>Add Boolean conditions to control how field filters are evaluated. You must add at least 1 field filter before applying filter logic.</td>
</tr>
<tr>
<td>Cross Filter</td>
<td>Filter a report by the child object using WITH or WITHOUT conditions. Add subfilters to further filter by fields on the child object. For example, if you have a cross filter of Accounts with Opportunities, click Add Opportunity Filter and create the Opportunity Name equals ACME subfilter to only include those opportunities.</td>
</tr>
<tr>
<td>Row Limit</td>
<td>For tabular reports, select the maximum number of rows to display, then choose a field to sort by and the sort order. You can use a tabular report as the source report for a dashboard table or chart component, if you limit the number of rows it returns.</td>
</tr>
</tbody>
</table>

---

**Example: Report on Related Objects with Cross Filters**

Use a cross filter to fine-tune your results by including or excluding records from related objects, without having to write formulas or code. You can apply cross filters by themselves, or in combination with field filters.

**Example: Using Row Limits in Report Filters**

Here is where you can see a sample of a report filter using a field filter, filter logic, and a row limit.

---

### Example: Report on Related Objects with Cross Filters

Use a cross filter to fine-tune your results by including or excluding records from related objects, without having to write formulas or code. You can apply cross filters by themselves, or in combination with field filters.

Watch a Demo: [Using Cross Filters in Reports](#)

To change a report filter, hover over it and click **Edit** or **Remove**. Your filters display when you run your report; click **Edit** on that page to make additional changes.

Add subfilters to further filter by fields on the child object. For example, if you have a cross filter of Accounts with Opportunities, click **Add Opportunity Filter** and create the Opportunity Name equals ACME subfilter to see just those opportunities. You can create up to five subfilters for each cross filter.

- Each report can have up to three cross filters.
- Each cross filter can have up to five subfilters.
- Filter logic applies only to field filters, not cross filters.

1. **Create a Cross Filter**
   - Use cross filters to include or exclude records in your report results based on related objects and their fields.

2. **Example: Using WITH in Cross Filters**
   - Use cross filters to filter a report by an object’s child objects using WITH conditions. For example, filter a report to show just accounts with cases.

---

**EDITIONS**

Available in: Salesforce Classic

Available in: Enterprise, Performance, Unlimited, and Developer Editions

**USER PERMISSIONS**

To create, edit, and delete reports:
- “Create and Customize Reports”
  - AND
    - “Report Builder”
3. Example: Using WITHOUT in Cross Filters
   Use cross filters to filter a report by an object’s child objects using WITHOUT conditions. For example, filter a report to show just contacts without activities.

4. Example: Using Multiple Cross Filters
   Use cross filters to filter a report by an object’s child objects using both WITH and WITHOUT conditions. For example, filter a report to show accounts that have cases but don’t have activities.

5. Tips for Working with Cross Filters
   Cross filters work like ordinary filters, but they have some special characteristics of their own.

Create a Cross Filter

Use cross filters to include or exclude records in your report results based on related objects and their fields.

Watch a Demo: Using Cross Filters in Reports

1. In the Filters pane of report builder, click Add > Cross Filter.
2. Select a parent object from the drop-down list. Your choice determines which related objects you see in the child object list.
   Tip: In report types based on Campaigns, the parent object can be the secondary object in the report type. For example, in a “Campaigns with Leads” report, the parent object can be Campaigns or Leads.
3. Choose with or without.
4. Select a child object from the drop-down or search by its name. The drop-down list contains all eligible child objects of your selected parent object.
5. Optionally add subfilters:
   a. Click Add Your Related Child Object Filter.
   b. Select a field. The fields are determined by the child object in the cross filter. For example, if your cross filter is Accounts with Cases, you can use case fields for your subfilter.
   c. Choose a filter operator.
   d. Enter a value.
6. Click OK.

   Example: Using Multiple Cross Filters
   Example: Using WITH in Cross Filters
   Example: Using WITHOUT in Cross Filters
Example: Using WITH in Cross Filters

Use cross filters to filter a report by an object's child objects using WITH conditions. For example, filter a report to show just accounts with cases.

Let’s say a recent campaign in California won you a lot of new customers. You want to ensure that their customer cases get resolved quickly. You can create a report to see which of those accounts currently have cases.

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder’s Filters pane, set the appropriate standard filters.
3. Create a field filter where **Billing State/Province equals CA** and click **OK**.
4. Click **Add > Cross Filter** and specify **Accounts with Cases**.

When you click **Run Report**, the results will include only California accounts with an associated case.

SEE ALSO:
- Create a Cross Filter

Example: Using WITHOUT in Cross Filters

Use cross filters to filter a report by an object’s child objects using WITHOUT conditions. For example, filter a report to show just contacts without activities.

Let’s say that you’ve just imported a list of California accounts and you want to find which ones are missing contacts before you assign owners:

1. Create a new report. For the report type, click **Accounts & Contacts**, select **Accounts**, and click **Create**.
2. In the report builder’s Filters pane, set the appropriate standard filters.
3. Create a field filter where **Billing State/Province equals CA** and click **OK**.
4. Click **Add > Cross Filter** and specify **Accounts without Contacts**.

When you click **Run Report**, the results will include only California accounts without an associated contact.

SEE ALSO:
- Create a Cross Filter
Example: Using Multiple Cross Filters

Use cross filters to filter a report by an object's child objects using both WITH and WITHOUT conditions. For example, filter a report to show accounts that have cases but don't have activities.

Say you're a salesperson who wants to see which customer accounts have unresolved problem escalations because you want to ensure your support team takes care of them.

1. Create a new report. For the report type, click Accounts & Contacts, select Accounts, and click Create.
2. In the report builder's Filters pane, set the appropriate standard filters.
3. To limit your report to customer accounts, click Add > Field Filter and specify Type equals Customer.
4. To see which accounts have no activities, click Add > Cross Filter and specify Accounts without Activities.
5. To see only accounts without completed activities, add a subfilter to your cross filter:
   a. Click Add Activities Filter and specify Status equals Completed.
   b. Click OK.
6. To include your accounts that currently have cases, add another cross filter but this time specify Accounts with Cases.
7. To exclude cases that were not escalated, add a subfilter to this cross filter:
   a. Click Add Cases Filter and specify Type equals Problem.
   b. Click Add Cases Filter again, but this time specify Status equals Escalated.
   c. Click OK.

When you run the report, it will include only customer accounts without completed activities with escalated cases.

Create a Cross Filter
Tips for Working with Cross Filters

Cross filters work like ordinary filters, but they have some special characteristics of their own.

- Adding cross filters can potentially slow down your report. To avoid having the report or preview time out, limit the data returned by setting filters. For example, select My opportunities for Show and Current FQ for Range instead of viewing all opportunities for all time.
- Since the objects available in cross filters depend on the parent object of the report type you choose, consider the related child objects before selecting a report type. For example, choose the Accounts report type to filter on Accounts with Partners because Partner is a child object of Account.
- Cross filters work in conjunction with your report type selection. Cross filters have an AND relationship with the report type you select. Therefore, choosing a report type of Accounts with Partners and adding a cross filter for Accounts without Partners will yield no results.

- Example: Using Multiple Cross Filters
- Create a Cross Filter
- Example: Using WITH in Cross Filters
- Example: Using WITHOUT in Cross Filters

Example: Using Row Limits in Report Filters

Here is where you can see a sample of a report filter using a field filter, filter logic, and a row limit.

Say you are a sales executive who wants to see which California accounts currently have the most potential to generate revenue:

2. Open the Accounts & Contacts report type, choose Accounts, and click Create.
3. To find California accounts that either have over $10 million in revenue or are public companies, click Add > Field Filter and create these filters:
   a. Billing State/Province equals CA
   b. Annual Revenue greater than 10000000
   c. Ownership equals Public
4. To ensure that your results include all California accounts with $10 million in revenue OR that are public, click Add > Filter Logic and enter 1 AND (2 OR 3).
5. To limit the number of results for a tabular report to 10, click Add > Row Limit and enter 10. Choose your sort field and sort order. Click OK.

When you click Run Report, your results will contain ten rows and include public companies in California with revenues of more than $10 million.

### Filter Operators Reference

The operator in a filter is like the verb in a sentence. Operators specify how filter criteria relate to one another. Refer to this list of filter operators while setting filters on list views, reports, dashboards, and some custom fields.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>Use for an exact match. For example, “Created equals today.”</td>
</tr>
<tr>
<td>less than</td>
<td>Use for results that are less than the value you enter. For example, “Quota less than 20000” returns records where the quota field ranges from 0 to 19,999.99.</td>
</tr>
<tr>
<td>greater than</td>
<td>Use when you want results that exceed the value you enter; for example, “Quota greater than 20000” returns records where the quota amount begins at 20,000.01.</td>
</tr>
<tr>
<td>less or equal</td>
<td>Use for results that match or are less than the value you enter.</td>
</tr>
<tr>
<td>greater or equal</td>
<td>Use for results that match or exceed the value you enter.</td>
</tr>
<tr>
<td>not equal to</td>
<td>Shows results that don’t have the value you enter. This operator is especially useful for eliminating empty fields. For example, “Email not equal to &lt;blank&gt;.”</td>
</tr>
<tr>
<td>contains</td>
