<td>Use for fields that include your search string, but sometimes also include other information. For example, “Account contains California” would find California Travel, California Pro Shop, and Surf California. Keep in mind that if you enter a short search string, it can match a longer word. For example, “Account contains pro” would find California Pro Shop and Promotions Corporation. This operator is not case-sensitive.</td>
</tr>
<tr>
<td>does not contain</td>
<td>Eliminates records that don’t contain the value you enter. For example, “Mailing Address Line 2 does not contain P. O. Box.”</td>
</tr>
</tbody>
</table>

**Note:** When specifying filter criteria on roll-up summary fields, does not contain uses “or” logic on comma-separated values. On list views, reports, and dashboards, does not contain uses “and” logic.
This operator is not case-sensitive.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Uses</th>
</tr>
</thead>
<tbody>
<tr>
<td>starts with</td>
<td>Use when you know what your value starts with, but not the exact text. This operator is a narrower search term than “contains.” For example, if you enter “Account starts with California,” you find California Travel and California Pro Shop, but not Surf California.</td>
</tr>
<tr>
<td>includes</td>
<td>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that include one or more of the values you enter. For example, if you enter “Interests includes hockey, football, baseball,” you find records that have only hockey selected, and records that have two or three of the values entered. Results do not include partial matches of values.</td>
</tr>
<tr>
<td>excludes</td>
<td>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that do not contain any values that match the ones entered. For example, if you enter “Interests exclude wine, golf,” your report lists records that contain any other values from that picklist, including values that are blank. Results do not include partial matches of values.</td>
</tr>
</tbody>
</table>
UsesOperator
between Available for dashboard filters only. Use to filter on ranges of values. For each range, the filter returns results that are greater than or equal to the minimum value and less than the maximum value.

For example, if you enter “Number of Employees from 100 through 500,” your results include accounts with 100 employees up to those with 499 employees. Accounts with 500 employees aren’t included in the results.

within Available when you create list views based on a Geolocation custom field. Shows results that are within the specified radius from a fixed latitude and longitude. For example, if you enter “Warehouse location within 50 miles 37.775° – 122.418°,” your list view includes all warehouses within a 50–mile radius of San Francisco, California.

Add Filter Logic

Filter logic governs how and when filters apply to your report.

After adding a filter to your report, the filter is numbered. Your first filter becomes Filter 1 and your second filter becomes Filter 2. You apply filter logic based on these numbered filters.

For example, let’s say you have a report of Accounts with fields like State, Annual Revenue, and Industry. Your report has these filters:

1. State includes California, Arizona, Nevada
2. Industry equals Banking
3. Annual Revenue greater than 1,000,000

These three filters cause your report to return Accounts located in California, Arizona, or Nevada in the Banking industry with annual revenue greater than $1,000,000. But what if you only want Accounts located in California, Arizona, or Nevada AND in the Banking industry, OR with annual revenue greater than $1,000,000.00? Add filter logic to your report.

1. Click Add > Filter Logic
2. Enter each filter line number, separated by a filter logic operator.

For example, (1 AND 2) OR 3 finds records that match both Filter 1 and Filter 2, or Filter 3.

Here’s a complete table of filter logic operators:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>AND</td>
<td>Finds records that match both values. 1 AND 2</td>
</tr>
<tr>
<td>OR</td>
<td>Finds records that match either value. 1 OR 2</td>
</tr>
<tr>
<td>NOT</td>
<td>Finds records that exclude values. For example, Filter 1 is Industry equals “Biotechnology”. You set filter logic as Not 1. Your report returns records which aren’t equal to Biotechnology.</td>
</tr>
</tbody>
</table>

USER PERMISSIONS

To create, edit, and delete reports:

- “Create and Customize Reports” AND “Report Builder”

To create custom list views:

- “Read” on the type of record included in the list

To create, edit, or delete public list views:

- “Manage Public List Views”
3. Click **Save**.

Now your report shows Banking industry Accounts in California, Arizona, and Nevada with any amount of revenue, and any Account with annual revenue above $1,000,000.00.

**Note:**

- Filter logic isn’t available for all filters. For example, you can’t use them for roll-up summary fields.
- On reports where object A may or may not have object B, you can’t use the OR condition to filter across multiple objects. For example, if you enter filter criteria **Account Name starts with M OR Contact First Name starts with M**, an error message displays informing you that your filter criteria is incorrect.
- Except filter logic on lookup fields, you can’t use filter logic if your field filters use any of the following fields:
  - **Topics**
  - **Description**
  - any **Address Line 1, Address Line 2, Address Line 3** fields
  - **Forecast Category**
  - **Campaign: Member Type**
  - **User: Profile Name**
  - **Login Status**
  - custom long-text area fields

**Filter Operators Reference**

The operator in a filter is like the verb in a sentence. Operators specify how filter criteria relate to one another. Refer to this list of filter operators while setting filters on list views, reports, dashboards, and some custom fields.

**Filtering on Special Picklist Values**

SEE ALSO:

- **Filter Operators Reference**
- **Filtering on Special Picklist Values**
- **Notes about Filtering on Types of Fields and Values**

**Notes about Filtering on Types of Fields and Values**

Keep these tips in mind when filtering on text fields, date fields, numeric values, picklist values, and blank or null values.

**Filtering on Text Fields**

- Separate search terms by commas to filter by more than one value. For example, to search for accounts in California, New York, or Washington, use **State contains CA,NY,WA**.
- Filtering isn’t case sensitive. For example, searching **State contains ID** returns all matches for “ID”, but also returns any instances of “Florida” and “Idaho” because they contain “id” in their names.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports. Reports can’t be filtered on custom long text area fields. Only the first 255 characters are shown for custom long text area fields in list views.
Filtering on Date Fields
• If entering a date, use the format allowed by your Locale setting. You can also use special date values like TODAY, NEXT WEEK, NEXT YEAR, LAST <number> DAYS, and so on.

Filtering on Numeric Values
• Place quotation marks around numbers or other data that includes commas. For example, Amount equals "10,000" returns records that have an amount of $10,000 but Amount equals 10,000 returns $10,000 as well as $10 and $0.
• To search for phone numbers, include the exact phone number formatting or example, Phone starts with (561).

Filtering on Picklist Values
• When filtering on multi-select picklist fields, use a semicolon between values to specify an exact match. For example, selecting the "equals" operator and a semicolon between two values includes records with both values specified, excluding all other values.
• If your organization uses record types, the lookup dialog lists picklist values for all record types. Use the "equals" or "not equal to" operators for these filters.

Note: If you change the label for a picklist value that is used as a filter criterion, the picklist value is automatically removed from the filter criteria. For example, if your report contains a filter where Lead Source equals Email or Web and you change the picklist value Web to Referral, your report filter changes to Lead Source equals Email. If the changed picklist value was the only value specified for a particular filter, it continues to show up in your filters, but an error appears.

Filtering on Blank or Null Values
• When you use the "less than," "greater than," "less or equal," or "greater or equal" operators on fields that have numeric values, records with blank or "null" values are returned as if their value is zero (0). For example, if you create a workflow rule or a lead assignment rule for accounts with the criteria Annual Revenue less than 100000, account records match if their Annual Revenue is blank.

However, records with blank field values are not considered matches in report filters, custom list views, and account assignment rules (which assign accounts to territories).

• To limit results to records that are blank or contain "null" values for a particular field, choose the field and the "equals" or "not equal to" operators, leaving the third field blank. For example, Amount equals returns records with blank amount fields. You can search for blank values or other specified values at the same time. For example, Amount equals 1,2 returns records where the Amount is blank or contains the value "1" or "2".

Relative Date Values for Filter Criteria
Tips for Filtering on Multiple Currencies

Tips for filtering on currency fields when your organization uses multiple currencies.

If your organization uses multiple currencies, follow these tips to create more effective filters:

- Use the Currency field to find items with a particular currency. For example, Opportunity Currency equals AUD finds opportunities with amounts in Australian dollars.

- Prefix currency amounts with a currency code, such as Annual Revenue greater than USD 50000000.

Without the currency code, all amounts are assumed to be in the user’s currency. For example, if the user’s currency is U.S. dollars, Annual Revenue greater than 50000000 means 50 million U.S. dollars.

If the user’s currency is invalid, the corporate currency is used.

From Setup, enter Manage Currencies in the Quick Find box, then select Manage Currencies to obtain the currency codes.

- All amounts are converted to the corporate currency for comparison. For example, Annual Revenue greater than USD 50000000 finds accounts with revenue greater than 50 million U.S. dollars. This would include an account with revenue of 114 million Australian dollars, which is the equivalent of 60 million U.S. dollars, assuming a conversion rate of 1.9.

- Amounts in reports are shown in their original currencies, and report totals are displayed in your personal currency. You can change the currency used for report totals by clicking Show > Currencies. For any amount, you can also choose to display the “converted” column (for example, “Annual Revenue (converted)”), which will show amounts in the currency you select from the Display Currencies Using drop-down list.

Notes about Filtering on Types of Fields and Values

Run and Read a Report

Click on a report’s name to run it. After running a report, there are a series of tools you can use to help you read the information.

1. Find a Report
   Search for a report by name, description, or who created it or modified it last. Filter, sort, or search within a selected folder to refine your results.

2. Get the Information You Need From the Reports Tab List View
   To see the information you want to see about your reports, you can resize, hide, reorder, sort columns, and select the number of records to display in your list view on the Reports tab.

3. Print a Report
   Print a report from the run page of a report using your browser’s print function.
Find a Report

Search for a report by name, description, or who created it or modified it last. Filter, sort, or search within a selected folder to refine your results.

1. On the Reports tab, type in the search box.
   - Search looks up all folders. Filters are set to All Items and All Types to display all of the folder’s contents.
   - Salesforce searches these fields: Name, Description, Last Modified By, or Created By. Results are based on an exact match of what you typed with those fields.
   - If tagging is enabled and added to a custom report or dashboard, search by its tag in the global search box.

2. Refine results using these options:

   **To refine results by** | **Do this**
   --- | ---
   Type | Select a filter:
   - Reports
   - Dashboards
   - All Types
   Type filters don’t apply to report templates in standard report folders.
   View | Select a filter:
   - All Items
   - Recently Viewed
   - Items I Created
   - Items I’m Following
   View filters.
   A selected folder | Select a folder, then type in the search box.
   Filters are set to All Items and All Types to display all of the folder’s contents.
   Sorting | Click ▼ for the column and select Sort Ascending or Sort Descending. Sorting applies to all items in the list view, including the ones on subsequent pages.

SEE ALSO:
  - Dashboards Help You Visualize Complex Information
  - Get Started with Dashboards
**Get the Information You Need From the Reports Tab List View**

To see the information you want to see about your reports, you can resize, hide, reorder, sort columns, and select the number of records to display in your list view on the Reports tab.

- Customize your list view as follows:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To resize a column</td>
<td>Click and drag its right margin to the preferred size.</td>
</tr>
</tbody>
</table>
  | To hide a column        | Click > **Columns** on any column and deselect the column you want to hide. |<br>**SEE ALSO:**<br>Reports Give You Access to Your Data
  | To reorder a column     | Drag it to where you’d like it to appear.                                  |
  | To sort a column        | Click for the column and select **Sort Ascending** or **Sort Descending**. Sorting applies to all items in the list view, including the ones on subsequent pages. |
  | To change the number of records displayed per page | Click in the lower left corner of the list and select the desired setting. You can view 10, 25, 50, 100, or 200 records at a time. When you change this setting, you return to the first page of list results. Once set, however, you view the same number of records throughout the list. The record display setting on the Reports tab doesn’t affect list views elsewhere in Salesforce. |
Print a Report

Print a report from the run page of a report using your browser’s print function.

- Click **Printable View** from the report’s run page.
- From the browser dialog, do one of the following:
  - Open the report with your browser and use your browser’s print function.
  - Save the file in Excel and use the print option in Excel.

**EDITIONS**

Available in: Salesforce Classic

Available in: All editions except Database.com

**USER PERMISSIONS**

To print reports:

- “Run Reports” and “Export Reports”
1. **Share Reports and Dashboards**

   Reports and dashboards are shared through folders. You share the folder, not the report or dashboard itself. To let others work with your report or dashboard, give them Viewer, Editor or Manager access to the folder where the report or dashboard is stored.

2. **Deliver Your Report**

   To get the information in your report to the people who need it, you can share the report’s URL, make the report available for Chatter feeds, or export the data to another tool, such as Excel. You can also set the report to run on a schedule so that viewers always have the latest information.

3. **Overview of Embedded Report Charts**

   Typically, users have had to navigate to the Reports tab to find data. But you can give them valuable information directly on the pages they visit often. To do that, just embed report charts in detail pages for standard or custom objects. When users see charts on pages, they are empowered to make decisions based on data they see in the context of the page without going elsewhere to look for it. For example, an opportunity record shows important data directly on its detail page.

---

### Share Reports and Dashboards

Reports and dashboards are shared through folders. You share the folder, not the report or dashboard itself. To let others work with your report or dashboard, give them Viewer, Editor or Manager access to the folder where the report or dashboard is stored.

- **Note:** Users can’t share report and dashboard folders in Lightning Experience. All sharing permissions set on folders in Salesforce Classic are obeyed in Lightning Experience.

1. **Share a Report or Dashboard Folder**

   To enable others to use a report or a dashboard, share the folder it is in. Give each user, public group, or role the degree of access to the folder that makes sense for them.

2. **Access Levels for Report and Dashboard Folders**

   Each user, group, or role can have its own level of access to a report and dashboard folder. Viewers can see the data; Editors can determine what data is shown; and Managers can control access.

3. **Compare Access Levels for Report and Dashboard Folders**

   Use this chart for a quick view of what Viewer, Editor, and Manager access enables users to do with report and dashboard folders.

4. **User Permissions for Sharing Reports and Dashboards**

   Each level of access to a report or dashboard folder consists of a combination of specific user permissions. As an administrator, you can further fine-tune users’ access to dashboards and reports by assigning or removing one or more permissions.
Share a Report or Dashboard Folder

To enable others to use a report or a dashboard, share the folder it is in. Give each user, public group, or role the degree of access to the folder that makes sense for them.

**Note:** To give someone access to a folder, you must have either Manager access to that folder, the “Manage Reports in Public Folders” permission (for report folders), or the “Manage Dashboards in Public Folders” permission (for dashboard folders).

When you create a folder, you’re its manager. Only you, and others with administrative permissions, can see it.

If a folder does not have Manager access, it is public, and users with the “View Reports in Public Folders” permission can view it. Depending on their object access, these users can also run the report.

(1) Share your folder by user, by user group, or by role. (2) Choose the access level you want each user, group, or role to have. (3) Stop sharing the folder with the user, group, or role.

1. **Share a Report or Dashboard with an Individual User**
   
   If you only have one or two people to share a report or dashboard folder with, give them access individually.

2. **Share a Report or Dashboard with a Group**

   If more than one or two people need access to an analytics folder, share the folder with a public group. That way you don’t have to keep track of which individuals you’ve shared it with.
3. **Share a Report or Dashboard by Role**

When you give people access to a report or dashboard folder based on their role, you can control who has access without having to keep track of users or groups.

SEE ALSO:
- Access Levels for Report and Dashboard Folders
- User Permissions for Sharing Reports and Dashboards

Share a Report or Dashboard with an Individual User

If you only have one or two people to share a report or dashboard folder with, give them access individually.

1. On the Reports tab, hover over a report folder in the left pane, click ![Folder](image), and then select **Share**.
2. Select **Internal Users**.
   
   | Note: | Internal users don’t include customer portal or partner portal users. |

3. Find the user you want, click **Share**, and choose an access level.
   To search, just start entering a name.

4. Click **Done**, review your changes, and click **Close**.
Share a Report or Dashboard with a Group

If more than one or two people need access to an analytics folder, share the folder with a public group. That way you don’t have to keep track of which individuals you’ve shared it with.

1. On the Reports tab, hover over a report folder in the left pane, click ☰, and then select Share.
2. Select Public Groups.
3. Find the group you want, and click Share.
   To search, start typing a name.
4. Choose the sharing level you want to give this group.
   Note: Portal users can only have Viewer access to reports, and they can’t use dashboards.
5. Click Done, review your changes, and click Close.

Share a Report or Dashboard by Role

When you give people access to a report or dashboard folder based on their role, you can control who has access without having to keep track of users or groups.

You can give report or dashboard folder access to users in a role, or to those users plus users in roles subordinate to that role.

For example, suppose the VP of Sales role and its subordinates have Viewer access to a dashboard folder, while the role itself (VP of Sales) has Manager access to the folder. This means a user in the VP of Sales role has greater control than someone with a role that’s lower in the role hierarchy. If the VP of Sales leaves the company, whoever next assumes that role will be able to manage dashboards in the folder.

1. On the Reports tab, hover over a report folder in the left pane, click ☰, and then select Share.
2. Select Roles or Roles and Subordinates.
   • Select Roles if you want to give access to all users who have that role.
   • Select Roles and Subordinates if you want to give access to those users plus everyone with a role below them in the role hierarchy.
3. Find the role you want, click Share, and choose a level of access.
   To search, enter a name.
4. Click **Done**, review your changes, and click **Close**.

**Access Levels for Report and Dashboard Folders**

Each user, group, or role can have its own level of access to a report and dashboard folder. Viewers can see the data; Editors can determine what data is shown; and Managers can control access.

**Tip:** If you’re not ready to share a report or dashboard, keep it in a personal folder that only you can access. The “My Personal Custom Reports” folder and the “My Personal Dashboards” folder are already set up for you. Create more if you need them. When you create a folder, it is accessible only to you and users with administrative permissions until you share it.

1. **Viewer Access Levels to Report and Dashboard Folders**
   
   With Viewer access you can see the data in a report or dashboard, but you can’t make any changes, except by cloning it into a new report or dashboard. All users have at least Viewer access to report and dashboard folders that have been shared with them. (Some users may have administrative user permissions that give them greater access.)

2. **Editor Access to Report and Dashboard Folders**
   
   When you are an Editor on a folder, you can view and modify the reports and dashboards it contains, and move them to and from any other folders you have Editor or Manager access to.

3. **Manager Access to Report and Dashboard Folders**
   
   With Manager access, you can do everything Viewers and Editors can do, plus control other users’ access to it, change its properties, or delete it.

**SEE ALSO:**

- Share a Report or Dashboard Folder
- Compare Access Levels for Report and Dashboard Folders

**Viewer Access Levels to Report and Dashboard Folders**

With Viewer access you can see the data in a report or dashboard, but you can’t make any changes, except by cloning it into a new report or dashboard. All users have at least Viewer access to report and dashboard folders that have been shared with them. (Some users may have administrative user permissions that give them greater access.)

For example, Samir is a sales rep who likes to start his day by checking his position on the sales leader board, which appears on the Master Sales dashboard. He has to refresh the dashboard to get the latest standings, so he needs to be able to view the data in the underlying reports. But he doesn’t want to edit the reports or the dashboard. All he needs is Viewer access to the folder that contains the Master Sales dashboard.
Editor Access to Report and Dashboard Folders

When you are an Editor on a folder, you can view and modify the reports and dashboards it contains, and move them to and from any other folders you have Editor or Manager access to.

For example, Allison, a sales manager, wants to provide a different sales dashboard for each of three regional teams. She’ll need Editor access to the folder that contains the Master Sales dashboard so she can move the underlying reports into the right folders and then modify them to show the appropriate data. She’ll also need the Create and Customize Dashboards user permission.

Note: You can’t give Editor access to standard report folders. All users get Viewer access to these folders by default.

Manager Access to Report and Dashboard Folders

With Manager access, you can do everything Viewers and Editors can do, plus control other users’ access to it, change its properties, or delete it.

For example, Alan is a sales administrator who manages too many reports to pay attention to them all individually. He creates a report folder called Regional Reports. As its creator, he automatically has Manage rights to the folder. He gives Sales Reps, a public group, Viewer access. And he makes Allison, the sales manager, another Manager on the folder.

Note: You can’t give Manager access to standard report folders. All users get Viewer access to these folders by default.

Compare Access Levels for Report and Dashboard Folders

Use this chart for a quick view of what Viewer, Editor, and Manager access enables users to do with report and dashboard folders.

User Permissions for Sharing Reports and Dashboards

Each level of access to a report or dashboard folder consists of a combination of specific user permissions. As an administrator, you can further fine-tune users’ access to dashboards and reports by assigning or removing one or more permissions.

When analytics folder sharing is enabled, all users get Viewer access to report and dashboard folders except users with higher administrative permissions. To give users broader privileges, assign Editor or Manager folder access and give report and dashboard user permissions as needed.

<table>
<thead>
<tr>

Deliver Your Report

To get the information in your report to the people who need it, you can share the report’s URL, make the report available for Chatter feeds, or export the data to another tool, such as Excel. You can also set the report to run on a schedule so that viewers always have the latest information.

Administrators, or users with the “Manage Public Reports” and “Create and Customize Reports” permissions, can create custom reports that all users can view. They can also organize reports by creating custom report folders and configuring which groups of users have access to them.

To make a report public, run the report and click Save As. Give the report a name and choose a public report folder.

1. Export a Report
   To work with report data in a dedicated tool, such as a spreadsheet, export report data as a Microsoft Excel (*.xlsx) or comma-separated values (*.csv) file.

2. Run Reports in the Background
   Run large reports in the background so you can keep working in Salesforce without waiting for results to display. This is a good way to run data-intensive reports that might otherwise time out due to the large number of report results.

3. Schedule Reports
   You can set up a report to run itself daily, weekly, or monthly and send the results automatically to the people who need to see them, so that you don’t have to remember to log in and do it yourself.
4. **Subscribe to Get Report Notifications**

Subscribe to a report to receive report notifications periodically when the metrics you care about most meet certain conditions. Set the conditions that trigger notification, and specify if you want to be notified via Salesforce1 notifications, Chatter, or email.

**SEE ALSO:**
- Export a Report
- Schedule a Report for Refresh

---

**Export a Report**

To work with report data in a dedicated tool, such as a spreadsheet, export report data as a Microsoft Excel *(.xls)* or comma-separated values *(.csv)* file.

When exporting reports in the comma-separated values *(.csv)* format, the locale settings on your user detail page determine the field separator (delimiter) included in the exported file. For example, if your locale setting is English (United States), then the decimal separator is a period (*)(“.”). If your locale setting is French (France), then the decimal separator is a comma (*)(“,“). You can override the default separator for your locale by choosing Comma Delimited (non-locale) *(.csv)* from the Format drop-down list.

Excel does not display the field separator in *(.csv)* format. If you want to work with *(.csv)* files in Excel, we recommend that your locale setting in Salesforce match your Regional Options setting in Windows.

1. From Reports, next to the report you want to export, click > **Export**.
   - If you set the “Do not save encrypted pages to disk” option in Internet Explorer, you can’t open your report online in Excel. Instead, save the exported report to your computer, and then open it in Excel. To change this setting in Internet Explorer, deselect “Do not save encrypted pages to disk” under Internet options.
   - Reports in the joined format can’t be exported, but you can choose a printable view.

2. Set an **Encoding** appropriate for your language.

3. Set the **Format** to **Excel Format** *(.xls)* or **Comma Delimited** *(.csv)*.

4. Click **Export**.

5. If prompted by a browser dialog, choose to save the file.

You can export up to 256 columns and 65,536 rows of data in one report.

Your exported report downloads.

**Note:** For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization’s data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay’s text box field. Note that the words entered into the text box field must be separated by a space.

Run Reports in the Background

Run large reports in the background so you can keep working in Salesforce without waiting for results to display. This is a good way to run data-intensive reports that might otherwise time out due to the large number of report results.

Contact Salesforce to activate this feature for your organization.

Reports exported to the background run sequentially, one at a time. Therefore, the latest report exported to the background runs after all reports previously exported to the background finish running.

You can export an unlimited number of reports to the background.

1. **Export a Report to Run in the Background**
   To set up a report to run in the background, you have to export it in a special way.

2. **View and Manage Background Reports**
   Once you’ve set up a report to run in the background, you can view and manage it from the background report exports list.

Editions

Available in: Salesforce Classic

Available in: **All editions** except Database.com

User Permissions

To export reports to the background:
- “Background Report Export”

To view reports exported to the background by other users:
- “Background Report Export”
  AND
  “View All Data”

To manage reports exported to the background by other users:
- “Background Report Export”
  AND
  “Modify All Data”
Export a Report to Run in the Background

To set up a report to run in the background, you have to export it in a special way.

1. Create or run a report.
2. Click Export Details and choose Run Background Export from the drop-down button.
   
   Tip: When running an existing report, click this button to avoid waiting for report results to display.
3. Select a file encoding setting and a file format in which to export the report.
4. Choose how to save the report parameters.
   
   • Click Save revisions to save any parameter changes you made to the report before exporting. Selecting this option overwrites the parameters of the original report.
   
   • Click Save revisions to a copy to create a new report before exporting. If you select this option, enter a name and description for the report, and choose a report folder in which to save the report parameters.
   
   Note: Only parameters are saved, not results. To view report results, you must view report details from the background report exports list.
5. Click Start Background Export.

When your report has finished running and its results are ready for viewing, a link to the report details is emailed to you. You can download report results from the report exports list. You can only download data that you have permission to view.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

In the unlikely event that a background export of a report fails, an email notification is sent to you. Reports exported to the background can fail for a number of reasons. For example, between the time you exported the report and the export process began, fields may have been deleted from the report, the report may have been deleted, or the status of the custom report type from which the report was created may have been changed to “In Development.”

View and Manage Background Reports

Once you’ve set up a report to run in the background, you can view and manage it from the background report exports list.

1. From Setup, enter Background Report Exports in the Quick Find box, then select Background Report Exports. The background report exports list appears.
2. View the details of a report exported to the background, such as its name, status, and location, by clicking the name of a report in the Job Name column.
   
   Note: For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization’s data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay’s text box field. Note that the words entered into the text box field must be separated by a space.
3. Click Cancel or Del next to the name of a report to cancel a pending export or to delete a report from the background report exports list.

When a report exported to the background finishes running, it is available for viewing in the background report exports list for 48 hours. After 48 hours, the report is automatically deleted.
Important: Reports deleted from the background report exports list are permanently deleted and not sent to the Recycle Bin.

4. Click Refresh List to view any reports that have been exported to the background since you began viewing the background report exports list.

Schedule Reports

You can set up a report to run itself daily, weekly, or monthly and send the results automatically to the people who need to see them, so that you don’t have to remember to log in and do it yourself.

Tips for Scheduling Reports

1. Schedule a Report for Refresh
   Schedule a report to run daily, weekly, or monthly. An HTML version of the report can be sent by email to users in your organization.

2. View a Report’s Schedule
   View a report’s schedule on the Schedule Report page or from the Reports tab. View all report schedules for the organization under Setup.

3. Manage a Report’s Schedule
   Create, change, view or delete a scheduled report from the Schedule Report page.

4. Change a Report’s Schedule
   You can make changes to an already scheduled report on the Schedule Report page.

5. Delete a Report’s Schedule
   Select a scheduled report and unschedule it to delete its scheduled run.

6. Tips on Scheduling Reports
   Some tips to keep in mind about timings, limits, and email notifications when scheduling a report.

SEE ALSO:

Schedule a Report for Refresh

Schedule a report to run daily, weekly, or monthly. An HTML version of the report can be sent by email to users in your organization.

Watch a Demo: Tips for Scheduling Reports

1. On the Reports tab, click a report name.

2. Click Schedule Future Runs from the Run Report drop-down menu.
   If you’re creating a new report, you are asked to save the report in a folder before scheduling. If the report folder is shared with a group, you can schedule the report only for the entire group. To schedule the report for an individual group member, share the report folder with that member.

3. On the Schedule Report page, specify a running user who has access to the folder where the report is stored.
   The access level of the running user determines what other users, including portal users, see when they receive the scheduled report run results. This means that not all users can see every field, and the running user can see fields that others may not be able to see. When it’s sent, the report indicates which fields the running user can see that can’t be viewed by others. You need the “View All Data” permission to specify a running user other than yourself.

   Note: If the running user becomes inactive, the report doesn’t run. Salesforce sends an email notification to either activate the user, delete the report schedule, or change the running user to an active one. Salesforce sends the notification to users with the “Manage Users,” “Modify All Data,” and “Manage Billing” permissions. If no user has all these user permissions, Salesforce sends the notification to users with the “Manage Users” and “Modify All Data” user permissions.

4. Select an email setting.

<table>
<thead>
<tr>
<th>Select</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>To me</td>
<td>Send the report to your email address specified on your user profile.</td>
</tr>
<tr>
<td>To me and/or others</td>
<td>Email the report to additional users.</td>
</tr>
</tbody>
</table>

   You can send reports only to email addresses included on Salesforce user records. When portal users receive emailed reports, they see the same data as the running user set in the report schedule. If you have information you’d rather not share, schedule the report to run with a portal user as the running user.

   Note: Portal users receive report and dashboard refresh email notifications when the Allow Reports and Dashboards to Be Sent to Portal Users option is enabled.

5. Set the frequency, duration, and time for running the report:
   - In the Frequency field, select Daily, Weekly, or Monthly and then refine the frequency criteria.
   - Using the Start and End fields, specify the dates during which you want to schedule the report. To enter the current date, click the link showing the date.
   - Next to Preferred Start Time, click Find available options to choose a start time.
   Your preferred start time might not be available if other users have already selected that time to schedule a report.

6. Click Save Report Schedule. You can choose:
Choose

Save report modifications with this schedule  To  Save both the report schedule and changes you made to the report.

Discard report modifications  Save the schedule only. Changes you made to the report are discarded.

Report recipients can click the report name in emailed reports to log in to Salesforce and view the report directly.

Example: A report is scheduled to run every Friday at midnight, and its results are emailed to a selected group and user.

1. All users, including portal users, viewing the scheduled report see the report data that Sales Director Chet’s access level allows.

2. Report run results are set to be emailed to a public user group called All Internal Users and the admin user. You can only send emails to users and groups with access to the report folders. The Search drop-down displays all available categories based on your search criteria in the Running User field.

3. The report is scheduled to run every Friday.

4. The report run is scheduled to start on the current date.

5. The schedule is saved without saving prior changes made to the report.

Tips on Scheduling Reports
Some tips to keep in mind about timings, limits, and email notifications when scheduling a report.

Scheduling Report Runs
• On the Reports tab, hover over in the schedule column to view a report’s schedule. Note that users without the “Schedule Reports” permission can’t see this icon and information.
• You can’t create schedules for joined reports.
• Your organization is limited to no more than 200 scheduled reports. Daily limits differ by edition. Additional scheduled reports may be available for purchase.
• Scheduled reports run in the time zone of the user who set up the schedule. For example, if the Time Zone field on your user record is set to Pacific Standard Time, and you schedule a report to run every day at 2:00 PM, then the report runs every day between 2:00 PM and 2:29 PM Pacific Standard Time.

• If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.

• If you schedule a report to run on a specific day of every month, the report runs only on months that have that specific day. For example, if you schedule a report to run on the 31st day of every month, then the report runs only on months that have 31 days. To schedule a report on the last day of every month, choose last from the On day of every month drop-down list.

• The report runs within 30 minutes of the time you select for Preferred Start Time. For example, if you select 2:00 PM as your preferred start time, the report runs any time between 2:00 PM and 2:29 PM, depending on how many other reports are scheduled at that time.

• Scheduling reports is not tracked in the audit trail history.

Emailing Scheduled Reports

• Emailed reports don’t include report charts. To email a chart of the report, create a dashboard and schedule a dashboard refresh.

• Reports display only the first 2,000 records (same as in a browser).

• Outlook 2007 limitation: Report emails containing tables more than 22 inches wide or with more than 63 columns might not display properly.

• The maximum size for emailed reports is 10 MB. Try the following techniques to reduce the amount of data in your report:
  – Filter for your own records, rather than all records.
  – Limit the scope of the data to a specific date range.
  – Exclude unnecessary columns from your report.
  – Hide the report details.

Schedule a Dashboard Refresh
Manage a Report’s Schedule

Subscribe to Get Report Notifications

Subscribe to a report to receive report notifications periodically when the metrics you care about most meet certain conditions. Set the conditions that trigger notification, and specify if you want to be notified via Salesforce1 notifications, Chatter, or email.

For example, you could subscribe to an open-issue report and get notified every morning if there are over 20 open issues. You can subscribe to notifications for up to five reports.

Watch a demo: Report Notifications

Note: Report Notifications doesn’t appear as an available option for unsaved reports. Save the report before subscribing to it.

Personal Report Notifications aren’t related to the Schedule Future Runs feature, which enables you to email reports at specified times without specifying conditions. To schedule emailed reports, select Schedule Future Runs from the Run Report drop-down menu.

2. On the Report Subscription page, choose whether to be notified each time conditions are met or only the first time.

3. Specify each condition in three parts: aggregate, operator, value.
   For example, trigger notifications whenever the sum of amount is less than $1 million.
   - Aggregate is the metric that’s the basis of your condition. It can be Record Count, Average Amount, Smallest Amount, Largest Amount, or Sum of Amount.
   - Operator is the basis of comparison, such as Equal, Not Equal, Greater Than, and so on.
   - Value is the number that you want the aggregate compared to.
   Your conditions are evaluated when the report is run, and notifications are sent if all conditions are met (up to five conditions per report).

4. Schedule how often (every weekday, daily, or weekly) and when to evaluate for your conditions.
   For example, run the report every weekday at 7 a.m.

5. Select one or more notification types.
   - Send a Salesforce1 in-app notification
   - Post to Chatter
   - Send an email notification
   - Execute a custom Apex action, such as creating tasks or escalating cases
     For more information about developing a custom Apex class, see the Apex Developer Guide.

6. Make sure that the subscription is active if you’re ready to start receiving notifications.

7. Click Save to schedule the notifications.
Example: A report is scheduled to be run every weekday at 7 a.m. If the sum of the amount is less than 1,000,000, a Salesforce1 notification is sent and a Chatter post is made.

Overview of Embedded Report Charts

Typically, users have had to navigate to the Reports tab to find data. But you can give them valuable information directly on the pages they visit often. To do that, just embed report charts in detail pages for standard or custom objects. When users see charts on pages, they are empowered to make decisions based on data they see in the context of the page without going elsewhere to look for it. For example, an opportunity record shows important data directly on its detail page.
1. **Example of Report Charts on an Account Page**
   In this example, we've embedded two report charts on an important account page that show deals in the pipeline and open support cases for the account. From looking at the charts, the account executive can quickly gauge the account's activity and health.

2. **Add a Report Chart to a Page Layout**
   To embed a report chart on standard or custom object pages, edit the object’s page layout with the enhanced page layout editor, then add the chart.

3. **Customizing a Report Chart in a Page Layout**
   After you add a report chart to a page, you can customize it in the Chart Properties dialog box on the page layout editor.

4. **Limits on Report Charts in Pages**
   Consider these limits when embedding charts in detail pages.

**Example of Report Charts on an Account Page**

In this example, we've embedded two report charts on an important account page that show deals in the pipeline and open support cases for the account. From looking at the charts, the account executive can quickly gauge the account's activity and health.
Report Charts on an Account Page

1. The pipeline chart shows opportunities for the account in various stages including two that were won. The account executive can hover on the chart to get the value of each opportunity (Values are highlighted if the source report chart has hover enabled). She is able to click the chart, go to the report, and get more details for these opportunities.

2. From the charts on open cases, she can see there are a couple of unresolved support issues for the account. She can click the chart, drill into the report for case details and follow up with the support engineers to get them resolved before a crucial meeting with the client.

Add a Report Chart to a Page Layout

To embed a report chart on standard or custom object pages, edit the object’s page layout with the enhanced page layout editor, then add the chart.

Before you add a chart, check that:

- Its source report is in a folder that’s shared with users who need access. Reports in personal report folders are unavailable to add to a page.
- The source report format is summary or matrix.
- The source report has a chart.

1. Go to the page layout editor for the object that you’re adding a chart to.
2. Click Edit next to the page layout.
3. Click Report Charts.
4. In the Quick Find box, type the name of the report and click to find and select the report chart. You can browse up to 200 recently viewed reports by chart type in the Report Charts palette.

5. Drag the chart to a new or existing section of the layout.

6. Click on the chart to customize it.

7. Click Save.

   The Preview As option is unavailable for report charts.

SEE ALSO:

   Customizing a Report Chart in a Page Layout
   Example of Report Charts on an Account Page
   Limits on Report Charts in Pages
   Find Object Management Settings
   Page Layouts
   Page Layouts

Customizing a Report Chart in a Page Layout

After you add a report chart to a page, you can customize it in the Chart Properties dialog box on the page layout editor.

1. Hiding a Report Chart that Shows an Error
   A chart can sometimes, for whatever reason, show an error on the detail page instead of data. Since a chart with an error is not that useful, you have the option to hide it from viewers.

2. Filtering Report Charts to Show Data Relevant to the Page
   Charts usually filter to show relevant data when the chart’s report type has a matching ID field for the record, such as Account ID for an account record. Occasionally, charts show data unfiltered. But you can set up a chart to be filterable if its report type has a lookup to the matching ID field.

3. Refreshing Report Chart Data
   Normally, charts refresh data once every 24 hours. But you can change a chart to refresh each time someone opens the page it’s on. The refresh option is under the Chart Properties dialog box of the page layout editor. However, we recommend daily refresh over selecting the option, because users will soon reach the refresh limit or will wait for chart data to show until refresh is complete.
Hiding a Report Chart that Shows an Error

A chart can sometimes, for whatever reason, show an error on the detail page instead of data. Since a chart with an error is not that useful, you have the option to hide it from viewers.

To hide such a chart, select **Hide chart with error** from the Chart Properties dialog box in the page layout editor.

![Chart Properties dialog box](image)

A chart can show an error on a page for one or more of these reasons.

- The viewer doesn’t have access to the field that’s used for filtering.
- The viewer doesn’t have access to the report folder.
- The report chart has been deleted from the report.
- The report definition has changed.
- The report itself is no longer available.

Filtering Report Charts to Show Data Relevant to the Page

Charts usually filter to show relevant data when the chart’s report type has a matching ID field for the record, such as Account ID for an account record. Occasionally, charts show data unfiltered. But you can set up a chart to be filterable if its report type has a lookup to the matching ID field.

**Make a Chart Filterable**

When the chart’s report type doesn’t have a matching ID field for the record, the chart is not filtered. Instead, it shows all data.

A report chart on open cases shows information for all accounts on an account record. To make the chart filterable, edit the layout of the chart’s cases custom report type, and add the Account ID field via lookup. Now when you view an account record, the chart is filtered.

**Pick a Relevant Filter**

Sometimes when there are multiple ID fields available to filter, the chart may not show any data. In such situations, select the most relevant ID field from the Filtered by drop-down in the Chart Properties dialog box. A chart on open opportunities on account records is filtered by Partner Account ID, which isn’t that useful. But we can edit the chart properties and choose Account ID from the drop-down to filter by the account record.
Note: Charts can’t filter for relevant data if the source report has reached the limit of 20 field filters.

Refreshing Report Chart Data

Normally, charts refresh data once every 24 hours. But you can change a chart to refresh each time someone opens the page it’s on. The refresh option is under the Chart Properties dialog box of the page layout editor. However, we recommend daily refresh over selecting the option, because users will soon reach the refresh limit or will wait for chart data to show until refresh is complete.

Daily Refresh

Charts refresh data once every 24 hours. If within that time users want the latest, they can click Refresh on the chart.

Refresh When User Opens the Page

To change a chart’s normal refresh, select Refresh each time a user opens the page in the Chart Properties dialog box of the page layout editor. This option triggers a chart refresh each time someone opens the page the chart is on. Selecting the option is not recommended for two reasons.

- There’s a risk of reaching the chart refresh limit faster. Refreshes count towards the hourly limit for each user and organization.
- For reports that take longer to run, selecting this option can make users wait to see chart data.

Limits on Report Charts in Pages

Consider these limits when embedding charts in detail pages.

- You can have two report charts per page.
- You can only add report charts from the enhanced page layout editor. The mini console and the original page layout editor are not supported.
- On detail pages, users can refresh up to 100 report charts every 60 minutes.
Your org can refresh up to 3,000 report charts every 60 minutes.

Add a Report Chart to a Page Layout
Example of Report Charts on an Account Page

Organize Reports
Keep your reports at your fingertips by sorting them into folders and deleting unused reports. If you have a lot of reports, you can use the search field to find the one you need.

1. Keep Favorite Report Folders In View
   Pin your most-used report and dashboard folders to the top of the folder list so you don’t have to scroll down every time you need them.

2. Hide Unused Report Types
   If your users use only a subset of the available standard report types, you can hide the ones they don’t need.

3. Move a Report or Dashboard Between Folders
   It’s a good practice to keep reports and dashboards organized in folders that reflect their function and audience. You can drag and drop reports and dashboards from one folder to another.

4. Delete a Report
   You can delete a selected report from the Reports tab or from its run page.

Keep Favorite Report Folders In View
Pin your most-used report and dashboard folders to the top of the folder list so you don’t have to scroll down every time you need them.

1. In the list of report and dashboard folders, hover over any folder, then click 📁.

2. Select Pin to top.
   Your folder moves to the top of the folders list.
Each new folder that you pin goes to the top of the list, above any folders you have already pinned. To move a pinned folder back to the top, just pin it again.

**Hide Unused Report Types**

If your users use only a subset of the available standard report types, you can hide the ones they don’t need.

1. On the Reports tab, click **New Report**.
2. Select **Select Report Types to Hide**.
   - The green check mark next to a report means it’s visible to everyone.
3. To hide the report type, click the check mark to change it to an X.

Hidden report types don’t show up when you use the search box on the Create New Report page.

If you hide all the report types in a folder, the folder is also hidden. However, if you later unhide the report type in the “Select Report Types to Hide” dialog box, users can see the folder.
Move a Report or Dashboard Between Folders

It’s a good practice to keep reports and dashboards organized in folders that reflect their function and audience. You can drag and drop reports and dashboards from one folder to another.

**Note:** You need edit access to folders before moving items between them. Moving items using drag-and-drop isn’t supported in accessibility mode.

Move a report or dashboard between folders by dragging from the list view to a report or dashboard folder on the Folders pane.

1. On the Reports tab list view, click and hold an item.

2. Drag the item into its destination folder in the Folders pane.

As you drag an item across a folder, a green check mark (✓) indicates that the item can be moved into the selected folder. Conversely, a red icon (✗) means that the item can’t be moved into a selected folder.

Keep the following in mind when moving items:

- Drag one item at a time.
- You can’t move items from installed AppExchange packages or standard report folders into other folders.
• Move reports into report folders and dashboards into dashboard folders.

Delete a Report
You can delete a selected report from the Reports tab or from its run page.

1. Delete a report in one of two ways:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>To delete from the Reports tab</td>
<td>Next to the report, click &lt; &gt; Delete.</td>
</tr>
<tr>
<td>To delete from the report’s run page</td>
<td>Click Delete.</td>
</tr>
</tbody>
</table>

2. Click OK.
Deleted reports are moved to the Recycle Bin. You can’t delete reports in others’ personal folders. You also can’t delete reports used by dashboard components or reporting snapshots unless you first delete the dashboard component or reporting snapshot.

</table>

1. These limits apply to the report builder. If you’re using the report wizard, the limit is 10.
2. Up to 200 total.
3. Off-peak hours (between 6 PM and 3 AM local time) only.
4. Limited to one preferred start time per day.
5. Limited to three preferred start times per day.

Salesforce retains historical data for the previous three months, plus the current month.

The following Salesforce Reports and Dashboards limits apply to all supported editions.

**Report Limits**

- The report builder preview shows a maximum of 20 rows for summary and matrix reports, and 50 rows for tabular.
- You can’t have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.
- Reports display a maximum of 2,000 rows. To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.
  - Summary and matrix reports display the first 2,000 groupings when Show Details is disabled.
  - Matrix reports display a maximum of 400,000 summarized values.
  - Matrix reports display a maximum of 2,000 groupings in the vertical axis when Show Details is disabled. If there are more than 400,000 summarized values, rows are removed until the 2,000 groupings limit is met, then columns are removed until the number of summarized values moves below 400,000.
- When reports that have groupings are viewed in Salesforce1, they’re converted to tabular reports.
- By default, reports time out after 10 minutes.
- In a joined report, each block can have up to 100 columns. A joined report can have up to 5 blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each joined report can have up to 10 cross-block custom summary formulas.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports.
• Only the first 254 characters in a rich text area or a long text area are displayed in a report.
• Summary fields on tabular, summary, and matrix reports can display up to 21-digits.
• Reports can’t be filtered on custom long text area fields.
• Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
• Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
• Internet Explorer 6 is not supported for joined reports.

Dashboard Limits
• A dashboard filter can have up to 50 options. By default, 10 options are enabled. Contact Salesforce to extend your limit.
• Each dashboard can have up to 20 components.
• It’s not possible to filter on bucket fields. However, it is possible to use a report filtered on a bucket field on the dashboard page.
• A dashboard table or chart can display up to 20 photos.
• You must wait at least one minute between dashboard refreshes.

Report Type Limits
• A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
• You can add up to 1000 fields to each custom report type.

Reporting Snapshot Limits
• The maximum number of rows you can insert into a custom object is 2,000.
• The maximum number of runs you can store is 200.
• The maximum number of source report columns you can map to target fields is 100.

Filtering Limits
 Only the first 255 characters in a custom text field count for filtering purposes.

Embedded Report Charts Limits
• You can have two report charts per page.
• You can only add report charts from the enhanced page layout editor. The mini console and the original page layout editor are not supported.
• On detail pages, users can refresh up to 100 report charts every 60 minutes.
• Your org can refresh up to 3,000 report charts every 60 minutes.

List View Limits
• Only the first 255 characters are shown for custom long text area fields in list views.

Bucket and Bucket Field Limits
• Each report can include up to five bucket fields.
• Each bucket field can contain up to 20 buckets.
• Each bucket can contain up to 20 values.
• Bucket fields are available for use only in the report where they’re generated. To use a bucket in multiple reports, create the field for each report, or create a separate formula field for the object that’s dependent on the bucket.
Note: These limits don’t apply to the use of Other as permitted within the bucket field’s setup.

Acceptable range for values: The maximum value allowed is 999999999999999. The minimum value allowed is -999999999999999.

Reports and Dashboards API Limits

The following limits apply to both the Reports and Dashboards REST API and Reports and Dashboards API via Apex.

• Cross filters, standard report filters, and filtering by row limit are unavailable when filtering data.
• Historical trend reports are only supported for matrix reports.
• The API can process only reports that contain up to 100 fields selected as columns.
• A list of up to 200 recently viewed reports can be returned.
• Your org can request up to 500 synchronous report runs per hour.
• The API supports up to 20 synchronous report run requests at a time.
• A list of up to 2,000 instances of a report that was run asynchronously can be returned.
• The API supports up to 200 requests at a time to get results of asynchronous report runs.
• Your organization can request up to 1,200 asynchronous requests per hour.
• Asynchronous report run results are available within a 24-hour rolling period.
• The API returns up to the first 2,000 report rows. You can narrow results using filters.
• You can add up to 20 custom field filters when you run a report.
• Your org can request results for up to 5,000 dashboards per hour.

Reports and Dashboards: What’s Not in Lightning Experience

Troubleshoot Reports

Use these tips to help solve problems that arise when you’re working with reports.

1. **Why do my chart labels overlap?**
   Sometimes the labels for your charts can overlap and be difficult to read. There may be too much data in the same space, or the segments or wedges of the chart may be too small.

2. **Why doesn’t my report return any data?**
   Check with your administrator to make sure you have access to the records you’re trying to report on. If you’re still not seeing any results in your report, try casting a wider net.

3. **Why can’t I see formula options in report builder?**
   If you can’t see the *Add Formula* option in the Fields pane of report builder, change your report format to summary, matrix, or joined. Formulas don’t show up for tabular reports.

4. **Why doesn’t my report return the data I expect?**
   Check your filters, groupings, fields, report type, and role or user hierarchy to make sure you are asking the right questions of your data.

5. **What are some common report limits?**
   Here are some common report limits. To see a full list of analytics limits, see the Salesforce Limits guide.
6. **Why am I getting an “obsolete report” error message?**
   You may be trying to report on data that isn’t available.

7. **Improve Report Performance**
   Many factors can cause a report to perform poorly or to time out. You can address most of them with simple changes, such as using the correct filter operators, applying more filters, and reducing the amount of data.

8. **Why is an old role name appearing in the “role hierarchy” trail of my report?**
   Changes to role names aren't automatically updated in reports. To see the latest role name, change the Role name as displayed on reports field for the role record.

---

**Why do my chart labels overlap?**

Sometimes the labels for your charts can overlap and be difficult to read. There may be too much data in the same space, or the segments or wedges of the chart may be too small.

To fix overlapping labels, try the following:

- **Enlarge the chart.** Change the chart size in the report to large or extra large or make the dashboard column wider.
- **Remove extra grouping levels.** Reduce the number of grouping levels by using a different chart type. For example, horizontal bar charts have fewer values than grouped horizontal bar charts.
- **Use horizontal charts.** Horizontal charts use different spacing than vertical charts. The advantage of the horizontal bar charts is that the chart can be extended vertically to show numerous groupings, though the width is fixed. Depending on chart settings, you can also display Chatter photos.
- **Change the scale.** Set the chart to use larger units. For example, show values as multiples of 1000 or 1000000.
- **Group small values.** Select the Combine Small Groups into 'Others' option for pie, donut, and funnel charts.

---

**Why doesn’t my report return any data?**

Check with your administrator to make sure you have access to the records you’re trying to report on. If you’re still not seeing any results in your report, try casting a wider net.

- **Show more than your own records.** For example, select Show > All accounts.
- **Expand your time frame filters.** For example, select All Time for Range, or select a broader custom range.
- **Choose field filter operators carefully.** If you select Account Owner equals John James, you limit potential results to exactly “John James.” If you don’t see the results you expect, consider expanding the selection by using Account Owner contains James instead.
- **Check your filter logic.** Make sure your combination of conditions isn’t excluding all data.

Limiting your report can improve performance, but make sure you’re not filtering out the data you want to see.

---

**Why can’t I see formula options in report builder?**

If you can’t see the Add Formula option in the Fields pane of report builder, change your report format to summary, matrix, or joined. Formulas don’t show up for tabular reports.

---

**Why doesn’t my report return the data I expect?**

Check your filters, groupings, fields, report type, and role or user hierarchy to make sure you are asking the right questions of your data.
Filters
Make sure to include all the data you want. To change a report filter, hover over it and click Edit or Remove. Your filters display when you run your report; click Edit on that page to make additional changes.

Groupings
When you group by a field, you remove it from the details of the report. If you export the report, you see the field, though it does not appear in the detail area.

Fields
After checking your groupings, check your fields. If your report contains multiple related records—for example, an account, its opportunities, and their products—look at the detail pages for the account record, opportunity record, and product line item to ensure that the fields contain data. If the data isn’t available in the format you want, work with your Salesforce administrator to add formula fields to get the data. When formula fields are added to an object, they appear in record detail pages and in reports.

Report Type
The report type selected may not be appropriate or the records anticipated may not share the relationship between objects required for the report type. When choosing a report, be sure you understand which fields are available in the report type.

If your report type includes both parent and child objects, but no child fields are used in a report, the report shows parent records whether they have a child record or not.

Hierarchy
Hierarchy options let you drill down to different data sets based on the role or user hierarchy. The selected hierarchy level, or its default role, may affect the data shown.

Note: Hierarchy applies to activity and opportunity reports.

What are some common report limits?
Here are some common report limits. To see a full list of analytics limits, see the Salesforce Limits guide.

</tbody>
</table>

**Why am I getting an “obsolete report” error message?**

You may be trying to report on data that isn’t available. Data may be unavailable because:

- An object in the report isn’t enabled for reporting anymore.
- A lookup relationship used by objects in the report has been deleted or modified.
- An object in the report has been deleted.
- You don’t have “View” permissions for an object in the report.

**Improve Report Performance**

Many factors can cause a report to perform poorly or to time out. You can address most of them with simple changes, such as using the correct filter operators, applying more filters, and reducing the amount of data.

Watch this video for quick tips on [Making Your Reports Run Faster](#).

A report can take anywhere from a few seconds to several minutes to run. Occasionally, a report is so complex that it exceeds the timeout limit and fails. If the report is slow to load, it’s usually because it is:

- Querying too many objects
- Dealing with intricate lookups
- Has too many fields

For example, say that you run a sales team and want to see how many Leads each of your salespeople has. You build a report that returns all the leads in your company. Now you have all the data you need, but also some that you don’t, and your report takes a long time to run. To make your report run faster, filter it so that it only returns Leads assigned to your team. If you need your report to run even faster, consider filtering by time. Do you need to see Leads from last year, or the year before? If not, add a second filter which scopes your report to this year only. Now your report runs as fast as lightning!

If you can’t view a report and want to edit it to avoid the time-out, append ?edit=1 to the report URL. Doing so gets you into edit mode, where you can adjust the criteria. Try these tips to get your reports to run more efficiently:

- When filtering, use the equals or not equal to operators instead of contains or does not contain. For example, use Account Owner equals John James, not Account Owner contains John. Choose AND rather than OR for filter logic.
- To narrow your report’s date range, use time frame filters. For example, use Last 30 Days instead of Current FY.
- Set time frame filters by choosing a Date Field and Range to view. Only records for that time frame are shown.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All editions** except Database.com

3748
• Reduce the number of fields in the report by removing unnecessary columns or fields.
• If you receive an error message saying that your activity report has too many results, filter on a picklist, text, or date field. Alternatively, rerun the report using a different activity data type such as “Activities with Accounts” or “Activities with Opportunities”.
• Add time filters, scope filters, and filter criteria to the report to further narrow the results.

Why is an old role name appearing in the “role hierarchy” trail of my report?
Changes to role names aren’t automatically updated in reports. To see the latest role name, change the Role name as displayed on reports field for the role record.

Get the Right Data into Your Report
A well-designed report helps you turn raw data into information people can act on. Summarize values and group them into meaningful categories, filter out irrelevant facts, and gather data about multiple objects at once.

Communicate Your Report Data Effectively
A report produces information in the form of a table. You can set up that table to help people scan quickly for the information they need. You can also add a graph to help users understand the data visually, and you can display the report’s data on a dashboard.

SEE ALSO:
  Show Report Data Graphically
  Show Report Data in Tables

The Report Run Page
The Report Run page lets you control what happens to your report when you run it.
From the report run page, you can:
• Display a Chatter feed of updates and posts about the report.
• View Report Generation Status.
• Choose hierarchy options.
• Change top-level groupings using the Summarize information by drop-down.
• Change Time Frame and View options.
• Click Run Report to immediately run or schedule the report.
• Click Show Details to view all data or Hide Details to show only summary information.
• Click Customize to open the report in report builder.
• Print or export the report.
• Click Subscribe to set up report notifications, which notify you whenever certain metrics in the report meet your conditions.
• Click Edit next to the chart to change its properties, or click Large, Medium, or Small to change its size.
• Sort report results.
• Edit or clear applied filter criteria.
For summary and matrix reports, filter selected rows by a particular field. Select the rows you want to view, choose a field to group by, then click Drill Down. For example, if you created an opportunity report that displays deals by industry, you can select the industries that are doing well and group by Product Name to see which products are selling in that industry. Click Clear to remove the drill-down filter.

SEE ALSO:
- Report Run Page Options
- Limit Report Results

Report Run Page Options

Customize the report run page to support the specific information you need for the way you work.

The following fields and buttons are available from the report run page, depending on your setup.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customize</td>
<td>Opens the report builder to help you customize the report.</td>
</tr>
<tr>
<td>Date Field</td>
<td>Choose date-specific information about the records: created date, last updated date, and date of last activity.</td>
</tr>
<tr>
<td>Delete</td>
<td>Deletes the report. Deleted reports are moved to the Recycle Bin.</td>
</tr>
<tr>
<td>Display Currencies Using</td>
<td>Determines the currency type for report subtotals and amounts in the “converted” column of any field. Available only for organizations using multiple currencies. Amounts in reports are shown in their original currencies, and report totals are displayed in your personal currency. To change the currency go to the report builder and click Show &gt; Currencies Using, then select an active currency. For any amount, you can also choose to display the “converted” column (for example, “Annual Revenue (converted)”), which will show amounts in the selected currency.</td>
</tr>
<tr>
<td>Division</td>
<td>Determines the division of records to include in the report. Select --Current-- to show records in your current working division. Reports that are already scoped (such as My Cases or My Opportunity Team’s Accounts) include records in all divisions. Available only if your organization uses divisions to segment data and you have the “Affected by Divisions” permission. If you do not have the “Affected by Divisions” permission, your reports include records in all divisions.</td>
</tr>
<tr>
<td>Drill Down</td>
<td>For summary and matrix reports, filter selected rows by a particular field. Select the rows you want to view, choose a field to group by, then click Drill Down. For example, if you created an opportunity report that displays deals by industry, you can select the industries that are doing well and group by Product Name to see which products are selling in that industry. Click Clear to remove the drill-down filter.</td>
</tr>
<tr>
<td>Export Details</td>
<td>Exports data from the report to a Microsoft® Excel spreadsheet or CSV (comma-separated values) file.</td>
</tr>
<tr>
<td>Hierarchy</td>
<td>Provides options to view the report data based on role or territory hierarchy. View data for an individual user, a role, or an entire organization. Available only for Professional, Enterprise, Unlimited, Performance, and Developer Editions.</td>
</tr>
<tr>
<td>Printable View</td>
<td>Lets you display the report in Microsoft Excel format, for easy printing.</td>
</tr>
</tbody>
</table>
### Option Description

**Relationship to Opportunity**
Specifies a scope based on opportunity ownership or opportunity team; limits the data in an opportunity report.

**Range**
Specifies a time period for a report. You can limit the data by specific dates using any standard or custom date field defined for the type of record in the report. Works with `From` and `To` fields.

**Run Report**
Regenerates the report data based on current report settings.

**Save**
Saves changes to one of your existing custom reports.

**Save As**
Saves parameter changes to any custom, standard, or public report under a new name, without altering the original report.

**Show**
Specifies which items to include in the report: just the records you own, or all records to which you have access. Use this option to see team data in your report.

**Show/Hide Details**
Toggles the display to show all information or just summary information.

**Subscribe**
Lets you subscribe to receive report notifications, whenever certain metrics meet conditions you specify.

**Summarize information by**
Provides subtotals for the fields you specify.

**Units**
Choose to view the age of a case in days, hours, or minutes. The age of an open case is the elapsed time from creation to the present. The age of a closed case is the elapsed time from creation to the closing time of the case.

- Creating a Custom Report

### Get Started with Reports

Set up your reporting environment, use the report builder to create a basic report, and organize your reports to make it easy to find information when you need it. In most cases, you can start with a standard report and customize it to your needs.

You can report on any data you have read or read/write access to. The available data varies depending on your sharing model, but you can almost always report on data owned by or shared with users below you in the role hierarchy, regardless of your sharing model. (Certain sharing models do not allow this.) Salesforce offers two ways to report on information owned by you or users who report to you:

- Some reports have a `View` filter. Choose the “My team’s” option, such as “My Team’s Opportunities,” to view data owned by you and users below you in the role hierarchy.
- Some reports, such as opportunity and activity reports, have `Hierarchy` links that allow you to drill down to different data sets based on the role or user hierarchy. If your organization uses territory management, in some reports these links are based on the territory hierarchy.
You can choose to sort the report by record owner or role when customizing the report.

Reports Give You Access to Your Data

Use reports to leverage the data your organization has accumulated over time. You can examine your organization’s data in almost infinite combinations, display it in easy-to-understand formats, and share the resulting insights with others via dashboards.

A report returns a set of records that meets certain criteria, and displays it in organized rows and columns. Report data can be filtered, grouped, and displayed graphically as a chart. Reports are stored in folders, which control who has access.

- Standard Report Types

Dashboards

Learn about Dashboards

Dashboards give over-arching views of your Salesforce data. Before building, reading, and sharing dashboards, review these dashboard basics.

As you prepare to curate your Salesforce data with dashboards, keep these tips in mind:

- Reports provide all the data shown in a dashboard. Dashboards can show data from more than one report.
- When refreshing a dashboard, all the data-providing reports must run. If the reports take a long time to run, then the dashboard does too.
- Dashboards are shared via folders. Whomever has permission to the folder your dashboard is saved in also has access to your dashboard. Ensure that you save your dashboard in an appropriate folder.

Before creating or reading a dashboard, familiarize yourself with these features and concepts.

Dashboard Editor

The Dashboard Editor is a visual, drag-and-drop tool which you use to create dashboards and edit existing ones. The Dashboard Editor is where you add, edit, and arrange dashboard components.

To launch the Dashboard Editor, click New Dashboard.
Components

Dashboards are made up of components. Each component contains a chart or metric which shows data from one report. Different components can show data from different reports.

Running User (Viewing As)

In Salesforce, different users have different permissions to access data. A dashboard only displays data that the dashboard’s running user can access.

For example, say you’re viewing a dashboard describing Leads. Emily is a sales operations manager who sees all Leads, and Marcus is a direct sales specialist who sees only the leads he owns. If Emily is the dashboard’s running user, then the dashboard shows data about all the Leads in Salesforce. If Marcus is the running user, then the dashboard only shows data about Leads that Marcus owns.

Build a Dashboard

When you’re ready to share Salesforce data with colleagues, build a dashboard. Dashboards let you curate data from reports using charts, tables, and metrics. If your colleagues need more information, they’re able to view your dashboard’s data-supplying reports.

1. Create a Salesforce Classic Dashboard
   Create a dashboard to provide a graphical view of the data in your reports.

2. Install the CRM Sample Dashboards from AppExchange
   Use these dashboards from the AppExchange as a starting point for building dashboards that meet your business needs.
Create a Salesforce Classic Dashboard

Create a dashboard to provide a graphical view of the data in your reports.

This topic is about creating dashboards for reports in Salesforce Classic. For information on creating dashboards in Wave Analytics, review the article Create a Dashboard in Wave Analytics on page 3479.

Tip: You can clone a dashboard to quickly create a new dashboard with the same properties and components as the one you're viewing. Click Clone, modify the dashboard settings, and save.

1. Create the custom reports containing the data you want to display.
   
   Important: Be sure to store these reports in folders that your intended dashboard viewers can access.

2. Click the Dashboards tab.

3. Click Go To Dashboard List.

4. Click New Dashboard to create a new dashboard.
   
   To modify an existing dashboard, click its name from the list.

5. Customize your dashboard and click Save.

SEE ALSO:

Delete a Dashboard

Install the CRM Sample Dashboards from AppExchange
Install the CRM Sample Dashboards from AppExchange

Use these dashboards from the AppExchange as a starting point for building dashboards that meet your business needs.

The CRM sample dashboards package from AppExchange offers best-practice dashboards with underlying reports that are based on your organization’s standard objects and fields. You can use these sales, marketing, service, and support dashboards to track business processes and key performance metrics for yourself, your team, and your company. Dashboards in this package include:

- **Sales & Marketing Dashboards**
  - Marketing Executive Dashboard
  - Sales Executive Dashboard
  - Sales Manager Dashboard
  - Salesperson Dashboard

- **Customer Service Dashboards**
  - Agent Supervisor Overview Dashboard
  - Service Executive Overview Dashboard
  - Service KPIs Dashboard

1. In AppExchange, search for “Salesforce CRM Dashboards” and click Get It Now.
2. To install the sample dashboards, install the package.

Filter Your Dashboard

Dashboard filters make it easy to provide different combinations of data from a single dashboard. You don’t need separate dashboards for different sets of users — just give each group a filter that makes sense for them. When you use a filter on a dashboard, the filtered view is shown again the next time you visit the dashboard.

A filter has a name, a filter operator and one or more values. Each filter can have up to 10 options. Each dashboard can have up to 3 filters. Contact Salesforce to increase the filter options limit. A maximum of 50 filter options is possible.

You can filter on picklists, lookups, and checkboxes, and on text, numeric, date, and datetime fields. When you change filters on a dashboard, the dashboard shows previously cached data, if it exists. If no data exists, the dashboard fetches the latest. Either way, the dashboard’s “Last Refreshed” date shows you the timestamp for the data you’re viewing. Click Refresh to get the most recent data.

**Note:** There are some things you can’t do with dashboard filters.
- Filters can’t be added to dashboards that contain Visualforce or s-control components.
- It’s not possible to filter on bucket fields. However, it is possible to use a report filtered on a bucket field on the dashboard page.
- Filters aren’t applied when you schedule or email a dashboard.
- You can’t filter data on a joined report in dashboard view or add a filter to a dashboard that only has joined reports.
- You can’t use custom formula fields in a dashboard filter.
In Lightning Experience, you can’t edit filtered dashboards, which means you can’t add new dashboard filters. (You can change existing filters while viewing the dashboard, though!) Switch to Salesforce Classic to edit filtered dashboards.

1. Add a Dashboard Filter
   To create a dashboard filter, select a field that contains the type of information you want to filter on, then define how the filter returns the data.

2. Apply a Dashboard Filter
   Filter a dashboard to analyze the information interactively. When you filter a Salesforce Classic dashboard, the filtered view is preserved so that the next time you see the dashboard, data is filtered by the same view. In Lightning Experience, dashboards always open with no filters applied.

3. Dashboard Filter Examples
   Filters on a dashboard allow you to choose different views of data. When you filter a Salesforce Classic dashboard, the filtered view is preserved so that the next time you see the dashboard, data is filtered by the same view. In Lightning Experience, dashboards always open with no filters applied. Without dashboard filters, you’d have to create multiple dashboards, each with its own set of filtered reports.

Add a Dashboard Filter

To create a dashboard filter, select a field that contains the type of information you want to filter on, then define how the filter returns the data.

The field you select for the filter may have equivalent fields. Equivalent fields share the same underlying object as the field you select for the filter. You can use equivalent fields to filter components that don’t have the exact field you selected for the filter, or to filter some components differently. For example, if you filter on the Account Owner field, equivalent fields may include Opportunity Owner or Opportunity Created by, as all three are part of the User object.

When you edit a dashboard, you can see how each component is being filtered under Filtered By. If equivalent fields are available for a component, you can select a different field to filter the component.

1. Click Edit on your dashboard, then click Add Filter.
   In Lightning Experience, you can’t edit filtered dashboards, which means you can’t add new dashboard filters. (You can change existing filters while viewing the dashboard, though!) Switch to Salesforce Classic to edit filtered dashboards.

2. Select the field to filter on from the Field drop-down. The drop-down shows fields that can be used to filter all components. (To see equivalent fields for your selection, click ![](https://www.salesforce.com/static/images/icons/icon-filters.png).)

3. Give your filter a display label to identify it. If your filter has many equivalent fields, we recommend using a label that works for all components.

4. Under Filter Options, select an operator and provide one or more values to filter by.
   Use the Group Name field to give your filter a name. For example, on a sales dashboard, you might gather several stages of Opportunities into a group called “Early.” This lets users quickly filter the dashboard to show only data relevant to deals that are in the early stages of development.

EDITIONS

Available in: Salesforce Classic

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To add filters to a dashboard:

- “Run Reports” AND “Manage Dashboards”
5. Click OK. When you click OK, you can see how the filter is applied on each component. If equivalent fields are available for a component, you can select which one to use to filter the component.

To modify or delete an existing filter, from the filter drop-down, select Edit Filter or Remove Filter.

### Apply a Dashboard Filter

Filter a dashboard to analyze the information interactively. When you filter a Salesforce Classic dashboard, the filtered view is preserved so that the next time you see the dashboard, data is filtered by the same view. In Lightning Experience, dashboards always open with no filters applied.

- **Note:** All components on the dashboard aren’t necessarily filtered on the same field. The person who created or edited the dashboard specifies which field is used.

1. Open a dashboard.
   - In Salesforce Classic, if you applied any filters last time you used this dashboard, notice that they are still selected. In Lightning Experience, the dashboard always opens with no filters applied.

2. Select an option from the filter drop-down.
   - Each filter has one or more options you can choose to narrow your selection further.
3. To see data unfiltered, select **Clear Filter** or **All** from the filter drop-down.

**Dashboard Filter Examples**

Filters on a dashboard allow you to choose different views of data. When you filter a Salesforce Classic dashboard, the filtered view is preserved so that the next time you see the dashboard, data is filtered by the same view. In Lightning Experience, dashboards always open with no filters applied. Without dashboard filters, you’d have to create multiple dashboards, each with its own set of filtered reports.

**Sales Performance by Products**

Create a sales dashboard that lets viewers track sales performance by products. To do so, create a dashboard with key performance indicators, like closed revenue. Add a filter on the **Product Name** field so viewers can see performance by product.

**Deals for Different Account Segments**

Show how different types of deals are performing across different account segments by creating a dashboard with two filters. Create a filter for **Annual Revenue** that contains several ranges that reflect how your organization segments accounts, then create a filter...
on opportunity **Type**, and finally add a filter to show deals by **Region**. Create this as a dynamic dashboard to let the entire sales organization use it: managers can use it to view the performance of their teams, while reps can use it to monitor their own performance.

Provide Individualized Views of a Dashboard

Dynamic dashboards enable each user to see the data they have access to. With a dynamic dashboard, you can control data visibility without having to create a separate dashboard, with its own running user and folder, for each level of data access.

Administrators control access to dashboards by storing them in folders with certain visibility settings. Dashboard folders can be public, hidden, or restricted to groups, roles, or territories. If you have access to a folder, you can view its dashboards.

Folders control access to the dashboard, but the **running user** determines access to data. The running user options are:

- **Run as specified user.** The dashboard runs using the security settings of that single, specific user. All users with access to the dashboard see the same data, regardless of their own personal security settings. This approach is perfect for sharing the big picture across a hierarchy or motivating team members by showing peer performance within a team. If you don’t have “View All Data,” you can only choose yourself. If you have “View My Team’s Dashboards,” you can choose any user below you in the role hierarchy.

- **Run as logged-in user.** A dynamic dashboard runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

With a dynamic dashboard, you can control data visibility without having to create a separate dashboard, with its own running user and folder, for each level of data access. A single dynamic dashboard can display a standard set of metrics across all levels of your organization.

You can create up to three filters for each dynamic dashboard. Filtering dynamic dashboards gives administrators additional flexibility in creating dashboards. For example, you can create an organization-wide sales scorecard that contains sales rep and product filters. This allows individual sales managers to view their reps’ performance collectively as well as individually. It also lets them view sales by product to understand which products specific reps are or aren’t selling.
Managers with the “View My Team’s Dashboards” or “View All Data” permission can set an option to preview the dashboard from the point of view of users under them in the role hierarchy.

Your organization can have up to 5 dynamic dashboards for Enterprise Edition, 10 for Unlimited and Performance Edition, and 3 for Developer Edition. Additional dynamic dashboards may be available for purchase.

Note:
- Dynamic dashboards are viewable in both Salesforce Classic and Lightning Experience, but you must switch to Salesforce Classic to set them up.
- Following components isn’t supported for dynamic dashboards.
- You can’t save dynamic dashboards to personal folders.
- You can’t schedule refreshes for dynamic dashboards. They must be refreshed manually.

Example Business Scenario

Let’s say that your opportunity team consists of one vice president, four sales managers, and 40 sales reps—10 reps per manager. You’ve been asked to create dashboards that display the following metrics, restricted by role and hierarchy:

<table>
<thead>
<tr>
<th>Role</th>
<th>Total Bookings</th>
<th>Close Rates by Competitor</th>
<th>Number of Activities by Meeting Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales Rep</td>
<td>![Checkmark]</td>
<td></td>
<td>![Checkmark]</td>
</tr>
<tr>
<td>Sales Manager</td>
<td>![Checkmark]</td>
<td>![Checkmark]</td>
<td></td>
</tr>
<tr>
<td>VP of Sales</td>
<td>![Checkmark]</td>
<td>![Checkmark]</td>
<td></td>
</tr>
</tbody>
</table>

Sales reps should only see their own data; managers should only see data for the reps they manage; and the VP should see data across the entire team. In this scenario, you’d typically have to create 45 different dashboards—one for every single person. You’d also have to create multiple folders to manage access rights.

With dynamic dashboards, you can create just two dashboards and store them in a single folder:

- Create a dynamic dashboard for sales reps with the following components:
  - A gauge of total bookings
  - A table of activities by meeting type
- Create a dynamic dashboard for managers and the VP with the following components:
  - A gauge of total bookings
  - A column chart of close rates by competitor
- Optionally, create filters that let viewers further refine their dashboard views. For example, create a filter on key accounts to let viewers focus on bookings, activities, and competitive threats for each account.

All users only see data that they can access. Sales reps see their own bookings and activities. Managers see bookings and close rates for the reps they manage. The VP sees bookings and close rates for the whole team. Because the metrics are the same for managers and the VP, you can use the same dynamic dashboard for both roles. The dynamic dashboards feature reduces the number of required dashboards from 45 to two!
1. Set Up Dynamic Dashboards
To set up a dynamic dashboard, switch to Salesforce Classic. Create a folder to hold the dashboard and its underlying reports, then create the dashboard.

SEE ALSO:
Filter Your Dashboard
Create a Salesforce Classic Dashboard
Set Up Dynamic Dashboards

Set Up Dynamic Dashboards
To set up a dynamic dashboard, switch to Salesforce Classic. Create a folder to hold the dashboard and its underlying reports, then create the dashboard.

Note:
• Dynamic dashboards are viewable in both Salesforce Classic and Lightning Experience, but you must switch to Salesforce Classic to set them up.
• You can't save dynamic dashboards to personal folders.
• You can't schedule refreshes for dynamic dashboards. They must be refreshed manually.

1. Create folders accessible to all dashboard viewers to store dynamic dashboards and corresponding component source reports.
2. From the Dashboards tab, create a new dashboard or edit an existing one.
3. Click the button next to the View dashboard as field.
   Note: If you don’t have “Manage Dynamic Dashboards” permission, just enter a running user and skip to the final step. Enter **” to see all available users.
4. Select Run as logged-in user.
5. Optionally, select Let authorized users change running user to enable those with permission to change the running user on the dashboard view page.
   • Users with “View My Team’s Dashboards” can view the dashboard as any user below them in the role hierarchy.
   • Users with “View All Data” can edit the dashboard and view it as any user in their organization.
   • Users with “Enable Other User’s Dashboard” can edit the dashboard if they have access to it, even if they aren’t the running user and don’t have “View All Data.”
6. Click OK.
7. In the View dashboard as field, enter a running user.
8. Save your dashboard.
9. Set the appropriate Show option on the report run page.
   For example, if you choose “My Team’s Opportunities,” each dynamic dashboard viewer can see all opportunities for the team.
Tip: To avoid restricting the dashboard’s view of the data:

- Make sure advanced filters don’t include specific record owners (for example, Opportunity Owner equals Frank Smith).
- Don’t click Save Hierarchy Level when saving opportunity reports.

SEE ALSO:
- Add a Dashboard Filter
- Provide Individualized Views of a Dashboard
- Choose a Dashboard Running User

Choose a Dashboard Running User

Select a running user to specify which data to display in a dashboard. Each dashboard has a running user, whose security settings determine which data to display in a dashboard.

Note: The "Manage Dynamic Dashboards" permission, required for selecting a running user, isn’t available in Professional Edition.

If you have “View All Data,” you can choose any user in your organization to be a running user of the dashboard. If you have “View My Team’s Dashboards,” you can choose any user below you in the role hierarchy.

Note: Dashboard components that use Visualforce ignore the running user; content displays only if the viewing user has access to the Visualforce page. Other components in the dashboard are not affected.

Users with a Salesforce Platform or Salesforce Platform One user license can only view a dashboard if the dashboard running user also has the same license type. Consider creating separate dashboards for users with different license types.

To select a dashboard’s running user, switch to Salesforce Classic and then:

1. Edit a dashboard.
2. Click the button next to the View dashboard as field.
   
   Note: If you don’t have “Manage Dynamic Dashboards” permission, just enter a running user and skip to the final step. Enter ** to see all available users.

3. Choose a running user setting.
   - Run as specified user. The dashboard runs using the security settings of that single, specific user. All users with access to the dashboard see the same data, regardless of their own personal security settings. This approach is perfect for sharing the big picture across a hierarchy or motivating team members by showing peer performance within a team. If you don’t have “View All Data,” you can only choose yourself. If you have “View My Team’s Dashboards,” you can choose any user below you in the role hierarchy.
   - Run as logged-in user. A dynamic dashboard runs using the security settings of the user viewing the dashboard. Each user sees the dashboard according to his or her own access level. This approach helps administrators share one common set of dashboard components to users with different levels of access.

EDITIONS
Available in: both Salesforce Classic and Lightning Experience

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS
To create, edit, and delete dashboards:
- “Run Reports” AND “Manage Dashboards”

To create, edit, and delete dynamic dashboards:
- “Run Reports” AND “Manage Dynamic Dashboards”

To enable choosing a different running user for the dashboard:
- “View My Team’s Dashboards” OR “View All Data”
4. Optionally, select Let authorized users change running user to enable those with permission to change the running user on the dashboard view page.

- Users with “View My Team’s Dashboards” can view the dashboard as any user below them in the role hierarchy.
- Users with “View All Data” can edit the dashboard and view it as any user in their organization.
- Users with “Enable Other User’s Dashboard” can edit the dashboard if they have access to it, even if they aren’t the running user and don’t have “View All Data.”

Note: If you have “View All Data” or “View My Team’s Dashboards,” you can preview the dashboard edit page as a different user, but you must select Let authorized users change running user to change the running user from the dashboard view page.

5. Click OK.

6. In the View dashboard as field, enter a running user.

7. Save your dashboard.

Run and Then Read a Dashboard

Click on a dashboard’s name to run it. Dashboard charts are interactive, so be sure to hover and click on them to get more info!

1. Refresh Dashboard Data

   Click Refresh to load the latest data into the dashboard. The data is as current as the date and time displayed after As of... at the top right corner of the dashboard.

2. Schedule a Dashboard Refresh

Refresh Dashboard Data

Click Refresh to load the latest data into the dashboard. The data is as current as the date and time displayed after As of... at the top right corner of the dashboard.

1. Click Refresh to replenish your dashboard with the most recent data.

   When dashboard data is being refreshed, the Refresh button changes to Refreshing...You can leave the dashboard and do other things in Salesforce while the data refreshes. When the dashboard has finished refreshing, Salesforce 1 tells you that the dashboard is ready through the right-hand notification panel. Since push notifications aren’t enabled for dashboard refreshes, you’re notified only in the app and not in through email.

   Tip: If your dashboard data doesn’t refresh after ten minutes, the refresh automatically stops. If necessary, click Refresh again.

When you refresh a dashboard, the dashboard data refreshes for anyone else in your organization that has access to that dashboard. Additional refreshes submitted during a refresh and up to one minute after the completion of a refresh are ignored; users view the most current data.

When you change filters on a dashboard, the dashboard shows previously cached data, if it exists. If no data exists, the dashboard fetches the latest. Either way, the dashboard’s “Last Refreshed” date shows you the timestamp for the data you’re viewing. Click Refresh to get the most recent data.
Schedule a Dashboard Refresh

Note: Users with the “View Setup and Configuration” permission can view all the dashboards scheduled to refresh for your organization on the All Scheduled Jobs page. To view the All Scheduled Jobs page, from Setup, enter Scheduled Jobs in the Quick Find box, then select Scheduled Jobs. Users with “Modify all Data” permission can click Del next to a specific scheduled dashboard refresh to permanently delete all instances of the scheduled refresh.

You can also set up Salesforce to send an email with an HTML version of the dashboard when the refresh completes. For email applications that don’t support HTML, the email includes text and a link to the dashboard.

1. On the Dashboards tab, select a dashboard using the View Dashboard field.

2. Click Refresh and choose Schedule Refresh

Filters aren’t applied when you schedule or email a dashboard.

Each dashboard has a running user, whose security settings determine which data to display in a dashboard.

Note: If the running user becomes inactive, the dashboard doesn’t run.

3. Select notification settings.

   • Click To me to send an email to your user’s address.
   • Click To others... to send an email to additional Salesforce users.

 Note: Portal users receive report and dashboard refresh email notifications when the Allow Reports and Dashboards to Be Sent to Portal Users option is enabled.

   • Dashboard refresh notifications may not display properly in Outlook 2007.
   • In HTML-formatted dashboard refresh notifications, users can click the name of the dashboard to log in to Salesforce and view the dashboard.
   • To send a dashboard refresh notification to other users, store the dashboard in a public folder with access granted to others. Other users can’t access dashboards in your personal folders. To add a dashboard to a public folder, edit the dashboard properties.
   • Users can click components in a dashboard refresh notification to view the source report in Salesforce.
   • Dashboard components that include Visualforce pages and s-controls may not display in dashboard refresh notifications. Users must view them in Salesforce.
   • Dashboard refresh notifications can be viewed offline in email clients.
   • If a dashboard has filters, only the unfiltered version is emailed.
   • By default, Salesforce sends images in dashboard emails as .png (Portable Network Graphic) files, which are not supported in Lotus Notes. When you enable the Use Images Compatible with Lotus Notes in Dashboard Emails > option, Salesforce uses .jpg images, which Lotus Notes supports, when sending dashboard emails. The “Schedule Dashboard” permission is required to view this option.

 Note: Dashboard emails that contain images compatible with Lotus Notes are substantially larger and the image quality may be lower.

4. Schedule the refresh.
a. Set the Frequency field.
   Click the Daily, Weekly, or Monthly fields to show more options.
   The total number and frequency of your scheduled dashboard refreshes depends on your Salesforce edition. Enterprise, Unlimited, and Performance Editions can have up to 200 scheduled dashboard refreshes. Unlimited and Performance Edition users can schedule up to two dashboard refreshes an hour per day. Enterprise Edition users can schedule up to one dashboard refresh an hour per day. Additional scheduled dashboards may be available for purchase. Contact your Salesforce representative for information.

b. Specify dates in the Start and End fields.
   Dashboards refresh in the time zone of the user who scheduled the refresh. For example, if the Time Zone field on your user record is set to Pacific Standard Time (PST), and you schedule a dashboard to refresh every day at 2:00 PM, then the dashboard will refresh every day between 2:00 PM and 2:29 PM PST. If you view and save a schedule in a time zone different from the one in which it was previously scheduled, the time slot could potentially change.

c. Under Preferred Start Time, click Find available options... to choose a time.
   The dashboard refresh runs within 30 minutes of your preferred start time. For example, if you select 2:00 PM, the refresh may happen any time between 2:00 PM and 2:29 PM, depending on availability.

   Note: Your preferred start time may not be available if other users have already selected it.

   • If you schedule a dashboard to refresh on a specific day of every month, it only refreshes on months that have that specific day. For example, if you schedule a refresh for the 31st of every month, the dashboard won’t refresh on 30-day months. To refresh on the last day of every month, choose “Last” from the On day of every month drop-down list.
   • Dashboards won’t refresh as scheduled if the running user doesn’t have access to the dashboard folder.
   • If a dashboard has filters, only the unfiltered version is refreshed.
   • You can’t schedule refreshes for dynamic dashboards. They must be refreshed manually.

5. Click Save.
   To delete a scheduled dashboard refresh, click Refresh > Schedule Refresh > Unschedule Dashboard.
   The scheduled refresh is permanently deleted, and not sent to the Recycle Bin. Deleting the scheduled refresh does not affect the dashboard itself.

1. Manage Access to Reports and Dashboards
   Access to reports and dashboards is controlled through settings for the folder they are stored in. To give others access to your reports or dashboards, place them in a shared folder. To prevent others from accessing your reports, place them in personal folders that only you can access.

2. Print a Dashboard
   Print dashboards using your browser’s print option.
Manage Access to Reports and Dashboards

Access to reports and dashboards is controlled through settings for the folder they are stored in. To give others access to your reports or dashboards, place them in a shared folder. To prevent others from accessing your reports, place them in personal folders that only you can access.

To access report or dashboard folders go to the Reports tab. On the tab, in the folders pane, click and select New Report Folder or New Dashboard Folder to create a folder, or click on a folder to edit.

Consider the following when you edit reports or dashboards you didn’t create or when you’re trying to share reports with others:

- You can modify the contents of a folder only if the folder access level is set to Read/Write. Only users with the “Manage Public Reports” or “Manage Public Dashboards” can delete or change a Read Only folder. Regardless of permissions or folder settings, you can’t edit any unfilled folders or others’ personal folders.

- Administrators, or users with the “Manage Public Reports” and “Create and Customize Reports” permissions, can create custom reports that all users can view. They can also organize reports by creating custom report folders and configuring which groups of users have access to them. Note that public reports and report folders are not available with Personal, Contact Manager, and Group Editions.

- To make a report public, run the report and click Save As. Give the report a name and choose a public report folder.

1. **Access to Report Folders**
   Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared report folders.

2. **Access to Dashboard Folders**
   Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared dashboard folders.

SEE ALSO:
- Access to Dashboard Folders

### Access to Report Folders

Folder access is controlled by permissions. Users must have certain permissions to access public, hidden, or shared report folders.

The following tables show the permissions that users must have to access the three different types of report folders: public, hidden, and shared.

**Public Folders**

The following permissions apply to folders with these visibility settings:

- **This folder is accessible by all users, including portal users**

---

**Editions**

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

**User Permissions**

To create, edit, and delete public report folders:

- “Manage Public Reports”

To create, edit, and delete public dashboard folders:

- “Manage Dashboards” AND “View All Data”

---

**Editions**

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except Database.com

Report folders not available in: Contact Manager, Group, and Personal Editions

---

Note: The “View Reports in Public Folders” permission is available only in organizations with enhanced sharing for reports and dashboards. Organizations without enhanced sharing for reports and dashboards use “View All Data.”
This folder is accessible by all users, except for portal users

<table>
<thead>
<tr>

Print a Dashboard

Print dashboards using your browser’s print option.

- Set the paper orientation to print in landscape format so that it is wide enough for all three columns of dashboard components.
- If necessary, resize your columns and remove the browser-imposed headers and footers.

Organize Dashboards

Keep your dashboards at your fingertips by sorting them into folders and deleting unused reports. If you have a lot of reports, you can use the search field to find the one you need.

1. **Delete a Dashboard**
   
   It’s a good idea to delete dashboards that you no longer need.
Delete a Dashboard

It's a good idea to delete dashboards that you no longer need.

Deleting a dashboard also deletes the components within it. It doesn't delete the custom reports used by the components.

Deleted dashboards are moved to the Recycle Bin.

To delete a dashboard in Lightning Experience, open the dashboard and then click **Delete**.

To delete a dashboard in Salesforce Classic:

1. Click the Dashboards tab.
2. Click **Go To Dashboards List**.
3. Choose the folder where the dashboard is stored.
4. Click **Del** next to the name of the dashboard.

Dashboard Limits

As you build dashboards of your Salesforce data, be aware of these limits, restrictions, and differences between dashboards in Lightning Experience and Salesforce Classic.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To delete dashboards:
- “Run Reports” AND “Manage Dashboards”

To delete dashboards created by another user:
- “Manage Dashboards” AND “Modify All Data”
### Report Limits

- The report builder preview shows a maximum of 20 rows for summary and matrix reports, and 50 rows for tabular.
- You can’t have more than 250 groups or 4,000 values in a chart. If you see an error message saying that your chart has too many groups or values to plot, adjust the report filters to reduce the number. In combination charts, all groups and values count against the total.
- Reports display a maximum of 2,000 rows. To view all the rows, export the report to Excel or use the printable view for tabular and summary reports. For joined reports, export is not available, and the printable view displays a maximum of 20,000 rows.
  - Summary and matrix reports display the first 2,000 groupings when Show Details is disabled.
  - Matrix reports display a maximum of 400,000 summarized values.
  - Matrix reports display a maximum of 2,000 groupings in the vertical axis when Show Details is disabled. If there are more than 400,000 summarized values, rows are removed until the 2,000 groupings limit is met, then columns are removed until the number of summarized values moves below 400,000.
- When reports that have groupings are viewed in Salesforce1, they’re converted to tabular reports.
- By default, reports time out after 10 minutes.
- In a joined report, each block can have up to 100 columns. A joined report can have up to 5 blocks.
- You can add up to 10 custom summary formulas to each block in a joined report. A joined report can have a total of 50 custom summary formulas.
- Each joined report can have up to 10 cross-block custom summary formulas.
- When you filter on standard long text area fields, such as Description or Solution Details, only the first 1000 characters of the field are searched for matches in reports.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report.
- Summary fields on tabular, summary, and matrix reports can display up to 21-digits.
• Reports can’t be filtered on custom long text area fields.
• Joined reports require that the new user interface theme is enabled. Users without the new theme are unable to create, edit, or run joined reports.
• Forecast reports include only opportunities that are set to close within the forecast period, except those assigned to the Omitted forecast category.
• Internet Explorer 6 is not supported for joined reports.

Dashboard Limits
• A dashboard filter can have up to 50 options. By default, 10 options are enabled. Contact Salesforce to extend your limit.
• Each dashboard can have up to 20 components.
• It’s not possible to filter on bucket fields. However, it is possible to use a report filtered on a bucket field on the dashboard page.
• A dashboard table or chart can display up to 20 photos.
• You must wait at least one minute between dashboard refreshes.

Report Type Limits
• A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
• You can add up to 1000 fields to each custom report type.

Reporting Snapshot Limits
• The maximum number of rows you can insert into a custom object is 2,000.
• The maximum number of runs you can store is 200.
• The maximum number of source report columns you can map to target fields is 100.

Filtering Limits
Only the first 255 characters in a custom text field count for filtering purposes.

Embedded Report Charts Limits
• You can have two report charts per page.
• You can only add report charts from the enhanced page layout editor. The mini console and the original page layout editor are not supported.
• On detail pages, users can refresh up to 100 report charts every 60 minutes.
• Your org can refresh up to 3,000 report charts every 60 minutes.

List View Limits
• Only the first 255 characters are shown for custom long text area fields in list views.

Bucket and Bucket Field Limits
• Each report can include up to five bucket fields.
• Each bucket field can contain up to 20 buckets.
• Each bucket can contain up to 20 values.
• Bucket fields are available for use only in the report where they’re generated. To use a bucket in multiple reports, create the field for each report, or create a separate formula field for the object that’s dependent on the bucket.

Note: These limits don’t apply to the use of Other as permitted within the bucket field’s setup.
Acceptable range for values: The maximum value allowed is 999999999999999. The minimum value allowed is -999999999999999.

Reports and Dashboards API Limits

The following limits apply to both the Reports and Dashboards REST API and Reports and Dashboards API via Apex.

• Cross filters, standard report filters, and filtering by row limit are unavailable when filtering data.
• Historical trend reports are only supported for matrix reports.
• The API can process only reports that contain up to 100 fields selected as columns.
• A list of up to 200 recently viewed reports can be returned.
• Your org can request up to 500 synchronous report runs per hour.
• The API supports up to 20 synchronous report run requests at a time.
• A list of up to 2,000 instances of a report that was run asynchronously can be returned.
• The API supports up to 200 requests at a time to get results of asynchronous report runs.
• Your organization can request up to 1,200 asynchronous requests per hour.
• Asynchronous report run results are available within a 24-hour rolling period.
• The API returns up to the first 2,000 report rows. You can narrow results using filters.
• You can add up to 20 custom field filters when you run a report.
• Your org can request up to 200 dashboard refreshes per hour.
• Your org can request results for up to 5,000 dashboards per hour.

Reports and Dashboards: What’s Not in Lightning Experience

Why Doesn’t My Dashboard Display the Data I Expect?

If you’re not seeing data you expect, refresh for latest data, check that you have the right running user, and verify your dashboard data sources.

If your dashboard data doesn’t look as you expect, check the following:

• Running user. Remember that you’re viewing the dashboard from the perspective of the running user. What you see is based on that user’s access rights. For dynamic dashboards, you can only see what you yourself can access.
• Refresh Dashboard. If you are viewing old data, click Refresh to refresh your dashboard.
• Data sources. Verify that your data sources (reports, s-controls, or Visualforce pages) contain the information you want displayed in the dashboard components.

For further information regarding dashboard running user and dashboard refresh, review the articles Choose a Dashboard Running User on page 3762 and Refresh Dashboard Data on page 3763.
Dashboards Help You Visualize Complex Information

Dashboards help you make decisions based on real-time data you’ve gathered with reports. Use dashboards to help users identify trends, sort out quantities, and measure the impact of their activities.

Watch a Demo: An Overview of Dashboards

Note: Dashboards in Group Edition organizations are view-only.

1. Get Started with Dashboards
   After you’ve found the data that you need, use a dashboard to find patterns, stay up-to-the-minute on changes, and share knowledge that you and your coworkers can act on in real time.

2. Use Dashboards on the iPad
   Salesforce Mobile Dashboards for the iPad, available from the Apple App Store, lets you access dashboards you recently viewed or are following when you’re on the go.

3. View Dashboard Lists
   The dashboard list contains all the dashboards you can view.

SEE ALSO:
- Filter Your Dashboard
- Create a Salesforce Classic Dashboard
- Get Started with Dashboards
- Provide Individualized Views of a Dashboard
Get Started with Dashboards

After you’ve found the data that you need, use a dashboard to find patterns, stay up-to-the-minute on changes, and share knowledge that you and your coworkers can act on in real time.

- Users with a Salesforce Platform or Salesforce Platform One user license can only view a dashboard if the dashboard running user also has the same license type. Consider creating separate dashboards for users with different license types.
- Dashboards in Group Edition organizations are view-only.

Clicking the Dashboards tab displays the dashboard you viewed most recently. The top of the page shows the time the dashboard was refreshed last and the user whose permissions determine what data is visible on the dashboard. If you can’t access a dashboard, verify your folder permissions.

Use Dashboards on the iPad

Salesforce Mobile Dashboards for the iPad, available from the Apple App Store, lets you access dashboards you recently viewed or are following when you’re on the go.

Important: As of Summer ’15, the Mobile Dashboards for iPad app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

The mobile dashboards app keeps you in touch with your organization’s data, performance, and trends, whether you’re in the office or on the road. Use this app to:

- Browse recently viewed dashboards, or ones you’re following
- Search for dashboards
- View individual dashboard components, highlight their values, and drill into reports for each
- Modify your report view
• Email a dashboard or an individual component to others
• View, post, and comment on a dashboard’s Chatter feed
• When offline, access some dashboards and reports you recently viewed in the app

Note: The app doesn’t support dynamic dashboards or dashboard filters.

You can download the app for free from the Apple App Store or from the AppExchange. You can use the mobile dashboards app on all iPad models with iOS 5 or higher. The app is available in Salesforce Enterprise, Unlimited, Performance, and Developer Editions, and additionally in any organization that has enabled REST API.

If you can access your Salesforce organization from your iPad, you can use the mobile dashboards app. Open the app and log in using your Salesforce email and password. If you don’t have a Salesforce account, you can still explore the app by tapping Demo.

Note: Dashboard access for your iPad is available by default for your organization. If it isn’t, an administrator must enable it before you can log in to the app.

In the Salesforce Classic Mobile client application, the Dashboards tab displays if your Salesforce administrator has added the tab to your mobile configuration.

View Dashboard Lists

The dashboard list contains all the dashboards you can view.

1. From the Dashboards tab, click Go to Dashboard List.
   The enhanced Reports tab lists your recently viewed dashboards in that dashboard’s folder.
2. On the dashboard list page, select a folder to view a list of dashboards stored in that folder, or search with filters.
3. Click a dashboard name to display the dashboard.
4. If you’re working in Salesforce Classic, Click next to a dashboard name to edit or delete a dashboard.
   Note: Dashboards in Group Edition organizations are view-only.
5. If Chatter is enabled, click or to follow or stop following a dashboard in your Chatter feed.

Dashboards Help You Visualize Complex Information
Get Started with Dashboards

EDITIONS
Available in: both Salesforce Classic and Lightning Experience
Available in: Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS
To view and refresh dashboards:
• “Run Reports” AND access to dashboard folder
To create dashboards:
• “Run Reports” AND “Manage Dashboards”
To edit and delete dashboards you created:
• “Run Reports” AND “Manage Dashboards”
To edit and delete dashboards you didn’t create:
• “Run Reports,” “Manage Dashboards,” AND “View All Data”
Let Users View Dashboards on the iPad

The Mobile Dashboards for iPad app is automatically enabled for your organization so your users can access the app without any configuration on your part.

**Important:** As of Summer ’15, the Mobile Dashboards for iPad app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

You can disable the app if you don’t want users accessing Salesforce data from mobile devices and you can easily re-enable it if you change your mind later.

To configure access to Mobile Dashboards for iPad:

1. From Setup, enter Mobile Dashboards in the Quick Find box, then select Mobile Dashboard Settings.
2. Select or deselect Enable the Mobile Dashboards iPad app for all users.
3. Click Save.
In addition to online help, Salesforce creates video demos, guides, and tip sheets to help you learn about our features and successfully administer Salesforce.

STREAMLINE SALES AND SERVICE WITH THE SALESFORCE CONSOLE

Salesforce Console

A Salesforce console is designed to boost productivity in fast-paced service and sales environments. Watch a Demo: Introducing the Salesforce Console

The console’s dashboard-like interface reduces clicking and scrolling so that you can quickly find, update, or create records. Use a console to easily access data and features you use most. For example, support agents can use multiple applications at once and keep the context of cases as priorities change. Sales reps can immediately contact leads, assess companies, identify key contacts, and access sales intelligence.

The console’s tab-based interface makes it easy for you to see records and their related items on one screen, and work on multiple items simultaneously.

**Salesforce Console User Interface**

(1) Select objects and records from the navigation tab. (2) Records display in a list, which you can pin at the left of the top of the screen. (3) Selected records appear as primary tabs, and tabs let you work on several items at once. (4) A highlights panel shows key information related to records. (5) Records related items appear as subtabs, and subtabs let you quickly switch between related information without losing context. (6) View and interact with content in the feed or detail area. (7) Access custom component data in sidebars and footers.

Administrators can customize a console to determine everything from the objects in the navigation tab, to whether you can place phone calls with a SoftPhone. More customizations can include displaying knowledge base articles alongside cases, creating custom actions with keyboard shortcuts, or chatting with customers over the Web with Live Agent (Service Cloud only). Administrators and developers...
can solve more unique business problems with custom console components, and use code with an API named the Salesforce Console Integration Toolkit, to add third-party integrations, or expand console customizations to new levels.

**Tip:** If you’re already using a console for service, you can create a console for sales without purchasing separate licenses.

**Note:** The Salesforce console improves upon the Agent console by providing you with more options and more advanced technologies.

---

**Salesforce Console Limitations**

Learn about display, access, and customization limitations for a console.

### Display Limitations

A Salesforce console is available only in Supported Browsers for Salesforce Classic. If you use an unsupported browser, you’ll get a degraded experience.

**Tip:** For best performance, we recommend that console users adopt the Google Chrome™ browser and machines with 8 GB of RAM. Note that 32-bit systems are subject to memory limitations. To take full advantage of the added RAM, use 64-bit versions of both the OS and the browser.

A console offers limited support for right-to-left languages, such as Arabic or Hebrew. Since right-to-left languages aren’t fully supported, some features don’t appear as expected in a console, such as Case Feed, Live Agent, and Salesforce Knowledge.

All Salesforce CRM Content items display as primary tabs in a console.

When using Social Accounts, Contacts, and Leads, the Social Viewer window doesn’t align properly within a console.

Record home pages, including their standard Tools sections, don’t display in a console.

### Behavior and Access Limitations

Back buttons on browsers are not supported for a console and don’t work as expected.

A Salesforce console doesn’t meet accessibility requirements.

Visualforce pages don’t refresh when you click and select Refresh all primary tabs or Refresh all subtabs. In addition, if you override a detail page with a Visualforce page that uses related lists, any new records created using that related list aren’t displayed until the page is reopened in a new tab.

You can’t directly edit the fields on the highlights panel; however, when you change those fields on a record, the highlights panel is automatically updated.

Some objects haven’t been fully adapted to a console, such as reports, dashboards, and Chatter. These and other objects are marked with an asterisk (*) in the console setup area and might cause unexpected behaviors. For example: (1) When viewing opportunity splits, clicking Cancel doesn’t close the subtab; instead, the page detail information is opened in a subtab; (2) opportunity line items and quote line items don’t automatically refresh when changed—you might need to refresh the page to see the latest changes.

If you leave a console and return to it, any subtabs that were displayed might not automatically reload. Also, if you leave a console by selecting an app from the Force.com app menu, your browser’s Back and Forward buttons might not work as expected.

---

EDITIONS

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

---

3783
If you save changes in a lookup component, and you have unsaved changes in another lookup component, the unsaved changes are lost without a warning message.

If you click a custom link or a link in a text field, such as http://www.salesforce.com/ in a case Description, the link appears in a popup window instead of a tab.

If you refresh the Change Case Status page in a console, an Unable to Access Page error appears.

You can't use pinning in search results if Chatter is disabled.

**Customization Limitations**

A console doesn’t support Chatter Messenger or the App Launcher.

Some Visualforce pages won’t display correctly in a console unless they’re updated to show in it.

If you enable clickjack protection for Visualforce pages in your Salesforce org’s security settings, Visualforce pages won’t work correctly.

Call center users can only use a SoftPhone in a Salesforce console if they’re using a CTI adapter built with version 3.0 or 4.0 of the CTI Toolkit; or if they’re using a call center built with Open CTI.

Live Agent is only available for a console with the Service Cloud.

The highlights panel for Live Agent Transcripts is editable, but you can’t turn it on for users.

**SEE ALSO:**

Salesforce Console

---

**Set Up a Salesforce Console**

**Prepare to Set Up a Salesforce Console**

Before you set up a console, determine if it’s for service or sales.

A Salesforce console is a type of custom app that you can customize for support agents or sales reps. You can set up multiple consoles in your Salesforce org as long as you don’t exceed your edition’s custom apps limit. For example, you can set up one console for customer service, and another for telesales. Consoles for service and sales are almost identical, except that consoles for service can include Live Agent—a Web chat tool for support agents and customers.

As you prepare to set up a console, think about who will use it and what information they access most. For each console, determine which objects are available to users, which fields users should quickly spot in highlights panels, and which licenses you should assign to users so that they can access various Salesforce features. You should also think about which records display as primary tabs and subtabs.

Pick the center of your business process as a primary tab, and related items as subtabs. For example, you might set accounts as a primary tab, and cases and contacts as subtabs. When you set up a console, we recommend giving it a name that represents its function so that users can easily recognize it. For example, Customer Service Desk.
Tip: If you are assigned the Service Cloud User feature license, you can review and customize an out-of-the-box console by selecting Sample Console from the Force.com app menu.

Salesforce Console Implementation Tips

Before you implement a console, review these tips.

General Implementation Tips

A console respects all the security and sharing settings in your Salesforce org.

For best performance, we recommend that console users adopt the Google Chrome™ browser and machines with 8 GB of RAM. Note that 32-bit systems are subject to memory limitations. To take full advantage of the added RAM, use 64-bit versions of both the OS and the browser.

To further improve performance, enable Tab Limits (under Setup > Create > Apps > [name of console] > Edit).

Even if the Salesforce Classic 2010 user interface theme isn’t enabled for your org, console users still see the new interface on all pages inside a console.

To see any setup changes to a console, refresh your browser.

You can’t add a console to customer portals or partner portals.

Salesforce Console for Service Implementation Tips

To use a console for service, users must be assigned the Service Cloud User feature license.

To use Live Agent in a console, users must be assigned the Live Agent User feature license.

If Salesforce Knowledge is set up, turn on the Knowledge sidebar so that console users can automatically see relevant articles alongside any cases that they’re working on.

- Prepare to Set Up a Salesforce Console
- Salesforce Console Implementation Guide

Salesforce Console Planning Questions

Before you set up a console, review these questions to help you get the most out of your implementation.

Who will use a console in your Salesforce org?

A console is designed for users who want to find, update, and create records quickly. If users’ profiles are assigned to a console app, they can access it. Before creating a console, we recommend determining which of your existing user profiles will benefit the most from console access, such as profiles assigned to support agents or a telesales team. You can also consider creating a profile or cloning an existing profile from which you can assign users to a console. See Set up a Salesforce Console App on page 3791.
Have you purchased enough feature licenses?
Salesforce users must have a feature license to use a console. After you set up a console, you can manually assign the licenses to users. See Assign the Service Cloud Feature License to Users on page 3789.

Who will implement console apps for your company?
A console is an app, consisting of a group of tabs working as a unit to provide application functionality. Salesforce provides standard apps, such as Sales and Call Center. You create a console as a custom app that users select from the Force.com app menu. If there is a user in your company who is familiar with creating apps in Salesforce, have that person implement console apps. See Set up a Salesforce Console App on page 3791.

Which items do you want users to access from the console’s navigation tab?
The navigation tab appears when users select a console from the Force.com app menu. This tab lets users select an object, such as a case, account, or contact, and view that object’s home page. We recommend that you add any objects to the navigation tab that function as the center of your business process. For example, the center of support agents’ business process is most likely cases, so make cases available to agents from the navigation tab. See Set up a Salesforce Console App on page 3791.

How do you want records to display in a console when they’re selected from outside of primary tabs or subtabs?
A console displays all records as tabs so that users can quickly find, update, and create records on one screen. Primary tabs display the main item to work on, such as an account. Subtabs display related records, such as cases or contacts on an account. You can choose how records display when they’re selected outside of primary tabs or subtabs, for example, when users select cases from list views or search results. See Set up a Salesforce Console App on page 3791.

Which fields do you want to highlight on records?
A console includes a highlights panel that showcases the most important fields on each record. The highlights panel helps users see critical information without having to click a button or scroll down a page. We recommend working with your users to determine the most important fields on records, such as cases, accounts, and contacts, so that you can set up a console to highlight the most useful information. See Configure Highlights Panels for a Salesforce Console on page 3793.

Do you want users to add notes to records using interaction logs?
An interaction log lets Salesforce console users write notes on records that appear on primary tabs. You can create multiple interaction logs and customize them to display specific task fields for different users to update. Determine if it’s necessary for your users to add notes to records or updated task fields on records directly. For example, some users might use a console to quickly find and review records versus adding or updating record information. If the former suits your business needs, don’t set up interaction logs. Also, if it’s not critical that your users add notes to records, you can save screen space by not setting up interaction logs. See Set Up Interaction Logs for a Salesforce Console on page 3803.

Do you want to assign interaction logs to specific user profiles or all users?
Since not all console users add notes to records using an interaction log, you can assign interaction logs to specific user profiles. See Assign Interaction Logs on page 3804.

How do you want lists to display in a console?
List views let users see a specific set of records, such as closed cases or new accounts. You can choose how list views appear in each console, such as to the left of the screen, at the top of the screen, or full screen. We recommend asking your users how they prefer to view lists and if there’s a particular format for displaying lists that’s most productive for them. See Choose How Lists Display in a Salesforce Console on page 3796.

Do you want console users to access domains outside of Salesforce?
Determine if there are any domains that you want users to access from within a console. For example, you might find it useful to let users access www.google.com or your business processes might require users to access a third-party system to complete tasks. See Whitelist Domains for a Salesforce Console on page 3800.

Do you want console users to automatically see visual indicators when lists or records they’re working on have changed?
Push notifications are visual indicators on lists and detail pages in a console that show when a record or field has changed during a user’s session. For example, if two support agents are working on the same case, and one agent changes the Priority, a push notification appears to the other agent so he or she spots the change and doesn’t duplicate the effort. Before you create push
notifications, we recommend determining which objects and fields change frequently, and then adding those items to push notifications to help users. See Configure Push Notifications for a Salesforce Console on page 3801.

Do you want to add any keyboard shortcuts to a console?
Keyboard shortcuts let users perform actions by pressing a combination of keys instead of having to use a mouse. Keyboard shortcuts can make working with a console more efficient. For example, instead of typing case details and using a mouse to click Save, you can create a keyboard shortcut so that users can type case details and press CTRL+S. Before you create any shortcuts, we recommend determining if there are any frequent user actions, or combination of actions, that you can streamline with key commands. See Customize Keyboard Shortcuts for a Salesforce Console on page 3798.

Do you want users to receive and make phone calls from a console?
You can integrate Salesforce with third-party computer-telephony integration systems (CTI), or you can have developers create call control tools for Salesforce with the Open CTI. Both call center approaches work with the console and provide users with a SoftPhone from which they can receive and make phone calls. Call center users can only use a SoftPhone in a Salesforce console if they're using a CTI adapter built with version 3.0 or 4.0 of the CTI Toolkit; or if they're using a call center built with Open CTI. See “Setting Up Salesforce CRM Call Center” and “Salesforce Open CTI Overview” in the online help.

Do you want to save user sessions automatically so that each time users log in they can continue to work from where they left off?
User sessions are automatically saved so that when users close their browsers or log out of Salesforce they can continue working from any open tabs, console components, or screen-sizing customizations; but you can turn off this feature. See Save User Sessions for a Salesforce Console on page 3797.

Do you want to add a component to the footer of a console that lets users quickly access the last ten tabs they viewed or edited?
If a console is set up, you can add the History component to the footer so that users can quickly access recent primary tabs or bookmarks without having to search Salesforce. See Turn On the History Component for a Salesforce Console on page 3797.

Do you want relevant knowledge base articles to automatically appear alongside cases in the console?
If Salesforce Knowledge is set up, you can turn on the Knowledge sidebar so that users working on cases can automatically see relevant knowledge articles that can help them close cases faster. See Turn On Knowledge for a Salesforce Console on page 3822 and “Build Your Knowledge Base” in the online help.

Do you want console users to connect with customers or website visitors in real time through text-only live chats?
If Live Agent is set up, you can add it to a console so that users can chat with your customers while viewing customer data. See Add Live Agent to the Salesforce Console and “Setting Up Live Agent” in the online help.

Do you want to customize, extend, or integrate a console with other systems?
Create components to customize, extend, or integrate the Salesforce console with other systems. For example, you might want to create components that display third-party apps or content when users view specific pages. See Console Components on page 3823 and “Visualforce” in the online help.

Set up Service Cloud Features with Launch Pad Templates

Deploy and test Service Cloud features with just a few clicks. This suite of templates helps you set up some of the most popular Service Cloud features, such as time-saving console configurations and reports and dashboards essential for service organization.

To use templates, from the Setup Quick Search box, enter Launch Pad.

Tip: It’s best to try Launch Pad in your sandbox environment, so that you can test out new features without affecting your live production environment.

Launch Pad templates aren’t supported for IE version 9 or earlier.

Set Up a Salesforce Console for Service

Create and customize a console app, then assign the Service Cloud User feature license to users.

Important: If you plan to add Live Agent to a console, set it up completely before you set up your console.

1. Customize highlight panels for all objects and turn them on.
2. Create a console app and assign it to user profiles.
3. Optionally, for support agents:
   - Brand your console.
   - Choose how pinned lists display.
   - Whitelist domains.
   - Customize push notifications.
   - Customize keyboard shortcuts.
   - Turn on the Knowledge Sidebar.
   - Set up interaction logs and assign them to user profiles.
   - Turn on Live Agent (available only for a console for service).
4. Assign users the Service Cloud User feature license.

Tip: To add third-party integrations, or expand console customizations to new levels, advanced Salesforce admins and developers can create console components, or use code with an API named the Salesforce Console Integration Toolkit.

- Salesforce Console Implementation Guide
Assign the Service Cloud Feature License to Users

The Service Cloud User feature license entitles users to additional Salesforce features, such as the Salesforce console.

To assign the license to a user:

1. From Setup, enter Users in the Quick Find box, then select Users.
2. Click Edit next to a user’s name.
4. Click Save.

SEE ALSO:

Set Up a Salesforce Console for Service

Set Up a Salesforce Console for Sales

To enable a console for the first time, contact Salesforce then assign users the correct permission set license and user permissions.

1. To have the console for sales enabled for your Salesforce org, contact Salesforce.
2. Customize highlight panels for all objects and turn them on.
3. Assign the Sales Console User permission set license to users.
4. Enable the “Sales Console” permission on the permission set.
5. Assign users to the permission set. You can only assign users with a Sales Console User permission set license to permission sets that include the “Sales Console” permission.
6. Optionally, for sales reps:
   - Brand your console.
   - Choose how pinned lists display.
   - Whitelist domains.
   - Customize push notifications.
   - Customize keyboard shortcuts.
   - Turn on the Knowledge Sidebar.
   - Set up interaction logs and assign them to user profiles.
7. Create a console app and assign it to user profiles.
Tip: To add third-party integrations, or expand console customizations to new levels, advanced Salesforce admins and developers can create console components, or use code with an API named the Salesforce Console Integration Toolkit.

### Enable the Sales Console User Permission for a Salesforce Console

After users are licensed for the Salesforce Console for Sales, add the Sales Console permission to a permission set.

1. From Setup, enter Permission Sets in the Quick Find box, then select Permission Sets.
2. Create a permission set. When creating the permission set, select the user license type None. If another license type is selected, you won’t be able to add the Sales Console user permission for this permission set.
3. On the Permission Set page, click App Permissions.
4. Select the Sales Console permission and click Save.

SEE ALSO:
- Set Up a Salesforce Console for Sales

### EDITIONS

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

### USER PERMISSIONS

To create permission sets:
- “Manage Users”
Set up a Salesforce Console App

To create a console, administrators must create a console app.

Walk Through It (Requires the “Sales Console” user permission or the Service Cloud User license)

Watch a Demo: Prepare to Set Up a Salesforce Console

Each console is a custom app that users select from the Force.com app menu. The number of console apps you can create is based on your Salesforce org’s custom app limits.

1. From Setup, enter Apps in the Quick Find box, then select Apps, then click Next.

2. Click New, select Console, and click Next. Optionally, to copy an existing console, click Clone on the console’s detail page. Save a console that you’ve copied before you can update its cloned push notifications or keyboard shortcuts.

3. Type a label for the app, then click Next. The label can have a maximum of 40 characters, including spaces. This label is the app’s name in the Force.com app menu.

4. Optionally, add a custom logo. Click Insert an image, choose a file image from the document library, then click Next.

5. Select the items to include in the navigation tab, then click Next. You can’t add the following to the navigation tab: forecasts, ideas, answers, connections, portals, console, activities (tasks and events), the App Launcher, or buttons for customizing your org. Tab visibility settings, and the Overwrite users’ personal tab customizations setting, don’t apply to the navigation tab. For example, you can access Accounts from the navigation tab even if Accounts are Tab Hidden on user profiles.

6. Choose how items that aren’t selected from a primary tab or subtab display, then click Next. For example, choose whether cases display as primary tabs or as subtabs on parent records when selected from list views, search results, or screen pops. Click:
   - As a primary tab to display the object’s records as primary tabs.
   - As a subtab of to display the object’s records as subtabs. From the drop-down list, choose the parent record where the subtabs appear. For example, if you want cases to appear as subtabs on contacts, select Contact Name (Contact) in the Cases row. If parent records don’t apply, subtabs appear as primary tabs. For example, if you make campaigns a subtab of leads but a lead doesn’t belong to a campaign, that campaign appears as a primary tab.

7. Optionally, if your org has Service Cloud and Live Agent, select Include Live Agent in this App, and click Next. If you choose to include a chat workspace for Live Agent in your console, you can:
   - Choose records or pages to open as subtabs of chat sessions.
   - Select Include Suggested Articles from Salesforce Knowledge in Live Agent to display the articles tool in the chat workspace.

8. Assign the Salesforce console to user profiles:
   a. Check the Visible box to choose the user profiles for which the app is available.
   b. Check the Default box to set the app as that profile’s default app, meaning that new users with the profile see this app the first time they log in. Profiles with limits are excluded from this list.

9. Click Save.
Turn On Salesforce Console Highlights Panels

To display highlights panels in a console, you must turn them on.

1. Edit any page layout and click **Layout Properties**.
2. Check **Highlights Panel**, and click **OK**.
3. Click **Save**.

SEE ALSO:
- Set Up a Salesforce Console for Service
- Set Up a Salesforce Console for Sales
- Configure Highlights Panels for a Salesforce Console
- Highlights Panel Fields and Format
Configure Highlights Panels for a Salesforce Console

The highlights panel is a customizable table of up to four columns at the top of every primary tab in a console. It helps console users see key information at a glance.

To edit a highlights panel, hover over the panel on any page layout and click or double-click the panel. To add or change fields, click the appropriate column and select fields from the Top Field and Bottom Field lists. If the fields you want to add aren’t listed, you must first add them to the detail page layout. Fields can appear once on each highlights panel, and fields already in use appear as gray in the field selection list. Highlights panels don’t support rich text area (RTA) fields, custom long-text area fields, or the Transcript object.

To remove fields, click the appropriate column and select -None- from the field lists. To add columns, click Add Column. To remove columns, hover over the column and click .

To save highlights panel changes, click OK in the Highlights Panel Properties dialog box. When you’ve finished editing the page layout, click Save. To display highlights panels in a console, you must turn them on.

Important: If you leave a page layout before clicking Save, you’ll lose your highlights panel changes.

Highlights Panel Fields and Format

Before you configure a highlights panel for a Salesforce console, review these formatting rules.

A highlights panel can include any standard or custom fields that’ve already been added to a page layout. Each panel can have a minimum of one column of fields and a maximum of four columns. Each column can have one or two fields in top or bottom positions.

When users see a highlights panel, top fields appear in bold and in a larger font than bottom fields. Users can only see fields that they have permission to view—otherwise fields appear blank. When both fields appear blank in a column, the column appears blank.

Choose How Lists Display in a Salesforce Console

Administrators can change how lists appear to console users.

In a console, you can display lists in one of three ways:

<table>
<thead>
<tr>
<th>List Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Full screen, unpinned</td>
<td>Lists are visible only when the navigation tab is selected. When you select a record from the list, it opens in a new tab.</td>
</tr>
<tr>
<td>Pinned to top</td>
<td>Lists appear at the top of the page and are always visible. When you select a record from the list, it opens in a new tab below the list.</td>
</tr>
<tr>
<td>Pinned to left</td>
<td>Lists appear on the left side of the page and are always visible. When you select a record from the list, it opens in a new tab to the right of the list.</td>
</tr>
</tbody>
</table>

To change how lists display:

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Select a console app.
3. Click Edit.
4. Choose how you want lists to display. If you choose pinned lists, specify a default size, in pixels or percentage of screen space.
5. Click Save.

SEE ALSO:

Salesforce Console Configurable Features
Salesforce Console
Save User Sessions for a Salesforce Console

Administrators can save user sessions so that when you close your browser or log out of Salesforce, you can quickly return to what you were working on when you log in again.

If a console is set up, user sessions are automatically saved so that when you log in again, the following appear: any previously open console tabs, custom console components, resized sidebar components, an open or closed search header, and interaction logs.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Select a console app.
3. Click Edit.
4. If user sessions aren’t saved, click Save User Sessions.
5. Click Save.

Note: Console uses the browser sessionStorage property to retain tabs until a user closes them. If a user logs out of Salesforce and logs in again using the same window, the previously open tabs reopen in the new session, even when Save User Sessions is disabled.

SEE ALSO:
- Salesforce Console Configurable Features
- Salesforce Console

Turn On the History Component for a Salesforce Console

If a console is set up, you can add the History component to the footer so that users can quickly access recent primary tabs or bookmarks without having to search Salesforce.

Note: With Summer ‘15, Most Recent Tabs was renamed History and bookmarks were added to it to give you a more streamlined experience for finding and retrieving tabs. These features aren’t available in Internet Explorer® 7 and 8.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Select a Salesforce console app.
3. Click Edit.
4. In Choose Console Components, add History to Selected Items.
5. In Align Custom Console Component, choose whether the component will appear in the footer’s right or left side.
6. Click Save.

SEE ALSO:
- Salesforce Console Configurable Features
- Salesforce Console
Customize Keyboard Shortcuts for a Salesforce Console

Create or customize keyboard shortcuts so that users can quickly perform actions by pressing keys instead of having to use a mouse.

If a console is set up, several default keyboard shortcuts are automatically turned on and available for customization. For example, pressing keys to open and close tabs, move between tabs, and save records. Before you can create custom shortcuts, a developer must define the shortcut’s action with the addEventListener() method in the Salesforce Console Integration Toolkit. You can only create shortcuts for actions performed inside of a console.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Click Edit next to a Salesforce console app.
3. Click Customize keyboard shortcuts.
4. Click Edit on the top of the page.
5. Click Edit to customize an existing shortcut, or click +Add Keyboard Shortcut to create a new one. When creating a new shortcut, you must add a Console Event Name, which is a unique identifier for the key commands, and then send the event name to the developer who defined the shortcut’s action so that he or she can add it to the method that will trigger the shortcut. You can’t delete the default shortcuts, but you can edit or deactivate them.
6. Click Save.

After you customize or create shortcuts, notify users assigned to a console about the new actions they can perform.

Choose yourEditions

EDITIONS

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To customize keyboard shortcuts for a Salesforce console:
- “Customize Application”

Note: You can have up to 144 shortcuts for each console, which includes the default shortcuts and any that you create. If you create or customize keyboard shortcuts that include standard browser shortcuts, such as CTRL+F, your shortcuts might not work as intended.

Keyboard shortcuts aren’t case sensitive, even when you press SHIFT before a letter key. For example, SHIFT+b is the same as SHIFT+B. If CTRL, ALT, or SHIFT is in a keyboard shortcut, the sequence of those keys doesn’t matter. For example, CTRL+ALT+A is the same as ALT+CTRL+A.

Tip: You can include as many keys in a shortcut as you want, but we recommend that you limit a shortcut to three keys so that users can remember it. Console users can press SHIFT+K to view an overlay with a list of all console shortcuts.

SEE ALSO:

Default Keyboard Shortcuts for a Salesforce Console
Salesforce Console Configurable Features
Salesforce Console

3798
Turn On Multi-Monitor Components for a Salesforce Console

If a console is set up, multi-monitor components are turned on so that you can move portions of a console to different areas of your screens to help you work best.

With multi-monitor components, you can pop out primary tabs or open CTI SoftPhones from browsers and drag them across multiple monitors. You can also move the History component, Live Agent chats (but not the footer component), and any console components included in a console’s footer.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Select a console app.
3. Click Edit.
4. If multi-monitor components are turned off, click Enable Multi-Monitor Components.
5. Click Save.

Note: Popped out items close and lose their positions on screen when you log out of Salesforce, click Setup, click a link to leave a console, or refresh or close browsers.

Tip: To pop out components, you might need to update these settings in your browser: (1) allow popup windows; (2) set links to open in new windows, not tabs.

SEE ALSO:
Salesforce Console Configurable Features
Salesforce Console

Preview List Details with Responsive Lists

You can peek into list-view rows just by mousing over them. In addition to resizing dynamically, responsive lists display the details of a row in a hover, so you can preview it without opening each record.

Here’s how to enable responsive lists with hovers:

1. In Setup, select Create > Apps, and find the name of the console you want to modify.
2. Click Edit.
4. Click Save.

The fields that appear in the overlay mirror the fields in the active list view. To customize which fields appear, see Edit List Views on page 131 and Create Custom List Views on page 127 in the Salesforce help. (The list view must be expanded wide enough for the Edit, Delete, and Create New View links to be visible.)

Some more detail about list hovers:

- For cases, the hover title is always the Subject field. For other entities, it’s the Name field.
- You always see the Description field on case hovers, even though it can’t be added to the list view.
- If the Subject or Name field isn’t in the list view, the hover doesn’t have a title.
Responsive lists aren’t supported for IE version 10 or earlier.

Whitelist Domains for a Salesforce Console

Salesforce admins can let console users access domains outside of Salesforce. For example, you can add www.example.com to a console’s whitelist so that console users can access that domain.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Select a console app.
3. Click Edit.
4. In Whitelist Domains, type the domains you want users to access, and separate multiple domains by commas. You don’t need to add http:// or https:// because those are part of a URL, not a domain.
5. Click Save.

SEE ALSO:
Salesforce Console Configurable Features
Salesforce Console

Editions
Available in Professional, Enterprise, Performance, Unlimited, and Developer Editions

User Permissions
To whitelist domains for a Salesforce console:
- “Customize Application”
Configure Push Notifications for a Salesforce Console

Administrators can set up push notifications in a console so that users can see when a record they're working on has been changed by others.

Push notifications are visual indicators on lists and detail pages in a console that show when a record or field has changed during a user's session. For example, if two support agents are working on the same case, and one agent changes the Priority, a push notification appears to the other agent so he or she spots the change and doesn’t duplicate the effort.

Choose when push notifications appear and which objects and fields trigger them:

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Select a console app, and click Edit.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>None</td>
<td>Lists don’t refresh and push notifications don’t appear.</td>
</tr>
<tr>
<td>Refresh List</td>
<td>The entire list refreshes when there are any changes to it. Records are added or removed from the list based on the list’s criteria, but new records added to queues only refresh the record owner’s list.</td>
</tr>
<tr>
<td>Refresh List Rows</td>
<td>Rows in the list refresh when there are any changes to fields selected for push notifications.</td>
</tr>
</tbody>
</table>

4. In Choose How Detail Pages Refresh, select when push notifications appear.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do Not Refresh</td>
<td>Detail pages don’t refresh and push notifications don’t appear.</td>
</tr>
<tr>
<td>Automatically Refresh</td>
<td>The detail page automatically refreshes when a record is changed.</td>
</tr>
<tr>
<td>Flag</td>
<td>A message appears on the detail page when a record is changed.</td>
</tr>
</tbody>
</table>

5. Click Select objects and fields for notifications, and select Edit. The push notification settings you choose here apply to all your console apps.
6. Select the objects that you want to trigger push notifications. For example, if you want any changes to cases or case fields to trigger push notifications, move Cases from Available Items to Selected Items.
7. Under Fields, click Edit and choose the fields you want to trigger push notifications.
8. Click OK, then select Save.
9. Grant push notification users at least the “Read” permission on the Push Topics standard object. See User Permissions and Access on page 497.
Important: When the `Require HttpOnly` attribute is turned on for session security, push notifications don’t appear.

Note:
- These objects and their fields are available for push notifications: accounts, contacts, cases, leads, opportunities, campaigns, tasks, and custom objects.
- Push notifications aren’t available in the console in Professional Edition.
- If you set up push notifications for the lead object and use Data.com Clean rules, push notifications are triggered in the console. Keep in mind that extra notifications can affect your push notification limit.

EDITIONS

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To turn on interaction logs:
- “Customize Application”
Set Up Interaction Logs for a Salesforce Console

An interaction log lets Salesforce console users write notes on records that appear on primary tabs. For example, when cases appear on primary tabs, an interaction log can appear so that users can take notes on cases. You can create multiple interaction logs and customize them to display specific task fields for different users to update.

1. From Setup, enter Interaction Log Layouts in the Quick Find box, then select Interaction Log Layouts.
2. Click New.
3. Name the interaction log.
4. Select task fields to add to the interaction log and click Add.
   - * indicates required fields.
   - You can only add editable task fields to interaction logs.
   - The Enter your notes here... field is automatically added to all interaction logs; you can’t remove it.
5. If you want this interaction log to be the default for all users, select Set as default layout.
   You can’t delete a default interaction log; you must first mark another interaction log as the default for your organization.
6. Click Save.

After you set up or customize interaction logs, you can assign them to different user profiles and turn them on to display.

Tip: You can create custom fields for tasks and add them to interaction logs. For example, you can create a Caller Disposition picklist with values of Angry, Neutral, and Satisfied.

Add Live Agent to the Salesforce Console

Adding Live Agent to the Salesforce console enables agents and supervisors to chat with customers and access other customer service tools in one place.

Before you add Live Agent to a Salesforce console app, you need to create a Salesforce console app if you don’t have one set up.

After you set up Live Agent, add it to a Salesforce console app. After Live Agent is set up in the console, your agents can interact with chat customers. With the Salesforce console, your agents and supervisors can access Live Agent and other Service Cloud products in one place to provide customers fast and efficient customer service.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Click Edit next to the name of the Salesforce console app in which you want to set up Live Agent.
3. Select Include Live Agent in this App.
4. Choose the records or pages that you want to open as subtabs of chat sessions in the chat workspace.
5. Optionally, if your Salesforce org has Knowledge enabled, select Include Suggested Articles from Knowledge in Live Agent to display the Knowledge One widget in the chat workspace.
6. Click Save.

You can run multiple Salesforce apps at the same time. However, if you log in to another Salesforce app while you’re logged in to a Salesforce console app, you can’t accept new chat requests.

SEE ALSO:

Using Macros in Service Console

Macros

Support agents who use Case Feed now can run macros to automatically complete repetitive tasks—such as selecting an email template, sending an email to a customer, and updating the case status—all in a single click. Macros save time and add consistency to support agents’ work.

You can create macros to perform multiple actions on the Case Feed. For example, a macro can enter the subject line of an email and update the case status. A single macro can perform multiple actions on different parts of the Case Feed at the same time.

Note: Macros are supported on feed-based standard and custom objects.

Getting Started with Macros

Before you can create and run macros, set up the Salesforce Console for Service environment.

Tips for Creating Macros

How you name and design your macro can impact its usefulness to support agents. Keep these tips in mind when creating macros.

Create Macros

You can create a macro by specifying the instructions for actions that the macro performs. A macro is like a little computer program. You need to tell the macro each step that it performs. This example shows how to create a simple macro.

Run a Macro in the Salesforce Console for Service

Macros automate a series of repetitive keystrokes that support agents make in the Salesforce Console for Service. You can quickly complete repetitive tasks, such as updating the case status, by running a macro.

Shortcuts for Macros

You can use the keyboard shortcuts to work even more efficiently with macros.

SEE ALSO:

Feed-Based Layouts Overview

Getting Started with Macros

Before you can create and run macros, set up the Salesforce Console for Service environment.

1. Enable feed tracking for the object.
2. Create a feed-based page layout on a supported object. Macros are supported on feed-based standard and custom objects.
3. Add the publisher actions that you want to use in macros to the page layout. For example, add the Email Action to the case page layout.
4. If you want to use Quick Actions in macros, create a Quick Action and add it to the page layout.
5. Add the Macros browser as a console component to the page layout.
6. Make sure that users have the user permissions to create macros or run macros, as appropriate.

Tips for Creating Macros

How you name and design your macro can impact its usefulness to support agents. Keep these tips in mind when creating macros.

1. The **Macro Name** helps support agents decide which macro to use. The name is used when agents search for macros, so it’s useful to use a short name (so that agents can see it in the macros list) that succinctly identifies the macro’s purpose.

2. Although **Description** is optional, it is useful for helping support agents to understand what the macro does.

3. The macro instructions are like a little computer program, so you must tell the macro each step, or instruction, to perform. Each instruction is equivalent to a click that the support agent makes when manually performing the task. The first macro instruction selects the object that the macro acts upon, such as the Active Case Tab.

4. The second macro instruction specifies the context, or component of the Salesforce Console for Service, in which the macro works. For example, the Email Action context allows the macro to set fields and perform actions within the Email Publisher.
   
   **Note**: If a Salesforce Console for Service component isn’t enabled and configured, then you can’t create a macro for it.

5. The third macro instruction specifies the action that the macro performs. For example, the macro in the screenshot changes the value for the CC Address field in an email action in the active case tab.

6. You can add an additional set of instructions in the same context or in a different context. A simple macro just performs one task. Create more complex macros by adding instructions.
Create Macros

You can create a macro by specifying the instructions for actions that the macro performs. A macro is like a little computer program. You need to tell the macro each step that it performs. This example shows how to create a simple macro.

User Permissions Needed

<table>
<thead>
<tr>
<th>To view macros:</th>
<th>“Read” on Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td>To create and edit macros:</td>
<td>“Create” and “Edit” on Macros</td>
</tr>
<tr>
<td>To create and run irreversible macros:</td>
<td>“Manage Macros That Users Can’t Undo”</td>
</tr>
</tbody>
</table>

To create this example macro, the Email Publisher must be enabled in your Salesforce org.

1. Create a macro.
   a. In the Salesforce for Service Console, click the Macros widget.
   b. Click + Create Macros.
   c. For Macro Name, enter a name that makes it easy to understand what this macro does.
      For example, Replace email subject with “Steps for Resetting Your Password”.
   d. For Description, explain the purpose for this macro. The optional Description field helps support agents understand what this macro does and distinguish it from similar macros.

2. Add the instructions for the macro.
   a. Select a context for the macro. The context specifies the part of case feed that the macro interacts with.
      For example, selecting Select Active Tab tells the macro that it’s performing an action on the active case tab in Case Feed.
   b. Click Done. After every instruction, click Done to move to the next line.
   c. Select the object that the macro interacts with.
      For example, selecting Select Email Action tells the macro to interact with the Email Publisher in Case Feed.
   d. Select the action that you want the macro to perform.
      For example, suppose that you want to replace the subject line of an email in the case, so you select Replace Subject. This instruction tells the macro to change the subject field in the email. It also displays a text field, where you can specify the subject that you want to replace.
   e. In the text field, enter the subject line. This instruction clears the original subject and replaces it with the value you specified in the macro.
      For example, you enter Steps for Resetting Your Password in the text field. Suppose the customer’s original email contained the subject “Password Problems.” The agent runs the macro, automatically replacing the original subject with the new subject.
   f. Finally, select Submit Action to tell the macro to execute these instructions.

3. Save the macro.
   You’ve created a macro that replaces the original subject line in an email in Case Feed with a new subject line.
   After creating a macro, it’s a good idea to run it to make sure that it works the way you want. To test this macro, go to the Salesforce Console for Service and open a case record. Open the Macros widget. Select and run this macro.
Run a Macro in the Salesforce Console for Service

Macros automate a series of repetitive keystrokes that support agents make in the Salesforce Console for Service. You can quickly complete repetitive tasks, such as updating the case status, by running a macro.

---

### User Permissions Needed

<table>
<thead>
<tr>
<th>To view macros:</th>
<th>“Read” on Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td>To create and edit macros:</td>
<td>“Create” and “Edit” on Macros</td>
</tr>
<tr>
<td>To create and run irreversible macros:</td>
<td>“Manage Macros That Users Can’t Undo”</td>
</tr>
</tbody>
</table>

---

**Note:** You need the Manage Macros That Users Can’t Undo permission only if you want to run macros that contain a Submit Action instruction. All bulk macros contain a Submit Action instruction. The lightning bolt icon (bolt) indicates that the macro performs an action—such as sending an email—that cannot be undone.

1. Open the Macros widget.
2. Search for a macro and select it from the macros list.
   - To search for a macro, enter some letters from its name in the Search Macros box. Salesforce lists macros that contain the search keywords or letters in the results. If the Search Macros box is empty, the list displays your 25 most recently used macros. If you ran a macro or viewed its detail page, then it is considered to be recently used.
3. Optionally, review the macro’s description and instructions to make sure that this macro does what you expect. The instructions show you the steps that the macro performs. Reviewing the instructions is helpful when running a macro for the first time.
4. Click Run (play) to start the macro.
   - A message displays indicating whether the macro ran successfully. A green dot appears next to each instruction that ran successfully. A red dot and an error message appear next to each instruction that could not be performed, so you can troubleshoot the issue.

### Irreversible Macros

Some macros perform actions that can’t be undone, such as sending outbound emails to customers or updating a case status. A macro that contains a Submit Action instruction is irreversible. You must have the Manage Macros Users Can’t Undo user permission to create, edit, and run macros that contain instructions for performing irreversible actions.

---

**Editions**

Available in: Salesforce Classic

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

---

Irreversible Macros

Some macros perform actions that can’t be undone, such as sending outbound emails to customers or updating a case status. A macro that contains a Submit Action instruction is irreversible. You must have the Manage Macros Users Can’t Undo user permission to create, edit, and run macros that contain instructions for performing irreversible actions.

The lightning bolt icon (bolt) indicates that a macro is irreversible.

If you don’t have the Manage Macros Users Can’t Undo permission, you can still:

- Create and edit macros that don’t contain instructions for performing irreversible actions
- Clone, delete, and share macros that do contain instructions for performing irreversible actions
Example: Macros that perform the following types of actions are considered to be irreversible:

- Send email
- Update a case status

Shortcuts for Macros

You can use the keyboard shortcuts to work even more efficiently with macros.

<table>
<thead>
<tr>
<th>Press</th>
<th>To</th>
</tr>
</thead>
<tbody>
<tr>
<td>M</td>
<td>Open the Macros widget.</td>
</tr>
<tr>
<td>S</td>
<td>Put your cursor in the search bar.</td>
</tr>
<tr>
<td>E</td>
<td>Edit the selected macro.</td>
</tr>
<tr>
<td>V</td>
<td>View the Macro Details page.</td>
</tr>
<tr>
<td>Enter</td>
<td>Run the selected macro.</td>
</tr>
<tr>
<td>Space bar</td>
<td>Expand or collapse the selected macro’s instructions.</td>
</tr>
<tr>
<td>Up Arrow</td>
<td>Scroll up the macros list.</td>
</tr>
<tr>
<td>Down Arrow</td>
<td>Scroll down the macros list.</td>
</tr>
</tbody>
</table>

Bulk Macros

A bulk macro is a macro that you can run on multiple records at the same time. Bulk macros let support agents quickly address spikes in customer cases involving the same issue. Macros must meet certain criteria be run as bulk macros.

Bulk macros are supported for the:

- Email Publisher in Case Feed on the Salesforce Console for Service
- All Quick Actions except for Social Quick Actions

Bulk macros are not supported for:

- Salesforce Knowledge actions
- Community actions
- Social post actions
- “Add” and “Insert” instructions (such as the Add to Subject instruction or the Insert into HTML Body instruction for the Email Publisher)

If the bulk macro interacts with the Email Publisher, it can contain only one Email Publisher action.

A bulk macro must contain at least one Submit Action instruction.

Example: For example, suppose that your company has a service outage and lots of customers have contacted customer support. You want support agents to send an email to customers who have opened cases about the outage telling them when the service outage will end. You can create a bulk macro that uses an email template to create and send an email to these customers.
Create a Bulk Macro
This example shows you how to create a bulk macro that sends an email to the contact person for the selected customer cases.

Tips for Creating Bulk Macros
The key to successfully using bulk macros is to select the right records to run the macro on. Support agents can filter the list views to identify which records to select.

Run a Bulk Macro on Multiple Records
You can run a bulk macro on only one record at a time, or you can run it on multiple records at the same time. Use bulk macros to quickly address similar customer cases or records.

Create a Bulk Macro
This example shows you how to create a bulk macro that sends an email to the contact person for the selected customer cases.

User Permissions Needed

<table>
<thead>
<tr>
<th>Permission</th>
<th>Permission Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>To view macros:</td>
<td>&quot;Read&quot; on Macros</td>
</tr>
<tr>
<td>To create and edit macros:</td>
<td>&quot;Create&quot; and &quot;Edit&quot; on Macros</td>
</tr>
<tr>
<td>To create and run irreversible macros:</td>
<td>&quot;Manage Macros That Users Can't Undo&quot;</td>
</tr>
<tr>
<td>To run bulk macros:</td>
<td>&quot;Run Macros on Multiple Records&quot;</td>
</tr>
</tbody>
</table>

For example, suppose that your company has a service outage and lots of customers have contacted customer support. You want support agents to send an email to customers who have opened cases about the outage telling them when the service outage will end. You can create a bulk macro that uses an email template to create and send an email to these customers.

These steps show you how to create a bulk macro that sends an email to the contact person on the selected cases. To re-create this example in your Salesforce org, enable the Email Publisher.

1. Create a macro.

2. Add the instructions for the macro.
   a. Select a context for the macro. The context specifies the object that the macro interacts with.
      For example, selecting Select Active Tab tells the macro that it’s performing an action on the active case tab in Case Feed.
   b. Click Done. After every instruction, click Done to move to the next line.
   c. Select the publisher that the macro interacts with.
      For example, selecting Select Email Action tells the macro to interact with the Email Publisher in Case Feed.
   d. Select the action that you want the macro to perform.
      You can select Apply Email Template and specify which email template to use.
   e. Finally, select Submit Action to tell the macro to perform these instructions.

3. Save the macro.
You’ve created a macro that creates and sends an email to the contact person for the selected cases. This macro can be run as a bulk macro because it meets all the criteria for a bulk macro. It interacts with the Email Publisher, it uses a supported instruction, and it includes a Submit Action instruction. You can run this macro as a bulk macro on multiple records at the same time. You also can run it on a single record at a time.
When you look at the macros list, an icon showing a green lightning bolt with two underlines (跑了) appears next to bulk macros. Make sure that this icon appears next to your macro.

**Tips for Creating Bulk Macros**

The key to successfully using bulk macros is to select the right records to run the macro on. Support agents can filter the list views to identify which records to select.

When you create a bulk macro, it’s a good practice to add an instruction that changes a field value on the record. Agents can filter records in the list view based on the field value. Updating a field value lets agents distinguish the records on which the macro has been run from the cases on which the macro hasn’t been run.

**Example:** For example, suppose many customers open cases about the same issue in a short time. The support agent can run a bulk macro that emails these customers to tell them that the company knows of the issue and is fixing it. But what happens two days later, when the agent wants to run the bulk macro a second time on new cases about the same issue? Because agents use filtering to determine which cases to apply the macro to, it’s helpful to add instructions to the bulk macro that change a field value. This way, when the macro runs, it automatically updates the field value. Later on, when the agent has new cases to respond to, the agent can filter cases based on this field.

**Run a Bulk Macro on Multiple Records**

You can run a bulk macro on only one record at a time, or you can run it on multiple records at the same time. Use bulk macros to quickly address similar customer cases or records.

<table>
<thead>
<tr>
<th>User Permissions Needed</th>
<th>EDITIONS</th>
</tr>
</thead>
<tbody>
<tr>
<td>To view macros: “Read” on Macros</td>
<td>Available in: Salesforce Classic</td>
</tr>
<tr>
<td>To create and edit macros: “Create” and “Edit” on Macros</td>
<td>Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions</td>
</tr>
<tr>
<td>To create and run irreversible macros: “Manage Macros That Users Can’t Undo”</td>
<td></td>
</tr>
<tr>
<td>To run bulk macros: “Run Macros on Multiple Records”</td>
<td>Available in: Salesforce Classic</td>
</tr>
</tbody>
</table>

**Note:** You need the Manage Macros That Users Can’t Undo permission only if you want to run macros that contain a Submit Action instruction. All bulk macros contain a Submit Action instruction. The lightning bolt icon (跑了) indicates that the macro performs an action—such as sending an email—that cannot be undone.

You can run bulk macros on records from the Accounts, Cases, Contacts, and Leads objects. However, you can run a bulk macro only on records in one object list view at a time. For example, you can run a bulk macro on multiple cases in the Cases list view, but not on cases and accounts at the same time.

An icon showing a green lightning bolt with two underlines (跑了) indicates whether a macro is a bulk macro.

Bulk macros are processed in increments of 10 macros at a time. You can run a bulk macro on more than 10 cases, but the system processes the macro in groups of 10 at a time.

1. In the Case list view, select the cases that you want to run the macro on.
   
   You can filter the cases to identify which cases you want to run the macro on.
2. Open the Macros widget.

3. In the Macro widget, select a macro with the green lightning bolt icon (🔥) and click Run.

4. In the confirmation window, click OK to continue.

The macro runs on the selected cases. In the list view, the cases on which the macro ran successfully are highlighted in green and denoted by a green check mark icon. Cases that the macro didn’t run successfully on are highlighted in red and denoted by a red X icon. To see an explanation about why the macro didn’t work on a case, hover over the red X icon.

Examples of Macros

These examples show how you can create different types of macros based on your business needs.

Add and Replace Field Values in a Case Using Macros

Suppose that your support agents often add the same field values to a record, or that they often replace a field value. You can create a macro that automatically adds content to a field or that replaces the values in a field. Using a macro saves agents time because it automates repetitive and routine actions, freeing them to focus on helping customers.

Insert Quick Text in a Social Post

Suppose that support agents often respond to customer questions on social networks, such as Twitter or Facebook. You can use a macro to automatically insert a reply into the post using Quick Text or text. This type of macro enables agents to quickly respond to customers without interrupting their workflow.

Automatically Attach a Salesforce Knowledge Article to an Email in Case Feed Using Macros

Perhaps your support agents often send customers the same article in Salesforce Knowledge. This example explains how to create a macro that automatically selects a specific article and inserts it into an email in Case Feed. This macro lets agents answer a common customer question by clicking one button, instead of spending time searching for the article and copying it into the email.
Add and Replace Field Values in a Case Using Macros

Suppose that your support agents often add the same field values to a record, or that they often replace a field value. You can create a macro that automatically adds content to a field or that replaces the values in a field. Using a macro saves agents time because it automates repetitive and routine actions, freeing them to focus on helping customers.

The Email Publisher must be enabled in your Salesforce org.

These steps illustrate some ways that you can use Add, Replace, and Insert instructions in a macro.

1. Create a macro.
2. Add the instructions to tell the macro what email field value to replace. This example shows how to replace the Subject field in an email.
   a. In the Macro Instructions section, click +Add Instruction.
   b. The first instruction tells the macros which object to act upon. Here, select Select Active Case Tab.
   c. The next instruction tells the macro which action in the Case Feed Publisher to interact with. Here, select Select Email Action.
   d. Now, tell the macro what to do in the Email Action. Select Replace Subject. In the text field, specify the subject line.
      Selecting a Replace instruction clears the existing value in the field, and replaces it with the value specified in the macro.
      For example, enter Update on Your Order. Suppose that the subject line was Haven’t Received My Order. The macro clears the old subject line and replaces it with Update on Your Order.
3. Add the instructions to tell the macro to replace an email field with a blank value. In this example, we clear the BCC field.
   a. Select Replace BCC Addresses. Leave the text field empty.
      Selecting a Replace instruction and leaving the text field empty clears the values in the field, so you end up with a blank field.
4. Add the instructions to tell the macro to insert values into a field. In this example, we add two email addresses to the CC field.
   a. Select Add CC Addresses. In the text field, specify the email addresses. You can specify multiple email addresses by separating them with a comma.
      Selecting an Add or Insert instruction adds the value specified in the macro to the field, but doesn’t delete values that are already there.
      For example, enter shipping@example.com, invoices@example.com. Suppose that the CC field already contains support@example.com. This macro appends the shipping@example.com and invoices@example.com after support@example.com.
5. Select Submit Action. This instruction tells the macro to execute the email action.
6. Save the macro.
Insert Quick Text in a Social Post

Suppose that support agents often respond to customer questions on social networks, such as Twitter or Facebook. You can use a macro to automatically insert a reply into the post using Quick Text or text. This type of macro enables agents to quickly respond to customers without interrupting their workflow.

The Email Publisher, Quick Text, and Social Customer Service must be enabled in your organization. These steps illustrate one way that you can use Insert instructions in a macro.

1. Create a macro.
2. Add the instructions to tell the macro what to do. This example shows how to insert Quick Text into a social post.
   a. In the Macro Instructions section, click +Add Instruction.
   b. The first instruction tells the macros which object to act upon. Here, select Select Active Case Tab.
   c. The next instruction tells the macro which action in the Case Feed publisher to interact with. Here, select Select Social Action.
   d. Now, tell the macro what to do in the social action. Select Insert into Body. You can insert either Quick Text or Text.
      Selecting an Insert instruction appends the Quick Text or Text specified in the macro to the end of the text already in the field. In social publisher actions, the Insert instruction is useful because you can retain the @mention and add text after it.
   e. Specify which Quick Text you want to macro to use, or enter the text that you want it to use.
3. Select Submit Action. This instruction tells the macro to execute the social action.
4. Save the macro.
Automatically Attach a Salesforce Knowledge Article to an Email in Case Feed Using Macros

Perhaps your support agents often send customers the same article in Salesforce Knowledge. This example explains how to create a macro that automatically selects a specific article and inserts it into an email in Case Feed. This macro lets agents answer a common customer question by clicking one button, instead of spending time searching for the article and copying it into the email.

You must have Salesforce Knowledge One enabled for your organization. The Salesforce Knowledge One component must be enabled and added as a component to the Salesforce Console for Service page.

1. Create a macro.

2. Add the instructions to tell the macro to search for a specific article.
   a. In the Macro Instructions section, click **Add Instruction**.
   b. The first instruction tells the macros which case to act upon. Here, select **Select Active Case Tab**.
   c. The next instruction tells the macro which part of the console to act upon. Here, select **Select Knowledge Sidebar Component**.
   d. Now, let’s tell the macro what do in the Knowledge Sidebar. Select **Select Articles Search**.
   e. This step defines the keyword that the Knowledge search uses to find the right article. Select **Set Keywords**. In the text field, you can specify either the article number or a keyword.
      - Article number: The article number retrieves an article by its number, which is useful when you want to select a specific article. The syntax is `articlenumber:123456789`.
      - Keywords: You also can search by keywords. Salesforce looks for these keywords in the title and body of the articles in the knowledge base. For example, enter “Reset Your Password.”
   f. Select **Run Search**. This instruction tells the macro to perform the search when someone runs this macro.

3. Add the instructions to tell the macro to insert the article into the email that is being edited in Case Feed.
   a. Click **Select Most Relevant Article**. This instruction tells the macro to use the article that came up first in the search results.
   b. Select **Insert into Email as HTML**. This instruction inserts the entire article, including text and images, into the email at the cursor position.

4. Save the macro.
Manage Macros

It's simple to clone, share, and delete macros.

**Clone Macros**
You can quickly copy macros by cloning them. Cloning macros is useful for creating macros that are variants of the source macro.

**Share Macros**
Macros use the same sharing model as other objects in Salesforce. You can share macros with public groups and other users, allowing other support agents to increase their efficiency with macros.

**Delete Macros**
You can delete macros that you don’t need anymore.

Clone Macros
You can quickly copy macros by cloning them. Cloning macros is useful for creating macros that are variants of the source macro.

**User Permissions Needed**

<table>
<thead>
<tr>
<th>To view macros:</th>
<th>“Read” on Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td>To clone macros:</td>
<td>“Create” and “Edit” on Macros</td>
</tr>
</tbody>
</table>

Both administrators and support agents can clone macros if they have the appropriate user permissions.

1. Open the Macros widget.
2. Click the macro that you want to clone.
3. If you are using the Macros widget, click the View Detail icon ( ).
4. Click Clone.
5. In the Macro Name field, enter a unique name for the macro.
6. Optionally, modify the instructions for the macro. You can also modify the instructions at another time.
7. Click Save.

Share Macros
Macros use the same sharing model as other objects in Salesforce. You can share macros with public groups and other users, allowing other support agents to increase their efficiency with macros.

**User Permissions Needed**

<table>
<thead>
<tr>
<th>To view macros:</th>
<th>“Read” on Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td>To share macros:</td>
<td>“Create” and “Edit” on Macros</td>
</tr>
</tbody>
</table>

Available in: Salesforce Classic
Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions
1. Open the Macros widget.

2. Select the macro that you want to share.

3. Click the View Detail icon ( ).

4. Click Sharing.

5. In the New Sharing page, search for a public group or for a user by name.

6. Share the macro by selecting a group or user from the Available list and clicking Add. To stop sharing a macro, select a group or user from the Share With list and click Remove.

7. If you’re sharing the macro, set the Access Level to either Read Only or Read/Write.
   - Read Only allows support agents to view and run the macro.
   - Read/Write allows support agents to edit, view, and run the macro.

8. Click Save.

Delete Macros

You can delete macros that you don’t need anymore.

<table>
<thead>
<tr>
<th>User Permissions Needed</th>
</tr>
</thead>
<tbody>
<tr>
<td>To view macros:</td>
</tr>
<tr>
<td>To delete macros:</td>
</tr>
</tbody>
</table>

Both administrators and support agents can delete macros, provided that they have the appropriate user permissions.

1. In the Salesforce Console Home Page, click Macros or M to open the Macros widget. You also can access macros from the Macros tab.

2. Click the macro that you want to delete.

3. If you are using the Macros widget, click the View Detail icon ( ). (This step is not necessary if you are using the Macros tab.)

4. Click Delete.

5. Click OK on the confirmation window.

Publishers and Actions Supported in Macros

The following publishers and actions are supported on macros in the Salesforce Console for Service.

Email Publisher Actions Supported in Macros

These actions are available when you click Select Email Action in the macro instructions. Email actions let you modify text in emails in Case Feed. You can create and run macros to perform these actions on the Email Publisher in the Salesforce Console for Service.
Salesforce Knowledge Actions Supported in Macros
These actions are available when you click Select Knowledge Sidebar Component in the macro instructions. Knowledge actions let you search for knowledge articles and add articles to cases. You can create and run macros to perform these actions on the Salesforce Knowledge Publisher in the Salesforce Console for Service.

Custom Quick Actions Supported in Macros
These actions are available when you click Select Name of Quick Action in the macro instructions. You can create and run macros to perform custom quick actions in the Salesforce Console for Service.

Community Publisher Actions Supported in Macros
These actions are available when you click Select Community Action in the macro instructions. Community actions let you update and post to Salesforce Communities. You can create and run macros to perform these actions on the Community Publisher in the Salesforce Console for Service.

Social Actions Supported in Macros
These actions are available when you click Select Social Action in the macro instructions. You can create and run macros to perform these actions on the Social Publisher in the Salesforce Console for Service.

Email Publisher Actions Supported in Macros
These actions are available when you click Select Email Action in the macro instructions. Email actions let you modify text in emails in Case Feed. You can create and run macros to perform these actions on the Email Publisher in the Salesforce Console for Service.

To use these actions, you must have the Email Publisher enabled in your Salesforce org and added as a console component to the case page layout.
Bulk macros are supported for Email Publisher actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Supported in Bulk Macros?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replace To Addresses</td>
<td>Clears the email addresses in the To Address field and replaces them with the specified email addresses. To use multiple email addresses, separate them with a comma.</td>
<td>Yes</td>
</tr>
<tr>
<td>Add to To Addresses</td>
<td>Adds these email addresses to the To field, but does not delete any addresses already in the To field. To use multiple email addresses, separate them with a comma.</td>
<td>No</td>
</tr>
<tr>
<td>Replace CC Addresses</td>
<td>Clears the email addresses in the CC Address field and replaces them with the specified email addresses. To use multiple email addresses, separate them with a comma.</td>
<td>Yes</td>
</tr>
<tr>
<td>Add to CC Addresses</td>
<td>Adds these email addresses to the CC field, but does not delete any addresses already in the CC field. To use multiple email addresses, separate them with a comma.</td>
<td>No</td>
</tr>
<tr>
<td>Replace BCC Addresses</td>
<td>Clears the email addresses in the BCC Address field and replaces them with the specified email addresses. To use multiple email addresses, separate them with a comma.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
### Salesforce Knowledge Actions Supported in Macros

These actions are available when you click **Select Knowledge Sidebar Component** in the macro instructions. Knowledge actions let you search for knowledge articles and add articles to cases. You can create and run macros to perform these actions on the Salesforce Knowledge Publisher in the Salesforce Console for Service.

To use these actions, you must have Salesforce Knowledge enabled in your organization and added as a console component. Salesforce Knowledge actions, such as attaching an article to a case, must be enabled in the console.

**Note:** The Knowledge Sidebar must be expanded when you run a Knowledge macro. If the sidebar is collapsed, the macro doesn’t work.

Internet Explorer 7 and Bulk macros are not supported for Salesforce Knowledge actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Supported in Bulk Macros?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select Knowledge Sidebar Component</td>
<td>Tells the macro that these instructions affect the Knowledge Sidebar in the console.</td>
<td>No</td>
</tr>
<tr>
<td>Select Article Search</td>
<td>Tells the macro that the instructions affect Knowledge search.</td>
<td>No</td>
</tr>
</tbody>
</table>
**Custom Quick Actions Supported in Macros**

These actions are available when you click `Select Name of Quick Action` in the macro instructions. You can create and run macros to perform custom quick actions in the Salesforce Console for Service.

To use these actions, you must have Quick Actions defined in your Salesforce org and added to the case feed page layout.

Bulk macros are not supported on Quick Actions for social actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Supported in Bulk Macros</th>
</tr>
</thead>
<tbody>
<tr>
<td>Replace <code>&lt;text field&gt;</code></td>
<td>Clears the contents of the text field and replaces it with the specified text.</td>
<td>Yes</td>
</tr>
<tr>
<td>Add to <code>&lt;text field&gt;</code></td>
<td>Adds the specified text to the end of the text field, but does not delete any existing text already there. The Text is inserted at the cursor position.</td>
<td>No</td>
</tr>
<tr>
<td>Submit Action</td>
<td>Tells the macro to perform these instructions when someone runs this macro.</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**EDITIONS**

Available in: Salesforce Classic

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions
Community Publisher Actions Supported in Macros

These actions are available when you click Select Community Action in the macro instructions. Community actions let you update and post to Salesforce Communities. You can create and run macros to perform these actions on the Community Publisher in the Salesforce Console for Service.

To use these actions, you must have the Community Publisher enabled in your Salesforce org and added as a console component to the case page layout.

Bulk macros are not supported on Community Publisher actions.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
<th>Supported in Bulk Macros?</th>
</tr>
</thead>
<tbody>

Social Actions Supported in Macros

These actions are available when you click Select Social Action in the macro instructions. You can create and run macros to perform these actions on the Social Publisher in the Salesforce Console for Service.

To use these actions, you must have Social Actions enabled in your organization and added as a console component to the case feed page layout.

Bulk macros are not supported on Social Actions.

### Turn On Knowledge for a Salesforce Console

If Salesforce Knowledge is set up, you can turn on the Knowledge sidebar so that users working on cases can automatically see relevant knowledge articles that can help them close cases faster.

⚠️ **Important:** You must have Salesforce Knowledge set up in your Salesforce org before you can add it to a console. Knowledge articles appear based on matching words typed into a case’s Subject.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to a page layout.
3. Click **Layout Properties**.
4. Check **Knowledge Sidebar**, and click **OK**.
5. Click **Save**.

---

**EDITIONS**

Available in: **Professional, Enterprise, Performance, Unlimited**, and **Developer** Editions

**USER PERMISSIONS**

To turn on the Knowledge sidebar:
- “Customize Application”
Repeat these steps for each case page layout assigned to console users.

- Find Object Management Settings

Customize a Salesforce Console

Console Components

Create components to customize, extend, or integrate the Salesforce console with other systems. Components let you display many types of data in the footer, sidebars, highlights panels, and interaction logs of a console. You can create components to solve a variety of business problems and to display items, such as:

- Third-party apps
- Chat or Softphone widgets
- Content when users view specific pages
- Contextual information alongside records
- Custom highlights panels or interaction logs
- Content when users click a customizable button in the footer

Components let you get creative with a console and build what your users need to do their jobs. To create components, you can use Visualforce, canvas apps, lookup fields, related lists, or report charts. You can also use Force.com Canvas or the Salesforce Console Integration Toolkit to build components. Both technologies are JavaScript APIs that let developers extend or integrate a console. The toolkit provides you with programmatic access to a console to do things like open and close tabs to streamline business processes, whereas Canvas helps you integrate a console with external applications that require authentication methods. For more information (English only) about canvas apps or the toolkit, see Force.com Canvas Developer’s Guide and the Salesforce Console Integration Toolkit Developer’s Guide.

- Process for Creating Console Components
- Console Component Implementation Tips
Process for Creating Console Components

Developers and administrators typically follow these steps when creating components for a Salesforce console.

Even though you can create a variety of console components to solve many types of business problems, the process for creating components generally follows these steps.

1. Developers create a Visualforce page or a canvas app.
2. Administrators add the Visualforce page or canvas app to either:
   - Page layouts to display content on specific pages or
   - Console apps to display content across all pages and tabs
3. Administrators who add a component to page layouts:
   - Choose the sidebar in which the console displays, such as right, left, top, or bottom
   - Select whether to add multiple components to a sidebar and arrange them as either a stack, tabs, or accordion
4. Administrators who add a component to apps:
   - Specify the look and feel of the button used to access the component from the console’s footer
   - Assign the component to each console where they want users to access it
5. Users view the component when they access page layouts or click a button in the footer of a console.

Tip: To add a lookup field or related list as a component, you can do so without creating a Visualforce page or canvas app. Just follow the steps in “Add Console Components to Page Layouts,” and in the Type field, select Lookup or Related List to choose a specific field or list.

- Console Component Implementation Tips
- Add Console Components to Page Layouts
- Add Console Components to Apps

Console Component Implementation Tips

Before you create a component for a Salesforce console, review these tips.

Behavior and Access Tips
- You can’t add canvas app components to AppExchange packages.
- When you update records on primary tabs or subtabs, components don’t refresh automatically.
- If you change the Height or Width of a console component, refresh your browser to see your updates.
- Report chart components aren’t available to developers using the Salesforce Metadata API or for migration between sandbox and production instances.

Page Layout Tips
- You can add components to page layouts if you’re assigned to a Sales Cloud User Permission or Service Cloud User feature license.
After you turn off the highlights panel or interaction log on a page layout, you can add a component to the Top Sidebar or Bottom Sidebar of primary tabs.

If you want a component to display across all the subtabs on a primary tab, add the component to the Primary Tab Components section on page layouts. If you add a component to the Subtab Components section on page layouts, the component displays on individual subtabs.

If Salesforce Knowledge is enabled and the Knowledge sidebar is turned on, don’t add a component to the Right Sidebar of case page layouts, otherwise the Knowledge sidebar displays over components.

**Visualforce Tips**

For each page layout, you can use a Visualforce page as a component once.

If Visualforce pages are assigned to page layouts as components, you can’t delete them.

Visualforce pages don’t refresh when you click ![Refresh](https://www.salesforce.com) and select Refresh all primary tabs or Refresh all subtabs.

If you enable clickjack protection for Visualforce pages in your organization’s security settings, Visualforce pages won’t display correctly.

Unlike other Visualforce pages, you don’t have to set the standard controller on components to the object whose page layout you’re customizing.

If you add `showHeader=true` to a Visualforce page, you can add a 15-pixel gap to the right and left sides of a component to visually indicate its location in a sidebar. For example, `<apex:page standardController="Contact" showHeader="false" title="List of Cases">`.

When Visualforce pages are used as components, two URL parameter values are passed automatically:

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Parameter Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>A case-sensitive 15-character alphanumeric string that uniquely identifies a record.</td>
<td>The ID of the detail page in which the component displays. This parameter is only passed if the ID is available.</td>
</tr>
<tr>
<td>inContextPane</td>
<td>true</td>
<td>Indicates the Visualforce page displays as a component in a Salesforce console.</td>
</tr>
</tbody>
</table>

SEE ALSO:

Console Components
Add Console Components to Page Layouts

After you create a console component, you can add it to page layouts so that users can access it from a sidebar in a Salesforce console.

1. From the object management settings for the object whose page layout you want to edit, go to Page Layouts.
2. Click Edit next to a page layout.
3. Click Custom Console Components.
4. Next to the sidebar in which you want to add your component, choose how to display and organize your components by Style. See Sidebar Styles for Console Components.
5. Specify the size of the sidebar in the console by selecting height or width, and typing its percentage or number of pixels. When the height or width of the sidebar is below the following number of pixels, these components types automatically hide because they become too difficult to read:
   - Knowledge One - 250
   - Lookups - 150
   - Related lists - 200
   - Report charts - 150
6. Under Type, choose whether your component is a Visualforce Page, Canvas App, Lookup, Related List, or Report Chart. Before you can choose a Report Chart, add it to the page layout and make sure it’s in a folder that’s shared with users who need access.
   - If the Knowledge tab is set up in your Salesforce org, add the Knowledge One component to case pages so agents can easily find and work with articles.
   - If your org uses entitlement management, add the Milestone Tracker to case pages so agents can see the latest information on milestones related to cases they’re working with.
   - If you have topics enabled for an object, add the Topics component so users can view, add, and delete topics on the records they’re working with.
   - Add the Files component to case pages so support agents can use drag-and-drop to quickly attach files to cases, see files that are already attached, and include attached files to case emails.
   - If your org uses Knowledgeable People and topics on objects, add the Case Experts component to case page layouts so agents can easily collaborate with colleagues who have expertise in specific areas.
   
   **Note:** Case Experts is available through a pilot program. For information on enabling Case Experts for your org, contact Salesforce.

Since page layouts are limited to two report charts, you can add up to two report charts to a sidebar. You can add up to five components to a sidebar and a maximum of eight components to a page layout. Any canvas app components you add can’t be added to AppExchange packages.

7. Under Component, set the details:
   - For Visualforce pages or canvas apps, click 📦 under Component to find and select your component.
     
     **Tip:** You can include Lightning components in Visualforce pages. See Lightning FAQ.
   - If your component is a lookup field, related list, or report chart, choose the field, list, or chart’s name. Optionally, you can add more fields to look up components by defining objects’ mini page layouts. You can also hide report charts and related lists from

---

**Editions**

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

**User Permissions**

To add custom console components:
- “Customize Application” AND “Service Cloud User” OR “Sales Console”

To create Visualforce pages:
- “Customize Application”

To manage canvas apps:
- “Customize Application”
pages where they appear as components to prevent duplicate information from showing. If you want to reorder related lists, do so from page layouts. Related list components don’t display custom buttons.

8. Under Label, type the name for your component to display to console users from the sidebar. If you don’t type a label for a report chart, the report chart’s name is used.

9. Specify the size of the component in the sidebar by selecting height or width, and typing its percentage or number of pixels. If you don’t specify a height or width, the component is automatically sized to appear correctly in a console.

Autosize Components is available for components with the Stack style. It’s selected by default so that when users resize browsers, Stack components fit nicely in sidebars. Salesforce chooses a minimum height and width for Stack components, and you can’t change those values. The fit-automatically option is unavailable for Visualforce pages, and canvas apps.

10. Click Save.

- Sidebar Styles for Console Components
- Add a Report Chart to a Page Layout
- Find Object Management Settings

Add Quick Actions to the Console Sidebar

Add custom quick actions to the console sidebar to let support agents easily create, update, and search for records associated with cases. Quick actions are added as console components.

Create the quick actions before adding them to the Case page layouts in the console.

1. From Setup, enter Page Layouts in the Quick Find box, then select Page Layouts under Cases.

2. Select a page layout to work with.

3. Click Custom Console Components.

4. Scroll to the sidebar section where you want to add the quick action component. For example, to add it to the left sidebar, go to the Left Sidebar section.

5. Configure the quick action component:
   - **Field**: Select the record field that the quick action affects. For example, if the quick action creates a contact record, select the Contact field.
   - **Enable Linking**: If selected, support agents can associate this record with a case. For example, a support agent can create a contact and link it to a case.
   - **Create Action**: Select the “Create” quick action. This quick action lets support agents create a record.
   - **Update Action**: Select the “Update” quick action. This quick action lets support agents update a record.

6. Add more quick action components as needed.
Streamline Sales and Service with the Salesforce Console

7. Click **Save**.

**Sidebar Styles for Console Components**

When administrators add components to page layouts, they choose the sidebar style in which to display the components in a Salesforce console.

The following sidebar styles are available for console components on page layouts.

<table>
<thead>
<tr>
<th>Multi-Component Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stack</td>
<td>A content area with multiple frames.</td>
</tr>
<tr>
<td>Tabs</td>
<td>A single content area with a list of multiple panels.</td>
</tr>
<tr>
<td>Accordion</td>
<td>A collapsible content area. This style is only available for vertical sidebars.</td>
</tr>
</tbody>
</table>

SEE ALSO:
- **Add Console Components to Page Layouts**

**EDITIONS**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**
Add Console Components to Apps

After you create a console component, you can add it as a button in the footer of Salesforce console so users have access to it.

1. From Setup, enter Custom Console Components in the Quick Find box, then select Custom Console Components.

2. Click New.

3. Type a name for your component.

4. In Button Name, type the label to display on the button users click to launch your component. For example, Live Agent.

5. In Button CSS, enter the in-line style used to define how the button looks to users who click it to launch your component. The styles supported include font, font color, and background color.

6. Type the width of the button to display in the console.

7. In Component, select Visualforce Page or Canvas App, and either type the name of your component, or click to find and select it.

Tip: You can include Lightning components in Visualforce pages. See Lightning FAQ.

8. Type the height and width of the window used to display your component in the console.

9. To prevent users from changing the dimensions of the window used to display your component, click Fixed Width or Fixed Height.

10. Click Save.

Before users can access your component, you must assign it to a console. See Assigning a Custom Console Component to an App.

SEE ALSO:

Assign a Console Component to an App
Assign a Console Component to an App

After you add a console component to Salesforce console apps, you must assign it to each console for user access.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Select a console app.
3. Click Edit.
4. In Choose Custom Console Components, add any available components to your app.
5. In Align Console Components, choose whether to align components to the left or right of the console’s footer.
6. Click Save.

SEE ALSO:
Add Console Components to Apps

Brand a Salesforce Console

You can brand a console by adding a custom logo to its header and specifying colors for its header, footer, and primary tabs.

1. From Setup, enter Apps in the Quick Find box, then select Apps.
2. Click Edit next to a console.
3. To add a custom logo, click Insert an image, and choose an image from the document library.
   Consider these requirements when choosing a custom app logo from the document library:
   • The image must be in GIF or JPEG format and less than 20 KB.
   • If the image is larger than 300 pixels wide by 55 pixels high, then it is scaled to fit.
   • For the best on-screen display, we recommend that you use an image with a transparent background.
   • The Externally Available checkbox must be selected on the document’s properties so that users can view the image.
4. To specify a color, type a hex code in Header Color, Footer Color, or Primary Tab Color. For example, type #0000FF to define the header as blue.
5. Click Save.

To verify that the correct colors display, view your console.

Note: Defining header or footer colors is not yet available for the Metadata API.
Use a Salesforce Console

Use a Salesforce Console

Get more done faster using a console's enhanced interface to work with records. Unlike standard Salesforce pages, all items you click in a console display as tabs. Along with the efficiency of tab-based navigation, a console helps you:

- Work with many records simultaneously
- View most recently used tabs and bookmarks
- Resize pinned lists to see more information
- Navigate more quickly using keyboard shortcuts
- Work across multiple monitors

A console's dashboard-like interface organizes related data all on one screen so that you can:

- Search for records
- Jot notes on records using the interaction log
- See when records you’re viewing have been edited by others
- Use a SoftPhone to make and receive calls

Additionally, with a Salesforce console for service, you can:

- Find Salesforce Knowledge articles to solve cases
- Chat with customers using Live Agent

Note: If your Salesforce admin adds custom console components, additional functionality might be available for you in the sidebars and footers of a console.

Salesforce Console Tabs

Any items you click on in a console display as tabs. Tabs let you see all the information you need on one screen without losing context.
(1) The navigation tab lets you select objects and records to work with. (2) Primary tabs display the main work items in a console, such as an account. (3) Subtabs display related items on a primary tab, such as an account’s contact. Use tabs to navigate within the console as you do your work.

⚠️ **Warning:** Browsers’ back buttons aren’t supported for a console and might not work as expected. Console tabs are saved in browser tabs until you close them.

When you close browser tabs, you lose any open console tabs. If your administrator sets up saved user sessions for a console, when you log back into Salesforce, any of your previously open console tabs and console components automatically appear again. Also, if you resize any sidebar components, interaction logs, or close the global search header, those customizations appear again too. If you log out of Salesforce and log in again using the same window, your previously open tabs reopen in the new session, even when Save User Sessions is disabled.

### Salesforce Console Navigation Tab

Use the navigation tab to select an object and view its home page.
A Console's Navigation Tab

Each console displays one navigation tab. Your administrator determines the list of objects you can choose from a navigation tab, but if it’s turned on for you, you can click Customize My Tabs to hide, display, and organize the objects.

Most object home pages selected from a navigation tab display list views, which automatically appear as enhanced lists. A navigation tab doesn’t display forecasts, ideas, answers, connections, portals, console, or buttons for customizing your Salesforce org.

Salesforce Console Tabs
Use a Salesforce Console

Guidelines for Working with Salesforce Console Tabs
Learn how you can get the most out of working with a console’s primary tabs and subtabs.

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

A Console’s Primary Tabs and Subtabs

(1) A primary tab is the main item to work on, such as an account. (2) A subtab is a related item on a primary tab, such as an account’s contact. Salesforce doesn’t limit the number of tabs you can display.
When viewing tabs, ✯ appears on tabs where you haven't saved changes, except for reports, Visualforce pages, or your Salesforce org's setup pages. ⚠ appears on tabs where you need to fix errors. If your administrator has added external domains to a console's whitelist, tabs can display pages outside of Salesforce. New tabs don't appear when you click a custom button or change a record's type, owner, or territory; instead, the current tab goes to the item you selected.

You can do a variety of things with tabs from the tab bar by clicking ▼ and selecting an option, such as closing tabs, refreshing tabs, showing keyboard shortcuts, and more. To rearrange a tab, drag it to a new position along the tab bar. Tabs maintain their status as primary tabs or subtabs, meaning that you can't move primary tabs to the subtabs bar or vice versa. Rearranging tabs isn't available for Internet Explorer® 7.

If your administrator has turned on multi-monitor components, you can pop out primary tabs from your browser and drag them to any location on your screen to personalize the way you work. Just click ▼ and select Pop out primary tabs. To return primary tabs to their original browser, click ▼ and select Pop tabs back into console.

To copy the URL of a console tab and send it to another user, click ▼ and select next to the tab's name. If you’re sending the URL to a non-console user, choose to create a standard Salesforce URL from the Link to Share dialog box. Then, press CTRL+C to copy the URL. To add a new tab to your console in which to paste a URL you've copied, click +. In the text box, press CTRL+V to paste the URL, then click Go! You can paste a console URL or a standard Salesforce URL into a new tab.

To pin a frequently visited primary tab to the tab bar for quick access, click ▼ and select . When a tab is pinned, it's moved to the front of the tab bar and its text is removed to provide more screen space. To unpin a tab, click ▼ and select .

To bookmark a favorite or occasionally visited tab for quick access, click ▼ and select . When a tab is bookmarked, it's moved to the History component in the footer (formerly named Most Recent Tabs). To remove a bookmarked tab, click ▼ and select , or click Remove next to the tab in the History component. See View Bookmarks or Recently Used Tabs in a Salesforce Console on page 3835.

⚠️ Warning: If you click Cancel on a newly created item that you haven't saved, the item and its tab are deleted and aren't sent to the Recycle Bin.

⚠️ Note: If your Salesforce admin adds custom console components, additional functionality might be available for you to work with in the sidebars next to tabs.

利好 Tip: To reopen the last tab you closed, press SHIFT+C or click ▼ and select Reopen last-closed tab. You can reopen up to ten closed tabs.

SEE ALSO:
- Salesforce Console Navigation Tab
- Salesforce Console Tabs
- Use a Salesforce Console
View Bookmarks or Recently Used Tabs in a Salesforce Console

If set up by your Salesforce admin, you can quickly access any primary tabs that you’ve bookmarked or recently used in a console without having to search Salesforce.

Note: With Summer ‘15, Most Recent Tabs was renamed History and bookmarks were added to it to give you a more streamlined experience for finding and retrieving tabs. These features aren’t available in Internet Explorer® 7 and 8.

To view any bookmarked or recently used primary tabs, click History in the console’s footer. Then click the Bookmarks or Recent Tabs column and select a tab. You can get each tab’s URL to send it to another user, or remove bookmarks and clear recently used tabs to start from scratch. Next to each recent tab, you can access up to ten subtabs when they’re available. Items that don’t display as tabs, such as meeting request overlays, don’t display in the History footer.

Use a Salesforce Console

Resize and Minimize Pinned Lists in a Salesforce Console

If an administrator has turned on pinned lists and chosen where they display on screen, you can resize and minimize the lists.

To resize a pinned list, click the right or bottom margin of the list and drag it to the size you want. To minimize a pinned list, click the arrow on the right or bottom margin. To display the list again, click the arrow once more. If you haven’t yet selected a record from a list, the list automatically displays full screen.

SEE ALSO:  
Use a Salesforce Console

Work with Keyboard Shortcuts in a Salesforce Console

Keyboard shortcuts let you quickly perform actions by pressing keys instead of having to use a mouse.

Keyboard shortcuts can make working with a console more efficient. For example, instead of typing case details and then using a mouse to click Save, an administrator can create a shortcut so that you can type case details and press CTRL+S to save cases without switching to your mouse. Only administrators can create or customize shortcuts.

To view an overlay that lists shortcuts for a console, press SHIFT+K or click and select Show Keyboard Shortcuts. If a shortcut appears dimmed on the overlay, it hasn’t been enabled or it’s been customized.
Keyboard shortcuts aren’t case sensitive, even when you press SHIFT before a letter key. For example, SHIFT+b is the same as SHIFT+B. If CTRL, ALT, or SHIFT is in a keyboard shortcut, the sequence of those keys doesn’t matter. For example, CTRL+ALT+A is the same as ALT+CTRL+A.

Guidelines for Working with Salesforce Console Multi-Monitor Components

Move portions of a console to different areas of your computer screens so that you can view data in ways that help you work best.

After a Salesforce admin turns on multi-monitor components, you can pop out and drag primary tabs and Open CTI SoftPhones to other locations on your screens. You can also move the History component, Live Agent chats (but not the footer component), and any custom console components or Force.com Canvas components in a console’s footer. To use multi-monitor components, you might need to update your browser’s settings to: (1) allow popup windows; (2) open links in windows, not tabs.

To pop out and drag primary tabs, click and select Pop out primary tabs. To return primary tabs to their original browser, click and select Pop primary tabs into console.

To pop out and drag components in a console’s footer, click the items and select . To return items to their original browser, click . To refresh a popped out footer component, right-click on it and choose Reload or Refresh. When you refresh a popped out footer component, it’s returned to the console’s footer.

If pinned lists are set up, a playground appears as a blank area next to lists and it says Drag Footer Components Here. Use this area to keep track of Salesforce windows among several applications on your screens.

Important: Popped out items close and lose their positions on your screens when you: (1) log out of Salesforce; (2) click Setup; (3) click a link to leave a console; (4) refresh or close your browsers.

Note: You can’t pop out SoftPhones built with versions 3.0 or 4.0 of the CTI Toolkit.

Tip: Any items popped out of the console have blue headings to help you locate them among other windows on your screens.

To use keyboard shortcuts from popped out components, focus on the correct window. For example, if you’re focused on a window with the navigation tab, the default shortcut to go to primary tabs, key command P, won’t work.

Use a Salesforce Console
Add Notes to Records in a Salesforce Console

The interaction log helps you quickly add notes to records on a console’s primary tabs.

If you’re assigned to an interaction log layout, you can access the log from a console’s footer. Logs appear on items that have an Activity History related list, such as accounts and contacts, but not solutions. Logs aren’t available for reports, dashboards, Salesforce CRM Content, the Article Management tab, or Visualforce pages.

To show or hide the interaction log, hover over the log’s border and click or . To resize the interaction log and a detail page, drag the bar in between them. To help you quickly save notes on customers, when a contact appears on a subtab, the contact’s name is added to the log’s Name. However, you can change the Name before you save a log. When you click Clear Log to remove notes or a Subject, any saved notes aren’t removed—they’re stored on the record’s Activity History related list. For easy review and retrieval, all logs are saved as tasks on records’ Activity History related list.

Note: Administrators can customize the fields that appear on logs.

Tip: If you use a SoftPhone, click Add Call Data to add a call’s date and time to the log. When screen popup windows appear from inbound calls, click End Call to end the call and save any updates that you’ve made to the log.

Use a Salesforce Console

View Push Notifications in a Salesforce Console

Push notifications are visual indicators that appear when a record or field you’re viewing was changed by others.

After a Salesforce admin configures push notifications, visual indicators for record or field changes appear on lists and detail pages. When changes happen, detail pages automatically refresh and show updates, or notifications appear as dialog boxes. Lists display notifications as:

Editions

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

User Permissions
To view the interaction log:
• “Read” on tasks
To save notes in the interaction log:
• “Edit” on tasks

Editions

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

Note: Administrators can customize the fields that appear on logs.

Tip: If you use a SoftPhone, click Add Call Data to add a call’s date and time to the log. When screen popup windows appear from inbound calls, click End Call to end the call and save any updates that you’ve made to the log.

SEE ALSO:
Use a Salesforce Console
Push Notifications for Lists

(1) Yellow when a record changes. (2) Blue if it’s the last item you viewed. (3) Bold and italic when a field specified by an admin changes.

Note:

- These objects and their fields are available for push notifications: accounts, contacts, cases, leads, opportunities, campaigns, tasks, and custom objects.
- Push notifications aren’t available in the console in Professional Edition.
- If you set up push notifications for the lead object and use Data.com Clean rules, push notifications are triggered in the console. Keep in mind that extra notifications can affect your push notification limit.

Use a Salesforce Console

Use a SoftPhone with a Salesforce Console

A SoftPhone in a console lets you view records related to phone calls, as well as receive, place, and transfer calls.

You can access a SoftPhone if you’re assigned to a call center using a CTI adapter built with version 3.0 or 4.0 of the CTI Toolkit, or if you’re using a call center built with Open CTI.

Click 📞 to display a SoftPhone from the footer of a console. Use the interaction log to write notes in call logs. A call log is an activity record that automatically generates when you use a SoftPhone, and it tracks the phone number, caller, date, time, and duration of the call. You can view call logs in the Activity History related list of any record associated with the call.

Important: Data might not save properly when you: (1) Refresh your browser during a call; (2) use a SoftPhone in multiple browsers simultaneously; (3) switch to a SoftPhone in a browser without a console.

Note: If you’re using a CTI adapter built with version 4.0 of the CTI Toolkit, 📞 displays in the footer even when you’re not connected to the adapter.

EDITIONS

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To view and use the SoftPhone:

- Member of a call center
Tip: You can hide the SoftPhone by clicking ☰️, but you can’t move it away from the footer of a console. You can also resize the height of a SoftPhone by dragging the bar on top of it. When you click End Call, any updates you’ve made to the interaction log are saved before the call ends.

Find Knowledge Articles in a Salesforce Console

If Salesforce Knowledge and the Knowledge sidebar is set up by an administrator, articles automatically appear when you select a case in a console.

To help you solve cases faster, suggested articles appear in the sidebar as you type details into a case’s Subject. Only articles updated within the last 30 days appear, but you can view older articles by specifying a search term or filtering search results. To filter articles by a specific category, language, or validation status, click ☰️ and choose filter options. To access these filters, validation status and multilingual articles must be enabled. An administrator determines which languages are available for articles. The columns available in the sidebar are New, Article Title, and Most Viewed. You can drag the bar in between the columns to resize them, but you can’t add, remove, or rearrange columns.

To find articles to help you solve a case, click ☰️, type keywords into Search, and click Go. To attach an article to a case, click the checkbox next to the article and click Attach to Case. You can only attach an article to a saved case. ☑️ displays next to an article already attached to a case.

To change the number of articles displayed, click the article count indicator in the lower left corner of the sidebar and choose a setting. You can view 10, 25, 50, 100, or 200 articles at a time. When you change this setting, you return to the first page of the list.

To show or hide the sidebar, hover over the scrollbar and click ☰️ or ☰️. You can drag the bar in between the articles sidebar and a detail page to resize the width of either one.

Live Agent for Support Agents

Welcome to Live Agent for support agents! Live Agent is a comprehensive chat solution that makes it easy for you to support customers.

As a support agent, you assist dozens of customers with their support issues every day. Live Agent is a chat solution that’s fully integrated with the rest of Salesforce, making it easy for you to access all the information you need about your customers in a single workspace. In addition, Salesforce leverages the power of the Service Cloud, giving you access to important tools like a knowledge base and pre-defined support messages, that let you assist your customers and close cases more quickly.

Whether you’re a seasoned veteran or new to Live Agent, there are several tools at your disposal that make it easy to assist multiple customers at the same time with chat. Let’s get started.

**Change Your Live Agent Status**

Change your Live Agent status to control when you’re available to receive new and transferred chats.

In Live Agent, you can set your online status to online, away, or offline. When you exit Live Agent, your status automatically changes to offline and any active chat sessions end.

1. Click the Live Agent footer widget to open the chat monitor.
2. Click the drop-down arrow in the upper right corner of the chat monitor to view your status options.
3. Select your status.

### Live Agent Statuses

Live Agent statuses define how you can interact with customers while you’re online, away, or offline.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online</td>
<td>You can receive and accept incoming chats and transfers.</td>
</tr>
<tr>
<td>Away</td>
<td>You can continue any chat sessions you’ve already started, but you can’t accept incoming chats or transfers.</td>
</tr>
<tr>
<td>Offline</td>
<td>You can’t accept incoming chats or transfers, and no chats can be routed to you.</td>
</tr>
</tbody>
</table>
Chat with Customers

Accept incoming chat requests to begin chatting with customers.

When you receive a new chat or transfer request, the pending request appears in your chat monitor. You can see the deployment or website the chat came from, the customer's name (if it's available), and the number of minutes the request has been waiting to be answered.

You can chat with several customers at the same time. Each chat session opens in a separate primary tab.

1. In the chat monitor, click Accept on the chat request.
   The chat log opens in a new primary tab.

2. Type your message to the customer in the message field.

3. Click Send or hit ENTER on your keyboard to send your message to the customer.

4. Click End Chat when you're done assisting the customer.
   If the customer ends the chat first, a notice appears in the chat log.

- End a Chat Session
Access Customer Details During a Chat

When you accept a chat request, a details tab for that chat opens automatically. The details tab includes information about the visitor and lets you look up records related to the chat, such as contacts and cases.

- To search for a record, type a name in the relevant box in the Related Entities section of the page, then click search icon. To associate a record you find to the chat, select it from the search results list and click Save.

In older organizations, you could access records and visitor details from the Related Entities panel during chats. However, starting with Summer ’14, the Related Entities panel in the details tab isn’t available for new Live Agent customers. Existing customers will continue to have access to the Related Entities panel.

- Once you associate an existing record to the chat, click the name of the record to open it in a new tab.
- To create a new record, click New Case, New Lead, New Contact, or New Account.

Send Quick Text Messages in Chats

Send pre-written messages to chat customers to send common messages more quickly. Quick Text lets you respond to customers more efficiently by letting you insert predefined messages, such as greetings or common troubleshooting steps, into your chat messages.

Note: If you don't have access to Quick Text, contact your Salesforce admin.

1. While chatting with a customer, type ;; in the message field. A list of Quick Text messages appears. The messages you’ve used most recently appear at the top of the list.
2. To see additional Quick Text messages that are available, type a word or phrase. A list of messages that include those words appears.
3. To see the title and full text of a message, click it once or highlight it using the arrow keys on your keyboard. The full message appears at the bottom of the Quick Text list.
4. To select a message and add it to your chat, double-click it or highlight it and hit ENTER on your keyboard.
5. To send the message, click Send or hit ENTER on your keyboard.

SEE ALSO:
Create Quick Text Messages
Transfer Files During a Chat

Give customers the ability to upload and transfer files during a chat so they can easily share more information about their issues.

For example, if a customer is receiving an error when they try to complete a process, they can upload and transfer a screenshot of the error message to the agent.

Before a customer can upload a file, you must associate the chat with a record, such as a case or a contact. Since the chat transcript isn’t created until you end the chat, you can’t attach a customer’s file directly to the transcript during the chat.

1. Click  to search for or create a record to attach to the chat.
2. Click the file transfer icon ( ).
   
   Note: A customer can’t upload a file until you initiate the file transfer by clicking the file transfer icon. This helps prevent customers from uploading unsolicited or potentially dangerous files into the chat.
3. Select the record you chose in the first step to attach the transferred file to.
   The customer receives a prompt to upload their file to the chat window. The file can’t exceed 25 MB.
4. When the customer has sent the file through the chat, click the link in the chat log to view the file.
Add Attachments to a Chat

Attach Articles to Live Agent Chats

Use the Knowledge One widget to find articles that help solve customer issues during chats. The Knowledge One widget is only available if your Salesforce org uses Knowledge and your Salesforce admin has included the tool in your Salesforce console app.

1. When chatting with a visitor, click an article from the list in the Knowledge One widget. A tab with the full text of the article opens.

2. To search for a specific article in the list, type a word or phrase in the text box in the widget and click ✗ or press ENTER.
   - Alternatively, click ✗ at the top of the widget to search all articles, including those not in the list. The main widget search gives you the option of limiting your results to specific types of articles.
   - To filter your search results, click Filters and choose how you want to restrict your search.

3. When you find the article you want, click ✉️, then click Share. The text of the article appears in the chat text box.

4. Click Send or press ENTER on your keyboard to send the article to the visitor.

   ![Note: You can send articles to visitors only if your admin has set up a Chat Answer field on articles. If this field isn’t set up, you can view articles but can’t include them in chats.]

SEE ALSO:

Set Up Chat Answers from Knowledge Articles
Attach Records to Chat Transcripts

Search for or create records to attach to a chat transcript as you chat with customers. Find existing records or create new ones to associate with a transcript as you chat with customers. For example, you can create a new case based on the customer’s issue, or search for the customer’s existing contact record and attach these records to the transcript for later reference. You can attach standard or custom records to your chat transcripts.

1. While chatting with a customer, click to attach a record to the transcript.
   Note: You can only attach one of each type of record to a chat transcript. For example, you can’t attach more than one case to a single transcript.

2. To search for an existing record:
   a. Click the search icon ( ) in the records window next to the type of record you want to search for.
   b. Type the name of the record and hit ENTER. The record opens in a new tab.
   c. Click the attach icon ( ) again.
   d. Select the check box next to the record you searched for to link it to the chat transcript.

3. To create a new record:
   a. Click the create icon ( ) next to the type of record you want to create.
   b. Complete the information in the new record and save it. The record will automatically link to the transcript once the record is created.

4. After you complete the chat with the customer, exit the chat.

5. If prompted, click Save. The records you linked are now attached to the transcript. You can access them from the transcript’s detail view.

SEE ALSO:
Live Agent Transcripts
Block Unwanted Chat Customers

You can block chats from troublesome customers right from the Salesforce console. For example, if a customer is using abusive language or sending spam messages, you can block that user from starting a new chat.

Blocking a chat ends the chat and blocks any new chat requests coming from that user’s IP (Internet Protocol) address.

If your Salesforce org is receiving many spam chats from a particular region, your administrator can block entire ranges of IP addresses.

1. In the interaction pane, click the icon.

2. (Optional) Enter a comment explaining why you’re blocking this visitor.

3. Click Block.

When you click Block, you immediately end the chat, and the visitor sees a notification that an agent ended the chat. If multiple agents are engaged in a conference, Block immediately ends the conference, and the other agents are also notified.

If you don’t see the icon in your console, contact your Salesforce admin to enable it. Only a Salesforce admin can unblock an IP address.
End a Chat Session

End a chat session after you’ve finished chatting with a customer and updating the records related to their chat.

After you end a chat with a customer, the primary and secondary tabs related to that chat remain open in your console. Close them to save your work and free up space to take on more chats.

1. Close the primary tab for the chat.
2. If prompted, click Save.

Collaborate and Request Help

Transfer Chats to an Agent, Skill, or Button

Live Agent chats can be transferred to another agent, skill, or button so your customers always receive the highest-quality help from the most relevant sources.

Just as you forward an email or pass a case to another agent, you can transfer a Live Agent chat. Transferring is useful when a customer has an issue that another agent can solve, or requires an agent with a particular skill. How the chat gets to the next agent depends on the kind of transfer you use.

There are three types of transfers: Transfer to Agent, Transfer to Skill, and Transfer to Button. To ensure that your customers get help as quickly as possible, certain chat transfer types can exceed agents’ configured capacity. You can set agent capacity through the Live Agent Configuration, or the Presence Configuration if your organization uses Omni-Channel.
Can Exceed Configured Agent Capacity?

<table>
<thead>
<tr>
<th>Type of Transfer</th>
<th>Scenario</th>
<th>Method of Transfer</th>
<th>Can Exceed Configured Agent Capacity?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transfer to Agent</td>
<td>You want to transfer the chat to Agent Jane, because she's the perfect fit for the case.</td>
<td>A chat request is sent to Agent Jane. If she accepts the request, the chat is transferred to her, and your chat workspace closes.</td>
<td>Yes</td>
</tr>
<tr>
<td>Transfer to Skill</td>
<td>You want to forward the chat to an agent who has the skill “billing specialist.”</td>
<td>A chat request is sent to all agents assigned to the skill, and the chat is transferred to the first agent to accept it.</td>
<td>Yes</td>
</tr>
<tr>
<td>Transfer to Button</td>
<td>You want to transfer a chat from the sales queue to the service queue.</td>
<td>The chat is transferred to an available agent assigned to the selected button or queue.</td>
<td>No</td>
</tr>
</tbody>
</table>

When chats are transferred directly to an agent or skill group, the transferred chats are allowed to exceed the accepting agent’s capacity. This means that agents always receive a chat request, even if they’re handling the maximum allowed number of chats. If the transfer request is rejected or times out, the original agent can try another recipient or transfer method.

Chats routed from buttons or queues always respect the configured agent capacity. So, agents assigned to that button or queue don’t receive the transfer request—or any other chat requests—until they have open capacity. But don’t worry: customers still won’t get stuck waiting for another agent. When a chat is sent to the next queue, it’s added into the list of incoming chats by its age, so it will appear higher up than brand-new chat requests.

When an agent accepts a transferred chat, the records attached to the chat transcript, like a case or contact, open alongside the chat in the workspace. The accepting agent has the information to start assisting the customer right away, without having to search for related records. These records are also completely up-to-date, as the previous agent is prompted to save any changes when the transfer is initiated.

**Note:** If the accepting agent doesn’t have permissions to view one or more of the attached objects, those items won’t open in the transferred workspace.

**Transfer Chats**
You can transfer chat sessions to other agents when a customer needs extra help with an issue, or to make room for new requests.

**Transfer Chats**
You can transfer chat sessions to other agents when a customer needs extra help with an issue, or to make room for new requests.
Transfer Chats

You can transfer chat sessions to other agents when a customer needs extra help with an issue, or to make room for new requests.

1. While chatting with a customer, click **Transfer**.

2. Select a transfer option from one of the menus.
Note: There are options for each type of transfer that’s enabled for your Salesforce org. If you don’t see the option you need, ask your administrator to add it for you.

3. (Optional) Write a message for the agent receiving the chat. This message is part of the chat request to provide context for the next agent.
4. If the transfer is accepted, your chat and any associated records automatically close (don’t worry, you’ll be prompted to save your changes if you haven’t already). If it's rejected, you can try again with another recipient or transfer method.
Send a Chat Conferencing Request

As wise as support agents are, sometimes a single support agent doesn’t have all the information that’s required to solve a customer’s problem. Chat conferencing lets you invite one or more agents into your customer chats. That way, your agents can turn boring chats into veritable support parties for your customers—all without disrupting the flow of conversation! Send a chat conferencing request to ask another agent to join you in a customer chat.

Note: You can conference in a single agent, or send a request to all agents and the first to accept will join the conference. You can conference multiple agents into a chat, but you need to send each request individually.

1. While you’re chatting with a customer, click 🔄.
2. Select the skill group of the agents that you want to transfer into the chat.
3. Select whether to send the conference request to all agents with that skill or to a specific agent.
4. Click Conference to send the conference request.
   If the agent accepts the conference request, you see a notification in the chat log, and that agent can start chatting with you and the customer. If the agent declines the request, you see a notification above the chat log. The customer receives a notification when an agent joins or leaves a conference.
5. If you decide to exit the conference, click Leave, and then click Leave again.
   If the other agent leaves the conference, you’ll see a notification in the chat log.

Any saved and attached records will open for other agents who join the conference. But only the originating or longest-attending agent will be able to attach other records. If the longest-attending agent attaches or removes records during the conference, other agents won’t see these changes in their workspaces.

For more about transferring chats and workspaces, see Transfer Chats.

Request Help with a Chat

When you need help with a chat, you can raise a virtual flag to alert a supervisor. Supervisors are alerted that you need help, and they can respond directly via the console.

1. In the interaction pane, click the 📂 icon.
2. Enter a message briefly explaining what help you need.
3. Click Raise Flag.

Either you or a supervisor can lower the flag when your issue is resolved.

If you don’t see the 📂 icon in your console, contact your Salesforce admin to enable it.
View Customer Records

Salesforce automatically creates some records when a chat ends. These records store information about chat customers and their interactions with agents. These records are mostly used internally to provide an audit trail about your customers and their chats with agents. However, you can access these records yourself if you ever need them.

1. To access customer records in the Salesforce console, select the type of record you want to view from the Salesforce console navigation list. A list of those records will appear in the main window.

- **Live Agent Session Records**
  Every time your agents log in to Live Agent, a Live Agent session record is automatically created. These session records store information about your agents’ and customers’ interactions online, such as how many chat requests were processed, how long agents spent online, or how long agents were actively engaged in chats with customers.

- **Live Agent Visitor Records**
  Every time an agent chats with a customer, Salesforce automatically creates a visitor record that identifies the customer’s computer.

- **Live Agent Transcripts**
  A Live Agent transcript is a record of a chat between a customer and an agent. Salesforce automatically creates a transcript for each chat session.

- **Live Agent Session Records**
  Every time your agents log in to Live Agent, a Live Agent session record is automatically created. These session records store information about your agents’ and customers’ interactions online, such as how many chat requests were processed, how long agents spent online, or how long agents were actively engaged in chats with customers.

- **Live Agent Visitor Records**
  Every time an agent chats with a customer, Salesforce automatically creates a visitor record that identifies the customer’s computer.

- **Live Agent Transcripts**
  A Live Agent transcript is a record of a chat between a customer and an agent. Salesforce automatically creates a transcript for each chat session.
Live Agent Session Records

Every time your agents log in to Live Agent, a Live Agent session record is automatically created. These session records store information about your agents’ and customers’ interactions online, such as how many chat requests were processed, how long agents spent online, or how long agents were actively engaged in chats with customers.

Use Live Agent sessions to find and edit information about your support agents’ chats with customers. For example, you can create a list called "Today’s Sessions" to view chat activity that occurred in one day.

You can associate session records with cases, accounts, contacts, and leads or link them with other objects through custom lookup fields.

Note: If you have the correct permissions, you can create, view, edit, or delete session records, just like other record types in Salesforce. However, session records are meant to provide a paper trail for the chats between your agents and customers, so we don’t recommend tampering with these records in most cases.

Live Agent Visitor Records

Every time an agent chats with a customer, Salesforce automatically creates a visitor record that identifies the customer’s computer.

Each new visitor is associated with a session key, which Salesforce creates automatically. A session key is a unique ID that is stored in the visitor record and on the visitor’s PC as a cookie. If a customer participates in multiple chats, Salesforce uses the session key to link the customer to their visitor record, associating that record to all related chat transcripts.

Note: If you have the correct permissions, you can create, view, edit, or delete visitor records, just like other record types in Salesforce. However, visitor records are meant to provide a paper trail that associates your customers with their chat transcripts, so we don’t recommend tampering with these records in most cases.

SEE ALSO:

Create Records
Delete Records
Edit Records
Live Agent Transcripts

A Live Agent transcript is a record of a chat between a customer and an agent. Salesforce automatically creates a transcript for each chat session.

When a chat ends successfully—that is, when the chat is ended by a customer or an agent—the chat transcript is created as soon as the agent closes the chat window and any related tabs.

If a chat is disconnected or experiences another error, Salesforce still creates a chat transcript for it, though it takes up to 30 minutes to create the transcript after the chat is disconnected.

You can associate a transcript with cases, accounts, contacts, and leads, or you can link it to other objects.

Note: If you have the correct permissions, you can create, view, edit, or delete chat transcripts, just like other record types in Salesforce. However, chat transcripts are meant to provide a paper trail for the chats between your agents and customers, so we don’t recommend tampering with these records in most cases.

Live Agent Transcript Fields
Live Agent transcript fields help you track information about your agents’ chats with customers.

Live Agent Transcript Events
Live chat transcript events automatically track events that occur between your agents and customers during chats.

### Live Agent Transcript Fields

Live Agent transcript fields help you track information about your agents’ chats with customers.

A Live Agent transcript has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields might not be visible or editable.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abandoned After</td>
<td>The amount of time in seconds an incoming chat request went unanswered by an agent before the chat was disconnected by the customer</td>
</tr>
<tr>
<td>Account Name</td>
<td>The name of the account associated with the transcript</td>
</tr>
<tr>
<td>Agent Average Response Time</td>
<td>The average time it took an agent to respond to a chat visitor’s message</td>
</tr>
<tr>
<td>Agent Maximum Response Time</td>
<td>The maximum time it took an agent to respond to a chat visitor’s message</td>
</tr>
<tr>
<td>Agent Message Count</td>
<td>The number of messages an agent sent during the chat</td>
</tr>
<tr>
<td>Agent Skill</td>
<td>The skill associated with the live chat button used to initiate the chat</td>
</tr>
<tr>
<td>Body</td>
<td>The transcribed chat between an agent and a visitor</td>
</tr>
<tr>
<td>Browser</td>
<td>The type and version of the browser used by the visitor</td>
</tr>
<tr>
<td>Browser Language</td>
<td>The visitor’s browser language selection</td>
</tr>
<tr>
<td>Case</td>
<td>The case associated with the chat</td>
</tr>
<tr>
<td>Chat Button</td>
<td>The chat button that the visitor clicked to initiate the chat</td>
</tr>
<tr>
<td>Chat Duration</td>
<td>The total duration of the chat in seconds</td>
</tr>
<tr>
<td>Contact Name</td>
<td>The name of the contact that participated in the chat</td>
</tr>
<tr>
<td>Created By</td>
<td>The user who created the transcript, including creation date and time (Read only)</td>
</tr>
<tr>
<td>Created Date</td>
<td>The date and time the transcript was created (Read only)</td>
</tr>
<tr>
<td>Deployment</td>
<td>The deployment from which the visitor initiated the chat</td>
</tr>
<tr>
<td>Field</td>
<td>Definition</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>End Time</td>
<td>The time the chat ended</td>
</tr>
<tr>
<td>Ended By</td>
<td>Indicates whether the visitor or the agent ended the chat</td>
</tr>
<tr>
<td>Last Modified By</td>
<td>The user who last modified the transcript, including date and time (Read only)</td>
</tr>
<tr>
<td>Last Modified Date</td>
<td>The date and time the transcript was last modified (Read only)</td>
</tr>
<tr>
<td>Lead</td>
<td>The name of the lead that was generated by the chat or discussed during the chat</td>
</tr>
<tr>
<td>Live Chat Transcript</td>
<td>Unique, numerical identifier automatically assigned to the transcript. Administrators can modify the format and numbering for this field. Transcript numbers usually increase sequentially, but sometimes they can skip numbers in a sequence.</td>
</tr>
<tr>
<td>Live Chat Visitor</td>
<td>Unique, numerical identifier automatically assigned to the visitor. Administrators can modify the format and numbering for this field. Visitor numbers usually increase sequentially, but sometimes they can skip numbers in a sequence. Note that visitors and contacts are different: a visitor might be a contact, but this is not a requirement, and there is no relationship between contacts and visitors.</td>
</tr>
<tr>
<td>Location</td>
<td>The visitor’s geographic location. Either the city and state, or city and country (if the visitor is located outside of the United States).</td>

### Live Agent Transcript Events

Live chat transcript events automatically track events that occur between your agents and customers during chats.

You can edit live chat transcripts to track events that occur between your agents and customers during live chats. You can add the following events to a live chat transcript:

<table>
<thead>
<tr>
<th>Event</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chat Requested</td>
<td>Visitor requested a chat</td>
</tr>
<tr>
<td>Queued</td>
<td>Chat request was placed in queue</td>
</tr>
<tr>
<td>Routed (Push)</td>
<td>Chat request was routed to agent</td>
</tr>
<tr>
<td>Routed (Choice)</td>
<td>Chat request was routed to all available, qualified agents</td>
</tr>
<tr>
<td>Accepted</td>
<td>Chat request was accepted by agent</td>
</tr>
<tr>
<td>Critical Wait Alert Time Reached</td>
<td>Agent failed to respond to the customer’s message before reaching the critical wait alert time</td>
</tr>
<tr>
<td>Critical Wait Alert Cleared</td>
<td>Agent responded to the customer’s message after the critical wait alert was received</td>
</tr>
<tr>
<td>Transfer Requested</td>
<td>Agent requested chat transfer</td>
</tr>
<tr>
<td>Transfer Accepted</td>
<td>Chat transfer was accepted by agent</td>
</tr>
<tr>
<td>Transfer Request Canceled</td>
<td>Chat transfer request was canceled by the agent who sent the request</td>
</tr>
<tr>
<td>Transfer Request Declined</td>
<td>Chat transfer request was declined by the agent who received the request</td>
</tr>
<tr>
<td>Event</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>Transferred to Button</td>
<td>Chat was transferred to a button</td>
</tr>
<tr>
<td>Transfer to Button Failed</td>
<td>Chat transfer to button was unsuccessful</td>
</tr>
<tr>
<td>Chat Conference Requested</td>
<td>Agent sent a request to start a conference</td>
</tr>
<tr>
<td>Chat Conference Canceled</td>
<td>Conference request was canceled</td>
</tr>
<tr>
<td>Chat Conference Declined</td>
<td>Conference request was declined by an agent</td>

Live Agent for Support Supervisors

Welcome to Live Agent for support supervisors! Live Agent is a comprehensive chat solution that makes it easy for your agents to support customers. With Live Agent’s supervisor tools, you can easily monitor your agents’ activities, assist your agents in chats, and view data on your agents’ chat sessions.

As a support supervisor, you oversee your employees to ensure that they provide the best customer support possible. Live Agent is a chat solution that’s fully integrated with the rest of Salesforce, making it easy for you to access the information you need about your agents and their chat activity in a single workspace.

Whether you’re a seasoned veteran or new to Live Agent, there are several tools at your disposal that make it easy to support and monitor your chat agents as they work with customers. Let’s get started.

SEE ALSO:
- Live Agent for Support Agents
- Live Agent for Administrators
- Permissions for Live Agent Support Supervisors

The Live Agent Supervisor Panel

The Live Agent supervisor panel is your one-stop shop to find information about your department’s chat buttons and chat agents. From the supervisor panel, you can monitor agents’ chat activities as they chat with customers and view customer traffic on specific chat buttons, all in real time. The supervisor panel is conveniently located in the Salesforce console, so it’s easy to access it without switching out of the app.

Access the Supervisor Panel
Access the supervisor panel conveniently from the Salesforce console to easily monitor your agents’ chat activity.

Agent Status List
The agent status list in the supervisor panel gives you access to real-time information about your agents’ chat activity.

Queue Status List
The queue status list in the supervisor panel gives you access to real-time information about your organization’s chat buttons and queues.
Monitor Your Agents’ Chats

View your agents’ chats from the supervisor panel as they help customers. You can monitor agents’ performance and give them real-time feedback and help as they serve customers.

Access the Supervisor Panel

Access the supervisor panel conveniently from the Salesforce console to easily monitor your agents’ chat activity.

1. To access the supervisor panel in the Salesforce console, select Live Agent Supervisor in the console’s navigation list.

The supervisor panel appears in the main console window, giving you access to real-time information about your Salesforce org’s chat buttons and agents.

EDITIONS

Available in: Salesforce Classic

Live Agent is available in: Performance Editions and in Developer Edition orgs that were created after June 14, 2012

Live Agent is available in: Unlimited Edition with the Service Cloud

Live Agent is available for an additional cost in: Enterprise and Unlimited Editions

USER PERMISSIONS

To use the Live Agent supervisor panel in the Salesforce console:

- Access to the Live Agent supervisor tab in a user profile or permission set, and included in a Salesforce console app
Agent Status List

The agent status list in the supervisor panel gives you access to real-time information about your agents’ chat activity.

<table>
<thead>
<tr>
<th>Agent Detail</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agent Name</td>
<td>The name of the agent.</td>
</tr>
<tr>
<td>Status</td>
<td>The agent’s Live Agent status.</td>
</tr>
<tr>
<td>Action</td>
<td>The actions you can take to change the agent’s status.</td>
</tr>
<tr>
<td>No. Chats in Progress</td>
<td>The number of chats that an agent is engaged in.</td>
</tr>
<tr>
<td>No. Requests Assigned</td>
<td>The number of pending chat requests that are currently assigned to the agent.</td>
</tr>
<tr>
<td>Time Elapsed Since Login</td>
<td>The amount of time the agent has been logged in to Live Agent.</td>
</tr>
<tr>
<td>Time Elapsed Since Last Accept</td>
<td>The amount of time since the agent last accepted a chat request.</td>
</tr>
<tr>
<td>Message to Supervisor (optional)</td>
<td>The private message that the agent sent with a help flag.</td>
</tr>
</tbody>
</table>

**Note:** If a red flag appears next to the name, the agent has requested help. Respond via the chat detail module (far right).

Expand each agent’s name to see details about the customers they’re chatting with.

<table>
<thead>
<tr>
<th>Customer Detail</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Visitor Name</td>
<td>The name of the customer, if available.</td>
</tr>
<tr>
<td>IP</td>
<td>The IP address of the customer’s device.</td>
</tr>
<tr>
<td>Network</td>
<td>The customer’s network, if available.</td>
</tr>
<tr>
<td>Browser</td>
<td>The type of internet browser the customer is using to connect to their chat window.</td>
</tr>
<tr>
<td>City</td>
<td>The city the customer is chatting from.</td>
</tr>
<tr>
<td>Country</td>
<td>The country the customer is chatting from.</td>
</tr>
<tr>
<td>Duration</td>
<td>The amount of time the customer has been engaged in a chat with the agent.</td>
</tr>
<tr>
<td>Action</td>
<td>The actions you can take to view the customer’s chat with the agent.</td>
</tr>
</tbody>
</table>

Live Agent Statuses
Queue Status List

The queue status list in the supervisor panel gives you access to real-time information about your organization's chat buttons and queues.

<table>
<thead>
<tr>
<th>Queue Detail</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Button Name</td>
<td>The name of the chat button.</td>
</tr>
<tr>
<td>ID</td>
<td>The unique Salesforce ID of the chat button.</td>
</tr>
<tr>
<td>Queue Length</td>
<td>The number of chats that are waiting to be assigned to an agent.</td>
</tr>
<tr>
<td>Longest Wait</td>
<td>The longest amount of time a customer chat has waited to be connected to an agent.</td>
</tr>
</tbody>
</table>

Available in: Salesforce Classic

Live Agent is available in: Performance Editions and in Developer Edition orgs that were created after June 14, 2012.

Live Agent is available in: Unlimited Edition with the Service Cloud.

Live Agent is available for an additional cost in: Enterprise and Unlimited Editions.
Monitor Your Agents’ Chats

View your agents’ chats from the supervisor panel as they help customers. You can monitor agents’ performance and give them real-time feedback and help as they serve customers.

1. In the Agent Status list, click to expand the information about the agent whose chat you want to view. If an agent has requested help, you see a red flag next to the name and a private message (far right) if the agent entered one.

2. To view a chat, click View in the Action column of the chat you want to monitor.
   The chat monitor opens in the Agent Status list.

3. To send a private message to an agent as the agent is chatting with a customer, type your message in the message field and press Enter.
   The agent can see your message in the chat log, but the message is invisible to the customer.

When you finish monitoring your agent’s chat, click again to collapse the chat monitor.
To remove a flag after you’ve provided help, click Lower Flag.

Agent Status List
Assign Skills to Agents

Assign skills to your agents as the expertise of your team evolves.

1. In Setup, enter Skills in the Quick Find box, then select Skills.
2. Click the name of the skill you want to assign.
3. Click Edit.
4. Select either the profiles (recommended) or individual users who have this skill.
5. Click Save.

If you don’t have access to the Skills page, ask your Salesforce administrator about enabling this permission. Only your administrator can create skills.
Report on Live Agent Sessions

Gain insight into your agents’ chat activities by building reports about Live Agent chat sessions. You can create a custom report type for Live Agent chat sessions and use it to run reports on your agents’ sessions using the Report Builder. These Live Agent session reports can provide insight about your agents’ chat activities—for example, whether or not your agent team is able to handle all chat requests from your customers.

1. Create a custom report type using Live Agent Sessions as the primary object.
3. Customize your report to include the columns of information you want to feature.
4. Save or run the report.

SEE ALSO:
  - Create a Report
  - Build a New Report

EDIIONS

Available in: Salesforce Classic

Live Agent is available in:
- Performance Editions and
- in Developer Edition orgs
  that were created after June 14, 2012

Live Agent is available in:
- Unlimited Edition with the Service Cloud

Live Agent is available for an additional cost in: Enterprise and Unlimited Editions

USER PERMISSIONS

To create, edit, and delete reports:
- “Create and Customize Reports”
- AND
- “Report Builder”
Ready to go beyond the basics of Salesforce administration? Want to customize your organization, push its boundaries, and enhance its functionality? You can do that and so much more without writing a single line of code. All you need is your mouse and a sense of adventure. Put on your fedora, it’s time to explore!

Inside you’ll find a multitude of features you can use to expand your organization. Enhance your objects, data, and fields, customize your organization’s look and feel, augment your business processes, create websites, and even create apps—all using point-and-click tools.

Find Object Management Settings

Salesforce lets you personalize your object model with features like custom fields, page layouts, and validation rules. Depending on which experience of Salesforce you have enabled, these customizations are located in different areas of Setup.

**Find Object Management Settings in Lightning Experience**
Salesforce lets you customize your object model with features like custom fields, page layouts, and validation rules. Most objects are available from the Object Manager in Setup.

**Find Object Management Settings in Salesforce Classic**
Salesforce lets you personalize your object model with features like custom fields, page layouts, and validation rules. Depending on which type of object you want to find, these customizations are located in different areas of Setup.

Find Object Management Settings in Lightning Experience

Salesforce lets you customize your object model with features like custom fields, page layouts, and validation rules. Most objects are available from the Object Manager in Setup.

**Standard Objects and Custom Objects**

A **standard object**, such as Account or Contact, comes out of the box with your Salesforce organization. A **custom object** is an object that you or another administrator created.

From Setup, enter **Object Manager** in the Quick Find box, then select **Object Manager**. Select one of the objects in the list, and then scroll to the section for the specific customization.
For example, to add a custom field to the Account object, enter **Object Manager** in the Quick Find box, then select **Object Manager**. Next, select **Account**, and then scroll to Fields & Relationships.

**Other Standard Objects**

Some standard objects aren’t housed in the Object Manager. To access customization settings for one of those objects, from Setup, enter the object name in the Quick Find box, then select the customization setting.

From Setup, enter the object name in the Quick Find box, then select the customization.

For example, to add a trigger to the Groups object, enter **Group** in the Quick Find box, then select **Group Triggers**.

**External Objects**

An **external** object is similar to custom objects, except that it maps to data that’s stored outside your Salesforce organization.

From Setup, enter **External Objects** in the Quick Find box, then select **External Objects**. Next, click one of the external objects in the list. Then scroll to the section for the specific customization.

For example, to add a custom field to the Orders external object, enter **External Objects** in the Quick Find box, then select **External Objects**. Click **Orders**, and then scroll to Custom Fields and Relationships.

Customize Your Salesforce Org

Watch a Demo: How to Change the Look and Feel of Salesforce for Your Company

Quick demo of how to customize the way Salesforce looks for your organization.

You can customize each of the standard tabs and types of records, including adding custom fields and setting page layouts. You can also customize search, tagging, and user interface options for your org. In addition, every Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition user can customize various personal display options.

To tailor Salesforce for your org, you can customize the display of the various tabs and other items. Select a link to get started on any task.

Force.com Quick Access Menu

The Force.com quick access menu offers handy shortcuts to customization features.

When you’re working on apps or objects, use this menu to jump to relevant app customization features. It’s available from object list view pages and record detail pages.

Note: If drag-and-drop scheduling on list views is enabled, the Force.com quick access menu isn’t visible for list views on accounts, contacts, and custom objects.

- To expand or collapse the menu, click ↓ (or press ALT+↑).
- To scroll down the list of the menu, press TAB.
- To select an option on the menu, press ENTER.
- To remove the menu from all list views and record pages, click Turn off menu.

To restore the quick access menu:

1. From your personal settings, enter Advanced User Details in the Quick Find box, then select Advanced User Details. No results? Enter Personal Information in the Quick Find box, then select Personal Information.
2. Click Edit.
4. Click Save.

SEE ALSO:

Personalize Your Salesforce Experience
Rename Object, Tab, and Field Labels

You can change the name of almost any object, field, or tab in Salesforce. This simple adjustment lets you continue using the terminology your users already know and helps them transition to using Salesforce. However, Salesforce Help and most pages in Setup always display the original names for standard objects, fields, and tabs.

For example, you can change the name label for the "Accounts" object and related "Accounts" tab to "Companies", and change the field "Account Name" to "Company Name." When you rename an object, tab, or field, the new name appears on all pages the user sees, in Salesforce for Outlook, and in Connect Offline.

Before renaming tabs, objects, fields, and other related labels, review the implementation tips for administrators.

If you use person accounts in your Salesforce organization, see Renaming Person Account Labels.

1. From Setup, enter Rename Tabs and Labels in the Quick Find box, then select Rename Tabs and Labels.

2. Select your default language from the Select Language drop-down list at the top of the page.

Note: In Hebrew, we recommend keeping tab renaming to a minimum because variable gender in verbs is not supported and verbs can lose gender agreement.

3. Click Edit next to the tab you want to rename. Click Reset to revert to a tab’s original name.

Note: You can’t reset custom object tab names.

4. Enter the singular and plural forms of the new tab name. Also, if applicable for the language, select Starts with a vowel sound for labels that start with a vowel to ensure that Salesforce uses the proper article (such as "a" or "an"). Then click Next.

When you rename a tab or an object, you can’t use the name of another standard tab, custom object, external object, or custom tab.

5. Enter your labels for the standard field labels and other user interface elements. Be sure to enter both a singular and plural form for each label that requires it. Select Starts with a vowel sound for labels that start with a vowel.

Note: Some standard fields, such as Created By and Last Modified By, are purposely omitted from renaming because they track system information.

6. Click Save.

Repeat this procedure to translate labels into all other languages used in your organization.

Tip: After renaming a tab or object, rename any custom reports, dashboards, profiles, permission sets, custom fields, and list views that contain the original name. You can modify labels using the Translation Workbench. To rename a standard report, click Save As and save it to a folder designed for your new name.

Other tab customization options include:

- Individual users can control which tabs and related lists display for their own logins.
• In addition to the standard tabs provided by Salesforce, users can create entirely new custom tabs depending on their Edition. For more information, see Custom Tabs.

• In Enterprise, Unlimited, Performance, and Developer Edition organizations, you can override the tab home page that is displayed when a user clicks a standard, custom, or external object tab. For more information, see Override Standard Buttons and Tab Home Pages on page 4777.

Renaming Person Account Labels

If your organization uses person accounts, you can rename these standard fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Tab</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business Account</td>
<td>Accounts</td>
<td>An account that is not a person account because it does not have a record type specific to person accounts. This label is primarily used to clarify the type of accounts you are importing.</td>
</tr>
<tr>
<td>Person Account</td>
<td>Accounts</td>
<td>A person account.</td>
</tr>
<tr>
<td>Business Contact</td>
<td>Contacts</td>
<td>A contact that is associated with a business account. This label is primarily used to clarify the type of accounts you are importing.</td>
</tr>
</tbody>
</table>

When you rename the Person Account field label, the renamed label appears in Salesforce:

• As a prefix to differentiate person account fields such as Birthdate and Home Phone from business account fields. For example, Person Account: Birthdate is available as an account column in opportunity reports.

• In the name of the Is Person Account field and icon. For example, if you rename the Person Account field to “Consumer,” then Is Person Account becomes Is Consumer.

⚠️ Note: The Person Account and Business Account field labels are independent from actual record type names.

• To customize person account record types, from the object management settings for person accounts, go to Record Types.

• To customize business account record types, from the object management settings for accounts, go to Record Types.

SEE ALSO:
Considerations for Renaming Tab and Field Labels
Rename the Chatter Tab
Find Object Management Settings
Considerations for Renaming Tab and Field Labels

Before renaming standard and custom tabs and fields, learn how those changes affect your users.

- Most standard tabs and objects can be renamed but not all. For example, the Forecasts tab is not available for renaming. From Setup, enter Rename Tabs and Labels in the Quick Find box, then select Rename Tabs and Labels to view a list of the tabs and objects you can rename.

- The renamed labels appear on all user pages in Salesforce including Personal Setup. However, all pages in the Setup area use the default, original labels.

- Some standard fields, such as Created By and Last Modified By, are purposely omitted from renaming because they track system information.

- After renaming tabs, objects, or fields, check the following additional items that may need manual updates:
  - Review all list view names. List view names continue to display the original object name until you change them manually.
  - Check standard report names and descriptions for the objects you renamed.
  - Update the titles and descriptions of any email templates that contain the original object or field name.
  - Manually change any other items you customized with the new object or field name. For example, custom fields, page layouts, and record types may contain the original tab or field name.

- Connect Offline, Lightning for Outlook, and Salesforce for Outlook use your new names.

- If you have renamed tabs, objects, or fields, you can also replace the Salesforce Help with another URL. Users can view this URL whenever they click on any context-sensitive help link on an end-user page or within their personal settings. After you replace the help, the Help & Training link at the very top of every page and all Setup pages will continue to display the Salesforce Help. For instructions on replacing the online help, see Replacing the Salesforce Help on page 3927.

- In Hebrew, we recommend keeping tab renaming to a minimum because variable gender in verbs is not supported and verbs can lose gender agreement.

Customizing Your Pages

Page Layouts and Field-Level Security

Use field-level security to control user access to fields. Use page layouts to control the layout and organization of detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal. Customize search layouts to change which fields display in search results and the buttons that display on list views.

**Important:** When you use page layouts to hide fields from detail and edit pages, users can still access them. Users see fields via reports, search results, list views, and the API. To restrict field access, use field-level security. Field-level security doesn’t prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values. Also don’t use page layouts to secure data. For example, removing the **Edit** button from a page layout doesn’t prevent users from using inline editing. To prevent users from editing data, use sharing rules, field-level security, page layout field properties, validation rules, object permissions, and Visualforce pages.

Field-Level Security

- Restrict users’ access to view and edit fields. For example, restrict access in reports, search results, list views, related lists, email and mail merge templates, custom links, Connect Offline. Also restrict API access and when synchronizing data or importing personal data.
- Override less-restrictive field access settings in page layouts and mini page layouts. For example, if a page layout requires a field that’s read-only in field-level security settings, the field remains read-only for the user.
- Override less-restrictive field settings in search layouts. For example, if a field is visible in the search layout but hidden via field-level security settings, the field remains hidden.

Page Layouts

- Control the layout and organization of detail and edit pages.
- Control which fields, related lists, and custom links users see, on detail and edit pages only.
- Control which standard and custom buttons display on detail pages and related lists.
- Determine whether fields are visible, read only, or required, on detail and edit pages only.
- Determine the fields that users can import data into.
- In Personal, Contact Manager, Group, and Professional Editions, control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data.
- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, determine aspects of mini page layouts, including:
  - record type
  - profile associations
  - related lists
  - fields and field access settings.

The visible fields and related lists of the mini page layout can be further customized. However, other items inherited from the associated page layout cannot be changed on the mini page layout. Mini page layouts display selected fields and related lists of records in the mini view of the console.
Tip: To automatically add a field to all page layouts and make it visible and required everywhere regardless of field-level security, make it a universally required field.

Page Layouts

Feed-Based Layouts Overview

Feed-based page layouts make it easier to work with records by providing two separate views: one for the record’s feed, and one for its details, including related lists.

Available in: Enterprise, Performance, Unlimited, and Developer Editions

Unlike standard page layouts, which include all of a record’s information—the feed, details, and related lists—on one page, feed-based layouts let you switch between the feed view and the details view so you can focus on the type of information you need at any given moment. For example, to see comments others have made about a record or to create a new record that’s related to it, you’d use the feed view. To delve into the record’s related lists, attachments, and other in-depth information, you’d use the details view.

Feed-based layouts are available on account, asset, case, contact, lead, opportunity, and custom objects.

The feed view in these layouts includes:

1. Tabs or, if you’re working in the Salesforce console, toggle buttons ( ) to switch between the feed view and the detail view.
2. The publisher, which might include actions that let you do things like create related records or log calls, depending on how your administrator has set up your organization.
3. The record feed, which shows activity on the record, such as comments others have made about it.
4. Any custom buttons and links your administrator has added.

5. A follow button (👍) or following indicator (✔️) and a list of people who follow the record. Depending on how your administrator has set up the page, these might appear on the left side or on the right side.

6. Feed filters, which let you choose which information from the feed you see. Depending on how your administrator has set up the page, the filters might appear on the left side of the page, in the center, or on the right.

Detail views show in-depth information about the record, including related lists.

SEE ALSO:

Create Feed-Based Page Layouts
Create Page Layouts

With the enhanced page layout editor, you can tailor record page layouts to the needs of your users. Add, remove, or reorder actions, buttons, fields, and sections on a record’s detail page.

1. From the management settings for the object that you want to edit, go to Page Layouts.
2. Click New.
3. Optionally, choose an existing page layout to clone.
4. Type a name for the new layout.
5. Optionally, select Feed-Based Layout to create a layout that includes separate tabs for a record’s feed and detail pages.
6. Click Save.
7. Modify the layout.
8. Assign the new layout to user profiles.

Tip: You can also create a new page layout by cloning an existing one using Save As from within the layout.

- Find Object Management Settings

Create Feed-Based Page Layouts

Make it easier for your users to work with account, contact, lead, opportunity, and custom object records by creating feed-based layouts. These layouts include two separate views: one for the record’s feed and one for its details.

Feed-based layouts offer a more streamlined way of working with records, and don’t require users to scroll through information they’re not interested in to find what they’re looking for. Users can easily switch back and forth between the feed view, which includes the publisher and important events on the record, shown in chronological order, and the details view, which shows in-depth information about the record, including related lists.

You can create feed-based layouts for account, asset, contact, lead, opportunity, and custom objects. To create feed-based layouts for cases, use Case Feed.

1. Be sure feed tracking is enabled for the object on which you want to create a feed-based layout.
   To enable feed tracking, from Setup, enter Feed Tracking in the Quick Find box, then select Feed Tracking.
2. Create a new page layout and select Feed-Based Layout.
   Note: Only new page layouts can be feed-based; you can’t change an existing standard layout to a feed-based layout.
3. Click Edit next to your layout and use the enhanced page layout editor to configure it.
You can’t configure feed-based layouts with the original page layout editor.

4. On the main page layout editor page, customize the publisher to include the actions you want to make available to users, and add any custom buttons or links.

5. Click Feed View in the page layout editor header to customize what appears on the feed page.

You can:
- Enable full-width feed so the feed expands horizontally when users view records in Salesforce console tabs or subtabs.
- Turn on compact feed so users see a cleaner, more streamlined feed view when working with records in Salesforce console tabs or subtabs.
- Choose to automatically collapse the publisher when it’s not in use so users can see more of the information below it on the page.
- Add custom components, which are Visualforce pages with functionality you define.
- Choose where on the page custom buttons and links and standard components like the Follow button and followers list appear.
- Hide the standard sidebar.
- Choose which feed filters are available, and where they appear.

6. Assign the page layout to user profiles.

Page Layouts

Page layouts control the layout and organization of buttons, fields, s-controls, Visualforce, custom links, and related lists on object record pages. They also help determine which fields are visible, read only, and required. Use page layouts to customize the content of record pages for your users.

Page layouts can include s-controls and Visualforce pages that are rendered within a field section when the page displays. You can control the size of the s-controls and Visualforce pages, and determine whether or not a label and scroll bars display.

Salesforce has two drag-and-drop tools for editing page layouts: the original page layout editor and an enhanced page layout editor. The enhanced page layout editor is enabled by default, and provides all the functionality of the original editor, as well as additional functionality and an easier-to-use WYSIWYG interface.

You can enable the original page layout editor in the User Interface settings. Your Salesforce org can use only one page layout editor at a time.

From within a page layout, you can access a mini page layout. The mini page layout defines the hover details that display when you mouse over a field on an object’s detail page in the Agent console or in the Recent Items section of the sidebar in Salesforce Classic.

For Personal, Contact Manager, Group, and Professional Edition orgs, every user views the same layout. Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs can create different page layouts for use by different profiles and record types and set field-level security settings to further restrict users’ access to specific fields.
In Professional, Enterprise, Performance, Unlimited, and Developer Editions, you can set the mini page layouts and related objects that appear in the Console tab.

SEE ALSO:
- Page Layouts and Field-Level Security
- Edit Page Layouts for Standard Objects
- Edit Page Layouts for Custom Objects

Edit Page Layouts for Standard Objects

Change the look and feel of page layouts for standard Salesforce objects.

From the management settings for the appropriate object, go to Page Layouts.

Alternately, if you’re using the Enhanced Page Layout Editor, which is enabled by default, you can customize a standard object’s page layout by clicking Edit Layout on the object’s detail page.

SEE ALSO:
- Page Layouts
- Page Layouts and Field-Level Security
- Customize Page Layouts with the Original Page Layout Editor
- Customize Page Layouts with the Enhanced Page Layout Editor

Edit Page Layouts for Custom Objects

Change the look and feel of page layouts for custom objects.

1. From the management settings for the object whose page layout you want to edit, go to Page Layouts.

2. Complete one of the following.
   a. If you have “Customize Application” permission, open the page layout that you want to customize for edit.
   b. If you have the “View Setup” permission, click the page layout that you want to view.

- Customize Page Layouts with the Enhanced Page Layout Editor
- Find Object Management Settings
Customize Page Layouts with the Enhanced Page Layout Editor

The enhanced page layout editor is a WYSIWYG tool that allows you to customize your organization’s page layouts for detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal. The enhanced page layout editor has all the functionality of the original page layout editor, but has more features and an easier-to-use interface.

The enhanced page layout editor has two parts: a palette on the upper portion of the screen and the page layout on the lower portion of the screen. The palette contains the user interface elements that you can add to your page layout, such as fields, actions, buttons, links, and related lists.

When working with the enhanced page layout editor:

- To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.
- To change the properties of an element on the page layout, double-click the element or click the wrench icon (🔧) next to it. You can’t change the properties of elements in the palette.
- To make a field read-only or required, double-click the field in the page layout and select the appropriate checkbox.
- To access the other layouts for an object with multiple page layouts, click the page layout name at the top of the page and select another layout to view.
- To change the name of the page layout, add personal and public tags if available, and display standard object checkboxes on the page layout, click **Layout Properties**.

**Note:** You can’t rename a page layout if you’re using Salesforce Professional Edition.

- In Enterprise, Unlimited, Performance, and Developer Editions, you can select a profile to preview how the pages will look for users with that profile. Most related lists’ columns preview without data.
- If you’re working with a feed-based page layout, click **Feed View** to customize the tools and components that appear when users are working in the feed on a record.
- To choose which fields display on the record detail page and the order in which they appear, click **Edit Multi-Line Layout**.
- The mini page layout defines the hover details that display when you mouse over a field on an object’s detail page, in the Agent console, or in the Recent Items section of the sidebar in Salesforce Classic. To customize the fields in the mini page layout, click **Mini Page Layout** at the top of the palette.
- When you’re done customizing the page layout, save it. If you navigate away from your page layout before saving, you lose your changes.

- Page Layouts
Enhanced Page Layout Editor User Interface Elements

This list describes the enhanced page layout editor user interface elements and how you can use them in your page layout. To add elements, drag them from the palette to the layout. Valid drop locations show up in green. To remove elements, drag them off the layout and back to the palette.

Tip: Create the appropriate buttons, custom links, fields, custom s-controls, and Visualforce pages before editing your page layout.

Actions

Mobile smart actions appear as a single action element in the page layout editor. However, they appear in the action bar and action menu in Salesforce1 as distinct create actions. These distinct actions allow users to create records directly from the action bar. The create actions included in the set of mobile smart actions vary depending on the page layout’s object.

Note: If you delete an action, the action is removed from all layouts that it’s assigned to.

Wave Analytics Assets

You can add and move a Wave Analytics dashboard to any section on the page layout, except Mobile Cards.

For a Wave Analytics dashboard element, use field mapping to map data fields in the dashboard to the object’s fields so that the dashboard shows only the data that’s relevant for the record being viewed. You can specify fields from multiple datasets. Identify each dataset by its system name, which is listed on the dataset’s edit page. Identify the data fields by row, and for the values, specify either the field names from the Salesforce object or specific values. The JSON field mapping follows this format:

```json
{
  "dataset1_system_name": {
    "row_name": ["$field_name"],
    "row_name": ["$field_name"]
  },
  "dataset2_system_name": {
    "row_name": ["$field_name"],
    "row_name": ["$field_name"]
  }
}
```

For example, if the dashboard shows data from a dataset named Service, with the dimensions Account and Industry, the field mapping would be defined as:

```json
{
  "service": {
    "account": ["$Name"],
    "industry": ["$Industry"]
  }
}
```

Blank Spaces

You can add and move blank spaces to any section on the page layout, except Mobile Cards. Use blank spaces to visually align and distinguish elements on the page.

Note: If you use the original page layout editor to view a page layout that was created in the enhanced page layout editor, the original page layout editor shows the blank spaces you added. You can’t move or add blank spaces in the original page layout editor, but you can remove them by dragging them to the box on the right.

Blank spaces aren’t supported in Lightning Experience.
Buttons
You can control which standard and custom buttons are displayed and the order in which the custom buttons appear. You can't rearrange the order of the standard buttons.

Standard and custom buttons are available as actions in Salesforce1 and Lightning Experience.

Canvas Apps
For the Canvas Apps category to appear in the palette, set the canvas app location to Visualforce Page when you create the canvas app in Salesforce.

- If you add a canvas app to any section other than the Mobile Cards section, the canvas app appears in the page layout in the full Salesforce site or in the record detail page in Salesforce1.
- If you add a canvas app to the Mobile Cards section, the canvas app appears as a card on the record related information page in Salesforce1.

Components
When you add a component to the Mobile Cards section of a page layout, it displays as a card on a record's related information page in Salesforce1. Components are supported only in the Mobile Cards section of a page layout, and they only appear in Salesforce1.

In organizations that are created after Spring '14, the Twitter component is added by default to the Mobile Cards section of page layouts for objects that support it.

Note: Social Accounts and Contacts must be enabled for your organization before you can add the Twitter component to a page layout.

The Twitter card that you see on account, contact, and lead record pages in Lightning Experience isn’t the same as the Twitter component available as a mobile card in the page layout editor. The Twitter card in Lightning Experience is a Lightning component. You must have Social Accounts and Contacts enabled for it to appear.

Expanded Lookups
The Expanded Lookups category for the enhanced page layout editor contains fields with lookup relationships. These fields, when added to the Mobile Cards section of the layout, display as related lookup cards on a record's related information page in Salesforce1.

A page layout can have up to 20 expanded lookups.

The Expanded Lookups category only contains fields with lookup relationships to objects that support compact layouts.

Expanded lookups aren't supported in Lightning Experience.

Fields
A field can display one or more of these icons:

- The field must have a value to save the record, but isn’t required on the page layout itself.
- The field must be included on the page layout because either an administrator configured the field as universally required or Salesforce automatically requires the field. Although you can’t remove such fields, you can move them to different locations.
- The field is a controlling field.
- The field is a dependent field.
- The field is read only.

To set which fields are required and read only, select one or more fields and click the wrench icon (🍴) on any of the selected fields.

- The field properties of some standard fields cannot be changed. Custom fields can only be changed if they are not universally required fields.
- Fields marked as read only are always editable by administrators and users with the “Edit Read Only Fields” permission.
- If you make a picklist field read only, all new records contain the default value for that picklist.
- Auto-number fields are always read only.
• If you mark the opportunity Probability field as read only, the Probability value is still updated when a user changes the Stage value of an opportunity.

When working with fields:

• In Personal, Contact Manager, and Group Editions, page layouts control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data. In Professional, Enterprise, Unlimited, Performance, and Developer Editions, field-level security controls this access. Field-level security settings override field properties that you set on the page layout if the field-level security is more restrictive than the page layout setting.
• Users can import values into a field only if they have read and edit access. Field access is determined by user permissions, page layout assignments, and field-level security settings.

Related Lists
A page layout can have up to 100 related lists. You can place related lists at the bottom of the page layout. To move a related list on the page layout, drag the handle located above the related list.

To customize a related list, double-click the related list handle or click the wrench icon (🔧) inside the handle. Use the related list properties to:
• Specify which fields display as columns on the related list, the order in which they appear, and the sort order of the records in the related list. In Professional, Enterprise, Unlimited, and Performance Editions, you can also opt to apply the column information to other page layouts for the same type of object.
• Specify which standard and custom buttons appear on the related list.

When working with related lists on page layouts, note the following:
• The View All button only displays up to 2,000 items in a related list.
• Some related lists aren't customizable because they link to data rather than store it. Salesforce denotes related lists that aren't customizable on the page layout.
• You can't add related lists to the page layouts for the User object.
• You can also enable related list hover links for your organization so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows them to quickly view and manage the related list items. Users can also click a related list hover link to jump down to the content of the related list without scrolling down the page.
• In Professional, Enterprise, Unlimited, Performance, and Developer Edition, individual users can customize which related lists display for their personal use. Administrators can overwrite these user customizations and apply the related list configuration in the page layout to all users, even if they already customized their display. To overwrite users' related list customizations, click Yes on the Overwrite Users' Customized Related Lists popup window, which appears when saving a page layout if you moved or added a related list.
• Related lists show up on the record related information page in Salesforce1.

Custom S-Controls
A page layout can have up to 20 s-controls.

To change the properties of an s-control, double-click the s-control or click its wrench icon (🔧) and set the following attributes:
• Width sets the horizontal size in pixels or a percent.
• Height sets the vertical size in pixels.
• Show scrollbars determines whether the iFrame in which the s-control displays contains scroll bars when necessary.
• Show label determines whether the page layout includes the Label of the custom s-control. Remove the label to display the s-control in a wider area.

S-controls aren’t supported in Lightning Experience.
Sections
You can add and move sections anywhere above the related lists on the page layout. The sections you add can contain fields, s-controls, and blank spaces. In addition, each page layout has a default section that can only contain custom links and blank spaces. You can change the location of the custom link section, but you can’t remove it from the page.

The Section user interface element is the second option in the palette when you select the Fields or Custom S-Controls category on the palette.

To change the attributes of a section, double-click the section or select its associated wrench icon (🔧). You can:

- Enter a name for the section. Names of some standard page sections cannot be changed.
- Specify whether the section has one or two columns.
- Specify the order in which users can tab through the items in that section.
- Specify whether the section heading is shown on the detail and edit pages.

Tags
If tags are enabled in your organization, click Layout Properties and use the checkboxes to indicate whether personal and public tags are included in the header section of the page layout. Users can’t tag a record if neither personal nor public tags are included in the header section. Also, the positioning of personal and public tags in the header cannot be modified.

Tags aren’t supported in Lightning Experience.

Visualforce Pages
Visualforce pages can be added to any section on the page layout except for sections reserved for custom links and related lists. A page layout can have up to 20 Visualforce pages.

You can add a Visualforce page to a page layout only if the standard controller on the Visualforce page is set to the object for which you are creating the page layout. If you don’t have any Visualforce pages with a standard controller set to that object, the Visualforce Pages category doesn’t appear in the palette.

Only Visualforce pages with the Available for Salesforce mobile apps and Lightning Pages checkbox selected will display in Salesforce1.

Mobile-enabled Visualforce pages show up as slightly differently colored elements in the palette than their non-mobile-enabled counterparts. Hovering your mouse over a Visualforce page element in the palette shows whether the Visualforce page is mobile-enabled.

SEE ALSO:
Guidelines for Using the Enhanced Page Layout Editor
Customize Page Layouts with the Enhanced Page Layout Editor
Guidelines for Using the Enhanced Page Layout Editor

- Elements that are already on the page layout still appear on the palette but are inactive. When you click an inactive element on the palette, Salesforce highlights the element on the page layout.
- Removing a field from a page layout doesn’t remove it from the object’s compact layout. The two layout types are independent.
- If the original page layout editor is enabled, users can click the page layout name to access the detail page of the page layout. The enhanced page layout editor doesn’t have detail pages, as all the detail page functionality is always available on the enhanced editor. Salesforce displays a read-only version of the enhanced page layout editor to users with the “View Setup” permission.

Note: The read-only view of the page layout doesn’t display field types and lengths in hover details.

- The Custom Links, Custom S-Controls, and Visualforce Pages categories only appear in the palette if you have defined those types of elements for the object for which you are defining a page layout. When you create a custom link for an object, you add it to the Custom Links section on that object’s page layout. In non-English Salesforce organizations, the “Custom Links” section title is not translated from English automatically for the Territory and Territory Model objects, but you can edit the section title.
- The Canvas Apps category appears in the palette only if you defined at least one canvas app with a location of Visualforce Page.
- The Components category appears in the palette only if the available components are supported by the object for which you are defining a page layout. For example, the Twitter component is supported only on account, contact, and lead page layouts.
- When editing a person account page layout:
  - If you add Shipping Address next to Billing Address in the Address Information section, a link displays on the person account edit page that allows you to copy the billing address to the shipping address. Also, an equivalent link appears if you add Other Address to the Address Information section.
  - Contact fields and related lists are available on person account page layouts, but contact custom links and custom buttons are not.
- This table lists standard objects that have checkboxes that are specific to page layouts for that object. To configure how Salesforce displays the checkboxes, click Layout Properties when customizing the page layout. Use the Select by default checkbox associated with a checkbox if you want Salesforce to automatically select the option when a user accesses the edit page.

<table>
<thead>
<tr>
<th>Object</th>
<th>Checkboxes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account</td>
<td>Evaluate this account against territory rules on save checkbox — Displays the Evaluate this account against territory rules on save checkbox on account edit pages. Territory assignment rules run automatically when the Select by default checkbox is selected. If both Show on edit page and Select by default are selected, users can uncheck the Evaluate this account against territory rules on save checkbox on the account edit page, and territory assignment rules will not be run.</td>
</tr>
<tr>
<td>Case</td>
<td>- Case assignment checkbox — Displays the Assign using active assignment rules checkbox on case edit pages.</td>
</tr>
</tbody>
</table>
Case assignment rules run automatically when the **Select by default** checkbox is selected.

If both **Show on edit page** and **Select by default** are selected, the assignment checkbox is selected by default, but users can deselect it to override the assignment rule.

- **Email notification checkbox** — Displays the **Send notification email to contact** checkbox on case edit pages.

<table>
<thead>
<tr>
<th>Case Close</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>- <strong>Solution information section</strong> — Displays the solution information section on the case close edit pages.</td>

- [Customize Page Layouts with the Enhanced Page Layout Editor](#)
**Page Layout Tips**

Here are a few tips to keep your page layouts organized and easy to use.

- Use field-level security to restrict users’ access to fields; then use page layouts to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain. Field-level security settings override the visible and read-only settings on the page layout if the field-level security has a more restrictive setting than the page layout.
- Remove unnecessary fields.
- Keep the number of required fields to a minimum.
- Group similar fields with sections.
- Think about the right TAB key order for each section.
- Check your layouts in Read and Edit modes.
- Add help and description text to custom fields. Use it to explain to users what data you’re looking for in the field.
- In Professional, Enterprise, Performance, Unlimited, and Developer Editions, use record types to provide unique layouts for different records.
- Optimize related lists—adjust their overall order, the sorting of the records, and display of relevant columns and buttons.
- If you want to customize the user profile layout in Salesforce1, create a new layout or edit an existing layout in the User Profile Page Layouts section.
- If a dependent lookup is above its controlling field on a page layout, make its lookup filter optional or redesign the page layout. Placing a required dependent lookup above its controlling field on a page layout could confuse users who typically start from the top of the page when entering data.
- A background process periodically runs that cleans up metadata associated with deleted custom fields. This process will affect the Last Modified Date and Last Modified By fields on page layouts, record types, and custom objects.
- Salesforce recommends creating no more than 200 page layouts. Although there is no limit, it can be difficult to manage your page layouts if you have more than 200.

**Page Layout Considerations**

Keep these considerations in mind when working with page layouts in the enhanced page layout editor.

- You can’t rename a page layout if you’re using Salesforce Professional Edition.
- You can drag up to 20 s-controls, 20 Visualforce pages, 20 expanded lookups, and 100 related lists onto a page layout. There are no limits on fields and custom links. You can add one Wave Analytics dashboard per page layout.
  
  **Note:** You can’t place a Visualforce page more than once on a page layout.

- Page layouts for the user object only include custom fields, custom links, s-controls, and Visualforce pages. Tagging, related lists, custom buttons, and standard field customizations are not included on page layouts for the user object. Also, field-level security is only available for custom fields on the user object. Only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear on the user profile page, regardless of the actions in the User page layout.
You can edit only certain attributes when you’re working with a page layout that was installed from a managed app. Some changes that you make to managed page layouts, such as adding components, work when you’re editing the page layout but aren’t reflected on the record detail page.

Chatter group layout changes affect the Salesforce1 app only. Changes to the group publisher (actions and layout) reflect in both the full Salesforce site and the Salesforce1 app.

Mini Page Layouts

- You can’t choose Mini Console View for the Close Case layout, Log a Case page, or View Cases page layouts on the Self-Service Portal. You can’t choose Mini Console View for opportunity team page layouts.
- Field properties on the page layout determine field properties on the mini page layout. For example, if a field is read-only on the page layout, that same field will be read-only on the mini page layout. To change the field properties of fields on the mini page layout, you must change the field properties of fields on the page layout.
- You can’t define mini page layouts for the Close Case layout, Log a Case page, or View Cases page layouts on the Self-Service Portal. You can’t define mini page layouts for opportunity team page layouts.
- You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won’t display in the Agent console.
- Overrides for the Edit and View buttons for an object don’t affect the Edit and View buttons in mini page layouts.
- Fields marked Always Displayed or Always on Layout on page layouts are automatically included on the mini page layout and cannot be removed unless they are removed from the page layout.

Customizing Home Tab Page Layouts

You can customize the Home tab to include components such as sidebar links, a company logo, a dashboard snapshot, or custom components that you create. A dashboard snapshot is a clipping of the top row of a dashboard’s components. Just like other tabs, you can also assign different home page layouts to different users based on profile.

You can add components to the sidebar or the main panel. You can also determine if custom sidebar components appear only on the Home tab or on all Salesforce pages.

To start customizing your home page layouts, see:

- Create Custom Home Page Components on page 3894
- Design Home Page Layouts on page 3895
- Assign Home Tab Page Layouts to Profiles on page 3897
Create Custom Home Page Components

Use custom components to configure the Salesforce Classic home page for your users. Add HTML, images, links, and more to enhance your users’ productivity.

Before you begin:

- If you’re creating custom link components, define your Home tab custom links first. See *Custom Buttons and Links* on page 4767.
- If you’re creating an image component, upload your image to the Documents tab first.
- If you’re creating a Visualforce Area component, create your Visualforce page first.

1. From Setup, enter *Home Page Components* in the Quick Find box, then select *Home Page Components*.
2. Click *New*.
3. Enter a name for the component. For custom links, this name is displayed as the section heading in the sidebar on the Home tab.
4. Choose the type of component.
5. Click *Next*, and then complete one or more of these steps.
   - For links, select the appropriate custom links, and then click *Add*.
   - For images, click *Insert an image*, choose the document folder, and then select the image file. The image file must be in a public folder and *Externally Available* must be enabled on the document’s properties so that users can view the image.
     
     ☞ Tip: Keep your image size smaller than 20 KB for optimum performance.
   - For an HTML Area component, choose where to display it—in the wide or narrow column—and then enter your content in the box below.
     
     ☑ Note: HTML Area home page components don’t support JavaScript, CSS, iframes, and some other advanced markup. To use JavaScript or other advanced HTML elements in your home page component, we recommend that you use a Visualforce Area component instead.
   - For a Visualforce Area component, choose where to display it—in the wide or narrow column—then select the Visualforce page, and assign it a height.
6. Click *Save*.

After creating the home page component, you need to add it to a home page layout. See *Design Home Page Layouts* on page 3895.

☑ Note: Components in the narrow column are displayed in the sidebar. They aren’t displayed in the sidebar on other pages in Salesforce unless you specify that in your user interface settings or by assigning the “Show Custom Sidebar On All Pages” permission.

SEE ALSO:

- Visualforce Area Home Page Components
- Home Page Components Tips and Considerations
Visualforce Area Home Page Components

Use Visualforce Area home page components to add dynamic content to your home page. For example, you can present content from partner apps, display charts with the Reports and Dashboards REST API, or add a canvas app to the home page.

The Visualforce page that you choose for the component can use a standard or custom controller. You can include JavaScript in your Visualforce page, but because the component is rendered in an iframe on the home page layout, the JavaScript can’t interact with the page that contains the component.

Sample Usage

If your Visualforce Area home page component displays in the sidebar, you can dynamically get the record ID and top-level URL of the page that the component is being displayed on by using the $CurrentPage global variable in your Visualforce markup.

Using $CurrentPage, you can access the query string parameters for the page by specifying the parameters attribute, after which you can access each individual parameter:

```$CurrentPage.parameters.parameter_name```

The parameters for record ID and top-level page URL are, respectively, id and sfdoFrameOrigin. For more information, see “Getting Query String Parameters” in the Visualforce Developer’s Guide.

Design Home Page Layouts

After creating the components you want displayed on the Home tab, design your home page layouts. You can design your layouts based on your unique organizational and user needs.

1. From Setup, enter Home Page Layouts in the Quick Find box, then select Home Page Layouts.
2. Click to edit an existing layout or create one. Alternately, select a layout to copy and click Clone.
3. If you create a layout, give it a name and then click Save.
4. Select the components to display on the layout.
   - To add the Find Articles component, select Article Search. This component is only available for Salesforce Knowledge users.
   - To add the Customer Portal component, select Customer Portal Welcome. If the My Profile site Visualforce page has been enabled, this component contains a personalized welcome message and a link to the portal user’s profile. The My Profile page enables users logged into either your Force.com site, or your Customer Portal from Force.com sites, to update their own contact information. When they make changes to this page, the corresponding portal user and contact records are updated.
   - To allow your users to resume flow interviews that they’ve paused, select Paused Flow Interviews. This component displays only flow interviews that the user has paused.
5. Click Next.
6. Customize the order in which the narrow and wide components appear. Move a component by selecting it and using the arrow buttons.
7. Click Save.

Customizing Home Tab Page Layouts

Home Page Components Tips and Considerations

Keep these considerations in mind when creating custom components that you want displayed on the Salesforce Classic Home tab.

- Standard components without an Edit link are read only.
- The components that you select for the narrow column display in the sidebar. They don’t display in the sidebar on other pages within Salesforce unless you specify that in your user interface settings. If you only want certain users to view sidebar components on all pages, grant those users the “Show Custom Sidebar On All Pages” permission.
- When editing the standard Messages & Alerts component, enter the text that you want to display to users. If entering HTML code for your message, make sure that it’s self-contained, well-formed HTML.

Note: Standard Messages & Alerts home page components don’t support JavaScript, CSS, iframes, and some other advanced markup.

- When editing the standard Custom Links home page component, enter the link text to display to users in the Bookmark field. In the URL field, enter the complete website address, such as http://www.yahoo.com. To link to a Salesforce page, enter only the part of the URL after salesforce.com, for example, /00Ox0000000esq4. These links always open within the main Salesforce window, not in a popup window.
- The standard Custom Links home page component is a quick way to add links to the sidebar, but it doesn’t support merge fields, functions (such as URLFOR), executing JavaScript, or customizable window opening properties. If you need this additional functionality:
  1. From Setup, enter Home in the Quick Find box, then select Custom Links, and then create your home page custom links on that page.
  2. From Setup, enter Home in the Quick Find box, then select Home Page Components, and then create a custom home page component of type Links on that page that includes the custom links that you created in the first step. Creating a custom home page component for your links doesn’t change the visual styling for your end users.

- The Dashboard Snapshot component displays the top three components of the last dashboard the user accessed. Users can view a dashboard snapshot on their Home tab if they have access to at least one dashboard.
- When designing home page layouts for your Customer Portal, we recommend adding the following components: Search, Solution Search, Recent Items, Customer Portal Welcome, and a custom HTML Area component that includes your corporate branding in the wide column.

SEE ALSO:
Create Custom Home Page Components
Assign Home Tab Page Layouts to Profiles

Your home page layouts are only visible to users after you assign them to a user profile.

1. From Setup, enter Home Page Layouts in the Quick Find box, then select Home Page Layouts.
2. Click Page Layout Assignment.
3. Click Edit Assignment.
4. Choose the appropriate page layout for each profile.
   Initially, all users, including Customer Portal users, are assigned to the Home Page Default layout.
5. Click Save.
   Tip: Users can customize the dashboard settings on their Home tab in their personal settings.

Set Page Layouts and Field-Level Security

Use field-level security as the means to restrict users’ access to fields; then use page layouts primarily to organize detail and edit pages within tabs. This reduces the number of page layouts for you to maintain. For example, if a field is required in the page layout and read only in the field-level security settings, the field-level security overrides the page layout and the field will be read only for the user.

Note: Field-level security doesn’t prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

For Personal, Contact Manager, and Group Editions

1. Create custom fields.
2. Create any custom buttons or links.
3. Create any custom s-controls.
4. Define page layouts. All users automatically use the same page layout for each object.
5. Set the related objects and the mini page layouts that display in the console.
6. Define search layouts. All users use the same search layouts.

For Professional, Enterprise, Unlimited, Performance, and Developer Editions

1. Create custom fields.
2. Create any custom buttons or links.
3. Create any custom s-controls.
4. Create any custom profiles.
5. Create record types for different business scenarios.
6. Assign which record types are available to users with different profiles.
7. Set the field-level security for each profile to restrict users’ access to specific fields.
8. Define page layouts to organize your pages.
9. Set the related objects and the mini page layouts that display in the console.
10. Assign page layouts to users based on profiles and record types.
11. Check the field accessibility grid to verify that all field access settings are correct.
12. Define search layouts. All users use the same search layouts.

Tip: Click Preview while editing a page layout to see how the page will look for users with different profiles. This preview includes any extra security that is set in field-level security.

Assigning Page Layouts

After defining page layouts, assign which page layouts users see. A user’s profile determines which page layout he or she sees. In addition, if your organization is using record types for a particular tab, the combination of the user’s profile and the record type determine which page layout is displayed.

You can assign page layouts from:

- The object’s customize page layout or record type page
- The original or enhanced profile user interface.

To verify that users have the correct access to fields based on the page layout and field-level security, you can check the field accessibility grid.

SEE ALSO:

- Page Layouts
- Assign Page Layouts in the Original Profile User Interface
- Assign Record Types and Page Layouts in the Enhanced Profile User Interface
- Record Types
- Page Layouts and Field-Level Security

Assign Page Layouts from a Customize Page Layout or Record Type Page

1. From the management settings for the appropriate object, go to Page Layouts or Record Types.
2. Click Page Layout Assignment.
3. Click Edit Assignment.
4. Use the table to specify the page layout for each profile. The table displays the page layout assignments for each profile. If your organization uses record types, a matrix displays a page layout selector for each profile and record type.

When selecting page layout assignments:

- Click a cell, column, or row heading to select all the table cells in that column or row.
- Press SHIFT+click to select multiple adjacent table cells, columns, or rows.
- Press CTRL+click to select multiple nonadjacent table cells, columns, or rows.
- Click any cell and drag to select a range of cells.
- Click Next or Prev to view another set of record types.

Selected page layout assignments are highlighted. Page layout assignments you change are italicized until you save your changes.

5. If necessary, select another page layout to assign from the Page Layout To Use drop-down list and repeat the previous step for the new page layout.
6. Click **Save**.

**SEE ALSO:**
- Assigning Page Layouts

### Edit Multi-Line Layouts for Opportunity Products

You can customize the columns that display when you click **Edit All** in the Products related list of an opportunity detail page.

1. From the object management settings for opportunity products, go to Page Layouts.
2. Next to the name of an opportunity product page layout, click **Edit**.
3. Click **Edit Multi-Line Layout**.
   - To customize which fields display in the layout, select one or more fields in Available Fields and click **Add** or **Remove**.
   - To sort fields in the layout, select one or more fields in Selected Fields and click **Up** or **Down**.
   - To select multiple fields individually, use CTRL+click.
   - To select multiple fields as a group, use SHIFT+click.
5. Click **Save** to apply your changes.

### Build Page Layouts for Custom Objects

Page layouts define which fields users can view and edit when entering data for a custom object record. You can use the default page layout that is created automatically when you create a custom object. You can also build your own page layout with related lists and custom links. If you do not use any page layout with your custom object, you can still interact with it by using the Force.com API to manage custom data or build a custom user interface.

**EDITIONS**
Available in: both Salesforce Classic and Lightning Experience

**EDITIONS**
Available in: **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

**USER PERMISSIONS**
To edit multi-line layouts for opportunity products:
- “Customize Application”

**EDITIONS**
Available in: both Salesforce Classic and Lightning Experience

**EDITIONS**
Available in: **Contact Manager**, **Group**, **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

**USER PERMISSIONS**
To define page layouts for custom objects:
- “Customize Application”
1. From the object management settings for a custom object, go to Page Layouts.
2. In the Page Layouts related list, open an existing page layout for edit, or create a new page layout.
3. If creating a new page layout, enter a name for it, and select an existing page layout to clone, if desired.
4. Edit the page layout just as you would any other page layout.
5. Click Save.

How Page Layouts Work in Salesforce1

Use the enhanced page layout editor to customize the layout of an object’s record detail pages, configure actions, and adjust which fields and related lists appear in Salesforce1.

In Salesforce1, page layouts drive these areas of the mobile experience.

Record Related Information and Detail Pages

When you view a record in Salesforce1, you see the fields, Visualforce pages, and related lists that are based on the record type and the user’s profile. Related lists show up as single-line cards containing the name of the page or related list. Tapping the related list card displays its details.

Mobile Cards

You can add expanded lookups, components, canvas apps, and Visualforce pages to the Mobile Cards section of your page layout to have them show up as mobile cards in Salesforce1. The elements you place in this section don’t show up on a record’s detail page in the full Salesforce site. They appear only on the record’s related information page in Salesforce1.

Note: In organizations that are created after Spring ’14, the Twitter component is added by default to the Mobile Cards section of page layouts for objects that support it.
**Actions**

In Salesforce1, actions in the Salesforce1 and Lightning Experience Actions section of a page layout appear in the action bar and action menu on the object’s record pages.

Here are the record detail page, related information page, and action menu for a sample account, Edge Communications:

--

**Page Layouts in Lightning Experience**

When you customize your object record pages in Salesforce Classic, they affect the content of object record pages in Lightning Experience. However, in Lightning Experience, the page elements display differently, and some aren’t supported.

If you’re in an organization that supports multiple page layouts, you can create page layouts directly from the Page Layouts related list on any object in the Object Manager. You can also edit or delete an object’s page layouts by clicking on a page layout in the Page Layouts related list.

Here’s a sample contact record in Lightning Experience. The highlights panel, which contains key fields for the record, is the only part of a record page that you can’t customize using the page layout editor. The fields in the highlights panel are customized using a compact layout.
These page layout elements are supported in Lightning Experience.

**Actions**
Actions display in different places, such as the highlights panel, Activity tab, and the Collaborate tab. The actions are derived from the list of actions in the Salesforce1 and Lightning Experience Actions section of the page layout. Some actions aren’t supported in Lightning Experience.

For more information, see *Actions in Lightning Experience* on page 4751.

**Canvas Apps**
Canvas apps are supported in Lightning Experience.

**Custom Links**
Custom links display under the Details tab.

**Fields**
Fields display under the Details tab. You can remove or reorder fields on a page layout only via the page layout editor.

**Related Lists**
Related lists are included as Lightning components in Lightning Experience. Not all related lists are supported in Lightning Experience. For example, the *Object* History related list isn’t supported.

**Standard and Custom Buttons**
Standard and custom buttons are treated as actions in Lightning Experience, just like in Salesforce1.

*Important:* Custom buttons that call JavaScript aren’t supported in Lightning Experience.

**Visualforce Pages**
Visualforce pages that you’ve added to the page layout appear under the Details tab. Only Visualforce pages with *Available for Salesforce mobile apps and Lightning Pages* enabled display in Lightning Experience.

Visualforce pages that have been put into the Mobile Cards section as components don’t appear in Lightning Experience.

These page layout elements aren’t supported in Lightning Experience:

- Blank spaces
- Expanded lookups
Mobile cards

Note: The Twitter card that you see on account, contact, and lead record pages in Lightning Experience isn’t the same as the Twitter component available as a mobile card in the page layout editor. The Twitter card in Lightning Experience is a Lightning component. You must have Social Accounts and Contacts enabled for it to appear.

S-controls
Sections
Tags

Note: You can’t use the enhanced page layout editor to customize the layout of Lightning Experience record home pages. All users see the same record layout in Lightning Experience, regardless of profile or record type.

Tips for Optimizing Page Layouts for Salesforce1

Here are some tips and tricks for making your existing page layouts more mobile-friendly.

Page layouts containing dozens of fields and lots of related lists might be manageable when viewing records on a computer screen, but on a small mobile device, viewing that same record can be overwhelming. People accessing information using a mobile device are looking for a quick way to get what they need, and making your users sift through hundreds of fields and related lists just doesn’t make sense.

When optimizing a page layout, consider:

• What are the important things to see at a glance?
• What are the important moments for your users when they’re working in Salesforce1?
• What actions or processes can you automate so that your users don’t have to manually do them?

The Key: Organize and Minimize Fields

• Use sections to organize information logically, putting the most important things at the top of the page so they show up first. Your users don’t want to search for fields individually. Organizing similar fields in sections will help your users find what they need. They can then easily scroll down the page to the section they care about.
• For accounts, contacts, and leads, you don’t need to put phone or email fields near the top. They’re already quickly accessible via the ☎️ and 📧 icons on each record page’s action bar.
• You don’t need to keep fields in one column, as the page will render dynamically based on the device that’s viewing it. A phone will reorder the fields into a single column, and a tablet or desktop will show two columns.
• Put the most important fields into the compact layout—which drives record highlights and record preview cards in Salesforce1—so they’re available right up front, and so your mobile users don’t have to drill into the record detail. We’ll get into compact layouts in more detail soon.
• Keep the number of required fields to a minimum. Setting a field to required means it must appear on the detail page of all page layouts, so consider whether each field is truly required. You might have to convince stakeholders that a field isn’t actually necessary for a record to be saved.
• If available in your organization, think about using record types so that fields that aren’t common to all records don’t have to appear on all records.
To reduce the number of fields on a screen, consider using default values for new records instead of having the user enter the data.

**Manage Mobile Cards in the Enhanced Page Layout Editor**

Add expanded lookups, components, and Visualforce pages to the Mobile Cards section of your page layout to have them show up as mobile cards in Salesforce1.

The items you place in the Mobile Cards section don’t show up on a record’s detail page in the full Salesforce site but only on the record’s related information page in Salesforce1.

You can add these types of elements to the Mobile Cards section of a page layout.

- Components
- Expanded lookups
- Visualforce pages
- Canvas apps

Some standard objects have mobile cards that are added for you by default. Customize the page layout to remove them or add additional cards.

1. Access the page layout editor.
2. From the Expanded Lookups, Components, Visualforce Pages, or Canvas Apps categories, drag an element into the Mobile Cards section.
3. Save the page layout.

After saving the layout, the items you added show up immediately in Salesforce1. You may need to refresh to see the changes.

**Customize Related Lists**

You can customize the buttons, columns displayed, column order, and record sort order of related lists on record detail pages in Salesforce and the Salesforce Customer Portal.

1. Access the page layout editor.
2. Double-click a related list on the layout to edit it. If you are using the enhanced page layout editor, you can also click the wrench icon (🔧).

   **Note:** You can’t customize the History related list because it doesn’t store data. The History related list links to data stored elsewhere.

3. Select which fields to include in the related list, and define the order in which the fields display. You can include up to 10 fields per related list.

   **Note:** You can’t move the first field of a related list, because it’s a unique identifier for the record.

You can add custom fields of the long text area type to a related list. However, you can’t add some standard fields of the long text area type. For example, you can’t add the Description field on an Opportunity to a related list.

The default sort order varies per record. The **Sort By** drop-down isn’t available for activities and opportunity products.

Lookup fields aren’t available for display on their corresponding lookup related list. For example, the case lookup field on an account page layout isn’t available when editing the cases related list.
4. If desired, select other page layouts to apply your related list customizations to.

Only layouts that include this related list appear in the list. Layouts that include related lists with the same customizations as the current layout had when you opened it are selected by default.

5. Click + in the Buttons section to customize which standard and custom buttons are displayed in the related list.

   Note: The custom button must be defined for the object contained in the related list, not the parent object, and the button Type must be List Button. For example, to display a custom button on the Contacts related list of an account, define the custom button for contacts, not accounts.

6. If necessary, click Revert to Defaults to undo any customizations and use the default Salesforce settings in the related list.

7. Click OK to store your customizations. Changes aren’t saved until you save the page layout.

8. Select Overwrite users’ customized related lists to apply the related lists in the page layout to all users, even if they have already customized their display.

9. Save the page layout.

   Note: You can enable related list hover links so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump to the content of the related list without scrolling down the page.

Customize Detail Page Buttons

When customizing page layouts, you can control which standard and custom buttons are displayed and the order in which the custom buttons are shown. To customize the buttons on record detail pages:

1. From the management settings for the object whose page layout you want to customize, go to Page Layouts.

2. Click Edit next to the page layout you want to customize.

3. Do one of the following.

   • In the original page layout editor, double-click the Detail Page Buttons item in the Button Section.
     - To hide any standard button, deselect the checkbox next to the button name.
     - To add or remove a custom button, select the button in the Available Buttons list, and click Add or Remove.
     - Sort custom buttons by selecting them and clicking Up or Down.
     - To undo your customizations and restore default settings, click Revert to Defaults.
     - Click OK to close the popup when you are done.

   • In the enhanced page layout editor, select the Buttons category on the palette and drag one or more buttons from the palette to the buttons section on the page layout. Standard buttons must go in the standard buttons area, and custom buttons must go in the custom buttons area. To remove a standard or custom button from the page layout, drag the button to the palette.

4. Click Save on the page layout.
5. Click Save.

SEE ALSO:
- Override Standard Buttons and Tab Home Pages
- Define Custom Buttons and Links
- Find Object Management Settings

Customize Page Layouts with the Original Page Layout Editor

The original page layout editor allows you to customize page layouts for detail and edit pages in Salesforce, the Self-Service Portal, and the Salesforce Customer Portal.

Note: Salesforce recommends using the enhanced page layout editor instead of the original page layout editor.

1. Access the page layout editor.
   - Edit Page Layouts for Standard Objects
   - Edit Page Layouts for Custom Objects

2. If tags are enabled, specify whether personal and public tags should be included in the header section of the page layout. Users can tag a record only if personal or public tags are included here.
   - To add personal or public tags, select Header Items from the View drop-down list and then drag the Personal Tags or Public Tags items to the header section. You can’t change the order in which personal and public tags appear when both are in the header section at the same time.
   - To remove tags, drag the Personal Tags and Public Tags items from the header section to the area under the View drop-down list.

3. To customize buttons, double-click Detail Page Buttons in the Button section.
   - To hide any standard button, deselect the checkbox next to the button name.
   - To add or remove a custom button, select the button in the Available Buttons list, and click Add or Remove.
   - To sort custom buttons, select them and click Up or Down.
   - To undo your customizations and restore default settings, click Revert to Defaults.
   - To close the popup, click OK.

4. To arrange fields, custom s-controls, Visualforce pages, custom links, and related lists on the layout, select one or more items from the box on the right and drag them to the desired location. You can drag up to 20 s-controls, 20 Visualforce pages, 20 expanded lookups, and 100 related lists onto a page layout. There are no limits on fields and custom links.
   - To select multiple items individually, use CTRL+click.
   - To select multiple items as a group, use SHIFT+click.

Note:
- You can add a Visualforce page to a page layout only if the standard controller on the Visualforce page is set to the object for which you are creating the page layout. If you don’t have any Visualforce pages with a standard controller set to that object, the Visualforce Pages category doesn’t appear in the palette.
- Items that are not in the page layout are displayed in the scrolling box on the right-hand side.
5. To set which fields are required and read only, select one or more fields and click **Edit Properties**.
   - The field properties of some standard fields cannot be changed. Custom fields can be changed only if they are not universally required fields.
   - Fields marked as read only are always editable by administrators and users with the “Edit Read Only Fields” permission.
   - If you make a picklist field read only, all new records will contain the default value for that picklist.
   - Auto-number fields are always read only.
   - If you mark the opportunity **Probability** field as read only, the **Probability** value will still be updated automatically when a user changes the **Stage** value of an opportunity.
   - In Professional, Enterprise, Unlimited, Performance, and Developer Editions, field-level security settings override any field properties you set here if the field-level security is more restrictive than the page layout setting.

6. To change the properties of an s-control or Visualforce page, double click it and set the following attributes.
   - **Width** sets the horizontal size in pixels or a percent.
   - **Height** sets the vertical size in pixels.
   - **Show scrollbars** determines whether the iFrame in which the s-control displays contains scrollbars when necessary.
   - **Show label** determines whether the page layout includes the **Label** of the custom s-control. Remove the label to display the custom s-control in a wider area.

7. To organize the page using sections, click **Edit** next to an existing page section, or click **Create New Section** to create a new page section.
   - Enter a name for the section. Note that names of some standard page sections cannot be changed.
   - Set whether the section should have one or two columns.
   - Set the order in which users can tab through the items in that section.
   - Set whether the section name should be shown on the detail and edit pages.

8. To customize related lists on the page layout, double-click a related list in the Related List section.
   - To add or remove fields, select one or more fields and use the arrows to add or remove them to the related list columns on the page layout and to define the order in which the related list columns display. You can include up to 10 fields per related list.
   - To select multiple fields individually, use CTRL+click.
   - To select multiple fields as a group, use SHIFT+click.
   - To sort the items in the related list, select a field from the **Sort By** drop-down list. Items are displayed in ascending order unless you select **Descending**. The default sort order varies per record. The **Sort By** drop-down is not available for activities and opportunity products.
   - If necessary, select additional page layouts to which your related list customizations will apply.
   - To customize which standard buttons display in the related list, select or deselect the checkbox next to the button name.
   - To customize which custom buttons display in the related list, select the button and click **Add** or **Remove**. To sort custom buttons, select them and click **Up** or **Down**.

**Note:** To create a custom button for the related list, see **Define Custom Buttons and Links**. The custom button must be defined for the object contained in the related list, instead of the parent object, and the button **Type** must be List Button. For example, to display a custom button on the Contacts related list of an account, define the custom button for contacts, not accounts.
Some related lists are not customizable because they link to data rather than store it. You can move your cursor over any related list section to see if it is customizable. Also, lookup fields are not available for display on their corresponding lookup related list. For example, the case lookup field on an account page layout is not available when editing the cases related list.

**Note:** You can enable related list hover links so that record detail pages include links for each related list at the top of the page. Users can hover the mouse over a related list hover link to display the corresponding related list in an interactive overlay that allows users to quickly view and manage the related list items. Users can also click a related list hover link to jump to the content of the related list without scrolling down the page.

9. To apply the related lists in the page layout to all users, even if they have already customized their display, select **Overwrite users’ customized related lists**.

10. To review the page layout, click **Preview**. From the preview in Enterprise, Unlimited, Performance, and Developer Editions, select a profile to see how the pages will look for users with different profiles. Note that most related lists’ columns preview without data.

11. Click **Save** to finish. Alternatively, click **Quick Save** to save and continue editing the page layout.

In Professional, Enterprise, Unlimited, Performance, and Developer Editions:

- To choose which related records display in the Console tab’s mini view, click **Mini Console View**.
- To define the mini page layouts of the records that appear in the Console tab’s mini view, click **Mini Page Layout**.

**Note:** You cannot define mini console views or mini page layouts for the Close Case Layout or the Log a Case Page and View Cases Page layouts on the Self-Service Portal.

In Enterprise, Unlimited, Performance, and Developer Editions:

- You can assign page layouts for different profile and record type combinations.
- You can set field-level security to restrict field access further.

**SEE ALSO:**

- Notes on Using the Original Page Layout Editor
- Customize Related Lists
- Page Layouts

**Notes on Using the Original Page Layout Editor**

- When customizing page layouts for tasks, you can select the following checkboxes. (These options are unavailable when user control over task assignment notifications is enabled.)
  - **Show Task Email Notification** checkbox displays the Send Notification Email checkbox when users create or edit a task.
  - **Select Task Email Notification** checkbox by default selects the Send Notification Email checkbox by default when users create or edit a task. Note that a user’s personal preference for defaulting the state of the checkbox takes precedence over the organization-wide setting.

- When customizing page layouts for cases, you can select the following checkboxes. (These options are unavailable when user control over task assignment notifications is enabled.)
  - **Show on edit page Case Assignment** checkbox displays the Assign using active assignment rules checkbox when users create or edit a case.
  - **Default Case Assignment** checkbox automatically runs case assignment rules.
If both **Show on edit page** and **Select by default** are selected, the assignment checkbox is selected by default, but users can deselect it to override the assignment rule.

- **Show Case Email Notification** checkbox displays the **Send Notification Email** checkbox when users create or edit a case.
- **Select Case Email Notification** checkbox by default selects the **Send Notification Email** checkbox by default when users create or edit a case.

- Page layouts for the user object only include custom fields, custom links, s-controls, and Visualforce pages. Tagging, related lists, custom buttons, and standard field customizations are *not* included on page layouts for the user object. Also, field-level security is available only for custom fields on the user object.
- You can define mini page layouts for the user object; however, you cannot add standard fields or related lists. Also, a customized mini page layout won’t display in the Agent console.
- Users can import values into a field only if they have read and edit access. Field access is determined by user permissions, page layout assignments, and field-level security settings.
- In Personal, Contact Manager, and Group Editions, page layouts control which fields users can access in related lists, list views, reports, Connect Offline, email and mail merge templates, custom links, and when synchronizing data. In Professional, Enterprise, Unlimited, Performance, and Developer Editions, this access is controlled by field-level security.
- In Professional, Enterprise, Unlimited, Performance, and Developer Edition, individual users can customize which tabs and related lists display for their personal use.
- When editing a person account page layout, if you add **Shipping Address** next to **Billing Address** in the Address Information section, a link will display on the person account edit page that allows you to copy the billing address to the shipping address. Also, an equivalent link appears if you add **Other Address** to the Address Information section.
- Some items can only be moved to certain sections on the page layout. For example, you can drag a custom s-control to any field section on the page layout but not a related list section or button section.
- Create the appropriate buttons before editing your page layout. For example, create an account custom button for the detail page and a contact custom list button before putting them both on an account page layout.
- If you use the original page layout editor to view a page layout that was created in the new page layout editor, the original page layout editor will show any blank spaces you added. You cannot move or add blank spaces in the original page layout editor, but you can remove them by dragging them to the box on the right.

**SEE ALSO:**
- [Customize Page Layouts with the Original Page Layout Editor](#)

### Compact Layouts

Compact layouts are used in Salesforce1 and Lightning Experience to display a record’s key fields at a glance.

In the full Salesforce site, compact layouts determine which fields appear in the Chatter feed item that appears after a user creates a record with a quick action.

**Note:** To avoid inadvertent sharing of information through the feed, the Task page layout determines the fields displayed in the Chatter feed items for tasks created using a quick action.

In Salesforce1, the first four fields that you assign to a compact layout appear in:

- An object’s record highlights area
- Expanded lookup cards on a record’s related information page
In Lightning Experience, the first five fields that you add to a compact layout display in an object's record highlights panel.

Note: If a user doesn't have access to one of the fields that you assign to a compact layout, the next field on the layout is used.

If you don't create custom compact layouts for an object, all the object's record highlight fields, preview cards, and action-related feed items are driven by a read-only, system default compact layout that contains a predefined set of fields. After you create one or more custom compact layouts, you can set one as the primary compact layout for the object. The primary compact layout is then used as the default for that object.

Primary compact layouts determine which fields are shown in Chatter personal digest emails.

If you have record types associated with an object, you can override the primary compact layout assignment and assign specific compact layouts to different record types.

Compact layouts support all field types except:
- text area
- long text area
- rich text area
- multi-select picklist

Create Compact Layouts

Use compact layouts to customize the fields that display for object records when viewed in Salesforce1 and Lightning Experience.

The first four fields on your compact layout populate the record highlights section at the top of each record view in Salesforce1. The record highlights section in Lightning Experience uses the first five fields on the compact layout.

1. From the management settings for the object that you want to edit, go to Compact Layouts.
2. Create a new compact layout and give it a label.
3. Add up to 10 fields.

Tip: Put the object’s Name field first to provide context for your users when they view a record.

4. Sort the fields by selecting them and clicking Up or Down. The order you assign to the fields determines the order in which they display.

5. Save the layout.

6. To set the compact layout as the primary compact layout for the object, click Compact Layout Assignment.

Example: This image shows a sample edit compact layout page for the standard Account object:
Here is the detail page for a sample account in the Salesforce1 mobile app. You can see that the account's name, site, phone number, and account number are concisely displayed at the top of the page.

Assign Compact Layouts to Record Types

If you don’t create custom compact layouts for an object, all the object’s record highlight fields, preview cards, and action-related feed items are driven by a read-only, system default compact layout that contains a predefined set of fields. After you create one or more custom compact layouts, you can set one as the primary compact layout for the object. The primary compact layout is then used as the default for that object. If you have record types associated with an object, you can override the primary compact layout assignment and assign specific compact layouts to different record types.

1. From the management settings for the object that you want to edit, go to Compact Layouts.
   
   Tip: For Salesforce Knowledge articles, from Setup, enter Knowledge Article Types in the Quick Find box, then select Knowledge Article Types, click the name of an article type, then scroll down to the Compact Layouts related list.

2. Click Compact Layout Assignment.

3. Select a compact layout to use as the primary compact layout for this object.

4. In the Record Type Overrides section, select one or more record types to which you want to assign a compact layout.
   If you don’t have record types set for the object, you won’t see this section. If you don’t set any record type overrides, all record types use the object’s primary compact layout by default.
   Some record types in the list might be inactive. You can assign a compact layout to an inactive record type.

5. Select a compact layout from the Compact Layout To Use drop-down list to assign it to the selected cells.

6. Click Save.

Notes on Compact Layouts

- Changes you make to a compact layout are reflected in both Salesforce1 and Lightning Experience.
- Each record type can have only one compact layout assigned to it. However, a compact layout can be associated with multiple record types.
- Users who don’t have access to certain fields in Salesforce won’t see them on the compact layout.
- A compact layout must contain at least one field.
- A compact layout can only contain fields from its object, including a formula field that is a cross-object reference to another object.
- Removing a field from a page layout doesn’t remove it from the object’s compact layout. The two layout types are independent.
• If you change a field on a compact layout to an unsupported type, the field is removed from the compact layout.
• Before you can delete a compact layout that’s set as the primary compact layout for the object, you must choose another compact layout to replace it.
• In Salesforce1, tasks automatically show whether a task is open or closed and the due date (depending on a user’s access to activity dates). When customizing a task compact layout, you don’t need to add these fields to the Selected Fields list.
• Compact layouts aren’t available for the Chatter Mobile for BlackBerry or Dashboards for iPad mobile apps.

Select Fields to Display in the Recently Viewed List on Object Home Pages in Lightning Experience

As a Salesforce admin, you can customize the Recently Viewed list that appears on the home page for most standard and custom objects. Choose and order the fields to display so that your users see the information that’s most important for your company.

Note: These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you’re in Lightning Experience. If you see a row of tabs across the top of the screen, you’re in Salesforce Classic.

For most list views, your users can select which fields to display and how to order the view columns. However, they can’t edit the recent records quick list on object home pages. Only Salesforce admins can select and order the fields to display for the recent records quick list. Admins can’t make any other changes to this default list.

1. From Setup, enter Object Manager in the Quick Find box, then select Object Manager.
2. Click the label name of the object for the Recently Viewed list you want to modify.
3. From the menu of links at the top of the page, click Search Layouts.
4. In the far right of the Search Results column, click and select Edit.
5. To add columns to the Recently Viewed list, select one or more fields from Available Fields and click Add. To remove columns, select one or more fields from Selected Fields and click Remove.
6. Order columns by selecting one or more fields from Selected Fields and clicking Up or Down.
7. Click Save.

Example: Your users collaborate on opportunities. To make it easy to see who worked on a recent opportunity last, select Last Modified By from the Available Fields list. Click Add to move it to Selected Fields. Now this information appears on the Recently Viewed list on the Opportunities home page.
Customize Search Layouts

Customize which fields display for users in search results, search filter fields, lookup dialogs, the recent records lists on tab home pages in Salesforce Classic, and in lookup phone dialogs for Salesforce CRM Call Center.

You can specify a different set of fields to show in each search layout. The settings apply to all users in your organization and Salesforce Customer Portal.

You can also customize which buttons display in custom list views and search results. You can hide a standard list view button or display a custom button. Standard buttons aren’t available on search result layouts. To display a custom button, create the custom button, giving it the List Button Display Type.

1. From the management settings for the appropriate object, go to Search Layouts.
2. Click Edit next to the layout you want to customize. Specify a different set of items to display. You can edit search results, lookup dialogs, recent records lists on tab home pages in Salesforce Classic, lookup phone dialogs, list views, and search filter fields.
3. For list view and search results layouts, select the standard or custom buttons you want to display. To hide a standard button on the list view, deselect it. Standard buttons aren’t available on search result layouts.
   - To customize which fields display in the layout, select one or more fields and click Add or Remove.
   - To sort fields in the layout, select one or more fields in Selected Fields and click Up or Down.
   - To select multiple fields individually, use CTRL+click.
   - To select multiple fields as a group, use SHIFT+click.
   - To customize which items display in the layout, select the item and click Add or Remove.
   - To sort items in the layout, select the item and click Up or Down.

   Note: When editing a search results layout for an object, you can select the Override the search result column customizations for all users checkbox. If selected, all user column customizations within your organization are overwritten and restored to the organization-wide default settings.

5. Click Save.

SEE ALSO:
- Page Layouts
- Notes on Search Layouts
Notes on Search Layouts

- Search layouts don’t apply to Salesforce CRM Content.
- Search layouts don’t apply to campaign members, opportunity teams, or account teams.
- The search layout doesn’t control which fields are searched for keyword matches. The list of fields searched is the same across Salesforce.
- You can add up to 10 fields to each search layout.
- You can’t remove unique identifying fields, such as Account Name or Case Number, from the search layout. These fields must be listed first in the order of fields in the search layout.
- You can’t add long text fields such as Description, Solution Details, or custom long text area fields to search layouts.
- All fields are available to be added to the search layout even if some fields are normally hidden for the user customizing the search layout.
- For Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, search layouts don’t override field-level security. If a field is included in the search layout but hidden for some users via field-level security, those users do not see that field in their search results.
- For Personal, Contact Manager, Group, and Professional Edition organizations, search layouts override page layout settings. If a field is included in the search layout but hidden in the page layout, that field will be visible in search results.
- The search results layouts for leads, accounts, contacts, and opportunities also apply to the search results displayed when finding duplicate leads.
- Formula fields are not available in search result layouts.
- Don’t remove the Phone field from any lookup phone dialogs search layout. If you do, users can’t use the directory search results to enter a phone number into a SoftPhone dial pad.
- To add a custom button to a list view or search layout, create the custom button for a standard or custom object, giving it the List Button Display Type. The custom button will be available in the list view and search result layouts for that object.

Tip: In account search results, you can visually differentiate business accounts from person accounts by adding the Is Person Account field, which displays as the person account icon ( ).

You may specify the Is Person Account field as the first column in account search layouts. Otherwise, Account Name must be the first column.
Custom Tabs

Display custom object data or other web content using custom tabs in Salesforce.

Custom tabs display custom object data or other web content embedded in the application. You can create any of these types of custom tabs.

**Custom Object Tabs**

Custom object tabs (available only at an app level and not on subtab apps) display the data of your custom object in a user interface tab. Custom object tabs look and function just like standard tabs.

**Web Tabs**

Custom web tabs display any external web-based application or web page in a Salesforce tab. You can design web tabs to include the sidebar or span across the entire page without the sidebar.

**Visualforce Tabs**

Visualforce tabs display data from a Visualforce page. Visualforce tabs look and function just like standard tabs.

**Lightning Component Tabs**

Lightning component tabs make Lightning components available in the Salesforce1 mobile app (via the navigation menu) or in Lightning Experience (via the App Launcher). Lightning components aren’t supported in Salesforce Classic.

**Lightning Page Tabs**

Lightning Page tabs let you add Lightning Pages to the Salesforce1 and Lightning Experience navigation menus.

In Salesforce Classic, Lightning Page tabs don’t show up on the All Tabs page when you click the plus icon (➕) that appears to the right of your current tabs. Nor do Lightning Page tabs show up in the Available Tabs list when you customize the tabs for your apps.

In Lightning Experience, if a Lightning Page tab is set to Default On, it appears in the Lightning Experience custom navigation menu assigned to that profile. If a Lightning Page tab is set to Default Off, it appears in the App Launcher under Other Items.

Subtab apps support only web tabs and Visualforce tabs.

Delegated administrators who can manage specified custom objects can also create and customize tabs for those custom objects.

**Note:** To expose Lightning components via Lightning component tabs, you must enable and deploy My Domain.

SEE ALSO:

Creating Custom Apps
What is a Subtab App?
Create Web Tabs

Build web tabs so that your users can use your web applications or other websites from within the application.

1. From Setup, enter Tabs in the Quick Find box, then select Tabs.
2. Click New in the Web Tabs related list.
3. Choose a layout for the new tab. The full page width spans across the entire page without the sidebar, while the column style allows users to view the sidebar.
4. Click Next.
5. Enter a label to display on the tab.
6. Click the Tab Style lookup icon to display the Tab Style Selector.
   - If a tab style is already in use, a number enclosed in brackets [ ] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click Hide styles which are used on other tabs to filter this list.
7. Click a tab style to select the color scheme and icon for the custom tab.
   - Optionally, click Create your own style on the Tab Style Selector dialog to create a custom tab style if your org has access to the Documents tab. To create your own tab style:
     a. Click the Color lookup icon to display the color selection dialog and click a color to select it.
     b. Click Insert an Image, select the document folder, and select the image you want to use.
        - Alternatively, click Search in Documents, enter a search term, and click Go! to find a document file name that includes your search term.
        - Note: This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ( ).
     c. Select a file and click OK. The New Custom Tab wizard reappears.
8. Change the content frame height if necessary.
9. Optionally, select Salesforce Classic Mobile Ready to indicate that the web page displays and functions properly in the Salesforce Classic Mobile app.
   Selecting this checkbox adds the tab to the list of available tabs for your Salesforce Classic Mobile configurations. Before mobilizing a web tab, review the Salesforce Classic Mobile tab considerations to ensure that the pages in your web tabs are compatible with mobile browsers.
   - Note: The Salesforce Classic Mobile Ready checkbox is only visible if Salesforce Classic Mobile is enabled for your organization.
10. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab. Don’t use a splash page if you plan to mobilize the web tab, as splash pages don’t display in the mobile application.
11. Enter a description of the tab, if desired, and click Next.
12. Enter the URL or choose the custom s-control that you want to display in the tab. Optionally, copy and paste any merge fields for data that you want dynamically replaced in the link.
Create a Custom Object Tab

Define a tab to display the data stored in your custom object records.

1. From Setup, enter Tabs in the Quick Find box, then select Tabs.
2. Click New in the Custom Object Tabs related list.
3. Select the custom object to display in the custom tab. If you have not already created the custom object, click create a new custom object now and follow the instructions in Define a Custom Object on page 3955.
   The label of the new tab is the same as the plural version of the custom object label.
4. Click the Tab Style lookup icon to display the Tab Style Selector. If a tab style is already in use, a number enclosed in brackets [ ] appears next to the tab style name. Hover your mouse over the style name to view the tabs that use the style. Click Hide styles which are used on other tabs to filter this list.
5. Click a tab style to select the color scheme and icon for the custom tab. Optionally, click Create your own style on the Tab Style Selector dialog to create a custom tab style if your org has access to the Documents tab. To create your own tab style:
   a. Click the Color lookup icon to display the color selection dialog and click a color to select it.
   b. Click Insert an Image, select the document folder, and select the image you want to use. Alternatively, click Search in Documents, enter a search term, and click Go! to find a document file name that includes your search term.
   Note: This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ( ).
   c. Select a file and click OK. The New Custom Tab wizard reappears.
6. Optionally, choose a custom link to use as the introductory splash page when users initially click the tab.
7. Enter a description of the tab, if desired, and click Next.
8. Choose the user profiles for which the new custom tab will be available.
   For Professional Edition users and Salesforce Platform One license users, tab visibility is set to Default On.

   | **Note:** | Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren't required to add the tab for display. |

9. Specify the custom apps that should include the new tab.
10. Select *Append tab to users' existing personal customizations* to add the tab to your users' customized display settings if they have customized their personal display.

11. Click *Save*.

   Depending on the visibility settings you selected, you'll see the tab right away:

   ![Custom Tab Example](image)

### Create Lightning Page Tabs

Before you can include an App Page type of Lightning Page in the Salesforce1 or Lightning Experience navigation menu, you must create a custom tab for it.

When you first activate an app page in the Lightning App Builder, a tab is created for the page as part of the activation process. You can also create a tab for the page manually in Setup.

Lightning Page tabs only facilitate inclusion of the Lightning Page in the Salesforce1 and Lightning Experience navigation menus.

You can create a tab only for an App Page type of Lightning Page.

1. From Setup, enter *Tabs* in the *Quick Find* box, then select *Tabs*.
2. Click *New* in the Lightning Page Tabs related list.
3. Choose a Lightning Page for the tab.
4. Enter a label.
This text is used as the display name for the Lightning Page in the navigation menu.

5. Select a tab style to set a color scheme and icon for the Lightning Page tab.
   The icon you choose here is the icon that displays to the left of the Lightning Page label in the navigation menu.
   Optionally, click **Create your own style** on the Tab Style Selector dialog to create a custom tab style if your org has access to the Documents tab. To create your own tab style:
   a. Click the **Color** lookup icon to display the color selection dialog and click a color to select it.
   b. Click **Insert an Image**, select the document folder, and select the image you want to use.
      Alternatively, click **Search in Documents**, enter a search term, and click **Go!** to find a document file name that includes your search term.

   ![Note: This dialog only lists files in document folders that are under 20 KB and have the Externally Available checkbox selected in the document property settings. If the document used for the icon is later deleted, Salesforce replaces it with a default multicolor block icon ( ).](image)

   c. Select a file and click **OK**. The New Custom Tab wizard reappears.

6. Enter a description of the tab, if desired, and click **Next**.

7. Choose the user profiles for which the new custom tab will be available.

   ![Note: In Salesforce Classic, the Default On and Default Off options for Lightning Page tabs don’t work the same way as for other custom tabs. The Lightning Page menu item appears for the selected profiles in Salesforce1 whether you choose Default On or Default Off. Select the **Tab Hidden** option to hide the Lightning Page menu item for the selected profiles.](image)

8. Click **Save**.

### Custom Tab Considerations

When working with custom tabs, keep these considerations in mind.

- To enable Visualforce or web tabs for use in the Salesforce Classic Mobile app, edit the properties of the tabs and select the **Salesforce Classic Mobile Ready** checkbox.
- The custom tabs limit is a fixed number based on edition and can’t be increased. For more information, contact Salesforce.
- If you choose Default On or Default Off when setting custom object tab visibility, an option is added to the **Create** drop-down list in the Salesforce Classic sidebar so that users with the “Create” permission can quickly create a record. For example, if the custom object displayed in the custom tab is named Expenses, an **Expense** option appears in this list.
- Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren’t required to add the tab for display.
- A Web tab or custom link could display a blank page if the embedded site:
  - Has been set to deny the loading of its content in a frame.
  - Has been set to allow the loading of its content in a frame only if the same site is delivering the content.
  - Contains a mix of secure and unsecure content, and the user’s browser has been configured to block mixed active content.

To resolve this issue, try these workarounds.

---

**EDITIONS**

Available in: both Salesforce Classic and Lightning Experience

Custom Object Tabs and Web Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Visualforce Tabs available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Lightning Page Tabs available in: **All Editions except Database.com**
Set your custom link to either open in a new window or display in the existing window without the sidebar or header.

Move the URL from a Web tab into a custom link instead, and set the URL to either open in a new window or display in the existing window without the sidebar or header.

If the site you’re embedding has an HTTP prefix and mixed active content, try changing the prefix to HTTPS. If the embedded site has a valid security certificate and it hasn’t blocked itself from being displayed in frames, using HTTPS as the prefix allows the site to display.

In Salesforce Classic, Lightning Page tabs don’t show up on the All Tabs page when you click the plus icon (➕) that appears to the right of your current tabs. Nor do Lightning Page tabs show up in the Available Tabs list when you customize the tabs for your apps.

In Salesforce Classic, the Default On and Default Off options for Lightning Page tabs don’t work the same way as for other custom tabs. The Lightning Page menu item appears for the selected profiles in Salesforce1 whether you choose Default On or Default Off. Select the Tab Hidden option to hide the Lightning Page menu item for the selected profiles.

In Lightning Experience, if a Lightning Page tab is set to Default On, it appears in the Lightning Experience custom navigation menu assigned to that profile. If a Lightning Page tab is set to Default Off, it appears in the App Launcher under Other Items.

Custom Help

The Help & Training link at the top of every page opens the Salesforce Help & Training window which includes online help topics, solutions, and recommended training classes. Additionally, the Help for this Page link on any page opens a context-sensitive online help topic that describes that page.

Salesforce custom help functionality allows you to augment these standard help features with information on using fields and functionality unique to your organization or the Force.com AppExchange app you are developing.

Custom help allows you to:

• Override the standard Salesforce context-sensitive online help topics for your custom objects using object-level help
• Add field-level help that displays when users hover their mouse over a field

SEE ALSO:

Getting Started with Field-Level Help
Getting Started with Object-Level Help

Getting Started with Field-Level Help

Field-level help lets you provide help text detailing the purpose and function of any standard or custom field. You can define custom help text for your organization's fields to provide users with a helpful description for any field on all detail and edit pages where that field displays. Users can view the field-level help text by hovering over the Info icon next to the field.

Before you begin defining field-level help, review these implementation tips and best practices.

Implementation Tips

• Field-level help is enabled by default for all editions.
• Field-level help is not available for some standard fields, including fields on the User object, system read only fields, auto-number fields, multi-currency fields, Ideas fields, and Community fields.
The help text for a field is automatically added to a package when you add the associated field to any Force.com AppExchange package. In a managed package, the help text is locked to the developer, giving installers full capabilities to change it.

Best Practices
- Because your custom help text displays on both edit and detail pages, avoid instructions for entering data. Instead, construct help text that defines the field's purpose, such as:
  
  The maximum discount allowed for this account.

- Provide information in your help text about the attributes of the field, such as:
  
  A detailed description of the purpose for the expense report. Up to 32 KB of data are allowed. Only the first 255 characters display in reports.

- Provide examples in your help text that help users understand the field's meaning clearly, such as:
  
  The four-digit promotional code used to determine the amount charged to the customer, for example, 4PLT (for level-four platinum pricing).

- If your organization uses more than one language, provide translations for your Help Text using the Translation Workbench.

Define Field-Level Help

Field-level help lets you provide help text detailing the purpose and function of any standard or custom field. You can define custom help text for your organization’s fields to provide users with a helpful description for any field on all detail and edit pages where that field displays. Users can view the field-level help text by hovering over the Info icon next to the field.

1. From the management settings for the field’s object, go to Fields.
2. Click Edit next to the field.
3. In the Help Text field, enter the text you want displayed when a user hovers the mouse over the Info icon that appears adjacent to the field on a detail or edit page. You can enter up to 255 characters.
4. Click Save.

SEE ALSO:

- Getting Started with Field-Level Help
- Find Object Management Settings

Getting Started with Object-Level Help

Help your users by providing object-level help for your custom and external objects. This way, when your users click the Help for this Page link on your custom object, they’ll find useful information that’s relevant to your custom object.
Note: If you don't create object-level help, the Help for this Page link provides information about standard objects that won’t be relevant to your custom object.

You can override the Help for this Page links for a custom object or external object with help content contained in a Visualforce page. But don’t worry! You don’t have to learn Visualforce to add help content to your custom objects.

When you add custom help to a custom or external object, the Help for this Page link on those object pages displays your custom help instead of generic help. Your users can access the custom help content from the object home (overview), detail, and edit pages, list views, and related lists.

You can create object-level help for all custom objects and external objects in the Salesforce editions that support custom and external objects. For more information, see Salesforce Limits.

SEE ALSO:
  - Custom Help
  - Define Object-Level Help
  - Object-Level Help Best Practices and Considerations

Define Object-Level Help

Object-level help overrides the Help for this Page links for a custom object or external object with your own help content contained in a Visualforce page. To make object-level help available to all your users, create a Visualforce page that contains your help content. Then edit the custom or external object definition to reference the page. Object-level help becomes available to all your users instantly.

1. Create a Visualforce page that contains your help content.
2. Edit the custom object definition or external object definition that uses the custom help when users click the Help for this Page link.
3. For Context-Sensitive Help Setting, select Open a window using a Visualforce page.
4. Select the Visualforce page that contains your help content.
5. Click Save.

SEE ALSO:
  - Getting Started with Object-Level Help
  - Custom Help
Create a Custom Object Help Page with Static Content

If you know HTML, it’s easy to add help to your custom objects by writing the content in HTML and saving it in a Visualforce page. No need to learn Visualforce. Just use the template that we provide.

1. From Setup, enter Visualforce Pages in the Quick Find box, then select Visualforce Pages.
2. Click New.
   The Visualforce page editor opens with a new page.
3. Complete the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>The human-friendly name of the page used to identify the page in Setup tools.</td>
</tr>
<tr>
<td>Tip: It’s a great idea to have a naming convention for your custom help pages. For example, start all custom help pages with “Help_” and then the object name.</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>The API name for the page. You can use the auto-filled value.</td>
</tr>
<tr>
<td>Description</td>
<td>An optional description of the page.</td>
</tr>
<tr>
<td>Available for Sales</td>
<td>Select this option if your custom object is available in Salesforce1.</td>
</tr>
<tr>
<td>Mobile apps and</td>
<td></td>
</tr>
<tr>
<td>Lightning Pages</td>
<td></td>
</tr>
</tbody>
</table>

4. Click Quick Save.
5. In the Visualforce Markup tab code editor, select the default code and delete it.
6. Paste the following help template code into the code editor.

```apex
<apex:page showHeader="false">

    <!-- Add your help styles -->

    <h1>Help for {YourObjectName} Object</h1>

    <p>Your custom help message here.</p>

</apex:page>
```

7. Click Quick Save.
8. Edit the template to add your help content.
   To add formatting to your page, use HTML markup. You can also use Visualforce markup if you know it.
9. Click Save.
You can now add this page as custom help. When users click Help for this Page, they see this page in the Help & Training window.

Object-Level Help Best Practices and Considerations

Create Custom Object Help with a PDF File

Add help to your custom objects by creating Visualforce pages that redirect to PDF help files or a URL. No need to learn Visualforce. Just use the template that we provide.

You can write your help content in an authoring tool such as Microsoft Word and convert it to a PDF file.

1. Upload your PDF file as a static resource.
   Users see this PDF file when they request help with the custom object.

2. From Setup, enter Visualforce Pages in the Quick Find box, then select Visualforce Pages.

3. Click New.
   The Visualforce page editor opens with a new page.

4. Complete the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>The human-friendly name of the page used to identify the page in Setup tools.</td>
</tr>
<tr>
<td></td>
<td>Tip: It’s a great idea to have a naming convention for your custom help pages. For example, start all custom help pages with “Help_” and then the object name.</td>
</tr>
<tr>
<td>Name</td>
<td>The API name for the page. You can use the auto-filled value.</td>
</tr>
<tr>
<td>Description</td>
<td>An optional description of the page.</td>
</tr>
<tr>
<td>Available for Salesforce mobile apps and Lightning Pages</td>
<td>Select this option if your custom object is available in Salesforce1.</td>
</tr>
</tbody>
</table>

5. Click Quick Save.

6. In the Visualforce Markup tab code editor, select the default code and delete it.

7. Paste the following help template code into the code editor.

<apex:page showHeader="false" action="(! URLFOR($Resource.YourCustomHelpResource) )">
8. Replace `YourCustomHelpResource` in the action attribute with the name of the static resource that you uploaded.

9. Click **Save**.

You can now add this page as help. When users click **Help for this Page**, they're redirected to the resource you set in the action attribute.

**Note:** The user's browser controls the behavior of a PDF link, not your Visualforce page. The PDF content might display in the browser or be downloaded as a PDF file.

- Object-Level Help Best Practices and Considerations

### Object-Level Help Best Practices and Considerations

Before defining object-level help text for your custom or external objects, review these best practices and implementation considerations.

**Best Practices**

- The window that displays your object-level help has the same height and width dimensions as the standard Salesforce Help & Training window. To increase the usability of your help content, size and style your content appropriately.
- To give your custom help a professional tone using Salesforce terminology, follow the [Salesforce Style Guide for Documentation and User Interface Text](#).
- Your Visualforce help content pages can use merge fields or other functions to make the experience more personalized. For example, you can design the help to add the user’s name when the help page is displayed.

**Advanced Implementation Considerations**

- Create custom help Visualforce pages without a controller, or use a custom controller. You can’t use a standard controller.
- If you have defined object-level help for an object that you add to a Force.com AppExchange package, Salesforce adds the Visualforce page or static resource referenced in your `Context-Sensitive Help Settings` for that object.
- In managed packages, object-level help is locked to the developer, giving installers the ability to change it if needed.

- Define Object-Level Help
- Getting Started with Object-Level Help

---

**EDITIONS**

Available in: Salesforce Classic

- Custom objects are available in: **Contact Manager, Group,** **Professional, Enterprise,** **Performance, Unlimited, and Developer** Editions
- Salesforce Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance,** and **Unlimited** Editions
- Visualforce is available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions
Replacing the Salesforce Help

If you rename standard tabs, objects, fields, and other related user interface labels, you can also replace the Salesforce Help with another URL.

Users can view this URL whenever they click on any context-sensitive help link on an end-user page or within their personal settings. After you replace the help, the Help & Training link at the very top of every page and all Setup pages will continue to display the Salesforce Help.

1. From Setup, enter Help Settings in the Quick Find box, then select Help Settings.
2. Enter the complete URL for your help file that you would like to replace the Salesforce Help.
3. Click Save.

Considerations for Replacing the Salesforce Help

• When you replace the Salesforce Help with your own help file, the Help & Training link still displays Salesforce Help, but the Help for this Page links on all pages other than within Setup are no longer context-sensitive. That is, your help file will open at the same place regardless of which page the user is viewing when they click the link.

• You can make your help context-sensitive by taking advantage of the context-specific parameters that are passed with each help link. For example, the help link from the Opportunities tab home page is constructed as follows (without any line breaks):

The values of the target and section parameters are unique for every page within the application. You can parse these parameters to display context-sensitive help content for your users.

• If your online help file is compatible with the Web browser on your users’ mobile devices, you can contact Salesforce to enable a custom URL for the online help in Salesforce Classic Mobile. If you enable a mobile help URL, the Help link in the mobile application launches the custom help URL instead of the Salesforce Classic Mobile online help. Don’t deploy customized mobile help without testing it thoroughly on all the device models carried by your users. Even if all of your users have the same type of mobile device, the experience can vary widely depending on which operating system version is installed on the device.
Using Record Types

Record Types
Customize business processes, picklist values, and page layouts for multiple groups of users.
Record types let you offer different business processes, picklist values, and page layouts to different users. Create record types for various reasons, like for:

- Opportunities to differentiate your regular sales deals from your professional services engagements and offer different picklist values for each.
- Cases to display different page layouts for your customer support cases versus your billing cases.

SEE ALSO:
- View and Edit Record Types
- Create Record Types
- How is record type access specified?
- Considerations for Creating and Updating Record Types
- Administrator tip sheet: Tips & Hints for Record Types

Considerations for Creating and Updating Record Types
Learn important details before you create and update record types.

- Before creating record types, include all of the possible record type values in your master list of picklists. The master picklist is a complete list of picklist values that can be used in any record type.
- The master picklist is independent of all record types and business processes. If you add a picklist value to the master picklist, you must manually include the new value in the appropriate record types. If you remove a picklist value from the master, it is no longer available when creating new records, but records assigned to that value are unchanged.
- The following special picklist fields are not available for record types because they are used exclusively for sales processes, lead processes, support processes, and solution processes:
  - Opportunity Stage
  - Case Status
  - Solution Status
  - Lead Status
You can use these fields to provide different picklist values for different record types by assigning a different process to each record type.
- Renaming a record type doesn’t change the list of values included in it.
- Person accounts are account records to which a special kind of record type has been assigned. These record types are called person account record types. Person account record types allow contact fields to be available on the account and allow the account to be used in many situations as if it were a contact. A default person account record type named “Person Account” is automatically created when person accounts are enabled for your organization. You can change the name of this record type, and you can create additional person account record types.
- You cannot delete all the record types for an object if the object is referenced in Apex.
• You cannot deactivate a record type if it is in use by an email routing address for Email-to-Case or On-Demand Email-to-Case.

• To create record types for campaign members, from the object management settings for campaign members, go to Record Types. Record types can only be assigned to campaign members using the Campaign Member Type field on new or existing campaigns. To assign record types to campaign members, add the Campaign Member Type field to the campaign page layout. You must have the Marketing User user permission to change the campaign member type. You can also add a read-only Campaign Member Type field to the campaign members page layout.

• The following campaign member picklists are not available for record types:
  - Status
  - Salutation
  - Lead Source

• Salesforce recommends creating no more than 200 record types. While there is no limit, organizations may have difficulty managing their record types if they exceed 200.

• Deleting a record type also deletes the related sales path.

When users convert, clone, or create records, the following special considerations apply.

• When a user converts a lead, the new account, contact, and opportunity records automatically use the default record type for the owner of the new records.

• When a user clones a record, the new record has the record type of the cloned record. If the record type of the cloned record isn’t available in the user’s profile, the new record adopts the user’s default record type.

• When a user creates a new case or lead and applies assignment rules, the new record can keep the creator’s default record type or take the record type of the assignee, depending on the case and lead settings specified by the administrator.

  Guidelines for Changing an Account’s Record Type
Create Record Types

Tip: Before creating record types, include all of the possible record type values in your master list of picklists. The master picklist is a complete list of picklist values that can be used in any record type.

1. From the management settings for the appropriate object, go to Record Types.
2. Click New.
3. Choose Master from the Existing Record Type drop-down list to copy all available picklist values, or choose an existing record type to clone its picklist values.
   
   Note: When you create a new record type without cloning an existing one, the new record type automatically includes the master picklist values for both standard and custom picklists. You can then customize the picklist values for the record type.

4. Enter a Record Type Label that’s unique within the object.
5. Enter a Record Type Name. The Record Type Name refers to the component when using the Web services API and prevents naming conflicts on package installation in managed packages.
6. For opportunity, case, lead, and solution record types, select a business process to associate with the record type.
7. Enter a description.
8. Select Active to activate the record type.
9. Select Enable for Profile next to a profile to make the record type available to users with that profile. Select the checkbox in the header row to enable it for all profiles.
   
   Tip: If each profile is associated with a single record type, users will never be prompted to select a record type when creating new records.

10. For enabled profiles, select Make Default to make it the default record type for users of that profile. Select the checkbox in the header row to make it the default for all profiles.
11. Click Next.
12. Choose a page layout option to determine what page layout displays for records with this record type:
   - To apply a single page layout for all profiles, select Apply one layout to all profiles and choose the page layout from the drop-down list.
   - To apply different page layouts based on user profiles, select Apply a different layout for each profile and choose a page layout for each profile.

13. Click Save to edit the values of the standard and custom picklists available for the record type, or click Save and New to create another record type.

SEE ALSO:
- Record Types
- View and Edit Record Types
- Considerations for Creating and Updating Record Types
Edit Picklists for Record Types and Business Processes

Customize the values in record type or business process picklists based on your organization’s unique needs.

1. Select a record type or business process and click Edit next to the picklist field to change its values.
2. Add or remove values as needed. Users can choose from these values when creating or editing records.
3. Optionally, choose a default picklist value. Some picklists require a default value. The default value in a dependent field is ignored.
4. Click Save.

SEE ALSO:
- Custom Fields
- Considerations When Creating Picklists

Considerations When Creating Picklists

Refer to these considerations when you edit record type or business process picklists values. For example, after you create a picklist, update the appropriate page layouts so that users can access the picklist.

- The master picklist is independent of all record types and business processes. If you add a picklist value to the master picklist, you must manually include the new value in the appropriate record types. If you remove a picklist value from the master, it is no longer available when creating new records, but records assigned to that value are unchanged.
- Renaming a record type doesn’t change the list of values included in it.
- The following special picklist fields are not available for record types because they are used exclusively for sales processes, lead processes, support processes, and solution processes:
  - Opportunity Stage
  - Case Status
  - Solution Status
  - Lead Status

You can use these fields to provide different picklist values for different record types by assigning a different process to each record type.

- The following campaign member picklists are not available for record types:
  - Status
To display the field on record detail and edit pages, add the Record Type field to your page layouts. A user can be associated with several record types. For example, a user who creates marketing campaigns for both U.S. and European divisions can have both U.S. and European campaign record types available when creating new campaigns.

Record types can only be assigned to campaign members using the Campaign Member Type field on new or existing campaigns. To assign record types to campaign members, add the Campaign Member Type field to the campaign page layout. You must have the Marketing User user permission to change the campaign member type. You can also add a read-only Campaign Member Type field to the campaign members page layout.

SEE ALSO:
Edit Picklists for Record Types and Business Processes

View and Edit Record Types

To view a list of record types, from the management settings for an object, go to Record Types.

- Click New to create a new record type.
- Click Edit to change the name of a record type or deactivate it by deselecting the Active checkbox. Deactivating a record type does not remove it from any user profiles or permission sets.

  Note: When creating and editing record types for accounts, opportunities, cases, contacts, or custom objects, check for criteria-based sharing rules that use existing record types as criteria. A record type change may affect the number of records that the rule shares. For example, let’s say you have a record type named “Service,” and you created a criteria-based sharing rule that shares all Service record types with your service team. If you create another record type named “Support” and you want these records shared with your service team, you must update the sharing rule to include Support record types in the criteria.

- Click Del to delete an inactive record type and assign associated records a different record type. To leave the record type field blank on records associated with the deleted record type, select None.

  Note: Deleting campaign member record types updates the Campaign Member Type field on campaign and campaign member records.

- Click the name of the record type to edit the picklists associated with it.
- Click Page Layout Assignment to set which page layouts users can see based on profiles and record types.
Note: You cannot edit or delete a record type for an object if the object is referenced in Apex.

Managing Multiple Business Processes

Use multiple business processes to display different picklist values for users based on their profile. Multiple business processes allow you to track separate sales, support, and lead lifecycles.

Sales Processes
Create different sales processes that include some or all of the picklist values available for the opportunity Stage field.

Lead Processes
Create different lead processes that include some or all of the picklist values available for the Lead Status field.

Support Processes
Create different support processes that include some or all of the picklist values available for the case Status field.

Solution Processes
Create different solution processes that include some or all of the picklist values available for the Status field.

After creating a sales, support, lead, or solution process, assign the process to a record type. The record type determines the user profiles that are associated with the business process.

To view a list of business processes, from Setup, enter Processes in the Quick Find box, then select the appropriate link.

- Click New to create a new business process.
- Click Edit to change the name or inactivate the business process.
- Click Del to delete an unused business process.
- Click the name of the business process to edit the picklist values associated with it.

SEE ALSO:
- Edit Picklists for Record Types and Business Processes
- Administrator tip sheet: Tips & Hints for Multiple Business Processes
Create Multiple Business Processes

Follow these steps to create sales processes, support processes, lead processes, and solution processes.

1. From Setup, enter Processes in the Quick Find box, then select the appropriate link.
2. Click New.
3. Choose an existing process to copy its picklist values into the new process. Select Master to copy all available picklist values.
4. Enter a name and description for the new process. The name must be unique within the tab.
5. Click Save.

All of the available values in the picklist are displayed. Choose the values that you would like included in the new business process.

Next, add the new business process to a record type, and then make the record type available to users based on profile.

Translation Workbench

If your org has multiple languages enabled, use Translation Workbench to maintain your translated labels in your org. You can manage translated values for any Salesforce supported language.

Note: Standard objects aren’t available in the Translation Workbench. Use the rename tabs and labels interface for standard object translation.

If a customized component doesn’t have a translated value, the component uses the org’s default language. When you deactivate a language, all translations for that language are still available in the Translation Workbench, but users with that language selected see the org’s default language values.

Translation Workbench isn’t available for single-language orgs. If you aren’t sure whether you have a single-language or multi-language organization, contact Salesforce.

Enabling the Translation Workbench makes these changes to your Salesforce org.

- You must edit picklist values individually. You can’t mass-edit existing picklist values, but you can still mass-add new values.
- When picklist values are sorted alphabetically, the values are alphabetical by the org’s default language.
- Reports have a Filter Language drop-down list in the Filters pane of the report builder. Selecting a language filters on translated strings for any filter criteria that use the starts with, contains, or does not contain operator.
- Import files have a Language drop-down list, and all records and values within the import file must be in the selected language.
- Web-to-Lead and Web-to-Case have a Language drop-down list before you generate the HTML.

Enable and Disable the Translation Workbench

The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you’ve made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

Add Translated Languages and Translators

Add supported languages, activate or deactivate a language, assign translators for that language, and enter translated terms for customizations you’ve made in your org’s default language.
Translate Terms

Override Translations in Managed Packages
Although you can’t edit labels or translations in a managed package, they are controlled by the developer, you can override them with the Translation Workbench. For example, override a custom field in a package.

Translatable Customizations
You can translate only certain components.

Translation Files
Salesforce provides different file types to translate customization labels and review translations.

Considerations for Updating Translated Terms
Translators are responsible for keeping the translated terms updated. When translated components change, the translated value is marked Out of Date.

Exporting Translation Files
Create files that contain your org’s translatable metadata, such as custom fields, report types, and picklist values. Send these files to your outside translators or translation agency for bulk translation activities, then use Import to update your labels.

Import Translated Files
Import and update the translations for your org’s metadata, such as custom fields, report types, and picklist values. Typically, the original files are exported from Salesforce, then sent to your outside translators or translation agency for bulk translation activities and returned to you for importing.

Common Errors with Exporting and Importing Translation Files
Troubleshoot issues you might encounter while exporting and importing files in the Translation Workbench.

Best Practices for the Translation Workbench
To make the Translation Workbench most effective, keep these tips in mind.

Enable and Disable the Translation Workbench
The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you’ve made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

1. From Setup, enter Translation Settings in the Quick Find box, then select Translation Settings.

2. On the welcome page, click Enable.

Note: The "Manage Translation" permission is enabled by default in the System Administrator profile.

To disable the Translation Workbench, from Setup, enter Translation Settings in the Quick Find box, select Translation Settings, and then click Disable.

Note: In a Developer organization with a managed package containing translations, once the Translation Workbench is enabled, it can’t be disabled.

SEE ALSO:
Considerations for Updating Translated Terms
Administrator tip sheet: Setting Up the Translation Workbench
Add Translated Languages and Translators

Add supported languages, activate or deactivate a language, assign translators for that language, and enter translated terms for customizations you've made in your org's default language.

Note: The "Manage Translation" permission is enabled by default in the System Administrator profile.

1. From Setup, enter Translation Settings in the Quick Find box, then select Translation Settings.

2. Click Add to activate a new language or Edit to change an existing supported language.

3. If adding a new language, choose a language.

4. To make the entered translations available to your users - select Active. Users can change their personal language anytime whether or not it's active in the Translation Workbench. Selecting Active makes the translations available to the users in that language.

Tip: We recommend you don't make a language active until the translators have translated all values.

5. To assign translators for this language, select them from the Available List and click Add. If you don't see the member you want to add, enter keywords in the search box and click Find.

Important: Ensure all translators have the "View Setup and Configuration" permission so that they can begin translating. Users can only translate languages they're assigned to.

6. Click Save.

SEE ALSO:
Enable and Disable the Translation Workbench
Translate Terms
Considerations for Updating Translated Terms
Translate Terms

1. From Setup, enter Translate in the Quick Find box, then select Translate.
2. Select the Language you’re translating into.
3. Select a Setup Component. Click the pull-down menu to select from the list of translatable customizations. See Translatable Customizations for a complete list of possible customizations.
4. If necessary select an object and aspect. For example, workflow tasks have an object (Account, Contact, etc.) and aspect (Subject or Comment).
5. Double click in the translation column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.
   
   **Note:** The Out of Date column indicates that the item has been updated and the term may need translating. When editing a button or link label, you see the Button or Link Name column, which is used to refer to the component when using the SOAP API.

6. Click Save.

SEE ALSO:
- Considerations for Updating Translated Terms
- Add Translated Languages and Translators

Override Translations in Managed Packages

Although you can’t edit labels or translations in a managed package, they are controlled by the developer, you can override them with the Translation Workbench. For example, override a custom field in a package.

1. From Setup, enter Override in the Quick Find box, then select Override.
2. Select the Package that you’re overriding.
3. Select the Language that you’re entering your overrides in.
4. Select a Setup Component. Click the pull-down menu to select from the list of translatable customizations. See Translatable Customizations for a complete list of possible customizations.
5. If necessary select an object and aspect. For example, workflow tasks have an object (Account, Contact, etc.) and aspect (Subject or Comment).
6. Double click in the override column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.
   
   **Note:** The Out of Date column indicates that the item has been updated and the term may need to be changed. When editing a button or link label, you see the Button or Link Name column, which is used to refer to the component when using the SOAP API.

7. Double click in the translation column to enter new values. You can press TAB to advance to the next editable field or SHIFT-TAB to go to the previous editable field.
Note: The Out of Date column indicates that the item has been updated and the term may need translating. When editing a button or link label, you see the Button or Link Name column, which is used to refer to the component when using the SOAP API.

8. Click Save.

Enable and Disable the Translation Workbench

Translatable Customizations

You can translate only certain components.

To view the translatable customizations in your organization, from Setup, enter Translate in the Quick Find box, select Translate, and then select a Setup Component. Then, if needed, select Object, Custom Report Type Entity, or Aspect.

You can translate the following components.

- Action
- Address Country
- Address State
- Apex Sharing Reason
- Button and Link Label
- Custom App
- Custom Field
- Custom Field
- Custom Report Type
- Data Category
- Data Category Group
- Division
- Global Picklist
- Layout Section
- Lookup Filter
- Navigation Menu Item (for Communities)
- Lookup Filters
- Picklist Values
- Quick Action Labels
- Record Type
- Related List Label
- Reputation Levels (for Communities)
- Sales Path Step Rich Text
- S-Control
- Solution Category
- Standard Field Help

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions
Translation Files

Salesforce provides different files types to translate customization labels and review translations.

- **Source**: Use to translate labels for the first time.
- **Untranslated**: Use to translate labels after the first translation pass.
- **Bilingual**: Use to review and edit translations.

Translation files are identified by the extension `.stf`, to represent the Salesforce translation format.

A translation filename includes the name of the export option used to create it, the language code for the file’s content, and a date stamp.

Multiple `.stf` files created with the Untranslated and Bilingual options are compressed into zip files up to 5 MB in size. If multiple zip files are needed, the zip filenames are each date stamped and incremented. For example, `Untranslated 2010-09-20 05:13 1of2.zip`.

**Warning**: Consider the following when editing your `.stf` files:

- Don’t change the `.stf` file extension.
- If you use tabs, new lines, or carriage returns in your text for translation, notice that they are represented with special characters in the `.stf` file format. Tabs are `\t`, new lines are `\n` and carriage returns are `\r`. To ensure consistency between your language versions, ensure these characters are maintained in your translations.

Working with the Source File

Use the Source file to translate an organization’s labels for the first time. The Source file contains labels for all of an organization’s translatable customizations in the organization’s default language.

If you aren’t using a standard translation tool such as Trados, work with the file using an application that supports tabs and word wrap, such as WordPad or MS Excel.

**Note**: If you use MS Excel to enter translations in your `.stf` file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

To prepare the Source file for your translators:

- Create one copy of the Source file for each language you are translating into.
- In the header of each Source file, change the language code from the organization’s default language (such as `en_US`) to the translation language (such as `fr`).

Tell your translators to replace the untranslated values in the LABEL column with translated values.
Working with the Untranslated File

Use the Untranslated file to translate labels that haven’t been translated. One Untranslated file is generated for each language. When multiple files are generated, they’re exported to a .zip file containing .stf files for each translation language.

If you aren’t using a standard translation tool such as Trados, work with the file using an application that supports tabs and word wrap, such as WordPad or MS Excel.

Note: If you use MS Excel to enter translations in your .stf file, your file format may be corrupted. MS Excel automatically adds quotation marks around entries that have commas. We advise you open your files in a text editor before import and remove these quotation marks if they have been added. The import will fail if these quotation marks are not removed.

Tell your translators to replace the untranslated values in the LABEL column with translated values.

Note: Don’t add columns to or remove columns from the translation file.

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Edit Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>KEY</td>
<td>Unique identifiers for labels</td>
<td>Do not edit</td>
</tr>
<tr>
<td>LABEL</td>
<td>Labels that are visible to end users</td>
<td>Replace untranslated values with translated values</td>
</tr>
</tbody>
</table>
Attention: Don’t attempt to delete a translation by deleting a translated label from the file. Deleting a translation in the file doesn’t remove the translation from the application after the file is imported.

Note: Don’t add columns to or remove columns from the translation file.

<table>

<tr>
<td></td>
<td>• A dash (−): The translation is current.</td>
<td></td>
</tr>
</tbody>
</table>

SEE ALSO:
- Exporting Translation Files
- Import Translated Files

Considerations for Updating Translated Terms

Translators are responsible for keeping the translated terms updated. When translated components change, the translated value is marked Out of Date.

For example, say you enter a translation for an error message on a lookup filter. Later, you edit the lookup filter and change the error message. When you go into the Translation Workbench and view the message translation column, it still shows the translation for the old error message and the checkbox in the Out of Date column is selected.
For best results, have your translators check their translations frequently, and be sure to notify them when changes occur. To generate a list of all the translatable customizations and their associated Out of Date states, export the translation files.

SEE ALSO:
- Translate Terms
- Add Translated Languages and Translators

Exporting Translation Files

Create files that contain your org’s translatable metadata, such as custom fields, report types, and picklist values. Send these files to your outside translators or translation agency for bulk translation activities, then use Import to update your labels.

1. From Setup, enter Export in the Quick Find box, then select Export.
2. Select which labels you want to export.
   - **Source**—Used as the initial source for creating new translations.
     Creates a single file that contains a list of all your translatable customizations. Typically, the content is in your organization’s default language.
   - **Untranslated**—Used to make updates.
     Creates a set of files that contain only customizations that have not been translated, including new and modified customizations.
     One file is created for each language. These files are then compressed into .zip files.
   - **Bilingual**—Used for reference and reviewing all your untranslated and translated customizations.
     Creates a list of all the translatable labels in their current translated or untranslated state.
     One file is created for each language. These files are then compressed into .zip files.
     The content in each file is divided into Untranslated and Translated sections. Each translatable label is in either the Untranslated or Translated section, according to its translation state.
     In the Translated section, out of date status for the labels in included.

3. Click Export.
   A status message tells you that the export is being processed. When the export is complete an email is sent to the email address specified in your profile.

4. Locate the exported .stf or .zip file.
   Go to Your name > Documents > Document Folders > My Personal Documents > Go!
   All exported files indicate the Export option used to create them and are date and time stamped. Individual files end with the extension .stf. Multiple files are grouped into .zip files.
   If you have a large number of documents in your personal documents area, you’ll find the exported files under the sort letter:
   - B—Bilingual export option, for example: Bilingual_2010-09-23_11:20.zip.
   - S—Source export option, for example: Source_en_US_2010-09-23_11:20.stf.
   - U—Untranslated export option, for example: Untranslated_2010-09-23_11:20.zip.
5. Save the files for translation by your translators or translation agency.
   
   Click **View > Save File > OK**. The file is saved to the location specified by your browser. For example, C:/Users/username/Downloads.

- Enable and Disable the Translation Workbench

### Import Translated Files

Import and update the translations for your org’s metadata, such as custom fields, report types, and picklist values. Typically, the original files are exported from Salesforce, then sent to your outside translators or translation agency for bulk translation activities and returned to you for importing.

**Note:** Labels that are exported and left as is are not saved as translations on import.

1. Bundle multiple files into .zip files that are no larger than 5 MB. Create multiple .zip files as needed.
   
   The zipped files don’t have to be in the same order or grouping as the exported .zip files.
   
   For example, you start with two exported .zip files. The first file includes French, Italian, and Japanese. The second file includes Russian, Simplified Chinese, and Greek. You can create:
   - One .zip file with French, Greek, and Italian.
   - One .zip file with Russian and Greek.
   - One .zip file with Simplified Chinese.

2. From Setup, enter **Import** in the **Quick Find** box, then select **Import** under Translation Workbench.

3. Click **Browse** to locate and select the file you want to import.

4. Click **Import**.

   After the import is complete:
   - The labels are updated with the translations.
   - A confirmation email is sent to the email address specified in your profile.

5. Verify the imported changes have been implemented. You can:
   - Check labels in your Salesforce organization.
   - Check labels through the Translation Workbench.

## Common Errors with Exporting and Importing Translation Files

Troubleshoot issues you might encounter while exporting and importing files in the Translation Workbench.

<table>
<thead>
<tr>
<th>Error Message</th>
<th>What It Means</th>
<th>Troubleshooting Steps</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bilingual File starts with non-section header row: {0}</td>
<td>The header rows of the file you’re trying to import are missing, or there is extraneous text (such as notes that aren’t commented out) in those rows.</td>
<td>Export your file again and make sure there are header rows for all sections, and that all extraneous text has been commented out or removed from the header rows.</td>
</tr>
<tr>
<td>Duplicate key: {0} exists in import file, please re-export.</td>
<td>The specified key appears in your imported file more than once. Each translated item needs to have its own unique key, and each key can only appear in the file one time.</td>
<td>Export your file again and make sure that each key in it is unique, and then re-import the file.</td>
</tr>
<tr>
<td>Invalid Key</td>
<td>During translation, Salesforce generates unique keys, or identifiers, for each object, picklist value, or page element you’re translating. If these names or keys are changed after you export your file, Salesforce can’t match the correct key with the correct name.</td>
<td>Export your file again and make sure the keys in it match those in the file you’re trying to import.</td>
</tr>
<tr>
<td>Key: {0} could not be uniquely resolved. This is caused by a change to our Custom Report Type Column key format. Please re-export and use the new key format for those keys.</td>
<td>One of the keys in your Custom Report Type (CRT) column is in the wrong format.</td>
<td>Export your file again and make sure you’re using the correct CRT key format.</td>
</tr>
<tr>
<td>Maximum character limit (x) for (field type) translation exceeded in line:</td>
<td>Each type of field, such as a picklist value, can only have a certain number of characters. Your translated labels for the type of field at the line specified in the error message are too long.</td>
<td>Edit your translated labels so they’re within the character limit listed for the field type and import your file again.</td>
</tr>
<tr>
<td>No data to import</td>
<td>The file you’re trying to import is empty or does not contain any translation changes.</td>
<td>Make sure you’re importing the correct file, and that it contains translated data.</td>
</tr>
<tr>
<td>Error Message</td>
<td>What It Means</td>
<td>Troubleshooting Steps</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>No language code specified in file header</td>
<td>The file you’re trying to import doesn’t have a valid language code, or the language code is in the wrong place.</td>
<td>Make sure your language code is valid and isn’t missing or commented out.</td>
</tr>
<tr>
<td>No translated or untranslated section header found in the bilingual file</td>
<td>The file you’re trying to import is missing section headers.</td>
<td>Make sure your file has section headers and import it again.</td>
</tr>
<tr>
<td>No valid file type specified in file header</td>
<td>The file you’re trying to import doesn’t have a valid import/export type (Source, Untranslated, or Bilingual) specified in the file header. The file type should be in the default language for your organization.</td>
<td>Make sure your file has a valid import/export type in the file header, and that the header did not get translated.</td>
</tr>
<tr>
<td>Not a valid file to import. Please select a .stf or a .zip file for import.</td>
<td>You can only import files in .stf format or .zip files that contain .stf files.</td>
<td>Make sure your file is a .stf or a .zip file and try importing it again.</td>
</tr>
<tr>
<td>Some keys are appended with their sort order for uniqueness. Re-export your file and ensure that the keys in both files match.</td>
<td>The order of the picklist values in your source file don’t match your setup.</td>
<td>Export your source file and match the order of the picklist values to your import file, then import again.</td>
</tr>
<tr>
<td>Wrong number of columns in line: {x}. Check that you have escaped tabs (\t), new lines (\n), and carriage returns (\v) in your files.</td>
<td>The file you’re importing has extra tabs, new lines, or carriage returns in the line specified in the error message.</td>
<td>Edit your data to remove or escape any extra tabs, newlines, or carriage returns, and make sure the file you’re importing has the same number of columns as the file you exported.</td>
</tr>

Best Practices for the Translation Workbench

To make the Translation Workbench most effective, keep these tips in mind.

• Let translators know which languages they are responsible for translating.
• Notify all translators when new translated components are added to your org.
• Advise users when customizing reports or list views to use filter criteria values in their personal language. However, if they use the starts with or contains operators, advise them to choose the language of the filter criteria values they entered.
• When creating a custom report type that will be translated into multiple languages via the Translation Workbench, we recommend that you set your personal language to match your org’s default language. This ensures that words that are translated display in the correct language for translators.
• Salesforce assumes that all customizations are entered in the org’s default language. Global administrators should work together in the org’s default language.

Enhancing Your Objects, Data, and Fields

Using Custom Object Records

Custom Object Record Overview

Important: You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

Custom objects records store information that’s unique and important to you and your organization. For example, your organization may use a custom object called “Merchandise” to store data about your company’s merchandise. You can also use custom objects for custom applications, such as tracking software enhancements in a development life-cycle.

Your administrator first defines the custom object and its properties, such as custom fields, relationships to other types of data, page layouts, and a custom user interface tab. Once the custom object is created and deployed to users, you can enter data to create individual custom object records. If your administrator has created a tab for the custom object, the tab displays a home page that lets you quickly create and locate custom object records. You can also sort and filter your custom object records using standard and custom list views. In addition, the tab lets you view and edit detailed information on each custom object record to which you have access.

Administrators, and users with the “Modify All Data” permission, can import custom objects.

Custom Objects Home
Custom Objects Home

**Important:** You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

**Note:** Clicking on a custom object tab displays the tab home page. The name of a custom object tab is the plural form of the custom object as defined by your administrator.

Use the home tab of a custom object to view records.

- To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views. List views let you display a list of records that match specific criteria, such as all custom objects for a tab or just the ones you own. To edit or delete any view you created, select it from the **View** drop-down list and click **Edit**.
- If custom objects are shared with external contacts via Salesforce to Salesforce, choose one of the list views under [Custom Object Name] from Connections to view the custom objects that your business partners have shared with you.
- In the **Recent** section, select an item from the drop-down list to display a brief list of the top custom object records matching that criteria. From the list, you can click any custom object name to go directly to the detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the “Custom Object Tab” search layout defined by your administrator and by your field-level security settings (available in Professional, Enterprise, Unlimited, Performance, and Developer Editions). The key list choices are:

<table>
<thead>
<tr>
<th>Recent Custom Objects Choice</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Recently Viewed</td>
<td>The last ten or twenty-five custom object records you viewed, with the most recently viewed item listed first. This list is derived from your recent items and includes records owned by you and other users.</td>
</tr>
<tr>
<td>Recently Created</td>
<td>The last ten or twenty-five custom object records you created, with the most recently created item listed first. This list only includes records owned by you.</td>
</tr>
<tr>
<td>Recently Modified</td>
<td>The last ten or twenty-five custom object records you updated, with the most recently updated item listed first. This list only includes records owned by you.</td>
</tr>
</tbody>
</table>

Creating Custom Object Records

**Important:** You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

To create a custom object record:

1. Click **New**.
2. Enter the information for the custom object record.
3. Click **Save** when you are finished, or click **Save & New** to save the current record and add another.

If your administrator has defined relationships to other types of records, you can automatically associate the new custom object with another record. View the other record and select the custom object name from the Create New drop-down list in the sidebar, or click **New Object Name** in the custom object related list of the other record.

If your organization uses divisions to segment data, custom objects that are detail objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division.

- Custom Object Record Fields

Clone Custom Object Records

**Important:** You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

The **Clone** button on a custom object record creates a custom object record with the same information as the existing record.

- **Note:** When you clone a record, the new record has the record type of the original record. If the record type of the cloned record isn’t available in your profile or permission sets, the new record adopts your default record type.

To clone a custom object record:

1. Click **Clone** on an existing custom object record.
2. Enter or change any information for the new record.
3. Click **Save**.

- **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.
Deleting Custom Object Records

**Important**: You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

To delete a custom object record, click **Delete** next to the record on the custom object’s list page or in the custom related list of an associated record. You can also delete a custom object record by clicking **Delete** on the custom object record detail page.

When you delete a custom object record, all related events, tasks, notes, and attachments are also deleted. If the custom object is the master object in a master-detail relationship, any associated detail records are also deleted. If the custom object is the detail side of a master-detail relationship, any associated records are not deleted.

The deleted custom object record is moved to the Recycle Bin. If you undelete the record, any related items are also restored.

**Note**: You can delete a custom object record if you are an administrator, the record owner, or a user above the record owner in the organization role hierarchy, and if you have the appropriate user permission. Custom objects that are on the detail side of a master-detail relationship do not have an Owner field and can be deleted by any user who has access to edit the associated master record.

- Object Relationships Overview

Displaying and Editing Custom Object Records

**Important**: You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

**Note**: Clicking on a custom object tab displays the tab home page. The name of a custom object tab is the plural form of the custom object as defined by your administrator.

Displaying Custom Object Records

Once you have located a custom object record on the custom objects tab home or list pages, click the custom object record name to display detailed information.

If the Salesforce console is set up to include custom objects, select it from the Force.com app menu to find, view, and edit custom object records and their related items on one screen.

Editing Custom Object Records

To update custom object record details, click **Edit**, and then change the fields you want to update. When you have finished, click **Save**. You can also click **Save & New** to save the current custom object record and create another. Required fields are marked with red.

**Note**: You cannot change the Object Name or Data Type if the custom object is referenced in Apex.
Custom Object Related Lists

The lower portion of the custom object record detail page provides information related to the custom object record, including activities, notes, attachments, and any other related records. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click on individual items to display additional detail. Click more at the bottom of the page or View More below a related list to display more items. Clicking New lets you directly add new items.

Tip: To help your users see record details and related lists more easily, enable Hover Details in the User Interface panel of Setup.

Printing Custom Object Records

On a custom object detail page, click Printable View to print the record.

To return to the last list page you viewed, click Back to list at the top of any custom object record detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

SEE ALSO:
Creating Custom Object Records

Sharing Custom Object Records

Important: You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

The administrator defines the default sharing model for an entire organization. You can change this model to extend sharing to more users than the default set. However, you cannot change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click Sharing on the custom object record detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the record. On this page, you can:

- Grant access to the record to other users, groups, roles, or territories
- Note: You can’t share a custom object record with another user unless that user has the “Read” permission on the custom object.
- View all users who have access to the record
- Edit or delete the record’s access level
Custom Object Record Fields

**Important:** You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

Custom object record fields contain the data you enter for your custom object records. Here is a description of the fields (in alphabetical order) that make up a custom object record. Some of these fields may not be visible or editable depending on your page layout and field-level security settings. Your administrator may also have defined additional custom fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created By</td>
<td>User who created the record.</td>
</tr>
<tr>
<td>Currency</td>
<td>Currency of the record if multicurrency is enabled.</td>
</tr>
<tr>
<td>Division</td>
<td>Division to which the custom object record belongs. Custom objects that are “detail” objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division. Available only in organizations that use divisions to segment their data.</td>
</tr>
<tr>
<td>Last Modified By</td>
<td>User who most recently changed the record.</td>
</tr>
<tr>
<td>Name</td>
<td>Identifier for the custom object record. This name appears in page layouts, related lists, lookup dialogs, search results, and key lists on tab home pages. By default, this field is added to the custom object page layout as a required field.</td>
</tr>
<tr>
<td>Owner</td>
<td>Assigned owner of the custom object record. If the custom object becomes the detail side of a master-detail relationship, this field is removed, as ownership of the data is controlled by the master object, or by the primary master object for a custom object with two master-detail relationships.</td>
</tr>
</tbody>
</table>

**Note:** Custom objects on the “detail” side of a master-detail relationship can’t have sharing rules, manual sharing, or...
DescriptionField
queues, as these require the Owner field.

Custom Objects Home

Using Custom Related Lists

**Important:** You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

Custom related lists display on the lower portion of the detail page for another record. They list the custom object records that are associated with that record.

From a custom related list, you can:

- Click the custom object record name to view detailed information.
- Click **Edit** or **Del** to edit or delete the custom object record.
- Click **New** to create a new custom object record that is associated with the record you are viewing.

SEE ALSO:
Custom Object Record Overview

**EDITIONS**

Available in: Salesforce Classic

Available in: Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions

**USER PERMISSIONS**

To view custom object record related lists:

- “Read” on the custom object
  AND
  “Read” on the associated record

To change custom object records:

- “Edit” on the custom object

To create custom object records:

- “Create” on the custom object

To delete custom object records:

- “Delete” on the custom object
Viewing Custom Object Lists

**Important:** You might be viewing this page because your Salesforce administrator didn’t create custom help. If you need information on a specific custom object, contact your administrator about creating custom help for your custom objects. The Salesforce Help covers only the standard objects provided with the initial Salesforce integration.

The custom objects list page displays a list of custom object records in your current view. A list view includes custom object records of one type only; you cannot view more than one type of custom object in a single list view.

- Click a custom object name to view the custom object record detail. Click Edit or Del next to a custom object record name to edit or delete the record.
- To take ownership of custom object records in a queue, view the queue list view, check the box next to one or more records, and then click Accept.
- Note: You can view and accept records only from queues you belong to, or if you are higher in the role hierarchy than a queue member. Administrators, users with the “Modify All” object-level permission for the given object, and users with the “Modify All Data” permission, can view and take records from any queue.

- To transfer ownership of multiple records at once, select the box next to one or more custom object records and click Change Owner. Enter the new record owner, optionally select Send Notification Email to send an email to the new record owner, and click Save.
- Click New Custom Object Name or select the custom object name from the Create New drop-down list in the sidebar to create a custom object of that type.

**SEE ALSO:**

Custom Object Record Overview

Administering Custom Objects

Custom Objects

Store information that’s unique to your organization. Choose whether your custom objects are searchable, support sharing, or include access to the Bulk API and Streaming API.

Every custom object is classified as either an Enterprise Application object or a Light Application object. The difference between these two categories is that Light Application objects don’t support sharing, access to the Bulk API, or access to the Streaming API.

If you need to track your organization’s usage of each category, create a custom report type with a primary object of User Licenses and a child object of Custom Object Usage by User License Metrics.

By default, all custom objects are Enterprise Application objects. To make your custom object a Light Application object, disable Allow Sharing, Allow Bulk API Access, and Allow Streaming API Access on the object’s detail page.

After you define a custom object, you can:

- Create custom fields.
- Associate the custom object with other records and display the custom object data in custom related lists.
• Track tasks and events for custom object records.
• Build page layouts.
• Customize the search results and the custom object fields that display in them.
• Create a custom tab for the custom object.

Note: To allow your users to find a custom object’s records when they search, create a custom tab set to Default On or Default Off. Creating a custom tab enables the custom object’s Allow Search setting.

• Create reports and dashboards to analyze custom object data.
• Share your custom objects, custom tabs, custom apps, and any other related components with other Salesforce users on Force.com AppExchange.
• Import custom object records.

SEE ALSO:
Tip sheet: Building Custom Objects, Tabs, and Related Lists
Track Your Organization’s Custom Object Usage by User License Type

Manage Custom Objects

Create, customize, edit, delete, or truncate custom objects to extend the functionality that standard objects, like accounts and contacts, provide.

Note: Your administrator may have created a tab without any help. If you need help to understand how a tab for a custom object works, contact your administrator.

Your object management settings list the custom objects that are defined for your organization. From this list, you can:

• Define a custom object.
• Display detailed information about a custom object.
  Optional features you can customize include enabling search and reports, tracking activities, tracking field history, and making the object available for the Salesforce Customer Portal.
• To update the custom object definition, click Edit and update the desired fields.

  Note: The Allow Reports, Allow Activities, and Allow Search fields are not locked in Managed - Released and can be changed by the developer in future releases of a managed package.

• To delete a custom object, click Del.
• To truncate a custom object, click Truncate.
• To view deleted custom objects, click the Deleted Objects link. The total number of deleted custom objects for your organization is listed in parentheses.

The detail page of the custom object provides information about various characteristics of the object, including standard fields, custom fields, field history tracking, relationships, custom links, search layouts, page layouts, and object limits. You can:

• Click individual items to display additional detail.
• To delete a custom field, click Del next to its name in the Custom Fields & Relationships section.
• Click More at the bottom of the page or View More below a related list to display more items.
• Click **New** to directly add new items.

**Note:** The object limit percentages are truncated, not rounded. For example, if your org uses 95.55% of the limit for a particular customization, the object limit displays 95%.

## Deployment Status for Custom Objects and External Objects

While developing a custom object or external object, you might not want users to see and interact with it. Because users might get frustrated with changes in layout or lose data when you delete custom fields, control visibility of the new object until you are finished.

Use the Deployment Status setting in the object definition to control when users can see and use the object and its associated custom tab, related lists, and reports.

- **Choose “In Development” as the Deployment Status when first creating your custom object or external object. Doing so hides it from users while you are designing and testing it. Only users with the “Customize Application” permission can see the object tab, search results, related lists, and report data types.**
- **Change the Deployment Status to “Deployed” when you want to allow all users to use the object and any associated custom tab, related lists, and reports.**
- **If you make more enhancements after deploying a custom object or external object, you can change the Deployment Status back to “In Development.”**

**Note:** A custom report type’s Deployment Status changes from Deployed to In Development if its primary object is a custom object whose Deployment Status similarly changes.

Fields for Defining Custom Objects

When you create a custom object, several fields are required to define how you can access the object.

**Note:** If an administrator created a tab without including help, contact your administrator if you need help with how a custom object works.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>This name is used to refer to the object in a user interface page.</td>
</tr>
<tr>
<td>Plural Label</td>
<td>The plural name of the object. If you create a tab for this object, this name is used for the tab.</td>
</tr>
<tr>
<td>Gender</td>
<td>If it is appropriate for your organization’s default language, specify the gender of the label.</td>
</tr>
<tr>
<td></td>
<td>This field appears if the organization-wide default language expects gender.</td>
</tr>
<tr>
<td></td>
<td>Your personal language preference setting does not affect whether the field appears.</td>
</tr>
<tr>
<td></td>
<td>For example, if the organization’s default language is English and your personal language is French,</td>
</tr>
<tr>
<td></td>
<td>you aren’t prompted for gender when creating a custom object.</td>
</tr>
<tr>
<td>Starts with a vowel sound</td>
<td>If it is appropriate for your organization’s default language, indicate whether the label is preceded</td>
</tr>
<tr>
<td></td>
<td>by “an” instead of “a.”</td>
</tr>
<tr>
<td>Object Name</td>
<td>A unique name used to refer to the object when using the API. In managed packages, this name prevents</td>
</tr>
<tr>
<td></td>
<td>naming conflicts with package.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Description</td>
<td>An optional description of the object. A meaningful description helps you remember the differences between your custom objects when you are viewing them in a list.</td>
</tr>
<tr>
<td>Context-Sensitive Help Setting</td>
<td>Defines what displays when a user clicks Help for this Page from the custom object record home (overview), edit, and detail pages, list views, and related lists.</td>
</tr>
<tr>
<td></td>
<td>To display the standard Salesforce help available for any custom object record, select Open the standard Salesforce Help &amp; Training window.</td>
</tr>
<tr>
<td></td>
<td>To display custom object-level help for your custom object, select Open a window using a Visualforce page and then select the Visualforce page to use as the target of the context-sensitive help link from that custom object’s pages.</td>
</tr>
<tr>
<td></td>
<td>☑️ Note: This setting doesn’t affect the Help &amp; Training link at the top of a page. That link always opens the Salesforce Help &amp; Training window.</td>
</tr>
<tr>
<td>Record Name</td>
<td>The name used in page layouts, list views, related lists, and search results.</td>
</tr>
<tr>
<td>Data Type</td>
<td>The type of field (text or auto-number) for the record name. Records that have unique IDs instead of names are auto-numbered and always a read-only field.</td>
</tr>
<tr>
<td>Display Format</td>
<td>For an auto-numbered record name, enter the display format. You can have up to two sets of curly braces. For more information, see Custom Field Attributes on page 4007.</td>
</tr>
<tr>
<td>Starting Number</td>
<td>For an auto-numbered record name, enter the number to use when creating your first record for this custom object.</td>
</tr>
<tr>
<td>Allow Reports</td>
<td>Makes the data in the custom object records available for reporting purposes.</td>
</tr>
<tr>
<td></td>
<td>To create reports on custom objects, choose the Other Reports report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.</td>
</tr>
<tr>
<td>Allow Activities</td>
<td>Allows users to associate tasks and scheduled calendar events related to the custom object records.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow in Chatter Groups</td>
<td>Allows users to add records of this custom object type to Chatter groups.</td>
</tr>
<tr>
<td></td>
<td>When true, users with permissions can create records of this object type using the group publisher. The created record is associated with the group and appears in the group record list. When false, users with permissions can use the group publisher to create records of this object type, but the record is not associated with the group.</td>
</tr>
<tr>
<td>Enable Divisions</td>
<td>If your organization has divisions enabled, select this option to enable the custom object for divisions. Divisions group records for simplified search results, list views, reports, and other areas within Salesforce. Salesforce adds a Division field to the custom object. If the custom object is the master in a master-detail relationship, custom objects on the detail side also get the Division field and inherit their division from the master record.</td>
</tr>
</tbody>
</table>
| Available for Customer Portal | Makes the custom object available to all portal users. This option is available only if your organization has a customer portal.  
If you enable Communities in your organization, this option no longer appears, and all custom objects are available in your communities. If, before enabling Communities, you had a Customer Portal and custom objects without this option selected, those objects become available in your Customer Portal.                                                                                                                                                                                                                                                                 |
| Track Field History           | Enables your organization to track changes to fields on the custom object records. For example, it tracks who changed the field value and when, what the value was before the edit, and what it was changed to. History data is available for reporting, so users can easily create audit trail reports when this feature is enabled.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Allow Sharing                 | When this setting is enabled, the custom object is an Enterprise Application object. When this setting isn’t enabled, the custom object is a Light Application object.  
When this setting is enabled, you must also enable Allow Bulk API Access and Allow Streaming API Access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Allow Bulk API Access         | When this setting is enabled, the custom object is an Enterprise Application object. When this setting isn’t enabled, the custom object is a Light Application object.  
When this setting is enabled, you must also enable Allow Sharing and Allow Streaming API Access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
### Field | Description
--- | ---
Allow Streaming API Access | When this setting is enabled, the custom object is an Enterprise Application object. When this setting isn’t enabled, the custom object is a Light Application object. When this setting is enabled, you must also enable Allow Bulk API Access and Allow Sharing.

Deployment Status | Indicates whether the custom object is visible to other users.

Allow Search | To allow your users to find a custom object’s records when they search, create a custom tab set to Default On or Default Off. Creating a custom tab enables the custom object’s Allow Search setting.

Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren’t required to add the tab for display.

Add Notes & Attachments... | Allows users to attach notes and attachments to custom object records. You can attach external documents to any object record in much the same way that you can add a PDF file or photo as an attachment to an email.

This option is available only when you are creating a new object.

Launch the New Custom Tab Wizard | Starts the custom tab wizard after you save the custom object.

---

### Considerations for Creating Custom Objects

Before you create a custom object, make sure that you’ve reviewed the considerations.

**Object Permissions**

In Enterprise, Unlimited, Performance, and Developer Editions, when you create a custom object, the “Read,” “Create,” “Edit,” and “Delete” permissions for that object are disabled for profiles that have “View All Data” or “Modify All Data” disabled. Enable access to custom objects in permission sets or custom profiles, and assign them to the users who need access.

In Contact Manager, Group, and Professional Editions, when you create a custom object, the “Read,” “Create,” “Edit,” and “Delete” permissions for that object are enabled for all profiles.

**Sharing Model**

An organization-wide default setting controls the data sharing model for custom objects. For more information, see [Custom Object Security](#) on page 3979.

**Delegating Custom Object Administration**

After you create a custom object, you can delegate its administration to non-administrator users.
Queues

After you create a custom object, you can define queues to distribute ownership of custom object records to your users.

SEE ALSO:

Define a Custom Object

Modify Custom Objects

Customize the user interface for your custom objects by:

• Creating a custom tab (see Custom Tabs)
• Creating custom fields and relationships (see Define Custom Object Fields on page 3962)
• Adding customized buttons and links to perform actions or link to other pages or websites (see Define Custom Buttons and Links on page 4768)
• Defining which fields display for users on record detail and edit pages (see Build Page Layouts for Custom Objects on page 3899)
• Specifying which fields display for users in search results, lookup dialogs, and in the key lists on custom object tabs (see Customize Search Layouts for Custom Objects on page 3979)
• Creating record types to display different picklist values and page layouts to different users based on their profiles (see Create Record Types for Custom Objects on page 3978)
Define Custom Object Fields

Custom object fields store the data for your custom object records.

Custom Fields for Custom Objects

You can create custom fields to store information unique to your organization. You can also create custom relationship fields to associate your custom object with another object in Salesforce.

Standard Fields for Custom Objects

Custom objects automatically include the following standard fields. Click Edit to modify any of the editable fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Created By</td>
<td>User who created the record.</td>
</tr>
<tr>
<td>Currency</td>
<td>Currency of the record if multicurrency is enabled.</td>
</tr>
<tr>
<td>Division</td>
<td>Division to which the custom object record belongs. Custom objects that are “detail” objects in a master-detail relationship inherit their division from the master object. Custom objects that are not related to other records are automatically in the global division. Available only in organizations that use divisions to segment their data.</td>
</tr>
<tr>
<td>Last Modified By</td>
<td>User who most recently changed the record.</td>
</tr>
<tr>
<td>Name</td>
<td>Identifier for the custom object record. This name appears in page layouts, related lists, lookup dialogs, search results, and key lists on tab home pages. By default, this field is added to the custom object page layout as a required field.</td>
</tr>
<tr>
<td>Owner</td>
<td>Assigned owner of the custom object record. If the custom object becomes the detail side of a master-detail relationship, this field is removed, as ownership of the data is controlled by the master object, or by the primary master object for a custom object with two master-detail relationships.</td>
</tr>
</tbody>
</table>

Note: Custom objects on the “detail” side of a master-detail relationship can’t have sharing rules, manual sharing, or queues, as these require the Owner field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com Editions

Divisions are not available in Database.com.

USER PERMISSIONS

To view and edit standard fields:
• “Customize Application”

To create custom fields:
• “Customize Application”
Delete Custom Objects

When you delete a custom object, Salesforce does not add it to the Recycle Bin. Instead, deleted objects appear in the Deleted Objects list for 15 days. During this time, the object and its data are soft deleted, meaning you can restore or permanently erase (hard delete) the object and its data. After 15 days, the object and its data are automatically hard deleted.

Soft-deleted custom objects and their data count against your organization's limits; hard-deleted items do not.

To delete a custom object:

1. From the object management settings for custom objects, click Del next to object that you want to delete.
2. When prompted, select the Yes, I want to delete the custom object checkbox to confirm and click Delete.

Why Can't I Delete a Certain Custom Object?

You can't delete a custom object if it:

• Is on the master side of a master-detail relationship.
• Contains custom fields that are used in a roll-up summary field on another object.
• Is referenced in Apex, a Visualforce page, or an reporting snapshot.
• Is referenced by a duplicate rule or a matching rule.
• Contains more than 100,000 records. If the object you want to delete has more than 100,000 records, first delete an appropriate number of records and then delete the object.

Results of Deleting Custom Objects

When you delete a custom object, Salesforce:

• Displays an Insufficient Privileges message if someone clicks a bookmark to a deleted custom object record's URL.
• Removes the object from Force.com AppExchange packages.
• Changes the master-detail relationship to a lookup relationship, if the deleted object is on the detail side of a master-detail relationship.
• Removes or erases:
  - The object's custom tab
  - List views and workflow rules for the object
  - Mobile configuration settings, including data sets, mobile views, and excluded fields
  - Standard report types associated with the object, and reports based on standard report types if the deleted object is on the detail side of a master-detail relationship
• Hides, inactivates, or disables:
  - The custom object definition and related definitions
  - The object’s records and related records, including any records in the Recycle Bin
  - Custom report types for which the deleted object is the main object
  - Custom reports for which the deleted object is the main object
  - Custom formula fields on the object
  - Custom validation rules and approval processes on the object
Note: Many removed, hidden, inactive, or disabled items can be restored if you undelete the custom object. See Manage Deleted Custom Objects for information about restoring deleted custom objects.

Results of Hard Deleting Custom Objects

When a custom object is hard deleted, either manually, or automatically after 15 days:

- The custom object’s definition and data are permanently deleted, and can’t be restored.
- The custom object and its data no longer count against your organization’s limits.
- If the deleted object is on the detail side of a master-detail relationship, master records currently in the Recycle Bin aren’t restorable if one or more detail records were automatically deleted as a result of the master record being deleted. Attempting to undelete the master record results in an error.

Note: This only happens when the deleted detail records have their custom object definition hard deleted while the master record is in the Recycle Bin.

SEE ALSO:
Manage Deleted Custom Objects
Find Object Management Settings

Manage Deleted Custom Objects

Deleted custom objects appear in the Deleted Objects list for 15 days. During this time, you can choose to permanently delete the object and its data, or you can undelete them. If you undelete a custom object, you might need to do some manual cleanup to restore list views and other customizations that use the object.

- To view a list of deleted custom objects:
  1. Go to the object management settings for custom objects.
  2. Click Deleted Objects at the bottom of the list.

The Deleted Objects link appears only when you have at least one deleted custom object in your organization. The number in parentheses indicates the total number of deleted custom objects.

- In the Deleted Objects list, you can do any of the following:
  - Click the object’s label to view details about it
  - Click Erase to permanently remove the object and its data
  - Click Undelete to restore the object and its data

Results of Hard Deleting Custom Objects

When a custom object is hard deleted, either manually, or automatically after 15 days:

- The custom object’s definition and data are permanently deleted, and can’t be restored.
- The custom object and its data no longer count against your organization’s limits.
- If the deleted object is on the detail side of a master-detail relationship, master records currently in the Recycle Bin aren’t restorable if one or more detail records were automatically deleted as a result of the master record being deleted. Attempting to undelete the master record results in an error.
Note: This only happens when the deleted detail records have their custom object definition hard deleted while the master record is in the Recycle Bin.

Limitations for Restoring Truncated Custom Objects
Copies of truncated custom objects also appear in the list of deleted objects. Truncated custom objects can’t be restored to their original state, even from their copies in the Deleted Objects list. Undeleted copies of truncated objects have a new name and new URL, and some fields and data cannot be manually restored.

Restoring a Custom Object to Its Predeleted State
When you restore a deleted custom object, its records are also undeleted, including any that were in the Recycle Bin.

Note: It might take several hours before you can search the undeleted object’s records.

To ensure that you return the object to its fully functional, predeleted state, check all affected conditions and customizations, and manually fix them if necessary.

AppExchange packages
Add the custom object to any appropriate Force.com AppExchange packages.

Custom tabs
Re-create a custom tab for the object and add it to any custom apps that use it.

List views, reports, and workflow rules
Re-create them.

Validation rules and approval processes
Re-activate them.

Formula fields
Open and save any custom formula fields on the object to re-enable them.

Page layouts
Page layouts are restored automatically on the undeleted object. Page layouts are also restored automatically on other objects that use the page layout in a related list—as long as the page layout wasn’t edited while the object was deleted. Otherwise, you have to add the related list back to the other object.

Custom report types
For custom report types where the deleted object was not the main object, add the reference back to the restored object. Reports based on the custom report type are automatically restored if they weren’t edited while the object was deleted. Re-create any reports that have been edited.

Relationships
If the deleted custom object was on the detail side of a master-detail relationship, Salesforce converted it to a lookup relationship. Change it back to master-detail.

Developer name
The developer name for the object was changed to objectname_del. Change it back to the original name, objectname_c, so that customizations using the name will work properly.
Deployment status

When the custom object was deleted, its Deployment Status field was set to In Development. When you’ve restored all affected customizations to the undeleted object, change its status back to Deployed.

SEE ALSO:
- Delete Custom Objects
- Truncating Custom Objects
- Find Object Management Settings

Truncating Custom Objects

It’s important to understand what truncating an object does before using it to remove records. Truncating a custom object allows you to remove all of the object’s records, while keeping the object and its metadata. Truncating custom objects is similar to the mass delete option available for standard objects.

When you truncate a custom object, Salesforce places a copy of the truncated object in the Deleted Objects list for 15 days. It appears in the list as objectname_trunc[number]. During this period, the object and its records continue to count against your organization limits.

After 15 days, the records are permanently erased and no longer count against your limits.

Important: Truncated custom objects can’t be restored to their original state, even from their copies in the Deleted Objects list.

You can’t truncate standard objects or custom objects that:
- Are referenced by another object through a lookup field or that are on the master side of a master-detail relationship
- Are referenced in a reporting snapshot
- Have a custom index or an external ID
- Have activated skinny tables

In addition, you can’t truncate custom objects when your organization has reached its limit of the allowed number of custom objects.

Truncating a custom object erases:
- All records currently sitting in the custom object’s Recycle Bin
- The custom object’s history
- Related events, tasks, notes, and attachments for each deleted record

Truncating a custom object breaks:
- Bookmarks to the truncated objects and its records. If someone clicks a bookmark to the truncated custom object or to a deleted record’s URL, Salesforce displays an Insufficient Privileges message.
- Apex scripts and Visualforce pages with references to a truncated object or record.

After truncating a custom object, you can continue to use the custom object and add new records. Salesforce preserves:
- The custom object definition and all related definitions
- Workflow rules, actions, and triggers
- Sharing rules associated with the custom object
- Validation rules and approval processes
- Master-detail relationships and formula fields
Translations
Mobile configuration settings

When working with truncated objects, keep in mind:
• The truncated object tab has a new URL, so new bookmarks need to be created.
• List views and reports need to be refreshed after truncation.
• Roll-up summary fields need to be recalculated after truncation.
• There is no support for truncation in the API.
• To truncate objects that contain master-detail relationships, first truncate the detail (child) objects and then the (master) parent objects, working your way up the relationship tree.

SEE ALSO:
Truncate Custom Objects
Manage Deleted Custom Objects

Truncate Custom Objects

Truncating custom objects allows you to permanently delete all of the object’s records but preserve the empty object and its metadata.

Important: Truncating custom objects causes some irreversible changes to the truncated object and its records. Before truncating, see Truncating Custom Objects. Then, enable it for your organization by entering User Interface in the Quick Find box, selecting User Interface, and then selecting the permission.

Truncating custom objects is a fast way to permanently remove all of the records from a custom object, while keeping the object and its metadata intact for future use. Truncating is useful, for example, if you have created a custom object and filled it with test records. When you're done with the test data, you can truncate the object to purge the test records, but keep the object and put it into production. This is much faster than batch-deleting records and possibly recreating the object.

1. Go to the object management settings for custom objects.
2. Click an object name to go to the object’s detail page, and then click Truncate.
3. In the Confirm Custom Object Truncate window, review the warning and then enter the name of the object to truncate in the empty field.
4. Click Truncate.

Manage Deleted Custom Objects
Find Object Management Settings
Track Your Organization’s Custom Object Usage by User License Type

To keep track of how many custom objects your users are assigned to, create a custom report type with the User Licenses and Custom Object Usage by User License Metrics objects.

1. From Setup, enter Report Types in the Quick Find box, then select Report Types.
2. Click New Custom Report Type.
3. Fill out the fields.

<table>
<thead>
<tr>
<th>For this field...</th>
<th>Enter or select...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Object</td>
<td>User Licenses</td>
</tr>
<tr>
<td>Report Type Label</td>
<td>A label for this report type. The label appears when users create a report. For example, Custom Object Usage by User License.</td>
</tr>
<tr>
<td>Report Type Name</td>
<td>A unique name for this report type.</td>
</tr>
<tr>
<td>Description</td>
<td>A description for this report type. This description appears when users create a report.</td>
</tr>
<tr>
<td>Store in Category</td>
<td>Other Reports</td>
</tr>
</tbody>
</table>

4. (Optional) To make this report type available to other users, select a Deployment Status of Deployed.
5. Click Next.
6. Click the box under the primary object.
7. Select Custom Object Usage by User License Metrics.
8. Click Save.
9. Create a report using the new report type.

Object Relationships Overview

Create relationships to link objects with each other, so that when your users view records, they can also see related data. For example, link a custom object called “Bugs” to cases to track product defects that are associated with customer cases.

You can define different types of relationships by creating custom relationship fields on an object. Before you begin creating relationships, determine the type of relationship that suits your needs.

Different types of relationships between objects in Salesforce determine how they handle data deletion, sharing, and required fields in page layouts. Let’s review the types of relationships.

Master-detail
Closely links objects together such that the master record controls certain behaviors of the detail and subdetail record. For example, you can define a two-object master-detail relationship,
such as Account—Expense Report, that extends the relationship to subdetail records, such as Account—Expense Report—Expense Line Item. You can then perform operations across the master—detail—subdetail relationship.

Behaviors of master-detail relationships include:

- Deleting a detail record moves it to the Recycle Bin and leaves the master record intact; deleting a master record also deletes related detail and subdetail records. Undeleting a detail record restores it, and undeleting a master record also undeletes related detail and subdetail records. However, if you delete a detail record and later, separately, delete its master record, you cannot undelete the detail record, as it no longer has a master record to relate to.
- By default, records can’t be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the Allow reparenting option in the master-detail relationship definition.
- The Owner field on the detail and subdetail records is not available and is automatically set to the owner of the master record. Custom objects on the “detail” side of a master-detail relationship can’t have sharing rules, manual sharing, or queues, as these require the Owner field.
- The security settings for the master record control the detail and subdetail records.
- The master-detail relationship field (which is the field linking the objects) is required on the page layout of the detail and subdetail records.
- The master object can be a standard object, such as Account or Opportunity, or a custom object.
- As a best practice, don’t exceed 10,000 child records for a master-detail relationship.

**Many-to-many**

You can use master-detail relationships to model many-to-many relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

**Lookup**

Links two objects together. Lookup relationships are similar to master-detail relationships, except they do not support sharing or roll-up summary fields. With a lookup relationship, you can:

- Link two different objects.
- Link an object with itself (with the exception of the user object; see Hierarchical on page 3970). For example, you might want to link a custom object called “Bug” with itself to show how two different bugs are related to the same problem.

**Note:** Lookup relationships from objects related to the campaign member object aren’t supported; however, you can create lookup relationships from the campaign member object related to other objects.

When you create a lookup relationship, you can set these options:

- Make the lookup field required for saving a record, requiring it on the corresponding page layout as well.
- If the lookup field is optional, you can specify one of three behaviors to occur if the lookup record is deleted:
  - **Clear the value of this field** This is the default. Clearing the field is a good choice when the field does not have to contain a value from the associated lookup record.
  - **Don’t allow deletion of the lookup record that’s part of a lookup relationship** This option restricts the lookup record from being deleted if you have any dependencies, such as a workflow rule, built on the relationship.
  - **Delete this record also** Available only if a custom object contains the lookup relationship, not if it’s contained by a standard object. However, the lookup object can be either standard or custom. Choose when the lookup field and its associated record are tightly coupled and you want to completely delete related data. For example, say you have an expense report record with a lookup relationship to individual expense records. When you delete the report, you probably want to delete all of the expense records, too.
**Warning:** Choosing Delete this record also can result in a cascade-delete. A cascade-delete bypasses security and sharing settings, which means users can delete records when the target lookup record is deleted even if they don't have access to the records. To prevent records from being accidentally deleted, cascade-delete is disabled by default. Contact Salesforce to get the cascade-delete option enabled for your organization. Cascade-delete and its related options are not available for lookup relationships to business hours, community, lead, price book, product, or user objects.

When you define a lookup relationship, you have the option to include a lookup field on the page layouts for that object as well as create a related list on the associated object’s page layouts. For example, if you have a custom object called “PTO Requests” and you want your users to link a PTO request with the employee submitting the request, create a lookup relationship from the PTO Request custom object with the user object.

If the parent record in a lookup relationship is deleted, the field history tracking for the child record does not record the deletion. For example, if a parent account is deleted, the Account History related list for the child account does not show the deletion.

You can’t delete an object or record in a lookup relationship if the combined number of records between the two linked objects is more than 100,000. To delete an object or record in a lookup relationship, first delete an appropriate number of its child records.

**External lookup**

An external lookup relationship links a child standard, custom, or external object to a parent external object. When you create an external lookup relationship field, the standard External ID field on the parent external object is matched against the values of the child’s external lookup relationship field. External object field values come from an external data source.

**Indirect lookup**

An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match and associate records in the relationship. Specifically, you select a custom unique, external ID field on the parent object to match against the child’s indirect lookup relationship field, whose values come from an external data source.

**Hierarchical**

A special lookup relationship available for only the user object. It lets users use a lookup field to associate one user with another that does not directly or indirectly refer to itself. For example, you can create a custom hierarchical relationship field to store each user’s direct manager.

**Tip:** When creating a hierarchical field in Personal, Contact Manager, Group, and Professional Editions, you can select the Restricted Field checkbox so that only users with the “Manage Internal Users” permission can edit it. In Professional, Enterprise, Unlimited, Performance, and Developer Edition, use field-level security instead.

- Create a Many-to-Many Relationship
- Define a Custom Object
Create a Many-to-Many Relationship

You can use master-detail relationships to model many-to-many relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. When modeling a many-to-many relationship, you use a junction object to connect the two objects you want to relate to each other.

Junction Object

A custom object with two master-detail relationships. Using a custom junction object, you can model a “many-to-many” relationship between two objects. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs.

Creating the many-to-many relationship consists of:
1. Creating the junction object.
2. Creating the two master-detail relationships.
3. Customizing the related lists on the page layouts of the two master objects.
4. Customizing reports to maximize the effectiveness of the many-to-many relationship.

Creating the Junction Object

1. Create a custom object to be your junction object.
2. In the custom object wizard, consider these tips specifically for junction objects:
   • Name the object with a label that indicates its purpose, such as BugCaseAssociation.
   • For the Record Name field, it is recommended that you use the auto-number data type.
   • Do not launch the custom tab wizard before clicking Save. Junction objects do not need a tab.

Creating the Two Master-Detail Relationships

To create the two master-detail relationships:
1. Verify that the two objects you want to relate to each other already exist. For example, you may want to relate the standard case object to a custom bug object.
2. On the junction object, create the first master-detail relationship field. In the custom field wizard:
   a. Choose Master-Detail Relationship as the field type.
   b. Select one of the objects to relate to your junction object. For example, select Case.

The first master-detail relationship you create on your junction object becomes the primary relationship. This affects the following for the junction object records:
   • Look and feel: The junction object’s detail and edit pages use the color and any associated icon of the primary master object.
   • Record ownership: The junction object records inherit the value of the Owner field from their associated primary master record. Because objects on the detail side of a relationship do not have a visible Owner field, this is only relevant if you later delete both master-detail relationships on your junction object.
   • Division: If your organization uses divisions to segment data, the junction object records inherit their division from their associated primary master record. Similar to the record ownership, this is only relevant if you later delete both master-detail relationships.
Customizing Many-to-Many Relationship Related Lists

For a many-to-many relationship in Salesforce, each master object record displays a related list of the associated junction object records. To create a seamless user experience, you can change the name of the junction object related list on each of the master object page layouts to have the name of the other master object. For example, you might change the BugCaseAssociations related list to Cases on the bugs page layout and to Bugs on the cases page layout. You can further customize these related lists to display fields from the other master object.

To customize the fields that display in the junction object related list on each master object page layout:

1. Edit the page layout of each master object that is related to the junction object. For example, modify the BugCaseAssociations related list for case records by editing the page layout for cases.
2. Edit the properties of the related list you want to modify. For example, on cases the BugCaseAssociations related list was renamed to Bugs, so select the Bugs related list.
3. Add the fields to display in the related list. You can add fields from the junction object itself, but more importantly, you can add fields from the other master object.

Each field is prefixed with its object name in the popup window. In the related list itself, only fields from the junction object are prefixed with the object name; fields from the other master object are not.

Note: The junction object related list does not include an icon on the master record’s detail pages because the junction object does not have a custom tab. If you make a tab for the junction object, the icon is included.

Customizing Reports for Many-to-Many Relationships

Many-to-many relationships provide two standard report types that join the master objects and the junction object. The report types are:

- “Primary master with junction object and secondary master” in the primary master object’s report category.
- “Secondary master with junction object and primary master” in the secondary master object’s report category.

The order of the master objects in the report type is important. The master object listed first determines the scope of records that can be displayed in the report.
You can create custom reports based on these standard report types. In addition, you can create custom report types to customize which related objects are joined in the report.

Considerations for Relationships

Review the following considerations before creating relationships between objects:

**Relationship Limits**
Each custom object can have up to two master-detail relationships and many lookup relationships. Each relationship is included in the maximum number of custom fields allowed.

**Converting Relationships**
You can convert a master-detail relationship to a lookup relationship as long as no roll-up summary fields exist on the master object.

You can convert a lookup relationship to a master-detail relationship, but only if the lookup field in all records contains a value.

**Self Relationships**
You can create a relationship from an object to itself, but it must be a lookup relationship, and a single record can’t be linked to itself. However, a record can indirectly relate to itself. For example, the Holiday Promotion campaign can have the Direct Mail campaign selected in the lookup relationship, and the Direct Mail campaign can have the Holiday Promotion campaign selected in the lookup relationship.

You can’t create a many-to-many self relationship, that is, the two master-detail relationships on the junction object can’t have the same master object.

**Icons for Custom Related Lists**
The icon you select for the associated custom tab also displays in any custom related list you create based on a relationship.

Custom related lists do not include an icon if they are based on a relationship with a custom object that does not have a custom tab.

**Master-Detail Relationships**
To create multilevel master-detail relationships, you need the “Customize Application” user permission.

When you define a master-detail relationship, the custom object on which you are working is the “detail” side. Its data can appear as a custom related list on page layouts for the other object.

By default, records can’t be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the Allow reparenting option in the master-detail relationship definition.

You can have up to three custom detail levels.

Standard objects can’t be on the detail side of a custom object in a master-detail relationship.
An object can appear once in multilevel master-detail relationships. For example, a subdetail object in one multilevel master-detail relationship can't also be the owner of the master object in another multilevel master-detail relationship. A subdetail object can't also be the master object of the subdetail object's detail object.

Multilevel master-detail relationships do not support division transfers.

You can't create a master-detail relationship if the custom object already contains data. You can, however, create the relationship as a lookup and then convert it to master-detail if the lookup field in all records contains a value.

Converting relationships from lookup to master-detail, or from master-detail to lookup behaves the same as for two-object master-detail relationships. That is, the two linked objects in the detail-subdetail1, or subdetail1-subdetail2 relationship have the same conversion limits as the master-detail relationship.

Roll-up summary fields work as in two-object master-detail relationships. A master can roll up fields on detail records; however, it can't directly roll up fields on subdetail records. To achieve this, the detail record must have a roll-up summary field for the field on the subdetail record, allowing the master to roll up from the detail's roll-up summary field.

You can use multilevel master-detail relationships in custom report types. The Allow Reports checkbox must be checked when you create the custom object. Custom report types created for multilevel master-detail relationships count towards the organization's custom report type limit and no reports are generated if this limit is exceeded.

Custom junction objects can't have detail objects. That is, a custom junction object can't become the master object in a multilevel master-detail relationship.

You can't delete a custom object if it is on the master side of a master-detail relationship. If you delete a custom object that is on the detail side of a master-detail relationship, the relationship is converted to a lookup relationship.

Deleting a detail record moves it to the Recycle Bin and leaves the master record intact; deleting a master record also deletes related detail and subdetail records. Undeleting a detail record restores it, and undeleting a master record also undeletes related detail and subdetail records. However, if you delete a detail record and later, separately, delete its master record, you cannot undelete the detail record, as it no longer has a master record to relate to.

As a best practice, don't exceed 10,000 child records for a master-detail relationship.

Many-to-Many Relationships

Junction object records are deleted when either associated master record is deleted and placed in the Recycle Bin. If both associated master records are deleted, the junction object record is deleted permanently and can't be restored.

Sharing access to a junction object record is determined by a user's sharing access to both associated master records and the Sharing Setting option on the relationship field. See Custom Object Security on page 3979. For example, if the sharing setting on both parents is Read/Write, then the user must have Read/Write access to both parents in order to have Read/Write access to the junction object. If, on the other hand, the sharing setting on both masters is Read-Only, a user with Read-Only rights on the master records would have Read/Write access to the junction object.

In a many-to-many relationship, a user can't delete a parent record if there are more than 200 junction object records associated with it and if the junction object has a roll-up summary field that rolls up to the other parent. To delete this object, manually delete junction object records until the count is fewer than 200.

The first master-detail relationship you create on your junction object becomes the primary relationship. This affects the following for the junction object records:

- Look and feel: The junction object's detail and edit pages use the color and any associated icon of the primary master object.
- Record ownership: The junction object records inherit the value of the Owner field from their associated primary master record. Because objects on the detail side of a relationship do not have a visible Owner field, this is only relevant if you later delete both master-detail relationships on your junction object.
- Division: If your organization uses divisions to segment data, the junction object records inherit their division from their associated primary master record. Similar to the record ownership, this is only relevant if you later delete both master-detail relationships.
The second master-detail relationship you create on your junction object becomes the secondary relationship. If you delete the primary master-detail relationship or convert it to a lookup relationship, the secondary master object becomes primary.

Roll-up summary fields that summarize data from the junction object can be created on both master objects.

Formula fields and validation rules on the junction object can reference fields on both master objects.

You can define Apex triggers on both master objects and the junction object.

A junction object can’t be on the master side of another master-detail relationship.

You can’t create a many-to-many self relationship, that is, the two master-detail relationships on the junction object can’t have the same master object.

**Lookup Relationships**

If the lookup field is optional, you can specify one of three behaviors to occur if the lookup record is deleted:

- **Clear the value of this field** This is the default. Clearing the field is a good choice when the field does not have to contain a value from the associated lookup record.

- **Don’t allow deletion of the lookup record that’s part of a lookup relationship** This option restricts the lookup record from being deleted if you have any dependencies, such as a workflow rule, built on the relationship.

- **Delete this record also** Available only if a custom object contains the lookup relationship, not if it’s contained by a standard object. However, the lookup object can be either standard or custom. Choose when the lookup field and its associated record are tightly coupled and you want to completely delete related data.

**Warning:** Choosing **Delete this record also** can result in a **cascade-delete**. A cascade-delete bypasses security and sharing settings, which means users can delete records when the target lookup record is deleted even if they don’t have access to the records. To prevent records from being accidentally deleted, cascade-delete is disabled by default. Contact Salesforce to get the cascade-delete option enabled for your organization.

Cascade-delete and its related options are not available for lookup relationships to business hours, community, lead, price book, product, or user objects.

In a chain of lookup relationships, these behaviors work independently on each target field at each level. Say, for example, field A is the target lookup of field B, which in turn is the target lookup of field C. You can have a delete restriction on A and none on B, which means that A can’t be deleted but B can. Once B is deleted, the relationship between A and B no longer exists and C will hold an empty value for the lookup.

In a multilevel lookup relationship, these options might conflict. For example, in the scenario where field A is the target lookup of field B, which in turn is the target lookup of field C, you might specify that A can delete B, but B cannot be deleted because it’s in a relationship with C. If you try to delete A, you’ll get an error saying that B can’t be deleted because it’s linked to C.

If the parent record in a lookup relationship is deleted, the field history tracking for the child record does not record the deletion. For example, if a parent account is deleted, the Account History related list for the child account does not show the deletion.

**Relationships on External Objects**

Lookup, external lookup, and indirect lookup relationships have some special behaviors and limitations.

- **Only lookup, external lookup, and indirect lookup relationships are available for external objects.** No other relationship types are supported.

- Depending on the availability of the external system, related lists of child external objects may load slowly when users view the parent record detail pages.

- Relationships that involve external objects allow users to create child records from the record detail pages of parent records. However, the relationship field on each new child record isn’t automatically populated to identify the parent record.
• Syncing doesn’t create relationship fields on the external objects in your Salesforce org. However, you can change the field type of a sync-created custom field to Lookup Relationship, External Lookup Relationship, or Indirect Lookup Relationship. Changing the field type of an existing custom field is simpler and more efficient than manually creating a relationship field on the external object.

For example, suppose that the external system has a foreign key relationship. Syncing the related tables creates a text field in your org for the external column that identifies the foreign keys. To reflect the foreign key relationship within your org, change the field type of that text field to External Lookup Relationship.

• A relationship field is a type of custom field. Therefore, like all custom fields on an external object, relationship fields can be overwritten when you sync the external object. See the sync considerations for each Salesforce Connect adapter that you use.

• Cascade-delete isn’t available for external object relationships.

• In Salesforce Classic only, external lookup and indirect lookup relationship fields don’t display the expected names of parent records.
  – An external lookup field displays either the parent object ID or the value of the parent object’s External ID standard field. The latter appears by default. If, however, a custom field on the parent object has the Is Name Field attribute, the parent object ID is displayed.
  – An indirect lookup field displays the value of the target field on the parent object. To find related records, target field values are matched against the values of the indirect lookup relationship field on the child object. The target field, which has the External ID and Unique attributes, is selected when an indirect lookup field is created.

• When a user tries to edit an external lookup or indirect lookup relationship field, a lookup dialog isn’t available for selecting the parent record.
  – To edit an external lookup relationship field, manually enter the value of the External ID standard field for the parent record.
  – To edit an indirect lookup relationship field, manually enter the value of the target field of the parent record. The target field is the custom field with External ID and Unique attributes that was selected when the indirect lookup relationship was created. To determine related records, Salesforce matches target field values against the values of the indirect lookup relationship field on the child object.

• With external lookup and indirect lookup relationships, the parent record appears as a clickable link in the relationship field on the child record. If the child record is viewed by a user who doesn’t have access to the parent record, the parent record appears in the relationship field as plain text instead of a link.

• Lookup filters aren’t available for external lookup relationship fields.

• Indirect lookup relationship fields can be created on external objects only.

• Only objects that have a custom field with the External ID and Unique attributes are available as parent objects in indirect lookup relationships. If you don’t see the desired object when you create an indirect lookup relationship field, add a custom unique, external ID field to that object.

**Impact of Relationships on Reports**

The type of relationship you create affects which standard report types are available and how they are categorized. These report types determine which related objects can be included in the report:

• Lookup relationships allow data from the two related objects to be joined in one report.

• Master-detail relationships allow data from three objects to be joined in one report: the master object, the detail object, plus one other lookup object. If the detail object has multiple lookup relationships, a separate report type is available based on each lookup.

• Many-to-many relationships provide two standard report types that join the master objects and the junction object. The report types are:
“Primary master with junction object and secondary master” in the primary master object’s report category.

“Secondary master with junction object and primary master” in the secondary master object’s report category.

The order of the master objects in the report type is important. The master object listed first determines the scope of records that can be displayed in the report.

The reporting impact of each relationship type is summarized in the following table:

<table>
<thead>
<tr>
<th>Relationship Type</th>
<th>Standard Report Types</th>
<th>Report Type Category</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lookup</td>
<td>Object by itself&lt;br&gt;Object with first lookup&lt;br&gt;Object with second lookup&lt;br&gt;Object with third lookup</td>
<td>Based on the object</td>
</tr>
<tr>
<td>Master-Detail</td>
<td>Master object by itself&lt;br&gt;Master object with detail object&lt;br&gt;Master object with detail object and first lookup&lt;br&gt;Master object with detail object and second lookup&lt;br&gt;Master object with detail object and third lookup</td>
<td>Master object</td>
</tr>
<tr>
<td>Many-to-Many</td>
<td>Primary master object by itself&lt;br&gt;Secondary master object by itself&lt;br&gt;Primary master object with junction object and secondary master object&lt;br&gt;Secondary master object with junction object and primary master object</td>
<td>Primary master object and Secondary master object</td>
</tr>
</tbody>
</table>

Custom report types give you more flexibility to join data from multiple objects, including lookups as well as master-detail relationships.

**Important:** Converting a relationship from lookup to master-detail or vice versa can cause existing custom reports to become unusable due to the different standard report types available for each type of relationship. We recommend that you test your custom reports immediately after converting the relationship type. If you revert your relationship back to the original type, the reports are restored and become usable again.

SEE ALSO:

- Create a Many-to-Many Relationship
- External Object Relationships
Create Record Types for Custom Objects

Create record types for a custom object to display different picklist values and page layouts to different users based on their profiles.

1. From the object management settings for a custom object, go to Record Types.
2. Click New in the Record Types related list.
3. Choose Master from the Existing Record Type drop-down list to copy all available picklist values, or choose an existing record type to clone its picklist values.
   
   **Note:** When you create a new record type without cloning an existing one, the new record type automatically includes the master picklist values for both standard and custom picklists. You can then customize the picklist values for the record type.

4. Enter a Record Type Label that's unique within the object.
5. Enter a description.
6. Select Active to activate the record type.
7. Select Enable for Profile next to a profile to make the record type available to users with that profile. Select the checkbox in the header row to enable it for all profiles.
   
   **Tip:** If each profile is associated with a single record type, users will never be prompted to select a record type when creating new records.

8. For enabled profiles, select Make Default to make it the default record type for users of that profile. Select the checkbox in the header row to make it the default for all profiles.
9. Click Next.
10. Choose a page layout option to determine what page layout displays for records with this record type:
    
    - To apply a single page layout for all profiles, select Apply one layout to all profiles and choose the page layout from the drop-down list.
    - To apply different page layouts based on user profiles, select Apply a different layout for each profile and choose a page layout for each profile.

11. Click Save to edit the values of the standard and custom picklists available for the record type, or click Save and New to create another record type.

SEE ALSO:

Find Object Management Settings
Customize Search Layouts for Custom Objects

You can customize which custom object fields display for users in search results, lookup dialogs, and the key lists on custom tab home pages. You can specify a different set of fields to show in each search layout. The settings apply to all users in your organization.

You can also customize which buttons display in custom list views and search results. You can hide a standard list view button or display a custom button. Standard buttons aren’t available on search result layouts. To display a custom button, create the custom button, giving it the List Button Display Type.

1. From the object management settings for a custom object, go to Search Layouts.
2. Click Edit next to the search layout that you want to modify.
   
   **Note:** The fields you select for the key lists on the custom tab home page are also used as the columns displayed in the default All list view and as the default columns for any new list views. To view different columns, customize the list view itself.

   - To customize which fields display in the layout, select one or more fields and click Add or Remove.
   - To sort fields in the layout, select one or more fields in Selected Fields and click Up or Down.
   - To select multiple fields individually, use CTRL+click.
   - To select multiple fields as a group, use SHIFT+click.

4. Click Save.

SEE ALSO:
   - Customize Search Layouts

Custom Object Security

Learn how security settings work together so you can control access to your custom objects with great flexibility.

Set custom object security at the following levels

- **Tab**—display the custom tab for the appropriate users based on their user profiles.
- **Object**—set the access users have to create, read, edit, and delete records for each object.
- **Records**—set the default sharing model for all your users. This determines the access users have to custom object records that they do not own.
- **Relationship**—for objects on the detail side of a master-detail relationship, specify the sharing access that users must have to the master record in order to create, edit, or delete the associated detail records. This is specified in the Sharing Setting attribute of the master-detail relationship field on the detail object.
- **Fields**—set the level of access users have to fields on your custom object page layout.

These requirements apply to custom objects with no master-detail relationship.
<table>
<thead>
<tr>
<th>Action</th>
<th>Required Privileges</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a record</td>
<td>“Create” permission. The user must have the tab displayed to create a new record from the Create New drop-down list in the sidebar.</td>
</tr>
<tr>
<td>View a record</td>
<td>“Read” permission and Public Read Only or Public Read/Write sharing model if not the record owner.</td>
</tr>
<tr>
<td>Edit a record</td>
<td>“Edit” permission and Public Read/Write sharing model if not the record owner.</td>
</tr>
<tr>
<td>Delete a record</td>
<td>“Delete” permission and must be the record owner or above the record owner in the role hierarchy.</td>
</tr>
</tbody>
</table>

These requirements apply to custom objects that have a master-detail relationship with a standard or custom object.

<table>
<thead>
<tr>
<th>Action</th>
<th>Required Privileges</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a record</td>
<td>“Create” permission and either read or read/write access to the related master record, depending on the value of the Sharing Setting attribute of the master-detail relationship field on the detail object.</td>
</tr>
<tr>
<td>View a record</td>
<td>“Read” permission and read access to the related master record. If the record has two master records in a many-to-many relationship, the user must have read access to both master records.</td>
</tr>
<tr>
<td>Edit a record</td>
<td>“Edit” permission and either read or read/write access to the related master record, depending on the value of the Sharing Setting attribute of the master-detail relationship field on the detail object.</td>
</tr>
<tr>
<td>Delete a record</td>
<td>“Delete” permission and either read or read/write access to the related master record, depending on the value of the Sharing Setting attribute of the master-detail relationship field on the detail object.</td>
</tr>
<tr>
<td></td>
<td>When a user deletes a record that has related custom object records, all related custom object records are deleted regardless of whether the user has delete permission to the custom object.</td>
</tr>
</tbody>
</table>

Delegated administrators can manage nearly every aspect of specified custom objects, but they cannot create or modify relationships on the object or set organization-wide sharing defaults.
Notes on Enabling Activities for Custom Objects

- If you enable activities when creating a custom object, the activity related lists are added to the default page layout automatically. If you enable activities later, after the custom object already exists, you must add the related lists to the page layout manually.
- Disabling activities for a custom object does not delete existing activity records. However, activity related lists are removed from custom object pages, and reports containing activities and the custom object are deleted.
- If a custom object has a master-detail relationship with accounts, the custom object’s activities roll up to the account and cause the account’s Last Activity date to be updated. For custom objects related to other types of records, the activities do not roll up.
- The ability to send emails or create mail merge documents is available for activities on custom objects. The email must be sent to a contact or lead.
- When you change the ownership of a custom object record, any open activities related to that custom object are also transferred to the new record owner.
- You cannot disable activity tracking for a custom object if any workflow tasks are associated with that custom object, or if tasks and events are child data sets of the custom object in a mobile configuration.
- Custom object records can only be associated with a call log in Salesforce CRM Call Center if activities are enabled for the object.

Managing Your Custom Objects and Fields With Schema Builder

Schema Builder

Schema Builder provides a dynamic environment for viewing and modifying all the objects and relationships in your app. This greatly simplifies the task of designing, implementing, and modifying your data model, or schema.

You can view your existing schema and interactively add new custom objects, custom fields, and relationships, simply by dragging and dropping. Schema Builder automatically implements the changes and saves the layout of your schema any time you move an object. This eliminates the need to click from page to page to find the details of a relationship or to add a new custom field to an object in your schema.

Schema Builder provides details such as the field values, required fields, and how objects are related by displaying lookup and master-detail relationships. You can view the fields and relationships for both standard and custom objects.

Schema Builder is enabled by default and lets you add the following to your schema:

- Custom objects
- Lookup relationships
- Master-detail relationships
How Do I Access Schema Builder?

From Setup, enter Schema Builder in the Quick Find box, then select Schema Builder. When working with Schema Builder:

- Click an object and move it to any space on the canvas. Schema Builder saves the layout of your schema any time you move an object.
- Click Auto-Layout to sort the layout of the objects in your schema.
  
  **Important:** When you click Auto-Layout, you can’t undo it.

- Click View Options to:
  
  - Display Element Names if you prefer system names, or Display Element Labels if you prefer text values.
  
  - Show/Hide Relationships
  
  - Show/Hide Legend

- The Elements tab lets you drag and drop new custom objects and fields onto the canvas.
  
  - To create a custom object, see Creating Objects with Schema Builder.
  
  - To create a custom field, see Creating Fields with Schema Builder.

- The Objects tab lets you select objects to display on the canvas.
  
  - Click the drop-down list in the sidebar to filter your list of objects:
    
    - All Objects
    
    - Selected Objects
    
    - Standard Objects
    
    - Custom Objects
    
    - System Objects

  **Note:** Objects created outside of Schema Builder, such as through an app or the API, don’t automatically display on the canvas. Select the checkbox for the object created outside Schema Builder to display it on the canvas.

  - To search for an object, type its name in the Quick Find box.
    
  - Hover over an object in your list of objects and click to find it on the canvas.

- Hover over relationship lines to show relationship details such as lookup and master-detail relationships. Click the name of the object to find it on the canvas. You can hide relationships if your schema is taking too long to load.

- To view the details of a field in a new window, right-click the element name or label and select View Field in New Window.

- To edit properties of a custom field, right-click the element name or label and select Edit Field Properties.

- To manage permissions of a custom field, click the element name or label and select Manage Field Permissions. Use the dialog box that appears to manage the field’s visibility and writeability for all standard and custom profiles. By default, the field-level security...
for custom fields is set to visible and editable for internal profiles—those not cloned from Partner User or Customer Portal Manager. Fields that are not normally editable, such as formulas and roll-up summary fields, are visible and read only.

• Click to:
  – Hide Object on Canvas
  – View Object detail in a new window
  – View Page Layouts detail in a new window

• For objects with many fields (Lead or Campaign, for example), click Show More Fields to display all the fields.

• To zoom in, click . To zoom out, click .

Note: You can’t save the level of zoom when closing Schema Builder.

• To collapse the sidebar, click . To expand it, click .

• The map in the lower right corner shows the overall layout of your objects on the canvas. Click the map to navigate the layout of your objects. To pan across the schema layout while zoomed in, click and hold the canvas while moving the mouse.

• To close the Schema Builder and save the layout of your objects, click Close.

Important: If your schema contains many objects and fields, loading can take a long time. Click Hide Relationships to improve Schema Builder performance.

Create Objects with Schema Builder

To create a custom object with Schema Builder:

1. Click the Elements tab.
2. Click Object and drag it onto the canvas.
3. Enter information to define your object. For a list of object definitions, see Schema Builder Custom Object Definition on page 3985.
4. Click Save.

Available in: both Salesforce Classic and Lightning Experience
Available in all editions

USER PERMISSIONS
To create new custom objects in Schema Builder:
• “Customize Application”
Create Fields with Schema Builder

To create a custom field with Schema Builder:

1. Click the **Elements** tab.
2. Click a field and drag it onto an object on the canvas.
3. Enter a **Field Label**.
   
   Salesforce populates **Field Name** using the field label. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

   Ensure that the custom field name and label are unique for that object.
   
   - If a standard and custom field have identical names or labels, the merge field displays the custom field value.
   - If two custom fields have identical names or labels, the merge field may display an unexpected value.

   If you create a field label called `Email` and a standard field labeled `Email` already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, `Email2`.

4. Enter a **Description** of the custom field.
5. Enter **Help Text** to detail the purpose and function of a custom field.
6. Enter a **Default Value** to automatically insert a value of a custom field when a new record is created.
7. Depending on the custom field type you choose, enter any remaining field attributes.
8. Click **Save**.

Any field you add through Schema Builder isn’t automatically added to the page layout. You will need to edit the page layout to specify where the field should be displayed.

Delete Custom Objects with Schema Builder

You can delete the custom objects that you no longer need by using Schema Builder.

Schema Builder displays a list of side effects when you try to delete a custom object. Be sure you’re ready to accept these side effects before finalizing the deletion. See Delete Custom Objects on page 3963 and Manage Deleted Custom Objects on page 3964.

1. Click **☐** on the custom object’s icon.
2. Select **Delete Object...** A dialog box displays that explains the side effects of deleting an object. Read this information carefully.
3. If you accept the conditions, check **Yes, I want to delete the custom object.**
4. Click **Delete**.
Delete Custom Fields with Schema Builder

Conveniently avoid "custom field clutter" by using Schema Builder to delete custom fields that you no longer need.

Schema Builder displays a list of side effects when you try to delete a custom field. Be sure you’re ready to accept these side effects before finalizing the deletion.

1. Right-click on the custom field.
2. Select Delete Field... A dialog box displays that explains the side effects of deleting a custom field. Read this information carefully.
3. If you accept the conditions, check Yes, I want to delete the custom field.
4. Click Delete.

Schema Builder Custom Object Definition

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>A name used to refer to the object in any user interface pages.</td>
</tr>
<tr>
<td>Plural Label</td>
<td>The plural name of the object. If you create a tab for this object, this name is used for the tab.</td>
</tr>
<tr>
<td>Starts with a vowel sound</td>
<td>If it’s appropriate for your organization’s default language, check if your label should be preceded by &quot;an&quot; instead of &quot;a&quot;.</td>
</tr>
<tr>
<td>Object Name</td>
<td>A unique name used to refer to the object when using the API. In managed packages, this unique name prevents naming conflicts on package installations. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>An optional description of the object. A meaningful description helps you remember the differences between your custom objects when you’re viewing them in a list.</td>
</tr>
<tr>
<td>Record Name</td>
<td>The name used in page layouts, list views, related lists, and search results.</td>
</tr>
<tr>
<td>Data Type</td>
<td>The type of field (text or auto-number) for the record name. Records that have unique IDs instead of names use auto-numbers. An auto-number is a unique number assigned automatically. It is always a read-only field.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow Reports</td>
<td>Makes the data in the custom object records available for reporting purposes. To create reports on custom objects, choose the <strong>Other Reports</strong> report type category unless the custom object has a relationship with a standard object. When the custom object has a master-detail relationship with a standard object, or is a lookup object on a standard object, select the standard object for the report type category instead.</td>
</tr>
<tr>
<td>Allow Activities</td>
<td>Allows users to associate tasks and scheduled calendar events related to the custom object records.</td>
</tr>
<tr>
<td>Track Field History</td>
<td>Enables your organization to track changes to fields on the custom object records, such as who changed the value of a field, when it was changed, and what the value of the field was before and after the edit. History data is available for reporting, so users can easily create audit trail reports when this feature is enabled.</td>
</tr>
<tr>
<td>Enable Divisions</td>
<td>If your organization has divisions enabled, select this option to enable the custom object for divisions. Divisions group records for simplified search results, list views, reports, and other areas within Salesforce. Salesforce adds a Division field to the custom object. If the custom object is the master in a master-detail relationship, custom objects on the detail side also get the Division field and inherit their division from the master record.</td>
</tr>
<tr>
<td>Available for Customer Portal</td>
<td>This option makes the custom object available through the Salesforce Customer Portal.</td>
</tr>
<tr>
<td>Namespace Prefix</td>
<td>In a packaging context, a namespace prefix is a one to 15-character alphanumeric identifier that distinguishes your package and its contents from packages of other developers on AppExchange. Namespace prefixes are case-insensitive. For example, ABC and abc are not recognized as unique. Your namespace prefix must be globally unique across all Salesforce organizations. It keeps your managed package under your control exclusively.</td>
</tr>
<tr>
<td>Deployment Status</td>
<td>Indicates whether the custom object is visible to other users.</td>
</tr>
<tr>
<td>Add Notes &amp; Attachments...</td>
<td>Allows users to attach notes and attachments to custom object records. This allows you to attach external documents to any object record, in much the same way that you can add a PDF or photo as an attachment to an email. This option is only available when you are creating a new object.</td>
</tr>
</tbody>
</table>

3986
Creating Unique Sets of Data

Custom Settings

Use custom settings to create custom sets of data, or to create and associate custom data for an org, profile, or user.

Custom settings are similar to custom objects in that they let you customize org data. Unlike custom objects which have records based on them, custom settings let you utilize custom data sets across your org, or distinguish particular users or profiles based on custom criteria.

Custom settings data is exposed in the application cache, which enables efficient access without the cost of repeated queries to the database. This data can then be used by formula fields, validation rules, flows, Apex, and the SOAP API.

Note: If you’re thinking of using List Custom Settings, consider using Custom Metadata Types on page 5150 instead. Unlike with List Custom Settings, you can migrate the records of Custom Metadata Types using Packages or Metadata API tools.

There are two types of custom settings:

List Custom Settings

A type of custom setting that provides a reusable set of static data that can be accessed across your organization. If you use a particular set of data frequently within your application, putting that data in a list custom setting streamlines access to it. Data in list settings does not vary with profile or user, but is available organization-wide. Examples of list data include two-letter state abbreviations, international dialing prefixes, and catalog numbers for products. Because the data is cached, access is low-cost and efficient: you don’t have to use SOQL queries that count against your governor limits.

Hierarchy Custom Settings

A type of custom setting that uses a built-in hierarchical logic that lets you “personalize” settings for specific profiles or users. The hierarchy logic checks the organization, profile, and user settings for the current user and returns the most specific, or “lowest,” value. In the hierarchy, settings for an organization are overridden by profile settings, which, in turn, are overridden by user settings.

The following examples illustrate how you can use custom settings:

• A shipping application requires users to fill in the country codes for international deliveries. By creating a list setting of all country codes, users have quick access to this data without needing to query the database.

• An application calculates and tracks compensation for its sales reps, but commission percentages are based on seniority. By creating a hierarchy setting, the administrator can associate a different commission percentage for each profile in the sales organization. Within the application, one formula field can then be used to correctly calculate compensation for all users; the personalized setting at the profile level inserts the correct commission percentage.

• An application displays a map of account locations, the best route to take, and traffic conditions. This information is useful for sales reps, but account executives only want to see account locations. By creating a hierarchy setting with custom checkbox fields for route and traffic, you can enable this data for just the “Sales Rep” profile.

To create and use custom settings:

1. Create the custom setting.

2. Add fields to the custom setting.

3. Add data and set the access level for the custom setting data.

4. Reference the custom setting data in your application, using formula fields, validation rules, Apex, or the SOAP API.
You can also include a custom setting in a package. The visibility of the custom setting in the package depends on the Visibility setting.

**Note:** Only custom settings definitions are included in packages, not data. If you need to include data, you must populate the custom settings using a standard Apex or API script run by the subscribing organization after they have installed the package.

SEE ALSO:
- View Custom Settings
- Custom Settings Limits and Considerations

## Accessing Custom Settings

You can access custom settings from formula fields, validation rules, Apex, and the SOAP API. Some sample code segments are provided below.

### Formula Fields

Formula fields only work for hierarchy custom settings; they can’t be used for list custom settings.

```plaintext
{!$Setup.CustomeSettingName__c.CustomeFieldName__c}
```

### Apex

Apex can access both custom setting types.

**Note:** If Privacy for a custom setting is Protected and the custom setting is contained in a managed package, the subscribing organization cannot edit the values or access them using Apex.

### Samples for List Custom Settings

When you add data to a custom setting, you must name each set of data. Then you can distinguish between the sets of data by the data set name. The following returns a map of custom settings data. The `getAll` method returns values for all custom fields associated with the list setting.

```plaintext
Map<String_dataset_name, CustomSettingName__c> mcs = CustomSettingName__c.getAll();
```
The following example uses the `getValues` method to return all the field values associated with the specified data set. This method can be used with both list and hierarchy custom settings, using different parameters.

```java
CustomSettingName_c mc = CustomSettingName_c.getValues(data_set_name);
```

**Samples for Hierarchy Custom Settings**

The following example uses the `getOrgDefaults` method to return the data set values for the organization level:

```java
CustomSettingName_c mc = CustomSettingName_c.getOrgDefaults();
```

The following example uses the `getInstance` method to return the data set values for the specified profile. The `getInstance` method can also be used with a user ID.

```java
CustomSettingName_c mc = CustomSettingName_c.getInstance(Profile_ID);
```

**SOAP API**

Custom settings that have **Privacy** defined as **Public** are exposed to the API in the same way custom objects are exposed.

Tip: If **Privacy** is defined as **Protected**, and the custom setting is contained in a managed package, the custom setting is not accessible using the API in either the developer organization or a subscribing organization.

Use any tool with API access to perform query or profile-permission-setting operations.

Tip: You can also access custom settings data through a Standard Object Query Language (SOQL) query, but this method doesn't make use of the application cache. It's similar to querying a custom object.

SEE ALSO:

- Custom Settings

**Define Custom Settings**

To create or edit a custom setting:

1. From Setup, enter **Custom Settings** in the Quick Find box, then select **Custom Settings**.

2. Click **New** to create a new custom setting, click **Edit** next to the name of a custom setting, or click **Edit** while viewing the details of a custom setting.

   Tip: A icon indicates that the custom setting is in an installed managed package. You can't edit or delete a custom setting installed from a managed package.

3. Define the following:
   - **Label**—Enter the label displayed in the application.
   - **Object Name**—Enter the name to be used when the custom setting is referenced by formula fields, validation rules, Apex, or the SOAP API.

   Tip: Salesforce recommends using ASCII for the **Object Name**. The name can't exceed 38 ASCII characters. If you use double byte, there are additional limits on the number of characters allowed.

   - **Setting Type**—Select a type of List or Hierarchy. The List type defines application-level data, such as country codes or state abbreviations. The Hierarchy type defines personalization settings, such as default field values, that can be overridden at lower levels in the hierarchy.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: Group, Professional, Developer, Enterprise, Performance, Unlimited, and Database.com Editions.

Packages are not available in Database.com.

USER PERMISSIONS

To manage, create, edit, and delete custom settings:

- “Customize Application”
**Important:** After you save a custom setting, you cannot change this value.

- **Visibility**—Select a visibility of Protected or Public.
  - Protected—If the custom setting is contained in a managed package, subscribing organizations can’t see the custom setting: it doesn’t display as part of the package list. In addition, subscribing organizations can’t access the custom setting using either Apex or the API, however, developer organizations can. If the custom setting is contained in an unmanaged package, the custom setting is available through the Enterprise WSDL like any custom object (as if the Visibility was Public.)
  - Public—The custom setting is available through the Enterprise WSDL like any custom object. You can package custom settings defined as public. The subscribing organizations can edit the values, as well as access them using Apex and the API, regardless of the type of package (either managed or unmanaged).

**Important:** After you save a custom setting, you cannot change this value.

4. Enter an optional description of the custom setting. A meaningful description will help you remember the differences between your custom settings when you’re viewing them in a list.

5. Click **Save**.

**Note:** Only custom settings definitions are included in packages, not data. If you need to include data, you must populate the custom settings using a standard Apex or API script run by the subscribing organization after they have installed the package.

After you create a custom setting, you must also add fields to the custom setting.

SEE ALSO:

- Add Custom Settings Fields
- Add Custom Settings Data

**View Custom Settings**

After you create a custom setting, you can view the details of the custom setting, manage the custom setting, and add fields.

From Setup, enter **Custom Settings** in the Quick Find box, then select **Custom Settings**, then click the name of the custom setting you’d like to view. While viewing a custom setting, you can:

- Click **Edit** to make changes to a custom setting.
- Click **Delete** to delete a custom setting.

**Note:** A **icon indicates that the custom setting is in an installed managed package. You can’t edit or delete a custom setting installed from a managed package.

- Click **Manage** to add data to a custom setting.
  In addition, click **New** to add fields to the custom setting.

SEE ALSO:

- Define Custom Settings
Add Custom Settings Fields

After you define custom settings, add fields to them. The custom fields contain the data used by the custom setting.

1. From Setup, enter Custom Settings in the Quick Find box, then select Custom Settings.
2. Click the custom setting that you want to add fields to. (If you just created the custom setting, the Custom Setting Detail page appears.)
3. Click New.
4. Select a field type and click Next.
   - Note: Record size is based on the maximum field size of each field type, not the actual storage that’s used in each field. When adding fields to a custom setting definition, use the appropriate type and specify a length that doesn’t exceed what’s needed for your data. This action helps you avoid reaching the cached data limit. For example, if you create a US social security number (SSN) field, select the Text data type and specify a length of 9. If instead you selected a Text Area data type, the field would add 255 characters to the usage count for each record, regardless of the number of characters entered.
5. Enter the details for the field.
6. Confirm the information, and then click Save or Save & New.

After you add fields, you need to add data, and for hierarchy custom settings, specify the access level.

SEE ALSO:
Add Custom Settings Data

Manage Custom Settings Data

After defining custom settings and adding fields, populate the fields:

1. From Setup, enter Custom Settings in the Quick Find box, then select Custom Settings.
2. Click Manage next to a custom setting, or from the detail page for a custom setting.
3. Provide or change values for the custom setting.
   - If you are managing a list setting:
     - Click New to add data to the fields.
     - Click Edit next to the name of an existing set of data to change the name of the data set or to change the data.
     - Click Del next to the name of an existing set of data to delete the data set.
   - If you are managing a hierarchy setting, decide where in the permission hierarchy you want to add default data (organization, profile, or user).
     To add default data at the organization level, click New in the Default Organization Level Value section. If data has already been defined for the organization, you can only edit or delete it.
To add default data at the profile or user level, click New in the lower section of the page, near the Setup Owner.

After you have defined data, you can:

- Click Edit in the Default Organization Level Value section to change the default data set at the organization level, or Delete to delete it (this is only for hierarchical custom settings.)
- Click View next to the name of an existing set of data to view the data (this is only for hierarchical custom settings.)
- Click Edit next to the name of an existing set of data to change the name of the data set or to change the data.
- Click Del next to the name of an existing set of data to delete the data set.

SEE ALSO:
- Custom Settings Limits and Considerations
- Add Custom Settings Data

Add Custom Settings Data

After you define your custom settings and add fields, you need to populate the fields with data. You can define one or more data sets. For list custom settings, each data set is named and can be accessed by that name using Apex, formula fields, and so on.

For custom settings that are hierarchies, the data is accessed based on the access level (user, profile, or organization). The lowest level is used first, which means if you defined a data set at the user level, unless otherwise specified in your application, that data is used. For example, you might want to specify different contact numbers for your application: one for the general user, and one that is only displayed for system administrators.

To add data to custom setting fields:

1. From Setup, enter Custom Settings in the Quick Find box, then select Custom Settings, then click Manage next to a custom setting. Or from the detail page for a custom setting, click Manage.
2. Click New or Edit next to an existing data set.
3. Add or change data.

   For custom settings that are lists:
   a. Specify or change the name for the data set. This name is used by Apex, formula fields, and so on.
   b. Enter or change data for all fields.
   c. Click Save.

   For custom settings that are hierarchies:
   a. For the default organization level values, enter or change the data for the fields. The default organization location is automatically populated.
   b. For profile or user level values, select either Profile or User from the Location picklist. Enter the name of the profile or user, or use the lookup dialog search. Then enter or change the data for the fields.
   c. Click Save.
**Note:** For a hierarchy custom setting, you can add only one record for a profile or user. Adding two records for the same profile or user results in an error.

SEE ALSO:
- Manage Custom Settings Data
- Add Custom Settings Fields

**View Custom Settings Data**

After you add fields and add data to those fields, you can view the data.

1. From Setup, enter Custom Settings in the Quick Find box, then select Custom Settings, then click Manage next to a custom setting that has already been defined. Or from the detail page for a custom setting, click Manage.
2. Click View next to the data set you want to view (this is only for hierarchical custom settings).

SEE ALSO:
- Add Custom Settings Fields
- Add Custom Settings Data

**Custom Settings Limits and Considerations**

When working with custom settings, be aware of the following considerations and limits on the amount of cached data.

- The total amount of cached data allowed for your org is the lesser of these two values:
  - 10 MB
  - 1 MB multiplied by the number of full-featured user licenses in your org

  For example, if your org has three full licenses, you have 3 MB of custom setting storage. If your org has 20 full licenses, you have 10 MB of storage.

  Each certified managed package gets a separate limit in addition to your org limit. For example, let’s say your org has two certified managed packages installed and your organization has three full licenses. Each certified managed package can have 3 MB of custom setting storage in addition to your org’s 3-MB custom setting storage limit.

- You can add up to 300 fields per custom setting, unless your field limit for custom objects is lower than 300. If your custom objects field limit is lower than 300, your field limit for custom settings is equal to your custom objects field limit.

- You can’t share a custom setting object or record.

- No owner is assigned when a custom setting is created, so the owner can’t be changed.
Custom settings are a type of custom object. Each custom setting counts against the total number of custom objects available for your organization.

Accessing an undeleted custom setting in a formula field results in an error if the user doesn’t have the “Customize Application” permission. To prevent this error, redeploy this custom setting to the organization. Alternatively, delete this custom setting, re-create it with the same name and data, and then delete and re-create all formula fields that use this setting.

If a cross-object formula references a currency field from a custom setting, this field value isn’t converted to the currency of the record containing the formula. The result of the formula could be inaccurate if the custom setting field’s currency and the record’s currency are different.

To see how much custom settings data your organization is using, from Setup, enter Custom Settings in the Quick Find box, then select Custom Settings. For each custom setting, this page lists the size of one record, the number of records created, and the total size used for each custom setting.

Record size is based on the maximum field size of each field type, not the actual storage that’s used in each field. When adding fields to a custom setting definition, use the appropriate type and specify a length that doesn’t exceed what’s needed for your data. This action helps you avoid reaching the cached data limit. For example, if you create a US social security number (SSN) field, select the Text data type and specify a length of 9. If instead you selected a Text Area data type, the field would add 255 characters to the usage count for each record, regardless of the number of characters entered.

Custom Settings

Working with Custom Fields

Customize Fields

Customize standard and custom fields to tailor your org to your own unique requirements. You can:

- Modify some aspects of standard fields
- Change or add values to standard and custom picklist fields
- Define dependency rules between fields
- Create custom fields to capture additional information
- Create formula fields that automatically calculate values based on the contents of other fields
- Define default values for custom fields
- Define validation rules for your fields
- Make a field required
- Set fields to track changes, including the date, time, nature of the change, and who made the change
- Create page layouts to control the display of fields
- Set field-level security to control access to fields
- Create or modify field sets

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions
Standard Fields and Page Layouts are not available in Database.com

USER PERMISSIONS

To create or change custom fields:

- “Customize Application”
**Customize Standard Fields**

You can customize several aspects of standard fields, such as the values in picklists, the format for auto-number fields, tracking field history, lookup filters on relationship fields, and field-level help.

⚠️ **Tip:** You can’t delete standard fields, but you can remove them from your page layouts.

1. Navigate to the fields page for your object.
   - For Knowledge validation status picklists, from Setup, enter Validation Statuses in the Quick Find box, then select Validation Statuses.

2. Click the field label.

3. To add custom help text, click **Edit**.

4. On the field’s information page, you can—depending on your Edition—set field-level security, view accessibility settings, and configure validation rules.

   You can also do more, depending on the field’s type. For example, if the field is a picklist, you can add, delete, and reorder its values, and set dependencies. You can’t increase the field length of a standard field. If you need a longer text area, consider creating a custom field.

---

**Beyond the Basics**

**What does that Indexed checkbox mean on a field, and how did it get there?**

If a field is indexed, you can use sidebar search or advanced search to find values in the field. Having a field indexed can also speed up other operations on the field, such as reporting. Check out this blog post to find out more: [Know Thy Salesforce Field Indexes for Fast Reports, List Views, and SOQL](#).

Modify Standard Auto-Number Fields

The unique identifiers for solutions, cases, and contracts are standard auto-number fields. Each record is assigned a unique number with a specified format upon creation. You can modify the format and numbering for these auto-number fields.

1. From the management settings for the object whose field you want to modify, go to the fields area.
2. Click Edit next to the name of the field.
3. Enter a Display Format to control such formatting details as the minimum number of leading zeros as well as any prefix or suffix for the number. See Custom Field Attributes on page 4006.
4. Enter the number to be assigned to the next record that is created after you save your changes.
5. Click Save.

Warning: Salesforce warns you if the next number you enter is not higher than existing numbers. However, it may be possible to create duplicate numbers if you change the auto-number format multiple times using similar formats each time.

SEE ALSO:
Custom Field Types

Custom Fields

To tailor your organization, you can add custom fields for each of the tabs and objects that your organization uses.

For the total number of custom fields you can create, see Salesforce Limits.

Note: When your org is close to the limit of 800 custom fields and you delete or create fields, field creation can fail. The physical delete process reclaims and cleans fields, making them count temporarily toward the limit. The delete process runs only when the queue is full, so it can take days or weeks to start. In the meantime, the deleted fields are still counted as part of the limit. To request immediate deletion of fields, contact Salesforce Support.

See the following for more information:
- Create Custom Fields
- Edit Custom Fields
- Manage Fields for a Specific Object
- Delete Fields
- Build a Formula Field
- Create a Custom Picklist Field
- Define Dependent Picklists
- Define Default Field Values
- Additional Custom Field Options
- Custom Field Attributes
Creating and Enhancing Custom Fields

Create Custom Fields

Capture your unique business data by storing it in custom fields. When you create a custom field, you configure where you want it to appear and optionally control security at the field level.

Watch a Demo: How to Create a Custom Field in Salesforce

Want to customize Salesforce so it captures all your business data? This short video walks you through how to create a custom picklist field, from choosing the correct field type to applying field level security.

Before you begin, determine the type of field you want to create.

Note: When your org is close to the limit of 800 custom fields and you delete or create fields, field creation can fail. The physical delete process reclaims and cleans fields, making them count temporarily toward the limit. The delete process runs only when the queue is full, so it can take days or weeks to start. In the meantime, the deleted fields are still counted as part of the limit. To request immediate deletion of fields, contact Salesforce Support.

1. From the management settings for the object you want to add a field to, go to Fields. Custom task and event fields are accessible from the object management settings for Activities.

2. Click New.

   Tip: On custom objects, you can also set field dependencies and field history tracking in this section.

3. Choose the type of field and click Next. Consider the following.
   - Some data types are available for certain configurations only. For example, the Master-Detail Relationship option is available for custom objects only when the custom object doesn’t already have a master-detail relationship.
   - Custom settings and external objects allow only a subset of the available data types.
   - You can’t add a multi-select picklist, rich text area, or dependent picklist custom field to opportunity splits.
   - Relationship fields count towards custom field limits.
   - Additional field types may appear if an AppExchange package using those field types is installed.
   - The Roll-Up Summary option is available on certain objects only.
   - Field types correspond to API data types.
   - If your organization uses Shield Platform Encryption, ensure you understand how to encrypt custom fields using the Shield Platform Encryption offering.

4. For relationship fields, associate an object with the field and click Next.

5. For indirect lookup relationship fields, select a unique, external ID field on the parent object, and then click Next. The parent field values are matched against the values of the child indirect lookup relationship field to determine which records are related to each other.
6. Enter a field label. Salesforce populates Field Name using the field label. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the field name for merge fields in custom links, custom s-controls, and when referencing the field from the API.

Tip: Ensure that the custom field name and label are unique for that object.
- If a standard and custom field have identical names or labels, the merge field displays the custom field value.
- If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called Email and a standard field labeled Email already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, Email2.

7. Enter field attributes and select the appropriate checkboxes to specify whether the field must be populated and what happens if the record is deleted.

8. For master-detail relationships on custom objects, optionally select Allow reparenting to allow a child record in the master-detail relationship to be reparented to a different parent record.

9. For relationship fields, optionally create a lookup filter to limit search results for the field. Not available for external objects.

10. Click Next.

11. In Enterprise, Unlimited, Performance, and Developer Editions, specify the field’s access settings for each profile, and click Next.

<table>
<thead>
<tr>
<th>Access Level</th>
<th>Enabled Settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Users can read and edit the field.</td>
<td>Visible</td>
</tr>
<tr>
<td>Users can read but not edit the field.</td>
<td>Visible and Read-Only</td>
</tr>
<tr>
<td>Users can’t read or edit the field.</td>
<td>None</td>
</tr>
</tbody>
</table>

Note:
- When you create a custom field, by default the field isn’t visible or editable for portal profiles, unless the field is universally required.
- Profiles with “View Encrypted Data” permission are indicated with an asterisk.

12. Choose the page layouts that will display the editable field and click Next.

<table>
<thead>
<tr>
<th>Field</th>
<th>Location on Page Layout</th>
</tr>
</thead>
<tbody>
<tr>
<td>Normal</td>
<td>Last field in the first two-column section.</td>
</tr>
<tr>
<td>Long text area</td>
<td>End of the first one-column section.</td>
</tr>
<tr>
<td>User</td>
<td>Bottom of the user detail page.</td>
</tr>
<tr>
<td>Universally required</td>
<td>Can’t remove it from page layouts or make read only.</td>
</tr>
</tbody>
</table>

13. For relationship fields, optionally create an associated records related list and add it to page layouts for that object.
- To edit the related list name on page layouts, click Related List Label and enter the new name.
To add the related list to customized page layouts, select Append related list to users' existing personal customizations.

14. Click Save to finish or Save & New to create more custom fields.

Note: Creating fields may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.

Create a Custom Picklist Field

Create custom picklist fields to enable your users to select values from lists that you define.

Watch a Demo: Custom Fields: Picklists

You can create two types of picklist fields:

- Picklist—Allows users to select a single value from a list that you define.
- Multi-select picklist—Allows users to select more than one picklist value from a list that you define. These fields display each value separated by a semicolon.

Note: Picklist fields aren't available for external objects. You can't add a multi-select picklist, rich text area, or dependent picklist custom field to opportunity splits.

1. From the object management settings for your object, go to the fields section.
   - For Knowledge validation status picklists, from Setup, enter Validation Statuses in the Quick Find box, then select Validation Statuses.

2. In the custom fields related list, click New.

3. Select Picklist or Picklist (Multi-Select), and then click Next.

4. Enter a label for the picklist field.

5. To use the values from an existing global picklist, select Use global picklist definition. To use values that you create specifically for this picklist, select Enter values for the picklist, with each value separated by a new line.

   Important: This release contains a beta version of global picklists that’s production-quality but has known limitations. You can provide feedback and suggestions for global picklists in the Global, Restricted Custom Picklists group in the Salesforce Success Community.

6. If you didn't use a global picklist, enter picklist values.
   - Put each value on a separate line. Values can be up to 255 characters long.

7. Optionally choose to sort the values alphabetically or to use the first value in the list as the default value, or both.
If you select both checkboxes, Salesforce alphabetizes the entries and then sets the first alphabetized value as the default.

**Note:** Don’t assign default values to fields that are both required and unique, because uniqueness errors can result. See About Default Field Values on page 4038.

8. Choose whether to restrict this picklist’s values to an admin-approved list. Selecting **Strictly enforce picklist values** prevents users from loading unapproved values through the API.

9. If you’re creating a multi-select picklist, enter how many values you want displayed at a time on edit pages. The number of values determines the box height.

10. Enter description or help text if desired, and then click **Next**.

11. Set field-level security for the picklist field, and then click **Next**.

12. Choose the page layouts on which to include the picklist field.

13. Click **Save**.

- Add or Edit Picklist Values
- Create a Global Picklist (Beta)

### Create a Global Picklist (Beta)

Use global picklists to share picklist values across objects and custom picklist fields, and to restrict the picklists to only the values that you specify.

**Note:** This release contains a beta version of global picklists that’s production-quality but has known limitations.

You can provide feedback and suggestions for global picklists in the Global, Restricted Custom Picklists group in the Salesforce Success Community.

A custom picklist is tied to a particular object as a field on the object. Unlike a custom picklist field, a global picklist exists independently as a “picklist value set.” Its values are shared with any picklist that’s based on it.

A global picklist is a “restricted” picklist by nature. Only a Salesforce admin can add to or modify its values. Users can’t add unapproved values, even through the API.

**Note:** You can have up to 500 global picklists (or picklist value sets) in an org. This limit doesn’t apply to custom picklists that are based on global picklists. Each global picklist value set can contain up to 500 values.

1. From Setup, enter *Picklists* in the Quick Find box, then select *Picklists*.

2. Next to Global Picklists, click **New**.

3. Enter a label for the global picklist. This name appears in Setup, and when users create a picklist based on this global picklist.

4. To tell admins what this set of values is for, enter a specific description of the global picklist. This text appears on the Picklists list page in Setup.

5. Click **Save**.

6. In the Picklist Value Set section, click **New**.
7. Add picklist values by clicking **New**, then entering the values one per line.

8. Click **Save**.

9. To reorder the values, click **Reorder**. Optionally, choose to sort values alphabetically or to use the first value as the default value.

Your global picklist definition is ready to be used as a picklist value set. To create a picklist based on the global picklist, see [Create a Custom Picklist Field](#).

To see all of the fields where this picklist value set is used, see the **Fields Where Used** section on the global picklist’s detail page.

**Known limitations for this beta release:**

- After you create a custom picklist field based on a global picklist, its values don’t appear directly on the custom picklist’s detail page in Setup. To see the inherited picklist value set, click the link next to Global Picklist Definition.

- For custom picklist fields based on a global picklist, you can change from a single-select to multi-select picklist, and from a multi-select to single-select picklist. However, you can’t change the picklist to a different field type such as checkbox, currency, or text.

- You can include global picklists in change sets, but their dependency rules aren’t included.

**Note:** This list of picklist limitations is not exhaustive. Features in pilot or beta status aren’t guaranteed to be complete and fully functional until they become generally available.

### Custom Field Types

When you have data that doesn’t match any of the standard fields, your administrator can create a custom field for that data. For example, you might want a **Middle Name** field for contacts.

The first step in creating a custom field is choosing the type of the field. Below is a description of each custom field type. Additional field types may appear if an AppExchange package using those field types is installed.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Auto Number</strong></td>
<td>Automatically assigns a unique number to each record. The maximum length of any auto-number field is 30 characters, 20 of which are reserved for prefix or suffix text. Not available for external objects.</td>
</tr>
<tr>
<td><strong>Checkbox</strong></td>
<td>Allows users to check a box, indicating a true or false attribute of a record. When using a checkbox field for a report or list view filter, use “True” for checked values and “False” for unchecked values. The Data Import Wizard and the weekly export tool use “1” for checked values and “0” for unchecked values.</td>
</tr>
<tr>
<td><strong>Currency</strong></td>
<td>Allows users to enter a currency amount. The system automatically formats the field as a currency amount. This can be useful if you export data to a spreadsheet application. Not available for external objects.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Date</strong></td>
<td>Allows users to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field.</td>
</tr>
<tr>
<td><strong>Date/Time</strong></td>
<td>Allows users to enter a date or pick a date from a popup calendar and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field.</td>
</tr>
<tr>
<td><strong>Email</strong></td>
<td>Allows users to enter an email address of up to 80 characters, which is validated to ensure proper format. If this field is specified for contacts or leads, users can choose the address when clicking Send an Email. Note that you can’t use custom email addresses for mass emails. Note: This field can be encrypted using Shield Platform Encryption.</td>
</tr>
<tr>
<td><strong>External Lookup Relationship</strong></td>
<td>An external lookup relationship links a child standard, custom, or external object to a parent external object. When you create an external lookup relationship field, the standard External ID field on the parent external object is matched against the values of the child’s external lookup relationship field. External object field values come from an external data source.</td>
</tr>
<tr>
<td><strong>Formula</strong></td>
<td>Allows users to automatically calculate values based on other values or fields such as merge fields. Not available for external objects. Note: Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.34.</td>
</tr>
<tr>
<td><strong>Geolocation</strong></td>
<td>Allows users to specify a location by its latitude and longitude. Geolocation is a compound field that counts toward your org’s limits as three custom fields: one for latitude, one for longitude, and one for internal use. Not available for external objects.</td>
</tr>
<tr>
<td><strong>Hierarchical Relationship</strong></td>
<td>Creates a hierarchical lookup relationship between users. Allows users to use a lookup field to associate one user with another that does not directly or indirectly refer to itself. For example, you can create a custom hierarchical relationship field to store each user’s direct manager.</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Indirect Lookup Relationship</td>
<td>An indirect lookup relationship links a child external object to a parent standard or custom object. When you create an indirect lookup relationship field on an external object, you specify the parent object field and the child object field to match and associate records in the relationship. Specifically, you select a custom unique, external ID field on the parent object to match against the child’s indirect lookup relationship field, whose values come from an external data source.</td>
</tr>
</tbody>
</table>
| Lookup Relationship         | Creates a relationship between two records so you can associate them with each other. For example, opportunities have a lookup relationship with cases that lets you associate a particular case with an opportunity.  
  - On a standard or custom object, a lookup relationship creates a field that allows users to click a lookup icon and select another record from a popup window.  
  - On an external object, the lookup relationship field references 18-character Salesforce IDs that are stored in an external data source. Those IDs are matched against the parent object to determine which records are related to each other.  
  On the parent record, you can display a related list to show all of the records that are linked to it. You can create lookup relationship fields that link to users, standard objects, or custom objects. If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they’re in a lookup relationship.  
  Lookup relationship fields are not available in Personal Edition.  
  Lookup relationship fields to campaign members are not available; however, lookup relationship fields from campaign members to standard or custom objects are available. |
| Master-Detail Relationship  | Creates a relationship between records where the master record controls certain behaviors of the detail record such as record deletion and security.  
  Not available for standard objects or external objects, although you can create a master-detail relationship field on a custom object that links to a standard object.  
  Master-detail relationships cannot be used with campaign members. |
| Number                      | Allows users to enter any number. This is treated as a real number and any leading zeros are removed.  
  **Note:** Salesforce uses the round half up tie-breaking rule for number fields. For example, 12.345 becomes 12.35 and |
<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>−12.345S becomes −12.34. Salesforce rounds numbers referenced in merge fields according to the user’s locale, not the number of decimal spaces specified in the number field configuration.</td>
</tr>
<tr>
<td>Percent</td>
<td>Allows users to enter a percentage number as a decimal—for example, 0.10. The system automatically converts the decimal to a percentage—for example, 10%.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Values lose precision after 15 decimal places. Also, if you enter a value with more than 15 decimal places and add a percent sign to the number, a runtime error occurs.</td>
</tr>
<tr>
<td>Phone</td>
<td>Allows users to enter any phone number. Character limit is 40. Salesforce automatically formats it as a phone number. If you are using Salesforce CRM Call Center, custom phone fields are displayed with the button, allowing click-to-dial functionality. Consequently, Salesforce recommends that you do not use a custom phone field for fax numbers.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field can be encrypted using Shield Platform Encryption.</td>
</tr>
<tr>
<td>Picklist</td>
<td>Allows users to select a single value from a list that you define. Not available for external objects.</td>
</tr>
<tr>
<td>Picklist (Multi-select)</td>
<td>Allows users to select more than one picklist value from a list that you define. These fields display each value separated by a semicolon. Not available for external objects.</td>
</tr>
<tr>
<td>Roll-Up Summary</td>
<td>Automatically displays the record count of related records or calculates the sum, minimum, or maximum value of related records. The records must be directly related to the selected record and on the detail side of a custom master-detail relationship with the object that contains the roll-up summary field. For example, a custom field called “Total Number of Guests” displays the number of guest custom object records in the Guests related list. Not available for external objects.</td>
</tr>
<tr>
<td>Text</td>
<td>Allows users to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This field can be encrypted using Shield Platform Encryption.</td>
</tr>
<tr>
<td>Text (Encrypted)</td>
<td>Allows users to enter any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Encrypted fields are encrypted with 128-bit master keys and use the Advanced Encryption Standard</td>
</tr>
<tr>
<td>Type</td>
<td>Description</td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>(AES) algorithm. You can archive, delete, and import your master encryption key. To enable master encryption key management, contact Salesforce. Not available for external objects.</td>
<td></td>
</tr>
<tr>
<td>Note: This field can be encrypted using Classic Encryption. If your org uses Shield Platform Encryption, use Text: to create an encrypted text field.</td>
<td></td>
</tr>
<tr>
<td>Text Area</td>
<td>Allows users to enter up to 255 characters that display on separate lines similar to a Description field.</td>
</tr>
<tr>
<td>Text Area (Long)</td>
<td>Allows users to enter up to 131,072 characters that display on separate lines similar to a Description field. You can set the length of this field type to a lower limit, if desired. Any length from 256 to 131,072 characters is allowed. The default is 32,768 characters. Note that every time you press Enter within a long text area field, a line break and a return character are added to the text. These two characters count toward the 131,072 character limit. This data type is not available for activities or products on opportunities. Only the first 254 characters in a rich text area or a long text area are displayed in a report.</td>
</tr>
<tr>
<td>Note: This field can be encrypted using Shield Platform Encryption.</td>
<td></td>
</tr>
<tr>
<td>Text Area (Rich)</td>
<td>With the use of a toolbar, users can format the field content and add images and hyperlinks. The toolbar allows the user to undo, redo, bold, italicize, underline, strike-out, add a hyperlink, upload or link to an image, modify alignment, add a numbered or non-numbered list, indent, and outdent. The maximum field size is 131,072 characters, inclusive of all the formatting and HTML tags. Only the first 254 characters in a rich text area or a long text area are displayed in a report. The maximum size for uploaded images is 1MB. Only .gif, .jpeg and .png file types are supported. Not available for external objects.</td>
</tr>
<tr>
<td>URL</td>
<td>Allows users to enter up to 255 characters of any valid website address. When users click on the field, the URL will open in a separate browser window. Note that only the first 50 characters are displayed on the record detail pages.</td>
</tr>
<tr>
<td>Note: This field can be encrypted using Shield Platform Encryption.</td>
<td></td>
</tr>
</tbody>
</table>

- Custom Field Attributes
What’s the Difference between Standard Fields and Custom Fields?

You can add custom fields to standard and custom objects in Salesforce, allowing you to infinitely customize your organization. Although custom fields are similar to the standard fields that come built-in to Salesforce, there are some differences between standard fields and custom fields.

Custom objects and fields let you tailor which data is stored to fit your organization’s needs. Though the Force.com database provides several standard objects and accompanying standard fields, you can easily customize how you track and report on your data.

Custom objects give you the flexibility to store any type of enterprise data that’s relevant to your app, by creating objects. For example, if you’re building a recruiting app, you can create custom objects called Position and Candidate to track information on job openings and candidates, respectively.

Categorize and track your data even more granularly by using custom fields. Like standard objects, custom objects have fields that define the data for those object records. You can, for example, add a custom number field Years of Experience to the custom candidate object or a custom text field Description to the custom position object. You can add custom fields to both custom and standard objects.

See the following for more information:

- Create Custom Fields
- Edit Custom Fields
- Manage Fields for a Specific Object
- Build a Formula Field
- Define Default Field Values
- Additional Custom Field Options
- Custom Field Attributes
- Change the Custom Field Type

Custom Field Attributes

A custom field entry consists of several attributes.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td># Visible Lines</td>
<td>For long text area fields, set the number of lines to be displayed on edit pages. You can display between 2 and 50 lines (the default is 6 lines). If the text does not fit in the specified number of visible lines, scroll bars appear. Long text area fields are fully displayed on detail pages and printable views.</td>
</tr>
<tr>
<td>Calculation Options</td>
<td>Determines how a roll-up summary field is recalculated after its properties change. Choose Automatic calculation to recalculate a field the next time it's displayed. Choose Force a mass recalculation of this field as a safety net option to force recalculation of the roll-up summary field values.</td>
</tr>
<tr>
<td>Child Relationship Name</td>
<td>The name used in API SOQL relationship queries.</td>
</tr>
<tr>
<td>Data Type</td>
<td>The data type of a field determines what type of information is in the field. For example, a field with the Number data type contains a positive or negative integer. For more information on data types, see Custom Field Types on page 4001.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Decimal Places</td>
<td>For currency, geolocation, number, and percent fields, this field represents the number of digits you can enter to the right of a decimal point. The system rounds the decimal numbers you enter, if necessary. For example, if you enter 4.986 in a field with Decimal Places set to 2, the number rounds to 4.99.</td>
</tr>
<tr>
<td>Default Value</td>
<td>The value to apply when a user creates a record. For checkbox custom fields, choose Checked or Unchecked as the default value to indicate the default when creating records. Don’t assign default values to fields that are both required and unique, because uniqueness errors can result. See About Default Field Values on page 4038.</td>
</tr>
<tr>
<td>Description</td>
<td>Text that describes the custom field. This description is for administration purposes only and doesn’t display to users on record detail and edit pages that include the field.</td>
</tr>
<tr>
<td>Display Format</td>
<td>For auto-number fields, enter a Display Format to control formatting details such as the minimum number of leading zeros and any prefix or suffix for the number. Begin by entering the required minimum ( {0} ) as a placeholder for the auto-number without any leading zeros. Add any prefix to your number before this placeholder and insert any suffix text after the placeholder. Insert any date prefixes or suffixes in the form of ( {YY}, {YYYY}, {MM}, \text{or} {DD} ), which always represent the create date of the record. For information on using auto-number formats when entering your Display Format, see Auto-Number Formatting Examples on page 4011.</td>
</tr>
<tr>
<td>Encrypted</td>
<td>If checked, this custom field is encrypted using Shield Platform Encryption. <strong>Note:</strong> This page is about Shield Platform Encryption, not Classic Encryption.</td>
</tr>
<tr>
<td>External Column Name</td>
<td>Available on external objects only. Maps the custom field to an external data source's table column. For a lookup relationship field, specify the external table column that contains 18-character Salesforce IDs.</td>
</tr>
<tr>
<td>External ID</td>
<td>For each object that can have custom fields, you can set up to seven custom auto-number, email, number, or text fields as external IDs. An external ID field contains record identifiers from a system outside of Salesforce. You can use an external ID field to update or upsert records using the API. When using the API or the Data Import Wizard for custom objects and solutions, you can use this field to prevent duplicates by also marking the field as Unique. <strong>Note:</strong> Custom fields marked as Unique count against an object’s limit of seven External ID fields. Custom indexing that occurs automatically in the background by Salesforce does not count against External ID limits.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Not available for external objects. Each external object has an External ID standard field. Its values uniquely identify each external object record in your org.</td>
<td></td>
</tr>
<tr>
<td>Filter Criteria</td>
<td>The criteria used to select a group of records to calculate the value of a roll-up summary field.</td>
</tr>
<tr>
<td>Formulas</td>
<td>Enter the formula for the custom formula field or custom summary formula for reports.</td>
</tr>
<tr>
<td>Help Text</td>
<td>The text that displays in the field-level help hover text for this field.</td>
</tr>
<tr>
<td>Is Name Field</td>
<td>For external object fields of type text, specifies this custom field as the name field for the external object. Not available for text area fields. By default, the External ID standard field is the name field for the external object.</td>
</tr>
<tr>
<td></td>
<td>If you select this checkbox, make sure that the External Column Name specifies a table column that contains name values. Each external object can have only one name field.</td>
</tr>
<tr>
<td></td>
<td>For internal use only, Salesforce stores the value of the name field from each row that's retrieved from the external system. This behavior doesn't apply to external objects that are associated with high-data-volume external data sources.</td>
</tr>
<tr>
<td>Filtering Disabled</td>
<td>For custom fields on external objects, determines whether the field is available in filters.</td>
</tr>
<tr>
<td>Label</td>
<td>The name of the custom field as you want it to appear.</td>
</tr>
<tr>
<td>Latitude and Longitude Display Notation</td>
<td>For geolocation fields, determines how the latitude and longitude notation appears in the Salesforce interface.</td>
</tr>
<tr>
<td>Degrees, Minutes, Seconds</td>
<td>A notation for angular measurement that is based on the number 60: there are 360 degrees to a circle, 60 minutes to a degree, and 60 seconds to a minute.</td>
</tr>
<tr>
<td>Decimal</td>
<td>Expresses the value as degrees, and converts the minutes and seconds to a decimal fraction of the degree. Decimal notation doesn't use cardinal points. North and East are positive values; South and West are negative values.</td>
</tr>
<tr>
<td></td>
<td>For example, the coordinates for San Francisco can be expressed as follows:</td>
</tr>
<tr>
<td></td>
<td><strong>Latitude</strong></td>
</tr>
<tr>
<td>Degrees, Minutes, Seconds</td>
<td>37° 46' 30&quot; N</td>
</tr>
<tr>
<td>Decimals</td>
<td>37.794016°</td>
</tr>
<tr>
<td></td>
<td>Regardless of the notation you choose to display in the interface, latitude and longitude are stored in Salesforce as decimals.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Length (for text fields)</td>
<td>For text fields, the maximum number of characters that a user can enter in a field (up to 255 characters).</td>
</tr>
<tr>
<td>Length (for number, currency, percent fields)</td>
<td>For number, currency, and percent fields, the number of digits you can enter to the left of the decimal point, for example, 123.98 for an entry of 3.</td>
</tr>
<tr>
<td>Mask Character</td>
<td>For encrypted text fields, determines the character to use for hidden characters. Available options are * and X.</td>
</tr>
<tr>
<td>Mask Type</td>
<td>For encrypted text fields, determines which characters are hidden and the use of dashes in the field. Masked characters are hidden using the character selected in Mask Character. Available options are:</td>
</tr>
</tbody>
</table>
|                              | **Mask All Characters**  
|                              | All characters in the field are hidden.                                                                                                  |
|                              | **Last Four Characters Clear**  
|                              | All characters are hidden but the last four display.                                                                                   |
| Credit Card Number           | The first 12 characters are hidden and the last four display. Salesforce automatically inserts a dash after every fourth character.          |
| National Insurance Number    | All characters are hidden. Salesforce automatically inserts spaces after each pair of characters if the field contains nine characters. Use this option for UK NINO fields. |
| Social Security Number       | The first five characters are hidden and the last four display. Salesforce automatically inserts a dash after the third and fifth characters. |
| Social Insurance Number      | All characters are hidden but the last three display. Salesforce automatically inserts a dash after the third and sixth characters.            |
| Master Object                | The object on the master side of a master-detail relationship used to display the value of a roll-up summary field.                          |
| Related List Label           | For relationship fields, the title for the related list that displays associated records on the parent record.                              |
| Related To                   | For relationship fields, the name of the associated object.                                                                               |
| Required                     | Makes the field required everywhere in Salesforce. Not available for external objects.                                                      |
|                              | You must specify a default value for required campaign member custom fields.                                                              |
|                              | Don’t assign default values to fields that are both required and unique, because uniqueness errors can result. See Require Field Input to Ensure Data Quality on page 4082. |
### Roll-Up Type

For **roll-up summary fields**, choose the type of calculation to make:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COUNT</td>
<td>Totals the number of related records.</td>
</tr>
<tr>
<td>SUM</td>
<td>Totals the values in the field you select in the <strong>Field to Aggregate</strong> option. Only number, currency, and percent fields are available.</td>
</tr>
<tr>
<td>MIN</td>

<tr>
<td>MAX</td>
<td>Displays the highest value of the field you select in the <strong>Field to Aggregate</strong> option for all directly related records. Only number, currency, percent, date, and date/time fields are available.</td>
</tr>
</tbody>
</table>

### Starting Number

For auto-number fields, enter a **Starting Number** that’s less than 1 billion. Select **Generate Auto Number for existing records** to automatically number all current records that begin with the starting number that you enter. If deselected, the next record that you enter is assigned the starting number and your older records are blank in this field. For leads, only unconverted leads are assigned a number.

When you create records, **Starting Number**’s value increments to store the number that will be assigned to the next auto-number field created. You can’t edit **Starting Number** after creating an auto-number field. To edit a **Starting Number** value, change your auto-number field to a text field and then back to an auto-number field. To restart **Starting Number** values for fields on objects from a managed package, uninstall and then reinstall the package.

**Warning:** Be sure that you don’t create records with duplicate auto-number values.

An auto-number field can contain up to 10 digits and up to 20 extra characters for your prefix or suffix.

**Note:**

- You can’t retrieve the starting number of an auto-number field through Metadata API. To specify a **Starting Number** while deploying, add a `startingNumber` tag for your field to your `package.xml` file. For example:
  ```xml
  <startingNumber>42</startingNumber>
  ```
- If you deploy without specifying a **Starting Number** value in your `package.xml` file, the default starting number for standard fields is 0. The default starting number for custom fields is 1.

</tbody>
</table>
The geolocation custom field allows you to identify locations by their latitude and longitude and to calculate distances between locations.

You can calculate the distance between two geolocation fields, such as between a warehouse and a store. Or you can calculate the distance between a geolocation field and a pair of latitude and longitude coordinates, such as between a warehouse and 37.794016°, -122.395016°—the location also known as San Francisco. Latitude values must be within –90 and 90. Longitude values must be within –180 and 180.

Geolocation is a compound field that counts toward your org’s limits as three custom fields: one for latitude, one for longitude, and one for internal use. Support for the compound field (geolocation) versus the field’s components (latitude and longitude) varies depending on the functionality you’re using in Salesforce. For example, you can create list views that show the field and its components, but you can’t select the compound geolocation field in Apex. You can run SOQL queries only on a geolocation field’s components.

Compound fields, including geolocation fields, have the following limitations.

- Compound fields are read-only. To update field values, modify the individual field components.
- Compound fields are accessible only through the SOAP and REST APIs. The compound versions of fields aren’t accessible anywhere in the Salesforce user interface.
- Although compound fields can be queried with the Location and Address Apex classes, they’re editable only as components of the actual field. Read and set geolocation field components by appending “__latitude__s” or “__longitude__s” to the field name, instead of the usual “__c.” For example:

  ```
  Double theLatitude = myObject__c.aLocation__latitude__s;
  myObject__c.aLocation__longitude__s = theLongitude;
  ```

  You can’t access or set the compound value.
- You can’t use compound fields in Visualforce—for example, in an `<apex:outputField>`. To access or update field values, use the individual field components.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.
- Geolocation fields and latitude and longitude on standard addresses aren’t supported in the Data Import Wizard. Use the SOAP or REST APIs to import these fields. If you don’t have a preferred tool for working with Salesforce APIs, Workbench is an easy way to get started.
- Custom geolocation and location fields on standard addresses aren’t supported with email templates.
- You can’t use compound fields in lookup filters, except to filter distances that are within or not within given ranges. You can use distance lookup filters only in the Metadata API.
The only formula functions that you can use with compound fields are ISBLANK, ISCCHANGED, and ISNULL. You can’t use BLANKVALUE, CASE, NULLVALUE, PRIORVALUE, or the equality and comparison operators with compound fields. The equality and comparison operators include = and == (equal), <> and != (not equal), < (less than), > (greater than), <= (less than or equal), >= (greater than or equal), & & (AND), and | | (OR).

Other limitations of geolocation fields include:

- Geolocation fields aren’t supported in custom settings.
- Geolocation fields aren’t available in dashboards or Schema Builder.
- Geolocation fields are available in Visual Workflow and in formula-based workflow and approvals, but they can’t be used in filter-based workflow updates and approvals.
- DISTANCE formulas are supported in:
  - Entry criteria for workflow rules and approval processes
  - Field update actions in workflow rules and approval processes
  - Custom validation rules
  - Lookup filters (in the Metadata API only)

- Geolocation fields and latitude and longitude on standard addresses aren’t supported in Salesforce to Salesforce.
- The geolocation component of address fields isn’t set automatically. Set values for latitude and longitude on your addresses by using SOQL, Workbench, the SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. Search the AppExchange for "geocode" to find some possible solutions.
- Geolocation fields are supported in SOQL with the following limitations.
  - DISTANCE and GEOLOCATION are supported in WHERE and ORDER BY clauses in SOQL, but not in GROUP BY. DISTANCE is supported in SELECT clauses.
  - DISTANCE supports only the logical operators > and <, returning values within (<) or beyond (>) a specified radius.
  - When using the GEOLOCATION function in SOQL queries, the geolocation field must precede the latitude and longitude coordinates. For example, DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km') works but DISTANCE(GEOLOCATION(37.775,-122.418), warehouse_location__c, 'km') doesn’t work.
  - Apex bind variables aren’t supported for the units parameter in DISTANCE or GEOLOCATION functions. This query doesn’t work.

```java
String units = 'mi';
List<Account> accountList = 
  [SELECT ID, Name, BillingLatitude, BillingLongitude
 FROM Account
 WHERE DISTANCE(My_Location_Field__c, GEOLOCATION(10,10), :units) < 10];
```

For more information and examples, see the Force.com SOQL and SOSL Reference.

- Custom Field Types
- Custom Field Attributes
Manage Fields for a Specific Object

1. From the object management settings for the object whose fields you want to view, go to Fields.

2. Click the field label.

3. To modify a custom field, add custom help text, or change the data type, click Edit.

4. If a custom field exists in a Managed - Released package, click Delete to delete the custom field component from future installations.

5. To set users’ access to the field, click Set Field-Level Security. This option is available depending on the edition that you have.

6. To view who can access the field based on permissions and record type, click View Field Accessibility. This option is available depending on the edition that you have.

7. If the custom field is a dependent picklist, click Change next to the controlling field to edit the dependency rules.

8. To change External ID, Required, or other attributes under the General Options section, see Custom Field Attributes.

9. To restore the field and its data, click Undelete. This option is available only if the field has been deleted but not permanently erased. The field’s behavior may be different after restoring it. To restore the field completely, see Manage Deleted Custom Fields.

Note: If your organization uses person accounts, the Account Fields page lists both person account and business account fields.

Person accounts use a combination of account and contact fields. The following contact fields are available for person accounts, but not for business accounts.

- Fields in the Account Standard Fields list that display with a person account icon.
- Fields in the Contact Custom Fields & Relationships list.

SEE ALSO:

Custom Settings
Edit Custom Fields

1. From the management settings for the field’s object, go to Fields.
2. Click **Edit** next to the field’s name.
3. Modify the **field attributes**. The attributes differ depending on the field type.
   - If you’re editing a picklist, you can change its definition and its values. For picklist settings, see **Add or Edit Picklist Values** on page 4021.
   - To change the type of this custom field, see **Change the Custom Field Type** on page 4035.
4. Optionally, define custom help text for the field.
5. For lookup and master-detail relationship fields, optionally define a lookup filter.
6. For formula fields, click **Next** to modify the formula.
7. In Enterprise, Unlimited, Performance, and Developer Editions, click **Next** to set the field-level security for the field.

**Note:**
- Editing fields may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- To customize the way a custom object’s related list appears on a parent record’s detail page, edit the parent record’s page layout. For example, if you want to edit which fields appear on a custom object’s related list on accounts, you would edit the account page layout.
- You cannot change the **Field Name** if a custom field is referenced in Apex.
- When editing fields for accounts, opportunities, cases, contacts, or custom objects, check for any criteria-based sharing rules that use the field in the rules. A field change may affect which records are shared.

SEE ALSO:
- **Define Default Field Values**
- **Find Object Management Settings**

Delete Fields

1. From the management settings for the field’s object, go to Fields.
2. Click **Del** next to the name of the field.
3. When prompted, select the **Yes, I want to delete the custom field** checkbox to confirm, and click **Delete**.

Deleted custom fields and their data are stored until your org permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data. For information on restoring deleted custom fields and relationships, see **Manage Deleted Custom Fields** on page 4016.
Note:

- Before deleting a custom field, consider where it's referenced. You can't delete a custom field that's referenced elsewhere. For example, you can't delete a custom field that's referenced by a field update or Apex.
- You can't delete a field if it is being updated by a background job, such as an update to a roll-up summary field. Wait until the background job finishes, and try again.
- When you delete a custom field, all of the field history data is deleted and changes are no longer tracked.
- A background process periodically runs that cleans up metadata associated with deleted custom fields. This process will affect the Last Modified Date and Last Modified By fields on page layouts, record types, and custom objects.

SEE ALSO:
Find Object Management Settings

Manage Deleted Custom Fields

Deleted custom fields and their data are stored until your org permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data. However, the field still counts against the maximum number of custom fields allowed in your organization. A deleted field also counts against any applicable limit for its field type. For example, a deleted custom roll-up summary field counts against the maximum number of roll-up summary fields for your Salesforce edition.

1. From the management settings for the field's object, go to Fields.
2. Click Deleted Fields at the bottom of the list of custom fields and relationships. The number in parentheses indicates the total number of deleted custom fields for this object. This link only displays when you have a deleted custom field.
3. Use the list of deleted fields to perform the following actions:

- To view details about a field, click the field label.
- To permanently remove the custom field and its data, click Erase.
- To restore the field and its data, click Undelete. Some attributes of deleted fields are not restored automatically. To restore these attributes manually:
  a. Add the field to any page layouts that changed during the time the custom field was deleted. If reports and page layouts were not edited, the restored field remains on them.
  b. Make the field unique if necessary. Salesforce automatically removes the unique attribute from any deleted custom field.
  c. Make the field required if necessary. Salesforce automatically removes the required attribute for any deleted custom field.
  d. Add the custom field to any appropriate Force.com AppExchange packages. Salesforce automatically removes deleted custom fields from packages that contain them.
  e. Convert any lookup relationships to master-detail relationships if necessary. Salesforce converts all relationships to lookup relationships when they are deleted. To convert a lookup relationship to a master-detail relationship, populate all the applicable records with the appropriate data.
  f. Redefine any field dependencies that Salesforce removed when the field was deleted.
  g. Edit and save any formula fields. Saving prompts a syntax check; if necessary, resolve errors.
h. Set up field history tracking if necessary. If the list of fields enabled for history tracking was modified during the deletion process, the restored field is no longer set up to track field history.

Notes on Restored Custom Fields

- When deleted, the following characters are appended to the end of a custom field’s developer name unless a deleted field already has that developer name: "_del". These characters remain when you restore the custom field.
- Formula fields are restored in a disabled state, which means they do not contain updated data until you edit and save them. While a formula field is disabled, "#Error!" displays in place of the formula value.
- Restored fields do not display in search results immediately after you restore them. It can take a short time before the restored custom field and its data are available in search results.
- Lead fields that are mapped to account, contact, or opportunity fields for lead conversion are still mapped accordingly when restored.
- Auto number fields continue to increment after they are deleted and contain the correct values when restored.
- Field history data for the deleted custom field is restored.

Find Object Management Settings

Additional Custom Field Options

Changing Page Layouts
To change the location of a new custom field, edit the page layout for the appropriate tab.

Using Record Types
If your organization uses record types, edit the record type to modify which picklist values are visible for the record type.

Tracking Custom Field History
You can select which custom fields to track on the History related list of custom objects and most standard objects. All entries include the date, time, nature of the change, and who made the change. History data does not count against your organization’s storage limit.

Using the Translation Workbench
If your organization uses the Translation Workbench, notify your translators that new fields need translations.

Activity Custom Fields
Activity custom fields can apply only to tasks or only to events, or to both tasks and events. For example, you can create one Time Spent field and then add it to both the event page layout and the task page layout.

Mapping Custom Lead Fields
For lead custom fields, you can click Map Lead Fields to specify which custom lead fields to map to custom account, contact, and opportunity fields during a lead conversion.

Which Fields Can I Encrypt?
Rich Text Area Field Tips

Use rich area text fields to improve the appearance of text, including adding images and hyperlinks. Rich text area fields use the Salesforce HTML editor to format content.

**Note:** The upgraded editor doesn’t support Internet Explorer version 7 or version 8 in compatibility mode. If you are using these browsers, you will use the older editor.

Implementation Tips

- Specify how large the editor box should be for a rich text field by configuring the “Number of lines displayed” property in the field's setup.
- When you view or print content, Salesforce preserves the formatted version of the HTML in rich text area fields.
- Searches of content that contains rich text area fields ignore images and tags.
- Deleting a rich text area field moves it to the Deleted Fields section on the custom object or Salesforce Knowledge article types.
- You can only convert rich text area fields into long text area fields. Any images are deleted the next time the long text area field is saved. After converting, markup is hidden in the long text area field but it is not removed from the record until you save the record. That way, the markup can be restored if you change your mind.
- JavaScript or CSS is treated as text. For example, if you’re creating an Idea through the API, any JavaScript or CSS code is removed without warning. Salesforce supports a limited number of approved HTML tags.
- When a rich text area field is used in a formula, the HTML tags are stripped out before the formula is run.
- Rich text area fields can be filtered and summarized in reports, but HTML tags and special formatting aren’t included in report results. For example, `<b>some</b> <i>text</i>` becomes “some text” instead of `<b>some</b> `<i>text</i>` or `some text`.
- The text part of rich text area fields counts towards data storage for the object that contains the field.
- You can copy and paste text from external sources such as Microsoft® Word, but you may have to reapply formatting.

Images in Rich Text Area Fields

- The maximum size of an image that can be uploaded in a rich text area field is 1 MB. Only .gif, .jpg, and .png file types are supported.
- To upload many images, use API version 20 or later. For more information, see the Force.com SOAP API Developer’s Guide.

**Note:** When you upload images via the API, the alt attribute isn’t populated unless you specified it separately.

- Images uploaded within a rich text area field are extracted in the organization’s weekly export and included in the exported data.
- Images within the rich text area fields count towards file storage for the object that contains the field.
- You can’t add a hyperlink to an image.

SEE ALSO:

Create Custom Fields
Rich Text Area Field Limitations

Keep these limitations in mind when working with rich text area fields.

- Salesforce supports up to 131,072 characters for each rich text area field, including the HTML tags. If desired, you can set a lower limit.
- An object can contain unlimited rich text area and long text area fields, although your edition’s limit for total custom fields allowed on an object, regardless of field type, applies. Each object can contain 1,600,000 characters across long text area and rich text area fields. When you create a long text area or rich text area field, you set a character limit for the field—the maximum length of the text that can be entered. The default character limit for long text area and rich text area fields is 32,768 (32 KB). The maximum character limit for long text area and rich text area fields is 131,072 (128 KB). The minimum character limit is 256.
- You can’t paste special characters, such as bullets or curly quotes, into a rich text field from another application. It’s best to type or paste in plain text and use the rich text editor to format it.
- You can’t disable specific rich text area features. For example, you can’t disable support for hyperlinks or images on certain fields.
- HTML code isn’t supported in the Salesforce HTML editor. HTML code is treated as text.
- Rich text area fields aren’t available in self service portals.
- Rich text area fields aren’t supported for external objects.
- Only the first 254 characters in a rich text area or a long text area are supported with the “contains” operator in a report filter.
- Only the first 254 characters in a rich text area or a long text area are displayed in a report. If you download the report, the entire field is available.

Classic Encryption for Custom Fields

Restrict other Salesforce users from seeing custom text fields you want to keep private. Only users with the permission “View Encrypted Data” can see data in encrypted custom text fields.

Note: This information is about Classic Encryption and not Shield Platform Encryption.

Before you begin working with encrypted custom fields, review these implementation notes, restrictions, and best practices.

Implementation Notes

- Encrypted fields are encrypted with 128-bit master keys and use the Advanced Encryption Standard (AES) algorithm. You can archive, delete, and import your master encryption key. To enable master encryption key management, contact Salesforce.
- You can use encrypted fields in email templates but the value is always masked regardless of whether you have the “View Encrypted Data” permission.
- If you have created encrypted custom fields, make sure that your organization has “Require secure connections (HTTPS)” enabled.
- If you have the “View Encrypted Data” permission and you grant login access to another user, the user can see encrypted fields in plain text.
- Only users with the “View Encrypted Data” permission can clone the value of an encrypted field when cloning that record.
- Only the <apex:outputField> component supports presenting encrypted fields in Visualforce pages.
Restrictions

Encrypted text fields:

- Cannot be unique, have an external ID, or have default values.
- For leads are not available for mapping to other objects.
- Are limited to 175 characters because of the encryption algorithm.
- Are not available for use in filters such as list views, reports, roll-up summary fields, and rule filters.
- Cannot be used to define report criteria, but they can be included in report results.
- Are not searchable, but they can be included in search results.
- Are not available for: Salesforce Classic Mobile, Connect Offline, Salesforce for Outlook, lead conversion, workflow rule criteria or formulas, formula fields, outbound messages, default values, and Web-to-Lead and Web-to-Case forms.

Best Practices

- Encrypted fields are editable regardless of whether the user has the "View Encrypted Data" permission. Use validation rules, field-level security settings, or page layout settings to prevent users from editing encrypted fields.
- You can still validate the values of encrypted fields using validation rules or Apex. Both work regardless of whether the user has the "View Encrypted Data" permission.
- Encrypted field data is not always masked in the debug log. Encrypted field data is masked if the Apex request originates from an Apex Web service, a trigger, a workflow, an inline Visualforce page (a page embedded in a page layout), or a Visualforce email template. In other cases, encrypted field data isn’t masked in the debug log, like for example when running Apex from the Developer Console.
- Existing custom fields cannot be converted into encrypted fields nor can encrypted fields be converted into another data type. To encrypt the values of an existing (unencrypted) field, export the data, create an encrypted custom field to store that data, and import that data into the new encrypted field.
- Mask Type is not an input mask that ensures the data matches the Mask Type. Use validation rules to ensure that the data entered matches the mask type selected.
- Use encrypted custom fields only when government regulations require it because they involve more processing and have search-related limitations.

Note: This page is about Classic Encryption, not Shield Platform Encryption.

SEE ALSO:

Create Custom Fields
Add or Edit Picklist Values

Add or edit values in a custom picklist from the fields page of an object.

1. Navigate to the fields page for your object.
   - For Knowledge validation status picklists, from Setup, enter Validation Statuses in the Quick Find box, then select Validation Statuses.

2. In the Custom Fields & Relationships related list, click the name of the picklist field to update.

3. In the Picklist Value Set section, click Edit next to a value.

4. Change the value’s name, and optionally make the value the default for the master picklist.

5. Assign a color to use in charts by clicking the button and selecting how to assign colors to values.
   - **Assign fixed colors to all values** assigns a fixed color to each value from the standard set of chart colors. The Chart Colors column shows the assigned colors. For example, if you want Closed Lost values always to be red in charts grouped by Opportunity Stage, assign red to that picklist value.
   - **Assign colors to values dynamically** assigns colors when a chart is generated. For example, if you only need certain picklist values to have fixed colors in charts, manually assign colors to those values and leave the rest to be assigned dynamically.

   **Note:** Chart colors aren’t available for multi-select picklists, currency picklists, or Task Subject, Event Subject, Knowledge Validation Status, and Opportunity Competitor picklists.

   **Tip:**
   - If you use record types, changing the default value of the master picklist doesn’t affect the default value of the picklist for a record type.
   - For Ideas, setting the default value of the Categories or Status picklists doesn’t affect the default value on the Ideas pages.
   - If you change the label for a picklist value that is used as a filter criterion, the picklist value is automatically removed from the filter criteria. For example, if your report contains a filter where Lead Source equals Email or Web and you change the picklist value Web to Referral, your report filter changes to Lead Source equals Email. If the changed picklist value was the only value specified for a particular filter, it continues to show up in your filters, but an error appears.

6. To open an easy-to-print list of your picklist values, click Printable View.

7. Click Save.

   **Note:** If your org uses the Translation Workbench, notify your translators that the translations can be outdated when you change picklist values.

- Manage Inactive Values in an Unrestricted Picklist
- Picklist Limitations

Picklists with Additional Information

These standard picklist fields have additional information that you can edit.
<table>
<thead>
<tr>
<th>Picklist</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Partner Role (for accounts)</td>
<td>Roles of account partners, for example, Consultant, Supplier. These options are available when you add an account to the Partners related list of an account or opportunity. To edit, from Setup, enter Partner Roles in the Quick Find box, then select Partner Roles. Enter the name of the partner role in the “Role” column. In the “Reverse Role” column, enter the corresponding reverse partner role. Assigning a partner role to an account creates a reverse partner relationship so that both accounts list the other as a partner. Each role and reverse role value can have up to 40 characters.</td>
</tr>
<tr>
<td>Priority (for cases)</td>
<td>Urgency of case, for example, Low, High. If you delete a value, you have the option to map the deleted value to another existing value in all your org’s cases. Each picklist value can have up to 40 characters.</td>
</tr>
<tr>
<td>Status (for campaign members)</td>
<td>State of a campaign member, for example, Sent or Responded. If you delete a Status value, you have the option to map the deleted value to another existing value. The new replacement value is automatically added to the member status for campaigns that contained the deleted value. If the deleted value is the default member status for a campaign, the new replacement value becomes the default status for that campaign.</td>
</tr>
<tr>
<td>Status (for cases)</td>
<td>State of case, for example, New, On Hold. If you delete a value, you have the option to map the deleted value to another existing value in all your org’s cases. Each picklist value can have up to 40 characters.</td>
</tr>
<tr>
<td>Status (for contracts)</td>
<td>State of the contract in the contract business process. You can add values to this picklist and organize each value into one of several categories, for example, “Draft”, “In Approval Process”, or “Activated”. Then sort your contracts using these categories in reports and views.</td>
</tr>
<tr>
<td>Contact Role (for contracts)</td>
<td>Role of a contact on a contract, for example, Business User, Decision Maker. These options are available when you add a contact to the Contact Roles related list of a contract. To edit, from Setup, enter Contact Roles in the Quick Find box, then select Contact Roles on Contracts. Each picklist value can have up to 40 characters.</td>
</tr>
<tr>
<td>Picklist</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Lead Status (for leads)</td>
<td>State of the lead, for example, Open, Qualified. Select one value as the “Default Status” assigned to all new leads created manually, via imports, or via your website. Select one or more values as the “Converted Status” assigned to converted leads. When you convert qualified leads into an account, contact, and opportunity, you can select one of the “Converted” statuses to assign to the lead. Leads with a “Converted” status type are no longer available in the Leads tab, although you can include them in reports. If you delete a value, you have the option to map the deleted value to another existing value in all your org’s leads. Each value can have up to 20 characters.</td>
</tr>
<tr>
<td>Contact Role (for opportunities)</td>
<td>Role of a contact for an opportunity, for example, Business User, Decision Maker. These options are available when you add a contact to the Contact Roles related list of an opportunity. To edit, from Setup, enter Contact Roles in the Quick Find box, then select Contact Roles on Opportunities. Each picklist value can have up to 40 characters.</td>
</tr>
<tr>
<td>Stage (for opportunities)</td>
<td>Sales process stages, for example, Prospect, Proposal. This picklist also affects the Type and Forecast Category values of an opportunity. Specifically, changing the Type or Forecast Category for a Stage picklist value updates all opportunities that have that stage value. To edit, from the management settings for opportunities, go to Fields, and then click Edit next to Stage. To deactivate an active stage, click Del next to the stage. On the mapping page, don’t replace the stage with another existing value; just click Save. The stage now appears in the Inactive Stage Picklist Values related list. The stage is no longer in use but can exist in older opportunity records.</td>
</tr>
<tr>
<td>Status (for solutions)</td>
<td>Status of a solution, for example, Draft, Reviewed. Mark one or more values as “Reviewed”. When users solve cases using solutions, they can view which solutions have been reviewed and which have not. Each picklist value can have up to 40 characters.</td>
</tr>
<tr>
<td>Priority (for tasks)</td>
<td>Importance of the task, for example, High, Normal, Low. Set one value as the default priority of all new tasks, and one value as the highest priority. If you delete a value, you have the option to map the deleted value to another existing value in all your org’s tasks. Each picklist value can have up to 20 characters.</td>
</tr>
</tbody>
</table>
### Picklist

<table>
<thead>
<tr>
<th>Picklist Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status (for tasks)</td>
<td>State of a task, for example, Not Started, Completed. Choose at least one value as the “Closed” status and one value as the “Default” status for all new tasks. If you delete a value, you have the option to map the deleted value to another existing value in all your org's tasks. Each picklist value can have up to 40 characters.</td>
</tr>
<tr>
<td>Task Type (for tasks)</td>
<td>Send Email Default specifies the default task type assigned when the task is sending email or mass email, and when tasks are created via inbound email, such as Email to Salesforce. Default specifies the default picklist value when creating tasks. To edit, from the management settings for tasks, go to Fields, and then click <strong>Edit</strong> next to the picklist value that you want to specify as the default.</td>
</tr>
</tbody>
</table>

---

- [Picklist Limitations](#)

### Picklist Limitations

The maximum entries you can have in a picklist is determined by the total number of characters allowed in the picklist, which is 15,000. Each entry includes a line break and a return character that aren't visible. These two additional characters per entry are counted as part of the 15,000 limit.

Additional limits apply to both standard and custom picklists.

#### Additional Limits for Standard Picklists

For standard picklists, each entry can have up to 40 characters, not including line breaks and returns. For standard multi-select picklists, the total number of characters for all entries combined can't exceed 255.

For standard picklists in orgs that use record types or the Translation Workbench, you can have unlimited entries with these exceptions for special picklists.

**EDITIONS**

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions

Standard Picklists are not available in Database.com

**USER PERMISSIONS**

To change picklists:
- “Customize Application”
Additional Limits for Custom Picklists

Within the 15,000 total character limit, custom picklists can have:

- Up to 1,000 entries
- Up to 255 characters per entry

Custom multi-select picklists can have up to 500 values. Users can select up to 100 values at a time on a record.

You can have up to 500 global picklists (or picklist value sets) in an org. This limit doesn’t apply to custom picklists that are based on global picklists. Each global picklist value set can contain up to 500 values.

You can have up to 1000 values in a custom restricted picklist.

Functional Limitations for Custom Picklists

- You can make a custom picklist field into a restricted picklist only if the picklist has fewer than 1,000 values (or entries). A restricted picklist’s values are limited to only those values defined by a Salesforce admin. This prevents users from loading redundant or erroneous values through the API.
- Global picklists are always restricted picklists. This is a good thing, as it preserves data integrity. (Global picklists are shared across objects. Reuse the picklist value set from a global picklist for any picklist that’s based on it.)
- For custom picklist fields based on a global picklist, you can change from a single-select to multi-select picklist, and from a multi-select to single-select picklist. However, you can’t change the picklist to a different field type such as checkbox, currency, or text.
- You can include global picklists in change sets, but their dependency rules aren’t included.

**Note:** Global picklists are in beta. This list of picklist limitations is not exhaustive. Features in pilot or beta status aren’t guaranteed to be complete and fully functional until they become generally available.

Replace Picklist Values

As your business needs change, replace picklist values with more relevant alternatives. Replacing a value globally replaces that field value on all existing records.

For example, let’s say you have a status picklist with three different closed values, Closed-red, Closed-yellow, and Closed-green, and you want to simplify those to just one value. Replace them with the new value Closed.

**Important:** If you replace a parent value in a controlling picklist, the picklist dependency on that value is lost. After replacing the parent value, re-create the dependency using the new parent value.

1. If necessary, create the replacement value in the picklist edit page. See Add or Edit Picklist Values.

2. Navigate to the picklist.
   - For a global picklist: From Setup, enter picklist in the Quick Find box, then select Picklists.
   - For a picklist on an object, go to the fields area of the object. For example, for an Account picklist: From Setup, enter Account in the Quick Find box, then select Fields under Accounts.

3. Start the picklist value replace process.
   - For a global picklist (Salesforce Classic only): Go to the Global Picklist Detail page by clicking the picklist name. In the Picklist Value Set section, click Replace.
   - For all other picklists: Click Replace next to the picklist name.
4. Enter the value you want to change, and select a new replacement value.

Note: Replacing an existing picklist value also changes the Modified By date and time for the record.

5. To use the new value in records where this field is currently empty, select Replace all blank values.

6. To update all occurrences of the value in your org’s records with the new value, click Replace. Occurrences in the Recycle Bin are also updated.

Your replace job is queued. To check the job’s status, from Setup, enter Background Jobs in the Quick Find box, then select Background Jobs. You receive an email when the job is complete.

Note: If you replace the Stage picklist for opportunities, the Probability, Forecast Category, and Expected Revenue fields are also updated with the corresponding values.

Create a Global Picklist (Beta)
Manage Inactive Values in a Restricted Picklist
Manage Inactive Values in an Unrestricted Picklist

Sort Picklists
1. From the management settings for the picklist field’s object, go to Fields.

Note:
- For custom task or event fields, go to the object management settings for Activities.
- For standard task fields, go to the object management settings for Tasks. For standard event fields, go to the object management settings for Events.
- For Knowledge validation status picklists, from Setup, enter Validation Statuses in the Quick Find box, then select Validation Statuses.

2. Click Edit next to the picklist you want to update.

3. Click Reorder.

4. Use the arrows to arrange the field in the proper sequence.

5. Select a default, if desired.

6. Check the box to alphabetize the entries for users on edit pages. The entries will always appear in alphabetical order, regardless of the user’s language.

7. Save your changes.

Note: On record edit and detail pages and in reports, picklist and multi-select picklist fields may include inactive values. These inactive values are sorted last, unless you have chosen alphabetical sorting. In that case, all values are sorted alphabetically.

SEE ALSO:
Find Object Management Settings
Manage Inactive Values in an Unrestricted Picklist

Deactivate or remove an unneeded value from a standard or custom unrestricted picklist. Use the delete functionality for picklist values to either deactivate a value, or remove a value from a picklist and all records that use it.

1. Navigate to the fields area of the object that has the picklist field. For example, for an Account picklist: From Setup, enter Account in the Quick Find box, then select Fields under Accounts.

2. Go to the picklist’s detail page by clicking the picklist’s name.

3. In the Picklist Value Set section, modify the picklist value.
   - To deactivate the value, which removes it from the picklist but keeps it on existing records: Click Del next to the value’s name. Then select Keep old value for existing records.
   - To remove the value from the picklist and records that use it: Click Del next to the value’s name and select Replace value on records with blank value. Then click Save.

Your picklist is updated. The delete job goes to the background jobs queue. You’re notified by email when it’s done.

Manage Inactive Values in a Restricted Picklist

Deactivate, reactivate, or remove a value from any custom restricted picklist. If it’s a global picklist, these actions simultaneously update all custom picklists that inherit its picklist value set.

- **Note:** This release contains a beta version of global picklists that’s production-quality but has known limitations.

When a picklist is restricted, only a Salesforce admin can modify its values. Users can’t add unapproved values, even through the API. A restricted picklist has the **Strictly enforce picklist values** setting enabled.

1. Navigate to the picklist you want to modify.
   - For a picklist on an object, go to the fields area of the object. For example, for an Account picklist: From Setup, enter Account in the Quick Find box, then select Fields under Accounts.
   - For a global picklist: From Setup, enter picklist in the Quick Find box, then select Picklists.

2. Go to the picklist’s detail page by clicking the picklist’s name.

3. In the Picklist Value Set section, modify the picklist value.
   - To deactivate a value, which removes it from the picklist but keeps it on existing records: Click Deactivate next to the value’s name. The value moves to the Inactive Values section. If you need the value again later, click Activate next to its name.
   - To remove a value from a restricted picklist and all records that use it: Click Del next to the value’s name and select Replace value on records with blank value. Then click Save.
   - To remove a value from a global picklist and any custom picklists that share its value set: Click Del next to the value’s name and then click OK. If any custom picklists use this picklist value set, you’re prompted to replace the value with either a blank value or an existing, active value. If no custom picklists use this value set, the value is deleted from the global picklist.

Delete jobs on global picklists are immediate. Delete jobs on non-global, restricted picklists go to the background jobs queue. When the job completes, your restricted picklist is updated and you’re notified by email.
Define Dependent Picklists

- **Tip:** If your org uses record types, make sure that your controlling and dependent picklist values are available in the appropriate record types before defining a dependent picklist.

1. From the management settings for the object you want to add a field to, go to Fields. Custom task and event fields are accessible from the object management settings for Activities.

2. Click *Field Dependencies*.

3. Click *New*.

4. Choose a controlling field and dependent field.
   - **Note:** Some picklist and checkbox fields may not be available as controlling fields.

5. Click *Continue*.

6. Use the *field dependency matrix* to specify the dependent picklist values that are available when a user selects each controlling field value.

7. Optionally, click *Preview* to test your selections. If your organization uses record types, choose a record type to test how it affects your controlling and dependent picklist values. The record type controls what values are available in the controlling field. The record type and the controlling field together determine what values are available in the dependent picklist. For example, a dependent value is only available if it is available in the selected record type and the selected controlling value.
   - **Note:** The *Filter by Record Type* option doesn’t appear in the Preview window for activity custom fields.

8. Click *Save*.

SEE ALSO:
- Dependent Picklist Considerations
- Edit Dependent Picklists
- Delete Picklist Dependencies

Dependent Picklists

Use dependent picklists to help your users enter accurate and consistent data. A *dependent picklist* is a custom or multi-select picklist for which the valid values depend on the value of another field, called the *controlling field*. Controlling fields can be any picklist (with at least one and fewer than 300 values) or checkbox field on the same record.

For example, you can define a *Reason* custom picklist on opportunities and make its valid values depend on the value of the *Stage* picklist as follows:
- If *Stage* is *Closed Won*, the valid values for *Reason* are *Superior features* or *Lower price*. 
If Stage is Closed Lost, the valid values for Reason are Inferior features, Higher price, or Company viability.

SEE ALSO:
- Define Dependent Picklists
- Dependent Picklist Considerations

### Using the Field Dependency Matrix

The field dependency matrix lets you specify the dependent picklist values that are available when a user selects each controlling field value. The top row of the matrix contains the controlling field values, while the columns list the dependent field values.

Use this matrix to include or exclude values. Included values are available in the dependent picklist when a value in the controlling field is selected. Excluded fields are not available in the dependent picklist for the selected controlling field value.

To include or exclude values:
- Double-click values to include them. Included values are indicated with highlighting. Double-click any highlighted values to exclude them.
- Click a value and use SHIFT+click on another value to select a range of adjacent values. Then click Include Values to make the values available, or Exclude Values to remove them from the list of available values.
- Click a value and use CTRL+click to select multiple values. Then click Include Values to make the values available, or Exclude Values to remove them from the list of available values.
- Click a column header to select all the values in that column. Then click Include Values to make the values available, or Exclude Values to remove them from the list of available values.

To change the values in your view:
- Click View All to view all available values at once.
- Click Go To and choose a controlling value to view all the dependent values in that column.
- Click Previous or Next to view the values in columns that are on the previous or next page.
- Click View sets of 5 to view 5 columns at a time.

### Edit Dependent Picklists

1. From the management settings for the picklist's object, go to Fields.
2. Click Field Dependencies.
3. Click Edit next to the field dependency relationship you want to change.
4. Use the field dependency matrix to specify the dependent picklist values that are available when a user selects each controlling field value.
5. Optionally, click Preview to test your selections.
6. Save your changes.

SEE ALSO:
- Find Object Management Settings
Delete Picklist Dependencies

If you no longer want the values of a dependent picklist to depend on a controlling field, delete its dependency. Deleting the dependency removes the logic that defines how the values of the picklist depend on the controlling field, but doesn’t delete the fields or affect their data.

1. From the management settings for the picklist’s object, go to Fields.
2. Click Field Dependencies.
3. Click Del next to the field dependency relationship you want to delete.
4. Click OK to confirm.

SEE ALSO:
Find Object Management Settings

Dependent Picklist Considerations

Consider the following when defining dependent picklists:

Checkboxes
Checkbox fields can be controlling fields but not dependent fields.

Converting fields
When you convert existing fields to dependent picklists or controlling fields, it doesn’t affect the existing values in your records. After conversion, the dependency rules apply to new records and to any changes to existing records.

Default values
You can set default values for controlling fields but not for dependent picklists.

Field-level security
Field-level security settings for a controlling field and dependent picklist are independent. Remember to hide a controlling field whenever its correlating dependent picklist is hidden.

Import
The Data Import Wizard doesn’t consider field dependencies. You can import any value into a dependent picklist regardless of the value imported for a controlling field.

Lead conversion
If you create a dependency for lead fields that map to account, contact, and opportunity fields for lead conversion, create the same dependency on the account, contact, or opportunity.

Dependent picklists and controlling lead fields can be mapped to account, contact, or opportunity fields with different dependency rules.

Multi-select picklists
Multi-select picklists can be dependent picklists but not controlling fields.

Standard versus custom picklists
Custom picklist fields can be either controlling or dependent fields.

Standard picklist fields can be controlling fields but not dependent fields.

Picklist limitations
A controlling field can have up to 300 values. If a field is both a controlling field and dependent picklist, it can’t contain more than 300 values.
The following fields are not available as controlling fields.

**Activity Fields**
- Call Type
- Create recurring series of events
- Show Time As
- Subject
- Task
- Type

**Contact Fields**
- Salutation
- Contact Currency

**Custom Object Fields**
- Currency

**Lead Fields**
- Converted
- Unread By Owner

**Dependency limitations**
Before defining a dependency, make sure that your picklist has at least one value. Standard fields like Product Family do not contain values until you add them.

If a standard controlling field relies on functionality that your organization decides to disable, the dependency rules for the picklist go away. For example, if your organization disables the Self-Service portal and the Closed by Self-Service User is a controlling field, its dependent picklist displays all available values.

If you replace a parent value in a controlling picklist, the picklist dependency is lost. After replacing the parent value, re-create the dependency using the new parent value.

**Connect Offline**
While controlling fields and dependent picklists are available in Connect Offline, the logic between them is not.

**Page layouts**
Page layouts that contain dependent picklists must also contain their controlling picklist fields, or the dependent picklist values don’t display.

For visually impaired users, make sure that the dependent picklist is lower on the page layout than its controlling field.

If a dependent picklist is required and no values are available for it based on the controlling field value, users can save the record without entering a value. The record is saved with no value for that field.

**Record types**
You can define or change the record type for your dependent picklist only within the Preview dialog when creating or editing the field dependency values. The record type controls what values are available in the controlling field. The record type and the controlling field together determine what values are available in the dependent picklist. For example, a dependent value is only available if it is available in the selected record type and the selected controlling value.
Using the HTML Editor

To create or change custom fields:

• "Customize Application"

Available in: Enterprise, Performance, Unlimited, and Developer Editions

To improve the appearance of text in custom fields, use the Salesforce HTML editor to format custom fields that were defined with the rich text area custom field type. The Salesforce HTML editor provides a WYSIWYG interface, allowing you to perform basic formatting operations. You can:

• Format text as bold, italicized, or underlined
• Create bulleted and numbered lists
• Change paragraph indentation
• Insert hyperlinks to Web pages
• Insert an image

Note: The upgraded editor doesn’t support Internet Explorer version 7 or version 8 in compatibility mode. If you are using these browsers, you will use the older editor.

Some features, such as Salesforce Knowledge or Ideas, let administrators enable extra functions like the ability to embed multimedia content, use drop-down lists, or select colors for text or backgrounds. Make sure that your browser security settings allow you to access these functions. For example, if browser security is set to high in Microsoft® Internet Explorer® 7, <iframe> content does not appear in the frame, drop-down lists are unavailable, and color cannot be selected for backgrounds or text.

Common scenarios for using the HTML editor include:

• Pasting a code sample into a Chatter Answers or Ideas post
• Adding a video to a knowledge article or an Idea Themes post
• Formatting resumes submitted by job candidates to create more readable and professional-looking versions for your users
• Emphasizing key points in descriptions or comments by setting various font options, such as bold typeface and a larger font size
• Itemizing steps in a numbered or bulleted list to help users better understand a procedure
• Supporting your company’s brand identity by specifying the URL of a logo on your website
• Including a link to a related and accessible page of your company’s website

Notes on Using the Salesforce HTML Editor

When you use the editor, note the following:

• Because the Salesforce HTML editor provides a WYSIWYG interface only, you don’t edit HTML tags.
• If you copy content from a Web page and paste it into the editor’s window, Salesforce automatically removes unsupported tags and preserves the text that was enclosed in unsupported tags as plain text. Salesforce does not notify users when it removes unsupported or potentially malicious HTML.
• The maximum number of characters you can enter in the Salesforce HTML editor window is equal to the field length specified when creating or editing the field. The default is 32,768 characters.
• When clicked, hyperlinks open in a new browser window. The Salesforce HTML editor supports HTTP, HTTPS, and mailto hyperlinks.
• When a record is saved, the Salesforce HTML editor does not validate hyperlinks to Web pages. Be sure to confirm that you are specifying a URL that Salesforce can access.
• To insert an image, click and either select:
  – Web Address tab and enter the URL of the image.
Upload Image tab and select an image from your localhost. You can upload only JPEG, PNG or GIF. The image you select cannot exceed 1 Megabyte. You can’t add a hyperlink to an image.

Optionally, enter a description that appears when a user hovers over the image. The image must have a URL that Salesforce can access.

- The Salesforce HTML editor supports all languages that Salesforce Knowledge supports.
- The Salesforce HTML editor does not support JavaScript or Cascading Style Sheets (CSS).
- The Salesforce HTML editor is disabled for users who have accessibility mode enabled; it’s replaced with a text box.

Supported HTML Tags and Attributes

The Salesforce HTML editor supports the tags listed in the following table.

<table>
<thead>
<tr>
<th>Tag</th>
<th>Tag</th>
<th>Tag</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;a&gt;</code></td>
<td><code>&lt;dt&gt;</code></td>
<td><code>&lt;q&gt;</code></td>
</tr>
<tr>
<td><code>&lt;abbr&gt;</code></td>
<td><code>&lt;em&gt;</code></td>
<td><code>&lt;samp&gt;</code></td>
</tr>
<tr>
<td><code>&lt;acronym&gt;</code></td>
<td><code>&lt;font&gt;</code></td>
<td><code>&lt;small&gt;</code></td>
</tr>
<tr>
<td><code>&lt;address&gt;</code></td>
<td><code>&lt;h1&gt;</code></td>
<td><code>&lt;span&gt;</code></td>
</tr>
<tr>
<td><code>&lt;b&gt;</code></td>
<td><code>&lt;h2&gt;</code></td>
<td><code>&lt;strike&gt;</code></td>
</tr>
<tr>
<td><code>&lt;bdo&gt;</code></td>
<td><code>&lt;h3&gt;</code></td>
<td><code>&lt;strong&gt;</code></td>
</tr>
<tr>
<td><code>&lt;big&gt;</code></td>
<td><code>&lt;h4&gt;</code></td>
<td><code>&lt;sub&gt;</code></td>
</tr>
<tr>
<td><code>&lt;blockquote&gt;</code></td>
<td><code>&lt;h5&gt;</code></td>
<td><code>&lt;sup&gt;</code></td>
</tr>
<tr>
<td><code>&lt;br&gt;</code></td>
<td><code>&lt;h6&gt;</code></td>
<td><code>&lt;table&gt;</code></td>
</tr>
<tr>
<td><code>&lt;caption&gt;</code></td>
<td><code>&lt;hr&gt;</code></td>
<td><code>&lt;tbody&gt;</code></td>
</tr>
<tr>
<td><code>&lt;cite&gt;</code></td>
<td><code>&lt;i&gt;</code></td>
<td><code>&lt;td&gt;</code></td>
</tr>
<tr>
<td><code>&lt;code&gt;</code></td>
<td><code>&lt;img&gt;</code></td>
<td><code>&lt;tfoot&gt;</code></td>
</tr>
<tr>
<td><code>&lt;col&gt;</code></td>
<td><code>&lt;ins&gt;</code></td>
<td><code>&lt;th&gt;</code></td>
</tr>
<tr>
<td><code>&lt;colgroup&gt;</code></td>
<td><code>&lt;kbd&gt;</code></td>
<td><code>&lt;thead&gt;</code></td>
</tr>
<tr>
<td><code>&lt;dd&gt;</code></td>
<td><code>&lt;li&gt;</code></td>
<td><code>&lt;tr&gt;</code></td>
</tr>
<tr>
<td><code>&lt;del&gt;</code></td>
<td><code>&lt;ol&gt;</code></td>
<td><code>&lt;tt&gt;</code></td>
</tr>
<tr>
<td><code>&lt;dfn&gt;</code></td>
<td><code>&lt;p&gt;</code></td>
<td><code>&lt;ul&gt;</code></td>
</tr>
<tr>
<td><code>&lt;div&gt;</code></td>
<td><code>&lt;pre&gt;</code></td>
<td><code>&lt;var&gt;</code></td>
</tr>
<tr>
<td><code>&lt;dl&gt;</code></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The tags can include the following attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Attribute</th>
<th>Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>alt</td>
<td>face</td>
<td>size</td>
</tr>
<tr>
<td>background</td>
<td>height</td>
<td>src</td>
</tr>
</tbody>
</table>
The attributes can include URLs that begin with the following:

- http:
- https:
- file:
- ftp:
- mailto:
- #
- / for relative links

Rich Text Area Field Tips
Add Videos Using the HTML Editor

Add Videos Using the HTML Editor

Available in: Salesforce Classic.
Available in: Enterprise, Performance, Unlimited, and Developer Editions

Before you can add videos to the HTML editor in a Knowledge article, make sure that your browser security settings allow you to embed multimedia content. Some browser security settings can block <iframe> elements. For example, if browser security is set to high in Internet Explorer 7, <iframe> content does not appear in the frame.

When the option to embed multimedia content is enabled during the setup of your application, users can cut and paste <iframe> HTML elements into the editor using one of two options:

1. Copy the <iframe> element from one of the approved video sites.
   Approved sites include Dailymotion, Vimeo, or YouTube.

2. Paste the code into the HTML editor by clicking one of these buttons:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Video" /></td>
<td>Lets you paste the &lt;iframe&gt; element into a text box on the Embed Multimedia Content dialog box. The frame and its contents are added to the editor window.</td>
</tr>
<tr>
<td><img src="image" alt="Source" /></td>
<td>Lets you paste the &lt;iframe&gt; element directly into the HTML code.</td>
</tr>
</tbody>
</table>
3. Click **Save**.

**SEE ALSO:**
- Using the HTML Editor

### Adding Code Samples to Posts

You can paste code samples into your posts in Chatter Answers and Ideas.

When you enable Chatter Answers and Ideas, users can add code samples to their posts. Code can be copied from any text editor and pasted into the body of a post with the formatting preserved.

1. Copy the code sample from a text editor to your clipboard.
2. In the editor, enter the text for your posts and click the `>` button to add the code sample.
3. Paste the code sample into the Add a code sample text box and click **OK**.

The code sample appears in the body of the post with its formatting intact.

### Change the Custom Field Type

**Note:** If you encrypt a custom field using Shield Platform Encryption, you can’t change the field type.

1. From the management settings for the field’s object, go to Fields.

**Note:** For fields on Salesforce Knowledge article types, from Setup, enter Knowledge Article Types in the Quick Find box, select Knowledge Article Types, and then select an article type.

2. Click **Edit** next to the custom field you want to change.
3. Click **Change Field Type**.
4. Select a new data type and click **Next**.
5. Enter a field label, name, and any other attributes, and then save your changes.

**SEE ALSO:**
- Notes on Changing Custom Field Types
- Custom Field Types
- Which Fields Can I Encrypt?
- Find Object Management Settings

### Notes on Changing Custom Field Types

Consider the following before converting fields:

- Only convert custom fields for which no data exists or you risk losing your data. Changing the data type of an existing custom field can cause data loss in the following situations:
  - Changing to or from type Date or Date/Time
  - Changing to Number from any other type
Changing to Percent from any other type
Changing to Currency from any other type
Changing from Checkbox to any other type
Changing from Picklist (Multi-Select) to any other type
Changing to Picklist (Multi-Select) from any other type

Currently defined picklist values are retained when you change a picklist to a multi-select picklist. If records contain values that are not in the picklist definition, those values will be deleted from those records when the data type changes.

Changing from Auto Number to any other type
Changing to Auto Number from any type except Text
Changing from Text to Picklist
Changing from Text Area (Long) to any type except Email, Phone, Text, Text Area, or URL

- If data is lost, any list view based on the custom field will be deleted, and assignment and escalation rules may be affected.
- If you change the data type of any custom field that is used for lead conversion, that lead field mapping will be deleted.
- If you change the data type of a custom field that is set as an external ID, choosing a data type other than text, number, or email will cause the field to no longer act as an external ID.
- The option to change the data type of a custom field is not available for all data types. For example, existing custom fields cannot be converted into encrypted fields nor can encrypted fields be converted into another data type.
- In Salesforce Knowledge article types, the file field type can’t be converted into other data types.
- You cannot change the data type of a custom field that is referenced by a Visualforce page.
- Changing a custom field type may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- Before changing a custom field’s type, make sure that it isn’t the target of a workflow field update or referenced in a field update formula that would be invalidated by the new type.

The following data types have additional restrictions when you convert them:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Auto Number</td>
<td>The data in any auto-number field remains unchanged if you convert it into a text field. Also, you can safely convert a text custom field into an auto-number field without losing your data. Converting an auto-number field into any other data type results in data loss. Auto-number fields can contain a maximum of 30 characters. Before converting a text custom field into an auto-number field, change any records that contain more than 30 characters in that field.</td>
</tr>
<tr>
<td>Formula</td>
<td>Formula fields are special read-only fields that cannot be converted to any other data type. Likewise, you cannot convert any other field type into a formula field.</td>
</tr>
<tr>
<td>Picklist</td>
<td>Changing your custom picklists into custom checkboxes is simple. If you select Checkbox as the new data type, you can choose which picklist values to map to checked boxes and unchecked boxes. You can change custom picklists into multi-select picklists without losing any data. Since your records only contain a single value of</td>
</tr>
<tr>
<td>Data Type</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Relationships</td>
<td>• You can convert relationship fields to nonrelationship fields and vice versa, but only on external objects.</td>
</tr>
<tr>
<td></td>
<td>• If your organization has a large number of records, Salesforce displays a waiting page after you have requested to change a master-detail into a lookup relationship or a lookup into a master-detail relationship.</td>
</tr>
<tr>
<td></td>
<td>• After you have created a roll-up summary field on an object, you cannot convert the object’s master-detail relationship into a lookup relationship.</td>
</tr>
<tr>
<td></td>
<td>• A lookup cannot be converted to a master detail relationship if there are any existing records on the object that have a null value set for the lookup relationship.</td>
</tr>
<tr>
<td></td>
<td>• If you are converting a master-detail relationship to a lookup for a custom object on the “detail” side, the organization-wide default for the object is automatically updated to Public Read/Write. Similarly, converting a lookup to a master-detail-relationship changes the organization-wide default to Controlled by Parent.</td>
</tr>
<tr>
<td>Text Area (Long)</td>
<td>When you convert a long text area field to an Email, Phone, Text, Text Area, or URL type field, the data in your records is truncated to the first 255 characters of the field.</td>
</tr>
<tr>
<td>Text Area (Rich)</td>
<td>You can only convert rich text area fields into long text area fields. Any images are deleted the next time the long text area field is saved. After converting, markup is hidden in the long text area field but it is not removed from the record until you save the record. That way, the markup can be restored if you change your mind.</td>
</tr>
</tbody>
</table>

Note: You cannot change the data type of a custom field if it is referenced in Apex.

Change the Custom Field Type
Define Default Field Values

To define a default field value:

1. Begin by creating a custom field; see Create Custom Fields on page 3997. You can also define a default value for an existing custom field; see Edit Custom Fields on page 4015.

2. Choose the type of field to create and click Next. For a list of the types available for default values, see About Default Field Values on page 4038.

3. Enter the attributes for the field.

4. Enter a default value or define a formula to calculate the default value.

   Note: You can define a formula for default values only where appropriate. For example, the default value options for picklist and checkbox fields are limited to the options available for those types of fields, such as Checked, Unchecked, or Use first value as default value.

5. Click Next.

6. Set the field-level security to determine whether the field should be visible for specific profiles, and click Next.

7. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.

8. Click Save to finish or Save & New to create more custom fields.

   Note: You must specify a default value for required campaign member custom fields. Don’t assign default values to fields that are both required and unique, because uniqueness errors can result.

Useful Default Field Value Formulas

About Default Field Values

Use default field values to make your users more productive by reducing the number of fields they need to fill in manually. Default field values automatically insert the value of a custom field when a new record is created. A default value can be based on a formula for some types of fields or exact values such as Checked or Unchecked for checkbox fields.

After you have defined default values:

1. The user chooses to create a new record.

2. Default field value is executed.

3. Salesforce displays the edit page with the default field value pre-populated.

4. The user enters the fields for the new record.

5. The user saves the new record.
The user can change the field’s value but the initial default field value is only executed once, during record creation. For example, you can set the default field value on a custom lead field to seven days after the creation date to signify when to contact the lead again. You can change this value later, but you cannot automatically restore the value that was seven days after the creation date.

Set up default field values for the following types of custom fields:

- Checkbox
- Currency
- Date
- Date/Time
- Email
- Number
- Percent
- Phone
- Picklist (use the default option when setting up the picklist)
- Text
- Text Area
- URL

For a description of these types, see Custom Field Types on page 4001.

SEE ALSO:
- Define Default Field Values
- Default Field Value Considerations
Useful Default Field Value Formulas

Maximum Discount Rate

Your organization may apply different discount rates to opportunities based on the department of the person creating the opportunity. Use the following example to set a default value for a custom field called Discount Rate on opportunities.

```
CASE(User.Department, "IT", 0.25, "Field", 0.15, 0)
```

In this example, the formula inserts a discount rate of 25% on any opportunity created by a user in the “IT” department or 15% on any opportunity created by someone in the “Field” department. A zero is applied if the creator does not belong to either of these departments. This is a custom percent field on opportunities that uses the standard user field Department.

Product Language

You may want to associate a product with its language so that your users know the type of documentation or adapter to include. Use the following default value formula to automatically set the language of a product based on the country of the user creating the product. In this example, the default value is “Japanese” if the user’s country is “Japan” and “English” if the user’s country is “US.” If neither is true, the default value “unknown” is inserted into the Product Language field.

```
```

Tax Rate

Use this default value formula to set the tax rate of an asset based on the user’s city. Create a custom percent field with the following default value:

```
IF($User.City = "Napa", 0.0750,
  IF($User.City = "Paso Robles", 0.0725,
    IF($User.City = "Sutter Creek", 0.0725,
      IF($User.City = "Los Olivos", 0.0750,
        IF($User.City = "Livermore", 0.0875, null )
      )
    )
  )
)
```
In this example, a tax rate of 8.75% is applied to an asset when the user’s address is in the city of Livermore. When none of the cities listed apply, the Tax Rate field is empty. You can also use the Tax Rate field in formulas to automatically calculate taxable amounts and final sales prices.

Default Field Value Considerations

Default Field Value Considerations

Default field values automatically insert the value of a custom field when a new record is created. A default value can be based on a formula for some types of fields or exact values such as Checked or Unchecked for checkbox fields. Review the following considerations before incorporating default field values in your organization.

- If a default value is based on the value of a merge field, Salesforce uses the value of the merge field at the time the default value is executed. If the value of the merge field changes later, the default value is not updated.

- Users can change or remove the default field value on a record.

- Don’t assign default values to fields that are both required and unique, because uniqueness errors can result.

- If you make an activity custom field universally required, you must also provide a default value.

- If an activity custom field is unique, you cannot provide a default value.

- Default field values are different from formula fields in the following ways: they are only executed once, at record creation; they are not read only; and the user can change the value but cannot restore the default field value.

- Since the default value is inserted before users enter any values in the new record, you cannot use the fields on the current record to create a default field value. For example, you cannot create a default field value on a contact that uses the first initial and last name because those values are not available when you click New to create a contact record. However, you can use the record type because it is selected before the record edit page displays.

- To apply a different default value for different record types, use the record type as a merge field in a CASE function within the default field value setup.

- Fields that are not visible to the user due to field-level security are still available in the formula for a default field value.

- Connect Offline and Salesforce for Outlook do not display default values. However, Salesforce inserts the default values when a user syncs unless the user entered a value.

- Default field values are not available in the Self-Service portal.

- Lead conversion, Web-to-Lead, and Web-to-Case do not execute default field values.
Note: You can define a formula for default values only where appropriate. For example, the default value options for picklist and checkbox fields are limited to the options available for those types of fields, such as Checked, Unchecked, or Use first value as default value.

Validation Rules

Improve the quality of your data using validation rules. Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of “True” or “False”. Validation rules also include an error message to display to the user when the rule returns a value of “True” due to an invalid value.

After you have defined validation rules:

1. The user chooses to create a new record or edit an existing record.
2. The user clicks Save.
3. All validation rules are verified.
   - If all data is valid, the record is saved.
   - If any data is invalid, the associated error message displays without saving the record.
4. The user makes the necessary changes and clicks Save again.

You can specify the error message to display when a record fails validation and where to display it. For example, your error message can be “The close date must occur after today’s date.” You can choose to display it near a field or at the top of the page. Like all other error messages, validation rule errors display in red text and are preceded by the word “Error”.

Important: Validation rules apply to new and updated records for an object, even if the fields referenced in the validation rule are not included in a page layout or an API call. Validation rules don’t apply if you create new records for an object with Quick Create. If your organization has multiple page layouts for the object on which you create a validation rule, verify that the validation rule functions as intended on each layout. If your organization has any integrations that use this object, verify that the validation rule functions as intended for each integration.

Managing Validation Rules

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of “True” or “False”. Validation rules also include an error message to display to the user when the rule returns a value of “True” due to an invalid value.

From the validation rules page you can:

- Define a validation rule.
- Click Edit next to a rule name to update the rule fields.
- Delete a validation rule.
- Click a validation rule name to view more details or to clone the rule.
- Activate a validation rule.

- Examples of Validation Rules

Define Validation Rules

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of “True” or “False”. Validation rules also include an error message to display to the user when the rule returns a value of “True” due to an invalid value.

Before creating validation rules, review the Validation Rule Considerations.

1. From the management settings for the relevant object, go to Validation Rules.
2. In the Validation Rules related list, click New.
3. Enter the properties of your validation rule.
4. To check your formula for errors, click Check Syntax.
5. Click Save to finish or Save & New to create additional validation rules.

Note: The detail page of a custom activity field does not list associated validation rules. To edit the validation rule for a custom activity field, select the validation rule from Setup by entering Activities in the Quick Find box, then selecting Activities and choose Task Validation Rules or Event Validation Rules.

Clone Validation Rules

1. From the management settings for the relevant object, go to Validation Rules.
2. In the Validation Rules related list, click the name of the validation rule.
3. Click **Clone**.
4. Define the new rule based on the original rule.
5. Click **Save** to finish or **Save & New** to create additional validation rules.

**Note:** The detail page of a custom activity field does not list associated validation rules. To edit the validation rule for a custom activity field, select the validation rule from Setup by entering **Activities** in the Quick Find box, then selecting **Activities** and choose **Task Validation Rules** or **Event Validation Rules**.

## Validation Rules Fields

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule Name</td>
<td>Unique identifier of up to 40 characters with no spaces or special characters such as extended characters.</td>
</tr>
<tr>
<td>Active</td>
<td>Checkbox that indicates if the rule is enabled.</td>
</tr>
<tr>
<td>Description</td>
<td>A 255-character or less description that distinguishes the validation rule from others. For internal purposes only.</td>
</tr>
<tr>
<td>Error Condition</td>
<td>The expression used to validate the field. See Build a Formula Field and Formula Operators and Functions.</td>
</tr>
<tr>
<td>Formula</td>
<td>The message that displays to the user when a field fails the validation rule.</td>
</tr>
<tr>
<td>Error Message</td>
<td>If your organization uses the Translation Workbench, you can translate the error message into the languages Salesforce supports. See Enable and Disable the Translation Workbench.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Determines where on the page to display the error. To display the error next to a field, choose Field and select the field. If the error location is a field, the validation rule is also listed on the detail page of that field. If the error location is set to a field that is later deleted, to a field that is read only, or to a field that isn't visible on the page layout, Salesforce automatically changes the location to Top of Page.</td>
</tr>
<tr>
<td>Note:</td>
<td>Error messages can only be displayed at the top of the page in validation rules for case milestones and Ideas.</td>
</tr>
</tbody>
</table>

- Define Validation Rules

### Tips for Writing Validation Rules

- Consider all the settings in your organization that can make a record fail validation, including assignment rules, field updates, field-level security, or fields hidden on a page layout.
- Be careful not to create contradicting validation rules for the same field; otherwise, users won't be able to save the record.
  
  **Tip:** A poorly designed validation rule can prevent users from saving valid data. Make sure you thoroughly test a validation rule before activating it. You can also use the debug log to monitor the details of your rule implementation.
- When referencing related fields in a validation formula, make sure those objects are deployed.
- Use the RecordType.Id merge field in your formula to apply different validations for different record types.
You don’t have to begin a validation rule formula with the IF function. Any Boolean error condition expression works. For example:

- Correct: CloseDate < TODAY()
- Incorrect: IF(CloseDate < TODAY(), TRUE, FALSE)

Keep in mind that when a validation rule contains the BEGINS or CONTAINS function, it processes blank fields as valid. For example, if you have a validation rule that tests whether the serial number of an asset begins with “3”, all assets with a blank serial number are considered valid.

When using a validation rule to ensure that a number field contains a specific value, use the ISBLANK function to include fields that don’t contain any value. For example, to validate that a custom field contains a value of ‘1’, use the following validation rule to display an error if the field is blank or any other number:

```
OR (ISBLANK (field__c), field__c<>1)
```

Avoid using the IsClosed or IsWon opportunity merge fields in validation formulas. Instead, use the ISPICKVAL function to determine if the Stage contains the appropriate value. For example, the following validation formula makes a custom Project Start Date field required whenever the Stage is “Closed Won”:

```
AND(ISPICKVAL(StageName, "Closed Won"),
    ISBLANK(Project_Start_Date__c))
```

Simplify your validation formulas by using checkbox fields, which don’t require any operator because they return true or false. For example, the following validation formula checks to be sure an opportunity has opportunity products using the HasOpportunityLineItem merge field before users can save a change to it:

```
NOT(OR(ISNEW(),HasOpportunityLineItem))
```

Tips for Writing Validation Rule Error Messages

- Give instructions. An error message like “invalid entry” doesn’t tell the user what type of entry is valid. Write something more specific, such as “Close Date must be after today.”
- Always include the field label. Users might not know what field is failing validation, especially if the error message appears at the top of the page.

**Note:** When defining validation rules, you can set the error location to Top of Page or Field. If the error location is set to a field that is later deleted, to a field that is read only, or to a field that isn’t visible on the page layout, Salesforce automatically changes the location to Top of Page.

- If you have a multilingual organization, translate your error messages. You can translate error messages using the Translation Workbench.
- Assign corresponding numbers to validation rules and their error messages. This allows you to identify the source of the error.

- Define Validation Rules
- Validation Rule Considerations
Validation Rule Considerations

Validation rules verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can contain a formula or expression that evaluates the data in one or more fields and returns a value of “True” or “False”. Validation rules also include an error message to display to the user when the rule returns a value of “True” due to an invalid value. Review these considerations before implementing validation rules in your organization.

How Salesforce Processes Validation Rules

Salesforce processes rules in the following order:

1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

In addition:

- When one validation rule fails, Salesforce continues to check any additional validation rules on that field or any other field on the page and displays all appropriate error messages at once.
- If validation rules exist for activities and you create an activity during lead conversion, the lead converts but a task isn’t created.
- Validation rules are only enforced during lead conversion if validation and triggers for lead conversion are enabled in your organization.
- Campaign hierarchies ignore validation rules.
- Salesforce runs validation rules before creating records submitted via Web-to-Lead and Web-to-Case, and only creates records that have valid values.
- Validation rules continue to run on individual records if the owner is changed. If the Mass Transfer tool is used to change the ownership of multiple records, however, validation rules won’t run on those records.

Validation Rule Field Restrictions

Validation rule formulas don’t or can’t refer to:

- Compound fields, including addresses, first and last names, and dependent picklists and lookups
- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies
- Merge fields for auto-number or compound address fields such as Mailing Address

Note: Merge fields for individual address fields, such as Billing City, are OK to use in validation rule formulas.

In addition, validation rules behave like this with regard to other fields and functions in Salesforce:

- The detail page of a custom activity field doesn’t list associated validation rules.
- Because updates to records based on workflow rules don’t trigger validation rules, workflow rules can invalidate previously valid fields.
- You can’t create validation rules for relationship group members.
- Because roll-up summary fields aren’t displayed on edit pages, you can use them in validation rules, but not as the error location.
Lookup Filters vs. Validation Rules

Validation rules and lookup filters achieve similar ends, but offer different advantages. Use a lookup filter if:

- You want to improve user efficiency by limiting the number of available options in a lookup search dialog.
- You want to improve user efficiency by automating filters on lookup search dialogs that your users manually set.

Use a validation rule if:

- You're close to the maximum number of lookup filters allowed.
- You must implement a complex business rule that requires you to use a formula. Formulas can reference fields that basic filter criteria can't reference, such as fields on the parent of the source object. Formulas can also use functions. For example, use `ISNEW` if the rule should only apply on record creation, or `ISCHANGED` if the rule should apply when a field changes.

### Canadian Billing Postal Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the account Billing Zip/Postal Code is in the correct format if Billing Country is Canada.</td>
</tr>
</tbody>
</table>

**Error Message:** Canadian postal code must be in A9A 9A9 format.

**Error Location:** Billing Zip/Postal Code

### Billing Zip Code Is in Billing State

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the account Billing Zip/Postal Code is valid by looking up the first five characters of the value in a custom object called Zip_Code__c that contains a record for every valid zip code in the US. If the zip code is not found in the Zip_Code__c object, or the Billing State does not match the corresponding State_Code__c in the Zip_Code__c object, an error is displayed.</td>
</tr>
</tbody>
</table>

**Error Message:** Billing Zip Code does not exist in specified Billing State.

**Error Location:** Billing Zip/Postal Code
### US Billing Zip Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that the account Billing Zip/Postal Code is in 99999 or 99999-9999 format if Billing Country is USA or US.</td>
</tr>
</tbody>
</table>
| **Formula:**    | ```
AND(
OR(BillingCountry = "USA", BillingCountry = "US"),
NOT(REGEX(BillingPostalCode, "\\d{5}(-\\d{4})?"))
)
``` |
| **Note:**       | This example uses the REGEX function; see Shipping Zip Code if you are not familiar with regular expressions. |
| **Error Message:** | Zip code must be in 99999 or 99999-9999 format. |
| **Error Location:** | Billing Zip/Postal Code |
# Shipping Zip Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that the account Shipping Zip/Postal Code is in 99999 or 99999-9999 format if Shipping Country is USA or blank.</td>
</tr>
<tr>
<td><strong>Formula:</strong></td>
<td><code>AND(OR(ShippingCountry = &quot;USA&quot;, ISBLANK(ShippingCountry)), OR(AND(LEN(ShippingPostalCode) &lt;&gt;5, LEN(ShippingPostalCode) &lt;&gt; 10), NOT(CONTAINS(&quot;0123456789&quot;, LEFT( ShippingPostalCode, 1))), NOT(CONTAINS(&quot;0123456789&quot;, MID( ShippingPostalCode, 2, 1)))))</code></td>
</tr>
</tbody>
</table>

**Note:** This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or “USA” in all capital letters. The rule is not enforced when the country is “usa.”

**Tip:** You can also validate zip codes using a regular expression; for an example of a formula using a regular expression, see **REGEX** on page 4147.

| **Error Message:** | Zip code must be in 99999 or 99999-9999 format. |
| **Error Location:** | Shipping Zip/Postal Code |
## Valid Billing State (US)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the account Billing State/Province is a valid two-character abbreviation if Billing Country is US, USA, or blank.</td>
</tr>
</tbody>
</table>

**Note:** This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or “USA” in all capital letters. The rule is not enforced when the country is “usa.”

**Error Message:** A valid two-letter state code is required.

**Error Location:** Billing State/Province

## Valid Billing Province (Canada)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the account Billing State/Province is a valid two-character abbreviation if Billing Country is CA or CAN.</td>
</tr>
</tbody>
</table>

**Error Message:** A valid two-letter province code is required.

**Error Location:** Billing State/Province
Valid Shipping State

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the account Shipping State/Province is a valid two-character abbreviation if Shipping Country is US, USA, or blank.</td>
</tr>
</tbody>
</table>

**Note:** This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or "USA" in all capital letters. The rule is not enforced when the country is "usa."

**Error Message:** A valid two-letter state abbreviation is required.

**Error Location:** Shipping State/Province

Valid Shipping Province (Canada)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the account Shipping State/Province is a valid two-character abbreviation, if Billing Country is CA or CAN.</td>
</tr>
</tbody>
</table>

**Error Message:** A valid two-letter province abbreviation is required.

**Error Location:** Shipping State/Province
Valid Billing Country

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Validates that the account Billing Country is a valid ISO 3166 two-letter code.</td>

</tr>
<tr>
<td>Error Message:</td>
<td>Comment contains offensive language.</td>
</tr>
</tbody>
</table>

Sample Contact Validation Rules

For more information on any of the formula functions used in these examples, see Formula Operators and Functions on page 4106.
### Mailing Address Fields Are Required

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the contact Mailing Street, Mailing City, and Mailing Country are provided.</td>
</tr>
<tr>
<td>Formula</td>
<td>OR( ISBLANK( MailingStreet ), ISBLANK( MailingCity ), ISBLANK( MailingCountry ) )</td>
</tr>
<tr>
<td>Error Message</td>
<td>Mailing Street, City, and Country are required.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Top of Page</td>
</tr>
</tbody>
</table>

### Mailing Street Is Required

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the contact Mailing Street is provided.</td>
</tr>
<tr>
<td>Formula</td>
<td>ISBLANK( MailingStreet )</td>
</tr>
<tr>
<td>Error Message</td>
<td>Mailing Street is required.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Mailing Street</td>
</tr>
</tbody>
</table>
Mailing Zip Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the contact Mailing Zip/Postal Code is in 99999 or 99999-9999 format if Mailing Country is USA or blank.</td>
</tr>
</tbody>
</table>

**Formula:**

```plaintext
AND(
    OR(MailingCountry = "USA", ISBLANK(MailingCountry)),
    OR(
        AND(LEN(MailingPostalCode) <> 5,
            LEN(MailingPostalCode) <> 10),
        NOT(CONTAINS("0123456789", LEFT( MailingPostalCode, 1))),
        NOT(CONTAINS("0123456789", MID( MailingPostalCode , 2, 1))),
        NOT(CONTAINS("0123456789", MID( MailingPostalCode , 3, 1))),
        NOT(CONTAINS("0123456789", MID( MailingPostalCode , 4, 1))),
        NOT(CONTAINS("0123456789", MID( MailingPostalCode , 5, 1))),
        AND(
            LEN(MailingPostalCode) = 10,
            OR(
                MID( MailingPostalCode , 6, 1) <> "-",
                NOT(CONTAINS("0123456789", MID( MailingPostalCode , 7, 1))),
                NOT(CONTAINS("0123456789", MID( MailingPostalCode , 8, 1))),
                NOT(CONTAINS("0123456789", MID( MailingPostalCode , 9, 1))),
                NOT(CONTAINS("0123456789", MID( MailingPostalCode , 10, 1))
            )
        )
    )
)
)
```

**Note:** This example interprets a blank country as US. To use this example with other countries, remove the clause that checks the length of the country field. Also, validation rule criteria are case sensitive, so this rule is only enforced when the country is blank or “USA” in all capital letters. The rule is not enforced when the country is “usa.”

**Tip:** You can also validate zip codes using a regular expression; for an example of a formula using a regular expression, see `REGEX` on page 4147.

**Error Message:** Zip code must be in 99999 or 99999-9999 format.

**Error Location:** Mailing Zip/Postal Code
Phone Number Has International Format

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the Phone number begins with a plus sign (+) for country code. Note that this validation rule conflicts with the ten-digit rule.</td>
</tr>
<tr>
<td>Formula</td>
<td>LEFT(Phone, 1) &lt;&gt; &quot;+&quot;</td>
</tr>
<tr>
<td>Error Message</td>
<td>Phone number must begin with + (country code).</td>
</tr>
<tr>
<td>Error Location</td>
<td>Phone</td>
</tr>
</tbody>
</table>

US Phone Number Has Ten Digits

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the Phone number is in (999) 999-9999 format. This works by using the REGEX function to check that the number has ten digits in the (999) 999-9999 format.</td>
</tr>
<tr>
<td>Formula</td>
<td>NOT(REGEX(Phone, &quot;\D*?{10}&quot;))</td>
</tr>
<tr>
<td>Error Message</td>
<td>US phone numbers should be in this format: (999) 999-9999.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Phone</td>
</tr>
</tbody>
</table>

Sample Cross Object Validation Rules

For more information on any of the formula functions used in these examples, see Formula Operators and Functions on page 4106.

Discounts Must Be Within Range

This example consists of three validation rules on opportunity products. The examples below work together to help you manage discount amounts for products and require a custom percent field on opportunity products called Line Discount. The examples below also require you to use price books and customize the Product Family field to include the following values: Software, Consulting, and Training.

Software Discounts

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Prevents users from saving software products with a discount over 10 percent.</td>
</tr>
<tr>
<td>Formula</td>
<td>AND(Line_Discount__c &gt; 0.10, ISPICKVAL(Product2.Family, &quot;Software&quot;))</td>
</tr>
</tbody>
</table>
Welcome, Salesforce Point & Click Administrators

### Consulting Discounts

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Message</td>
<td>The discount must be 15% or less for consulting products.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Line Discount</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Prevents users from saving consulting products with a discount over 15 percent.</td>
</tr>
<tr>
<td>Formula</td>
<td>( \text{AND(Line Discount}_c &gt; 0.15, \text{ISPICKVAL(Product2.Family, &quot;Consulting&quot;))} )</td>
</tr>
<tr>
<td>Error Message</td>
<td>The discount must be 15% or less for consulting products.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Line Discount</td>
</tr>
</tbody>
</table>

### Training Discounts

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Message</td>
<td>The discount must be 20% or less for training products.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Line Discount</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Prevents users from saving training products with a discount over 20 percent.</td>
</tr>
<tr>
<td>Formula</td>
<td>( \text{AND(Line Discount}_c &gt; 0.20, \text{ISPICKVAL(Product2.Family, &quot;Training&quot;))} )</td>
</tr>
</tbody>
</table>

### Prevent Changing Opportunity Products on Closed Opportunities

This example consists of two validation rules: one on opportunity products and another on opportunities.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Error Message</td>
<td>Cannot change opportunity products for closed opportunities.</td>
</tr>
<tr>
<td>Error Location</td>
<td>Line Discount</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Prevents users from editing opportunity products after an opportunity is closed. Create the following validation rule example on opportunity products.</td>
</tr>
<tr>
<td>Formula</td>
<td>( \text{OR(ISPICKVAL(Opportunity.StageName, &quot;Closed Won&quot;), ISPICKVAL(Opportunity.StageName, &quot;Closed Lost&quot;))} )</td>
</tr>
</tbody>
</table>

### Working with Custom Fields
The following validation rule is on opportunities.

**Description:** Prevents users from deleting opportunity products after an opportunity is closed. Create the following validation rule example on opportunities. It uses a custom roll-up summary field on opportunities that counts the number of opportunity products on an opportunity.

**Formula:**
\[
\text{AND} \left( \text{OR} \left( \text{ISPKVAL(StageName, "Closed Won"),}
\text{ISPKVAL(StageName, "Closed Lost"))},
\text{Number_of_Line_Items__c} < \text{PRIORVALUE(Number_of_Line_Items__c)} \right) \right)
\]

**Error Message:** Cannot delete opportunity products for closed opportunities.

**Error Location:** Top of Page

---

**Prevent Saving a Case When Account Does Not Have Support**

**Description:** Prevents users from saving a case for an account that does not have support. This example assumes you have a custom checkbox field on accounts called **Allowed Support** that tracks if the account has support.

**Formula:**
\[
\text{Account.Allowed_Support__c} = \text{FALSE}
\]

**Error Message:** Unable to create cases for this account because it is not signed up for support.

**Error Location:** Top of Page

---

**Prevent Saving a Case When Contact is No Longer with the Company**

**Description:** Prevents users from saving an open case associated with a contact that is no longer with the company. This example uses a custom checkbox field on contacts called **No Longer With Company**.

---

**Sample Date Validation Rules**

For more information on any of the formula functions used in these examples, see Formula Operators and Functions on page 4106.

### Date Must Be a Weekday

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the value of a custom date field is a weekday (not Saturday or Sunday).</td>
</tr>
</tbody>
</table>
| Formula     | \[
|             | \text{CASE}\left( \right. \begin{array}{l}
|             | \text{MOD} \left( \text{My\_Date\_c} - \text{DATE}(1900, 1, 7), 7\right), \\
|             | 0, 0, \\
|             | 6, 0, \\
|             | 1 \right) = 0 \]
|             | \text{Date must be a weekday.} |

### Date Must Be a Weekend Day

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the value of a custom date field is a Saturday or Sunday.</td>
</tr>
</tbody>
</table>
| Formula     | \[
|             | \text{CASE} \left( \text{MOD} \left( \text{My\_Date\_c} - \text{DATE}(1900, 1, 7), 7\right), \\
|             | 0, 1, \\
|             | 6, 1, \\
|             | 0 \right) = 0 \]
|             | \text{Date must be a weekend day.} |

**Available in:** Both Salesforce Classic and Lightning Experience

**Available in:** Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com Editions
## Date Must Be in the Current Month

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that a custom date field contains a date within the current month and year.</td>
</tr>
</tbody>
</table>
| Formula:    | \[
\text{OR} \left( \text{YEAR(}\text{My\_Date\_c}\text{)} \neq \text{YEAR(}\text{TODAY()}\text{)}, \text{MONTH(}\text{My\_Date\_c}\text{)} \neq \text{MONTH(}\text{TODAY()}\text{)} \right) \]
| Error Message | Date must be in the current month. |
| Error Location | My Date |

## Date Must Be in the Current Year

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that a custom date field contains a date within the current year.</td>
</tr>
</tbody>
</table>
| Formula:    | \[
\text{YEAR(}\text{My\_Date\_c}\text{)} \neq \text{YEAR(}\text{TODAY()}\text{)} \]
| Error Message | Date must be in the current year. |
| Error Location | My Date |

## Date Must Be the Last Day of the Month

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates whether a custom field called My Date is the last day of the month. To do this, it determines the date of the first day of the next month and then subtracts 1 day. It includes special case logic for December.</td>
</tr>
</tbody>
</table>
| Formula:    | \[
\text{DAY(}\text{My\_Date\_c}\text{)} \neq \text{IF( MONTH(}\text{My\_Date\_c}\text{)}=12, 31, \text{DAY(DATE(YEAR(}\text{My\_Date\_c}\text{),MONTH(}\text{My\_Date\_c}\text{)}+1,1)-1) )} \]
| Error Message | Date must be the last day of the month. |
| Error Location | My Date |
# Working with Custom Fields

## Date Must Be Within One Year of Today

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates whether a custom field called <em>Follow-Up Date</em> is within one year of today's date. This example assumes a 365 day year. (It does not handle leap years.)</td>
</tr>
<tr>
<td><strong>Formula:</strong></td>
<td><code>Followup_Date__c - TODAY() &gt; 365</code></td>
</tr>
<tr>
<td><strong>Error Message:</strong></td>
<td>Follow-Up Date must be within one year of today.</td>
</tr>
<tr>
<td><strong>Error Location:</strong></td>
<td>Follow-Up Date</td>
</tr>
</tbody>
</table>

## Day of Month Cannot Be Greater Than 15

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that a custom field called <em>Begin Date</em> contains a date in the first 15 days of the specified month.</td>
</tr>
<tr>
<td><strong>Formula:</strong></td>
<td><code>DAY( Begin_Date__c ) &gt; 15</code></td>
</tr>
<tr>
<td><strong>Error Message:</strong></td>
<td>Begin Date cannot be after the 15th day of month.</td>
</tr>
<tr>
<td><strong>Error Location:</strong></td>
<td>Begin Date</td>
</tr>
</tbody>
</table>

## End Date Cannot Be Before Begin Date

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that a custom field called <em>End Date</em> does not come before another custom field called <em>Begin Date</em>.</td>
</tr>
<tr>
<td><strong>Formula:</strong></td>
<td><code>Begin_Date__c &gt; End_Date__c</code></td>
</tr>
<tr>
<td><strong>Error Message:</strong></td>
<td>End Date cannot be before Begin Date.</td>
</tr>
<tr>
<td><strong>Error Location:</strong></td>
<td>Begin Date</td>
</tr>
</tbody>
</table>
## Expiration Date Cannot Be Before Close Date

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Validates that a custom field called <code>Expiration Date</code> does not come before <code>Close Date</code>.</td>
</tr>
<tr>
<td>Formula:</td>
<td><code>Expiration_Date__c &lt; CloseDate</code></td>
</tr>
<tr>
<td>Error Message:</td>
<td><code>Expiration Date cannot be before Close Date.</code></td>
</tr>
<tr>
<td>Error Location:</td>
<td><code>Expiration Date</code></td>
</tr>
</tbody>
</table>

## Sample Number Validation Rules

For more information on any of the formula functions used in these examples, see Formula Operators and Functions on page 4106.

## Time Cards Must Total 40 Hours

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Ensures that users cannot save a time card record with more than 40 hours in a work week. This example requires five custom fields on your custom object, one for each day of work.</td>
</tr>
<tr>
<td>Formula:</td>
<td><code>Monday_Hours__c + Tuesday_Hours__c + Wednesday_Hours__c + Thursday_Hours__c + Friday_Hours__c &gt; 40</code></td>
</tr>
<tr>
<td>Error Message:</td>
<td>Your total hours cannot exceed 40.</td>
</tr>
<tr>
<td>Error Location:</td>
<td>Top of Page</td>
</tr>
</tbody>
</table>

## Number Cannot Be Negative

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Validates that a custom field called <code>Hours Worked</code> is not a negative number.</td>
</tr>
<tr>
<td>Formula:</td>
<td><code>Hours_Worked__c &lt; 0</code></td>
</tr>
<tr>
<td>Error Message:</td>
<td>Hours Worked cannot be less than zero.</td>
</tr>
<tr>
<td>Error Location:</td>
<td>Hours Worked</td>
</tr>
</tbody>
</table>
### Number Must Be Even

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that a custom field called <code>Ark Passengers</code> is a non-negative even number.</td>
</tr>
</tbody>
</table>
| **Formula:** | \[
\begin{align*}
\text{OR} & (\text{Ark Passengers} < 0, \\
& \text{MOD(} \text{Ark Passengers, 2} \text{)} \neq 0
\end{align*}
\] |
| **Error Message:** | `Ark Passengers` must be a positive even number. |
| **Error Location:** | `Ark Passengers` |

### Number Must Be Odd

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that a custom field called <code>Socks Found</code> is a non-negative odd number.</td>
</tr>
</tbody>
</table>
| **Formula:** | \[
\begin{align*}
\text{OR} & (\text{Socks Found} < 0, \\
& \text{MOD(} \text{Socks Found, 2} \text{)} = 0
\end{align*}
\] |
| **Error Message:** | `Socks Found` must be an odd number. |
| **Error Location:** | `Socks Found` |

### Number Must Be a Multiple of Five

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that a custom field called <code>Multiple of 5</code> is a multiple of five.</td>
</tr>
<tr>
<td><strong>Formula:</strong></td>
<td>[\text{MOD(} \text{Multiple of 5}, 5 \text{)} \neq 0]</td>
</tr>
<tr>
<td><strong>Error Message:</strong></td>
<td><code>Number</code> must be a multiple of five.</td>
</tr>
<tr>
<td><strong>Error Location:</strong></td>
<td><code>Multiple of 5</code></td>
</tr>
</tbody>
</table>
### Number Must Be an Integer

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that a custom field called <em>My Integer</em> is an integer.</td>
</tr>
<tr>
<td>Formula</td>
<td><code>FLOOR(My_Integer__c) &lt;&gt; My_Integer__c</code></td>
</tr>
<tr>
<td>Error Message</td>
<td>This field must be an integer.</td>
</tr>
<tr>
<td>Error Location</td>
<td><em>My Integer</em></td>
</tr>
</tbody>
</table>

### Number Must Be Between -50 and 50

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that a custom field called <em>Volume</em> is between -50 and 50.</td>
</tr>
<tr>
<td>Formula</td>
<td><code>ABS(Volume__c) &gt; 50</code></td>
</tr>
<tr>
<td>Error Message</td>
<td>Volume must be between -50 and 50.</td>
</tr>
<tr>
<td>Error Location</td>
<td><em>Volume</em></td>
</tr>
</tbody>
</table>

### Number Range Validation

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Validates that the range between two custom fields, <em>Salary Min</em> and <em>Salary Max</em>, is no greater than $20,000.</td>
</tr>
<tr>
<td>Formula</td>
<td><code>Salary_Max__c - Salary_Min__c &gt; 20000</code></td>
</tr>
<tr>
<td>Error Message</td>
<td>Salary range must be within $20,000. Adjust the Salary Max or Salary Min values.</td>
</tr>
<tr>
<td>Error Location</td>
<td><em>Salary Max</em></td>
</tr>
</tbody>
</table>
Percentage Must Be Between Zero and 100

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Validates that a custom field called Mix Pct is between 0 and 100%. Note that percent fields are expressed divided by 100 in formulas (100% is expressed as 1; 50% is expressed as 0.5).</td>
</tr>
</tbody>
</table>
| Formula:       | \[ \begin{align*} 
    \text{OR} ( \\
    & \text{Mix Pct} > 1.0, \\
    & \text{Mix Pct} < 0.0 \\
    \end{align*} \) |
| Error Message: | Mix Pct must be between 0 and 100%.                                  |
| Error Location:| Mix Pct                                                               |

Sample Opportunity Management Validation Rules

For more information on any of the formula functions used in these examples, see Formula Operators and Functions on page 4106.

Conditionally-Required Field Based on Opportunity Stage

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Validates that a custom field called Delivery Date is provided if an opportunity has advanced to the Closed Won or Negotiation/Review stage.</td>
</tr>
</tbody>
</table>
| Formula:       | \[ \begin{align*} 
    \text{AND} ( \\
    & \text{OR} ( \\
    & \text{ISPKVIL(StageName, "Closed Won"),} \\
    & \text{ISPKVIL(StageName, "Negotiation/Review")),} \\
    & \text{ISBLANK(Delivery Date)} \\
    \end{align*} \) |
| Error Message: | Delivery Date is required for this stage.                             |
| Error Location:| Delivery Date                                                         |
## Close Date Cannot Be Prior to Current Month

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Validates that the Close Date of an opportunity is not within a month prior to the current month. Note the use of ISNEW and ISCHANGED in this formula to ensure the condition is only checked when the opportunity is being created or the Close Date field is modified subsequently.</td>
</tr>
</tbody>
</table>

**Formula:**

```plaintext
AND(
    OR (
        ISNEW(),
        ISCHANGED( CloseDate )),
    CloseDate < DATE( YEAR(TODAY()), MONTH(TODAY()), 1 ) )
```

| Error Message: | Close Date cannot be prior to current month. |
| Error Location: | Close Date |

## Close Date Must Be a Future Date

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>
<td>Ensures that users do not change the Close Date of an opportunity to a day in the past.</td>
</tr>
</tbody>
</table>

**Formula:**

```plaintext
SampleDate < TODAY()
```

| Error Message: | Close Date cannot be a day in the past. |
| Error Location: | Close Date |

## Discounts on Opportunities

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description:</strong></td>

\text{RIGHT( Web\_Site\_c, 6) <> ".co.uk"})
\] |
| **Error Message:** | Web Site must have an extension of .com, .org, .net, or .co.uk. |
| **Error Location:** | Web Site |

Require Field Input to Ensure Data Quality

Improve the quality of data that users enter in Salesforce by creating universally required fields. A universally required field is a custom field that must have a value whenever a record is saved within Salesforce, the Force.com API, Connect Offline, Salesforce for Outlook, the Self-Service portal, or automated processes such as Web-to-Lead and Web-to-Case. Making a field required on a page layout or through field-level security ensures users must enter a value, but making a field required universally gives you a higher level of data quality beyond the presentation level of page layouts.

You can make the following types of custom fields universally required:

- Currency
- Date
- Date/Time
- Email
- Master-Detail Relationship (always required)
- Number
- Percent
- Phone
- Text
- Text Area
- URL

To make a custom field universally required, select the Required checkbox when defining the custom field.

**Note:** You must specify a default value for required campaign member custom fields.

If you make a user field universally required, you must specify a default value for that field.
Relationship group members do not support universally required fields.

Considerations for Universally Required Fields

Considerations for Universally Required Fields

A universally required field is a custom field that must have a value whenever a record is saved within Salesforce, the Force.com API, Connect Offline, Salesforce for Outlook, the Self-Service portal, or automated processes such as Web-to-Lead and Web-to-Case. Review the following considerations before making your custom fields universally required.

- Standard fields cannot be universally required.
- Universally required fields are required across all record types.
- Edit pages always display universally required fields, regardless of field-level security.
- When designing your page layouts, universally required fields:
  - Cannot be removed from a page layout
  - Are automatically added to the end of the first section of a page layout if not already on it
  - Cannot be read only or optional
  - Display in bold, indicating they are always visible
  - Are disabled on the field properties page because you cannot remove the required setting
- Universally required fields are only enforced during lead conversion if validation and triggers for lead conversion are enabled in your organization.
- Quick Create does not enforce universally required fields.
- If you make an activity custom field universally required, you must also provide a default value.
- You must include universally required fields in your import files or the import will fail.
- Don’t assign default values to fields that are both required and unique, because uniqueness errors can result.
- You cannot make a field universally required if it is used by a field update that sets the field to a blank value.
- Required fields may be blank on records that existed before making the field required. When a user updates a record with a blank required field, the user must enter a value in the required field before saving the record.
- Web-to-Lead and Web-to-Case request data is not validated by Salesforce. Invalid data isn’t saved when requests are submitted. For example, if your custom field is a currency field and a user enters alphabetic characters such as “Abc” instead of numbers, the request is still submitted but with no value saved in the custom currency field.

Require Field Input to Ensure Data Quality
About Field Sets

A field set is a grouping of fields. For example, you could have a field set that contains fields describing a user’s first name, middle name, last name, and business title. When a field set is added to a Visualforce page, developers can loop over its fields and render them. If the page is added to a managed package, administrators can add, remove, or reorder fields in a field set to modify the fields presented on the Visualforce page without modifying any code. The same Visualforce page can present different sets of information, depending on which fields a subscriber prefers to keep. As an administrator, you can create or edit field sets for your organization, or edit any installed field set. Field sets are available on all standard objects that support custom fields, and any organization that supports creating Visualforce pages.

Fields added to a field set can be in one of two categories:

- If a field is marked as **Available for the Field Set**, it exists in the field set, but the developer hasn’t presented it on the packaged Visualforce page. Administrators can display the field after the field set is deployed by moving it from the Available column to the In the Field Set column.
- If a field is marked as **In the Field Set**, the developer has rendered the field on the packaged Visualforce page by default. Administrators can remove the field from the page after the field set is deployed by removing it from the In the Field Set column.

- ISVforce Guide

Creating and Editing Field Sets

Salesforce has a drag-and-drop WYSIWYG tool for creating and editing field sets. The enhanced field sets editor is enabled by default, and provides all of the functionality of the original editor, as well as additional functionality and an easier-to-use WYSIWYG interface.

1. From the management settings for the appropriate object, go to Field Sets, and then click New.
2. Enter a **Field Set Label**. This is the name presented to subscribers who install the field through a managed package.
3. Optionally, enter a name for your field set. This is used by your Visualforce page to reference the field set.
4. In the **Where is this used?** area, provide a brief description of which Visualforce pages use the field set, and for what purpose. This information helps a subscriber understand where and how an installed field set is being used, so that they can populate it with their own fields.
5. Save your changes.
6. To add fields to the field set, drag the fields from the object palette and drop them into the Available for the Field Set or the In the Field Set container. The fields in the Available for the Field Set container are not initially visible on the Visualforce page. The fields in the In the Field Set container are visible by default.

**Note**: In the field set, you can span to fields that reference multiple objects. When you span a field into a field set that references multiple objects, the only field you can span to is the Name object.
You can drag and drop a field from one container to the other. The vertical order of the In the Field Set list indicates the order of how the fields render on Visualforce pages.

7. To remove a field from the field set, drag the element back to the object palette, or click the icon next to the element.
8. To make a field required, double click the element or click the wrench icon (🔧) next to it and select the Required checkbox.

**Note:** Indicates the field is required and must have a value to save the record.

9. Save your changes.

**Important:** The total number of cross object spans within the In the Field Set container can't exceed 25.

After a field set is deployed in your organization, you can always mark fields that are in the Available for the Field Set list as In the Field Set, or vice versa. To do so:

1. Find the field set that you want to edit. From Setup enter Installed Packages in the Quick Find box, select Installed Packages, click an installed package, and then click the field set you want to edit. Alternatively, if you know which object contains the field set you want to edit, go to the object detail page and click Edit in the field set related list.

2. If you didn't create the field set initially, you'll only be able to edit the fields within the field set. To move fields between containers, drag and drop a field from one container to the other. To change the order of a rendered field, drag a field up or down the list and drop the field in the order you want it to appear.

3. Save your changes.

### Field Sets Required Bit

You can define a field as required when you create or edit field sets. You may want to define a field as required to ensure a user enters the necessary information on a field. The required field is only available in the In the Field Set container. If you define a field as required in the In the Field Set container, and remove the field from the In the Field Set, the required attribute is removed.

**Note:** If you remove fields that were made required by an installed managed package from the In the Field Set container, the required attribute isn't removed from those fields.

To define a field as required in a field set, see Creating and Editing Field Sets on page 4084

**SEE ALSO:**
- About Field Sets
- Creating and Editing Field Sets
Roll-Up Summary Field

A roll-up summary field calculates values from related records, such as those in a related list. You can create a roll-up summary field to display a value in a master record based on the values of fields in a detail record. The detail record must be related to the master through a master-detail relationship. For example, you want to display the sum of invoice amounts for all related invoice custom object records in an account’s Invoices related list. You can display this total in a custom account field called Total Invoice Amount.

You can perform different types of calculations with a roll-up summary field. You can count the number of detail records related to a master record. Or, you can calculate the sum, minimum value, or maximum value of a field in the detail records.

Before you begin creating roll-up summary fields for your organization, review the implementation tips and best practices.

Implementation Tips

Administration

- Create roll-up summary fields on:
  - Any custom object that is on the master side of a master-detail relationship
  - Any standard object that is on the master side of a master-detail relationship with a custom object
  - Opportunities using the values of opportunity products related to the opportunity
  - Accounts using the values of related opportunities
  - Campaigns using campaign member status or the values of campaign member custom fields

  Note: Campaign member custom formula fields that reference fields derived from leads or contacts are not supported.

- The types of fields you can calculate in a roll-up summary field depend on the type of calculation. For example,
  - Number, currency, and percent fields are available when you select SUM as the roll-up type.
  - Number, currency, percent, date, and date/time fields are available when you select MIN or MAX as the roll-up type.

- Sometimes you can’t change the field type of a field that you reference in a roll-up summary field.

- Make sure that the filter for your roll-up summary does not encounter a formula field that results in "#Error!". If one of your filter criteria uses a formula field that results in an error, no matches are returned for that filter criterion. For example, your roll-up summary filter is “Formula Field equals 10". Two records contain errors, and one contains the value “10” in that field. In this case, your summary includes only the record with the value “10”.

- Salesforce does not recalculate the value of campaign roll-up summary fields when leads or contacts are deleted. Select the Force a mass recalculation on this field option on the edit page of a campaign roll-up summary field to manually recalculate the value.

- You can’t use long text area, multi-select picklist, Description fields, system fields like Last Activity, cross-object formula fields, and lookup fields in the field column of roll-up summary filters.

- Auto number fields are not available as the field to aggregate in a roll-up summary field.

- After you have created a roll-up summary field on an object, you cannot convert the object’s master-detail relationship into a lookup relationship.

- Roll-up summary fields are not available for mapping lead fields of converted leads.

Management
If a roll-up summary field doesn’t contain cross-object field references or functions that derive values on the fly, such as NOW or TODAY, it can calculate the values of formula fields.  

**Note:** The value of a formula field can result in “#Error!”, which affects the summarized total. If your roll-up summary type is COUNT, records are included regardless of whether they contain a formula field with an error. However, when the Field to Aggregate is a formula field that results in “#Error!”, calculations of type MIN, MAX, and SUM exclude those formula values.

Changes to the value of a roll-up summary field can trigger assignment rules to run. If a roll-up summary field is part of the criteria in an assignment rule, the field’s new value is used to evaluate whether to reassign the record.

A roll-up summary field can trigger workflow rules and field validations. However, workflow rules and field validations do not fire when the following changes cause a mass recalculation of roll-up summary values:

- Changing the roll-up summary definition (such as the object, function, or field being aggregated)
- Changing the expression of a formula field referenced in a roll-up summary field
- Replacing picklist values for picklist fields referenced in the roll-up summary filter
- Changing picklist record type definitions
- Changing currency conversion rates
- Changing price book entries

Calculating roll-up summary field values can take up to 30 minutes, depending on the number of records affected and other factors.

You aren’t prevented from creating roll-up summary fields that can result in invalid values, such as February 29 in a non-leap year. If a roll-up summary field results in an invalid value, the value is not recalculated. The field continues to display with an invalid roll-up summary icon ( thở) until you change the values being summarized.

If your organization uses multiple currencies, the currency of the master record determines the currency of the roll-up summary field. For example, if the master and detail records are in different currencies, the detail record value is converted into the currency of the master record.

Changing a conversion rate triggers roll-up summary fields to recalculate. If you’re using multiple currencies, we recommend changing the conversion rate from Manage Currencies in Setup, and not from the API. If you change the rate from the API, related jobs that are less than 24 hours old can interfere with your change. For details, see Edit Conversion Rates.

If your organization has advanced currency management enabled, currency roll-up summary fields are invalid if they are on accounts and summarizing opportunity values, or on opportunities and summarizing custom object values.

Salesforce prevents users from saving a record if it invalidates a related record. For example, a master record has a validation rule that requires the roll-up summary field value to be greater than 100. If the user’s change to a related child record would put the value over 100, the user can’t save the record.

If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they’re in a lookup relationship.

To be used in a roll-up summary field with a Roll-Up Type of COUNT or SUM, the lookup field must have the What to do if the lookup record is deleted? option set to Don’t allow deletion of the lookup record that’s part of a lookup relationship. If the option Clear the value of this field. You can’t choose this option if you make the field required is selected, you can’t create a COUNT or SUM roll-up summary field that pulls data from your lookup field.

**Best Practices**

- Apply field-level security to your roll-up summary fields if they calculate values that you do not want visible to users. Fields that your users cannot see due to field-level security settings on the detail record are still calculated in a roll-up summary field.
• If you have validation rules, consider how they affect roll-up summary fields. The value in a roll-up summary field changes when the values in the detail records change. So, validation errors can display when saving either the detail or master record.

• Because roll-up summary fields are not displayed on edit pages, you can use them in validation rules but not as the error location for your validation.

• Avoid referencing a roll-up summary field from a child record. The roll-up summary fields referenced from child records can have outdated values, because their parent records have not been updated. Instead, reference roll-up summary fields from parent records. Your roll-up summary fields will always have updated values, because that rule runs after the parent value has been updated.

If you’re trying to enforce a record limit of 25 on the parent roll-up summary field, create validation rules on your child objects. When you add a child record, your validation rule on the child object can check if the count is already 25 or greater.

```
AND(ISNEW(), Sample.Line_Count__c >= 25)
```

• Plan your implementation of roll-up summary fields carefully before creating them. Once created, you cannot change the detail object selected or delete any field referenced in your roll-up summary definition.

• Advanced currency management affects roll-up summary fields. If your organization enables advanced currency management, delete the currency roll-up summary fields on accounts that summarize opportunity values and on opportunities that summarize custom object values. Otherwise, the fields continue to display with an invalid roll-up summary icon because their values are no longer calculated.

• Automatically derived fields, such as current date or current user, aren't allowed in a roll-up summary field. Forbidden fields include formula fields containing functions that derive values on the fly, such as DATEVALUE, NOW, and TODAY. Formula fields that include related object merge fields are also not allowed in roll-up summary fields.

  Custom Fields Allowed Per Object
  Defining Roll-Up Summaries
  Create Custom Fields
Defining Roll-Up Summaries

Define roll-up summary fields on the object that is on the master side of a master-detail relationship. If a relationship does not already exist, first create a master-detail relationship between the master object that displays the value and the detail object containing the records you are summarizing.

To define a roll-up summary field:

1. Create a custom field on the object where you want the field displayed. Summary fields summarize the values from records on a related object, so the object on which you create the field should be on the master side of a master-detail relationship. For instructions on creating a custom field, see Create Custom Fields on page 3997.

2. Choose the Roll-Up Summary field type, and click Next.

3. Enter a field label and any other attributes. Click Next.

4. Select the object on the detail side of a master-detail relationship. This object contains the records you want to summarize.

5. Select the type of summary:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>COUNT</td>
<td>Totals the number of related records.</td>
</tr>
<tr>
<td>SUM</td>
<td>Totals the values in the field you select in the Field to Aggregate option. Only number, currency, and percent fields are available.</td>
</tr>
<tr>
<td>MIN</td>
<td>Displays the lowest value of the field you select in the Field to Aggregate option for all directly related records. Only number, currency, percent, date, and date/time fields are available.</td>
</tr>
<tr>
<td>MAX</td>
<td>Displays the highest value of the field you select in the Field to Aggregate option for all directly related records. Only number, currency, percent, date, and date/time fields are available.</td>
</tr>
</tbody>
</table>

6. Enter your filter criteria if you want a selected group of records in your summary calculation. If your organization uses multiple languages, enter filter values in your organization’s default language.

When you use picklists to specify filter criteria, the selected values are stored in the organization’s default language. If you edit or clone existing filter criteria, first set the Default Language on the Company Information page to the same language that was used to set the original filter criteria. Otherwise, the filter criteria may not be evaluated as expected.

7. Click Next.

8. Set the field-level security to determine whether the field should be visible for specific profiles, and click Next.

9. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.

10. Click Save to finish or Save & New to create more custom fields.

Roll-Up Summary Field
Lookup Filters

Improve user productivity and data quality with lookup filters. Lookup filters are administrator settings that restrict the valid values and lookup dialog results for lookup, master-detail, and hierarchical relationship fields.

Administrators specify the restrictions by configuring filter criteria that compare fields and values on:

- The current record (source)
- The lookup object (target)
- The user’s record, permissions, and role
- Records directly related to the target object

For example, you can:

- Restrict the Account Name field on opportunities to allow only accounts with a record type of Customer, filtering out Partner and Competitor.
- Restrict the Account Name field on opportunities to allow only active accounts.
- Restrict the Contact field on cases to allow only contacts associated with the account specified in the Account Name field on the case record.
- Restrict the Account Name field on cases to allow only users with the “International Sales” profile to create or edit cases for accounts outside the United States.

⚠️ Tip: When you define a lookup filter, optionally click Insert Suggested Criteria to choose from a list of lookup filter criteria that Salesforce suggests based on the relationships between objects in your org.

Administrators can make lookup filters required or optional.

- For fields with required lookup filters, only values that match the lookup filter criteria appear in the lookup dialog. Also, users can’t save invalid values manually typed in the field when editing the record. If a user tries to save an invalid value, Salesforce displays an error message, which administrators can customize.
- For fields with optional lookup filters, only values that match the lookup filter criteria appear in the lookup dialog initially; however, users can click the Show all results link in the lookup dialog to remove the filter and view all search result values for the lookup field. Also, optional lookup filters allow users to save values that don’t match the lookup filter criteria, and Salesforce does not display an error message if a user tries to save such values.

Lookup filter criteria can compare fields on the source object with different types of fields on the target object as long as the fields are compatible.

<table>
<thead>
<tr>
<th>Source Object Field Type</th>
<th>Compatible Target Object Field Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Currency</td>
<td>Currency, Roll-Up Summary</td>
</tr>
<tr>
<td>Date</td>
<td>Date, Date/Time, Roll-Up Summary</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Date, Date/Time, Roll-Up Summary</td>
</tr>
<tr>
<td>Hierarchy</td>
<td>Hierarchy, Lookup, Master-Detail</td>
</tr>
<tr>
<td>Lookup</td>
<td>Hierarchy, Lookup, Master-Detail</td>
</tr>
<tr>
<td>Master-Detail</td>
<td>Lookup, Hierarchy, Master-Detail</td>
</tr>
<tr>
<td>Number</td>
<td>Number, Percent, Roll-Up Summary</td>
</tr>
</tbody>
</table>
## Supported Objects

Salesforce supports lookup filters on relationship fields that point to:

- Accounts
- Assets
- Badges
- Badges Received
- Business Hours
- Campaigns
- Cases
- Contacts
- Content Folders
- Contracts
- Endorsements
- Entitlements
- Ideas
- Leads
- Opportunities
- Order Products
- Orders
- Price Books
- Products
- Quotes
- Service contracts
- Skill Users
- Skills
- Social Personas
- Solutions
- Thanks
- User Provisioning Accounts
- User Provisioning Logs
- User Provisioning Requests
- Users
- Work Order Line Items
- Work Orders
Define Lookup Filters

1. You can create lookup filters for new relationship fields in step 3 of the custom field wizard.  
   a. From the management settings for the field’s object, go to Fields.  
   b. Click Edit next to the name of the lookup or master-detail relationship field to which you want to apply the filter.

2. In the Lookup Filter Options section, click Show Filter Settings.

3. Specify the filter criteria a record must meet to be a valid value. To specify criteria, click Insert Suggested Criteria and choose from a list of suggested criteria, or manually enter your own criteria. To enter your own criteria:
   a. In the first column, click the lookup icon or start typing in the text box and select a field.  
   b. In the second column, select an operator.  
   c. In the third column, select Value if Salesforce should compare the field in the first column with a static value, or select Field if Salesforce should compare the field in the first column with the value of another field.  
   d. In the fourth column, enter the value or select the field that Salesforce should compare with the field in the first column.

   Note:
   - Click Add Filter Logic to add Boolean conditions.  
   - Select a suggested field from the Field text box. You can only select fields on the current record, the lookup object, or the user record. You can also choose related fields that are one relationship away from the lookup object. Salesforce assists you by listing the available fields and relationships when you click the lookup icon or click inside the text box.  
   - Lookup filter criteria can compare fields of different types as long as they are compatible.

4. Specify whether the filter is required or optional. For fields with optional lookup filters, only values that match the lookup filter criteria appear in the lookup dialog initially; however, users can click the Show all results link in the lookup dialog to remove the filter and view all search result values for the lookup field. Also, optional lookup filters allow users to save values that don’t match the lookup filter criteria, and Salesforce does not display an error message if a user tries to save such values.
   For required lookup filters, specify whether you want Salesforce to display the standard error message or a custom message when a user enters an invalid value.

5. Optionally, enter text to display in the lookup search dialog. Consider text that guides users in their searches and explains the business rule that the lookup filter implements.

6. Leave Enable this filter selected.
7. Save your changes.

SEE ALSO:
- Notes on Lookup Filters
- Dependent Lookups
- Lookup Filter Examples
- Find Object Management Settings

Delete or Deactivate Lookup Filters

1. From the managements settings for the relationship field’s object, go to Fields.
2. Scroll to the Custom Fields & Relationships related list.
3. Click the name of the field containing the lookup filter.
4. Click Edit.
5. To deactivate the lookup filter, deselect Enable this filter, then save your changes. Deactivating a lookup filter preserves the lookup filter configuration but:
   - Prevents it from applying to the relationship field
   - Prevents it from impacting the cross-object references limit
   - Removes it as a dependency for fields referenced in the lookup filter criteria
6. To delete the lookup filter, click Clear Filter Criteria, then save your changes. Deleting a lookup filter permanently removes it. You can’t recover deleted lookup filters.

SEE ALSO:
- Dependent Lookups
- Notes on Lookup Filters
- Find Object Management Settings

View a List of Lookup Filters for a Target Object

You can quickly see a list of all of the lookup filters that restrict the values of each target object. This is useful when creating similar filters for a target object. Also, lookup filters that reference fields on related objects count against the cross-object reference limit, which is the number of unique relationships allowed for a target object. The Related Lookup Filters list lets you see which lookup filters might impact that limit.

To see which lookup filters affect the limit for a particular target object, from the management settings for the object, go to Related Lookup Filters.

SEE ALSO:
- Dependent Lookups
- Notes on Lookup Filters
Dependent Lookups

A dependent lookup is a relationship field with a lookup filter that references fields on the source object. For example, you can configure the case Contact field to only show contacts associated with the account selected in the case Account Name field.

When a user changes the value of a referenced field on the source object, Salesforce immediately verifies that the value in the dependent lookup still meets the lookup filter criteria. If the value doesn’t meet the criteria, an error message is displayed and users can’t save the record until the value is valid.

If the referenced field on the source object is a lookup, master-detail, or hierarchy field, users can’t change its value by typing. Instead, users must click the lookup icon and select a value in the lookup search dialog.

⚠️ Tip: Dependent lookups are supported in Visualforce pages.

SEE ALSO:
- Define Lookup Filters
- Lookup Filter Examples

Notes on Lookup Filters

- On the Fields page, the 🔍 icon indicates all fields with active lookup filters. The ✨ icon indicates that the lookup filter is required.
- The lookup filters you create in Salesforce also appear in the partner portal and Customer Portal.
- Lookup filters are case-sensitive.
- If you convert a required lookup filter with a custom error message to optional, Salesforce deletes the message.
- If you create a lookup filter that invalidates an existing value for that field, the value persists; however, when a user edits the record, Salesforce displays an error message and requires the user to change the invalid value before saving.
- Salesforce prevents you from saving changes that cause required lookup filters on related records to contain invalid values.
- Versions 16.0 and higher of the Salesforce API support lookup filters. Lookup filters are enforced when you load data through the API.
- If you configure a lookup filter to show inactive users only, the relationship field has no valid options because inactive users are never valid for relationship fields that point to the User object.
- If you create a filtered lookup on a field that looks up to another object, both objects must be deployed into the organization at the same time.
- Salesforce does not display an error message if the value of a controlling field invalidates the value of a dependent master-detail relationship field.
- Dependent lookups are supported in Visualforce pages.
Spanning Relationships in Lookup Filters

Filter criteria can include fields directly related to the target object (one level only). For example, on a lookup field pointing to contacts, a lookup filter can reference fields on the account related to the contact via the Account Name relationship field. The lookup field can also reference fields on the contact related to the contact via the Reports To relationship field.

For required lookup filters, each field referenced on a related lookup object counts against the number of unique relationships allowed for the referenced object, not the source object. For example, the two unique relationships described above count against the number allowed for the Contact object. Optional lookup filters don’t count against the limit on the number of unique relationships allowed per object.

To see which lookup filters affect the limit for a particular target object, from the management settings for the object, go to Related Lookup Filters.

Lookup Filters vs. Validation Rules

Validation rules and lookup filters achieve similar ends, but offer different advantages. Use a lookup filter if:

- You want to improve user efficiency by limiting the number of available options in a lookup search dialog.
- You want to improve user efficiency by automating filters on lookup search dialogs that your users manually set.

Use a validation rule if:

- You’re close to the maximum number of lookup filters allowed.
- You must implement a complex business rule that requires you to use a formula. Formulas can reference fields that basic filter criteria can’t reference, such as fields on the parent of the source object. Formulas can also use functions. For example, use ISNEW if the rule should only apply on record creation, or ISCHANGED if the rule should apply when a field changes.

SEE ALSO:
  - Lookup Filters
  - Dependent Lookups

Notes on Using Lookup Filters with Person Accounts

If your organization uses person accounts, note the following:

- Person Accounts don’t support Contact filters; however, Person Accounts support Account filters. For example, if the Account field has a dependent lookup filter that’s added to a Person Account, dependent lookups are supported. If the Contact field has a dependent lookup filter that’s added to a Person Account, dependent lookups isn’t supported.
- Lookup filter criteria on Account Name only apply to business accounts, not person accounts. For example, if your lookup filter criteria is Account Name does not contain book, business accounts with “book” in the name, such as John’s Bookstore, are not valid, but person accounts with “book” in the name, such as John Booker, are valid and appear in the lookup dialog for the Account field. If you need to filter on the name for a person account, use the First Name or Last Name fields instead.
- Use the Is Person Account field in your lookup filter criteria to restrict the valid values of a lookup field to one type of account (either person accounts or business accounts). For example, to restrict a lookup to only person accounts, include the following in your lookup filter criteria: Is Person Account equals True.
You can’t package lookup filters that reference standard fields specific to person accounts, such as the Email and Title fields.

SEE ALSO:
  Lookup Filters

Lookup Filters Best Practices

Custom Help
Define custom help for fields with lookup filters to let users know about the business rule the filter enforces. For example, if the lookup filter restricts the Account Name on opportunities to only allow active accounts, define custom help that states You can only associate active accounts with opportunities.

Error Messages
Customize lookup filter error messages to guide users who type invalid values. For example, if the lookup filter restricts the Account Name on opportunities to only allow active accounts, define an error message that states Value doesn’t exist or isn’t an active account.

Important: Salesforce translates the standard error message for required lookup filters, but not custom error messages. Use the Translation Workbench to translate lookup filter custom error messages. To restore the standard error message after modifying it, click Reset to default message.

Working with Master-Detail Relationship Fields
When creating a lookup filter on a master-detail relationship field, verify that the current values of the field on all of the detail records meet the criteria you specify. If you specify criteria that an existing value doesn’t meet, Salesforce prevents the user from saving changes to the detail record. If this occurs, the user must first modify the value on the master record to meet the criteria. For example, consider a custom object with a master-detail relationship field that points to accounts. If you define a lookup filter that excludes all accounts with a Create Date before 01/01/2009, verify that no existing records of that custom object have a master-detail relationship with any account created before 2009. A quick way to do this is to create a report that shows all accounts with a Create Date before 01/01/2009.

Profile-Based Lookup Filters
Use Current User Profile: ID in filter criteria to define different filter criteria for different users, or to let administrators enter values that don’t match the criteria. Avoid using Current User Profile: Name due to technical limitations on standard profiles.

If you enter Current User Profile: Name or Profile: Name in the Field column of your lookup filter criteria, Salesforce displays a lookup icon in that row. Click the lookup icon to select from a list of existing profiles rather than typing profile names.

Record IDs vs. Record Names
To reference a specific record in filter criteria, use the ID of the record instead of its name. IDs are always unique whereas names are not.

Testing
After creating a lookup filter, test it to make sure it is not too restrictive. Depending on their permissions, some users may have read-only access to some relationship fields; ensure your lookup filters don’t prevent those users from editing records critical to their job functions.

Dependent Lookups on Page Layouts and Mini Page Layouts in the Console
When designing page layouts with dependent lookups:
• If a dependent lookup is above its controlling field on a layout, make its lookup filter optional or redesign the layout. Moving a required dependent lookup above its controlling field may confuse users who typically start from the top of a page when entering data.
• Ensure that both the controlling and dependent fields are visible so users can correct invalid values.

**Lookup Filters and the Lookup Filter Fields Search Layout**
Don’t reference the same fields in both lookup filter criteria and the Lookup Filter Fields search layout. Users might assume that results from their custom search override administrator-controlled lookup filters.

SEE ALSO:
* Lookup Filters

**Lookup Filter Examples**

**Record Types in Lookup Filters**
If the value of a relationship field should only consist of records with a particular record type, specify the record type in a lookup filter. For example, if the Account Name field on opportunities should only have accounts with a Customer Account custom record type, define the following lookup filter to restrict users to only creating or editing opportunities associated with accounts that have a Customer Account record type, excluding accounts with Partner Account and Competitor Account record types:

**Filter Criteria**
- Account Name: Account Record Type equals value Customer Account

**Custom Error Message**
- Account does not exist or is not a customer account.

**Lookup Window Text**
- You can only associate customer accounts to an opportunity. Search results only display customer accounts.

**Record Status in Lookup Filters**
If the value of a relationship field should only consist of records with particular status, specify the status in a lookup filter. For example, consider a Job Application object with a relationship field that points to the Position object. If the relationship field should only have open positions, define the following lookup filter to restrict users to only creating or editing job applications for positions with the Status field set to Open:

**Filter Criteria**
- Position: Status equals value Open

**Custom Error Message**
- Position does not exist or is not an open position.

**Lookup Window Text**
- You can associate only open positions with job applications. Search results display open positions only.
Profiles in Lookup Filters

When a business rule does not apply to users with every profile, use the Current User Profile global variable fields to define lookup filters that only affect users with a particular profile.

For example, the following lookup filter on the Case object Account Name field restricts users with a "Domestic Sales" profile to only creating or editing opportunities associated with accounts that have a billing country of "USA" while allowing other users to associate opportunities with any account:

Filter Criteria
1. Current User Profile: Name equals value Domestic Sales
2. Account Name: Billing Country equals value USA
3. Current User Profile: Name not equal to value Domestic Sales

Filter Logic
(1 AND 2) OR 3

Custom Error Message
Account does not exist or the account billing country is not USA. Domestic sales reps can only create opportunities for accounts in the United States.

Lookup Window Text
Search results show only United States accounts in the for domestic sales representatives.

You can modify the above example to simultaneously restrict users with a "Global Sales" custom profile to only associating opportunities to accounts with a non-US billing country:

Filter Criteria
1. Current User Profile: Name equals value Global Sales
2. Account Name: Billing Country not equal to value USA
3. Current User Profile: Name equals value Domestic Sales
4. Account Name: Billing Country equals value USA
5. Current User Profile: Name not equal to value Global Sales, Domestic Sales

Filter Logic
(1 AND 2) OR (3 AND 4) OR 5

Custom Error Message
Account does not exist or the account billing country is not in your sales area. Sales reps can only create opportunities for accounts in their sales area.

Lookup Window Text
Search results only display accounts in your region.

Important: If you do not include line 5 in the filter criteria, users who are not in Global Sales or Domestic Sales cannot select or save any values on account records.

Roles in Lookup Filters

When a business rule does not apply to users in every role, use the Current User Role global variable fields to define lookup filters that only affect users with particular roles. For example, in a recruiting application that has a Position object with a lookup field to a Compensation Package object, you can restrict users from editing or creating positions that have an executive compensation plan.
unless they are executive administrators or vice presidents. To do this, define the following lookup filter on the Position object:

**Compensation Package Name field:**

**Filter Criteria**

1. **Current User Role:** Name does not start with value VP
2. **Current User Role:** Name does not equal value Executive Administrator
3. **Compensation Package:** Plan Type does not equal value Executive
4. **Current User Role:** Name starts with value VP
5. **Current User Role:** Name equals value Executive Administrator

**Filter Logic**

\((1 \text{ OR } 2) \text{ AND } 3) \text{ OR } (4 \text{ OR } 5)\)

**Custom Error Message**

The compensation plan does not exist, or you have selected an executive compensation plan but do not have access to create executive positions.

**Lookup Window Text**

Search results only display compensation plans that are relevant to positions you are allowed to create.

**Important:** Include the condition you are testing and the opposite condition. In this example, lines 1, 2, and 3 of the filter criteria ensure that users who are not VPs or Executive Administrators cannot select Executive compensation plans, while lines 4 and 5 ensure that VPs and Executive Administrators can select Executive compensation plans.

**Blank Values in Lookup Filters**

Your lookup filter criteria might reference a field that users often leave blank. You can design your lookup filter criteria to accept blank values by using the **Add Filter Logic** in the filter criteria to create an OR condition. For example, if you have a **Partner Contact** custom field on opportunities, restrict the field to only allow contacts that are associated to an account with a Partner Account record type, or private contacts not associated with any account.

**Filter Criteria**

1. **Partner Contact:** Account: Account Record Type equals value Partner Account
2. **Partner Contact:** Account: Account Name equals value

**Filter Logic**

1 \ OR \ 2

**Custom Error Message**

The partner contact must be associated with a partner account, or must be a private contact.

**Lookup Window Text**

Search results only display contacts from partner accounts or your private contacts.

**User IDs in Lookup Filters**

Using user IDs in optional lookup filters can significantly improve user efficiency by first showing lookup search dialog results that are most relevant to the user while still allowing users to see all results if necessary. For example, on a lookup field to accounts, you can create an optional lookup filter that restricts the search results to accounts that the user owns in the search lookup dialog results. If the user is looking for an account that someone else owns, the user can remove the filter.
Filter Criteria

Current User: User ID equals Field Account: Owner ID

Lookup Window Text

By default, search results only display accounts you own. To search all accounts, click “Show all results.”

Simple Dependent Lookups

If the value of a relationship field should depend on the value of another relationship field on the current record, specify the field to field comparison in the criteria. For example, if the case Contact Name field should only have contacts associated to the account specified in the case Account Name field, use the following lookup filter:

Filter Criteria

Contact Name: Account ID equals field Case: Account ID

Custom Error Message

Contact does not exist or is not associated to the case account.

Lookup Window Text

Search results only display contacts associated to the case account.

Note: When comparing lookup fields in lookup filter criteria, Salesforce always uses the ID of the relationship field, not the name.

Complex Lookup Filters and Dependent Lookups

Achieving complex business rules with lookup filters often involves combing your rules with filter logic and fields of various types. For example, consider an app for booking conference rooms that has the following data model:

<table>
<thead>
<tr>
<th>Object</th>
<th>Fields</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meeting</td>
<td>• Meeting Name</td>
</tr>
<tr>
<td></td>
<td>• Office lookup to the Office object</td>
</tr>
<tr>
<td></td>
<td>• Projector Required checkbox</td>
</tr>
<tr>
<td></td>
<td>• Number of Participants number field</td>
</tr>
<tr>
<td></td>
<td>• Conference Room lookup to the Conference Room object</td>
</tr>
<tr>
<td>Conference Room</td>
<td>• Conference Room Name</td>
</tr>
<tr>
<td></td>
<td>• Has Projector checkbox</td>
</tr>
<tr>
<td></td>
<td>• Number of Seats Available number field</td>
</tr>
<tr>
<td></td>
<td>• Conference Room Location lookup to the Office object</td>
</tr>
<tr>
<td>Office</td>
<td>• Office Name</td>
</tr>
</tbody>
</table>

The following lookup filter on the meeting Conference Room field restricts the valid values to conference rooms that have a projector if the meeting requires one, as well as the necessary number of seats:
Filter Criteria
1. Meeting: Projector Required equals field Meeting Conference Room: Has Projector
2. Meeting: Projector Required equals value False
3. Conference Room: Number of Seats Available greater or equal field Meeting: Number of Participants

Filter Logic
(1 OR 2) AND 3

Custom Error Message
Conference room not found or is insufficient for your meeting.

Lookup Window Text
Search results only display conference rooms that can support your meeting requirements.

To refine the valid values even further, incorporate the office where the conference room is located:

Filter Criteria
1. Meeting: Projector Required equals field Meeting Conference Room: Has Projector
2. Meeting: Projector Required equals value False
3. Conference Room: Number of Seats Available greater than field Meeting: Number of Participants
4. Meeting: Office equals Field Conference Room: Conference Room Location

Filter Logic
(1 OR 2) AND 3 AND 4

Custom Error Message
Conference room not found or is insufficient for your meeting.

Lookup Window Text
Search results only display conference rooms that can support your meeting requirements.

Notes on Lookup Filters

Formulas
A formula is an algorithm that derives its value from other fields, expressions, or values. Formulas can help you automatically calculate the value of a field based on other fields.

Watch a Demo: Getting Started With Formulas
This video gives a brief introduction to Salesforce formulas, accessing the formulas editor in the app, and how to use the editor tools to create formulas.

Where are Formulas Used in Salesforce?
Many areas in Salesforce use formulas. Before you begin using formulas, review the differences in their uses.
Formula Data Types
The data type of a formula determines the type of data you expect returned from your formula.

Elements of a Formula
A formula can contain references to the values of fields, operators, functions, literal values, or other formulas.

Formula Operators and Functions
Use these operators and functions when building formulas. All functions are available everywhere that you can include a formula—such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

Using Date and Date/Time Values in Formulas
Date formulas are useful for managing payment deadlines, contract ages, or any other features of your organization that are time or date dependent.

Build a Formula Field
Your custom formula fields require special attributes.

Formula Field Limits and Restrictions
Before you create formula fields, be aware of their limits and limitations.

Examples of Advanced Formula Fields
Review examples of formula fields for various types of apps that you can use and modify for your own purposes.

Common Formula Errors
Review common errors that can occur with formulas and how to fix them.

- Elements of a Formula
- Formula Data Types

Where are Formulas Used in Salesforce?
Many areas in Salesforce use formulas. Before you begin using formulas, review the differences in their uses.

<table>
<thead>
<tr>
<th>Use Formulas for:</th>
<th>To:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Processes</td>
<td>Define the criteria a record must meet to enter the approval process.</td>
</tr>
<tr>
<td>Approval Steps</td>
<td>Define the criteria a record must meet to enter the approval step.</td>
</tr>
<tr>
<td>Assignment Rules for Leads and Cases</td>
<td>Define the criteria the lead or case must meet for it to be assigned.</td>
</tr>
<tr>
<td>Auto-Response Rules for Leads and Cases</td>
<td>Define the criteria a lead or case must meet to trigger an auto-response rule.</td>
</tr>
<tr>
<td>Case Escalation Rules</td>
<td>Specify criteria a case must meet for it to be escalated.</td>
</tr>
<tr>
<td>Custom Buttons and Links</td>
<td>Define the content for custom links and buttons.</td>
</tr>
<tr>
<td>Custom Fields</td>
<td>Create custom formula fields that automatically calculate a value based on other values, merge fields, or expressions. Users can view formula</td>
</tr>
</tbody>
</table>
Use Formulas for: | To: fields on record detail pages but can’t see the underlying algorithm or edit the value of a formula field.

Note: Custom formula fields are not available in Connect Offline, Web-to-Lead forms, or Web-to-Case forms.

| Custom Summary Formulas in Reports | Automatically calculate more totals based on existing report summaries using the values, merge fields, or expressions you specify. Users can’t change these totals.

| Data Validations | Verify that the data a user enters in a record meets the standards you specify before the user can save the record. A validation rule can include a formula such as CloseDate >= TODAY().

| Default Field Values | Apply a value to a custom field when a user creates a record. Use formulas to define a default value such as TODAY() + 7.

Users can change a default value. Default field values can be based on a formula using values, merge fields, or expressions you specify.

| Escalation Rules | Define the criteria that a case must meet to be escalated.

| Formula Fields | Automatically calculate the value of a custom field using the values, merge fields, or expressions you specify. Users can’t change the value of a formula field.

| Reports | Create custom summary formulas in your reports to calculate more totals based on the existing summaries in that report.

| S-Controls | Define the content for s-controls.

| Validation Rules | Prevent users from entering an invalid value in a standard or custom field. Validation rules can be based on formulas and display an error message to users when the value they enter is not valid.

| Workflow Field Updates | Automatically change the value of a field to a value you specify. The formula can include other values, merge fields, or expressions. You can set field updates to occur as a result of a workflow rule or an approval process.

| Workflow Rules | Define the criteria a record must meet to trigger a workflow rule.

| Visualforce Pages | Define the content for Visualforce pages.

Common Formula Processes

<table>
<thead>
<tr>
<th>When are they executed?</th>
<th>Read only?</th>
<th>Can include functions?</th>
<th>Can specify null handling?</th>
<th>Can include references to parent merge fields?</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>
**Formula Data Types**

The data type of a formula determines the type of data you expect returned from your formula.

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checkbox</td>
<td>Returns a true or false value. The field appears as a checkbox in record detail pages and reports. Use True for checked values and False for unchecked values.</td>
</tr>
<tr>
<td>Currency</td>
<td>Returns a number in currency format of up to 18 digits with a currency sign.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Salesforce uses the round-half-to-even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, −22.5 becomes −22, and −23.5 becomes −24.</td>
</tr>
<tr>
<td>Date</td>
<td>Returns data that represents a day on the calendar. The current date can be acquired by calling the built-in function TODAY () in a formula. This data type is not available for custom summary formulas in reports.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Returns data that represents a moment in time. A date/time field includes the date and also the time of day including hour, minutes, and seconds. You can insert the current date and time in a formula using the NOW () function. This data type is not available for custom summary formulas in reports.</td>
</tr>
<tr>
<td>Number</td>
<td>Returns a positive or negative integer or decimal of up to 18 digits. Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.34.</td>
</tr>
<tr>
<td>Percent</td>
<td>Returns a number in percent format of up to 18 digits followed by a percent sign. Percent data is stored as a decimal divided by 100, which means that 90% is equal to 0.90.</td>
</tr>
<tr>
<td>Text</td>
<td>Returns a string of up to 3900 characters. To display text in addition to the formula output, insert that text in quotes. Use the text data type for text, text area, URL, phone, email, address, and auto-number fields. This data type isn’t available for custom summary formulas in reports.</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

*Build a Formula Field*
Elements of a Formula

A formula can contain references to the values of fields, operators, functions, literal values, or other formulas. Use any or all of these elements to build a formula.

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Literal Value</td>
<td>A text string or number you enter that is not calculated or changed. For example, if you have a value that’s always multiplied by 2% of an amount, your formula would contain the literal value of 2% of that amount:</td>
</tr>
</tbody>
</table>

```
ROUND((Amount*0.02), 2)
```

This example contains every possible part of a formula:
- A function called ROUND used to return a number rounded to a specified number of decimal places.
- A field reference called Amount.
- An operator, *, that tells the formula builder to multiply the contents of the Amount field by the literal value, 0.02.
- A literal number, 0.02. Use the decimal value for all percents. To include actual text in your formula, enclose it in quotes.
- The last number 2 in this formula is the input required for the ROUND function that determines the number of decimal places to return.

<table>
<thead>
<tr>
<th>Field Reference</th>
<th>Reference the value of another custom or standard field using a merge field. The syntax for a merge field is field_name for a standard field or field_name__c for a custom field. The syntax for a merge field on a related object is object_name__r.field_name. Use the Insert Field button or the drop-down list to insert a merge field in your formula where necessary.</th>
</tr>
</thead>
</table>

| Function | A system-defined formula that can require input from you and returns a value or values. For example, TODAY() does not require input but returns the current date. The TEXT(value) function requires your percent, number, or currency input and returns text. |

| Operator | A symbol that specifies the type of calculation to perform or the order in which to do it. For example, the + symbol specifies two values should be added. The open and close parentheses specify which expressions you want evaluated first. |

| Comment | An annotation within a formula that begins with a forward slash followed by an asterisk (/ *). and concludes with an asterisk followed by a forward slash (*/). For example, |

```
/*This is a formula comment*/
```

Comments are ignored when processing a formula. Comments are useful for explaining specific parts of a formula to anyone viewing the formula definition. For example:

```
AND(
     /*competitor field is required, check to see if field is empty */
     LEN(Competitor__c) = 0,
     /* rule only enforced for ABCD record types */
     RecordType.Name = "ABCD Value",
     /* checking for any closed status, allows for additional closed picklist values in the future */
     CONTAINS(TEXT(StageName), "Closed")
)
```
You can also use comments to comment out sections of your formula when debugging and checking the syntax to locate errors in the formula.

**Note:**
- Nesting comments causes a syntax error. For example, you cannot save a formula that has the following:

```cpp
/* /* comment */ */
```
- Commenting out a whole formula causes a syntax error.
- Comments count against the character and byte size limits in formulas.

### Formula Operators and Functions

Use these operators and functions when building formulas. All functions are available everywhere that you can include a formula—such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

**Note:** Extraneous spaces in the samples below are ignored.

- Math Operators
- Logical Operators
- Text Operators
- Date and Time Functions
- Informational Functions
- Logical Functions
- Math Functions
- Text Functions
- Summary Functions
- Advanced Functions
- Encoding Functions

#### Math Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ (Add)</td>
<td>Calculates the sum of two values.</td>
</tr>
<tr>
<td>- (Subtract)</td>
<td>Calculates the difference of two values.</td>
</tr>
<tr>
<td>* (Multiply)</td>
<td>Multiplies its values.</td>
</tr>
</tbody>
</table>
### Formulas

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/ (Divide)</td>
<td>Divides its values.</td>
</tr>
<tr>
<td>^ (Exponentiation)</td>
<td>Raises a number to a power of a specified number.</td>
</tr>
<tr>
<td>() (Open Parenthesis and Close Parenthesis)</td>
<td>Specifies that the expressions within the open parenthesis and close parenthesis are evaluated first. All other expressions are evaluated using standard operator precedence.</td>
</tr>
</tbody>
</table>

#### Logical Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>= and == (Equal)</td>
<td>Evaluates if two values are equivalent. The = and == operator are interchangeable.</td>
</tr>
<tr>
<td>&lt;&gt; and != (Not Equal)</td>
<td>Evaluates if two values are not equivalent.</td>
</tr>
<tr>
<td>&lt; (Less Than)</td>
<td>Evaluates if a value is less than the value that follows this symbol.</td>
</tr>
<tr>
<td>&gt; (Greater Than)</td>
<td>Evaluates if a value is greater than the value that follows this symbol.</td>
</tr>
<tr>
<td>&lt;= (Less Than or Equal)</td>
<td>Evaluates if a value is less than or equal to the value that follows this symbol.</td>
</tr>
<tr>
<td>&gt;= (Greater Than or Equal)</td>
<td>Evaluates if a value is greater than or equal to the value that follows this symbol.</td>
</tr>
<tr>
<td>&amp;&amp; (AND)</td>
<td>Evaluates if two values or expressions are both true. Use this operator as an alternative to the logical function AND.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

#### Text Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&amp; (Concatenate)</td>
<td>Connects two or more strings.</td>
</tr>
</tbody>
</table>

#### Date and Time Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DATE</td>
<td>Returns a date value from year, month, and day values you enter. Salesforce displays an error on the detail page if the value of the DATE function in a formula field is an invalid date, such as February 29 in a non-leap year.</td>
</tr>
<tr>
<td>DATEVALUE</td>
<td>Returns a date value for a date/time or text expression.</td>
</tr>
<tr>
<td>DATETIMEVALUE</td>
<td>Returns a year, month, and GMT time value.</td>
</tr>
<tr>
<td>DAY</td>
<td>Returns a day of the month in the form of a number between 1 and 31.</td>
</tr>
<tr>
<td>MONTH</td>
<td>Returns the month, a number between 1 (January) and 12 (December) in number format of a given date.</td>
</tr>
</tbody>
</table>
### Formulas

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NOW</td>
<td>Returns a date/time representing the current moment.</td>
</tr>
<tr>
<td>TODAY</td>
<td>Returns the current date as a date data type.</td>
</tr>
<tr>
<td>YEAR</td>
<td>Returns the four-digit year in number format of a given date.</td>
</tr>
</tbody>
</table>

### Informational Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLANKVALUE</td>
<td>Determines if an expression has a value and returns a substitute expression if it does not. If the expression has a value, returns the value of the expression.</td>
</tr>
<tr>
<td>ISBLANK</td>
<td>Determines if an expression has a value and returns TRUE if it does not. If it contains a value, this function returns FALSE.</td>
</tr>
<tr>
<td>ISNULL</td>
<td>Determines if an expression is null (blank) and returns TRUE if it is. If it contains a value, this function returns FALSE.</td>
</tr>
</tbody>
</table>

**Important:** Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NULLVALUE</td>
<td>Determines if an expression is null (blank) and returns a substitute expression if it is. If the expression is not blank, returns the value of the expression.</td>
</tr>
</tbody>
</table>

**Important:** Use BLANKVALUE instead of NULLVALUE in new formulas. BLANKVALUE has the same functionality as NULLVALUE, but also supports text fields. Salesforce will continue to support NULLVALUE, so you do not need to change existing formulas.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORVALUE</td>
<td>Returns the previous value of a field.</td>
</tr>
</tbody>
</table>

### Logical Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AND</td>
<td>Returns a TRUE response if all values are true; returns a FALSE response if one or more values are false.</td>
</tr>
<tr>
<td>CASE</td>
<td>Checks a given expression against a series of values. If the expression is equal to a value, returns the corresponding result. If it is not equal to any values, it returns the <code>else_result</code>.</td>
</tr>
<tr>
<td>IF</td>
<td>Determines if expressions are true or false. Returns a given value if true and another value if false.</td>
</tr>
<tr>
<td>ISCHANGED</td>
<td>Compares the value of a field to the previous value and returns TRUE if the values are different. If the values are the same, this function returns FALSE.</td>
</tr>
<tr>
<td>ISNEW</td>
<td>Checks if the formula is running during the creation of a new record and returns TRUE if it is. If an existing record is being updated, this function returns FALSE.</td>
</tr>
<tr>
<td>ISNUMBER</td>
<td>Determines if a text value is a number and returns TRUE if it is. Otherwise, it returns FALSE.</td>
</tr>
</tbody>
</table>
### Function | Description
--- | ---
**NOT** | Returns FALSE for TRUE and TRUE for FALSE.

**OR** | Determines if expressions are true or false. Returns TRUE if any expression is true. Returns FALSE if all expressions are false.

---

**Math Functions**

| Function | Description |
--- | --- |
**ABS** | Calculates the absolute value of a number. The absolute value of a number is the number without its positive or negative sign. |
**CEILING** | Rounds a number up to the nearest integer. |
**DISTANCE** | Calculates the distance between two locations in miles or kilometers. |
**EXP** | Returns a value for e raised to the power of a number you specify. |
**FLOOR** | Returns a number rounded down to the nearest integer. |
**GEOLOCATION** | Returns a geolocation based on the provided latitude and longitude. Must be used with the DISTANCE function. |
**LN** | Returns the natural logarithm of a specified number. Natural logarithms are based on the constant e value of 2.71828182845904. |
**LOG** | Returns the base 10 logarithm of a number. |
**MAX** | Returns the highest number from a list of numbers. |
**MIN** | Returns the lowest number from a list of numbers. |
**MOD** | Returns a remainder after a number is divided by a specified divisor. |
**ROUND** | Returns the nearest number to a number you specify, constraining the new number by a specified number of digits. |
**SQRT** | Returns the positive square root of a given number. |

---

**Text Functions**

| Function | Description |
--- | --- |
**BEGINS** | Determines if text begins with specific characters and returns TRUE if it does. Returns FALSE if it does not. |
**BR** | Inserts a line break in a string of text. |
**CASESAFEID** | Converts a 15-character ID to a case-insensitive 18-character ID. |
**CONTAINS** | Compares two arguments of text and returns TRUE if the first argument contains the second argument. If not, returns FALSE. |
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FIND</td>
<td>Returns the position of a string within a string of text represented as a number.</td>
</tr>
<tr>
<td>GETSESSIONID</td>
<td>Returns the user’s session ID.</td>
</tr>
<tr>
<td>HYPERLINK</td>
<td>Creates a link to a URL specified that is linkable from the text specified.</td>
</tr>
<tr>
<td>IMAGE</td>
<td>Inserts an image with alternate text and height/width specifications.</td>
</tr>
<tr>
<td>INCLUDES</td>
<td>Determines if any value selected in a multi-select picklist field equals a text literal you specify.</td>
</tr>
<tr>
<td>IS PICKVAL</td>
<td>Determines if the value of a picklist field is equal to a text literal you specify.</td>
</tr>
<tr>
<td>LEFT</td>
<td>Returns the specified number of characters from the beginning of a text string.</td>
</tr>
<tr>
<td>LEN</td>
<td>Returns the number of characters in a specified text string.</td>
</tr>
<tr>
<td>LOWER</td>
<td>Converts all letters in the specified text string to lowercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.</td>
</tr>
<tr>
<td>LPAD</td>
<td>Inserts characters you specify to the left-side of a text string.</td>
</tr>
<tr>
<td>MID</td>
<td>Returns the specified number of characters from the middle of a text string given the starting position.</td>
</tr>
<tr>
<td>RIGHT</td>
<td>Returns the specified number of characters from the end of a text string.</td>
</tr>
<tr>
<td>RPAD</td>
<td>Inserts characters that you specify to the right-side of a text string.</td>
</tr>
<tr>
<td>SUBSTITUTE</td>
<td>Substitutes new text for old text in a text string.</td>
</tr>
<tr>
<td>TEXT</td>
<td>Converts a percent, number, date, date/time, or currency type field into text anywhere formulas are used. Also, converts picklist values to text in approval rules, approval step rules, workflow rules, escalation rules, assignment rules, auto-response rules, validation rules, formula fields, field updates, and custom buttons and links.</td>
</tr>
<tr>
<td>TRIM</td>
<td>Removes the spaces and tabs from the beginning and end of a text string.</td>
</tr>
<tr>
<td>UPPER</td>
<td>Converts all letters in the specified text string to uppercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.</td>
</tr>
<tr>
<td>VALUE</td>
<td>Converts a text string to a number.</td>
</tr>
</tbody>
</table>

**Summary Functions**

The following functions are available with summary, matrix, and joined reports.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PARENTGROUPVAL</td>
<td>This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.</td>
</tr>
<tr>
<td>PREVGROUPVAL</td>
<td>This function returns the value of a specified previous grouping. A “previous” grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.</td>
</tr>
</tbody>
</table>
### Advanced Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GETRECORDIDS</td>
<td>Returns an array of strings in the form of record IDs for the selected records in a list, such as a list view or related list.</td>
</tr>
<tr>
<td>INCLUDE</td>
<td>Returns content from an s-control snippet. Use this function to reuse common code in many s-controls.</td>
</tr>
<tr>
<td>LINKTO</td>
<td>Returns a relative URL in the form of a link (href and anchor tags) for a custom s-control or Salesforce page.</td>
</tr>
<tr>
<td>REGEX</td>
<td>Compares a text field to a regular expression and returns TRUE if there is a match. Otherwise, it returns FALSE. A regular expression is a string used to describe a format of a string according to certain syntax rules.</td>
</tr>
<tr>
<td>REQUIRESCRIPT</td>
<td>Returns a script tag with source for a URL you specify. Use this function when referencing the Force.com AJAX Toolkit or other JavaScript toolkits.</td>
</tr>
<tr>
<td>URLFOR</td>
<td>Returns a relative URL for an action, s-control, Visualforce page, or a file in a static resource archive in a Visualforce page.</td>
</tr>
<tr>
<td>VLOOKUP</td>
<td>Returns a value by looking up a related value on a custom object similar to the VLOOKUP() Excel function.</td>
</tr>
</tbody>
</table>

### Encoding Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTMLENCODE</td>
<td>Encodes text and merge field values for use in HTML by replacing characters that are reserved in HTML, such as the greater-than sign (&gt;) with HTML entity equivalents, such as <code>&amp;gt;</code>.</td>
</tr>
<tr>
<td>JSENCODE</td>
<td>Encodes text and merge field values for use in JavaScript by inserting escape characters, such as a backslash (), before unsafe JavaScript characters, such as the apostrophe (').</td>
</tr>
<tr>
<td>JSINHTMLENCODE</td>
<td>Encodes text and merge field values for use in JavaScript inside HTML tags by replacing characters that are reserved in HTML with HTML entity equivalents and inserting escape characters before unsafe JavaScript characters. <code>JSINHTMLENCODE(someValue)</code> is a convenience function that is equivalent to <code>JSENCODE(HTMLENCODE((someValue)))</code>. That is, <code>JSINHTMLENCODE</code> first encodes <code>someValue</code> with <code>HTMLENCODE</code>, and then encodes the result with <code>JSENCODE</code>.</td>
</tr>
<tr>
<td>URLENCODE</td>
<td>Encodes text and merge field values for use in URLs by replacing characters that are illegal in URLs, such as blank spaces, with the code that represent those characters as defined in RFC 3986, Uniform Resource Identifier (URI): Generic Syntax. For example, blank spaces are replaced with <code>%20</code>, and exclamation points are replaced with <code>%21</code>.</td>
</tr>
</tbody>
</table>

**SEE ALSO:**
- Examples of Advanced Formula Fields
Formula Operators and Functions A–H

Use the following operators and functions when building formulas. Click on the name of the operator or function below to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

Important: Extraneous spaces in the samples below are ignored.

+ (Add)

Description: Calculates the sum of two values.

Use: value1 + value2 and replace each value with merge fields, expressions, or other numeric values.

Example:

Amount + Maint_Amount__c + Services_Amount__c

This formula calculates the sum of the product Amount, maintenance amount, and services fees. Note that Maint amount and Service Fees are custom currency fields.

Example:

EMAIL_OPT_OUT:SUM + DO_NOT_CALL:SUM calculates all Email Opt Out fields plus all Do Not Call fields on the leads in your report. This formula is a number data type that returns a positive integer.

Example:

You may have a custom object that allows users to track the total number of hours worked in a week. Use the following example to ensure that users cannot save a time card record with more than 40 hours in a work week.

Monday_Hours__c +
Tuesday_Hours__c +
Wednesday_Hours__c +
Thursday_Hours__c +
Friday_Hours__c > 40

Use a formula like this one in a validation rule to display the following error message when the total number of hours entered for each work day is greater than 40: “Your total hours cannot exceed 40.” This example requires five custom fields on your custom object, one for each day of work.

- (Subtract)

Description: Calculates the difference of two values.

Use: value1 - value2 and replace each value with merge fields, expressions, or other numeric values.

Example:

Amount - Discount_Amount__c

This formula calculates the difference of the product Amount less the Discount Amount. Note that Discount Amount is a custom currency field.
AMOUNT:SUM - Product.Discount_Amount__c:SUM calculates the difference of all Amount fields and all Discounted Amount custom fields on the products in your report. This formula is a currency data type that returns a currency sign and decimal places.

* (Multiply)

**Description:**
Multiplies its values.

**Use:**
value1 * value2 and replace each value with merge fields, expressions, or other numeric values.

**Example:**
Consulting_Days__c * 1200
This formula calculates the number of consulting days times 1200 given that this formula field is a currency data type and consulting charges a rate of $1200 per day. Note that Consulting Days is a custom field.

**Report Example:**
RowCount * AGE: AVG calculates the record count times the average age value of your report. This formula is a number data type that returns a positive or negative integer or decimal.

/ (Divide)

**Description:**
Divides its values.

**Use:**
value1 / value2 and replace each value with merge fields, expressions, or other numeric values.

**Example:**
AnnualRevenue/ NumberOfEmployees
This formula calculates the revenue amount per employee using a currency field.

```
IF(NumberOfOpportunities > 0, 
   NumberOfWonOpportunities / NumberOfOpportunities, null)
```
This formula calculates the win rate of opportunities on a campaign.

**Report Example:**
% Won Opportunities
WON:SUM / RowCount calculates the percent of Won opportunities using a record count representing the number of all opportunities in your report. This formula is a number data type that returns a positive or negative integer.

**% Difference between Cost and Sales Price**

```
```
This formula calculates the average percent difference between what a product costs and its selling price on a product-by-product level. Note that Product2.Cost__c:SUM is a custom currency field named Cost on products, which includes the cost of each product. This formula is a percent data type that returns a positive or negative integer. For best results, use this on a summary Opportunities with Products report that is summarized by Product Name and includes summary totals for Quantity, Total Price, and Cost.
\^\text{Exponentiation}\

\textbf{Description:} Raises a number to a power of a specified number.

\textbf{Use:} \textit{number}^\text{integer} and replace \textit{number} with a merge field, expression, or another numeric value; replace \textit{integer} with a merge field that contains an integer, expression, or any integer.

\textbf{Example:} \textit{NumberOfEmployees}^4 calculates the number of employees to the 4th power.

\textbf{Report Example:} \textit{ACTIVE:SUM}^2 calculates the number of active Salesforce users to the 2nd power for administration. This formula is a number data type that returns a positive integer.

\textbf{Tips:} Avoid replacing \textit{integer} with a negative number.

\textbf{() (Open Parenthesis and Close Parenthesis)}

\textbf{Description:} Specifies that the expressions within the open parenthesis and close parenthesis are evaluated first. All other expressions are evaluated using standard operator precedence.

\textbf{Use:} (\textit{expression1}) \textit{expression2}... and replace each \textit{expression} with merge fields, expressions, or other numeric values.

\textbf{Example:} (\textit{Unit\_Value\_c} - \textit{Old\_Value\_c}) / \textit{New\_Value\_c} calculates the difference between the old value and new value divided by the new value.

\textbf{Report Example:} (\textit{DURATIONHOURS:SUM} * \textit{RowCount}) / 24 calculates the duration of all event times the record count per 24 hours. This formula is a percent data type that returns a positive or negative integer or decimal, representing what percent of a day is spent on events.

\textbf{= and \texttt{==} (Equal)}

\textbf{Important:} Don’t use this function for a null comparison, such as \textit{MyDateTime\_c} == \texttt{null}. Use \texttt{ISBLANK} instead.

\textbf{Description:} Evaluates if two values are equivalent. The = and \texttt{==} operator are interchangeable.

\textbf{Use:} \textit{expression1}==\textit{expression2} or \textit{expression1} == \textit{expression2}, and replace each \textit{expression} with merge fields, expressions, or other numeric values.

\textbf{Example:}\n
\textbf{Due Date}

\textit{Due Date} = \textit{CreatedDate} + 5 returns true if the due date is equal to five days following a record’s created date.

\textbf{Commission Amount}

\texttt{IF(Probability =1, ROUND(Amount*0.02, 2), 0)}

This formula calculates the 2% commission amount of an opportunity that has a probability of 100%. All other opportunities will have a commission value of 0.

Possible results:

\begin{itemize}
  \item An opportunity with a \textit{Probability} of 90% will have a commission of 0.
\end{itemize}
An opportunity with a **Probability** of 100% and an **Amount** of $100,000 will have a commission of $2,000.

**<> and != (Not Equal)**

**Important:** Don’t use this function for a null comparison, such as `MyDateTime__c != null`. Use `ISBLANK` instead.

**Description:** Evaluates if two values are not equivalent.

**Use:** 

```
expression1 <> expression2 or expression1 != expression2, and replace each expression with merge fields, expressions, or other numeric values.
```

**Example:**

```
IF(Maint_Amount__c + Services_Amount__c <> Amount, "DISCOUNTED", "FULL PRICE")
```

This formula displays “DISCOUNTED” on product if its maintenance amount and services amount do not equal the product amount. Otherwise, displays “FULL PRICE.” Note that this example uses two custom currency fields for Maint Amount and Services Amount.

**< (Less Than)**

**Description:** Evaluates if a value is less than the value that follows this symbol.

**Use:** 

```
value1 < value2 and replace each value with merge fields, expressions, or other numeric values.
```

**Example:**

```
IF(AnnualRevenue < 1000000, 1, 2)
```

assigns the value “1” with revenues less than one million and the value “2” to revenues greater than one million.

**> (Greater Than)**

**Description:** Evaluates if a value is greater than the value that follows this symbol.

**Use:** 

```
value1 > value2 and replace each value with merge fields, expressions, or other numeric values.
```

**Example:**

```
IF(commission__c > 1000000, "High Net Worth", "General")
```

assigns the “High Net Worth” value to a commission greater than one million. Note, this is a text formula field that uses a commission custom field.

**<= (Less Than or Equal)**

**Description:** Evaluates if a value is less than or equal to the value that follows this symbol.

**Use:** 

```
value1 <= value2 and replace each value with merge fields, expressions, or other numeric values.
```

4115
### Example:

\[
\text{IF(AnnualRevenue } \leq 1000000, 1, 2)\]

assigns the value “1” with revenues less than or equal to one million and the value “2” with revenues greater than one million.

### >= (Greater Than or Equal)

<table>
<thead>
<tr>
<th>Description</th>
<th>Evaluates if a value is greater than or equal to the value that follows this symbol.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use:</td>
<td>value1 (\geq) value2 and replace each value with merge fields, expressions, or other numeric values.</td>
</tr>
<tr>
<td>Example:</td>
<td>IF(Commission__c (\geq) 1000000, &quot;YES&quot;, &quot;NO&quot;) assigns the “YES” value with a commission greater than or equal to one million. Note, this is a text formula field that uses a custom currency field called Commission.</td>
</tr>
</tbody>
</table>

### && (AND)

<table>
<thead>
<tr>
<th>Description</th>
<th>Evaluates if two values or expressions are both true. Use this operator as an alternative to the logical function AND.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use:</td>
<td>((\text{logical1}) &amp;&amp; (\text{logical2})) and replace \text{logical1} and \text{logical2} with the values or expressions that you want evaluated.</td>
</tr>
<tr>
<td>Example:</td>
<td>IF((Price&lt;100 &amp;&amp; Quantity&lt;5),&quot;Small&quot;, null) This formula displays “Small” if the price is less than 100 and quantity is less than five. Otherwise, this field is blank.</td>
</tr>
</tbody>
</table>

### || (OR)

<table>
<thead>
<tr>
<th>Description</th>
<th>Evaluates if at least one of multiple values or expressions is true. Use this operator as an alternative to the logical function OR.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use:</td>
<td>((\text{logical1}) || (\text{logical2})) and replace any number of logical references with the values or expressions you want evaluated.</td>
</tr>
<tr>
<td>Example:</td>
<td>IF((ISPICKVAL(Priority,&quot;High&quot;))</td>
</tr>
<tr>
<td>Validation Rule Example:</td>
<td>((\text{Discount Rate } _c &lt; 0) || (\text{Discount Rate } _c &gt; 0.40)) This validation rule formula displays the following error message when the Discount Rate custom field is not between 0 and 40%: “Discount Rate cannot exceed 40%.”</td>
</tr>
</tbody>
</table>
**& (Concatenate)**

<table>
<thead>
<tr>
<th><strong>Description:</strong></th>
<th>Connects two or more strings.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use:</strong></td>
<td><code>string1 &amp; string2</code> and replace each <code>string</code> with merge fields, expressions, or other values.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td>&quot;Expense-&quot; &amp; Trip_Name__c &amp; &quot;-&quot; &amp; ExpenseNum__c</td>
</tr>
</tbody>
</table>

This formula displays the text “Expense-” followed by trip name and the expense number. This is a text formula field that uses an expense number custom field.

**ABS**

<table>
<thead>
<tr>
<th><strong>Description:</strong></th>
<th>Calculates the absolute value of a number. The absolute value of a number is the number without its positive or negative sign.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use:</strong></td>
<td><code>ABS(number)</code> and replace <code>number</code> with a merge field, expression, or other numeric value that has the sign you want removed.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>ABS(ExpectedRevenue)</code> calculates the positive value of the Expected Revenue amount regardless of whether it is positive or negative.</td>
</tr>
</tbody>
</table>

**AND**

<table>
<thead>
<tr>
<th><strong>Description:</strong></th>
<th>Returns a TRUE response if all values are true; returns a FALSE response if one or more values are false. Use this function as an alternative to the operator <code>&amp;&amp; (AND)</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use:</strong></td>
<td><code>AND(logical1, logical2, ...)</code> and replace <code>logical1, logical2, ...</code> with the values that you want evaluated.</td>
</tr>
<tr>
<td><strong>Formula Field Example:</strong></td>
<td><code>IF(AND(Price&lt;1, Quantity&lt;1), &quot;Small&quot;, null)</code></td>
</tr>
</tbody>
</table>

This formula displays "Small" if the price and quantity are less than one. This field is blank if the asset has a price or quantity greater than one.

**BEGINS**

<table>
<thead>
<tr>
<th><strong>Description:</strong></th>
<th>Determines if text begins with specific characters and returns TRUE if it does. Returns FALSE if it does not.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Use:</strong></td>
<td><code>BEGINS(text, compare_text)</code> and replace <code>text</code>, <code>compare_text</code> with the characters or fields you want to compare.</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>IF(BEGINS(Product_type__c, &quot;ICU&quot;), &quot;Medical&quot;, &quot;Technical&quot;)</code></td>
</tr>
</tbody>
</table>

This example returns the text “Medical” if the text in any Product Type custom text field begins with "ICU." For all other products, it displays "Technical."

**Tips:**
- This function is case sensitive so be sure your `compare_text` value has the correct capitalization.
• When using this function in a validation rule or workflow rule, fields that are blank are considered valid. For example, if you have a validation rule that tests to see if the serial number of an asset begins with "3," all assets that have a blank serial number are considered valid.

BLANKVALUE

Description: Determines if an expression has a value and returns a substitute expression if it does not. If the expression has a value, returns the value of the expression.

Use: BLANKVALUE(expression, substitute_expression) and replace expression with the expression you want evaluated; replace substitute_expression with the value you want to replace any blank values.

Example: Example 1

BLANKVALUE(Department, "Undesignated")
This formula returns the value of the Department field if the Department field contains a value. If the Department field is empty, this formula returns the word Undesignated.

Example 2

(BLANKVALUE(Payment_Due_Date__c, StartDate +5)
This formula returns the date five days after the contract start date whenever Payment Due Date is blank. Payment Due Date is a custom date field.

Tips:
• Use BLANKVALUE instead of NULLVALUE in new formulas. BLANKVALUE has the same functionality as NULLVALUE, but also supports text fields. Salesforce will continue to support NULLVALUE, so you do not need to change existing formulas.
• A field is not empty if it contains a character, blank space, or zero. For example, a field that contains a space inserted with the spacebar is not empty.
• Use the BLANKVALUE function to return a specified string if the field does not have a value; use the ISBLANK function if you only want to check if the field has a value.
• If you use this function with a numeric field, the function only returns the specified string if the field does not have a value and is not configured to treat blank fields as zeroes.

BR

Description: Inserts a line break in a string of text.

Use: BR()

Example: CASE(ShippingCountry, "USA", ShippingStreet & BR() & ShippingCity & ", " & ShippingState & " " & ShippingPostalCode & BR())
This formula field displays a formatted mailing address for a contact in standard format, including spaces and line breaks where appropriate depending on the country.

**Tips:**
- Do not remove the parentheses after the function name.
- Keep the parentheses empty. They do not need to contain a value.
- Remember to surround the BR() with concatenation operators: &.
- Avoid using this function in mail merge templates.
- This function is not available in custom buttons and links, s-controls, or reports.

---

**CASE**

**Description:**
Checks a given expression against a series of values. If the expression is equal to a value, returns the corresponding result. If it is not equal to any values, it returns the `else_result`.

**Use:**

```
CASE(expression, value1, result1, value2, result2, ..., else_result)
```
and replace `expression` with the field or value you want compared to each specified value. Replace each value and result with the value that must be equivalent to return the result entry. Replace `else_result` with the value you want returned when the expression does not equal any values.

**Formula Field Example:**

**Days Open for Cases**

Use this example of a custom formula field called `Days Open` to display different text depending on the number of days a case has been open:

```
CASE(Days_Open__c, 3, "Reassign", 2, "Assign Task", "Maintain")
```

The following text is displayed:
- “Reassign” for any case open three days.
- “Assign Task” for any case open two days.
- “Maintain” for all other cases.

**Last Activity Month**

This formula field displays the month of the last activity or “None” if there are no activities.

```
CASE(MONTH(LastActivityDate), 1, "January", 2, "February", 3, "March", 4, "April", 5, "May")
```
Discount Rate

Use the following default value formula to insert a different discount rate on an opportunity based on the department of the person creating the opportunity:

```
CASE(User.Department, "IT", 0.25, "Field", 0.15, 0)
```

In this example, the formula inserts a discount rate of 25% on any opportunity created by a user in the "IT" department or 15% on any opportunity created by someone in the "Field" department. A zero is applied if the creator does not belong to either of these departments. This is a custom percent field on opportunities that uses the standard user field Department.

Product Language

You may want to associate a product with its language so that your users know the type of documentation or adapter to include. Use the following default value formula to automatically set the language of a product based on the country of the user creating the product. In this example, the default value is "Japanese" if the user’s country is "Japan" and "English" if the user’s country is "US." If neither is true, the default value "unknown" is inserted into the Product Language field.

```
```

Tips:

- Be sure your value1, value2…expressions are the same data type.
- Be sure your result1, result2…expressions are the same data type.
- CASE functions cannot contain functions that return true or false. Instead, make true or false expressions return numbers such as:

```
CASE(1, IF(ISPICKVAL(Term__c, "12"), 1, 0),
12 * Monthly_Commit__c,
IF(ISPICKVAL(Term__c, "24"), 1, 0),
24 * Monthly_Commit__c, 0)
```

In this formula, Term is a picklist field that is multiplied by the Monthly Commit whenever it contains the value 1 for true.

- The else_result value is required.
- CASE functions return an error whenever any of the expressions return an error, regardless of which one should be returned. For example, CASE(Field__c,"Partner", "P", "Customer", "C", LEFT(Field__c, -5))) returns an error even if the value of the field is "Partner" or "Customer" because the last statement is illogical.
- If the field in your CASE function is blank, it returns your else_result value. For example, this formula: CASE(Days_Open__c, 3, "Reassign", 2, "Assign Task",
"Maintain") displays “Maintain” if the Days Open field is blank, 0, or any value other than 2 or 3.

- Use CASE functions to determine if a picklist value is equal to a particular value. For example, the formula \( \text{CASE(Term__c, "12", 12 \times \text{Monthly_Commit__c}, "24", 24 \times \text{Monthly_Commit__c}, 0) \) multiplies the Monthly Commit amount by 12 whenever the Term is 12 or multiplies the Monthly Commit amount by 24 whenever the Term is 24. Otherwise, the result is zero.

### CASESAFEID

**Description:** Converts a 15-character ID to a case-insensitive 18-character ID.

**Use:** \( \text{CASESAFEID(id)} \) and replace id with the object’s ID.

**Example:**

\[
\text{CASESAFEID (Id)}
\]

This formula replaces the 15-character ID with the 18-character, case-insensitive ID.

**Tips:**
- Convert to 18-character IDs for better compatibility with Excel.
- The CASESAFEID function is available everywhere that you can define a formula except reports and s-controls.

### CEILING

**Description:** Rounds a number up to the nearest integer.

**Use:** \( \text{CEILING(number)} \) and replace number with the field or expression you want rounded.

**Example:**

\[
\text{Rounding Up (literal value)}
\]

\[
\text{CEILING(2.5)}
\]

This formula returns 3, which is 2.5 rounded up to the nearest number.

**Earthquake Magnitude**

\( \text{CEILING(Magnitude__c)} \) returns the value of a formula number field that calculates the magnitude of an earthquake up to the nearest integer.

### CONTAINS

**Description:** Compares two arguments of text and returns TRUE if the first argument contains the second argument. If not, returns FALSE.

**Use:** \( \text{CONTAINS(text, compare_text)} \) and replace text with the text that contains the value of compare_text.
Example:

```
IF(CONTAINS(Product_Type__c, "part"), "Parts", "Service")
```

This formula checks the content of a custom text field named `Product_Type` and returns “Parts” for any product with the word “part” in it. Otherwise, it returns “Service.” Note that the values are case sensitive, so if a `Product_Type` field contains the text “Part” or “PART,” this formula returns “Services.”

Tips:

- This function is case sensitive so be sure your `compare_text` value has the correct capitalization.
- When using this function in a validation rule or workflow rule, fields that are blank are considered valid. For example, if you have a validation rule that tests to see if the serial number of an asset contains “A,” all assets that have a blank serial number are considered valid.
- The CONTAINS function does not support multi-select picklists. Use INCLUDES to see if a multi-select picklist has a specific value.

**DATE**

Description: 
Returns a date value from year, month, and day values you enter. Salesforce displays an error on the detail page if the value of the DATE function in a formula field is an invalid date, such as February 29 in a non-leap year.

Use: 
```
DATE(year, month, day)
```
and replace `year` with a four-digit year, `month` with a two-digit month, and `day` with a two-digit day.

Example: 
```
DATE(2005, 01, 02)
```
creates a date field of January 2, 2005.

**DATEVALUE**

Description: 
Returns a date value for a date/time or text expression.

Use: 
```
DATEVALUE(expression)
```
and replace `expression` with a date/time or text value, merge field, or expression.

Example: 
Closed Date
```
DATEVALUE(ClosedDate)
```
displays a date field based on the value of the Date/Time Closed field.

Date Value
```
DATEVALUE("2005-11-15")
```
returns November 15, 2005 as a date value.

Tips:

- If the field referenced in the function is not a valid text or date/time field, the formula field displays #ERROR!
- When entering a date, surround the date with quotes and use the following format: YYYY-MM-DD, that is, a four-digit year, two-digit month, and two-digit day.
- If the `expression` does not match valid date ranges, such as the MM is not between 01 and 12, the formula field displays #ERROR!
• Dates and times are always calculated using the user’s time zone.

### DATETIMEVALUE

**Description:** Returns a year, month, day and GMT time value.

**Use:** DATETIMEVALUE(expression) and replace expression with a date/time or text value, merge field, or expression.

**Example:**

**Closed Date**

DATETIMEVALUE(ClosedDate) displays a date field based on the value of the Date/Time Closed field.

**Date Value**

DATETIMEVALUE("2005-11-15 17:00:00") returns November 15, 2005 5:00 PM GMT as a date and time value.

**Tips:**
- DATETIMEVALUE is always calculated using GMT time zone and can’t be changed.
- When entering a specific date, surround the date with quotes and use the following format: YYYY-MM-DD, that is, a four-digit year, two-digit month, and two-digit day.
- If the expression does not match valid date ranges, such as the MM is not between 01 and 12, the formula field displays #ERROR!

### DAY

**Description:** Returns a day of the month in the form of a number between 1 and 31.

**Use:** DAY(date) and replace date with a date field or value such as TODAY().

**Example:**

DAY(Code_Freeze__c) returns the day in your custom code freeze date. Note this does not work on date/time fields.

### DISTANCE

**Description:** Calculates the distance between two locations in miles or kilometers.

**Use:** DISTANCE(mylocation1, mylocation2, 'unit') and replace mylocation1 and mylocation2 with two location fields, or a location field and a value returned by the GEOLOCATION function. Replace unit with mi (miles) or km (kilometers).

**Examples:**

**Distance between two geolocation fields**

DISTANCE(warehouse_location__c, store_location__c, 'mi')

This formula returns the distance, in miles, between the warehouse and the store. In this example, warehouse_location__c and store_location__c are the names of two custom geolocation fields.
Distance between an address field and a geolocation field

DISTANCE(BillingAddress, store_location__c, 'mi')

This formula returns the distance, in miles, between an account’s billing address and a store. In this example, BillingAddress is the standard billing address field on an Account object, and store_location__c is the name of a custom geolocation field.

Distance between a custom geolocation field and fixed coordinates

DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km')

This formula returns the distance, in kilometers, between the warehouse and the known latitude and longitude 37.775°, -122.418° (San Francisco).

Distances with conditions

IF(DISTANCE(warehouse_location__c, ShippingAddress, 'mi')<10, "Near", "Far")

This formula updates a text formula field to Near if the distance between the warehouse and the account shipping address compound field is less than 10 miles. Otherwise, it updates the text field to Far.

Tip: Although DISTANCE can be calculated in miles or kilometers, the unit is not returned in the calculation. If possible, include the unit of measure in the name of your distance formula field, so users know whether the distance is in miles or kilometers.

Tips:

- The DISTANCE function returns a number data type. Distance is always calculated in decimals, even if you’re displaying the geolocation notation in degrees, minutes, and seconds in the user interface. Specify the number of decimal places to show when you create a custom field.

- The DISTANCE function isn’t available in reports, but it can be used in list views. To use DISTANCE in your reports, set up a formula field, and then reference the field in your reports.

- DISTANCE is the only formula function that can use GEOLOCATION parameters.

- There are limitations on DISTANCE accuracy and equality calculations.

  - DISTANCE supports only the logical operators > and <, returning values within (<) or beyond (>) a specified radius.
  
  - Distance is calculated as a straight line—as the crow flies—regardless of geography and topography between the two points.

For additional details, see “How SOQL Calculates and Compares Distances” in the Force.com SOQL and SOSL Reference.

EXP

Description: Returns a value for e raised to the power of a number you specify.

Use: EXP(number) and replace number with a number field or value such as 5.

Example: Exponent of a Literal Value

EXP (3)
This formula returns the value of $e$ to the third power.

**Compound Interest**

$$\text{Principal} \times \text{EXP}(\text{Rate} \times \text{Years})$$

This formula calculates the compound interest based on a custom currency field for principal, custom percent field for rate, and custom number field for years.

---

**FIND**

**Description:** Returns the position of a string within a string of text represented as a number.

**Use:**

```plaintext
FIND(search_text, text[, start_num])
```

and replace `search_text` with the string you want to find, replace `text` with the field or expression you want to search, and replace `start_num` with the number of the character from which to start searching from left to right.

**Example:**

**Street Address**

```plaintext
FIND(" ", Street)
```

returns the character position of the first space in the `Street` field. You can use this number to find out the length of the street address as a means of separating a street address from street name in an address field.

**Deriving Website Addresses**

```plaintext
SUBSTITUTE(Email, LEFT(Email, FIND("@", Email)), "www.")
```

finds the location of the `@` sign in a person’s email address to determine the length of text to replace with a "www." as a means of deriving their website address.

**Tips:**

- Be sure to remove the brackets, [ and ], from your formula before validating it.
- If the field referenced in your `text` parameter is blank, the formula field displays 0.
- Your `search_text` parameter is case sensitive and cannot contain any wildcard characters.
- If your search does not return any results, a 0 displays in the field.
- The `start_num` parameter is optional. If you do not enter a `start_num` value, the formula uses the value one, or the first character in the string.
- If your `start_num` is not greater than zero, a 0 displays in the field.
- If your `start_num` is greater than the length of the text, a 0 displays in the field.
- When entering your `start_num` parameter, remember that some fields like the `Website` field are unique because a "http://" is automatically appended to the beginning of the text you enter.
- Note that the first character in a string is designated as one rather than zero.

---

**FLOOR**

**Description:** Returns a number rounded down to the nearest integer.

**Use:**

```plaintext
FLOOR(number)
```

and replace `number` with a number field or value such as 5.245.
**Commission Amounts**

FLOOR(commission__c) rounds commission down to the nearest integer.

---

**GEOLOCATION**

**Description:**

Returns a geolocation based on the provided latitude and longitude. Must be used with the DISTANCE function.

**Use:**

GEOLOCATION(latitude, longitude) and replace latitude and longitude with the corresponding geolocation, numerical code values.

**Examples:**

**Distance between a custom geolocation field and fixed coordinates**

DISTANCE(warehouse_location__c, GEOLOCATION(37.775, -122.418), 'km')

This formula returns the distance, in kilometers, between the warehouse and the known latitude and longitude 37.775°, -122.418° (San Francisco).

**Tips:**

- The GEOLOCATION function returns a location data type that can be used only by, and must be used with, the DISTANCE function. The GEOLOCATION function doesn’t work on its own.

---

**GETRECORDIDS**

**Description:**

Returns an array of strings in the form of record IDs for the selected records in a list, such as a list view or related list.

**Use:**

{!GETRECORDIDS(object_type}) and replace object_type with a reference to the custom or standard object for the records you want to retrieve.

**Custom Button Example:**

```javascript
 {!REQUIRESCRIPT ('/soap/ajax/13.0/connection.js')} var records = {!GETRECORDIDS($ObjectType.Sample)}; var newRecords = []; if (records[0] == null) { alert("Please select at least one row"); } else {
 for (var n=0; n<records.length; n++) {
 var c = new sforce.SObject("Case"); c.id = records[n]; c.Status = "New";
 newRecords.push(c); }
 result = sforce.connection.update(newRecords); window.location.reload(); }
```

In this example, all selected case records are updated with a Status of "New." To set this up in your organization, create a custom list button for cases with the following attributes:

- **Display Type** is "List Button"
- **Behavior** is "Execute JavaScript"
- **Content Source** is "OnClick JavaScript"

Paste the sample code above into the content of your custom button. Finally, add the list button to the a page layout that contains the Cases related list, such as accounts or opportunities. Users can select any number of cases in the related list and click the list button to change the status of
those cases at once. Notice the check for `records[0] == null`, which displays a message to users when they do not select at least one record in the list.

**Tips:**

- Use global variables to access special merge fields for s-controls, custom buttons, and links.
- Activities are special types of objects. Use `{GETRECORDIDS($ObjectType.Task)}` when creating a task list button. Use `{GETRECORDIDS($ObjectType.Event)}` when creating an event list button.
- This function is only available in custom buttons, links, and s-controls.

---

### GETSESSIONID

**Description:**

Returns the user's session ID.

**Use:**

`GETSESSIONID()`

**Example:**

```javascript
HYPERLINK
("https://www.myintegration.com?sId="
GETSESSIONID() & "&rowID="&Name & "action=CreateTask","Create a Meeting Request")
```

creates a link to an application outside of Salesforce, passing the parameters so that it can connect to Salesforce via the API and create the necessary event.

**Tips:**

- **Important:** `$Api.Session_ID` and `GETSESSIONID()` return the same value, an identifier for the current session in the current context. This context varies depending on where the global variable or function is evaluated. For example, if you use either in a custom formula field, and that field is displayed on a standard page layout in Salesforce Classic, the referenced session will be a basic Salesforce session. That same field (or the underlying variable or formula result), when used in a Visualforce page, references a Visualforce session instead.

  Session contexts are based on the domain of the request. That is, the session context changes whenever you cross a hostname boundary, such as from `.salesforce.com` to `.visual.force.com` or `.lightning.force.com`.

  Session identifiers from different contexts, and the sessions themselves, are different. When you transition between contexts, the old session is replaced by the new one, and the old session is no longer valid. The session ID also changes at this time.

  Normally Salesforce transparently handles session hand-off between contexts, but if you’re passing the session ID around yourself, be aware that you might need to re-access `$Api.Session_ID` or `GETSESSIONID()` from the new context to ensure a valid session ID.

  Note also that not all sessions are created equal. In particular, sessions obtained in a Lightning Experience context have reduced privileges, and don’t have API access. You can’t use these session IDs to make API calls.
**HTMLENCODE**

**Description:** Encodes text and merge fields for use in HTML by replacing characters that are reserved in HTML, such as the greater-than sign (>), with HTML entity equivalents, such as &gt;.

**Use:**

\{ {!HTMLENCODE (text) } \} and replace text with the merge field or text string that contains the reserved characters.

**Example:**

If the merge field foo__c contains &lt;B&gt;Enter the user's name&lt;/b&gt;,
\{ {!HTMLENCODE (foo__c) } \} results in: &lt;B&gt;Enter the user&amp;#39;s name&lt;/b&gt;

**Tips:**

This function is only available in custom buttons and links, and in Visualforce.

**HYPERLINK**

**Description:** Creates a link to a URL specified that is linkable from the text specified.

**Use:**

HYPERLINK \( (url, \text{ friendly\_name }[, \text{ target}]) \) and replace url with the Web address, replace friendly\_name with the link text, and, optionally, replace target with the window or frame in which to display the content.

**Example:**

Creating Events

HYPERLINK("00U/e?retURL=%2F006x0000001T8Om&what_id=" & Id, "Create Event")

adds a link called “Create Event” that, when clicked, creates a new event that is associated with the current object.

**Phone Dialer**

HYPERLINK("http://servername/call?id=" & Id & "&phone=" & Phone, Phone) creates a linkable phone number field that automatically dials the phone number when clicked. In this example, replace "servername" and "call" with the name of your dialing tool and the command it uses to dial. The merge field, Id, inserts the identifier for the contact, lead, or account record. The first Phone merge field tells the dialing tool what number to call and the last Phone merge field uses the value of the Phone field as the linkable text the user clicks to dial.

**Tips:**

- Hyperlink formula fields are of type text.
- Include the protocol and URL in quotes as in HYPERLINK\( (\"http://www.cnet.com\", \"cnet\") \).
- Avoid using text functions such as LEN, LEFT, or RIGHT on HYPERLINK function results.
- When linking to Salesforce pages, use a relative link, such as “00U/e?retURL=%...”, for hyperlink formulas unless you want to add the formula field to a search layout. Use the complete URL, including the server name and https://, in a hyperlink formula to add it to a search layout. Note that formula fields are not available in search result layouts.
- Use the $Api variable to reference API URLs.
• Be sure to remove the brackets, [ and ], from your formula before validating it.
• The target parameter is optional. If you do not specify a target, the link opens in a new browser window. Some common target parameters are:

  _blank
  Displays link in a new unnamed window.

  _self
  Displays link in the same frame or window as the element that refers to it.

  _parent
  Displays link in the immediate frameset parent of the current frame. This value is the same as _self if the current frame has no parent.

  _top
  Displays link in the full original window, canceling any other frames. This value is the same as _self if the current frame has no parent.

  For more information on basic HTML tags, consult an HTML reference on the Internet.
• The HYPERLINK function is available everywhere that you can define a formula except default values, field updates, s-controls, validation rules, approval processes, custom buttons and links, and workflow rules.

SEE ALSO:
Formula Operators and Functions I–Z
Formula Operators and Functions

**Formula Operators and Functions I–Z**

Use the following operators and functions when building formulas. Click on the name of the operator or function below to view more details. All functions are available everywhere that you can include a formula such as formula fields, validation rules, approval processes, and workflow rules, unless otherwise specified.

**Note:** Extraneous spaces in the samples below are ignored.

**IF**

<table>
<thead>
<tr>
<th>Description:</th>
<th>Determines if expressions are true or false. Returns a given value if true and another value if false.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use:</td>
<td>IF(logical_test, value_if_true, value_if_false) and replace logical_test with the expression you want evaluated; replace value_if_true with the value you want returned if the expression is true; replace value_if_false with the value you want returned if the expression is false.</td>
</tr>
<tr>
<td>Formula Field Example:</td>
<td>Overdue Payments</td>
</tr>
<tr>
<td></td>
<td>IF(AND(Payment_Due_Date__c &lt; TODAY(), Payment_Status__c =&quot;UNPAID&quot;), &quot;PAYMENT OVERDUE&quot;, null)</td>
</tr>
</tbody>
</table>
This formula determines if the payment due date is past and the payment status is "UNPAID." If so, returns the text "PAYMENT OVERDUE" and if not, leaves the field blank. This example uses a custom date field called Payment Due Date and a text custom field called Payment Status.

**Insert Tax Rate**

Use this default value formula to set the tax rate of an asset based on the user’s city. Create a custom percent field with the following default value:

```plaintext
IF($User.City = "Napa", 0.0750, 
  IF($User.City = "Paso Robles", 0.0725, 
    IF($User.City = "Sutter Creek", 0.0725, 
      IF($User.City = "Los Olivos", 0.0750, 
        IF($User.City = "Livermore", 0.0875, null) 
      ) 
    ) 
  ) 
)
```

**Custom Button Example:**

```plaintext
{! IF(Sample.BillingCountry = "US", 
  IF(Sample.BillingCountry = "UK", 
    "http://maps.google.com"))} 
```

This example uses the IF function to determine if an address is in the United States or United Kingdom so that it can use the appropriate type of Google map to display the address.

**Tips:**

- Make sure your `value_if_true` and `value_if_false` expressions are the same data type.
- When using an IF function with the $Profile.UserType variable to determine the type of Salesforce user license the logged in user has, use the following values:
  - Standard for Salesforce
  - PowerPartner for PRM User
  - CustomerSuccess for Customer Portal User
  - PowerCustomerSuccess for Customer Portal Manager

For example, use the following formulas to determine if the logged in user has the license type in quotes:

```plaintext
IF(ISPICKVAL($Profile.UserType ,"Standard"), 100, 0.1) 
IF(ISPICKVAL($Profile.UserType ,"PowerPartner"), 100, 0.1) 
IF(ISPICKVAL($Profile.UserType ,"CustomerSuccess"), 100, 0.1) 
```
Note: $Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.

**IMAGE**

**Description:** Inserts an image with alternate text and height/width specifications.

**Use:** 
```plaintext
IMAGE(image_url, alternate_text, height, width)
```
and replace `image_url` with the full path to the image; replace `alternate_text` with the string of text you want to appear when the image can't be rendered for some reason, and which can be used by screen reader software; replace `height` with the vertical size of the image in pixels; replace `width` with the horizontal size of the image in pixels.

**Example:**
```plaintext
HYPERLINK("ymsgr:sendIM?" & Yahoo_Name__c, IMAGE("http://opi.yahoo.com/online?u=" & Yahoo_Name__c & 
"&m;=g&t;=0", "Yahoo"))
```

This formula displays a clickable Yahoo! Messenger icon indicating if the person is logged on to the service. Users can click the icon to launch a Yahoo! Messenger conversation with the person. This example uses a custom text field called `Yahoo Name` on contacts where you can store the contact's Yahoo! Messenger ID.

**Tips:**
- The `height` and `width` parameters are optional.
- Use a text string to replace the `image_url` and `alternate_text` parameters. Surround each text string in quotes.
- Use numbers to replace the `height` and `width` parameters.
- Add images to your Documents tab if you want to display them elsewhere. For example, store the image of a product in a document folder, copy the URL to the document, and paste that URL in the `image_url` parameter of a formula field on the Products tab.
- If you use Internet Explorer, you may need to change your security settings so that it does not display a warning prompt when images use HTTP protocol. See the online help for Internet Explorer for instructions on changing your security settings.
- The `IMAGE` function cannot include the GETSESSIONID function as one of its arguments.
- The `IMAGE` function is available only in formula fields and email templates.

**INCLUDE**

**Description:** Returns content from an s-control snippet. Use this function to reuse common code in many s-controls.

**Use:**
```plaintext
{!INCLUDE(source, [inputs])}
```
and replace `source` with the s-control snippet you want to reference. Replace `inputs` with any information you need to pass to the snippet.
S-Control Example: 

Including Header Snippet

```html
<html> <body> {! INCLUDE($SControl.Header_Snippet, [title = "My Title", theme = "modern"]) } </body> </html>
```

This example references a snippet that provides a header for a page that you created to display in a Web tab. It displays the page title “My Title.” Use the $SControl global variable to reference a custom s-control.

Including Input Parameters

Use the following two examples to see how you can create a reusable snippet and include it in an s-control.

```html
<h2 class="{"Request.titleTheme}.title">
{!Request.titleText}
</h2>
```

This snippet requires two input parameters: titleTheme and titleText. It is a reusable HTML tag that presents a page title and theme based on input parameters. Next, create an s-control that includes this snippet:

```html
<html> <head> </head> <body> {! INCLUDE($SControl.Title_Snippet, [titleTheme = "modern", titleText = "My Sample Title"]) } ... Insert your page specific content here ... </body> </html>
```

This s-control uses the snippet titled Title_Snippet to display the title of the page "My Sample Title" and modern theme. Replace Insert your page specific content here with your own HTML content and use the s-control as the source of a Web tab to create your own pages in Salesforce.

Tips:

- Because this function references an s-control snippet and does not copy it, it always runs the latest content of the s-control snippet. Remember when making a change to your s-control snippet that it affects all INCLUDE functions that refer to it.
- Use the $Request global variable to access any information inside the snippet.
- This function is only available in custom buttons, links, and s-controls.

INCLUDES

Description:

Determines if any value selected in a multi-select picklist field equals a text literal you specify.

Use:

`INCLUDES(multiselect_picklist_field, text_literal)` and replace `multiselect_picklist_field` with the merge field name for the multi-select picklist; and replace `text_literal` with the multi-select picklist value you want to match in quotes.

Examples:

`INCLUDES(Hobbies__c, "Golf")` returns TRUE if one of the selected values in the Hobbies custom multi-select picklist field is Golf.
Tips:

- The text_literal expression must be of type text and enclosed in quotes. It cannot be a merge field or the result of a function.
- Salesforce returns an error if any of the following occurs:
  - You do not provide a text_literal expression.
  - You provide an empty text_literal expression, such as "" or " ".
- Use ISBLANK to determine if a multi-select picklist field is empty.
- Use the PRIORVALUE function inside the INCLUDES function to check if the previous value of a multi-select picklist field included a specific value. For example:

  ```
  INCLUDES ( 
    PRIORVALUE (multiselect_picklist_field),
    text_literal 
  )
  ```

ISBLANK

Description: Determines if an expression has a value and returns TRUE if it does not. If it contains a value, this function returns FALSE.

Use: ISBLANK(expression) and replace expression with the expression you want evaluated.

Example:

```
(IF(ISBLANK(Maint_Amount__c), 0, 1) + 
 IF(ISBLANK(Services_Amount__c), 0,1) + 
 IF(ISBLANK(Discount_Percent__c), 0, 1) + 
 IF(ISBLANK(Amount), 0, 1) + 
 IF(ISBLANK(Timeline__c), 0, 1)) / 5
```

This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A "1" is counted for any field that contains a value and this total is divided by five (the number of fields evaluated). Note that this formula requires you select the Treat blank fields as blanks option under Blank Field Handling while the Advanced Formula subtab is showing.

Tips:

- Use ISBLANK instead of ISNULL in new formulas. ISBLANK has the same functionality as ISNULL, but also supports text fields. Salesforce will continue to support ISNULL, so you do not need to change any existing formulas.
- A field is not empty if it contains a character, blank space, or zero. For example, a field that contains a space inserted with the spacebar is not empty.
- Use the BLANKVALUE function to return a specified string if the field does not have a value; use the ISBLANK function if you only want to check if the field has a value.
- If you use this function with a numeric field, the function only returns TRUE if the field has no value and is not configured to treat blank fields as zeroes.
ISCHANGED

Description: Compares the value of a field to the previous value and returns TRUE if the values are different. If the values are the same, this function returns FALSE.

Use: ISCHANGED(field) and replace field with the name of the field you want to compare.

Validation Rule Example: The following validation rule prevents users from changing an object name after it has been created: NOT(ISCHANGED(Name)).

NOT(AND(ISCHANGED(Priority), ISPICKVAL(Priority, “Low”))) is a validation rule that ensures if a user changes the Priority of a case, the new priority cannot be “Low.”

NOT(AND(ISCHANGED(CloseDate), OR(MONTH(CloseDate) <> MONTH(TODAY()), YEAR(CloseDate) <> YEAR(TODAY())), $Profile.Name <> "Sales Manager")) is a validation rule that prevents a user from changing the Close Date of an opportunity to a date outside of the current month and year unless that user has the “Sales Manager” profile.

Tip: $Profile merge fields are only available in Enterprise, Unlimited, Performance, and Developer Editions.

Tips:
- This function is available only in:
  - Assignment rules
  - Validation rules
  - Field updates
  - Workflow rules if the evaluation criteria is set to Evaluate the rule when a record is: created, and every time it’s edited.
  - Formula criteria for executing actions in the Process Builder.
- Use the NOT function to reverse the return values of TRUE and FALSE.
- This function returns FALSE when evaluating any field on a newly created record.
- If a text field was previously blank, this function returns TRUE when it contains any value.
- For number, percent, or currency fields, this function returns TRUE when:
  - The field was blank and now contains any value
  - The field was zero and now is blank
  - The field was zero and now contains any other value

ISNEW

Description: Checks if the formula is running during the creation of a new record and returns TRUE if it is. If an existing record is being updated, this function returns FALSE.

Use: ISNEW()
Validation Rule Example:

Use the following validation rule to prevent users from creating a record with a close date in the past. \( \text{AND} \left( \text{ISNEW}(), \text{CloseDate} < \text{TODAY}() \right) \) checks if the user is creating a new opportunity and, if so, ensures that the \text{Close Date} is today or after today.

Use this validation rule to ensure users add at least one product to an opportunity after they have created it.

\[ \text{NOT} \left( \text{OR} \left( \text{ISNEW}(), \text{HasOpportunityLineItem} \right) \right) \]

In this example, the validation rule formula displays the following error message when an existing opportunity does not have any products: “You must add products to this opportunity before saving.” This does not display an error on the initial save because they cannot add products until after saving the record initially; but it prevents them from resaving or closing an opportunity that does not contain products.

Tips:

- This function is available only in validation rules, field updates, workflow rules, assignment rules, and Process Builder formula criteria.
- Use the \text{NOT} function to reverse the return values of TRUE and FALSE.
- This function always returns FALSE when used in a workflow rule with a time-based trigger.
- This function always returns FALSE when used in a field update for an approval action.

**ISNULL**

Important: Use \text{ISBLANK} instead of \text{ISNULL} in new formulas. \text{ISBLANK} has the same functionality as \text{ISNULL}, but also supports text fields. Salesforce will continue to support \text{ISNULL}, so you do not need to change any existing formulas.

Description:

Determines if an expression is null (blank) and returns TRUE if it is. If it contains a value, this function returns FALSE.

Use:

\[ \text{ISNULL} \left( \text{expression} \right) \]

and replace \text{expression} with the expression you want evaluated.

Example:

\[
\begin{align*}
\text{(IF(ISNULL(Maint\_Amount\_c), 0, 1) + IF(ISNULL(Services\_Amount\_c), 0, 1)) + IF(ISNULL(Discount\_Percent\_c), 0, 1) + IF(ISNULL(Amount), 0, 1) + IF(ISNULL(Timeline\_c), 0, 1)) / 5}
\end{align*}
\]

This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A “1” is counted for any field that contains a value and this total is divided by five (the number of fields evaluated). Note that this formula requires you select the Treat blank fields as blanks option under Blank Field Handling while the Advanced Formula subtab is showing.

Validation Rule Example:

\[ \text{AND} \left( \text{ISPICKVAL(StageName, "Closed Won"), ISNULL(Project\_Start\_Date\_c)} \right) \]

This validation rule makes the \text{Project Start Date} custom date field conditionally required whenever the stage is “Closed Won.”
**Tips:**

- Text fields are never null, so using this function with a text field always returns false. For example, the formula field `IF(ISNULL(new__c) 1, 0)` is always zero regardless of the value in the `New` field. For text fields, use the ISBLANK function instead.
- Multi-select picklist fields are never null in s-controls, buttons, and email templates, so using this function with a multi-select picklist field in those contexts always returns false.
- Empty date and date/time fields always return true when referenced in ISNULL functions.
- Don’t use ISNULL for date/time fields.
- Choose Treat blank fields as blanks for your formula when referencing a number, percent, or currency field in an ISNULL function. Choosing Treat blank fields as zeroes gives blank fields the value of zero so none of them will be null.
- Merge fields can be handled as blanks, which can affect the results of components like s-controls because they can call this function.
- When using a validation rule to ensure that a number field contains a specific value, use the ISNULL function to include fields that do not contain any value. For example, to validate that a custom field contains a value of ‘1’, use the following validation rule to display an error if the field is blank or any other number:

  ```
  OR(ISNULL(field__c), field__c<>1)
  ```

**ISNUMBER**

**Description:** Determines if a text value is a number and returns TRUE if it is. Otherwise, it returns FALSE.

**Use:** `ISNUMBER(text)` and replace `text` with the merge field name for the text field.

**Validation Rule Example:**

```
OR(LEN(Bank_Account_Number__c) <> 10,
  NOT(ISNUMBER(Bank_Account_Number__c)))
```

This validation rule ensures a custom text field called Bank Account Number is a number of 10 digits and is not blank.

**Tips:**

- This function returns FALSE for blank values.
- The ISNUMBER function is not aware of your locale. For example, `ISNUMBER("123,12")` and `ISNUMBER("1 000")` return FALSE even if the user’s locale is “French.”
- Chinese, Japanese, Korean, and special characters including a space return FALSE.
- The ISNUMBER function returns TRUE for scientific formatting such as “2E2” or “123.123.”

**IS PICKVAL**

**Description:** Determines if the value of a picklist field is equal to a text literal you specify.

**Use:** `IS PICKVAL(picklist_field, text_literal)` and replace `picklist_field` with the merge field name for the picklist; replace `text_literal` with the picklist value in quotes. `text_literal` cannot be a merge field or the result of a function.
Examples:

**Contract Activation**

`IF(ISPICKVAL(Status, "Activated"), NOW()-ActivatedDate, null)` calculates the number of days since the contract was activated. If the contract status is not “Activated,” this field is blank.

**Commission Amounts**

`IF(ISPICKVAL(StageName, "Closed Won"), ROUND(Amount *0.02, 2), 0)`

This example calculates the commission amount for any opportunity that has a “Closed Won” stage. The value of this field will be the amount times 0.02 for any closed/won opportunity. Open or lost opportunities will have a zero commission value.

**Competitor-Triggered Workflow**

`ISPICKVAL(Stage, "Closed Lost") && INCLUDES(Competitor__c, "Acme")`

In a workflow rule or the Process Builder, this formula configures Salesforce to trigger the associated actions if the Competitor multi-select picklist field on a lost business is Acme.

Tips:

- Replace `picklist_field` with a custom or standard field of type picklist.
- Your `text_literal` expression must be of type text and enclosed in quotes. It cannot be a merge field or the result of a function.
- Use `CASE` functions to determine if a picklist value is equal to a particular value.
- When using the `ISPICKVAL` function to return the previous value of a picklist field, include the `PRIORVALUE` function inside the `ISPICKVAL` function as in this example:

  ```plaintext
  ISPICKVAL(PRIORVALUE(picklist_field),
  text_literal)
  ```

**JSENCODE**

**Description:**

Encodes text and merge field values for use in JavaScript by inserting escape characters, such as a backslash (\), before unsafe JavaScript characters, such as the apostrophe (‘).

**Use:**

`{!JSENCODE(text)}` and replace `text` with the merge field or text string that contains the unsafe JavaScript characters.

**Example:**

If the merge field `foo__c` contains `<B>Enter the user's name</b>`, `{!JSENCODE(foo__c)}` results in: \u003CB\u003EEnter the user\'s name\u003C\b\u003E

**Tips:**

This function is only available in custom buttons and links, and in Visualforce.
**JSINHTMLENCODE**

**Description:** Encodes text and merge field values for use in JavaScript inside HTML tags by replacing characters that are reserved in HTML with HTML entity equivalents and inserting escape characters before unsafe JavaScript characters. `JSINHTMLENCODE(someValue)` is a convenience function that is equivalent to `JSENCODE(HTMLENCODE((someValue)))`. That is, `JSINHTMLENCODE` first encodes `someValue` with `HTMLENCODE`, and then encodes the result with `JSENCODE`.

**Use:** ` {!JSINHTMLENCODE(text) }` and replace `text` with the merge field or text string that contains the unsafe JavaScript characters.

**Example:** If the merge field `foo__c` contains `<B>Enter the user's name</b>`, ` {!JSINHTMLENCODE(foo__c) }` results in: `<B>Enter the user's name</b>`

**Tips:**
- This function is only available in custom buttons and links, and in Visualforce.

**LEFT**

**Description:** Returns the specified number of characters from the beginning of a text string.

**Use:** `LEFT(text, num_chars)` and replace `text` with the field or expression you want returned; replace `num_chars` with the number of characters from the left you want returned.

**Example:** `TRIM(LEFT(LastName, 5)) & "-" & TRIM(RIGHT(SSN__c, 4))`

This formula displays the first five characters of a name and the last four characters of a social security number separated by a dash. Note that this example uses a text custom field called `SSN`.

**Tips:**
- Reference auto-number fields as text fields in formulas.
- If the `num_chars` value is less than zero, Salesforce replaces the value with zero.

**LEN**

**Description:** Returns the number of characters in a specified text string.

**Use:** `LEN(text)` and replace `text` with the field or expression whose length you want returned.

**Example:** `LEN(PartNumber__c)`

This formula returns the number of characters in a `Product Code` field.

**LINKTO**

**Description:** Returns a relative URL in the form of a link (href and anchor tags) for a custom s-control or Salesforce page.
Use: \[\text{\{!LINKTO}(\text{\texttt{label}}, \text{\texttt{target}}, \text{\texttt{id}}, [\text{\texttt{inputs}}], [\text{\texttt{no override}}])\}\] and replace label with the text for the link, target with the URL, and id with a reference to the record. Inputs are optional and can include any additional parameters you want to add to the link. The no override argument is also optional and defaults to “false.” It applies to targets for standard Salesforce pages such as $Action.Account.New. Replace no override with “true” when you want to display a standard Salesforce page regardless of whether you have defined an override for it elsewhere.

S-Control Example: New Account S-Control

\[<html> <body> \{!LINKTO("Create a New Account", 
    $Action.Account.New, $ObjectType.Account)\} 
</body> </html>\]

This example allows users to click a link to create a new account. It is useful in account list views or Web tabs where you want users to create an account directly from that page. Use the $Action global variable to access the new account page in Salesforce.

New Email Window S-Control

\[<html> <body> \{!LINKTO("Email link", 
    "mailto:support@yourcompany.com?subject=Please%20Help")\}; 
</body> </html>\]

This example launches a new email window addressed to support@yourcompany.com with the subject “Please Help” whenever a user clicks “Mail link.”

Link to Another S-Control

\[<html> <body> \{!LINKTO("Check for duplicates", 
    $Scontrol.dedup_account, Account.Id)\} 
</body> </html>\]

Use this example to generate a page containing a hyperlink labeled “Check for duplicates.” When users click this link, Salesforce runs your custom s-control. This example assumes you have already created a custom s-control to find duplicate accounts and merge their information.

Tips:

- Avoid using this function in an inline s-control if you want it to open in a new window.
- Enclose multiple inputs in brackets to indicate they are together:
  \[\{!LINKTO("View Case", $Action.Case.View, Case.Id, [parm1="A", Parm2="B"]\)}\]
- Set inputs to null if you do not have any to pass yet you want to set the no override argument:
  \[\{!LINKTO("View Case", $Action.Case.View, Case.Id, null, true)\}\]
When you override the tab home page for a standard or custom tab, set target to the “Tab” $Action global variable and id to the object type. For example, LINKTO("Accounts Tab", $Action.Account.Tab, $ObjectType.Account)

- This function is only available in custom buttons, links, and s-controls.

LN

Description: Returns the natural logarithm of a specified number. Natural logarithms are based on the constant e value of 2.71828182845904.

Use: LN(number) and replace number with the field or expression for which you want the natural logarithm. Note: the LN function is the inverse of the EXP function.

Example: LN(10) returns the natural logarithm of 10, which is 2.30.

LOG

Description: Returns the base 10 logarithm of a number.

Use: LOG(number) and replace number with the field or expression from which you want the base 10 logarithm calculated.

Example: Salary

LOG(Salary__c) calculates the logarithm of a person’s salary. In this example, Salary is a custom currency field.

Hydrogen

-LOG(Hydrogen__c) calculates the pH and acidity using the LOG function and a custom number field called Hydrogen, which represents the concentration of Hydrogen ions in the liquid measured in moles per liter.

LOWER

Description: Converts all letters in the specified text string to lowercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.

Use: LOWER(text, [locale]) and replace text with the field or text you wish to convert to lowercase, and locale with the optional two-character ISO language code or five-character locale code, if available.

Example: MYCOMPANY.COM

LOWER("MYCOMPANY.COM") returns "mycompany.com."

Ticker Symbol

LOWER(TickerSymbol) returns the text in Ticker Symbol in lower case characters.
Applying Turkish Language Locale Rules

The Turkish language has two versions of the letter i: one dotted and one dotless. The locale rules for Turkish require the ability to capitalize the dotted i, and allow the dotless l to be lowercase. To correctly use the LOWER() function with the Turkish language locale, use the Turkish locale code tr in the LOWER() function as follows:

```
LOWER(text, "tr")
```

This ensures that Salesforce does not transform any dotted i in the text to a dotless l.

---

**LPAD**

**Description:** Inserts characters you specify to the left-side of a text string.

**Use:**

```
LPAD(text, padded_length[, pad_string])
```

- `text` is the field or expression you want to insert characters to the left of.
- `padded_length` is the number of total characters in the text that will be returned.
- `pad_string` is the character or characters that should be inserted. `pad_string` is optional and defaults to a blank space.

If the value in `text` is longer than `pad_string`, `text` is truncated to the size of `padded_length`.

**Example:**

**Field Name: Padding**

```
LPAD(Name, 20)
```

truncates the Name field after 20 characters. For example, if the name is mycompany.com, the value returned is "mycompany.com."

**My_Company: No Change**

```
LPAD('my_company.com', 14, 'z')
```

returns "my_company.com" without change because it has 14 characters.

**Field Name Padded with Z**

```
LPAD(Name, 15, 'z')
```

returns the name "zmycompany.com."

**Field Name: Truncating**

```
LPAD(Name, 2)
```

truncates the name after the second character. For example, if the name is mycompany.com, the value returned is "my."

**Tips:**

Leading blank spaces and zeros are omitted.

---

**MAX**

**Description:** Returns the highest number from a list of numbers.

**Use:**

```
MAX(number, number, ...)
```

and replace `number` with the fields or expressions from which you want to retrieve the highest number.
Example: **Service Charge**

\[
\text{MAX}(0.06 \times \text{Total\_Cost\_c}, \text{Min\_Service\_Charge\_c})
\]

In this example, the formula field calculates a service charge of 6% of the total cost or a minimum service charge, whichever is greater. Note that Min Service Charge is a custom currency field with a default value of $15. However, you could make it a formula field if your minimum service charge is always the same amount.

**Book Royalties**

\[
\text{MAX}(0.10 \times \text{Pages\_c}, \ (\text{Retail\_Price\_c} \times 0.07) \times \text{Total\_Sold\_c})
\]

This formula determines which amount to pay in royalties for a book. It displays the greater of two amounts: $0.07 for each book sold or $0.10 per page. It assumes you have custom number fields for Pages and Total Sold and a custom currency field for Retail Price.

**Commissions**

\[
\text{MAX}($\text{User\_Commission\_Percent\_c} \times \text{Price}, \ (\text{Price} \times \text{Account\_Discount\_c}) \times 100)
\]

This formula determines what commission to log for an asset based on which is greater: the user’s commission percentage of the price, the price times the discount percent stored for the account or 100 dollars. This example assumes you have two custom percent fields on users and assets.

---

**MID**

**Description:**

Returns the specified number of characters from the middle of a text string given the starting position.

**Use:**

\[
\text{MID(text, start\_num, num\_chars)}
\]

and replace text with the field or expression to use when returning characters; replace start\_num with the number of characters from the left to use as a starting position; replace num\_chars with the total number of characters to return.

**Example:**

\[
\text{MID(Division, 3, 4)}
\]

returns four characters of the Division name beginning with the third character from the left. On a user record, this represents the department code.

---

**MIN**

**Description:**

Returns the lowest number from a list of numbers.

**Use:**

\[
\text{MIN(number, number, ...)}
\]

and replace number with the fields or expressions from which you want to retrieve the lowest number.

**Example:**

**401K Matching**

\[
\text{MIN}(250, \text{Contribution\_c} / 2)
\]

This example formula determines which amount to provide in employee 401K matching based on a matching program of half of the employee’s contribution or $250, whichever is less. It assumes you have custom currency field for Contribution.
**Bonus**

```
MIN(Gross__c * Bonus_Percent__c,
    Performance__c / Number_of_Employees__c)
```

This example determines an employee’s bonus amount based on the smallest of two amounts: the employee’s gross times bonus percent or an equally divided amount of the company’s performance amount among all employees. It assumes you have custom number field for Number of Employees, a custom percent field for Bonus Percent, and currency custom fields for the employee’s Gross and company’s Performance.

---

**MOD**

**Description:** Returns a remainder after a number is divided by a specified divisor.

**Use:** `MOD(number, divisor)` and replace `number` with the field or expression you want divided; replace `divisor` with the number to use as the divisor.

**Example:**
- `MOD(3, 3)` returns 0
- `MOD(4, 3)` returns 1
- `MOD(123, 100)` returns 23

You may want to prevent users from scheduling meetings on a Saturday or Sunday. Use the following example to apply a validation rule to a custom date field called `My_Date`.

```
CASE(MOD(My_Date__c - DATE(1900, 1, 7), 7),
    0, 0,
    6, 0,
    1) = 0
```

This example displays the following error message when the value of `My_Date` is not Monday through Friday: “My Date is not a weekday.”

---

**MONTH**

**Description:** Returns the month, a number between 1 (January) and 12 (December) in number format of a given date.

**Use:** `MONTH(date)` and replace `date` with the field or expression for the date containing the month you want returned.

**Example:**
- `SLA Expiration`
  `MONTH(SLAExpirationDate__c)` returns the month that your service-level agreement expires. This example uses a custom date field called SLA Expiration Date.
- `Current Month`
  `MONTH(TODAY())` returns the current month in a number format. For example, the month of February would be the value “2.”
### NOT

**Description:**
Returns FALSE for TRUE and TRUE for FALSE.

**Use:**
\[ \text{NOT}(\text{logical}) \text{ and replace } \text{logical} \text{ with the expression that you want evaluated.} \]

**Example:**
\[ \text{IF}(\text{NOT}(\text{ISPICKVAL(Status, "Closed"))), \text{ROUND}(\text{NOW}()-\text{CreatedDate}, 0), \text{null}) \]
null checks to see if a variable is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the variable is not open, this field is blank.

### NOW

**Description:**
Returns a date/time representing the current moment.

**Use:**
\[ \text{NOW}() \]

**Example:**
\[ \text{IF}(\text{ISPICKVAL(Status, "Open"), \text{ROUND}(\text{NOW}()-\text{CreatedDate}, 0), \text{null})} \]
This formula checks to see if a lead is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the lead is not open, this field is blank.

### Tips:
- Do not remove the parentheses.
- Keep the parentheses empty. They do not need to contain a value.
- Use a date/time field in a NOW function instead of a date field. Created Date and Last Modified Date are date/time fields whereas Last Activity Date is a date field.
- Use TODAY if you prefer to use a date field.
- Dates and times are always calculated using the user's time zone.
- Use addition and subtraction operators with a NOW function and other date/time fields to return a number, representing number of days. For example \text{NOW}() - \text{CreatedDate} calculates the number of days since the created date of a record. In this example, the formula field data type is a number.
- Use addition and subtraction operators with a NOW function and numbers to return a date and time. For example \text{NOW}() +5 calculates the date and time five days ahead of now. In this example, the formula field data type is a date/time.

### NULLVALUE

**Important:** Use BLANKVALUE instead of NULLVALUE in new formulas. BLANKVALUE has the same functionality as NULLVALUE, but also supports text fields. Salesforce will continue to support NULLVALUE, so you do not need to change existing formulas.

**Description:**
Determines if an expression is null (blank) and returns a substitute expression if it is. If the expression is not blank, returns the value of the expression.

**Use:**
\[ \text{NULLVALUE}(\text{expression, substitute_expression}) \text{ and replace expression with the expression you want to evaluate; replace substitute_expression with the value you want to replace any blank values.} \]
Example: 

\[(\text{NULLVALUE}(\text{Sample\_Due\_Date\_c}, \text{StartDate} +5)\] 

This formula returns the date five days after the start date whenever Sample Due Date is blank. Sample Due Date is a custom date field.

Tips: 

- Avoid using this function with text fields because they are never null even when they are blank. Instead, use the \text{BLANKVALUE} function to determine if a text field is blank.
- Don’t use \text{NULLVALUE} for date/time fields.
- Choose Treat blank fields as blanks for your formula when referencing a number, percent, or currency field in a \text{NULLVALUE} function. Choosing Treat blank fields as zeroes gives blank fields the value of zero so none of them will be null.
- Use the same data type for both the \text{expression} and \text{substitute_expression}.

\text{OR} 

Description: 
Determines if expressions are true or false. Returns \text{TRUE} if any expression is true. Returns \text{FALSE} if all expressions are false. Use this function as an alternative to the operator \text{||} (\text{OR}).

Use: 
\text{OR} (\text{logical1, logical2...}) and replace any number of logical references with the expressions you want evaluated.

Formula Field Example: 
\text{IF(OR(ISPICKVAL(Priority, "High"), ISPICKVAL(Status, "New")), ROUND(NOW()–CreatedDate, 0), null)} 

This formula returns the number of days a case has been open if the Status is new or the Priority is high. If the case was opened today, this field displays a zero.

Validation Rule Example: 
\text{OR(Sample\_Rate\_c < 0, Sample\_Rate\_c > 0.40)} 

This validation rule formula displays the following error message when the Sample Rate custom field is not between 0 and 40%: “SampleRate cannot exceed 40%.”

\text{PARENTGROUPVAL} 

Description: 
This function returns the value of a specified parent grouping. A “parent” grouping is any level above the one containing the formula. You can only use this function in custom summary formulas for reports.

Use: 
\text{Summary and Joined:} \text{PARENTGROUPVAL(summary\_field, grouping\_level)} 
\text{Matrix:} \text{PARENTGROUPVAL(summary\_field, parent\_row\_grouping, parent\_column\_grouping)} 
Where \text{summary\_field} is the summarized field value, \text{grouping\_level} is the parent level for summary reports, and \text{parent\_row\_level} and \text{parent\_column\_level} are the parent levels for matrix reports.

Example: 
\text{TOTAL\_PRICE:SUM/PARENTGROUPVAL(TOTAL\_PRICE:SUM, GRAND\_SUMMARY)}
This formula calculates, for each product, its relative size compared to the grand total. In this example, the report is a summary of opportunities and their products, grouped by Product Name.

**PREVGROUPVAL**

**Description:**
This function returns the value of a specified previous grouping. A “previous” grouping is one that comes before the current grouping in the report. Choose the grouping level and increment. The increment is the number of columns or rows before the current summary. The default is 1; the maximum is 12. You can only use this function in custom summary formulas for reports.

**Use:**
PREVGROUPVAL(summary_field, grouping_level [, increment])

Where summary_field is the name of the grouped row or column, grouping_level is the summary level, and increment is the number of rows or columns previous.

**Example:**
AMOUNT:SUM - PREVGROUPVAL(AMOUNT:SUM, CLOSE_DATE)

This formula calculates, for each month, the difference in amount from the previous month shown in the report. In this example, the report is an opportunity matrix with columns grouped by Close Date and rows by Stage.

**PRIORVALUE**

**Description:**
Returns the previous value of a field.

**Use:**
PRIORVALUE(field)

**Validation Rule Example:**
The following validation rule prevents users from changing the expected revenue of an opportunity after it is closed: AND (PRIORVALUE(Amount) > Amount, IsClosed).

**Tips:**
- This function is available only in:
  - Assignment rules
  - Validation rules
  - Field updates
  - Workflow rules if the evaluation criteria is set to Evaluate the rule when a record is: created, and every time it’s edited.
  - Formula criteria for executing actions in the Process Builder.
- This function does not return default values.
- When users create a new record, this function returns the value of the field referenced rather than null. For example, if you create an account named “Acme,” PRIORVALUE(Account.Name) returns Acme.
When using the ISPICKVAL function to return the previous value of a picklist field, include the PRIORVALUE function inside the ISPICKVAL function as in this example:

```
ISPICKVAL(PRIORVALUE(picklist_field), text_literal)
```

Use the PRIORVALUE function inside the INCLUDES function to check if the previous value of a multi-select picklist field included a specific value. For example:

```
INCLUDES(PRIORVALUE(multiselect_picklist_field), text_literal)
```

---

**REGEX**

**Description:**
Comparisons a text field to a regular expression and returns TRUE if there is a match. Otherwise, it returns FALSE. A regular expression is a string used to describe a format of a string according to certain syntax rules.

**Use:**
```
REGEX(text, regex_text)
```
and replace `text` with the text field, and `regex_text` with the regular expression you want to match.

**Validation Rule Example:**
This example ensures that a custom field called `SSN` matches a regular expression representing a valid social security number format of the form 999-99-9999.

```
NOT(
 OR(
   LEN (SSN__c) = 0,
   REGEX(SSN__c, "[0-9]{3}-[0-9]{2}-[0-9]{4}"))
)
```

**Tips:**
- Regular expression syntax is based on [Java Platform SE 6 syntax](#). However, backslash characters (\) must be changed to double backslashes (\\) because backslash is an escape character in Salesforce.
- The Salesforce regular expression engine matches an entire string as opposed to searching for a match within a string. For example, if you are searching for the name Marc Benioff, use the regular expression, .*Marc Benioff.*, to find a match in a string like the following:

  According to Marc Benioff, the social enterprise increases customer success.

  If you use the regular expression, Marc Benioff, the only string that this regular expression will match is:

  Marc Benioff
• Capture groups and substitutions are ignored.
• This function is available everywhere formulas exist except formula fields and custom buttons and links.

REQUIRESCRIPT

Description: Returns a script tag with source for a URL you specify. Use this function when referencing the Force.com AJAX Toolkit or other JavaScript toolkits.

Use: {!REQUIRESCRIPT(url)} and replace url with the link for the script that is required.
For the AJAX Toolkit:

{"requireScript("/soap/ajax/13.0/connection.js")}

Returns:

<script src="/soap/ajax/13.0/connection.js"></script>{!REQUIRESCRIPT("/soap/ajax/13.0/connection.js")}

var c = new sforce.SObject("Case");
c.id = "{{Case.Id}}";
c.Status = "New";
result = sforce.connection.update([c]);
window.location.reload();

This example sets the Status of a case to "New" whenever a user clicks a custom button from the case detail page. To set this up in your organization, define a custom button for cases that has the following attributes:
• Display Type is "Detail Page Button"
• Behavior is "Execute JavaScript"
• Content Source is "OnClick JavaScript"

Next, paste the content above into your custom button definition and add it to your case page layouts.

Tips:
• Use global variables to access special merge fields for s-controls.
• Use this function when creating custom buttons or links where you have set the Behavior to "Execute JavaScript" and Content Source to "OnClick JavaScript" because the script tag should be outside the OnClick code.
• This function is only available for custom buttons and links that have Content Source set to "OnClick JavaScript."
• When working in Visualforce, use INCLUDESCRIPT instead.

RIGHT

Description: Returns the specified number of characters from the end of a text string.
### Use:

\[
\text{RIGHT} \left( \text{text}, \ num\_chars \right) \text{ and replace } \text{text} \text{ with the field or expression you want returned; replace } \ num\_chars \text{ with the number of characters from the right you want returned.}
\]

### Example:

\[
\text{TRIM} \left( \text{LEFT(LastName, 5)} \right) \text{ & "-" & TRIM} \left( \text{RIGHT(SSN\_c, 4)} \right) \text{ displays the first five characters of a name and the last four characters of a social security number separated by a dash. Note that this assumes you have a text custom field called } SSN.
\]

### Tips:

- Reference auto-number fields as text fields in formulas.
- If the \( num\_chars \) value is less than zero, Salesforce replaces the value with zero.

### ROUND

**Description:**
Returns the nearest number to a number you specify, constraining the new number by a specified number of digits.

**Use:**

\[
\text{ROUND} \left(\text{number, num\_digits}\right) \text{ and replace } \text{number} \text{ with the field or expression you want rounded; replace } \ num\_digits \text{ with the number of decimal places you want to consider when rounding.}
\]

**Example:**

\[
\text{ROUND} \left(1.5, 0\right) = 2
\]
\[
\text{ROUND} \left(1.2345, 0\right) = 1
\]
\[
\text{ROUND} \left(-1.5, 0\right) = -2
\]
\[
\text{ROUND} \left(225.49823, 2\right) = 255.50
\]

**Simple Discounting**

\[
\text{ROUND(Amount - Amount} \times \text{Discount\_Percent\_c, 2})
\]

Use this formula to calculate the discounted amount of an opportunity rounded off to two digits. This example is a number formula field on opportunities that uses a custom percent field called Discount\_Percent.

**Tips:**

- Enter zero for \( num\_digits \) to round a number to the nearest integer.
- Salesforce automatically rounds numbers based on the decimal places you specify. For example, a custom number field with two decimal places stores 1.50 when you enter 1.49999.
- Salesforce uses the round half-up rounding algorithm. Half-way values are always rounded up. For example, 1.45 is rounded to 1.5. –1.45 is rounded to –1.5.
- The decimal numbers displayed depend on the decimal places you selected when defining the field in the custom field wizard. The \( num\_digits \) represents the number of digits considered when rounding.

### RPAD

**Description:**
Inserts characters that you specify to the right-side of a text string.
Use: \[ \text{RPAD(} \text{text}, \text{padded_length}, \text{'pad_string'}) \] and replace the variables:

- **text** is the field or expression after which you want to insert characters.
- **padded_length** is the number of total characters in the text string that will be returned.
- **pad_string** is the character or characters that should be inserted. **pad_string** is optional and defaults to a blank space.

If the value in **text** is longer than **pad_string**, **text** is truncated to the size of **padded_length**.

**Example:**

<table>
<thead>
<tr>
<th>Field Name: Padding Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPAD(Name, 20) truncates the Name field after 20 characters. For example, if the name is mycompany.com, the value returned is &quot;mycompany.com.&quot;</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>My_Company: No Change</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPAD(‘my_company.com’, 14, ‘z’) returns &quot;my_company.com&quot; without change because it has 14 characters.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field Name: Padding with a Character</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPAD(Name, 15, ‘z’) returns &quot;mycompany.comz&quot;.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field Name: Truncating</th>
</tr>
</thead>
<tbody>
<tr>
<td>RPAD(Name, 2) truncates the name after the second character. For example, if the name is mycompany.com, the value returned is &quot;my.&quot;</td>
</tr>
</tbody>
</table>

**Tips:** Ending blank spaces are omitted.

---

**SQRT**

**Description:** Returns the positive square root of a given number.

**Use:** \[ \text{SQRT(} \text{number} \] and replace **number** with the field or expression you want computed into a square root.

**Example:** \[ \text{SQRT(} 25 \] returns the square root of 25, which is 5.

**Amplitude**

\[ \text{SQRT(} \text{Amplitude} \_\text{c}) \] returns the square root of a custom number field representing the amplitude of an earthquake.

**Tips:**
- Calculating the square root of a negative number results in an error on the detail page.
- Avoid division by zero errors by including an IF function such as: \[ \text{IF(} \text{Amplitude} \_\text{c} \geq 0, \text{SQRT(} \text{Amplitude} \_\text{c}) \), \text{null}) \].

---

**SUBSTITUTE**

**Description:** Substitutes new text for old text in a text string.
<table>
<thead>
<tr>
<th><strong>Use:</strong></th>
<th>SUBSTITUTE(<code>text</code>, <code>old_text</code>, <code>new_text</code>) and replace <code>text</code> with the field or value for which you want to substitute values, <code>old_text</code> with the text you want replaced, and <code>new_text</code> with the text you want to replace the <code>old_text</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Example:</strong></td>
<td>SUBSTITUTE(<code>Name</code>, &quot;Coupon&quot;, &quot;Discount&quot;) returns the name of an opportunity that contains the term &quot;Coupon&quot; with the opportunity name plus &quot;Discount&quot; wherever the term &quot;Coupon&quot; existed. SUBSTITUTE(<code>Email</code>, LEFT(<code>Email</code>, FIND(&quot;@&quot;, <code>Email</code>)), &quot;www.&quot;) finds the location of the @ sign in a person's email address to determine the length of text to replace with a &quot;www.&quot; as a means of deriving their website address.</td>
</tr>
</tbody>
</table>
| **Tips:** | • Each term provided in quotes is case sensitive.  
• If the `old_text` appears more than once, each occurrence is replaced with the `new_text` value provided even when that results in duplicates. |

---

**TEXT**

**Description:** Converts a percent, number, date, date/time, or currency type field into text anywhere formulas are used. Also, converts picklist values to text in approval rules, approval step rules, workflow rules, escalation rules, assignment rules, auto-response rules, validation rules, formula fields, field updates, and custom buttons and links.

**Use:** `TEXT(value)` and replace `value` with the field or expression you want to convert to text format. Avoid using any special characters besides a decimal point (period) or minus sign (dash) in this function.

**Example:** Expected Revenue in Text

`TEXT(ExpectedRevenue)` returns the expected revenue amount of an opportunity in text format without a dollar sign. For example, if the `Expected Revenue` of a campaign is "$200,000," this formula field displays "200000."

Asset ID

`SerialNumber &"-"& TEXT(Quantity)` returns an asset ID number starting with the serial number and ending with the quantity separated by a dash. The `Serial Number` field is already text but the `Quantity` field is a number, requiring the TEXT function before it.

**Use Picklist Values in Math Equations**

```
VALUE(LEFT(TEXT(Quantity), 5)) * Unit
```

This formula multiplies the first five numbers of the `Quantity` picklist by the `Unit` numeric field.

**Compare Two Picklists**

```
IF(TEXT(bug_status) = TEXT(case_status), "Match", "Out of Sync")
```

This formula compares the values of the `bug_status` picklist with values of the `case_status` picklist.
Display Picklist Values From Parent Records

```
TEXT(Account.Industry)
```

This formula field on opportunities shows the industry of the associated account.

Concatenate Picklist Values

```
TEXT(Account.Industry) & " - " & TEXT(Account.SubIndustry__c)
```

This formula field on opportunities shows the industry and subindustry of the associated account.

Validation Rule Examples:

Block the Save of a Closed Opportunity

```
CONTAINS(TEXT(Status), "Closed")
```

returns TRUE if the Status picklist contains the value "Closed," such as "Closed Won" and "Closed Lost." This validation rule formula blocks users from saving changes to a closed opportunity.

Use Numeric Functions on Numeric Picklist Values

```
VALUE(LEFT(TEXT(Quantity), 5)) * Unit > 10000
```

multiplies the first five numbers of the Quantity picklist by the Unit numeric field, and returns TRUE if the result is greater than 10,000.

Directly Compare Two Picklists

```
TEXT(bug_status) = TEXT(case_status)
```

compares the values of the bug_status picklist with values of the case_status picklist, and returns TRUE if they are equal.

Tips:

- The returned text is not formatted with any currency, percent symbols, or commas.
- Values are not sensitive to locale. For example, 24.42 EUR are converted into the number 24.42.
- Percents are returned in the form of a decimal.
- Dates are returned in the form of YYYY-MM-DD, that is, a four-digit year and two-digit month and day.
- Date/time values are returned in the form of YYYY-MM-DD HH:MM:SSZ where YYYY is a four-digit year, MM is a two-digit month, DD is a two-digit day, HH is the two-digit hour, MM are the minutes, SS are the seconds, and Z represents the zero meridian indicating the time is returned in UTC time zone.
- Picklist fields are supported in TEXT functions used in these kinds of formulas: validation rules, approval rules, approval step rules, workflow rules, escalation rules, assignment rules, auto-response rules, formula fields, field updates, and custom buttons and links. In other formulas, use ISPICKVAL or CASE when referencing a picklist field.
- The TEXT function always returns picklist values in your organization’s master language, not the language of the current user.

TODAY

Description: Returns the current date as a date data type.

Use: TODAY()

Example: TODAY()-Sample_date_c calculates how many days in the sample are left.
Validation Rule Example:

```
SampleDate < TODAY()
```

This example ensures that users cannot change the Sample Date to any date in the past.

Tips:

- Do not remove the parentheses.
- Keep the parentheses empty. They do not need to contain a value.
- Use a date field with a TODAY function instead of a date/time field. Last Activity Date is a date field whereas Created Date and Last Modified Date are date/time fields.
- See NOW if you prefer to use a date/time field.
- Dates and times are always calculated using the user’s time zone.
- Use addition and subtraction operators with a TODAY function and other date fields to return a number, representing number of days. For example TODAY() - LastActivityDate calculates the number of days since the last activity date. In this example, the formula field data type is a number.
- Use addition and subtraction operators with a TODAY function and numbers to return a date. For example TODAY() + 5 calculates the date five days ahead of today. In this example, the formula field data type is a date.

TRIM

Description: Removes the spaces and tabs from the beginning and end of a text string.

Use:

```
TRIM(text) and replace text with the field or expression you want to trim.
```

Example:

```
TRIM(LEFT(LastName, 5)) & "-" & RIGHT(FirstName, 1) returns a network ID for users that contains the first five characters of their last name and first character of their first name separated by a dash.
```

UPPER

Description: Converts all letters in the specified text string to uppercase. Any characters that are not letters are unaffected by this function. Locale rules are applied if a locale is provided.

Use:

```
UPPER(text, [locale]) and replace text with the field or expression you wish to convert to uppercase, and locale with the optional two-character ISO language code or five-character locale code, if available.
```

Example:

```
MYCOMPANY.COM
UPPER("mycompany.com") returns "MYCOMPANY.COM."
MYCOMPANY.COM 123
UPPER("Mycompany.com 123") returns "MYCOMPANY.COM 123."
```

Applying Turkish Language Locale Rules

The Turkish language has two versions of the letter i: one dotted and one dotless. The locale rules for Turkish require the ability to capitalize the dotted i, and allow the dotless I to be lowercase. To
correctly use the `UPPER()` function with the Turkish language locale, use the Turkish locale code `tr` in the `UPPER()` function as follows:

```
UPPER(text, "tr")
```

This ensures that any dotted i in the `text` does not transform to a dotless i.

---

### URL ENCODE

**Description:**
Encodes text and merge field values for use in URLs by replacing characters that are illegal in URLs, such as blank spaces, with the code that represent those characters as defined in RFC 3986, Uniform Resource Identifier (URI): Generic Syntax. For example, blank spaces are replaced with `%20`, and exclamation points are replaced with `%21`.

**Use:**
```
{!URLCODE(text)}
```
and replace `text` with the merge field or text string that you want to encode.

**Example:**
If the merge field `foo__c` contains `<B>Mark's page</b>`, `{!URLCODE(foo__c)}` results in: `%3CB%3EMark%27s%20page%3C%2Fb%3E`

**Tips:**
- This function is only available in custom buttons and links, and in Visualforce.
- Custom buttons and links with URL content sources have separate encoding settings. If you use the URL ENCODE function to encode a custom button or link that has an encoding setting specified, Salesforce first encodes the URL according to the custom button or link setting, then encodes the result. For example, if the URL in a custom link contains a space and its encoding setting is UTF8, Salesforce first encodes the space to a plus sign (+), then the URL ENCODE function converts the plus sign to its character code, `%2B`.
- When you include the standard `Account` field on opportunities (`Opportunity.Account`) in the URL ENCODE function, the value of the field is the account ID, not the account name. To encode the account name, create a custom cross-object formula field on opportunities that spans to the account name, and use that field in the URL ENCODE function instead of `Opportunity.Account`. For example, if the cross-object formula is `AccountNameFormula__c`, use the following:

```
http://www.google.com/search?q={!URLCODE(Opportunity.AccountNameFormula__c)}
```

---

### URL FOR

**Description:**
Returns a relative URL for an action, s-control, Visualforce page, or a file in a static resource archive in a Visualforce page.

**Use:**
```
{!URLFOR(target, id, [inputs], [no override])}
```
and replace `target` with the URL or action, s-control, or static resource merge variable, `id` with a reference to the record, and `inputs` with any optional parameters. The `no override` argument is also optional and defaults to “false.” It applies to targets for standard Salesforce pages such as `$Action.Account.New`. Replace `no override` with "true" when you want to display a standard Salesforce page regardless of whether you have defined an override for it elsewhere.
To access a Visualforce page, simply enter the name of your page preceded by an "apex/". For example, if your Visualforce page is named myTestPage, you would use {!URLFOR('/apex/myTestPage')}.  

Visualforce Example:

```xml
<apex:image url="{!URLFOR($Resource.TestZip, 'images/Bluehills.jpg')}" width="50" height="50"/>
```

In this example, the `<apex:image>` component references a .jpg file contained within a .zip file that has been uploaded as a static resource. When uploaded, the name of the static resource was defined as TestZip, and the path to the image within the resource is images/Bluehills.jpg.

Tips:

- Use global variables to access special merge fields for actions, s-controls, and static resources.
- If an input parameter name begins with any character other than a letter or dollar sign ($), enclose it in quotation marks.
- Enclose multiple inputs in brackets to indicate they are together:
  ```apex
  {!URLFOR($Action.Case.View, Case.Id, [parm1="A", parm2="B"])}
  ```
- Set inputs to null if you do not have any to pass yet you want to set the no override argument:
  ```apex
  {!URLFOR($Action.Case.View, Case.Id, null, true)}
  ```
- When you override a standard action, that action is no longer available in Salesforce. For example, if you override the new account action, that affects the New button on all pages such as the account detail page, account related lists on other detail pages, and the Create New drop down list in the sidebar. To override a standard action yet still access it, use the no override argument in your s-control to reference that action.
- When you override the tab home page for a standard or custom tab, set target to the “Tab” $Action global variable and id to the object type. For example, URLFOR($Action.Account.Tab, $ObjectType.Account)
- This function is only available in custom buttons, links, s-controls, and Visualforce pages.

---

**VALUE**

**Description:** Converts a text string to a number.

**Use:** `VALUE(text)` and replace `text` with the field or expression you want converted into a number.

**Example:**

**Lead Number**

`VALUE(Lead_Number__c)` returns a number for the text value in the auto-number field Lead Number. This can be useful if you want to use the Lead Number field in a calculation. Note that auto-number fields are actually text fields and must be converted to a number for numeric calculations.

**Round Robin Lead Assignment**
MOD(VALUE(Lead_Number__c), 3)

This formula is for a custom formula field named Round_Robin_ID that assigns each lead a value of 0, 1, or 2. This formula uses a custom auto-number field called Lead Number that assigns each lead a unique number starting with 1. The MOD function divides the lead number by the number of lead queues available (three in this example) and returns a remainder of 0, 1, or 2. Use the value of this formula field in your lead assignment rules to assign lead records to different queues. For example:

- Round_Robin_ID = 0 is assigned to Queue A
- Round_Robin_ID = 1 is assigned to Queue B
- Round_Robin_ID = 2 is assigned to Queue C

Tips:

Make sure the text in a VALUE function does not include any special characters other than a decimal point (period) or minus sign (dash). For example, the formula `VALUE(Text_field__c)` produces these results:

- If Text field is 123, the result is 123
- If Text field is blank, the result is #Error!
- If Text field is $123, the result is #Error!
- If Text field is EUR123, the result is #Error!

**VLOOKUP**

**Description:**

Returns a value by looking up a related value on a custom object similar to the VLOOKUP() Excel function.

**Use:**

VLOOKUP(`field_to_return, field_on_lookup_object, lookup_value`)

and replace `field_to_return` with the field that contains the value you want returned, `field_on_lookup_object` with the field on the related object that contains the value you want to match, and `lookup_value` with the value you want to match.

**Validation Rule Example:**

This example checks that a billing postal code is valid by looking up the first five characters of the value in a custom object called Zip_Code__c that contains a record for every valid zip code in the US. If the zip code is not found in the Zip_Code__c object or the billing state does not match the corresponding State_Code__c in the Zip_Code__c object, an error is displayed.

```
AND( LEN(BillingPostalCode) > 0, OR(BillingCountry = "USA", BillingCountry = "US"),
    VLOOKUP($ObjectType.Zip_Code__c.Fields.State_Code__c,
    $ObjectType.Zip_Code__c.Fields.Name, LEFT(BillingPostalCode,5)) <> BillingState )
```

**Note:**

- Use this example when the billing country is US or USA.
Tips:

- The `field_to_return` must be an auto number, roll-up summary, lookup relationship, master-detail relationship, checkbox, date, date/time, email, number, percent, phone, text, text area, or URL field type.
- The `field_on_lookup_object` must be the `Record Name` field on a custom object.
- The `field_on_lookup_object` and `lookup_value` must be the same data type.
- If more than one record matches, the value from the first record is returned.
- The value returned must be on a custom object.
- You cannot delete the custom field or custom object referenced in this function.
- This function is only available in validation rules.

YEAR

Description: Returns the four-digit year in number format of a given date.

Use: `YEAR(date)` and replace `date` with the field or expression that contains the year you want returned.

Example: `YEAR(TODAY()) - YEAR(Initial_Meeting__c)` returns the number of years since your initial meeting with a client. This example uses a custom date field called `Initial Meeting`.

Using Date and Date/Time Values in Formulas

Date formulas are useful for managing payment deadlines, contract ages, or any other features of your organization that are time or date dependent.

Two data types are used for working with dates: Date and Date/Time. Most values that are used when working with dates are of the Date data type, which store the year, month, and day. Some fields, such as `CreatedDate`, are Date/Time fields, meaning they not only store a date value, but also a time value (stored in GMT but displayed in the users’ time zone). Date and Date/Time fields are formatted in the user's locale when viewed in reports and record detail pages.

You can use operations like addition and subtraction on Date and Date/Time values to calculate a future date or elapsed time between two dates. If you subtract one date from another, for example, the resulting value will be the difference between the two initial values in days (Number data type). The same operation between two Date/Time values returns a decimal value indicating the difference in number of days, hours, and minutes.

For example, if the difference between two Date/Time values is 5.52, that means the two values are separated by five days, 12 hours (0.5 of a day), and 28 minutes (0.02 of a day). You can also add numeric values to Dates and Date/Times. For example, the operation `TODAY() + 3` returns three days after today’s date. For more information and examples of working with dates, see the list of Sample Date Formulas.

Throughout the examples, the variables `date` and `date/time` are used in place of actual Date and Date/Time fields or values.
Keep in mind that complex date functions tend to compile to a larger size than text or number formula functions, so you might run into issues with formula compile size. See *Tips for Reducing Formula Size* for help with this problem.

**TODAY() and NOW()**

The `TODAY()` function returns the current day, month, and year as a Date data type. This function is useful for formulas where you are concerned with how many days have passed since a previous date, the date of a certain number of days in the future, or if you just want to display the current date.

The `NOW()` function returns the Date/Time value of the current moment. It’s useful when you are concerned with specific times of day as well as the date.

For details on how to convert between Date values and Date/Time values, see Converting Between Date/Time and Date.

**The DATE() Function**

The `DATE()` function returns a Date value, given a year, month, and day. Numerical Y/M/D values and the `YEAR()`, `MONTH()`, and `DAY()` functions are valid parameters for `DATE()`. For example, `DATE( 2013, 6, 1 )` returns June 6, 2013. Similarly, `DATE( YEAR( TODAY() ), MONTH( TODAY() ) + 3, 1)` returns the Date value of the first day three months from today in the current year, assuming the date is valid (for example, the month falls between 1 and 12).

If the inputted Y/M/D values result in an invalid date, the `DATE()` function returns an error, so error checking is an important part of working with Date values. You can read about methods for handling invalid dates in Sample Date Formulas.

**Converting Between Date/Time and Date**

Date and Date/Time aren’t interchangeable data types, so when you want to perform operations between Date and Date/Time values, you need to convert the values so they are both the same type. Some functions (such as `YEAR()`, `MONTH()`, and `DAY()` ) also only work on Date values, so Date/Time values must be converted first.

Use the `DATEVALUE( date/time )` function to return the Date value of a Date/Time. For example, to get the year from a Date/Time, use `YEAR( DATEVALUE( date/time ) )`.

You can convert a Date value to a Date/Time using the `DATETIMEVALUE( date )` function. The time will be set to 12:00 a.m. in Greenwich Mean Time (GMT), and then converted to the time zone of the user viewing the record when it’s displayed. For a user located in San Francisco, `DATETIMEVALUE( TODAY() )` returns 5:00 p.m. on the previous day (during Daylight Saving Time) rather than 12:00 a.m. of the current day. See A Note About Date/Time and Time Zones for more information.

**Converting Between Date and Text**

If you want to include a date as part of a string, wrap the Date value in the `TEXT()` function to convert it to text. For example, if you want to return today’s date as text, use:

"Today's date is " & TEXT( TODAY() )

This returns the date in the format "YYYY-MM-DD" rather than in the locale-dependent format. You can change the format by extracting the day, month, and year from the date first and then recombining them in the format you want. For example:

"Today's date is " & TEXT( MONTH( date ) ) & "/" & TEXT( DAY( date ) ) & "/" & TEXT( YEAR( date ) )

You can also convert text to a Date so you can use the string value with your other Date fields and formulas. You’ll want your text to be formatted as "YYYY-MM-DD". Use this formula to return the Date value:

`DATEVALUE( "YYYY-MM-DD" )`
Converting Between Date/Time and Text

You can include Date/Time values in a string using the `TEXT()` function, but you need to be careful of time zones. For example, consider this formula:

"The current date and time is " & TEXT( NOW() )

In this formula, `NOW()` is offset to GMT. Normally, `NOW()` would be converted to the user's time zone when viewed, but because it’s been converted to text, the conversion won’t happen. So if you execute this formula on August 1st at 5:00 PM in San Francisco time (GMT-7), the result is “The current date and time is 2013–08–02 00:00:00Z”.

When you convert a Date/Time to text, a “Z” is included at the end to indicate GMT. `TEXT(date/time)` returns “Z” if the field is blank. So if the Date/Time value you’re working with might be blank, check for this before converting to text:

```
IF( ISBLANK( date/time ),
   "", TEXT( date/time ) )
```

To convert a string to a Date/Time value, use `DATETIMEVALUE()` passing in a string in the format “YYYY-MM-DD HH:MM:SS”. This method returns the Date/Time value in GMT.

A Note About Date/Time and Time Zones

Date and Date/Time values are stored in GMT. When a record is saved, field values are adjusted from the user’s time zone to GMT, and then adjusted back to the viewer’s time zone when displayed in record detail pages and reports. With Date conversions this doesn’t pose a problem, since converting a Date/Time to a Date results in the same Date value.

When working with Date/Time fields and values, however, the conversion is always done in GMT, not the user’s time zone. Subtracting a standard Date/Time field from another isn’t a problem because both fields are in the same time zone. When one of the values in the calculation is a conversion from a Text or Date value to a Date/Time value, however, the results are different.

Let’s say a San Francisco user enters a value of 12:00 AM on August 2, 2013 in a custom Date/Time field called `Date_Time_c`. This value is stored as 2013–08–02 07:00:00Z, because the time difference in Pacific Daylight Time is GMT-7. At 12:00 p.m. PDT on August 1st, the user views the record and the following formula is run:

```
Date_Time_c - NOW()
```

In the calculation, `NOW()` is 2013–08–01 19:00:00Z, and then subtracted from 2013–08–02 07:00:00Z, to return the expected result of 0.5 (12 hours).

Suppose that instead of `NOW()`, the formula converts the string “2013–08–01 12:00:00” to a Date/Time value:

```
Date_Time_c - DATETIMEVALUE( "2013-08-01 12:00:00" )
```

In this case, `DATETIMEVALUE( “2013–08–01 12:00:00” )` is 2013–08–01 12:00:00Z, and returns a result of 0.79167, or 19 hours.

There’s no way to determine a user’s time zone in a formula. If all of your users are in the same time zone, you can adjust the time zone difference by adding or subtracting the time difference between the users’ time zone and GMT to your converted values. However, since time zones can be affected by Daylight Saving Time, and the start and end dates for DST are different each year, this is difficult to manage in a formula. We recommend using Apex for transactions that require converting between Date/Time values and Text or Date values.

Tips for Building Formulas
Build a Formula Field

Your custom formula fields require special attributes.

Note: The Getting Started with Formulas help video includes a live demo of these steps.

1. Begin building a formula field the same way you create a custom field. See Create Custom Fields on page 3997.
2. Select the data type for the formula. Choose the appropriate data type for your formula based on the output of your calculation. See Formula Data Types on page 4104.
3. Choose the number of decimal places for currency, number, or percent data types. This setting is ignored for currency fields in multicurrency organizations. Instead, the Decimal Places for your currency setting apply.

Note: Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.34.

4. Click Next.
5. Build your formula:

   a. If you are building a formula in the Advanced Formula tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation, click Insert Field, choose a field, and click Insert.

      To create a basic formula that passes specific Salesforce data, select the Simple Formula tab, choose the field type in the Select Field Type drop-down list, and choose one of the fields listed in the Insert Field drop-down list.

      Tip: Build cross-object formulas to span to related objects and reference merge fields on those objects.

   b. To insert an operator, choose the appropriate operator icon from the Insert Operator drop-down list.

   c. Optionally, click the Advanced Formula tab to use functions and view additional operators and merge fields. Functions are prebuilt formulas that you can customize with your input parameters.

   d. To insert a function, double-click its name in the list, or select it and click Insert Selected Function. To filter the list of functions, choose a category from the Functions drop-down list. Select a function and click Help on this function to view a description and examples of formulas using that function.

   e. Consider adding comments to your formula, especially if it is complicated. Comments must begin with a forward slash followed by an asterisk (/*), and conclude with an asterisk followed by a forward slash (*/).

Comments are useful for explaining specific parts of a formula to anyone viewing the formula definition. For example:

```
AND(
    /* competitor field is required, check to see if field is empty */
    LEN(Competitor__c) = 0,
    /* rule only enforced for ABCD record types */
    RecordType.Name = "ABCD Value",
    /* checking for any closed status, allows for additional closed picklist values in the future */
    CONTAINS(TEXT(StageName), "Closed")
)
```

You can also use comments to comment out sections of your formula when debugging and checking the syntax to locate errors in the formula.
Note:

- Nesting comments causes a syntax error. For example, you cannot save a formula that has the following:

```c
/* /* comment */ */
```

- Commenting out a whole formula causes a syntax error.

- Comments count against the character and byte size limits in formulas.

Note: Formula fields can contain up to 3,900 characters, including spaces, return characters, and comments. If your formula requires more characters, create separate formula fields and reference them in another formula field. The maximum number of displayed characters after an evaluation of a formula expression is 1,300.

6. To check your formula for errors, click **Check Syntax**.

7. Optionally, enter a description of the formula in the **Description** box.

8. If your formula references any number, currency, or percent fields, choose an option for handling blank fields. To give any blank fields a zero value, choose **Treat blank fields as zeros**. To leave these fields blank, choose **Treat blank fields as blanks**.

9. Click **Next**

10. Set the field-level security to determine whether the field should be visible for specific profiles, and click **Next**

11. Choose the page layouts that should display the field. The field is added as the last field in the first two-column section on the page layout. For user custom fields, the field is automatically added to the bottom of the user detail page.

12. Click **Save** to finish or **Save & New** to create more custom fields.

Note: Because formula fields are automatically calculated, they are read-only on record detail pages and do not update last modified date fields. Formula fields are not visible on edit pages.

In account formulas, all business account fields are available as merge fields. However, account fields exclusive to person accounts such as **Birthdate** and **Email** are not available.

**Tips for Building Formulas**

Tips for Building Formulas

Watch a Demo: Formulas: Tips and Gotchas

- Formula fields that a user can see may reference fields that are hidden or read only using field-level security. If the formula field contains sensitive information, use field-level security to hide it.
- You can add activity formula fields to task and event page layouts. Note that a task-related formula field on an event page layout may not be useful. Likewise, event-related formula fields on task page layouts may not be useful.
- To determine if a record is a task or event, use the IsTask merge field. For example:

  ```
  IF(IsTask, "This is a task", "This is an event")
  ```

Tips for Working with Date and Date/Time Formula Fields

- Dates and times are always calculated using the user’s time zone.
- Date and date/time fields can’t be used interchangeably. The name alone may not indicate if a field is a date or date/time. For example, Created Date and Last Modified Date are date/time fields whereas Last Activity Date is a date field. Use the DATEVALUE function to convert a date/time field into a date field.

  ```
  Note: The Created Date and Last Modified Date fields display only the date, not the date and time.
  ```

- Use addition and subtraction operators with date or date/time fields to calculate duration. For example, subtract a date from another date to calculate the number of days between the two. Likewise, you can subtract the date/time from another date/time to get the number of days between the two as a number. See NOW or TODAY for suggested use.

- Use addition and subtraction operators with numbers to return another date or date/time. For example, `{!CreatedDate} + 5` calculates the date and time five days after a record’s created date. Note that the expression returns the same data type as the one given; a date field plus or minus a number returns a date, and a date/time field plus or minus a number returns a date/time.

- When calculating dates using fractions, Salesforce ignores any numbers beyond the decimal. For example:

  ```
  TODAY() + 0.7 is the same as TODAY() + 0, which is today’s date.
  TODAY() + 1.7 is the same as TODAY() + 1, which is tomorrow’s date.
  TODAY() + (-1.8) is the same as TODAY() + (-1), which is yesterday’s date.
  ```
To calculate the value of two fractions first, group them within parentheses. For example:

\[ \text{TODAY()} + 0.5 + 0.5 \text{ is the same as } \text{TODAY()} + 0 + 0, \text{ which is today's date.} \]

\[ \text{TODAY()} + (0.5+0.5) \text{ is the same as } \text{TODAY()} + 1, \text{ which is tomorrow's date.} \]

- Years can’t be zero and must be between -4713 and 9999.

- Tips for Building Formulas
- Tips for Using Merge Fields in Formulas

### Tips for Using Merge Fields in Formulas

- Delegated administrators need to have access to custom objects to access the objects’ merge fields from formulas.
- In account formulas, all business account fields are available as merge fields. However, account fields exclusive to person accounts such as Birthdate and Email are not available.
- You can’t use formula fields that include related object merge fields in roll-up summary fields.
- Formulas and roll-up summary fields can’t reference fields on external objects.
- Using RecordType.Id can make your formula less readable; when you do use it, write in-line comments into the formula to clarify.
- To determine if a record is a task or event, use the IsTask merge field. For example:

\[ \text{IF(IsTask, "This is a task", "This is an event")} \]

- To reference the unique identifier for your Salesforce organization in a formula, insert the $Organization.Id merge field. This merge field can display anywhere formula fields can except in reports.
- Some merge fields display as radio buttons but function like picklist fields when referenced in a formula. Use the values "Read," "Edit," and "None" in a formula when referencing:
  - $UserRole.CaseAccessForAccountOwner
  - $UserRole.OpportunityAccessForAccountOwner
  - CaseAccessLevel (on Territory)
  - OpportunityAccessLevel (on Territory)
- Use the values "Read," "Edit," and "All" in a formula when referencing:
  - AccountAccessLevel (on Territory)
- If you create a contacts formula field that references account merge fields, that field can be included in contact page layouts but should not be included in person accounts page layouts. The formula field will display a value of #Error on the person accounts page.

SEE ALSO:
- Tips for Building Formulas
Tips for Working with Number Formula Fields

• Use the decimal version of a percent when working with percent fields in formulas. For example, IF(Probability =1...) for 100% probability or IF(Probability =0.9...) for 90% probability.

• Reference auto-number fields as text fields in formulas.

• The output of your formula must be less than 19 digits.

• Formulas can contain a mix of numbers, percents, and currencies as in this example: AnnualRevenue / NumberOfEmployees.

• Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and −12.345 becomes −12.34.

SEE ALSO:
   Tips for Building Formulas

Tips for Working with Picklist and Multi-Select Picklist Formula Fields

• You can use special picklist fields in your formulas, such as IsEscalated for cases and IsWon for opportunities.

• Picklist fields can only be used in these functions:
  – ISPICKVAL—Compares the value of a picklist to a single value.
  – CASE—Compares the value of a picklist to multiple values.
  – TEXT—Converts a picklist value into a text value so that you can work with the value in functions that support text value, such as CONTAINS. (Available in only flow formula resources, formula fields, validation rules, and workflow field updates.)

• The TEXT function always returns picklist values in your organization’s master language, not the language of the current user.

• Multi-select picklist fields can only be used in these functions:
  – INCLUDES
  – ISBLANK
  – ISNULL
  – ISCHANGED (Only in assignment rules, validation rules, workflow field updates, and workflow rules in which the evaluation criteria is set to Evaluate the rule when a record is: created, and every time it’s edited)
  – PRIORVALUE (Only in assignment rules, validation rules, workflow field updates, and workflow rules in which the evaluation criteria is set to Evaluate the rule when a record is: created, and every time it’s edited)

SEE ALSO:
   Tips for Building Formulas
Tips for Referencing Record Types in Formulas

Reference record types in formulas if you want different workflow rules, validation rules, and lookup filters to apply to different record types. For example, you can:

- Create a workflow rule on accounts that emails different teams based on the account record type the user selects when creating the account.
- Create a validation rule on opportunities that allows only members of the North American sales team to save opportunities with the Domestic record type.

When possible, use `RecordTypeId` instead of `RecordType.Name` to reference a specific record type. While `RecordType.Name` makes a formula more readable, you must update the formula if the name of the record type changes, whereas the ID of a record type never changes. Also, `RecordType.Name` requires a cross-object reference to the record type, while `RecordTypeId` doesn’t. However, if you are deploying formulas across organizations (for example, between sandbox and production), use `RecordType.Name` because IDs are not the same across organizations.

Avoid using `$RecordType` in formulas, except in default value formulas. Instead, use the `RecordType` merge field (for example, `Account.RecordType.Name`) or the `RecordTypeId` field on the object.

SEE ALSO:
Tips for Building Formulas

Tips for Working with Text Formula Fields

- Before using the HYPERLINK function, consider the differences between hyperlinks and custom links.
  - Hyperlink formula fields are just like other custom fields that you can display in list views and reports.
  - Custom links display on detail pages in a predefined section; hyperlink formula fields can display on a detail page wherever you specify.
  - Using custom links, you can specify display properties such as window position and opening in a separate popup position; hyperlink formula fields open in a new browser window by default or you can specify a different target window or frame.
  - Your formulas can reference custom links. Before deleting a custom link, make sure it is not referenced in a formula field.
  - Hyperlink formula fields that contain relative URLs to Salesforce pages, such as `/rpt/reportwizard.jsp`, can be added to list views, reports, and related lists. However, use a complete URL, including the server name and `https://`, in your hyperlink formula before adding it to a search layout. Formula fields aren’t available in search result layouts.

- To insert text in your formula field, surround the text with quotation marks. For example, to display "CASE: 123," use this formula "CASE: "& CaseNumber__c.

- Use the backslash (\) character before a quote or backslash to insert it as a literal value in your output. For example, "Trouble\Case \"Ticket\": " in your formula displays Trouble\Case "Ticket": on detail pages.

Tips for Building Formulas
What Are Cross-Object Formulas?

*Cross-object formulas* are formulas that span two related objects and reference merge fields on those objects. Cross-object formulas can reference merge fields from a master (“parent”) object if an object is on the detail side of a master-detail relationship. Cross-object formulas also work with lookup relationships.

You can reference fields from objects that are up to 10 relationships away. Cross-object formulas are available anywhere formulas are used except when creating default values.

⚠️ **Note:** If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don’t have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don’t have access to the account record.

### Building Cross-Object Formulas in the Simple Formula Tab

**Build Cross-Object Formulas in the Advanced Formula Tab**

**Tips for Building Cross-Object Formulas**

SEE ALSO:

- Build a Formula Field

### Building Cross-Object Formulas in the Simple Formula Tab

To create a cross-object formula when building a formula in the Simple Formula tab, enter the relationship names of the objects to which you are spanning followed by the field you want to reference. Separate the relationship names of each object and the field with periods.

⚠️ **Example:** For example, enter `Contact.Account.Name` to reference the `Account.Name` for a contact associated with a case in a formula field on the Case object. Be sure to use the relationship names of the objects, not the labels. Although the relationship name is often the same as the object name, it is technically the field name of the relationship field.

To reference the parent account name from Account object, the syntax is `Parent.Name`, not `Account.Name`. When referencing a custom object, add two underscores and the letter `r` to its name. For example, `Position__r.title__c` references the `Job Title` field (title__c) on a Position custom object.

⚠️ **Note:** If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don’t have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don’t have access to the account record.

SEE ALSO:

- Build Cross-Object Formulas in the Advanced Formula Tab
- What Are Cross-Object Formulas?
Build Cross-Object Formulas in the Advanced Formula Tab

To create a cross-object formula when building a formula in the Advanced Formula tab or for approvals or rules, such as workflow, validation, assignment, auto-response, or escalation rules, click **Insert Field**, then click the related object to list its fields. Related objects are denoted by a “>” sign.

**Note:** If you create a formula that references a field on another object and display that formula in your page layout, users can see the field on the object even if they don’t have access to that object record. For example, if you create a formula field on the Case object that references an account field, and display that formula field in the case page layout, users can see this field even if they don’t have access to the account record.

**Example:** The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```
IF
  (OR
    (LastModifiedBy.Profile.Name = "Standard User",
     LastModifiedBy.Profile.Name = "PT2"),
    "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

**SEE ALSO:**
- Building Cross-Object Formulas in the Simple Formula Tab
- What Are Cross-Object Formulas?

Tips for Building Cross-Object Formulas

- Cross-object formulas that reference currency fields convert the value to the currency of the record that contains the formula. If the referenced currency field is from a custom setting, the field value isn’t converted to the record’s currency.
- Salesforce allows a maximum of 10 unique relationships per object in cross-object formulas. The limit is cumulative across all formula fields, rules, and lookup filters. For example, if two different formulas on opportunities reference two different fields of an associated account, only one unique relationship exists (from opportunities to accounts).
- You can’t reference cross-object formulas in roll-up summary fields.
- In cross-object formulas, you can’t reference merge fields for objects related to activities. For example, merge fields for contacts and accounts aren’t available in task and event formulas.

Using the Owner Field

Some objects support different object types for the Owner field, such as a User, Queue, or Calendar. On objects that support this behavior, when creating a cross-object formula using Owner, you must be explicit about the owner type you’re referencing.
For example, if you need owner email and you don’t use queues, your formula would be Owner:User.Email. If you do use queues, your formula could be

```plaintext
IF( ISBLANK( Owner:User.Id ), Owner:Queue.QueueEmail, Owner:User.Email )
```

Here’s how you would select Owner object fields on a Lead in the Advanced formula tab:

![Image of formula field selection](image)

**Note:**

- Owner references aren’t supported in Visualforce pages. For example, on a page with Case as a controller, you can’t include `{!Case.Owner:User.FirstName}`. However, you can include an existing spanning formula on a Visualforce page.
  - For example, if you have a custom text formula `MyFormula__c` on a Case with value `Owner:User.FirstName`, you can include `{!Case.MyFormula__c}` on your Visualforce page.
- Owner references aren’t supported on the Queue object. For example, you can’t reference `Owner:Queue.Owner.Email`.
- If your formula has `Owner:User.fieldname` and `Owner:Queue.fieldname`, both of these count against the limit of 10 unique relationships per object in cross-object formulas.
- On objects that don’t support Queues, User is implicit when referencing Owner. Your formula should be `Owner.fieldname`, not `Owner:User.fieldname`.

**Using Profile.Name**

The value of the `Profile.Name` merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use `Profile.Name` in a formula, use it within an `OR` function to ensure the formula always returns the intended result. For example:

```plaintext
IF( OR( LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name = "PT2"), "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the `$Profile` global variable.

Formula Field Limits and Restrictions

Before you create formula fields, be aware of their limits and limitations.

- Formula fields have these limits.
  - Character limit—Formula fields can contain up to 3,900 characters, including spaces, return characters, and comments. If your formula needs more characters, create separate formula fields and reference them in another formula field.

  📘 Note: The maximum number of displayed characters after an evaluation of a formula expression is 1,300.

  - Save size limit—Formula fields can’t exceed 4,000 bytes when saved. The save size is different from the number of characters if you use multi-byte characters in your formula.

  - Compile size limit—Formula fields can’t exceed 5,000 bytes when compiled. The compile size is the size of the formula (in bytes) including all of the fields, values, and formulas it references. There is no direct correlation between the compile size and the character limit. Some functions, such as TEXT, DATEVALUE, DATETIMEVALUE, and DATE significantly increase the compile size.

  📘 Tip: For tips on how to rework your formulas to avoid these limits, see Tips for Reducing Formula Size

- Default value formulas for a record type can only reference fields for that record type. However, formula fields and formulas for approvals or rules for a record type can reference fields for that record type as well as any records that are related through a lookup or master-detail relationship. For example, a formula for a validation rule on opportunities can reference merge fields for accounts and campaigns as well as opportunities, and a formula field on accounts can reference fields for cases.

- You can’t use long text area, encrypted, or Description fields in formulas.

- The value of a field can’t depend on another formula that references it.

- You can’t delete fields referenced in formulas. Remove the field from the formula before deleting it.

- Campaign statistic fields can’t be referenced in formulas for field updates, approval processes, workflow rules, or validation rules, but can be referenced in custom formula fields.

Quick Reference Guide: Formula Fields

Sample Account Management Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.
Account Rating

This formula evaluates Annual Revenue, Billing Country, and Type, and assigns a value of “Hot,” “Warm,” or “Cold.”

```
IF (AND (AnnualRevenue > 10000000, 
    "US")), 
  IF(ISPICKVAL(Type, "Manufacturing Partner"), "Hot", 
    IF(OR (ISPICKVAL (Type, "Channel Partner/Reseller"), 
      ISPICKVAL(Type, "Installation Partner")), "Warm", "Cold")), 
  "Cold")
```

In addition, you can reference this Account Rating formula field from the contact object using cross-object formulas.

```
Account.Account_Rating__c
```

Account Region

This formula returns a text value of “North,” “South,” “East,” “West,” or “Central” based on the Billing State/Province of the account.

```
IF(ISBLANK(BillingState), "None", 
```

Contract Aging

This formula calculates the number of days since a contract with an account was activated. If the contract Status is not “Activated,” this field is blank.

```
IF(ISPICKVAL(Contract_Status__c, "Activated"), 
  NOW() - Contract_Activated_Date__c, null)
```

Sample Account Media Service Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

**BBC™ News Search**

This formula creates a link to a BBC news search site based on the Account Name.

```
HYPERLINK("http://www.bbc.co.uk/search/news/?q="&Name, "BBC News")
```
<table>

</table>
Yahoo! News Search
This formula creates a link to a Yahoo! news search site using the Account Name.

```
```

Sample Case Management Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

**Autodial**
This formula creates a linkable phone number field that automatically dials the phone number when clicked. In this example, replace "servername" and "call" with the name of your dialing tool and the command it uses to dial. The merge field, Id, inserts the identifier for the contact, lead, or account record. The first Phone merge field tells the dialing tool what number to call and the last Phone merge field uses the value of the Phone field as the linkable text the user clicks to dial.

```
HYPERLINK("http://servername/call?id=" & Id & "&phone=" & Phone, Phone)
```

**Case Categorization**
This formula displays a text value of "RED," "YELLOW," or "GREEN," depending on the value of a case age custom text field.

```
IF(DaysOpen__c > 20, "RED", IF(DaysOpen__c > 10, "YELLOW", "GREEN") )
```

**Case Data Completeness Tracking**
This formula calculates the percentage of specific custom fields that contain data. The formula checks the values of two custom number fields: Problem Num and Severity Num. If the fields are empty, the formula returns the value "0." The formula returns a value of "1" for each field that contains a value and multiplies this total by fifty to give you the percentage of fields that contain data.

```
(IF(ISBLANK(Problem_Num__c), 0, 1) + IF(ISBLANK(Severity_Num__c ), 0,1)) * 50
```

**Suggested Agent Prompts**
This formula prompts an agent with cross-sell offers based on past purchases.

```
CASE(Product_Purch__c, "Printer", "Extra toner cartridges", "Camera", "Memory cards", "Special of the day")
```
Suggested Offers

This formula suggests a product based on the support history for a computer reseller. When the Problem custom field matches a field, the formula field returns a suggestion.

```
CASE(Problem__c,
    "Memory", "Suggest new memory cards",
    "Hard Drive failure", "Suggest new hard drive with tape backup",
   "
)
```

Sample Commission Calculations Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Commission Amounts for Opportunities

The following is a simple formula where commission is based on a flat 2% of the opportunity Amount.

```
IF(ISPICKVAL(StageName, "Closed Won"),
    ROUND(Amount *0.02, 2), 0)
```

This example calculates the commission amount for any opportunity that has a "Closed Won" stage. The value of this field will be the amount times 0.02 for any closed/won opportunity. Open or lost opportunities will have a zero commission value.

Commission Deal Size

This formula calculates a commission rate based on deal size, returning a 9% commission rate for deals over 100,000 and an 8% commission rate for smaller deals.

```
IF(Amount > 100000, 0.09, 0.08 )
```

Commission Greater Than or Equal To

This formula assigns the “YES” value with a commission greater than or equal to one million. Note, this is a text formula field that uses a custom currency field called Commission.

```
IF(Commission__c >= 1000000, "YES", "NO")
```

Commission Maximum

This formula determines what commission to log for an asset based on which is greater: the user’s commission percentage of the price, the price times the discount percent stored for the account or 100 dollars. This example assumes you have two custom percent fields on users and assets.

```
MAX($User.Commission_Percent__c * Price,
    Price * Account_Discount__c, 100)
```
Sample Contact Management Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Contact's Account Discount Percent

This percent formula displays the account's Discount Percent field on the contacts page.

Account.Discount_Percent__c

Contact's Account Name

This formula displays the standard Account Name field on the contacts page.

Account.Name

Contact's Account Phone

This formula displays the standard Account Phone field on the contacts page.

Account.Phone

Contact's Account Rating

Use this formula to display the Account Rating field on the contacts page.

Contact's Account Website

This formula displays the standard Account Website field on the contacts page.

Account.Website

If the account website URL is long, use the HYPERLINK function to display a label such as "Click Here" instead of the URL. For example:

IF(Account.Website="", "",
 IF( 
 OR(LEFT(Account.Website, 7) = "http://",LEFT(Account.Website, 8) = "https://"),
 HYPERLINK( Account.Website , "Click Here" ),
 HYPERLINK( "http://" & Account.Website , "Click Here" )
 )
 )

This formula also adds the necessary "http://" or "https://" before a URL if neither were included in the URL field.

Contact's LinkedIn™ Profile

You can configure a link that appears on your contacts’ profile page that sends you to their LinkedIn profile. To do so:

1. From the object management settings for contacts, go to Buttons, Links, and Actions.
2. Click New Button or Link.
3. Enter a **Label** for this link, like *LinkedInLink*.

4. Enter this formula in the content box:

   ```
   http://www.linkedin.com/search/fpsearch?type=people&keywords
   =(!Contact.FirstName)+(!Contact.LastName)
   ```

5. Click **Save**.

Remember to add this link to the Contact page layout in order for it to show up.

**Contact Identification Numbering**

This formula displays the first five characters of a name and the last four characters of a social security number separated by a dash. Note that this example uses a text custom field called *SSN*.

```
TRIM(LEFT(LastName, 5)) &
   "-" & TRIM(RIGHT(SSN__c, 4))
```

**Contact Preferred Phone**

This formula displays the contact’s preferred contact method in a contact related list—work phone, home phone, or mobile phone—based on a selected option in a *Preferred Phone* custom picklist.

```
CASE(Preferred_Phone__c,
   "Work", "w. " & Phone,
   "Home", "h. " & HomePhone,
   "Mobile", "m. " & MobilePhone,
   "No Preferred Phone")
```

**Contact Priority**

This formula assesses the importance of a contact based on the account rating and the contact’s title. If the account rating is *Hot* or the title starts with *Executive*, then the priority is high (P1). If the account rating is *Warm* or the title starts with *VP* then the priority is medium (P2), and if the account rating is *Cold* then the priority is low (P3).

```
IF(OR(ISPICKVAL(Account.Rating, "Hot"), CONTAINS(Title, "Executive")), "P1",
IF(OR(ISPICKVAL(Account.Rating, "Warm"), CONTAINS(Title, "VP")), "P2",
IF(ISPICKVAL(Account.Rating, "Cold"), "P3",
"P3")
)
```
Contact Yahoo! ID
This formula displays a clickable Yahoo! Messenger icon indicating if the person is logged on to the service. Users can click the icon to
launch a Yahoo! Messenger conversation with the person. This example uses a custom text field called Yahoo Name on contacts
where you can store the contact’s Yahoo! Messenger ID.

```
HYPERLINK("ymsgr:sendIM?" & Yahoo_Name__c,
    IMAGE("http://opi.yahoo.com/online?u=" & Yahoo_Name__c & 
    "&m=gt;=0", "Yahoo"))
```

Dynamic Address Formatting
This formula field displays a formatted mailing address for a contact in standard format, including spaces and line breaks where appropriate
depending on the country.

```
CASE(ShippingCountry,
    "USA",
    ShippingStreet & BR() &
    ShippingCity & ",
    " & ShippingState & " " &
    ShippingPostalCode & BR()
    & ShippingCountry,
    "France",
    ShippingStreet & BR() &
    ShippingPostalCode & " " &
    ShippingCity & BR() &
    ShippingCountry, "etc")
```

Telephone Country Code
This formula determines the telephone country code of a contact based on the Mailing Country of the mailing address.

```
CASE(MailingCountry,
    "USA", "1",
    "Canada", "1",
    "France", "33",
    "UK", "44",
    "Australia", "61",
    "Japan", "81",
    "?"
)
```

Unformatted Phone Number
This formula removes the parentheses and dash characters from North American phone numbers. This is necessary for some auto-dialer
software.

```
IF(Country_Code__c = "1", MID( Phone ,2, 3) & MID(Phone,7,3) & MID(Phone,11,4), Phone)
```
Sample Data Categorization Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Deal Size Large and Small
This formula displays “Large Deal” for deals over one million dollars or “Small Deal” for deals under one million dollars.

```plaintext
IF(Sales_Price__c > 1000000, "Large Deal", "Small Deal")
```

Deal Size Small
This formula displays “Small” if the price and quantity are less than one. This field is blank if the asset has a price or quantity greater than one.

```plaintext
IF(AND(Price<1,Quantity<1),"Small", null)
```

Product Categorization
This formula checks the content of a custom text field named Product_Type and returns “Parts” for any product with the word “part” in it. Otherwise, it returns “Service.” Note that the values are case sensitive, so if a Product_Type field contains the text “Part” or “PART,” this formula returns “Services.”

```plaintext
IF(CONTAINS(Product_Type__c, "part"), "Parts", "Service")
```

Sample Date Formulas

Watch a Demo: How to Calculate the Number of Days a Case is Open

Finding the Day, Month, or Year from a Date
Use the functions `DAY(date)`, `MONTH(date)`, and `YEAR(date)` to return their respective numerical values. Replace `date` with a value of type Date (e.g. `TODAY()`).

To use these functions with Date/Time values, first convert them to a date with the `DATEVALUE()` function. For example, `DAY(DATEVALUE(date/time))`.

Finding Out if a Year Is a Leap Year
This formula determines whether or not a year is a leap year. A year is only a leap year if it’s divisible by 400, or if it’s divisible by four but NOT by 100.

```plaintext
OR(
    MOD( YEAR(date), 400 ) = 0,
    AND(
    MOD( YEAR(date), 4 ) = 0,
    MOD( YEAR(date), 100 ) != 0
)
```
Finding Which Quarter a Date Is In

For standard quarters, you can determine which quarter a date falls in using this formula. This formula returns the number of the quarter in which date falls (1–4) by dividing the current month by three (the number of months in each quarter) and taking the ceiling.

\[
\text{CEILING( MONTH( date ) / 3 )}
\]

The formula for shifted quarters is similar, but shifts the month of the date by the number of months between January and the first quarter of the fiscal year. The example below illustrates how you can find a date's quarter if Q1 starts in February instead of January.

\[
\text{CEILING( ( MONTH( date ) - 1 ) / 3 )}
\]

If you want to check whether a date is in the current quarter, add a check to compare the date's year and quarter with TODAY()'s year and quarter.

\[
\text{AND( CEILING( MONTH( date ) / 3 ) = CEILING( MONTH( TODAY() ) / 3 ), YEAR( date ) = YEAR( TODAY() ) )}
\]

Finding the Week of the Year a Date Is In

To find the number of a date's week of the year, use this formula:

\[
\text{IF( CEILING( ( date - DATE( YEAR( date ), 1, 1 ) + 1) / 7) > 52, 52, CEILING( ( date - DATE( YEAR( date ), 1, 1 ) + 1 ) / 7) )}
\]

You can find the current week by determining how many days there have been in the current year and dividing that value by 7. The IF() statement ensures that the week number the formula returns doesn't exceed 52. So if the given date is December 31 of the given year, the formula returns 52, even though it's more than 52 weeks after the week of January.

Finding Whether Two Dates Are in the Same Month

To determine whether two Dates fall in the same month, say for a validation rule to determine whether an opportunity Close Date is in the current month, use this formula:

\[
\text{AND( MONTH( date_1 ) == MONTH( date_2 ), YEAR( date_1 ) == YEAR( date_2 ) )}
\]

Finding the Last Day of the Month

The easiest way to find the last day of a month is to find the first day of the next month and subtract a day.

\[
\text{IF( MONTH( date ) = 12, DATE( YEAR( date ), 12, 31 ),}
\]

4179
Displaying the Month as a String Instead of a Number

To return the month as a text string instead of a number, use:

```
CASE( MONTH( date ),
  1, "January",
  2, "February",
  3, "March",
  4, "April",
  5, "May",
  6, "June",
  7, "July",
  8, "August",
  9, "September",
 10, "October",
 11, "November",
 "December"
 )
```

If your organization uses multiple languages, you can replace the names of the month with a custom label:

```
CASE( MONTH( date ),
  1, $Label.Month_of_Year_1,
  2, $Label.Month_of_Year_2,
  3, $Label.Month_of_Year_3,
  4, $Label.Month_of_Year_4,
  5, $Label.Month_of_Year_5,
  6, $Label.Month_of_Year_6,
  7, $Label.Month_of_Year_7,
  8, $Label.Month_of_Year_8,
  9, $Label.Month_of_Year_9,
 10, $Label.Month_of_Year_10,
 11, $Label.Month_of_Year_11,
 $Label.Month_of_Year_12
 )
```

Finding and Displaying the Day of the Week From a Date

To find the day of the week from a Date value, use a known Sunday (e.g. January 7, 1900) and subtract it from the date (e.g. TODAY()) to get the difference in days. The MOD() function finds the remainder of this result when divided by 7 to give the numerical value of the day of the week between 0 (Sunday) and 6 (Saturday). The formula below finds the result and then returns the text name of that day.

```
CASE( MOD( date - DATE( 1900, 1, 7 ), 7 ),
  0, "Sunday",
  1, "Monday",
  2, "Tuesday",
  3, "Wednesday",
  4, "Thursday",
  5, "Friday",
  6, "Saturday"
 )
```
Note that this formula only works for dates after 01/07/1900. If you’re working with older dates, use the same process with any Sunday prior to your earliest date (e.g. 01/05/1800).

You can also adjust this formula if your week starts on a different day. For example, if your week starts on Monday, you can use January 8, 1900 in your condition. The new formula looks like this:

```sql
CASE(
    MOD( date - DATE( 1900, 1, 8 ), 7 ),
    0, "Monday",
    1, "Tuesday",
    2, "Wednesday",
    3, "Thursday",
    4, "Friday",
    5, "Saturday",
    "Sunday"
)
```

Like the formula for getting the name of the month, if your organization uses multiple languages, you can replace the names of the day of the week with a variable like $Label.Day_of_Week_1, etc.

### Finding the Next Day of the Week After a Date

To find the date of the next occurrence of a particular day of the week following a given Date, get the difference in the number of days of the week between a `date` and a `day_of_week`, a number 0–6 where 0 = Sunday and 6 = Saturday. By adding this difference to the current date, you’ll find the date of the `day_of_week`. The `IF()` statement in this formula handles cases where the `day_of_week` is prior to the day of the week of the `date` value (e.g. `date` is a Thursday and `day_of_week` is a Monday) by adding 7 to the difference.

```sql
date + ( day_of_week - MOD( date - DATE( 1900, 1, 7 ), 7 ) )
+ IF( MOD( date - DATE( 1900, 1, 7 ), 7 ) >= day_of_week, 
    7,
    0 )
```

You can substitute either a constant or another field in for the `day_of_week` value based on your needs.

### Finding the Number of Days Between Two Dates

To find the number of days between two dates, `date_1` and `date_2`, subtract the earlier date from the later date: `date_1 - date_2`

You can alter this slightly if you want to determine a date a certain number of days in the past. For example, say you want a formula to return true if some date field is more than 30 days prior to the current date and false otherwise. This formula does just that:

```sql
TODAY() - 30 > date
```
Finding the Number of Business Days Between Two Dates

Calculating how many business days passed between two dates is slightly more complex than calculating total elapsed days. The basic strategy is to choose a reference Monday from the past and find out how many full weeks and any additional portion of a week have passed between the reference date and the date you’re examining. These values are multiplied by five (for a five-day work week) and then the difference between them is taken to calculate business days.

\[
(5 \times (\text{FLOOR}(\text{\(\text{date}_1\)} - \text{DATE}(1900, 1, 8)) / 7)) + \text{MIN}(5, \text{MOD}(\text{\(\text{date}_1\)} - \text{DATE}(1900, 1, 8), 7)) \\
- (5 \times (\text{FLOOR}(\text{\(\text{date}_2\)} - \text{DATE}(1900, 1, 8)) / 7)) + \text{MIN}(5, \text{MOD}(\text{\(\text{date}_2\)} - \text{DATE}(1900, 1, 8), 7))
\]

In this formula, \(\text{\(\text{date}_1\)}\) is the more recent date and \(\text{\(\text{date}_2\)}\) is the earlier date. If your work week runs shorter or longer than five days, replace all fives in the formula with the length of your week.

Adding Days, Months, and Years to a Date

If you want to add a certain number of days to a date, add that number to the date directly. For example, to add five days to a date, the formula is \(\text{\(\text{date}\)} + 5\).

Adding years to a date is fairly simple, but you do need to check that the future date is valid. That is, adding five years to February 29 (a leap year) results in an invalid date. The following formula adds \(\text{\(\text{num\_years}\)}\) to \(\text{\(\text{date}\)}\) by checking if the date is February 29 and if the future date is not in a leap year. If these conditions hold true, the formula returns March 1 in the future year. Otherwise, the formula sets the Date to the same month and day \(\text{\(\text{num\_years}\)}\) in the future.

\[
\text{IF}( \text{AND}( \text{MONTH}(\text{\(\text{date}\)}) = 2, \text{DAY}(\text{\(\text{date}\)}) = 29, \text{NOT}(\text{OR}(\text{MOD}(\text{YEAR}(\text{\(\text{date}\)}), 400) = 0, \text{AND}(\text{MOD}(\text{YEAR}(\text{\(\text{date}\)}), 4) = 0, \text{MOD}(\text{YEAR}(\text{\(\text{date}\)}), 100) != 0))))) \\
\text{DATE}(\text{YEAR}(\text{\(\text{date}\)} + \text{\(\text{num\_years}\)}, 3, 1)), \text{DATE}(\text{YEAR}(\text{\(\text{date}\)} + \text{\(\text{num\_years}\)}, \text{MONTH}(\text{\(\text{date}\)}), \text{DAY}(\text{\(\text{date}\)})))
\]

Adding months to a date is slightly more complicated as months vary in length and the cycle of months restart with each year. Therefore, a valid day in one month (January 31) might not be valid in another month (February 31). A simple solution is to approximate each month’s length as 365/12 days:

\[
\text{\(\text{date}\)} + ( (365 / 12) \times \text{\(\text{Number\_months}\)} )
\]

While this formula is a good estimate, it doesn’t return an exact date. For example, if you add two months to April 30 using this method, the formula will return June 29 instead of June 30. Returning an exact date depends on your organization’s preference. For example, when you add one month to January 31, should it return February 28 (the last day of the next month) or March 2 (30 days after January 31)?
This formula does the following:

- Returns March 1 if the future month is a February and the day is greater than 28. This portion of the formula performs the same for both leap and non-leap years.
- Returns the first day of the next month if the future month is April, June, September, or November and the day is greater than 30.
- Otherwise, it returns the correct date in the future month.

This example formula adds two months to a given date. You can modify the conditions on this formula if you prefer different behaviors for dates at the end of the month.

```plaintext
DATE(
    YEAR( date ) + FLOOR( ( MONTH( date ) + 2 - 1 ) / 12 ),
    MOD( MONTH( date ) + 2 - 1 +
        IF( DAY( date ) > CASE( MOD( MONTH( date ) + 2 - 1, 12 ) + 1,
            2, 28,
            4, 30,
            6, 30,
            9, 30,
            11, 30,
            31 ), 1, 0 ), 12 ) + 1,
        IF( DAY( date ) > CASE( MOD( MONTH( date ) + 2 - 1, 12 ) + 1,
            2, 28,
            4, 30,
            6, 30,
            9, 30,
            11, 30,
            31 ),
            1, DAY( date )
        )
    )
)
```

If you’re using these formulas for expiration dates, you might want to subtract a day from the return value to make sure that some action is completed before the calculated date.

**Adding Business Days to a Date**

This formula finds three business days from a given date.

```plaintext
CASE(
    MOD( date - DATE( 1900, 1, 7 ), 7 ),
    3, date + 2 + 3,
    4, date + 2 + 3,
    5, date + 2 + 3,
    6, date + 1 + 3,
    date + 3
)
```

This formula finds the day of the week of the date field value. If the date is a Wednesday, Thursday, or Friday, the formula adds five calendar days (two weekend days, three weekdays) to the date to account for the weekend. If the date is a Saturday, you need four additional calendar days. For any other day of the week (Sunday — Tuesday), simply add three days. You can easily modify this formula to add more or less business days. The tip for getting the day of the week might be useful if you need to adjust this formula.
Finding the Hour, Minute, or Second from a Date/Time

To get the hour, minute, and second from a Date/Time field as a numerical value, use the following formulas where TZoffset is the difference between the user's time zone and GMT. For hour in 24-hour format:

\[
\text{VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) )}
\]

For hour in 12-hour format:

\[
\text{IF( OR( VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 0,}
\text{ VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 12 )},
\text{12,}
\text{VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) )}
\text{ - IF( VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) < 12,}
\text{ 0,}
\text{ 12 )} \}
\]

For minutes:

\[
\text{VALUE( MID( TEXT( date/time - TZoffset ), 15, 2 ) )}
\]

For seconds:

\[
\text{VALUE( MID( TEXT( date/time - TZoffset ), 18, 2 ) )}
\]

And, to get "AM" or "PM" as a string, use:

\[
\text{IF( VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) < 12,}
\text{ "AM",}
\text{ "PM" )}
\]

To return the time as a string in "HH:MM:SS A/PM" format, use the following formula:

\[
\text{IF( OR( VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 0,}
\text{ VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) = 12 )},
\text{"12",}
\text{TEXT( VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) )}
\text{ - IF( VALUE( MID( TEXT( date/time - TZoffset ), 12, 2 ) ) < 12,}
\text{ 0,}
\text{ 12 )} \})}
\]
When working with time in formula fields, you need to consider the time difference between your organization and GMT. See A Note About Date/Time and Time Zones on page 4159 for help understanding the time zone offset used in this formula.

Finding the Elapsed Time Between Date/Times

To find the difference between two Date values as a number, subtract one from the other like so: `date_1 - date_2` to return the difference in days.

Finding the elapsed time between two Date/Time values is slightly more complex. This formula converts the difference between two Date/Time values, `datetime_1` and `datetime_2`, to days, hours, and minutes.

```
IF( datetime_1 - datetime_2 > 0 ,
    TEXT( FLOOR( datetime_1 - datetime_2 ) ) & " days "
    & TEXT( FLOOR( MOD( (datetime_1 - datetime_2) * 24, 24 ) ) ) & " hours "
    & TEXT( ROUND( MOD( (datetime_1 - datetime_2) * 24 * 60, 60 ), 0 ) ) & " minutes",
    ""
)
```

Finding the Number of Business Hours Between Two Date/Times

The formula for finding business hours between two Date/Time values expands on the formula for finding elapsed business days. It works on the same principle of using a reference Date/Time, in this case 1/8/1900 at 16:00 GMT (9 a.m. PDT), and then finding your Dates’ respective distances from that reference. The formula rounds the value it finds to the nearest hour and assumes an 8–hour, 9 a.m. – 5 p.m. work day.

```
ROUND( 8 * {
    ( 5 * FLOOR( ( DATEVALUE( date/time_1 ) - DATE( 1900, 1, 8) ) / 7 ) +
        MIN(5,
            MOD( DATEVALUE( date/time_1 ) - DATE( 1900, 1, 8), 7) +
            MIN( 1, 24 / 8 * ( MOD( date/time_1 - DATETIMEVALUE( '1900-01-08 16:00:00' ), 1 ) )
            )
        )
    )
  )
- ( 5 * FLOOR( ( DATEVALUE( date/time_2 ) - DATE( 1900, 1, 8) ) / 7 ) +
    MIN( 5,
        MOD( DATEVALUE( date/time_2 ) - DATE( 1996, 1, 1), 7 ) +
        MIN( 1, 24 / 8 * ( MOD( date/time_2 - DATETIMEVALUE( '1900-01-08 16:00:00' ), 1 ) )
        )
    )
)
```

4185
You can change the eights in the formula to account for a longer or shorter work day. If you live in a different time zone or your work day doesn’t start at 9:00 a.m., change the reference time to the start of your work day in GMT. See A Note About Date/Time and Time Zones for more information.

Tips for Building Formulas

Sample Discounting Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Maintenance and Services Discount
This formula field uses two custom currency fields: Maintenance Amount and Services Amount. It displays “Discounted” on an opportunity if its maintenance amount and services amount do not equal the opportunity Amount standard field value. Otherwise, it displays “Full Price.”

\[
\text{IF(Maintenance\_Amount\_c + Services\_Amount\_c <> Amount, \}
\text{"Discounted", \}
\text{"Full Price")}
\]

Opportunity Discount Amount
This formula calculates the difference of the product Amount less the Discount Amount. Note that Discount Amount is a custom currency field.

\[
\text{Amount} - \text{Discount\_Amount\_c}
\]

Opportunity Discount Rounded
Use this formula to calculate the discounted amount of an opportunity rounded off to two digits. This example is a number formula field on opportunities that uses a custom percent field called Discount Percent.

\[
\text{ROUND(Amount} - \text{Amount} \ast \text{Discount\_Percent\_c, 2)}
\]

Opportunity Discount with Approval
This formula adds a “Discount Approved” checkbox to an opportunity. It uses conditional logic to check the value of the approval flag before calculating the commission.

\[
\text{IF(Discount\_Approved\_c, ROUND(Amount} - \text{Amount} \ast \text{Discount\_Percent\_c, 2), Amount)}
\]
Sample Employee Services Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

**Bonus Calculation**

This example determines an employee’s bonus amount based on the smallest of two amounts: the employee’s gross times bonus percent or an equally divided amount of the company’s performance amount among all employees. It assumes you have custom number field for **Number of Employees**, a custom percent field for **Bonus Percent**, and currency custom fields for the employee’s **Gross** and company’s **Performance**.

\[
\text{MIN}(\text{Gross}_{\text{c}} \times \text{Bonus}_\text{Percent}_{\text{c}}, \text{Performance}_{\text{c}} / \text{Number\text{\_}of\text{\_}Employees}_{\text{c}})
\]

**Employee 401K**

This example formula determines which amount to provide in employee 401K matching based on a matching program of half of the employee’s contribution or $250, whichever is less. It assumes you have custom currency field for **Contribution**.

\[
\text{MIN}(250, \text{Contribution}_{\text{c}} / 2)
\]

**Hours Worked Per Week**

This formula uses a custom tab to enable time tracking of hours worked per day. It uses a formula field to sum the hours per week.

\[
\text{MonHours}_{\text{c}} + \text{TuesHours}_{\text{c}} + \text{WedsHours}_{\text{c}} + \text{ThursHours}_{\text{c}} + \text{FriHours}_{\text{c}}
\]

**Total Pay Amount**

This formula determines total pay by calculating regular hours multiplied by a regular pay rate, plus overtime hours multiplied by an overtime pay rate.

\[
\text{Total Pay = IF(Total\_Hours}_{\text{c}} \leq 40, \text{Total\_Hours}_{\text{c}} \times \text{Hourly\_Rate}_{\text{c}}, 40 \times \text{Hourly\_Rate}_{\text{c}} + (\text{Total\_Hours}_{\text{c}} - 40) \times \text{Overtime\_Rate}_{\text{c}})}
\]

Sample Expense Tracking Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

**Expense Identifier**

This formula displays the text “Expense-“ followed by trip name and the expense number. This is a text formula field that uses an expense number custom field.

\[
\text{"Expense-" \& Trip\_Name\_c \& "}\& \text{Expense\_Num\_c}
\]
Mileage Calculation
This formula calculates mileage expenses for visiting a customer site at 35 cents a mile.

Miles_Driven__c * 0.35

Sample Financial Calculations Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Compound Interest
This formula calculates the interest, you will have after T years, compounded M times per year.

Principal__c * ( 1 + Rate__c / M ) ^ ( T * M )

Compound Interest Continuous
This formula calculates the interest that will have accumulated after T years, if continuously compounded.

Principal__c * EXP(Rate__c * T)

Consultant Cost
This formula calculates the number of consulting days times 1200 given that this formula field is a currency data type and consulting charges a rate of $1200 per day. Note that Consulting Days is a custom field.

Consulting_Days__c * 1200

Gross Margin
This formula provides a simple calculation of gross margin. In this formula example, Total Sales and Cost of Goods Sold are custom currency fields.

Total_Sales__c - Cost_of_Goods_Sold__c

Gross Margin Percent
This formula calculates the gross margin based on a margin percent.

Margin_percent__c * Items_Sold__c * Price_item__c

Payment Due Indicator
This formula returns the date five days after the contract start date whenever Payment Due Date is blank. Payment Due Date is a custom date field.

(BLANKVALUE(Payment_Due_Date__c, StartDate +5))
Payment Status
This formula determines if the payment due date is past and the payment status is "UNPAID." If so, it returns the text "PAYMENT OVERDUE" and if not, it leaves the field blank. This example uses a custom date field called Payment Due Date and a text custom field called Payment Status on contracts.

```java
IF(
AND(Payment_Due_Date__c < TODAY(),
ISPKVCAL(Payment_Status__c, "UNPAID")),
"PAYMENT OVERDUE",
null )
```

Sample Image Link Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

**Yahoo! Instant Messenger™ Image**
This formula displays an image that indicates whether a contact or user is currently logged in to Yahoo! Instant Messenger. Clicking the image launches the Yahoo! Instant Messenger window. This formula uses a custom text field called Yahoo Name to store the contact or user’s Yahoo! ID.

```java
IF(ISBLANK(Yahoo_Name__c),"", HYPERLINK("ymsgr:sendIM?" & Yahoo_Name__c,
IMAGE("http://opi.yahoo.com/online?u=" & Yahoo_Name__c & "&m=g&t=0", " ")))
```

Flags for Case Priority
This formula displays a green, yellow, or red flag image to indicate case priority.

```java
IMAGE(
CASE( Priority,
"Low", "/img/samples/flag_green.gif",
"Medium", "/img/samples/flag_yellow.gif",
"High", "/img/samples/flag_red.gif",
"/s.gif"),
"Priority Flag"
)
```

Color Squares for Case Age
This formula displays a 30 x 30 pixel image of a red, yellow, or green, depending on the value of a Case Age custom number field.

```java
IF( Case_Age__c > 20,
IMAGE("/img/samples/color_red.gif", "red", 30, 30),
IF( Case_Age__c > 10,
IMAGE("/img/samples/color_yellow.gif", "yellow", 30, 30),
IMAGE("/img/samples/color_green.gif", "green", 30, 30))
)
Traffic Lights for Status

This formula displays a green, yellow, or red traffic light images to indicate status, using a custom picklist field called Project Status. Use this formula in list views and reports to create a “Status Summary” dashboard view.

```plaintext
IMAGE(
  CASE(Project_Status__c,
   "Green", "/img/samples/light_green.gif",
   "Yellow", "/img/samples/light_yellow.gif",
   "Red", "/img/samples/light_red.gif",
   "/s.gif"),
  "status color")
```

Stars for Ratings

This formula displays a set of one to five stars to indicate a rating or score.

```plaintext
IMAGE(
  CASE(Rating__c,
   "1", "/img/samples/stars_100.gif",
   "2", "/img/samples/stars_200.gif",
   "3", "/img/samples/stars_300.gif",
   "4", "/img/samples/stars_400.gif",
   "5", "/img/samples/stars_500.gif",
   "/img/samples/stars_000.gif"),
  "rating")
```

Consumer Reports™—Style Colored Circles for Ratings

This formula displays a colored circle to indicate a rating on a scale of one to five, where solid red is one, half red is two, black outline is three, half black is four, and solid black is five.

```plaintext
IMAGE(
  CASE(Rating__c,
   "1", "/img/samples/rating1.gif",
   "2", "/img/samples/rating2.gif",
   "3", "/img/samples/rating3.gif",
   "4", "/img/samples/rating4.gif",
   "5", "/img/samples/rating5.gif",
   "/s.gif"),
  "rating")
```

Horizontal Bars to Indicate Scoring

This formula displays a horizontal color bar (green on a white background) of a length that is proportional to a numeric score. In this example, the maximum length of the bar is 200 pixels.

```plaintext
IMAGE("/img/samples/color_green.gif", "green", 15, Industry_Score__c * 2) & IMAGE("/s.gif", "white", 15, 200 - (Industry_Score__c * 2))
```
Sample Integration Link Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Application API Link

This formula creates a link to an application outside Salesforce, passing the parameters so that it can connect to Salesforce via the SOAP API and create the necessary event.

```
HYPERLINK ("https://www.myintegration.com?sId=" & GETSESSIONID() & "?&rowID=" & Name & "action=CreateTask","Create a Meeting Request")
```

**Important:** $Api.Session_ID and GETSESSIONID() return the same value, an identifier for the current session in the current context. This context varies depending on where the global variable or function is evaluated. For example, if you use either in a custom formula field, and that field is displayed on a standard page layout in Salesforce Classic, the referenced session will be a basic Salesforce session. That same field (or the underlying variable or formula result), when used in a Visualforce page, references a Visualforce session instead.

Session contexts are based on the domain of the request. That is, the session context changes whenever you cross a hostname boundary, such as from .salesforce.com to .visual.force.com or .lightning.force.com.

Session identifiers from different contexts, and the sessions themselves, are different. When you transition between contexts, the old session is replaced by the new one, and the old session is no longer valid. The session ID also changes at this time.

Normally Salesforce transparently handles session hand-off between contexts, but if you're passing the session ID around yourself, be aware that you might need to re-access $Api.Session_ID or GETSESSIONID() from the new context to ensure a valid session ID.

Note also that not all sessions are created equal. In particular, sessions obtained in a Lightning Experience context have reduced privileges, and don't have API access. You can't use these session IDs to make API calls.

Shipment Tracking Integration

This formula creates a link to FedEx, UPS, or DHL shipment tracking websites, depending on the value of a Shipping Method custom picklist field. Note that the parameters shown in this example for FedEx, UPS, and DHL websites are illustrative and do not represent the correct parameters for all situations.

```
CASE(Shipping_Method__c, 
"Fedex", 
HYPERLINK("http://www.fedex.com/Tracking?ascend_header=1&clienttype
dotcom&cntry_code=us&language=en&tracknumbers= "& tracking_id__c,"Track"),
"UPS", 
=5.0&sort_by=status&loc=en_US&InquiryNumber1= "& tracking_id__c & 
"track.x=32&track.y=7","Track") , 
"DHL", 
HYPERLINK("http://track.dhl-usa.com/TrackByNbr.asp?ShipmentNumber=" & 
tracking_id__c,"Track"), "")
```
Skype™ Auto Dialer Integration

This formula creates a linkable phone number field that automatically dials the phone number via the Skype VOIP phone application. It requires installation of the Skype application (a third-party product not provided by Salesforce) on your desktop.

```
HYPERLINK("callto://+" & Country_Code__c & Phone_Unformatted__c, Phone)
```

Sample Lead Management Formulas

For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

**Lead Aging (for open leads)**

This formula checks to see if a lead is open and if so, calculates the number of days it has been open by subtracting the date and time created from the current date and time. The result is the number of days open rounded to zero decimal places. If the lead is not open, this field is blank.

```
IF(ISPICKVAL(Status, "Open"), ROUND(NOW()-CreatedDate, 0), null)
```

**Lead Data Completeness**

This formula calculates the percent of certain lead fields that your sales personnel enter. The formula field checks the values of two custom number fields: Phone and Email. If the fields are empty, the formula returns the value "0." The formula returns a value of "1" for each field that contains a value and multiplies this total by fifty to give you the percentage of fields that contain data.

```
(IF(Phone = "", 0, 1) + IF(Email = "", 0, 1) ) * 50
```

**Lead Numbering**

This formula returns a number value for the text value in the auto-number field Lead Number. This can be useful if you want to use the Lead Number field in a calculation, such as round-robin or other routing purposes. Note that auto-number fields are text fields and must be converted to a number for numeric calculations.

```
VALUE(Lead_Number__c)
```

**Round-Robin Assignment of Cases or Leads**

The following formula example for leads assumes you have three lead queues and you want to assign an equal number of incoming leads to each queue. You can also assign cases using a similar formula.

```
MOD(VALUE(Lead_Number__c), 3)
```

This formula is for a custom formula field named Round_Robin_ID that assigns each lead a value of 0, 1, or 2. This formula uses a custom auto-number field called Lead Number that assigns each lead a unique number starting with 1. The MOD function divides the lead number by the number of lead queues available (three in this example) and returns a remainder of 0, 1, or 2. Use the value of this formula field in your lead assignment rules to assign lead records to different queues. For example:

- Round_Robin_ID = 0 is assigned to Queue A
- Round_Robin_ID = 1 is assigned to Queue B
- Round_Robin_ID = 2 is assigned to Queue C
Sample Metrics Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Temperature Conversion
This formula converts Celsius degrees to Fahrenheit.

1.8 * degrees_celsius__c + 32

Unit of Measure Conversion
This formula converts kilometers to miles.

Miles__c/.621371192

Sample Opportunity Management Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Expected Product Revenue
This formula calculates total revenue from multiple products, each with a different probability of closing.

ProductA_probability__c * ProductA_revenue__c + ProductB_probability__c * ProductB_revenue__c

Maintenance Calculation
This formula calculates maintenance fees as 20% of license fees per year. Maintenance Years is a custom field on opportunities.

Amount * Maint_Years__c * 0.2

Monthly Subscription-Based Calculated Amounts
This formula calculates an opportunity amount based on a monthly subscription rate multiplied by the subscription period.

Monthly_Amount__c * Subscription_Months__c

Monthly Value
This formula divides total yearly value by 12 months.

Total_value__c / 12
Opportunity Additional Costs
This formula calculates the sum of the product Amount, maintenance amount, and services fees. Note that Maint amount and Service Fees are custom currency fields.

\[ \text{Amount} + \text{Maint Amount\_c} + \text{Services Amount\_c} \]

Opportunity Categorization
This formula uses conditional logic to populate an Opportunity category text field, based on the value of the Amount standard field. Opportunities with amounts less than $1500 are “Category 1,” those between $1500 and $10000 are “Category 2,” and the rest are “Category 3.” This example uses nested IF statements.

\[ \text{IF}(\text{Amount} < 1500, \text{"Category 1"}, \text{IF}(\text{Amount} > 10000, \text{"Category 3"}, \text{"Category 2"})) \]

Opportunity Data Completeness
This formula takes a group of fields and calculates what percent of them are being used by your personnel. This formula field checks five fields to see if they are blank. If so, a zero is counted for that field. A “1” is counted for any field that contains a value and this total is divided by five (the number of fields evaluated). Note that this formula requires you select the Treat blank fields as blanks option under Blank Field Handling while the Advanced Formula subtab is showing.

\[ \frac{(\text{IF(ISBLANK(Maint Amount\_c)}, 0, 1) + \text{IF(ISBLANK(Services Amount\_c)}, 0,1) + \text{IF(ISBLANK(Discount Percent\_c)}, 0, 1) + \text{IF(ISBLANK(Amount)}, 0, 1) + \text{IF(ISBLANK(Timeline\_c)}, 0, 1))}}{5} \]

Opportunity Expected License Revenue
This formula calculates expected revenue for licenses based on probability of closing.

\[ \text{Expected rev licenses\_c} \times \text{Probability} \]

Opportunity Revenue Text Display
This formula returns the expected revenue amount of an opportunity in text format without a dollar sign. For example, if the Expected Revenue of a campaign is “$200,000,” this formula field displays “200000.”

\[ \text{TEXT(ExpectedRevenue)} \]

Opportunity Total Deal Size
This formula calculates the sum of maintenance and services amounts.

\[ \text{Amount} + \text{Maint Amount\_c} + \text{Services Amount\_c} \]

Opportunity Total Price Based on Units
This formula generates proposal pricing based on unit price and total volume.

\[ \text{Unit price\_c} \times \text{Volume\_c} \times 20 \]
Professional Services Calculation
This formula estimates professional service fees at an average loaded rate of $1200 per day. Consulting Days is a custom field on opportunities.

\[
\text{Consulting Days}_\text{c} \times 1200
\]

Stage-Based Sales Document Selection
This formula identifies a relevant document in the Documents tab based on opportunity Stage. Use document IDs in the form of “00130000000J7AO.”

```
CASE(StageName,
    "Prospecting", "Insert 1st Document ID",
    "Qualification", "Insert 2nd Document ID",
    "Needs Analysis", "Insert 3rd Document ID",
    "Value Proposition", ..., 
)
```

Sales Coach
This formula creates a hyperlink that opens a stage-specific document stored in the Documents tab. It uses the previously defined custom formula field that identifies a document based on opportunity Stage. See Stage-Based Sales Document Selection on page 4195.

```
HYPERLINK("/servlet/servlet.FileDownload?file=" & Relevant_Document__c, "View Document in New Window")
```

Shipping Cost by Weight
This formula calculates postal charges based on weight.

\[
\text{package_weight}_\text{c} \times \text{cost_lb}_\text{c}
\]

Shipping Cost Percentage
This formula calculates shipping cost as a fraction of total amount.

\[
\text{Ship_cost}_\text{c} / \text{total_amount}_\text{c}
\]

Tiered Commission Rates
This formula calculates the 2% commission amount of an opportunity that has a probability of 100%. All other opportunities will have a commission value of zero.

```
IF(Probability = 1,
    ROUND(Amount * 0.02, 2),
    0)
```
Total Contract Value from Recurring and Non-Recurring Revenue
This formula calculates both recurring and non-recurring revenue streams over the lifetime of a contract.

Non_Recurring_Revenue__c + Contract_Length_Months__c * Recurring_Revenue__c

Sample Pricing Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Total Amount
This formula calculates a total amount based on unit pricing and total units.

Unit_price__c * Total_units__c

User Pricing
This formula calculates a price per user license.

Total_license_rev__c / Number_user_licenses__c

Sample Scoring Calculations Formulas
For details about using the functions included in these samples, see Formula Operators and Functions on page 4106.

Lead Scoring
This formula scores leads, providing a higher score for phone calls than website requests.

CASE(LeadSource, "Phone", 2, "Web", 1, 0)

Here's a formula that scores a lead based on his or her rating:

CASE(1, IF(ISPICKVAL(Rating, "Hot"), 1, 0), 3, IF(ISPICKVAL(Rating, "Warm"), 1, 0), 2, IF(ISPICKVAL(Rating, "Cold"), 1, 0), 1))

Customer Success Scoring
This formula uses a simple scoring algorithm to rank customers a high score for positive survey results in Salesforce.

Survey_Question_1__c * 5 + Survey_Question_2__c *2
Formulas: How Do I ... ?

Common Math Calculations
- Add numbers?
- Convert text into a number?
- Divide numbers?
- Multiply numbers?
- Round numbers?
- Subtract numbers?

Common Text Functions
- Check if a field contains specified text?
- Check if a picklist field contains a specified value?
- Combine first and last names?
- Convert numbers into text?
- Create a hyperlink field?

Advanced Formulas
- Calculate Commission Amounts for Opportunities?
- Set Up Round-Robin Assignment of Cases or Leads?
- Set Up Opportunity Discount Rounded?

Custom Summary Formulas for Reports
- Calculate the sum of all leads that have Email Opt Out and Do Not Call fields selected?
- Calculate the difference of all Amount fields and all Discounted Amount fields on opportunities?
- Calculate the average age of all opportunities?
- Calculate what percent of all opportunities are closed won?
- Calculate the number of active Salesforce users to the 2nd power for administration?
- Calculate the duration of all activities (minutes) times the number of records per 24 hours?
- Calculate the average percent margin on a product-by-product level across many opportunities?
- Calculate the percentage of one product compared to all products in closed opportunities?
- Calculate the change in revenue from opportunities between months?

Cross-Object Formulas
- Display a Percent field from a parent object?
- Display a text field from a parent object?
- Display a phone number field from a parent object?
- Display a picklist field from a parent object?
- Display a URL field from a parent object?
Common Formula Errors

Review common errors that can occur with formulas and how to fix them.

- “#Error!” displays for a formula field whenever an error occurs while calculating the value of a formula. To resolve the error, check your formula.
  - Is the formula dividing by zero? If so, check if the denominator of your expression is zero and provide an alternative value. For example, the following campaign formula field is blank if the number of opportunities is zero:

  ```
  IF(NumberOfOpportunities > 0, 
    NumberOfWonOpportunities / NumberOfOpportunities, null)
  ```

- Is the formula calculating a value larger than the maximum value of the current type? If so, you can append L to numeric values to make them Long so the intermediate products will be Long and no overflow occurs. For example, the following example shows how to correctly compute the amount of milliseconds in a year by multiplying Long numeric values.

  ```
  Long MillsPerYear = 365L * 24L * 60L * 60L * 1000L;
  31536000000L;
  System.assertEquals(MillsPerYear, ExpectedValue);
  ```

- Is the formula calculating the square root of a negative number? If so, use an IF function similar to the one above to check if the value is a positive number.

- Is the formula calculating the LOG of a negative number? If so, use an IF function similar to the one above to make sure that the number is positive.

- Is the formula using the VALUE function with text that contains special characters? For examples of special characters, see Formula Operators and Functions on page 4106.

- Make sure the formula does not contain a HYPERLINK function within a text function, such as LEFT(HYPERLINK("http://MYCOMPANY.ORG ", "MYCOMPANY ") , 5).

- Is the formula disabled or referencing a disabled formula field? Salesforce disables formula fields when they are deleted and they remain disabled after they are restored. To enable disabled formula fields, edit and save the field. For more information on deleted custom fields and restoring them, see Manage Deleted Custom Fields on page 4016.

- “#Too Big!” displays if your formula output is over 18 digits. When this happens, check your formula for calculations that could result in more than 18 digits. Avoid multiplying large numbers, raising a large number to a power, or dividing by a very small number.

- CASE functions return an error whenever any of the expressions return an error, regardless of which one should be returned. For example, CASE(Field__c,"Partner", "P", "Customer", "C", LEFT(Field__c, -5)) returns an error even if the value of the field is "Partner" or "Customer" because the last statement is illogical.

- Prevent division by zero errors by including an IF function that determines if the value of a field is zero. For example, IF(Field__c =0, 0, 25/Field__c).
Merge Fields

Merge Fields Overview

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. For example, you can place a merge field in an email template so that the greeting includes the recipient’s name rather than a generic “Hello”. You can use merge fields within custom formula fields, s-controls, custom links, custom buttons, Visualforce pages, and when you create email or mail merge templates.

Merge field names are determined when you create a new custom field or object. Field Name is automatically populated based on what you type into Field Label. You can customize this field if you want, but keep in mind that the name must:

- Only use underscores and alphanumeric characters
- Begin with a letter and end with a letter
- Not include spaces
- Not contain two consecutive underscores

Important: Ensure that the custom field name and label are unique for that object.

- If a standard and custom field have identical names or labels, the merge field displays the custom field value.
- If two custom fields have identical names or labels, the merge field may display an unexpected value.

If you create a field label called Email and a standard field labeled Email already exists, the merge field may be unable to distinguish between the fields. Adding a character to the custom field name makes it unique. For example, Email2.

To find the merge field name for an object or field in Salesforce, visit the object or field’s detail page and refer to Field Name.

To incorporate merge fields, use the editor in the respective feature. Salesforce provides valid merge fields in each editor for all related standard and custom objects. If you’re using the Connect for Office Word add-in to create mail merge templates, you’ll see a complete list of valid merge fields to insert.

Syntax

A merge field’s syntax can vary depending on where you’re using the field. To make sure you’re using the correct syntax, select merge fields from the drop-down list in the editor where you’re using the merge field.

Custom objects and fields are always appended with __c when referenced. Field labels are preceded by the object, and all spaces are converted to underscores. For example, Account.CreatedDate references the Created Date standard field for the account object.

In standard relationships, the name of the relationship is the master object. For example, you can reference the account name from a contact validation rule using Account.Name; you can reference the phone number of the account creator from an opportunity product formula field using Opportunity.Account.CreatedBy.Phone. In custom relationships, the name of the relationship is the value specified in Field Name with __r appended to it. For example, you can reference contact email from a custom object validation rule using Contact__r.Email.

General Tips

- To use a merge field as the destination of a link, insert the merge field after http://.
- Salesforce rounds numbers referenced in merge fields according to the user’s locale, not the number of decimal spaces specified in the number field configuration.
You can store the name of an account, contact, or lead in your organization’s default language (the local name), in addition to the account or user’s default language (the standard name). If the local name is blank, the standard merge field name is used.

To reference a stand-alone file, use $Resource.<resource_name>, where <resource_name> is the name you specified when you uploaded the resource.

If you’re using the Translation Workbench to translate custom field names, users can look up merge fields in their chosen language.

You can’t use a lookup field as a merge field in an email template. You can, however, create a hidden formula field on the page layout that pulls the value from the lookup field. Then include the hidden field in the email template.

Merge Fields for Validation Rules

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

Syntax and Formatting

When you insert a merge field in a validation rule, the syntax consists of the object, a period, and the field name. For example, $User.State corresponds with a user’s state or province.

A merge field’s syntax can vary depending on where you’re using the field. To make sure you’re using the correct syntax, select merge fields from the drop-down list in the editor where you’re using the merge field. The merge fields for validation rules correspond directly with the fields in your app.

For a list of fields in an object, from the management settings for the object, go to the fields section.

Important:

- If two or more custom objects have matching names or labels, only one of the objects appears when you select from available merge fields. Make sure that all custom objects have unique names and labels so that you can select merge fields from any of the objects.

Limitations

Validation rules can’t reference merge fields for:

- Auto number fields, such as Requisition Number
- Compound fields, such as addresses, first and last names, dependent picklists, and dependent lookups

Note: Validation rules can reference merge fields individual address fields, such as Billing City.

- Campaign statistic fields, including statistics for individual campaigns and campaign hierarchies

Tips

- Some merge fields display as radio buttons but function like picklist fields when referenced in a formula.

  Use the values “Read,” “Edit,” and “None” in a formula when referencing:

  - $UserRole.CaseAccessForAccountOwner
  - $UserRole.OpportunityAccessForAccountOwner
  - CaseAccessLevel (on Territory)
  - OpportunityAccessLevel (on Territory)
Use the values “Read,” “Edit,” and “All” in a formula when referencing:

- **AccountAccessLevel** (on Territory)

- Use the `RecordType.Id` merge field in your formula to apply different validations for different record types.

SEE ALSO:
- Find Object Management Settings

**Merge Fields for Formulas**

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record.

**Syntax and Formatting**

Merge fields for formulas aren’t enclosed in curly braces or preceded by an exclamation point, nor are they preceded by the type of record. For example: `AccountNumber`. To ensure you’re using the correct syntax, use the **Insert Field** button or the drop-down list in the formula editor.

SEE ALSO:
- Tips for Using Merge Fields in Formulas
- Build a Formula Field

**Merge Fields for Cross-Object Formulas**

Cross-object formulas are formulas that span two related objects and reference merge fields on those objects. Cross-object formulas can reference merge fields from a master (“parent”) object if an object is on the detail side of a master-detail relationship. Cross-object formulas also work with lookup relationships. For example, you can write a cross-object formula that references the `Account Name` for a contact associated with a case. In this example, you would type `Contact.Account.Name` in a formula on the Case object.

**Syntax and Formatting**

Merge fields for formulas aren’t enclosed in curly braces or preceded by an exclamation point. Use the relationship names of the objects, not the labels. Although the relationship name is often the same as the object name, it is technically the field name of the relationship field.

To reference the parent account name from Account object, the syntax is `Parent.Name`, not `Account.Name`. When referencing a custom object, add two underscores and the letter `r` to its name. For example, `Position__r.title__c` references the Job Title field (`title__c`) on a Position custom object.

**Limitations**

You can’t reference:
- Merge fields for objects related to activities. For example, merge fields for contacts and accounts are not available in task and event formulas.
- The $RecordType global variable—it only resolves to the record containing the formula, not the record to which the formula spans. Starting with the Spring ’13 release, when you create a new formula the $RecordType global variable is only available for default value formulas.

The value of the Profile.Name merge field differs depending on the context of the cross-object formula field that references it. On detail pages, the value is the profile name, as expected; however, in list views and reports, the value is the internal value of the associated profile instead. If you use Profile.Name in a formula, use it within an OR function to ensure the formula always returns the intended result. For example:

```plaintext
IF
  (OR
    (LastModifiedBy.Profile.Name = "Standard User", LastModifiedBy.Profile.Name = "PT2"),
    "Standard", "Not Standard")
```

None of the above applies to profile names referenced by the $Profile global variable.

## Automate Your Business Processes

Instead of relying on your users to perform each part of a business process, automate it! The benefits are two-fold: your users can spend their time on other tasks, and you can trust that the process is always done just so. Salesforce offers tools to automate several kinds of business processes: workflow processes, approval processes, wizard-based processes, and more. You’ll be happy to know that these tools don’t require you to write code—they’re all point-and-click.

### Which Automation Tool Do I Use?

Salesforce provides multiple tools to automate your organization’s repetitive business processes: Approvals, Process Builder, Workflow, and Visual Workflow.

**Lightning Process Builder**

Many of the tasks you normally assign, the emails you regularly send, and other record updates are vital parts of your organization’s standard processes. Instead of doing this repetitive work manually, you can configure processes to do it automatically.

**Workflow**

Workflow allows you to automate standard internal procedures and processes to save time across your org. A workflow rule is the main container for a set of workflow instructions.

**Approvals**

It’s likely that you’re familiar with process automation in the form of workflow rules. Approvals take automation one step further, letting you specify a sequence of steps that are required to approve a record.

**Visual Workflow**

Visual Workflow lets you automate business processes by building flows and distributing them to the right users or systems. A flow is an application that can execute logic, interact with the Salesforce database, call Apex classes, and collect data from users. You can build flows by using the Cloud Flow Designer.

**Automated Actions**

An automated action is a reusable component that performs some sort of action behind the scenes—like updating a field or sending an email. Once you create an automated action, add it to a process, milestone, or other automated process.
Which Automation Tool Do I Use?

Salesforce provides multiple tools to automate your organization’s repetitive business processes: Approvals, Process Builder, Workflow, and Visual Workflow. The best automation tool for your needs depends on the type of business process that you’re automating.

• **How a record gets approved**
  Example: Managers approve their direct reports’ requests for vacation.

• **What to do when a record has certain values**
  Example: Notify the account owner when a related case is escalated.

• **Collecting information from users or customers and then doing something with that information**
  Example: Customer support uses a wizard to step through a call script, and cases are created based on the information they enter.

How a Record Gets Approved

To automate your organization’s processes for approving records, create approval processes.

What to Do When a Record Has Certain Values

Three of our tools can address this use case: Workflow, Process Builder, and Visual Workflow. Respectively, these tools create workflow rules, processes, and flows.

We recommend starting with Process Builder, especially for business processes that can be simplified to if/then statements. For example: if a case is escalated, then notify the account owner.

Process Builder includes almost all the functionality that’s available in workflow rules, and more. In fact, a single process can do what it would normally take multiple workflow rules to do. The only thing you can do with workflow that you can’t do with processes is send outbound messages without code. However, you can work around this limitation by calling Apex code from a process.

If the process is too complicated for the Process Builder or requires more advanced functionality, create a flow by using the Cloud Flow Designer. For example, create a flow to:

• **Use complex branching logic** (if certain conditions are true, evaluate for further conditions)
  Example: First, check whether a case is escalated. If the case is escalated, check the account’s region and route the case accordingly.

• **Sort through, iterate over, and operate on several records**
  Example: After an opportunity is closed and won, calculate the opportunity’s discount. Then apply that discount to all the related opportunity products.

Getting Information from Users or Customers and Then Doing Something with It

If you need to build a wizard to collect information, Visual Workflow is the tool for you. Create a flow that displays information to and requests information from a user. Then take the information that they enter and perform actions in Salesforce with it.

For example, create a flow that walks customer support representatives through a call script. The flow uses information that the representative entered, such as the caller’s name and account number, to create a case that’s assigned to the right person.

You can add more complexity to the flow to match your business process. For example:
• Route the representative to different screens, depending on earlier choices. This prevents the representative from doing things like trying to upsell a product to a customer who already bought that product.
• Check whether the reported problem is blocking the customer's business and the account is high-value. If so, the flow notifies the region director.

Automation Tool Features
Here's the breakdown of all the features and actions that are supported in each of our automation tools. Use it to figure out which tool is best for your business needs.

<table>

Many of the tasks you normally assign, the emails you regularly send, and other record updates are vital parts of your organization’s standard processes. Instead of doing this repetitive work manually, you can configure processes to do it automatically.

The Process Builder is a workflow tool that helps you easily automate your business processes by providing a powerful and user-friendly graphical representation of your process as you build it. The Process Builder’s simple and powerful design allows you to:

- Create your processes using a convenient layout with point-and-click efficiency.
- Create your whole process in one place rather than using multiple workflow rules.
- Create processes by collaborating with different teams in your business.
- Stop using Apex code to automate simple tasks.

Automated processes in the Process Builder are based on records and consist of:

- Criteria that determine when to execute action groups.
- Immediate and scheduled actions to execute when those criteria are met.

Any change that causes a record to match the criteria can automatically trigger the action group. A single process can also execute multiple action groups—so it’s easy to automate all of your business records, like accounts, in one place.

You can use the more powerful and flexible Process Builder to perform the same actions as workflow. With the Process Builder, you can:

- Create a record
- Update any related record—not just the record or its parent
- Use a quick action to create a record, update a record, or log a call
- Launch a flow—you can’t schedule this action with workflow
- Send an email
- Post to Chatter
- Submit for approval

If you need your process to do more than what those actions allow, don’t worry. You can also call Apex or a flow from a process.

1 The Process Builder has superseded flow trigger workflow actions, previously available in a pilot program. Orgs that are using flow trigger workflow actions can continue to create and edit them, but they aren’t available for new orgs.
Sample Process: Opportunity Management
This example automates a single business process by using the Process Builder instead of workflow rules.

Process Limits and Considerations
Before you start creating, managing, and activating processes, understand the limits and considerations.

Setting Values in the Process Builder
Throughout the Process Builder, you need to set values, for example, to set conditions in a criteria node, to set the fields on a new case in a Create a Record action, or to specify an Apex method to reference.

Create a Process
To create a process, define its properties and which records it should evaluate, and then add criteria nodes and actions.

Troubleshoot Processes
Use the error messages that appear in the Process Builder and the emails you receive when a process fails to help solve problems that arise when you’re working with processes. When all else fails, look at the Apex debug logs for your processes.

SEE ALSO:
Which Automation Tool Do I Use?

Sample Process: Opportunity Management
This example automates a single business process by using the Process Builder instead of workflow rules.

The example demonstrates how you can use the Process Builder to automate a single process by adding multiple groups of criteria and then associating individual actions with those criteria. In addition, some actions are available with the Process Builder that you can’t perform with workflow rules, such as creating records.

In this example, the process is defined to start when an opportunity record (1) is created or edited.

Three criteria nodes are then set up to check whether a high-value deal was won (2), a high-value deal was lost (3), or a quote was given (4). For the first criteria node that evaluates to true, the associated action group is executed.
The High Value Deal Won criteria checks whether the opportunity’s stage is closed and won and also whether the opportunity’s amount is greater than $1,000,000.00. If both of these conditions are met, the associated action group is executed. For this criteria node, three immediate actions (5) and one scheduled action (6) are defined.

These actions:

- Create a draft contract record that’s associated with the opportunity’s account.
- Congratulate the opportunity owner for closing and winning the opportunity by posting to the Sales Chatter group.
- Notify the VP of sales via email that the opportunity was closed and won.
- Create a high priority follow-up task for the associated account’s owner, which is scheduled to execute six days after the opportunity’s Close Date.

If the High Value Deal Won criteria conditions aren’t met, the associated group of actions doesn’t execute and the next criteria node (High Value Deal Lost) is evaluated.

The High Value Deal Lost criteria node checks whether the opportunity stage is closed and lost and whether the opportunity amount is greater than or equal to $1,000,000.00. If these conditions are true, we’ve set up an action (7) to notify the VP of sales by creating a chatter post on the opportunity record. The post identifies the opportunity and the opportunity amount that was lost.

If neither of the previous criteria conditions are met, the next criteria node defined in this process checks whether the opportunity stage is set to “Proposal/Quote Given.” If this condition is true, a scheduled action (8) is executed three days after the record is updated. The scheduled action creates a follow-up task for the opportunity owner to make a call to inquire about the opportunity.

Using the Process Builder, we’ve combined three criteria nodes and associated actions into a single, automated process. To automate the same business process with workflow, you would have to create three different workflow rules and use Apex triggers to create the contract record and post to the Sales Chatter group.
Process Limits and Considerations

Before you start creating, managing, and activating processes, understand the limits and considerations.

Note: We recommend that you use the most recent stable version of Google Chrome™, and your screen resolution must have a width of at least 1024.

Process Limits
When using the Process Builder, keep shared limits and Apex governor limits in mind.

Process Design Considerations
Before you design a process, understand the limitations and guidelines.

Process Chatter Considerations
When creating a Chatter post from a process, consider the limitations.

Process Scheduled Actions Considerations
Before you add scheduled actions to a process, understand the limitations and guidelines.

Process Builder Accessibility Considerations
Process Builder is 508-compliant, with one exception.

Change Sets and Packaging Considerations for Processes
Keep these considerations in mind when deploying processes.

Process Formula Limitations
Formulas that are used as conditions in a criteria node have some limitations. If a process contains an invalid formula, you can’t save or activate the process.

Process Activation Considerations
Before you activate a process, understand when processes start evaluating records.

Process Builder Error Messages
Error or warning messages might refer to a “flow” instead of a “process.” Those messages still apply to your process.

Process Limits
When using the Process Builder, keep shared limits and Apex governor limits in mind.

Limits Shared with Other Features
Processes share some limits with rules and Visual Workflow.

In addition to the following limits, a process's API Name must be unique across all processes and flows in your organization.

<table>
<thead>
<tr>
<th>Description</th>
<th>Per-Organization Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total active rules and active processes per object</td>
<td>50</td>
</tr>
<tr>
<td>Rules include workflow rules, escalation rules, assignment rules, and auto-assignment rules.</td>
<td></td>
</tr>
<tr>
<td>Total flows and processes</td>
<td>1,000</td>
</tr>
<tr>
<td>Description</td>
<td>Per-Organization Limit</td>
</tr>
<tr>
<td>----------------------------------------------------------------------------</td>
<td>------------------------</td>
</tr>
<tr>
<td>Active flows and processes</td>
<td>500</td>
</tr>
<tr>
<td>Total number of criteria nodes that are evaluated and actions that are executed at runtime</td>
<td>2,000</td>
</tr>
<tr>
<td>Total number of flow interviews that are resumed or groups of scheduled actions that are executed per hour</td>
<td>1000</td>
</tr>
<tr>
<td>Total number of flow interviews or groups of scheduled actions that are waiting to be processed</td>
<td>30,000</td>
</tr>
<tr>
<td>Total number of relative time alarms defined in flow versions or schedules based on a field value in processes</td>
<td>20,000</td>
</tr>
</tbody>
</table>

The daily limit for emails sent from email alerts is 1,000 per standard Salesforce license per organization—except for Developer Edition organizations, where the daily workflow email limit is 15 per standard Salesforce license. The overall organization limit is 2,000,000. This limit is shared across all features that use workflow email alerts: workflow rules, approval processes, flows, and processes.

### Apex Governors and Limits for Processes

Salesforce strictly enforces limits to ensure that runaway processes don’t monopolize shared resources in the multitenant environment. Processes are governed by the per-transaction limits that are enforced by Apex. If the process causes the transaction to exceed governor limits, the system rolls back the entire transaction. For details about the operations that are included in the transaction, see “Triggers and Order of Execution” in the Force.com Apex Developer’s Guide.

<table>
<thead>
<tr>
<th>Description</th>
<th>Per-Transaction Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of SOQL queries issued</td>
<td>100</td>
</tr>
<tr>
<td>Total number of records retrieved by SOQL queries</td>
<td>50,000</td>
</tr>
<tr>
<td>Total number of DML statements issued</td>
<td>150</td>
</tr>
<tr>
<td>Total number of records processed as a result of DML statements</td>
<td>10,000</td>
</tr>
</tbody>
</table>

Each “Create a Record” action uses one DML statement. Each “Quick Action” action uses one DML statement. Each “Update Records” action uses one SOQL query and one DML statement. Each “Flows” action can use multiple SOQL queries and DML statements, depending on the elements that the flow executes. For details, see Limits for Visual Workflow on page 4335.

### Other Process Limits

Consider these limits when creating and managing processes.

<table>
<thead>
<tr>
<th>Description</th>
<th>Limit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total number of characters in a process name</td>
<td>255</td>
</tr>
<tr>
<td>Total number of characters in a process’s API name</td>
<td>77</td>
</tr>
<tr>
<td>Total number of versions of a process</td>
<td>50</td>
</tr>
<tr>
<td>Total number of criteria nodes in a process</td>
<td>200</td>
</tr>
</tbody>
</table>
Process Design Considerations

Before you design a process, understand the limitations and guidelines.

- **Note:** The Process Builder is supported in Microsoft® Internet Explorer® version 11. Previous versions aren’t supported.

- Make sure that your processes aren’t set up to create infinite loops. For example, if an Update Records action for Process1 triggers Process2 and a Create a Record action for Process2 triggers Process1, the looping might cause your organization to exceed its hourly limits.

- If you create processes to replace other setup entities, such as a workflow rule, or an Apex trigger, make sure you delete those entities when you activate the equivalent processes. Otherwise, both workflow and processes will fire and cause unexpected results, such as overwritten records or redundant email messages.

- If you create processes to replace any Apex triggers, make sure you delete those Apex triggers when you activate the equivalent processes. Otherwise, both workflow and processes will fire and cause unexpected results, such as overwritten records or redundant email messages.

- Each process is associated with a single object.

- Actions are executed in the order in which they appear in the Process Builder.

- If any of the actions fail, the entire transaction fails and an error message displays. For example, a Post to Chatter action fails if the Chatter group that it tries to post to is private. For details, see Troubleshoot Processes on page 4244.

- If a single action group includes multiple “Update Records” actions that apply different values to the same field, the last action’s value is used.

- Processes that update owners don’t also transfer associated items. To ensure transfer, use one “Update Records” action for each type of child record that you want to transfer. For example, if you’re using a process to transfer an account to a new owner, use one action to update all the child contacts, one to update all the child opportunities, one to update all the child contracts, and so on.

- Before you change a custom field’s type, make sure that it isn’t referenced in a process that would be invalidated by the new type.

- You can’t delete a custom field that is referenced by a process.

- File type custom fields aren’t supported in Process Builder. For example, if your process creates a knowledge article record that has a custom field type of File, an error occurs when the process runs.

- If you have processes on converted leads and want to update the records that result from the conversion, you must enable the lead setting Enable Validation and Triggers from Lead Convert.

- If your organization uses multiple currencies, currency fields are updated using the record’s currency code. If you choose to update a field based on a formula, any values in your formula are interpreted in the currency code of the record.

- External objects aren’t supported in the Process Builder.

Process Chatter Considerations

When creating a Chatter post from a process, consider the limitations.

- If your process creates a Chatter post to the feed of a specific user or group, and you deploy the process to another organization, the “Post to Chatter” action may not work because those IDs don’t exist in the other organization.

- A Chatter action may fail to save if the Message starts with a field reference such as {! [Account] . Name}.

  To work around this issue, add a space at the beginning of the message. For example, if a “Post to Chatter” action’s Message starts with {! [Account] . Name} in an active process:

  1. Open the active process.
2. Click **Clone**.
3. Choose whether to create a version of the current process or a completely new process with its own version history.
4. Open the “Post to Chatter” action.
5. In **Message**, enter a space before “{”.
6. Save the action.
7. Save and activate the process. Make sure to deactivate the original process.

- If you use Microsoft® Internet Explorer® version 11, you can’t paste text into a message. Copy and paste actions are allowed in all other supported browsers.
- Post to Chatter actions aren’t supported if the action posts to a [Community](#) on page 3011 user or group. An error occurs when an activated process with this type of action evaluates a record.
- You can add up to 25 mentions to a Chatter message.

### Process Scheduled Actions Considerations

Before you add scheduled actions to a process, understand the limitations and guidelines.

- To add scheduled actions to your process, you have two options:
  - Start the process only when a record is created (1). Select this option when you choose an object for your process.
  - Start the process when a record is created or edited (2). In addition, select the advanced option to execute actions only when specified changes are made (3) when you add criteria to your process.

- If an action group contains scheduled actions, you can’t continue evaluating the next criteria in your process after executing those actions. For details about evaluating additional criteria after executing actions, see [Execute Actions on More Than One Criteria](#).
- If scheduled actions fail to execute—for example, because the user who caused the process to start is inactive—the admin who created the process receives an email with details about the failure. Salesforce makes additional attempts to execute failed scheduled actions before removing them from the queue. For details about error notifications, see [Errors Received after a Process Starts Evaluating a Record](#).
- After you deactivate a process, any scheduled actions continue as usual.
- You can’t delete a process if it has unexecuted groups of scheduled actions. For details about deleting unexecuted groups of scheduled actions, see [Delete Unexecuted Scheduled Actions](#) on page 4244.
• An organization can process up to 1,000 groups of scheduled actions per hour. Each group of scheduled actions is associated with a schedule, such as “3 days from now.” When a schedule is processed, the associated actions are executed. If an organization exceeds this limit, Salesforce processes the remaining schedules in the next hour. For example, if an organization has 1,200 groups of pending actions scheduled to be processed between 4:00 PM and 5:00 PM, Salesforce processes 1000 groups between 4:00 PM and 5:00 PM and the additional 200 groups between 5:00 PM and 6:00 PM.

• An organization can have up to 30,000 pending schedules and waiting flow interviews at one time.

• For processes that are set to run when a record is created or edited, scheduled actions remain in the queue only as long as the criteria for those actions are still valid. If a record no longer matches the criteria, Salesforce removes the scheduled actions for that record from the queue.

• For processes that are set to run when a record is created, Salesforce never reevaluates the record with that process. Scheduled actions remain in the queue, even if the record no longer meets the associated criteria when the scheduled actions are executed.

• If you schedule an action for \(0\) Days Before a date, save the process, and then reopen the process, the schedule in the process changes to \(0\) Days After the date. The process still executes at the specified time.

• If you schedule an action for \(0\) Days After a date, there may be a delay from the time represented by the date field before the action group executes.

**Transactions and Scheduled Actions**

Similar to workflow rules, immediate actions in processes are executed in the same transaction as the operation that caused the process to be triggered—when a user created or edited a record. For details about the operations that are included in that transaction, see Triggers and Order of Execution in the *Force.com Apex Developer’s Guide*. Scheduled actions are included in a separate transaction.

Groups of scheduled actions aren’t performed independently. They’re grouped into a single batch that starts performing within one hour after the first group enters the batch. The batch can also include flow interviews that are resumed after a specified time occurs. This behavior can cause you to exceed your Apex governor limits if any actions in the group execute DML operations or SOQL queries. A DML operation is used each time a Salesforce record is created, updated, or deleted, such as when a process executes a “Create a Record” action. A SOQL query is used each time Salesforce looks up information about an existing record, such as when a process executes an “Update Records” action. For details on Apex governor limits, see Process Limits on page 4208.

If your process contains scheduled actions, make sure that the actions don’t perform more DML operations or SOQL queries than are permitted by the Apex governor limits.

If a group of scheduled actions fails to be executed:

• Prior groups of scheduled actions in that batch’s transaction are successful.

• The immediate actions for that process are successful.

• All the scheduled actions in that group fail to be executed.

• The remaining groups of scheduled actions in that batch are tried.

**Example:** Salesforce is going to process a batch of 25 groups of scheduled actions in the same transaction. Up to 100 DML operations can be used across this batch. The first 22 groups each use five (5) DML operations, and the last three (3) groups don’t use any DML operations.

The 21st group violates the Apex governor limits by trying to execute the 101st through 105th DML operations for this transaction. Only this group of scheduled actions fails to execute. This means that the first 20 groups of scheduled actions are successfully executed and the 21st group of scheduled actions fails. None of the actions in the 21st group is successful, no matter which action in the group violated the limit. Salesforce then tries to execute the remaining groups of scheduled actions in the batch. Because the 22nd group uses five (5) DML operations and the transaction has already used all of its allowed DML operations, the 22nd group also fails. Because the last three (3) groups don’t use any DML operations, those groups are successfully executed.
Schedule Limitations

- If actions are scheduled for a time in the past, Salesforce executes that group of scheduled actions within one hour.
  
  For example, if a process is configured to email an opportunity owner seven days before the close date and the process runs for an opportunity with the close date set to today, Salesforce executes the scheduled actions within an hour.

If actions are scheduled based on the current time (i.e. 3 days from now):

- The schedule is evaluated based on the timezone of the user who created the process.

If actions are scheduled based on a field value (i.e. 3 days after a case’s Created Date):

- The schedule is evaluated based on the organization’s timezone.

- If a deactivated process still has pending scheduled actions and the record whose field the schedule is based on is changed, Salesforce recalculates the schedule for those actions. Once a process is deactivated, Salesforce ignores all other changes to associated records.

- Across all of your processes and flow versions, your organization can have up to 20,000 schedules based on a field and relative time alarms.

- The referenced field can’t be a:
  
  - DATE or DATETIME field that contains automatically derived functions, such as TODAY or NOW.
  - Formula field that includes related-object merge fields.

- If you change the referenced field value and the schedule hasn’t been processed, Salesforce recalculates the schedule associated with that field.

  For example, if a process is configured to email an opportunity owner seven days before the opportunity close date and the close date is set to 2/20/2014, Salesforce processes the schedule on 2/13/2014 and sends the email. If the close date is later updated to 2/10/2014 and the schedule hasn’t been processed yet, Salesforce recalculates the schedule and sends the email on 2/3/2014. If Salesforce recalculates the schedule to a date in the past, Salesforce executes the associated actions shortly after you save the record.

- Salesforce ignores schedules that reference null field values.

- If the record or the object that the schedule is associated with is deleted, the schedule is never processed.

- The following limitations apply for converted leads.
  
  - You can’t convert a lead if an unexecuted schedule is based on one of the lead’s fields.
  - If Validation and Triggers from Lead Convert is enabled, scheduled actions on leads aren’t executed during lead conversion.
  - If a campaign member based on a lead is converted before scheduled actions that are associated with that record finish, Salesforce still executes the scheduled actions.

Process Builder Accessibility Considerations

Process Builder is 508-compliant, with one exception.

You can close modal dialogs using the ESC key on your keyboard, but you can’t close side panels by using the ESC key.

Tip: You can change the order of criteria nodes in your process.

- To select criteria nodes, press Space.
- To change the order of a criteria node, use the up and down arrows.
- To save your changes, press Space.
- To cancel, press ESC.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions
Change Sets and Packaging Considerations for Processes

Keep these considerations in mind when deploying processes.

- The Metadata API allows you to deploy processes to another organization. However, keep in mind that:
  - If the process already exists in the target organization, it must be inactive or it won't deploy.
  - If the process doesn't exist in the target organization, it will deploy with an inactive status regardless of its status in the source organization.
- If a process is deployed to another organization in a managed package, you can only activate it or deactivate it. You can't view or edit the process.
- If you deploy a process through the Metadata API or change sets and the process contains any of the following actions, packageable components that they reference aren't included in the package or change set automatically. To deploy successfully, manually add those referenced components to the package or change set.
  - Apex
  - Email Alerts
  - Launch a Flow
  - Post to Chatter
  - Quick Actions
  - Submit for Approval

Process Formula Limitations

Formulas that are used as conditions in a criteria node have some limitations. If a process contains an invalid formula, you can't save or activate the process.

All formulas that are used in a criteria node must:

- Return true or false. If the formula returns true, the associated actions are executed.
- Not contain more than 3,000 characters.
- Not contain an unsupported function.

Tip: Parentheses aren't included automatically when you insert a function. Be sure to add parentheses, for example, TODAY(), when building a formula.

Unsupported Functions

If a formula in a process uses any of the following functions, the formula will return null.

- GETRECORDIDS
- IMAGE
- INCLUDE
- PARENTGROUPVAL
- PREVGROUPVAL
- REQUIRE SCRIPT
- VLOOKUP

For a complete list of operators and functions for building formulas in Salesforce, see Formula Operators and Functions on page 4106.
Note:

- If your process criteria uses a formula, don’t create a formula that always evaluates to true, such as $2 < 5$.
- ISCHANGED is available as both a formula function and as an operator. When it’s used as a formula function in process criteria, you can’t reference a child record’s related fields. For example, ISCHANGED isn’t supported when referencing a `[Case].Contact.AccountId` field, but it can be used when referencing `[Case].ContactId`.

SEE ALSO:
- Tips for Working with Picklist and Multi-Select Picklist Formula Fields
- Process Builder Advanced Option Considerations
- Tips for Working with Picklist and Multi-Select Picklist Formula Fields

Process Activation Considerations

Before you activate a process, understand when processes start evaluating records.

- After you activate a process, you can no longer edit that process.
- Salesforce processes rules in the following order:
  1. Validation rules
  2. Assignment rules
  3. Auto-response rules
  4. Workflow rules and processes (and their immediate actions)
  5. Escalation rules
- Because updates to records based on processes don’t trigger validation rules, processes can invalidate previously valid fields.
- Processes start automatically and are invisible to the user.
- Saving or creating records can trigger more than one process.

When Do Processes Start Evaluating Records?

- Processes can evaluate a record anytime a record is saved or created. However, processes that are created after records are saved don’t evaluate those records retroactively.
- Processes can evaluate records up to five times in a single transaction if another process, workflow rule, or flow updates the record in the same transaction. See Reevaluate Records in the Process Builder on page 4221 for more details.
- Processes are triggered when a standard object in a master-detail relationship is re-parented.
- Processes only evaluate converted leads if validation and triggers for lead convert are enabled in your organization.
- Processes evaluate changes made to records while using Connect Offline when users synchronize.
- In a batch update, processes are only retriggered on the entities where there is a change.
- The following actions don’t trigger processes:
  - Mass replacing picklist values
  - Mass updating address fields
  - Mass updating divisions
  - Changing the territory assignments of accounts and opportunities
  - Deactivating Self-Service Portal, Customer Portal, or partner portal users
Process Builder Error Messages

Error or warning messages might refer to a “flow” instead of a “process.” Those messages still apply to your process.

Keep these considerations in mind when errors occur.

- If you create or edit a person account and your process uses an account field value (for example, `Account.Name Equals Acme`), users might see this error. “Workflow Action Failed to Trigger Flow: The record couldn’t be saved because it failed to trigger a flow.” You can deactivate your process to avoid this error.

- A reference field contains an ID value that points to a unique record on another object. Errors occur if that ID value isn’t set. For example:
  - Your process has a “Post to Chatter” action with a message that references an account name related to a contact record. A new contact for account `{Contact}.Account.Name` was created. If the ID value for the account reference field on the contact record isn’t set, an error occurs when the process runs.
  - Your process criteria checks whether the Name field on an account related to a contact record equals “Acme” `([Contact].Account.Name Equals Acme)`). If a user creates a contact record (related to an account) without setting the ID value, an error occurs. In this case, you can avoid the error by adding an additional filter condition above `([Contact].Account.Name Equals Acme)` as follows: `([Contact].AccountId Is null False`.

- If your process criteria evaluates a lookup relationship field and that field value is empty, the process may fail.
  For example, your process evaluates a custom lookup relationship field that references the status of a custom bug record related to a case. If the bug’s status field is empty, the process fails and stops evaluating any remaining fields in the order listed in your process criteria. The process correctly evaluates the same lookup relationship field if you use an equivalent formula in your process criteria. If your process criteria doesn’t use a formula, we recommend checking for `isNull` when referencing fields that traverse multiple related records.

Setting Values in the Process Builder

Throughout the Process Builder, you need to set values, for example, to set conditions in a criteria node, to set the fields on a new case in a Create a Record action, or to specify an Apex method to reference.

**Field Picker**

Use the field picker to reference fields on the record that started the process or fields on related records.
Process Builder Value Types
When setting a value for a given field—whether on the record that started the process or a related record—the available value types are filtered based on the field that you’ve selected.

Multi-Select Picklists in the Process Builder
The Process Builder lets you select multiple values for a multi-select picklist field.

Setting Advanced Options in the Process Builder
The Process Builder allows you to choose some advanced options for executing actions in your processes.

Field Picker
Use the field picker to reference fields on the record that started the process or fields on related records.

To use fields on a related record, click a field with an arrow next to the value. For example, use the Account ID field value on the case’s contact’s account.

The field picker displays only fields that are compatible with what’s selected for Field or Flow and Apex Variables.

Process Builder Value Types
When setting a value for a given field—whether on the record that started the process or a related record—the available value types are filtered based on the field that you’ve selected.

The available value types are:

- **Currency**—manually enter a currency value.
- **Boolean**—choose a true/false boolean value.
- **DateTime** or **Date**—manually enter a date/time or date value.
- **Formula**—create a formula expression.
- **Global Constant**—choose a global constant to set a value to null or an empty string—for example, choose $GlobalConstant.Null.
- **ID**—manually enter a Salesforce ID value, for example, 00300000003T2PGAA0.

**Note:** If your process is based on a user ID (for example, when an [Event].OwnerId equals a specific ID value) make sure that the ID value is an 18-character ID and not a 15-character ID. You can convert a 15-character ID to 18 characters at www.adminbooster.com/tool/15to18.
MultiPicklist—choose one or more multi-select picklist values.
Number—manually enter a number value.
Picklist—choose a picklist value.
Reference—choose a field on the record or on a related record.
String—manually enter a string value.

Note: These global constant values aren’t supported with the “is null” operator.

- $GlobalConstant.Null
- $GlobalConstant.EmptyString

Multi-Select Picklists in the Process Builder

The Process Builder lets you select multiple values for a multi-select picklist field.

For example, set multiple values for the Country field for a company record that operates in Ireland, the UK, and France.

You can use multi-select picklists in:

- Formulas
- Process criteria
- Create a Record actions
- Quick Actions
- Update Records actions

In process criteria, set multiple values by creating one condition for each individual multi-select picklist value. For example, if your process checks whether changes were made to an account’s office locations, reference multiple values by choosing the same field for each multi-select picklist value.

Refer to Tips for Working with Picklist and Multi-Select Picklist Formula Fields for more information.

When you reference a multi-select picklist field in an action, enter values by clicking Choose values…

Add or remove values by dragging them between the Available (1) and Selected (2) columns.
Keep these considerations in mind when using operators with multi-select picklists.

- You can use the Equals operator if you select only one value from a multi-select picklist field.
- If you use the Equals operator with multiple multi-select picklist values and choose the **Any of the conditions are met (OR)** option, the condition matches on one value only. For example, if your process checks whether a Region field equals West or East, the condition evaluates to true when the value is West or when the value is East, but won’t evaluate to true when both West and East are selected values.
- If you use **Contains** and **OR** to evaluate multiple multi-select picklist values, the condition evaluates to true on multiple values. For example, if your process checks whether a Region field contains West or East, the condition evaluates to true when a Region field contains West and East or when a Region field contains West or East values.

### Setting Advanced Options in the Process Builder

The Process Builder allows you to choose some advanced options for executing actions in your processes.

Choose these options by expanding the **Advanced** area of the side panel when you:

- Add objects to your process
- Add criteria to your process

**Process Builder Advanced Option Considerations**

Keep these considerations in mind when choosing advanced options.

**Reevaluate Records in the Process Builder**

When you add objects to your process, you can choose to evaluate a record multiple times in a single transaction.

**Avoid Unwanted Actions in Processes**

When you add criteria to your process, you can choose to execute actions only when specified criteria changes.
Process Builder Advanced Option Considerations

Keep these considerations in mind when choosing advanced options.

- Avoid creating an infinite loop when allowing your process to reevaluate records. For example, if your process checks whether an account description changes and then updates an account description and creates a Chatter post every time an account record is created or edited, the process will evaluate and trigger actions resulting in six Chatter posts.

- If you choose to evaluate a record multiple times in a single transaction when you specify an object for your process, we recommend not setting any of your criteria to No criteria—just execute the actions!

- We recommend that you don’t use the advanced options if your process uses ISCHANGED, ISNEW, or PRIORVALUE formula functions. If you do use these options, keep these considerations in mind.

  - When a record is first created, ISNEW evaluates to true throughout a process transaction. If your process uses the ISNEW formula function and reevaluates a record multiple times in a single transaction, the process may execute actions multiple times.

    For example, your process checks whether an account is created or updated.

    1. When ISNEW evaluates to true, the process updates the account’s annual revenue and posts to Chatter.

    2. When the process updates the account’s annual revenue, the process then reevaluates the record (up to five additional times) because the record was changed.

    Each time the criteria is evaluated, ISNEW evaluates to true. The result is six Chatter posts. This example is true only if the process is triggered because an account record is created.

  - When a record is created, PRIORVALUE returns the current value as the prior value. When a record is updated, PRIORVALUE returns the field value that was set immediately before the transaction started. If your process uses the PRIORVALUE formula function and reevaluates a record multiple times in a single transaction, the process may execute actions multiple times. If your process reevaluates a record multiple times in a single transaction and executes actions only when specified criteria changes, the prior value returns the values that existed before the record was saved.

    For example, your process checks whether an account is created or updated.

    1. When PRIORVALUE([Account].Type) = 'Prospect' evaluates to true, the process updates the account’s annual revenue and posts to Chatter.

    2. When an account is created with Prospect as the account type, the criteria is always true until the end of the process transaction.

    3. If the process is changed to update the account type to Other when the criteria is true, then for an account created with Prospect as the account type, the formula PRIORVALUE([Account].Type) = 'Prospect' will be true until the end of the process transaction.

    Each time the record is reevaluated, the prior value of the account’s type is Prospect. The result is six Chatter posts.

  - ISCHANGED always evaluates to false when a record is first created.

    For example, your process checks whether an account description changes—ISCHANGED([Account].Description)—and the process also reevaluates records multiple times in a single transaction. If an account is first created with a blank description value and another process updates the account description in the same transaction, ISCHANGED evaluates to true every time the record is reevaluated because it compares the account description value when the record was first created (a blank value) with whatever’s set for the current value.

    Let’s say this same process creates a Chatter post every time ISCHANGED([Account].Description) evaluates to true. This process would create a recursive loop resulting in six Chatter posts because ISCHANGED evaluates to true throughout the transaction.
**Reevaluate Records in the Process Builder**

When you add objects to your process, you can choose to evaluate a record multiple times in a single transaction.

It's kind of like using a roundabout instead of a four-way stop to control process traffic. Instead of stopping and waiting for separate transactions, this option helps your business traffic flow a little more freely.

If you choose this option, the process can evaluate the same record up to five additional times in a single transaction. It might reevaluate the record because a process, workflow rule, or flow updated the record in the same transaction.

For example, your sales review process includes multiple steps, approvals, notifications, and fields that need to be updated. Some of these changes may be part of your process, or they may be managed by other workflow rules or flows in your organization. If you allow the Process Builder to reevaluate a record multiple times in a single transaction, you can manage and evaluate all of these changes—even changes from other processes—in a single transaction in your process.

**SEE ALSO:**
- [Process Builder Advanced Option Considerations](#)

**Avoid Unwanted Actions in Processes**

When you add criteria to your process, you can choose to execute actions only when specified criteria changes.

For example, your process sends an email alert whenever a case has an Escalated status. Let's say your support team repeatedly updates the case description with new information. Whenever the case is saved with a new description, your process can check specifically whether the Escalated status changed instead of just repeatedly sending email alerts. This way, the process executes actions only if the status wasn’t set to Escalated and was just changed to Escalated.

**Tip:** Check out this short video [Avoid Unwanted Actions in Your Process](#) to learn more about this option.

This setting isn’t supported if:

- Your process starts only when a record is created.
- Your process starts when a record is created or edited and the criteria node doesn’t evaluate any criteria.
- The criteria node evaluates a formula, but the formula doesn’t include a reference to the record that started the process.
- Your process uses the `Is changed` operator in a filter condition.

<table>
<thead>
<tr>
<th>If Yes is...</th>
<th>Actions are executed if...</th>
<th>Actions are not executed if...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Selected</td>
<td>The record was created.</td>
<td>The record’s current values meet the conditions, and the record’s most recent previous values did not meet the conditions.</td>
</tr>
<tr>

Process Builder Advanced Option Considerations

Create a Process
To create a process, define its properties and which records it should evaluate, and then add criteria nodes and actions.

1. **Define the Process Properties**
   Define the process properties to uniquely identify and help you manage your processes.

2. **Identify Which Records to Evaluate**
   Associate the process with an object, and specify when to start the process.

3. **Add Process Criteria**
   Define the criteria that must be true before the process can execute the associated actions.

4. **Add Actions to Your Process**
   After you’ve defined a criteria node, define the actions that are executed when the criteria are met.

5. **Execute Actions on More Than One Criteria**
   Choose whether to stop or continue your process after specific criteria are met and associated actions execute.
Define the Process Properties

Define the process properties to uniquely identify and help you manage your processes.

1. From Setup, enter Process Builder in the Quick Find box, select Process Builder, and then click New.

   You can also modify an existing active process by cloning a new inactive copy of it. The copy can be a new process or a new version of the current process.

2. Fill out these fields to define your process.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Name</td>
<td>The name for your process. Process Name must be 255 characters or fewer.</td>
</tr>
<tr>
<td></td>
<td>This name appears in the process management page (from Setup, this page is located by entering Process Builder in the Quick Find box, then selecting Process Builder), so consider naming your process so that you can differentiate it from other processes.</td>
</tr>
<tr>
<td>API Name</td>
<td>The name that’s used by the API and managed packages. API Name must be 79 characters or fewer.</td>
</tr>
<tr>
<td></td>
<td>This name must be unique across all processes and flows. (In flows, this field is Unique Name.) The name must begin with a letter and use only alphanumeric characters and underscores. It can’t include spaces, end with an underscore, or have two consecutive underscores. After it’s saved, API Name can’t be changed for the process.</td>
</tr>
<tr>
<td>Description</td>
<td>Optional. A description for your process.</td>
</tr>
<tr>
<td></td>
<td>The description also appears in the process management page and is intended to help you differentiate between processes, such as to understand what the process does and when.</td>
</tr>
</tbody>
</table>

3. Click Save.
Identify Which Records to Evaluate

Associate the process with an object, and specify when to start the process.

1. Click Add Object.

2. For Object, choose the object that you want to base this process on. Click Find an object... to open the drop-down list and type to filter the list. After you save this panel, you can't change the selected object.

3. Select when you need the process to start.

<table>
<thead>
<tr>
<th>If you want the process to start every time that...</th>
<th>Select</th>
</tr>
</thead>
<tbody>
<tr>
<td>A record of the specified object type is created but not updated.</td>
<td>only when a record is created</td>
</tr>
<tr>
<td>A record of the specified object type is created or updated.</td>
<td>when a record is created or edited</td>
</tr>
</tbody>
</table>

Note: If you're familiar with workflow rules and you're wondering what happened to the third option ("created, and any time it's edited to subsequently meet criteria"), don't worry! You'll get to that setting when you add criteria nodes if you select "when a record is created or edited" here.

4. To choose whether you want the process to evaluate a record multiple times in a single transaction, expand the Advanced area. If you select yes, the process can evaluate the same record up to five additional times in a single transaction. It might reevaluate the record because a process, workflow rule, or flow updated the record in the same transaction. See Reevaluate Records in the Process Builder on page 4221 for more information.

5. Click Save.
Add Process Criteria

Define the criteria that must be true before the process can execute the associated actions. When criteria are met, the process executes the associated action group. When criteria aren’t met, the process skips the action group and evaluates the criteria for the next action group.

1. Click Add Criteria.

2. Enter a name for this criteria node.
   The name appears on the canvas, so use a name that helps you differentiate between other criteria nodes.

3. Select the type of criteria that you need to define. This selection determines which fields appear later in the dialog box.

   **If you need...**

   **Select**

   The record to have certain field values.

   Conditions are met

   For example, to execute the associated actions on opportunity records with an amount greater than $5,000, set the filter to:

   `[Opportunity].Amount greater than $5000.00`

   To evaluate the record by using a formula.

   Formula evaluates to true

   For example, to execute the associated actions on accounts whose annual revenue is over $1,000,000 when the account is changed by someone other than the owner, use this formula.

   ```
   AND (([Account].LastModifiedBy.Id <> [Account].Owner.Id) , ([Account].AnnualRevenue > 1000000) )
   ```

   To simply execute the associated actions without evaluating the record.

   No criteria—just execute the actions!

   The process executes all the actions that are associated with this criteria node and, unless you specify otherwise, doesn’t evaluate any remaining criteria nodes in the process. If you choose to stop your process after executing these actions, we recommend choosing this option for only the last criteria node in your process.

4. If you selected “Conditions are met”:
   a. Define the filter conditions by identifying the field values that the process needs to evaluate.

      **Field**

      Select the field whose value you want to evaluate. You can also evaluate values for records that are related to the one that started the process. To do so, click on a related record with next to the ID field.

      For example, if a contact record started the process, you can evaluate the value for the contact’s Annual Revenue field. To access that field, click Account Id next to the annual revenue field.
The available operators depend on the field’s data type.

The available value types depend on the field’s data type.

Identify the value that you want to evaluate the field for. See Setting Values in the Process Builder on page 4216 for details.

b. For **Conditions**, identify which conditions must be true for the process to execute the associated actions.

If you choose to use custom logic, enter a text string using:

- Numbers to refer to each condition
- AND or OR to identify whether all or just one of the conditions must true
- Parentheses to group parts of the string together

For example, if you enter 1 AND (2 OR 3), the outcome evaluates to true if the first condition is true and either the second or third outcome is true. The maximum length of the condition logic text is 1000 characters as per Flow restrictions.

**Note:** Ambiguous logic separated by a parentheses may not cause a validation error. For example:

- 1 AND 2 OR 3 results in an error
- 1 AND (2 AND 3) OR 4 doesn't result in an error

Avoid creating ambiguous custom logic when grouping parts of a string or you may see unexpected results.

5. If you selected “Formula evaluates to true,” define the formula.

6. Optionally, to specify whether you want to execute the actions only if the record was created or edited to meet criteria, click **Advanced** at the bottom of the panel. For details, see Avoid Unwanted Actions in Processes on page 4221.

**Note:** This setting is available only if the process starts when a record is created or edited and you selected “Filter conditions are met” or “Formula evaluates to true.”

7. Click **Save**.

SEE ALSO:

Execute Actions on More Than One Criteria
Add Actions to Your Process

After you’ve defined a criteria node, define the actions that are executed when the criteria are met. An action group can consist of a combination of immediate and scheduled actions. Immediate actions are executed when evaluation criteria are met. Scheduled actions are executed at a specified time. For example, Salesforce can automatically send an email reminder to the account team if a high-value opportunity is still open ten days before the specified close date.

Before you begin, consider whether you want this action to be executed immediately or at a specific time. If you want to execute the action at a specific time, identify when those actions should be executed.

1. Click **Add Action**.
2. Select the type of action to create, and then fill out the fields to define the action.

- **Create a Record from a Process**
  Create a record by manually entering values or by using the values of related records.

- **Create a Chatter Post from a Process**
  Post to the feed of a user, a Chatter group, or the record that started the process.

- **Use a Quick Action from a Process**
  Create a record, update a record, or log a call by using a quick action that you or another administrator created for your organization.

- **Launch a Flow from a Process**
  Start an autolaunched flow from your process to automate complex business processes—create flows to perform logic and have events trigger the flows via processes—without writing code.

- **Send an Email from a Process**
  Easily send an email from a process by using an email alert. Email alerts are configured outside of the Process Builder and contain the standard text, list of recipients, and template for an email.

- **Submit a Record for Approval from a Process**
  Submit the record that started the process for approval.

- **Update Records from a Process**
  Update one or more records—that are related to the record that started the process—by manually entering values or by using the values from related records.

- **Call Apex Code from a Process**
  Add customized functionality to your process by calling Apex from the process.
Specify When Your Actions Should Execute

If you want some actions to be executed at a specific time, first define the schedule for those actions.

**Note:** Scheduled actions are complex features. See Scheduled Actions Considerations for more details.

Each action group that supports scheduled actions can have multiple schedules. For example, you can schedule some actions to be executed one day from now and other actions to be executed three days from now.

To identify when an action group’s scheduled actions should be executed:

1. In an action group that supports scheduled actions, click **Set Schedule**.
2. If you need to schedule actions based on a date/time field on the record that started the process:
   a. Leave the first radio button selected.
   b. Click the drop-down list on the right side of the panel, and select the date that you want to use to schedule the action.
      For example, if your process is based on an account record, choose the account’s Created Date.
   c. Specify a number of days or hours before or after the field.
      If the criteria for this action group are still met when this time occurs, Salesforce executes the scheduled actions.
3. If you need to schedule actions to be executed a certain number of days or hours from when the process is executed:
   a. Select the second radio button.
   b. Specify the number of days or hours from when the process is executed.
      If the criteria for this action group are still met when this time occurs, Salesforce executes the scheduled actions.
4. Click **Save**.
Create a Record from a Process

Create a record by manually entering values or by using the values of related records.

After you’ve created an action and selected “Create a Record” for the type, fill in the relevant fields to add the action to your process. The new record’s `Created By` field will be set to the user who started the process—by creating or editing a record.

**Warning:** If you create processes to replace any workflow rules, make sure you delete those workflow rules when you activate the equivalent processes. Otherwise, both workflow rules and processes will fire and cause unexpected results, such as overwritten records or redundant email messages. Do the same if you create processes to replace any Apex triggers.

1. **Enter a name for this action.**
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. **For Record Type, select the object that you want to create a record for.** To filter the drop-down list, type the name of the object to filter the drop-down list.

   When you select an object, at least one row appears to allow you to set field values for the new record.

   **Warning:** Rows appear automatically for fields that are required by the API. You might need to provide values for other fields. We recommend that you refer to your organization’s page layouts to determine which fields are required.

3. **Set the record’s field values.**

<table>
<thead>
<tr>
<th>Field</th>
<th>Select the field whose value you want to set. To filter the drop-down list, type the name of the field.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the type of value that you want to use. The available types depend on the field that you’ve selected.</td>
</tr>
<tr>
<td>Value</td>
<td>Set a value for the field. by using the text entry field to manually enter a value or the field picker to use a field value from a related record. See Setting Values in the Process Builder on page 4216 for details.</td>
</tr>
</tbody>
</table>

4. **Click Save.**

   **Tip:**
   - If you set up your process to create an account record, `Name` appears as a required field. If you want to create a person account, you can add `LastName` as a field but it won’t appear as required by default. You can enter a dummy value for the `Name` field.
   - When you create a record, required fields normally appear at the top of the list. However, if you save a Create a Record action, close the process, and then re-open the action, required fields may not appear in the normal order.
Create a Chatter Post from a Process

Post to the feed of a user, a Chatter group, or the record that started the process.
This action is available only if your organization has Chatter enabled.

Post to a User’s Chatter Feed from a Process
Post to the feed of a user by identifying a specific user in your organization or a User lookup field on a record.

Post to a Chatter Group from a Process
Post to the feed of a specific Chatter group.

Post to a Record’s Chatter Feed from a Process
Post to the feed of the record that started the process.

SEE ALSO:
Chatter Settings
Process Chatter Considerations

Post to a User’s Chatter Feed from a Process
Post to the feed of a user by identifying a specific user in your organization or a User lookup field on a record.

After you’ve created an action and selected “Post to Chatter” for the action type, fill in the relevant fields to add the action to your process. The feed item will appear as if the user who started the process—by creating or editing a record—created the post.

⚠️ Warning: If the feed that the process tries to post to isn’t available when the process is triggered (for example, because the user is now inactive), the user sees an error and the process fails.

1. Enter a name for this action.
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. In the Post to field, select User.
3. For User, select where you want to find the user.
4. Based on your selection for User, search for or browse for the user whose feed you want to post to.
   When you select a user from a record, you must ultimately select a field that contains a user’s ID—for example, Owner ID or User ID.

5. Fill out the message that you want to post. You can insert merge fields, add a topic, and mention users or groups.
   The message can contain up to 10,000 characters.
   You can only reference topics that already exist. If you reference a merge field and that field doesn’t have a value, it appears as a blank value.
6. Click **Save**.

SEE ALSO:

- Chatter Settings

Post to a Chatter Group from a Process

Post to the feed of a specific Chatter group.

After you've created an action and selected “Post to Chatter” for the action type, fill in the relevant fields to add the action to your process. The feed item will appear as if the user who started the process—by creating or editing a record—created the post.

⚠️ **Warning**: If the feed that the process tries to post to isn’t available when the process is triggered, the user sees an error and the process fails.

1. Enter a name for this action.

   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. In the **Post to** field, select Chatter Group.

3. For **Group**, search for the Chatter group whose feed you want to post to.

4. Fill out the message that you want to post. You can insert merge fields, add a topic, and mention users or groups.

   The message can contain up to 10,000 characters.

   You can only reference topics that already exist. If you reference a merge field and that field doesn’t have a value, it appears as a blank value.

5. Click **Save**.

SEE ALSO:

- Chatter Settings
Post to a Record’s Chatter Feed from a Process

Post to the feed of the record that started the process.

You can post to the record’s Chatter feed only if feed tracking is enabled for the object that the process is associated with. The feed item will appear as if the user who started the process—by creating or editing a record—created the post.

After you’ve created an action and selected “Post to Chatter” for the action type, fill in the relevant fields to add the action to your process.

⚠️ Warning: If the feed that the process tries to post to isn’t available when the process is triggered (for example, because the user is now inactive), the user sees an error and the process fails.

1. Enter a name for this action.
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. In the Post to field, select This Record.

3. Fill out the message that you want to post. You can insert merge fields, add a topic, and mention users or groups.
   The message can contain up to 10,000 characters.
   You can only reference topics that already exist. If you reference a merge field and that field doesn’t have a value, it appears as a blank value.

4. Click Save.

SEE ALSO:
   Chatter Settings
Use a Quick Action from a Process

Create a record, update a record, or log a call by using a quick action that you or another administrator created for your organization.

Quick actions can be object-specific or global actions. Only “Create,” “Update,” and “Log a Call” actions are supported. To use a quick action from a process, the action must exist in your organization.

If your organization is using quick actions to help your users more easily create and update records, you can also use those actions in your process. When you use these quick actions in a process, you can only set values for fields that are part of the action’s layout. If you don’t already have one of these actions created, see Create Global Quick Actions on page 4729 or Create Object-Specific Quick Actions on page 4731 for details.

After you’ve created an action and selected “Quick Actions” for the type, fill in the relevant fields to add the action to your process. The new or updated record will appear as if the user who started the process—by creating or editing a record—created or updated it.

1. Enter a name for this action.
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. Filter to specify the kind of action you want to use.

<table>
<thead>
<tr>
<th>Filter Search By</th>
<th>Lets You Search Through</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global actions</td>
<td>All global actions in your organization. You then filter even further by selecting the Type of actions that you need to search through.</td>
</tr>
<tr>
<td>Object</td>
<td>All object-specific actions in your organization that are associated with a certain Object Name. Global actions can’t be filtered by object.</td>
</tr>
<tr>
<td>Type</td>
<td>All object-specific and global actions in your organization based on the type, such as Create a Record or Log a Call.</td>
</tr>
</tbody>
</table>

- If you selected Global actions or Type, for Type select the specific type of quick action that you want to use.
- If you selected Object, for Object search for and select the object that you want to filter by.

3. For Action, search for and select the action that you want to use.

4. Set field values for the action.
   Rows that appear automatically represent the action’s required fields. To set values for the action’s optional fields, add rows.

<table>
<thead>
<tr>
<th>Field</th>
<th>Select the field whose value you want to set. To filter the drop-down list, type the name of the field. You can set values for fields that are included in the action’s layout only.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type</td>
<td>Select the type of value that you want to use. The available types depend on the field that you’ve selected.</td>
</tr>
<tr>
<td>Value</td>
<td>Set a value for the field. by using the text entry field to manually enter a value or the field picker to use a field value from a related record. See Setting Values in the Process Builder on page 4216 for details.</td>
</tr>
</tbody>
</table>
5. Click Save.

**Launch a Flow from a Process**

Start an autolaunched flow from your process to automate complex business processes—create flows to perform logic and have events trigger the flows via processes—without writing code.

In order to launch a flow from a process, you must create and activate the flow. The flow must be autolaunched. For details, see Create a Flow on page 4352.

1. Enter a name for this action.
   
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For Flow, search for and select the flow that you want to launch from this process.
   
   Only active, autolaunched flows are available.

3. Optionally, click Add Row to set values for the flow's variables.

| Flow Variable | Start typing the name of the flow variable whose value you want to set, or click ▼ to select a flow variable from the drop-down list. You can set values for any variables in the flow that have Input/Output Type set to Input Only or Input and Output.
| Type          | Select the type of value that you want to set. For example, select String to manually enter the values for a Text collection variable, or select Reference to use the value of a record for an sObject variable.
| Value         | Set a value for the flow variable.
|              | • For collection variables, use the text entry field to specify a value. The value must match the collection variable’s data type.
|              | • For sObject variables, use the field picker to select an ID field. The ID must correspond to a record whose object type matches the sObject variable’s object type.
|              | • For sObject collection variables, use the field picker to select a related list. The selected records' object type must match the sObject collection variable’s object type. For example, populate an sObject collection variable with all child contact records associated with the account that started the process.

**Note:** If the related list is empty when the flow tries to populate the sObject collection variable with field values from those records, the process fails.

4. Click Save.
Send an Email from a Process

Easily send an email from a process by using an email alert. Email alerts are configured outside of the Process Builder and contain the standard text, list of recipients, and template for an email.

To send an email from a process, you must create the email alert on page 4481.

You can use only email alerts that are associated with the same object that the process is associated with. The record that started the process is used as the starting point for any merge fields that are used in the email alert.

After you’ve created an action and selected “Email Alerts” for the type, fill in the relevant fields to add the action to your process.

1. Enter a name for this action.
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For Email Alert, type two or more letters to search for the email alert that you want to use to send an email.

3. Click Save.

Submit a Record for Approval from a Process

Submit the record that started the process for approval.

After you’ve created an action and selected “Submit for Approval” for the type, fill in the relevant fields to add the action to your process.

Only the record that started the process will be submitted. You can’t submit any related records for approval.

1. Enter a name for this action.
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For Approval Process, indicate whether you need to submit the record through the default approval process or through a specific approval process.
   The process fails if:
   - The record is submitted to the default approval process, and there are no active approval processes for the record’s object type.
   - The record is submitted to the default approval process, and it doesn’t meet the criteria for any of the approval processes for the record’s object type.
   - The record is submitted to a specific approval process, and it doesn’t meet the entry criteria.

3. If you need to submit the record to a specific approval process:
   a. Search for and select the approval process.
   b. Indicate whether you need to skip the entry criteria for the approval process.

4. For Submitter, identify who should receive notifications about the approval request.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Current User</td>
<td>The user who triggered the process by creating or editing a record.</td>
</tr>
</tbody>
</table>
If the submitter isn’t an allowed initial submitter on the approval process that runs, the process fails. Make sure that the initial submitters for the approval processes that are related to this object include all users who could trigger this process. For details about setting the initial submitters for an approval process, see Create an Approval Process with the Standard Wizard on page 4282.

5. If necessary, enter submission comments.
   Submission comments appear in the approval history for the specified record. This text also appears in the initial approval request email if the template uses the {!ApprovalRequest.Comments} merge field.

6. Click Save.

**Update Records from a Process**

Update one or more records—that are related to the record that started the process—by manually entering values or by using the values from related records.

After you’ve created an action and selected “Update Records” for the action type, fill in the relevant fields to add the action to your process. The records’ Last Modified By field will be set to the user who started the process—by creating or editing a record.

1. Enter a name for this action.
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. For Record Type, select the record or records that you need to update, and then click Choose.
   You can update only the record that started the process or records that are related to it. For example, you can reference [Case].ContactId, but not [Case].Contact.AccountId.

   • To update the record that started the process, click the appropriate radio button. For example, if your process is based on a case record, click next to Select the Case record that started your process.
To update a record that’s related to the record that started the process, click the appropriate radio button and select one of the field names in the drop-down list.

If you select a field that ends in “ID,” you’re selecting a single record. This field name corresponds to a lookup field on the original record. For details on lookup fields, see Custom Field Types on page 4001.

For example, if a case record started the process and you select Account Id, this action updates the account that’s associated with the case.

If you select a plural item that doesn’t end in “ID,” you’re updating all the records of that object type that are related to the record that started the process. This plural item corresponds to child records of the original record, which might appear in a related list on the original record.

For example, if you select CaseComments, this action updates all the case comments that are related to the case.
To update fields on a related record, click on a field with a next to it (ending in “ID”) to access that record’s fields. For example, let’s say that, for a process that evaluates a case record (1), you want to update all contacts that are related to the case’s parent account. Click Account ID (2), then Contacts (3), and then Choose.

3. Optionally, specify conditions to filter the records you’re updating. For example, if your process updates the status of a parent case, specify conditions so that you won’t update the parent case if its status is set to On Hold.

**Note:** When you define conditions for updating records, you can’t use filter logic (such as OR) or reference a child record’s related fields. For example, you can reference 

<table>
<thead>
<tr>
<th>Field</th>
<th>Select the field whose value you want to evaluate.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Operator</td>
<td>The available operators depend on the field’s data type.</td>
</tr>
<tr>
<td>Type</td>
<td>The available value types depend on the field’s data type. See Process Builder Value Types on page 4217 for details.</td>
</tr>
<tr>
<td>Value</td>
<td>Identify the value that you want to evaluate the field for.</td>
</tr>
</tbody>
</table>
For example, if your process updates account records, you can choose to update only accounts with an annual revenue (1) greater than (2) $1,000,000 (3).

4. Specify the new field values.

   **Field**  Select the field whose value you want to set. To filter the drop-down list, type the name of the field.
   You can assign values to fields only on the record or records that you identified in the **Object** field. Use a separate Update Records action to update fields on related records.

   **Type**  Select the type of value that you want to use. The available types depend on the field that you’ve selected.

   **Value**  Set a value for the field. For example, if you select a Formula value type, click **Build a formula...** to create a formula value for the field.

5. Click **Save**.

**Call Apex Code from a Process**

Add customized functionality to your process by calling Apex from the process.

After you’ve created an action and selected “Apex” for the type, fill in the relevant fields to add the action to your process.

**Important:** To use this action in a process, your developer needs to annotate one of the class’s methods with **@InvocableMethod**. For details, see “InvocableMethod Annotation” in the Force.com Apex Code Developer’s Guide.

The Apex class and the process are executed by the user whose action triggered the process.

1. Enter a name for this action.
   This text appears on the canvas and helps you differentiate this action from others in your process. The name is truncated to fit on the canvas.

2. Choose an Apex class by entering the name of the Apex class to filter results or select an Apex class from the drop-down list.

3. If the class includes an invocable variable, you can manually enter values or reference field values from a related record.
The value must match the variable’s data type. You can set values for SObject and primitive type list variables only.

   - To set values for SObject variables and SObject list values, reference an object’s related records, for example, all child contact records associated with the Account object that started the process.
To set a value for a primitive list variable (String, Integer, Time, and so on), select the String value type and enter a value in the text input field. You can’t pass multiple values to lists.

4. Click Save.

Note: If you define an Apex action in your process and then modify the Apex class by adding a standard field reference (for example, User.Phone), the Apex action is no longer visible in the process and must be re-added.

Execute Actions on More Than One Criteria

Choose whether to stop or continue your process after specific criteria are met and associated actions execute.

For each criteria and associated action group, you can choose whether to stop the process after actions execute or continue evaluating the next defined criteria.

1. Make sure you’ve defined the next criteria and that your action group includes only immediate actions. You can’t evaluate the next criteria when an action group contains scheduled actions.

2. To change what happens after actions execute, click STOP (1) or EVALUATE THE NEXT CRITERIA (2). Initially, each action group is set to stop after executing actions.

3. Save your changes, and your choice appears on the canvas.
Process Management

The Process Builder allows you to see and manage all your processes in one place. To manage a process, from Setup, enter Process Builder in the Quick Find box, then select Process Builder.

From the process management page, you can:

- Create a process
- Edit a process
- Delete an inactive process
- See the status of your existing processes
- Sort your processes by name, description, object, last modified date, or status

Note: If you create a Salesforce Knowledge Article Type object and use that object to trigger a process, the object name doesn’t display on the process management page.

When you open a process, you can:

- Clone the process
- Activate or deactivate the process
- Edit the process properties

From the Paused and Waiting Interviews list on the flow management page, you can:

- Monitor scheduled actions that haven’t yet been executed
- Delete groups of scheduled actions that you no longer need to wait for

Process Status

Each process has a status that determines whether the process can be edited, activated, or deleted.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>Editable?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active</td>
<td>The process has been activated.</td>
<td>No</td>
</tr>
<tr>
<td></td>
<td>You can’t make changes to an active process. However, you can clone it. Make any necessary changes to the cloned process and then activate it. Don’t forget to deactivate the original process if appropriate.</td>
<td></td>
</tr>
<tr>
<td>Inactive</td>
<td>The process is inactive and can be activated.</td>
<td>Yes</td>
</tr>
</tbody>
</table>
Clone a Process

If you want to make changes to an existing process, save a clone of that process. You can save the clone as either a new inactive process with its own version history, or as a new inactive version of the existing process.

To make changes to an active process, you have a few options.

- Deactivate it, make changes, and then reactivate it.
- Clone it as an inactive version, make changes, and then activate the new version. The original version is automatically deactivated.
- Clone it as a new inactive process, make changes and then activate it. The original process is not automatically deactivated, so consider whether it’s appropriate for both processes to be active.

You can create up to 50 versions of a process, but only one version of a given process can be active.

1. From Setup, enter Process Builder in the Quick Find box, then select Process Builder.
2. Open the process or process version that you want to activate.
3. Click Clone.
4. You can create a version of the current process or a completely new process with its own version history.
5. Enter a name, API name, and description.
6. Click Save.

Activate a Process

Salesforce doesn’t start using a process to evaluate records as they’re created or edited until you activate it.

After you activate a process, you can no longer edit that process. However, you can click Clone to save the process as a new inactive process.

You can’t activate a process unless it has:

- At least one defined criteria node
- At least one defined immediate or scheduled action

1. From Setup, enter Process Builder in the Quick Find box, then select Process Builder.
2. Open the process or process version that you want to activate.
3. Click Activate.
   - If you activate a version of a process that already has an active version, the previously active version is automatically deactivated. To see that version later, refer to the process’s version history.

After you’ve activated your process, consider creating or editing test records that will start the process to make sure it’s working correctly. If you do, remember to delete those test records or return them to their previous values once you’ve confirmed that your process works as designed.

If you later want Salesforce to stop using a process to evaluate records as they’re created or edited, open the active process and click Deactivate.
Delete a Process Version

If you no longer need to use a process version that you’ve defined, delete it.

To delete an active process, you must first deactivate it. You can’t delete process versions with an Active status. If a process has any scheduled actions, it can’t be deleted until those pending actions have been executed or deleted.

1. From Setup, enter Process Builder in the Quick Find box, then select Process Builder.
2. Click the name of the process whose version you want to delete.
3. For the version that you want to delete, click Delete.
   If your process has only one version and you delete that version, the whole process is deleted.
4. Click OK.

Monitor Your Processes’ Pending Scheduled Actions

To see which of your processes are still waiting to execute scheduled actions, see the Paused and Waiting Interviews list on the flow management page.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
2. Scroll down to the Paused and Waiting Interviews list.
3. Create a view to see scheduled actions in the Paused and Waiting Interviews list. We recommend displaying the following fields.

- Flow Name (1) corresponds to the process’s Process Name.
- Paused Date (2) is the time at which the schedule started for the action group.
- Current Element (3) identifies the group of scheduled actions that Salesforce is waiting to execute.
- Type (4) indicates the type of a paused or waiting interview. Processes that are waiting to execute scheduled actions are of type Workflow.
Current Element displays myWait_myRule_N, where N is the number of the associated criteria and action group. For example, if Current Element displays myWait_myRule_2, Salesforce is waiting to execute the group of scheduled actions that are associated with the second criteria in the process.

SEE ALSO:
Delete Unexecuted Scheduled Actions

Delete Unexecuted Scheduled Actions
If you no longer need to wait for a process’s scheduled actions to be executed—for example, because you need to delete the associated process—you can delete the unexecuted group of scheduled actions.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
   The Waiting Interviews related list displays any unexecuted scheduled actions in your organization, as well as any waiting flow interviews.

2. For each unexecuted group of scheduled actions that you want to delete, click Del.
   You can identify the correct row by the Flow Name field, which corresponds to the process’s Process Name.

SEE ALSO:
Monitor Your Processes’ Pending Scheduled Actions

Troubleshoot Processes
Use the error messages that appear in the Process Builder and the emails you receive when a process fails to help solve problems that arise when you’re working with processes. When all else fails, look at the Apex debug logs for your processes.

Identifying Errors in the Process Builder
The API names for criteria nodes and actions are created in the background. When you create or update processes, you might see error messages that reference those names to help you identify specifically where the problem occurred.

Errors Received after a Process Starts Evaluating a Record
When a user performs an action that triggers a process (such as creating a record) and that process fails, the user sees a page with this error: “Workflow Action Failed to Trigger Flow.” In addition, the administrator who created the process receives an email with more details.

Using Debug Logs to Troubleshoot Processes
Use debug logs to find detailed information about your running processes after they finish running. For example, if a process doesn’t seem to trigger when a record meets the process’s criteria, or if you want to understand the sequence of processes being executed.

SEE ALSO:
Process Builder Error Messages
Identifying Errors in the Process Builder

The API names for criteria nodes and actions are created in the background. When you create or update processes, you might see error messages that reference those names to help you identify specifically where the problem occurred.

<table>
<thead>
<tr>
<th>API Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>myVariable_current.field</td>
<td><em>field</em> is the name of the field that’s referenced. myVariable_current refers to the field values that the record had when it started the process. For example, myVariable_current.Id corresponds to the record’s field value for Id when the record started the process.</td>
</tr>
<tr>
<td>myVariable_old.field</td>
<td><em>field</em> is the name of the field that’s referenced. myVariable_old refers to the most recent previous values of the record that started the process. For example, myVariable_old.Id corresponds to the record’s field value for Id immediately before the record started the process.</td>
</tr>
</tbody>
</table>

**Example:**

The element has an invalid reference to ”myVariable_current.AnnualRevenue”.

myVariable_current.AnnualRevenue refers to the value for the field AnnualRevenue when the record started the process.

**Note:** Error or warning messages might refer to a “flow” instead of a “process.” Those messages still apply to your process.

SEE ALSO: Process Builder Error Messages

Errors Received after a Process Starts Evaluating a Record

When a user performs an action that triggers a process (such as creating a record) and that process fails, the user sees a page with this error: “Workflow Action Failed to Trigger Flow.” In addition, the administrator who created the process receives an email with more details.

The email includes the element that failed, the error message from that failure, and a list of the criteria and actions that were executed in the process. The subject line is Unhandled process fault from Company Name: Process_Name --- Error.

**Example:**

Unhandled process fault from Acme Wireless: LeadConvert: cannot reference converted...

// The error occurred when user 00DD0000000007dHy triggered the
Encountered unhandled fault when running process LeadConvertEmail/301D00000004HxZ exception by user/organization: 00DD00000007dHy/{4}

Error

// The error occurred at the first action (A1) that’s associated with the first criteria node (myRule_1).
An error occurred at element myRule_1_A1.
cannot reference converted lead.

This report lists the elements that the flow interview executed.

Flow Details
Flow Name: LeadConvertEmail
Type: Workflow
Version: 1
Status: ACTIVE

Flow Details
Start time (GMT): Thu Apr 09 21:52:14 GMT 2015
End time (GMT): Not Yet Finished
Duration: 0 seconds

// The process evaluated the first rule and tried to execute its action. The element that the process failed to executed, myRule_1_A1, is an Email Alert action.
Decision: myDecision
Email Alerts: myRule_1_A1

Using Debug Logs to Troubleshoot Processes

Use debug logs to find detailed information about your running processes after they finish running. For example, if a process doesn’t seem to trigger when a record meets the process’s criteria, or if you want to understand the sequence of processes being executed.

Tip: Make sure that your filters include FINER events in the WORKFLOW category. For details, see Debug Log Levels on page 5184.

When using debug logs to troubleshoot a process, consider the following.

- Processes created in the Process Builder appear as flows and workflow rules in debug logs. The generated names have some resemblance to the process names, but they don’t map one-to-one.
- Processes appear as flows of type Workflow.
- Immediate actions that may appear to be executed in a block are strung together in the flow. If one action fails in the middle, then the following actions might not run.
- Scheduled actions are executed after a Wait element. The actions are executed similarly to immediate actions after the process resumes.
- WF_CRITERIA-BEGIN and WF_CRITERIA-END refer to the workflow rule criteria that is always set to true and not the criteria defined in your process.

**Example: Debugging a Process with an Immediate “Apex” Action**

This example covers a process with an immediate “Apex” action.

Here’s what you can tell from this first snippet.

- The process is triggered by a lead with the name “L104”.
- The name of the process is “Apex Say Hello”, which corresponds with the name used in the log "Apex_Say_Hello301xx000000001Y". The number appended to the end of the name is the process version’s ID.
- The process is set to trigger when a record is created or edited (ON_ALL_CHANGES).

```
17:07:29.086 |EXECUTION_STARTED
17:07:29.086 |CODE_UNIT_STARTED|EXTERNAL|Workflow:Lead
17:07:29.113 |WF_RULE_EVAL_BEGIN|Assignment
17:07:29.114 |WF_SPOOL_ACTION_BEGIN|Assignment
17:07:29.114 |WF_ACTION|.17:07:29.114 |WF_RULE_EVAL_END
17:07:29.114 |WF_RULE_EVAL_BEGIN|Workflow
17:07:29.114 |WF_CRITERIA_BEGIN|
[Lead: L104 00Qxx000000258vh] |Apex_Say_Hello301xx000000001Y|
01Qxx0000002nea |ON_ALL_CHANGES|0
```

In this section, the process compares the record’s current values to the values it had before it was changed. “myVariable_current” contains all of the record’s current field values. “myVariable_old” contains all of the field values of the record immediately before it was changed. “myVariable_old” has no values (null), so the process is evaluating a newly created lead.

```
Welcome, Salesforce Point & Click Administrators

This section shows the start of the process—indicated by “FLOW_START_INTERVIEWS_BEGIN”—and the criteria defined in the process. “FLOW_RULE_” always corresponds to criteria in the process, and we see that “myRule_1” is evaluated as “true”. The
number in "myRule_1" indicates that the process is executing the group of scheduled actions that are associated with the first criteria in the process.

```
Example: Debugging a Process with a Scheduled “Post to Chatter” Action

This example highlights parts of a debug log for a process with a scheduled “Post to Chatter” action. A schedule is always indicated by "myWait_. This section shows the process’s running schedule “myWait_myRule_2”. Any events that start with “FLOW_WAIT_” also correspond to a schedule in a process.

For scheduled actions, the debug log shows an additional log when the scheduled actions are performed. This is a separate entry in the debug log, as shown in the following example for this scheduled “Post to Chatter” action. After the scheduled time occurs, an automated process executes the scheduled actions. The log uses coordinated universal time (UTC) instead of the user’s time zone. However, the actions are still executed as the user who originally caused the process to run.
“FLOW_WAIT_EVENT_RESUMING_DETAIL” indicates that the interview is being resumed so that the process can execute its scheduled actions. "alarmDateRef" indicates that this schedule is based on a field value. We then see that the "Post to Chatter" action is executed.

Troubleshoot Processes
**Workflow**

Workflow allows you to automate standard internal procedures and processes to save time across your org. A workflow rule is the main container for a set of workflow instructions. These instructions can always be summed up in an if/then statement, such as:

**If it’s raining, then bring an umbrella.**

Workflow rules can be broken into two main components.

1. **Criteria:** the “if” part of the “if/then” statement. In other words, what must be true of the record for the workflow rule to execute the associated actions.
2. **Actions:** the “then” part of the “if/then” statement. In other words, what to do when the record meets the criteria.

In the raining example, the criteria is “it’s raining” and the action is “bring an umbrella”. If the criteria isn’t met (it isn’t raining), then the action isn’t executed (you don’t bring an umbrella).

**Note:** Workflow isn’t the only tool that can be used to automate basic if/then processes. In fact, we recommend starting with the Process Builder instead.

When a record meets all the criteria for a workflow rule, that rule’s actions are executed. Just like with criteria, you should know about the different types of actions.

**Task Actions**

Create a task. For example, assign follow-up tasks to a support representative.

**Email Alert Actions**

Send an email by referencing an email template. For example, email sales management when a sales representative qualifies a large deal.

**Field Update Actions**

Update a field on the record that the workflow rule evaluated or a related record. For example, when a user record is created, set the **Active** field to true.

**Outbound Message Actions**

Send a secure, configurable API message (in XML format) to a designated listener. For example, send a message to an external HR system to initiate the reimbursement process for an approved expense report.

Create a Workflow Rule

Automate your organization’s standard process by creating a workflow rule.

Workflow Considerations

Learn the intricacies of workflow rules and workflow actions before you begin working with them.

Examples of Workflow Rules

Looking for ideas on how workflow rules can help streamline your business? Check out these examples.

MonitorPending Workflow Actions

When a workflow rule that has time-dependent actions is triggered, use the workflow queue to view pending actions and cancel them if necessary.
Workflow Terminology
The following terms are used when describing workflow features and functionality.

SEE ALSO:
Which Automation Tool Do I Use?
Set the Criteria for Your Workflow Rule
Examples of Workflow Rules

Create a Workflow Rule
Automate your organization's standard process by creating a workflow rule.

Watch a Demo: Creating a Workflow Rule

1. Set the Criteria for Your Workflow Rule
   Get started with creating a new workflow rule by selecting the object the rule relates to and configuring its criteria.

2. Add Automated Actions to Your Workflow Rule
   Once you've set the criteria for your workflow rule, identify what to do when that criteria are met.

3. Identify Your Salesforce Org's Default Workflow User
   Select a Default Workflow User that you want Salesforce to display with a workflow rule when the user that triggered the rule is not active.

4. Activate Your Workflow Rule
   Salesforce doesn't trigger a workflow rule until you activate it.

Set the Criteria for Your Workflow Rule
Get started with creating a new workflow rule by selecting the object the rule relates to and configuring its criteria.

1. From Setup, enter Workflow Rules in the Quick Find box, then select Workflow Rules.
2. Click New Rule.
3. Choose the object to which you want this workflow rule to apply.
4. Click Next.
5. Give the rule a name and description.
6. Set the evaluation criteria.
Evaluate the rule when a record is:

- **created**  
  Evaluate the rule criteria each time a record is created. If the rule criteria is met, run the rule. Ignore all updates to existing records.  
  With this option, the rule never runs more than once per record.

- **created, and every time it's edited**  
  Evaluate the rule criteria each time a record is created or updated. If the rule criteria is met, run the rule.  
  With this option, the rule repeatedly runs every time a record is edited as long as the record meets the rule criteria.  
  **Note:** If you select this option, you can't add time-dependent actions to the rule.

- **created, and any time it’s edited to subsequently meet criteria**  
  (Default) Evaluate the rule criteria each time a record is created or updated.  
  - For a new record, run the rule if the rule criteria is met.  
  - For an updated record, run the rule only if the record is changed from not meeting the rule criteria to meeting the rule criteria.  
  With this option, the rule can run multiple times per record, but it won't run when the record edits are unrelated to the rule criteria.  
  For example, suppose that for an opportunity record to meet the rule criteria, the opportunity probability must be greater than 50%. If you create an opportunity with a probability of 75%, the workflow rule runs. If you edit that opportunity by changing the probability to 25%, the edit doesn’t cause the rule to run. If you then edit that opportunity by changing the probability from 25% to 75%, the edit causes the rule to run. With this last edit, the rule runs, because the record is changed from not meeting the rule criteria to meeting the rule criteria.

7. Enter your rule criteria.
   - **Choose criteria are met** and select the filter criteria that a record must meet to trigger the rule. For example, set the filter to “Opportunity: Amount greater than 5000” if you want opportunity records with an amount greater than $5,000 to trigger the rule. If your organization uses multiple languages, enter filter values in your individual language. You can add up to 25 filter criteria, of up to 255 characters each.
   - **Choose formula evaluates to true** and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns “True.”

Examples of useful workflow formulas include:
- If the number of filled positions equals the number of total positions on a job, update the **Job Status** field to “Filled.”
- If mileage expenses associated with visiting a customer site are 35 cents per mile and exceed a $1,000 limit, automatically update the **Approval Required** field to “Required.”
- If a monthly subscription-based opportunity amount is greater than $10,000, create a task for an opportunity owner to follow up 60 days after the opportunity is closed.

The **$Label** variable isn’t supported in workflow rule formulas. Also, some functions aren’t available in workflow rule formulas.

**Tip:** You can use merge fields for directly related objects in workflow rule formulas.
8. Click **Save & Next**.

SEE ALSO:
- Workflow Considerations

**Add Automated Actions to Your Workflow Rule**

Once you’ve set the criteria for your workflow rule, identify what to do when that criteria are met.

**Add an Immediate Action to Your Workflow Rule**

Immediate actions, like their name suggests, are executed as soon as the workflow rule finishes evaluating the record.

**Add a Time-Dependent Action to Your Workflow Rule**

Time-dependent actions are executed at a specific time, such as ten days before a record’s close date. When that specific time passes, the workflow rule re-evaluates the record to make sure that it still meets the rule criteria. If the record does, the workflow rule executes those actions.

**Field Update Actions**

Field update actions let you automatically update a field value. You can associate field updates with workflow rules, approval processes, or entitlement processes.

SEE ALSO:
- Identify Your Salesforce Org’s Default Workflow User
- Set the Criteria for Your Workflow Rule
Add an Immediate Action to Your Workflow Rule

Immediate actions, like their name suggests, are executed as soon as the workflow rule finishes evaluating the record.

1. Open a workflow rule.
2. In the Immediate Workflow Actions section, click Add Workflow Action.
3. Select one of the options to create a new action or select an existing one.

For information on each action type, see Workflow on page 4253.

Add Automated Actions to Your Workflow Rule

Add a Time-Dependent Action to Your Workflow Rule

Time-dependent actions are executed at a specific time, such as ten days before a record’s close date. When that specific time passes, the workflow rule re-evaluates the record to make sure that it still meets the rule criteria. If the record does, the workflow rule executes those actions.

Time-dependent actions and time triggers are complex features. As you work with time-dependent actions and time triggers, keep in mind their considerations.

If you plan on configuring workflow rules that have time-dependent actions, specify a default workflow user. Salesforce associates the default workflow user with a workflow rule if the user who initiated the rule is no longer active.

1. Open a workflow rule.
2. In the Time-Dependent Workflow Actions section, click Add Time Trigger.
   
   Note: You can’t add a time trigger if:
   - The evaluation criteria is set to Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria.
   - The rule is activated.
   - The rule is deactivated but has pending actions in the workflow queue.

3. Specify a number of days or hours before or after a date that’s relevant to the record, such as the date when the record was created or modified.
   
   If the workflow rule is in effect when this time occurs, the time trigger fires the workflow action.

4. Save your time trigger.
5. In the section for the time trigger you created, click Add Workflow Action.
6. Select one of the options to create a new action or select an existing one.
7. Click Done.

- Add Automated Actions to Your Workflow Rule
- Considerations for Time-Dependent Actions and Time Triggers

Field Update Actions

Field update actions let you automatically update a field value. You can associate field updates with workflow rules, approval processes, or entitlement processes.

From Setup, enter Field Updates in the Update box, and select Field Updates. Then use these settings to configure your field update.

Before you begin, check the type of the field you want to update. Read-only fields like formula or auto-number fields are not available for field updates.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for this field update.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have field updates of the same type with the same unique name, provided they are defined in different objects. The Unique Name field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the field update.</td>
</tr>
<tr>
<td>Object</td>
<td>Select the object whose field you want to update.</td>
</tr>
<tr>
<td>Field to Update</td>
<td>Select the field to update. Fields are shown only for the object that you selected. You can select a field on a related object in a master-detail relationship. You can use field updates on encrypted custom fields, but the encrypted field isn’t available in the formula editor. <strong>Tip:</strong> Avoid associating more than one field update with a rule or approval process that applies different values to the same field.</td>
</tr>
<tr>
<td>Re-evaluate Workflow Rules After Field Change</td>
<td>Select if you want workflow rules on this object to be re-evaluated after the field value is updated. If you select this option, Salesforce re-evaluates all workflow rules on the object if the field update results in a change to the value of the field, triggering any workflow rules whose criteria are met. For more information, see Field Updates That Re-evaluate Workflow Rules on page 4494.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Specify New Field Value</td>
<td>The value that the field should be updated with. The available options depend on the type of field you are updating. For more information, see Value Options for Field Update Actions on page 4484.</td>
</tr>
</tbody>
</table>

- Considerations for Field Update Actions

**Identify Your Salesforce Org’s Default Workflow User**

Select a Default Workflow User that you want Salesforce to display with a workflow rule when the user that triggered the rule is not active.

If your organization uses time-dependent actions in workflow rules, you must designate a default workflow user. When the user who triggered the rule isn’t active, Salesforce displays the username of the default workflow user in the Created By field for tasks, the Sending User field for email, and the Last Modified By field for field updates. Salesforce does not display this username for outbound messages. If a problem occurs with a pending action, the default workflow user receives an email notification.

When workflow email alerts approach or exceed certain limits, Salesforce sends a warning email to the default workflow user or—if the default workflow user isn’t set—to an active system administrator.

1. From Setup, enter Process Automation Settings in the Quick Find box, then select Process Automation Settings.
2. For Default Workflow User select a user.
3. Click Save.

SEE ALSO:
- Daily Limit for Email Alerts
Associate Actions with Workflow Rules or Approval Processes

Associate actions that have already been created in your organization with a workflow rule and approval processes.

To associate existing workflow actions with a workflow rule:

1. From Setup, enter Workflow Rules in the Quick Find box, then select Workflow Rules.
2. Select the workflow rule.
3. Click Edit in the Workflow Actions section.
4. Click Add Workflow Action in either the Immediate Workflow Actions or Time-Dependent Actions section, depending on when you want the action to occur, and choose Select Existing Action.
5. Select the type of action to associate with the workflow rule.
6. Select the actions in the Available Actions box and use the right arrow to move them to the Selected Actions box. If necessary, select the left arrow to remove actions from the Available Actions box.
7. Save your changes.

To associate existing workflow actions with an approval process:

1. From Setup, enter Approval Processes in the Quick Find box, then select Approval Processes.
2. Click the name of an approval process.
3. Depending on when you want the action to occur, do one of the following:
   - Click Add Existing in the Initial Submission Actions, Final Approval Actions, Final Rejection Actions, or Recall Actions section.
   - Click Show Actions in the Approval Steps section, then click Add Existing in the Approval, Rejection, or Recall Actions section.

   See Add an Existing Automated Action to Your Approval Process on page 4291.
4. Select the type of action you want to associate with the approval process. The Available Actions box lists all existing actions of the selected type.
5. Enter the name of a specific action in the text field and click Find.
6. Select the actions in the Available Actions box that you want to associate with the approval process, and use the right arrow to move the actions to the Selected Actions box. If necessary, select the left arrow to remove actions from the Available Actions box.
7. Save your changes.
Activate Your Workflow Rule

Salesforce doesn’t trigger a workflow rule until you activate it.

To activate a workflow rule, click Activate on the workflow rule detail page. Click Deactivate to prevent a rule from triggering or if you want to edit the time-dependent actions and time triggers that are associated with the rule.

You can deactivate a workflow rule at any time. However, if you deactivate a rule that has pending actions, Salesforce completes those actions as long as the record that triggered the rule is not updated.

Note:

- You can’t delete a workflow rule that has pending actions in the workflow queue. Wait until pending actions are processed, or use the workflow queue to cancel the pending actions.
- You can’t add time-dependent workflow actions to active workflow rules. Deactivate the workflow rule first, add the time-dependent workflow action, and reactivate the rule.

SEE ALSO:

- Set the Criteria for Your Workflow Rule

Workflow Considerations

Learn the intricacies of workflow rules and workflow actions before you begin working with them.

- Each workflow rule applies to a single object.
- If you have workflow rules on converted leads and want to use cross-object field updates on the resulting accounts and opportunities, you must enable the lead setting Enable Validation and Triggers from Lead Convert.
- Workflow rules on custom objects are automatically deleted if the custom object is deleted.
- The order in which individual actions and types of actions are executed is not guaranteed. However, field update actions are executed first, followed by other actions.
- To create workflow rules that update case fields based on new case comments or incoming email messages, choose Case Comment or Email Message from the Select Object drop-down list; Email Message is only available if Email-to-Case or On-Demand Email-to-Case is enabled. You can only create email message workflow rules for field updates, and case comment workflow rules for field updates, email alerts, and outbound messages. For example, you can create a workflow rule so that an email marked as Is Incoming changes its case’s Status from Closed to New.
- Changes you make to records while using Connect Offline are evaluated by workflow rules when you synchronize.
- Salesforce processes rules in the following order:
  1. Validation rules
  2. Assignment rules
  3. Auto-response rules
  4. Workflow rules (with immediate actions)
  5. Escalation rules
- If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by default. Alternatively, you can choose to prevent records from being deleted if they’re in a lookup relationship.
• If you create workflow rules to replace any Apex triggers, make sure you delete those Apex triggers when you activate the equivalent workflow rules. Otherwise, both Apex triggers and workflow rules will fire and cause unexpected results, such as overwritten field updates or redundant email messages.

When Do Workflow Rules Get Triggered?

• Workflow rules can be triggered any time a record is saved or created, depending on your rule criteria. However, rules created after saving records aren’t triggered by those records retroactively.

• Workflow rules are triggered when a standard object in a master-detail relationship is re-parented, even if the object’s evaluation criteria is set to Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria.

• Saving or creating records can trigger more than one rule.

• Workflow rules only trigger on converted leads if validation and triggers for lead convert are enabled in your organization.

• Workflow rules trigger automatically and are invisible to the user. Alternatively, approval processes allow users to submit records for approval.

• If your organization uses multiple languages, enter filter values in your individual language. You can add up to 25 filter criteria, of up to 255 characters each.

When you use picklists to specify filter criteria, the selected values are stored in the organization’s default language. If you edit or clone existing filter criteria, first set the Default Language on the Company Information page to the same language that was used to set the original filter criteria. Otherwise, the filter criteria may not be evaluated as expected.

• If you use record types in your workflow rule criteria whose labels have been translated using the translation workbench, the translated label value won’t trigger the workflow rule. Workflow criteria evaluate the master label value and ignore the translated value. To avoid this problem, set the workflow criteria to evaluate the master record type label value by entering it manually in the Value field.

• Workflow rules can’t be triggered by campaign statistic fields, including individual campaign statistics and campaign hierarchy statistics.

• A workflow rule isn’t triggered if its condition references a field that doesn’t have a value. For example, if a User-based workflow rule checks “Role not equal to CEO”, the rule isn’t triggered for a user without an assigned role. Instead of conditions, use a formula to check that that the field is either null or set to something other than “CEO”:

```java
UserRole.Id == null || UserRole.Name != "CEO"
```

• The following actions don’t trigger workflow rules.
  – Mass replacing picklist values
  – Mass updating address fields
  – Mass updating divisions
  – Changing the territory assignments of accounts and opportunities
  – Converting leads to person accounts
  – Deactivating Self-Service Portal, Customer Portal, or Partner Portal users
  – Converting state and country data from the State and Country Picklists page in Setup
  – Making changes to state and country picklists using AddressSettings in the Metadata API

Workflow Rule Limitations

• You can’t package workflow rules with time triggers.
You can’t create outbound messages for workflow rules on junction objects.

Tip: Use the Developer Console to debug workflow rules. The Developer Console lets you view debug log details and information about workflow rules and actions, such as the name of the user who triggered the workflow rule and the name and ID of the record being evaluated.

Workflow for the User Object (Beta)

You can create workflow rules and actions for the User object. You can, for example, send welcome emails to new employees or sync user data with a third-party service using outbound message actions.

Considerations for Time-Dependent Actions and Time Triggers

SEE ALSO:
Workflow for the User Object (Beta)
Set the Criteria for Your Workflow Rule

Workflow for the User Object (Beta)

You can create workflow rules and actions for the User object. You can, for example, send welcome emails to new employees or sync user data with a third-party service using outbound message actions.

Note: This release contains a beta version of workflow on the User object that is production quality but has known limitations. To provide feedback and suggestions, go to IdeaExchange.

Example Use Cases

For the User object, you can set up workflow rules to:

- Send welcome email messages with training resources to newly created users by using email alert actions.
- Send emails when users change roles or are deactivated by using email alert actions.
- Deactivate temporary employees after a specified period by using field update actions.
- Sync user data with third-party systems by using outbound messages actions.

Merge Field Types for the User Object

To use merge fields from user records in email templates, select from the following merge field types:

- User Fields—Use these merge fields to represent the sending user. Merge fields named `{!User.field_name}` return values from the user record of the person who created or updated the record that triggered the workflow rule.
- Workflow Target User Fields—Use these merge fields only in email templates for workflow rules on the User object. Merge fields named `{!Target_User.field_name}` return values from the user record that was created or updated to trigger the workflow rule.

Beta Limitations for Workflow on the User Object

Understand these limitations before you create workflow rules or workflow actions for the User object.

- Tasks are not supported as workflow actions for the User object.
When setting the workflow rule criteria, you can’t select Current User fields using the picklists. You can, however, use a formula to set the rule criteria and include fields from the current user. In the formula editor, click **Insert Field**, select $User, select the field, and click **Insert**.

Remember that custom validation rules run before workflow rules are executed. Refer to “Triggers and Order of Execution” in the Apex Developer Guide.

- Workflow Considerations

### Considerations for Time-Dependent Actions and Time Triggers

When creating time-dependent actions and time triggers for workflow rules, consider the following.

#### Defining Time Triggers

- When defining a time trigger, use standard and custom date and date/time fields defined for the object. Specify time using days and hours. The valid range is 0 to 999 days or hours.
- You can modify existing time triggers by adding or removing actions.

  **Note:** Removing all the actions from a time trigger does not remove the trigger. Empty triggers are still queued and count against your hourly workflow time trigger limit. To remove scheduled time triggers, delete them from the workflow queue.

#### Time Trigger Processing

- Time-dependent actions aren’t executed independently. They’re grouped into a single batch that starts executing within one hour after the first action enters the batch. Therefore, any Apex triggers that fire as a result of those grouped actions are also executed in a single batch. This behavior can cause you to exceed your Apex governor limits if you design your time-based workflow in conjunction with Apex triggers.
- Salesforce evaluates time-based workflow on the organization’s time zone, not the user’s. Users in different time zones might see differences in behavior.
- Salesforce doesn’t necessarily execute time triggers in the order they appear on the workflow rule detail page. Workflow rules list time triggers that use the **Before** field first, followed by time triggers that use the **After** field.
- Salesforce doesn’t display time-dependent action controls on the workflow rule edit page if you set the workflow rule evaluation criteria to **Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria**.
- If you change a date field that is referenced by an unfired time trigger in a workflow rule that has been evaluated, Salesforce recalculates the unfired time triggers associated with the rule. For example, if a workflow rule is scheduled to alert the opportunity owner 7 days before the opportunity close date and the close date is set to 2/20/2011, Salesforce sends the alert on 2/13/2011. If the close date is updated to 2/10/2011 and the time trigger hasn’t fired, Salesforce reschedules the alert for 2/3/2011. If Salesforce recalculates the time triggers to a date in the past, Salesforce triggers the associated actions shortly after you save the record.
- If a workflow rule has a time trigger set for a time in the past, Salesforce queues the associated time-dependent actions to start executing within one hour. For example, if a workflow rule on opportunities is configured to update a field 7 days before the close date, and you create an opportunity record with the close date set to today, Salesforce starts to process the field update within an hour after you create the opportunity.
- Time-dependent actions remain in the workflow queue only as long as the workflow rule criteria are still valid. If a record no longer matches the rule criteria, Salesforce removes the time-dependent actions queued for that record.
For example, an opportunity workflow rule can specify:
- A criteria set to “Opportunity: Status not equals to Closed Won, Closed Lost”
- An associated time-dependent action with a time trigger set to 7 days before the opportunity close date

If a record that matches the criteria is created on July 1 and the Close Date is set to July 30, the time-dependent action is scheduled for July 23. However, if the opportunity is set to “Closed Won” or “Closed Lost” before July 23, the time-dependent action is removed from the queue.

- Salesforce ignores time triggers that reference null fields.
- Time-dependent actions can automatically be queued again if the record is updated and the evaluation criteria is set to Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria. Using the previous example, if the opportunity status is changed from Closed Lost to Prospecting and the workflow rule evaluation criteria is Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria, Salesforce reevaluates the time triggers and adds the appropriate actions to the workflow queue.

- Deleting a record that has pending actions removes the pending actions from the workflow queue. You can’t restore the actions, even if you undelete the record.
- If the evaluation criteria is set to Evaluate the rule when a record is: created, the workflow rule evaluates its time triggers only once. If the record that fired the rule changes to no longer meet the evaluation criteria, Salesforce removes the pending actions from the queue and never reapplies the rule to the record.
- You can deactivate a workflow rule at any time. If the rule has pending actions in the workflow queue, editing the record that triggered the rule removes the pending actions from the queue. If you don’t edit the record, the pending actions are processed even though the rule has been deactivated.

- Time-dependent actions aren’t executed for a reevaluated workflow rule in the following situations:
  - The reevaluated workflow rule’s immediate actions cause the record to no longer meet the workflow rule criteria.
  - An Apex after trigger that is executed as a result of a workflow or approvals action causes the record to no longer meet the workflow rule criteria.

- Configuring a task’s Due Date to “Rule Trigger Date” sets time triggers and workflow task due dates based on the date that the workflow time trigger’s action is executed. For example, if the task due date is “Rule Trigger Date plus 10 days,” and the time trigger is executed on January 1, Salesforce sets the task due date to January 11.

- You can add a new active workflow rule with time triggers in a change set and deploy it. You can only change time triggers on a workflow rule in a change set if it’s inactive. The rule must be activated in the destination organization manually or through another change set that only activates workflow rules and makes no time trigger changes.

For example, let’s say you have an inactive workflow rule in your destination organization, and your change set contains an active workflow rule with the same name and new or different time triggers. The deployment fails because it activates the workflow rule first and then tries to add or remove the time triggers.

**Note:** You must add time-dependent actions manually when including a workflow rule in a change set. The View/Add Dependencies function doesn’t detect time-dependent actions.

**Using Time-Dependent Workflow with Leads**

- You can’t convert a lead that has pending actions.
- If Validation and Triggers from Lead Convert is enabled, existing time-based workflow actions on leads aren’t triggered during lead conversion.
- If a campaign member based on a lead is converted before the completion of the time-based workflow actions associated with it, Salesforce still performs the time-based workflow actions.
Limitations

- Time triggers don’t support minutes or seconds.
- Time triggers can’t reference the following:
  - `DATE` or `DATETIME` fields containing automatically derived functions, such as `TODAY` or `NOW`.
  - Formula fields that include related-object merge fields.
- Salesforce limits the number of time triggers an organization can execute per hour. If an organization exceeds the limits for its Edition, Salesforce defers the execution of the additional time triggers to the next hour. For example, if an Unlimited Edition organization has 1,200 time triggers scheduled to execute between 4:00 PM and 5:00 PM, Salesforce processes 1,000 time triggers between 4:00 PM and 5:00 PM and the remaining 200 time triggers between 5:00 PM and 6:00 PM.
- You can’t archive a product or price book that has pending actions.
- If time-based workflow actions exist in the queue, you can’t add or remove time triggers or edit trigger dates without deleting the actions first. Because the deleted records can’t be restored, carefully consider the implications of editing the workflow rules before you proceed. If you decide to edit the workflow rules, deactivate the workflow that you want to edit, edit the rules as needed, and then save your changes. For information about finding and deleting time-based workflow actions in the queue, see Monitor Pending Workflow Actions on page 4276.
- You also can’t add or remove time triggers if:
  - The workflow rule is active.
  - The workflow rule is deactivated, but has pending actions in the queue.
  - The workflow rule evaluation criteria is set to Evaluate the rule when a record is: created, and every time it’s edited.
  - The workflow rule is included in a package.

Examples of Workflow Rules

Looking for ideas on how workflow rules can help streamline your business? Check out these examples.

**Business Processes**
- Follow Up Before Contract Expires
- Follow Up when Platinum Contract Case Closes
- Assign Credit Check for New Customer
- Notify Account Owner About New, High-Priority Cases
- Set a Default Entitlement for Each New Case
- Update Shipment Status if Shipment is Delayed
- Automatically Activate New Users

**Cross-Object Processes**
- Notify Sales VP About Cases Filed for Top Accounts
- Set Default Opportunity Name
Welcome, Salesforce Point & Click Administrators

Set Target Resolution Date for Cases
Update Application Record when Candidate Accepts Job

Deal Management
Track Closed Opportunities
Override Default Opportunity Close Date
Report Lost Opportunities
Report Unassigned Leads
Send Alert if Quote Line Item Discount Exceeds 40%

Notifications
Notify Key People About Account Owner Changes
Set Reminder for Contact Birthday
Set Reminder for High-Value Opportunity Close Date
Notify Account Owner of Updates by Others

Follow Up Before Contract Expires

Object: Contract
Description: Send an email reminder to the renewal manager 20 days before a contract’s end date.
Evaluation Criteria: Evaluate the rule when a record is created, and any time it’s edited to subsequently meet criteria.
Rule Criteria (Filter): Run this rule if the following criteria are met:

\[(\text{Contract: Status equals Activated})\]

Immediate Actions: None
Time-Dependent Actions: 20 Days Before Contract: End Date—Email Alert: Send an email reminder to the renewal manager to confirm whether the client would like an extension.

Follow Up when Platinum Contract Case Closes
This example assumes there is a Contract Type custom picklist used to identify the contract level on cases, and that the picklist contains the value “Platinum.”

Object: Case
Description: Send a feedback request in email to the case contact seven days after a high-priority case is closed if the customer has a platinum contract agreement.
Evaluation Criteria: Evaluate the rule when a record is created, and any time it’s edited to subsequently meet criteria.
### Assign Credit Check for New Customer

This example assumes there is a **New Customer** custom field on opportunities.

<table>
<thead>
<tr>
<th><strong>Object</strong></th>
<th>Opportunity</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Assign the Accounts Receivable (AR) department a task to check the credit of a potential customer 15 days before the opportunity close date if the amount is greater than $50,000.</td>
</tr>
<tr>
<td><strong>Evaluation Criteria</strong></td>
<td>Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria.</td>
</tr>
<tr>
<td><strong>Rule Criteria (Filter)</strong></td>
<td>Run this rule if the following criteria are met:</td>
</tr>
<tr>
<td></td>
<td>(Opportunity: Amount greater than 50000) and (Opportunity: Closed equals False) and (Opportunity: New Customer equals True)</td>
</tr>
<tr>
<td><strong>Immediate Actions</strong></td>
<td>None</td>
</tr>
<tr>
<td><strong>Time-Dependent Actions</strong></td>
<td>15 Days Before Opportunity: Close Date—Task: Create a task for users in the Accounts Receivable role to run a credit check.</td>
</tr>
</tbody>
</table>

### Notify Account Owner About New, High-Priority Cases

This example assumes there is a **Service Level Agreement** custom picklist called SLA that identifies the agreement level on accounts and contains the value **“Platinum.”**

<table>
<thead>
<tr>
<th><strong>Object</strong></th>
<th>Case</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Notify the account owner when a high-priority case is created for accounts with a platinum service level agreement.</td>
</tr>
<tr>
<td><strong>Evaluation Criteria</strong></td>
<td>Evaluate the rule when a record is: created.</td>
</tr>
<tr>
<td><strong>Rule Criteria (Filter)</strong></td>
<td>Run this rule if the following criteria are met:</td>
</tr>
<tr>
<td></td>
<td>(Case: Priority equals High) and (Account: SLA equals Platinum)</td>
</tr>
<tr>
<td><strong>Immediate Actions</strong></td>
<td>Email Alert: Email the details of the high-priority case to the account owner.</td>
</tr>
<tr>
<td><strong>Time-Dependent Actions</strong></td>
<td>None.</td>
</tr>
</tbody>
</table>
Set a Default Entitlement for Each New Case

This example assumes there is an active, autolaunched flow that looks up the relevant entitlement based on the account, asset, or contact associated with the new case and updates the case with the entitlement name.

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.

<table>
<thead>
<tr>
<th>Object</th>
<th>Case</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Set a default entitlement on each new case.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created.</td>
</tr>
<tr>
<td>Rule Criteria (Filter)</td>
<td>Run this rule if the following criteria are met: (Case: Status not equal to Closed)</td>
</tr>
<tr>
<td>Immediate Actions</td>
<td>Flow Trigger: Look up and assign the relevant entitlement to the case. Pass the account, asset, or contact associated with the new case into the relevant flow variable to enable the entitlement lookup. Also pass the case ID into the relevant flow variable to enable the case update.</td>
</tr>
<tr>
<td>Time-Dependent Actions</td>
<td>None.</td>
</tr>
</tbody>
</table>

Update Shipment Status if Shipment is Delayed

<table>
<thead>
<tr>
<th>Object</th>
<th>Shipment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Update the Shipment Status field to “Delayed” if a shipment has exceeded the expected delivery date and not reached the customer.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria.</td>
</tr>
<tr>
<td>Rule Criteria (Filter)</td>
<td>Run this rule if the following criteria are met: (Shipment: Status not equal to Delivered)</td>
</tr>
<tr>
<td>Immediate Actions</td>
<td>None.</td>
</tr>
<tr>
<td>Time-Dependent Actions</td>
<td>1 day after Shipment: Expected Delivery Date—Field Update: Change Shipment Status field to “Delayed” on Shipment record.</td>
</tr>
</tbody>
</table>

Automatically Activate New Users

<table>
<thead>
<tr>
<th>Object</th>
<th>User</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Make sure that each new user is active, so that the user can log in to Salesforce.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created.</td>
</tr>
</tbody>
</table>
Run this rule if the following criteria are met:

(User: Active equals False)

Field Update: Set Active to True.

Time-Dependent Actions None.

Notify Sales VP About Cases Filed for Top Accounts

Use the following workflow rule if your sales VP wants to know about any cases filed for top accounts, where top accounts are determined by size and revenue.

Object Case

Description Notify Sales VP about any cases filed for top accounts.

Evaluation Criteria Evaluate the rule when a record is: created.

Rule Criteria (Filter) Run this rule if the following criteria are met:

AND(Account.AnnualRevenue > 500000, Account.NumberOfEmployees > 5000)

Immediate Actions Email Alert: Notify VP about cases for big accounts.

Time-Dependent Actions None.

Set Default Opportunity Name

The opportunity naming convention for some companies is Account Name: Opportunity Name. To automate the default name of each opportunity in your organization, create the following workflow rule.

Object Opportunity

Description Enforce opportunity naming convention.

Evaluation Criteria Evaluate the rule when a record is: created, and every time it’s edited.

Rule Criteria (Filter) Run this rule if the following criteria are met:

NOT(CONTAINS(Name, Account.Name))

Immediate Actions Field Update: Set opportunity name to the following formula:

Account.Name & ": " & Name

Time-Dependent Actions None.
Set Target Resolution Date for Cases
This example illustrates how to automatically set a case resolution date based on the value of a field on the associated account. It uses a custom picklist field on accounts called Support Level, which has three values—Basic, Standard, and Premium—as well as a custom date field on cases called Target Resolution Date.

Use the following three workflow rule examples to automatically set the target resolution date of a case based on the support level for the related account.

### Set Resolution Date for Basic Support

<table>
<thead>
<tr>
<th>Object</th>
<th>Case</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Sets the case target resolution date for accounts that have basic support level to 30 days from today.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created.</td>
</tr>
<tr>
<td>Rule Criteria (Filter)</td>
<td>Run this rule if the following formula evaluates to true: <code>ISPICKVAL(Account.Support_Level__c , &quot;Basic&quot;)</code></td>
</tr>
<tr>
<td>Immediate Actions</td>
<td>Field Update: Set the Target Resolution Date to Today() + 30</td>
</tr>
<tr>
<td>Time-Dependent Actions</td>
<td>None.</td>
</tr>
</tbody>
</table>

### Set Resolution Date for Standard Support

<table>
<thead>
<tr>
<th>Object</th>
<th>Case</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Sets the case target resolution date for accounts that have standard support level to 14 days from today.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created.</td>
</tr>
<tr>
<td>Rule Criteria (Filter)</td>
<td>Run this rule if the following formula evaluates to true: <code>ISPICKVAL(Account.Support_Level__c , &quot;Standard&quot;)</code></td>
</tr>
<tr>
<td>Immediate Actions</td>
<td>Field Update: Set the Target Resolution Date to Today() + 14</td>
</tr>
<tr>
<td>Time-Dependent Actions</td>
<td>None.</td>
</tr>
</tbody>
</table>

### Set Resolution Date for Premium Support

<table>
<thead>
<tr>
<th>Object</th>
<th>Case</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Sets the case target resolution date for accounts that have premium support level to 5 days from today.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created.</td>
</tr>
<tr>
<td>Rule Criteria (Filter)</td>
<td>Run this rule if the following formula evaluates to true: <code>ISPICKVAL(Account.Support_Level__c , &quot;Premium&quot;)</code></td>
</tr>
<tr>
<td>Immediate Actions</td>
<td>Field Update: Set the Target Resolution Date to Today() + 5</td>
</tr>
</tbody>
</table>
### Update Application Record when Candidate Accepts Job

Use the following workflow rule if you want to close the Application record when a Candidate accepts a job. Cross-object field updates to the master record are supported between custom objects in a master-detail relationship.

<table>
<thead>
<tr>
<th>Object</th>
<th>Candidate</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Changes the Application Status to “Closed” for the custom Application object when the Candidate Status for the custom Candidate object changes to “Accepted.”</td>
</tr>
<tr>
<td><strong>Evaluation Criteria</strong></td>
<td>Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria.</td>
</tr>
<tr>
<td><strong>Rule Criteria (Filter)</strong></td>
<td>Run this rule if the following criteria are met:</td>
</tr>
<tr>
<td></td>
<td>(Candidate: Status equals Accepted)</td>
</tr>
<tr>
<td><strong>Immediate Actions</strong></td>
<td>Field Update: Change Application Status field to “Closed” on parent Application record.</td>
</tr>
<tr>
<td><strong>Time-Dependent Actions</strong></td>
<td>None.</td>
</tr>
</tbody>
</table>

### Track Closed Opportunities

This example assumes there is a “Closed Opportunities” record type that provides additional information to certain profiles.

- **Note:** For information on record types, see [Record Types](#) on page 3928.

<table>
<thead>
<tr>
<th>Object</th>
<th>Opportunity</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Change the record type of closed-won opportunities.</td>
</tr>
<tr>
<td><strong>Evaluation Criteria</strong></td>
<td>Evaluate the rule when a record is: created, and every time it’s edited.</td>
</tr>
<tr>
<td><strong>Rule Criteria (Filter)</strong></td>
<td>Run this rule if the following criteria are met:</td>
</tr>
<tr>
<td></td>
<td>(Opportunity: Closed equals True) and</td>
</tr>
<tr>
<td></td>
<td>(Opportunity: Stage equals Closed Won)</td>
</tr>
<tr>
<td><strong>Immediate Actions</strong></td>
<td>Field Update: Set the record type to “Closed Opportunities.”</td>
</tr>
<tr>
<td><strong>Time-Dependent Actions</strong></td>
<td>None.</td>
</tr>
</tbody>
</table>

### Override Default Opportunity Close Date

<table>
<thead>
<tr>
<th>Object</th>
<th>Opportunity</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Override the default close date from the close of the quarter to six months after the opportunity is created.</td>
</tr>
<tr>
<td><strong>Evaluation Criteria</strong></td>
<td>Evaluate the rule when a record is: created.</td>
</tr>
</tbody>
</table>
### Rule Criteria (Filter)
Run this rule if the following criteria are met:

```
(Opportunity: Closed equals False)
```

### Immediate Actions
Field Update: Use the following formula to set the opportunity close date to six months after the creation date:

```
DATE( YEAR(TODAY()) , (MONTH(TODAY()) + 6), DAY(TODAY()))
```

### Time-Dependent Actions
None.

---

### Report Lost Opportunities

<table>
<thead>
<tr>
<th>Object</th>
<th>Opportunity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Notify the VP of Sales when a deal is lost if the stage was “Proposal/Price Quote” and the amount was greater than $1,000,000.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created, and every time it’s edited.</td>
</tr>
</tbody>
</table>

#### Rule Criteria (Filter)
Run this rule if the following formula evaluates to true:

```
AND( ISCHANGED(StageName), ISPICKVAL(PRIORVALUE(StageName) , "Proposal/Price Quote"), ISPICKVAL(StageName,"Closed Lost"), (Amount >1000000))
```

#### Immediate Actions
Email Alert: Notify the VP of Sales role that the deal was lost.

#### Time-Dependent Actions
None.

---

### Report Unassigned Leads

This example assumes that all unassigned leads are placed in an unassigned leads queue by a leads assignment rule.

<table>
<thead>
<tr>
<th>Object</th>
<th>Lead</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Ensure that unassigned leads are tracked in a timely manner by notifying the manager if a lead is not accepted in two days.</td>
</tr>
<tr>
<td>Evaluation Criteria</td>
<td>Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria.</td>
</tr>
</tbody>
</table>

#### Rule Criteria (Filter)
Run this rule if the following criteria are met:

```
Lead Owner equals Unassigned Lead Queue
```

#### Immediate Actions
None.

#### Time-Dependent Actions
2 Days After Lead: Last Modified Date—Email Alert: Notify the manager role that there are unassigned leads in the queue that are older than two days.
Send Alert if Quote Line Item Discount Exceeds 40%

Object: Quote Line Item

Description: Ensure that an email alert is sent if a sales rep applies a quote line item discount that exceeds 40%.

Evaluation Criteria: Evaluate the rule when a record is created, and any time it’s edited to subsequently meet criteria.

Rule Criteria (Filter): Run this rule if the following criteria are met:

- Quote Line Item: Discount is greater than 40

Immediate Actions: Email Alert: Notify the manager role that the quote line item discount exceeds 40%.

Time-Dependent Actions: None.

Notify Key People About Account Owner Changes

Object: Account

Description: Notify key people in the sales department when the owner of an account changes if the account’s annual revenue is greater than $1,000,000.

Evaluation Criteria: Evaluate the rule when a record is created, and every time it’s edited.

Rule Criteria (Filter): Run this rule if the following formula evaluates to true:

- AND( ISCHANGED(OwnerId), AnnualRevenue > 1000000 )

Immediate Actions: Email Alert: Notify the person in the sales operations role of the change in account ownership.

Time-Dependent Actions: None.

Set Reminder for Contact Birthday

This example assumes there is a Next Birthday custom formula field that uses the following formula to calculate the date of the contact’s next birthday on contact records:

- IF(MONTH(Birthdate) > MONTH(TODAY()), DATE(YEAR(TODAY()), MONTH(Birthdate), DAY(Birthdate)),
- IF(MONTH(Birthdate) < MONTH(TODAY()), DATE(YEAR(TODAY())+1, MONTH(Birthdate), DAY(Birthdate)),
- IF(DAY(Birthdate) >= (DAY(TODAY())), DATE(YEAR(TODAY()), MONTH(Birthdate), DAY(Birthdate)),
- DATE(YEAR(TODAY())+1, MONTH(Birthdate), DAY(Birthdate)))))

Object: Contact

Description: Send an email to the contact two days before the contact’s birthday.

Evaluation Criteria: Evaluate the rule when a record is created.
### Rule Criteria (Filter)
Run this rule if the following formula evaluates to true:

\[
\text{Contact: Birthdate not equal to null} \text{ and } \text{Contact: Email not equal to null}
\]

### Immediate Actions
None.

### Time-Dependent Actions
2 Days Before Contact: Next Birthday—Email Alert: Send a birthday greeting to the contact’s email address.

### Set Reminder for High-Value Opportunity Close Date

<table>
<thead>
<tr>
<th>Object</th>
<th>Opportunity</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Remind the opportunity owner and senior management when the close date is approaching for a large deal, an opportunity that has an amount greater than $100,000. Also, create a follow-up task for the opportunity owner if the deal is still open when the close date passes.</td>
</tr>
</tbody>
</table>

### Evaluation Criteria
Evaluate the rule when a record is: created, and any time it’s edited to subsequently meet criteria.

### Rule Criteria (Filter)
Run this rule if the following criteria are met:

\[
\text{Opportunity: Amount greater than 100000} \text{ and } \text{Opportunity: Closed equals False}
\]

### Immediate Actions
None.

### Time-Dependent Actions
- 30 Days Before Opportunity: Close Date—Email Alert: Notify the opportunity owner that 30 days remain.
- 15 Days Before Opportunity: Close Date—Email Alert: Notify the opportunity owner that 15 days remain.
- 5 Days After Opportunity: Close Date—Task: Create a follow-up task for the opportunity owner to update the deal. Email Alert: Notify senior management to involve executives.

### Notify Account Owner of Updates by Others

<table>
<thead>
<tr>
<th>Object</th>
<th>Account</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>Notify the account owner when someone else updates the account if the account’s annual revenue is greater than $1,000,000.</td>
</tr>
</tbody>
</table>

### Evaluation Criteria
Evaluate the rule when a record is: created, and every time it’s edited.

### Rule Criteria (Filter)
Run this rule if the following formula evaluates to true:

\[
\text{AND( LastModifiedById <> CreatedById, AnnualRevenue > 1000000) }
\]

### Immediate Actions
Email Alert: Notify the account owner that someone else has updated the account.
Time-Dependent Actions

None.

Workflow
Set the Criteria for Your Workflow Rule

Monitor Pending Workflow Actions

When a workflow rule that has time-dependent actions is triggered, use the workflow queue to view pending actions and cancel them if necessary.

1. From Setup, enter Time-Based Workflow in the Quick Find box, then select Time-Based Workflow.
2. Click Search to view all pending actions for any active workflow rules, or set the filter criteria and click Search to view only the pending actions that match the criteria. The filter options are:
   - Workflow Rule Name: The name of the workflow rule.
   - Object: The object that triggered the workflow rule. Enter the object name in the singular form.
   - Scheduled Date: The date the pending actions are scheduled to occur.
   - Create Date: The date the record that triggered the workflow was created.
   - Created By: The user who created the record that triggered the workflow rule.
   - Record Name: The name of the record that triggered the workflow rule.
   
The filter is not case-sensitive.

To cancel pending actions:

1. Select the box next to the pending actions you want to cancel.
2. Click Delete.
Workflow Terminology

The following terms are used when describing workflow features and functionality.

Workflow Rule
A workflow rule sets workflow actions into motion when its designated conditions are met. You can configure workflow actions to execute immediately when a record meets the conditions in your workflow rule, or set time triggers that execute the workflow actions on a specific day. If a workflow action hasn’t executed yet, you can view and modify it in the workflow queue.

Workflow Action
A workflow action, such as an email alert, field update, outbound message, or task, fires when the conditions of a workflow rule are met.

Email Alert
Email alerts are actions that send emails, using a specified email template, to specified recipients. Workflow alerts can be sent to any user or contact, as long as they have a valid email address.

Field Update
A field update is an action that automatically updates a field with a new value.

Flow
A flow is an application that can execute logic, interact with the Salesforce database, call Apex classes, and collect data from users. You can build flows by using the Cloud Flow Designer.

Flow Trigger
A flow trigger is a workflow action that launches a flow. With flow triggers, you can automate complex business processes—create flows to perform logic, and have events trigger the flows via workflow rules—without writing code.

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.

Task
Assigns a task to a user you specify. You can specify the Subject, Status, Priority, and Due Date of the task.

Outbound Message
An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API.

Approvals

It’s likely that you’re familiar with process automation in the form of workflow rules. Approvals take automation one step further, letting you specify a sequence of steps that are required to approve a record.

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

Example: Your org has a three-tier process for approving expenses. This approval process automatically assigns each request to right person in your org, based on the amount requested.

If an expense record is submitted for approval, lock the record so that users cannot edit it and change the status to Submitted.
If the amount is $50 or less, approve the request. If the amount is greater than $50, send an approval request to the direct manager. If the amount is greater than $5,000 and the first approval request is approved, send an approval request to the vice president. If all approval requests are approved, change the status to Approved and unlock the record. If any approval requests are rejected, change the status to Rejected and unlock the record.

Set Up an Approval Process
If Approvals is the right automation tool for your business process, follow these high-level steps to create one for your org.

Prepare Your Org for Approvals
Make sure that your users can submit their records for approval, and consider how you can make it easy for approvers to respond to approval requests.

Considerations for Approvals
Before you automate something with an approval process, be aware of the limitations of the feature.

Sample Approval Processes
Review samples of common approval processes to help you get started creating your own.

Approval History Reports
If you create a custom report type for approval process instances, users can view the historical details of completed and in-progress approval processes and their individual steps.

Manage Multiple Approval Requests
Transfer multiple approval requests from one user to another or remove multiple approval requests from the approval process.

Approval Requests for Users
Your admin can set up approval processes that let you and other users submit records for approval, which results in approval requests.

Approval Process Terminology

Set Up an Approval Process
If Approvals is the right automation tool for your business process, follow these high-level steps to create one for your org.

1. Prepare to Create an Approval Process
   Plan each approval process carefully to ensure a successful implementation.

2. Choose the Right Wizard to Create an Approval Process
   Before you create an approval process, determine which wizard is best for your needs.

3. Add an Approval Step to an Approval Process
   Approval steps define the chain of approval for a particular approval process. Each step determines which records can advance to that step, who to assign approval requests to, and whether to let each approver’s delegate respond to the requests. The first step specifies what to do if a record doesn’t advance to that step. Later steps specify what happens if an approver rejects the request.

4. Add Automated Actions to an Approval Process
   You can associate actions to approval steps, initial submission, final approval, final rejection, or recall. Approval processes support four automated actions.

EDITIONS
Available in: both Salesforce Classic and Lightning Experience
Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS
To create approval processes:
- “Customize Application”
5. **Review an Approval Process**
   Generate a graphical representation of your approval process before you activate it. Use the Process Visualizer to gain buy-in from step owners and reinforce your company’s policies by documenting the decisions you reached when the approval process was designed.

6. **Activate an Approval Process**
   After you’ve created at least one step for the approval process, activate the process.

**SEE ALSO:**
- Approval Process Terminology
- Sample Approval Processes
- Prepare Your Org for Approvals

---

### Prepare to Create an Approval Process

Plan each approval process carefully to ensure a successful implementation.

Review the following checklist before creating your approval process.

- Prepare an approval request email template.
- Prepare an approval request post template.
- Determine the approval request sender.
- Determine the assigned approver.
- Determine the delegated approver.
- Decide if your approval process needs a filter.
- Design initial submission actions.
- Decide if users can approve requests from a wireless device.
- Determine if users can edit records that are awaiting approval.
- Decide if records should be auto-approved or rejected.
- Determine how many levels your process has.
- Determine the actions when an approval request is approved or rejected.

**Which email template do you want to use for approval requests?**

The email template you specify on an approval process is used when notifying users that an approval request is assigned to them. You can use the Salesforce default email template or create your own template. Include the appropriate approval process merge fields to link directly to the approval request.

Does your org have email approval response enabled? If so, the default email template includes instructions for replying to an approval request by typing `approve`, `approved`, `yes`, `reject`, `rejected`, or `no` in the first line of the email body and optionally adding comments in the second line.

**Which Chatter post template do you want to use for approval requests?**

If your org has Approvals in Chatter enabled, specify an approval post template to use when notifying a user via Chatter about an assigned approval request. You can use the Salesforce default post template or create your own.

**Who is the sender of approval requests?**

Approval request notifications are sent from the user who submitted the record for approval. When you configure an email alert, you can add a different return email address for these notifications. You can choose the email address of the default workflow user or a previously configured and verified org-wide address. Determine which email address to use.
Who can approve requests?

Any of the following can approve or reject a request.

- A user or queue that the approval request submitter chooses.
- A queue specified by the administrator.
- A user listed in the Manager standard field on the submitter's user detail page.
- A user listed in a custom hierarchy field on the submitter's user detail page.
- Any combination of users and related users (users listed in a standard or custom field on the submitted record) specified by the administrator.

Do you want approval requests delegated to another user for approval?

An approver can designate a delegate to approve requests, but you can disable this option. To assign delegates, for each user, populate the Delegated Approver field on the user's detail page.

Which records are included in this process?

Determine what attributes a record must have to be included in your approval process. If necessary, create the custom fields to store this information so that you can use it in your filter criteria. For example, if you want to include expense records from your headquarters office only, create a custom picklist field called Office Location that has two options: "HQ" and "Field." Then, you would specify in your filter criteria that records must have "HQ" in the Office Location field to be included in the approval process.

What happens when a record is first submitted for approval?

When users submit a record for approval, Salesforce automatically locks the record so that other users cannot change it while it is awaiting approval. You can still add campaign members to campaigns locked for approval.

Decide if you want other workflow actions to happen when a record is first submitted, such as email alerts, tasks, field updates, and outbound messages. These actions become your initial submission actions.

Can users approve requests from a mobile device?

Determine if you want to require users to log in to Salesforce to approve requests. You can also set up your approval process to allow users to approve requests remotely using a mobile browser.

Who can edit records that are awaiting approval?

Records submitted for approval are locked. Users with the “Modify All” object-level permission for the given object or the “Modify All Data” permission can always unlock a record and edit it. You can also specify that the currently assigned approver can edit the record. You can still add campaign members to campaigns locked for approval.

Can records be automatically approved, rejected, or skipped based on certain criteria?

You can set entry criteria for each step of your process and configure Salesforce to approve, reject, or skip the process if a record doesn't meet the criteria. For example, all expenses submitted with an Amount less than $15 are automatically approved.

How many people need to approve these requests?

An approval process can have several layers of approvals. Determine how many users need to approve requests and in what order.

What should happen when a request is approved or rejected?

When a request is recalled, approved, or rejected, Salesforce can perform up to 10 instances of each of the following types of actions—up to 40 actions total. You can also configure up to 40 actions to occur when a record has received all necessary approvals or is rejected.

Set Up an Approval Process

Create an Approval Process with the Jump Start Wizard
For approval processes that use a single step, use the jump start wizard. This wizard chooses some default options for you.

1. From Setup, enter Approval Processes in the Quick Find box, then select Approval Processes.
2. Select an object.
4. Configure the approval process by following the wizard.
   a. Default Selections for the Approval Process Jump Start Wizard
   b. Choose Approval Request Notification Templates
   c. Design the Approval Request Page
   d. Control Which Records Apply to an Approval Process
   e. Identify Assigned Approvers for an Approval Step

SEE ALSO:
Default Selections for the Approval Process Jump Start Wizard
Considerations for Configuring Approvals
Considerations for Setting Approvers
Set Up an Approval Process
Choose the Right Wizard to Create an Approval Process
Default Selections for the Approval Process Jump Start Wizard

To make it easier for you to get started with a simple approval process, the jump start wizard automatically chooses some default options for you.

After creating an approval process using the jump start wizard, you can modify these default options and add more steps from the approval process detail page. Exception: you can’t modify the Record Lock action on the Initial Submission Actions list.

- To edit records awaiting approval in the approval process, users must have the “Modify All” permission for the given object or the “Modify All Data” permission.
- The page layout for the approval request includes the record name (or number), owner, date created, and approval history.
- The security settings require approvers to log in to Salesforce to view the approval page.
- Only the owner of the record can submit the record for approval.
- Records are locked when submitted for approval.
- Records remain locked until approved or rejected.
- Rejected records are unlocked.
- Only admins can recall a record after it’s submitted.
- There are no auto-approve or auto-reject actions.
- No email notification is sent upon approval or rejection.
- No field values are automatically updated during the approval process.
- An approver cannot automatically delegate another user to approve the approval requests.
- The Allow submitters to recall approval requests option is not selected.

SEE ALSO:

- Create an Approval Process with the Jump Start Wizard
- Choose the Right Wizard to Create an Approval Process

Create an Approval Process with the Standard Wizard

When your approval process is more complex and you want to define specific steps, use the standard wizard.

From Setup, enter Approval Processes in the Quick Find box, then select Approval Processes.

Select an object, and then select Create New Approval Process > Use Standard Setup Wizard.

Configure the approval process.

1. **Control Which Records Apply to an Approval Process**
   Narrow down the list of records that can be part of the approval process by specifying criteria. You can either use filters or write a formula.

2. **Choose Approval Request Notification Templates**
   When an approval process assigns an approval request to a user, Salesforce sends the user an approval request email. If Approvals in Chatter is enabled, Salesforce also posts the approval request to Chatter. Choose templates for each of these notifications.
3. **Choose an Automated Approver Throughout an Approval Process**
   Associate a hierarchy field—such as the user’s manager—with an approval process. When selected, the field is available as an assigned approver option for approval steps. You can always select a hierarchy field here but not use it for any approval steps.

4. **Specify Who Can Edit Locked Records**
   When a record is submitted for approval, it’s locked to prevent users from editing it during the approval process. Use the record editability properties to determine who can edit records that are locked in this approval process.

5. **Design the Approval Request Page**
   The approval page is where an approver responds to an approval request. Customize which fields appear on that page and in which order. This page is used only for this approval process.

6. **Specify Who Can Submit Records to an Approval Process**
   Only specified individuals or roles can submit a record for approval. You can also let submitters recall an approval request.

**SEE ALSO:**
- [Set Up an Approval Process](#)
- [Considerations for Approvals](#)

**Control Which Records Apply to an Approval Process**

Narrow down the list of records that can be part of the approval process by specifying criteria. You can either use filters or write a formula.

If you want all records to pass through the approval process, click **Next**. If only certain types of records are considered, use one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>To enter the approval process...</th>
</tr>
</thead>
<tbody>
<tr>
<td>criteria are met</td>
<td>The record must meet the filter criteria.</td>
</tr>
<tr>
<td>formula evaluates to true</td>
<td>The formula must return <strong>True</strong>. Some functions aren’t available in approval process formulas. For information on which functions you can use in approval process formulas, see <a href="#">Formula Operators and Functions</a>.</td>
</tr>
</tbody>
</table>

**Example:** This filter lets an expense report enter this approval process only if the employee who submitted the report is located at headquarters.

```
Current User: Office Location Equals Headquarters
```

This formula lets a record enter this approval process only if its discount approval cutoff date is less than 30 days away.

```
(Discount_Approval_CutoffDate__c < (CloseDate - 30))
```

**SEE ALSO:**
- [Considerations for Configuring Approvals](#)
- [Formula Operators and Functions](#)
Choose Approval Request Notification Templates

When an approval process assigns an approval request to a user, Salesforce sends the user an approval request email. If Approvals in Chatter is enabled, Salesforce also posts the approval request to Chatter. Choose templates for each of these notifications.

These fields are available from both the jump start and standard wizards.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Assignment Email Template</td>
<td>Choose a custom email template to use when notifying approvers that an approval request is assigned to them. Or leave blank to use the default email template. The approval process uses the same template for every assignment email—no matter which approval step it’s for.</td>
</tr>
<tr>
<td>Approval Post Template</td>
<td>Available only when Approvals in Chatter is enabled. Choose an approval post template to use when notifying approvers via a post in their Chatter feed. Leave blank to use the default post template for this object or, if there isn’t one, the system default template.</td>
</tr>
</tbody>
</table>

**Note:** If email approval response is enabled, be sure that the email template you use describes how to correctly use both response options: clicking the link and replying by email. If the user doesn’t respond correctly (for example, if the user misspells approve or types it on the wrong line), Salesforce doesn’t register the user’s response.

**SEE ALSO:**
- Chatter Post Templates for Approval Requests
- Manage Email Templates
- Merge Fields for Approvals

Choose an Automated Approver Throughout an Approval Process

Associate a hierarchy field—such as the user’s manager—with an approval process. When selected, the field is available as an assigned approver option for approval steps. You can always select a hierarchy field here but not use it for any approval steps.

Set **Next Automated Approver Determined By** with one of the following options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--None--</td>
<td>Approval requests aren’t automatically assigned based on a field. Instead, you manually specify a user to approve all approval requests.</td>
</tr>
<tr>
<td>Field</td>
<td>Approval requests are assigned to an approver from the specified field. You can select only a hierarchical relationship field, such as Manager.</td>
</tr>
</tbody>
</table>
**Option** | **Description**
---|---
**Use Approver Field of Object Owner** | Available only when Field is selected.
If selected, the first executed approval step sets the approver to the value of Field on the record owner’s user record—instead of the submitter’s user record.
All remaining steps use Field in the user record of the preceding step’s approver.

**Example:** If you select the Manager field, you can configure any step in this process to route approval requests to the submitting user’s manager.

If you select **Use Approver Field of Object Owner**, the first step that isn’t skipped is routed to the owner’s manager. All other steps are routed to the previous approver’s manager.

**SEE ALSO:**
- Custom Field Types
- Considerations for Setting Approvers

**Specify Who Can Edit Locked Records**
When a record is submitted for approval, it’s locked to prevent users from editing it during the approval process. Use the record editability properties to determine who can edit records that are locked in this approval process.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Administrators ONLY... | Default. Lets users edit the record that’s pending approval only if they have:
  - The “Modify All” object-level permission for the given object, or
  - The “Modify All Data” permission |
| Administrators OR... | Lets the assigned approver and admins edit the record. |

**Note:** Even when a campaign is locked for approval, users can add campaign members to it.
Design the Approval Request Page

The approval page is where an approver responds to an approval request. Customize which fields appear on that page and in which order. This page is used only for this approval process.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Selected Fields</strong></td>
<td>Specifies which fields to display on the approval request page. Keep in mind that approvers could view this page on a mobile device. Select only the fields necessary for users to decide whether to approve or reject records.</td>
</tr>
<tr>
<td><strong>Display approval history information...</strong></td>
<td>If selected, the approval request page displays the approval history of the associated record.</td>
</tr>
<tr>
<td><strong>Security Settings</strong></td>
<td>Controls whether users have to log in to Salesforce to see the approval request.</td>
</tr>
<tr>
<td></td>
<td><strong>Allow approvers to access the approval page only from within the application (Recommended)</strong></td>
</tr>
<tr>
<td></td>
<td>Default. Users log in to Salesforce to view the approval page.</td>
</tr>
<tr>
<td></td>
<td><strong>Allow approvers to access the approval page only from within the application, or externally from a wireless-enabled mobile device</strong></td>
</tr>
<tr>
<td></td>
<td>Users can access an external version of the approval page from a browser, including browsers on mobile devices, without logging in to Salesforce. If selected, you can’t add approval steps that let users manually select the next approver.</td>
</tr>
</tbody>
</table>

Specify Who Can Submit Records to an Approval Process

Only specified individuals or roles can submit a record for approval. You can also let submitters recall an approval request.

<table>
<thead>
<tr>
<th>Submitter Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Submitter Type</strong></td>
<td>Select a type or search to populate the Available Submitters list.</td>
</tr>
<tr>
<td><strong>Allowed Submitters</strong></td>
<td>If the user who submits a record for approval isn’t included in this list, the record doesn’t enter this approval process—even if the record meets the entry criteria.</td>
</tr>
<tr>
<td><strong>Allow submitters to recall approval requests</strong></td>
<td>If selected, submitters can recall their approval requests. If unselected, only admins can recall requests. This option is useful for situations where things can change on the submitter’s side while waiting for an approval. For example, an opportunity could be lost after the user submits it for approval.</td>
</tr>
</tbody>
</table>
Add an Approval Step to an Approval Process

Approval steps define the chain of approval for a particular approval process. Each step determines which records can advance to that step, who to assign approval requests to, and whether to let each approver’s delegate respond to the requests. The first step specifies what to do if a record doesn’t advance to that step. Later steps specify what happens if an approver rejects the request.

You can add steps to an approval process only if it is inactive.

From the approval process, click New Approval Step, and follow the wizard.

Steps are executed in the order specified.

1. Control Which Records Apply to an Approval Step
   Control which records are part of the approval step by setting the step’s criteria. You can also specify what happens to records that don’t meet the step’s criteria.

2. Identify Assigned Approvers for an Approval Step
   Specify who to send an approval request for this step to.

3. Specify Rejection Behavior for an Approval Step
   Configure what happens if an approver rejects a request. The final rejection actions for the approval process determine the first step’s rejection behavior.

SEE ALSO:

- Enable Email Approval Response

Control Which Records Apply to an Approval Step

Control which records are part of the approval step by setting the step’s criteria. You can also specify what happens to records that don’t meet the step’s criteria.

Criteria Options
If all records go through this approval step, leave All records should enter this step selected.
If only certain types of records should enter this process, select Enter this step if the following... and choose the appropriate option (1). For details on the options, see Control Which Records Apply to an Approval Process.

(2) Else Options for Approval Step Criteria
If you specified filter criteria or entered a formula, choose what happens to records that do not meet the criteria or if the formula does not return True.
**Note:** You can’t change your selection after the approval process has been activated, even if you deactivate the approval process.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>approve record</td>
<td>Approves the request and performs all final approval actions.</td>
</tr>
<tr>
<td>reject record</td>
<td>Rejects the request and performs all final rejection actions. This option is available only for the first step in the approval process.</td>
</tr>
</tbody>
</table>
| go to next step | Skips this step and goes to the next step. Available only when there’s a later step. When you apply this option in the first step, keep in mind:  
  • If the record doesn’t meet the criteria for any subsequent steps, the record is rejected.  
  • If you delete all later steps, Salesforce rejects the record.  
  When you apply this option in another step, keep in mind:  
  • If you delete all later steps, Salesforce ends the process. |

### Identify Assigned Approvers for an Approval Step

Specify who to send an approval request for this step to.

<table>
<thead>
<tr>
<th>Select Approver</th>
<th>Specify who to assign the approval to.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Let the submitter choose the approver manually. (default)</td>
<td>Prompts the user to select the next approver.</td>
</tr>
<tr>
<td>Automatically assign an approver using a standard or custom hierarchy field.</td>
<td>Assigns the approval request to the user in the field displayed next to this option. You select this field when you configure the approval process.</td>
</tr>
<tr>
<td>Automatically assign to a queue.</td>
<td>Available only for objects that support queues. Assigns approval requests to a queue.</td>
</tr>
<tr>
<td>Automatically assign to approver(s).</td>
<td>Assigns the approval request to one or more specific users, specific queues, or users related to the submitted record. You can add up to 25 approvers per step per step.</td>
</tr>
</tbody>
</table>
When multiple approvers are selected:

Available only when Automatically assign to approver(s) is selected.

Approve or reject based on the first response.

The first response to the approval request determines whether the record is approved or rejected.

Require unanimous approval from all selected approvers.

The record is approved only if everyone approves the request. If any approvers reject the request, the approval request is rejected.

The approver’s delegate may also approve this request

Users can identify a delegate in their approval settings. Delegated approvers can’t reassign approval requests; they can only approve or reject them.

SEE ALSO:

Considerations for Setting Approvers

Specify Rejection Behavior for an Approval Step

Configure what happens if an approver rejects a request. The final rejection actions for the approval process determine the first step’s rejection behavior.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Perform all rejection actions...</td>
<td>Rejects the request completely even if previous steps were approved. Salesforce performs all rejection actions specified for this step and all final rejection actions.</td>
</tr>
<tr>
<td>Perform ONLY the rejection actions for this step...</td>
<td>Rejects the request, and returns the approval request to the previous approver. Salesforce performs all rejection actions specified for this step.</td>
</tr>
</tbody>
</table>

Add Automated Actions to an Approval Process

You can associate actions to approval steps, initial submission, final approval, final rejection, or recall. Approval processes support four automated actions.

<table>
<thead>
<tr>
<th>Action Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task</td>
<td>Assigns a task to a user who you specify. You can specify the subject, status, priority, and due date of the task.</td>
</tr>
<tr>
<td>Email Alert</td>
<td>Sends an email to a designated recipient using a specified email template.</td>
</tr>
<tr>
<td>Field Update</td>
<td>Changes the value of a selected field. You can specify a value or create a formula for the new value.</td>
</tr>
<tr>
<td>Outbound Message</td>
<td>Sends a message to a designated endpoint. You can also specify a username and the data to include in the message. Not supported for approval processes on junction objects.</td>
</tr>
</tbody>
</table>
Groups of Automated Actions in an Approval Process

Each approval process is organized into groups of actions based on when the actions occur, such as initial submission. To add an automated action to your approval process, determine which group of actions to add it to.

Add an Automated Action to Your Approval Process

If you didn’t create an automated action before configuring your approval process, you can create one directly from the approval process.

Add an Existing Automated Action to Your Approval Process

If you’ve already created an automated action, you can add it to your approval process.

Icon and Shape Examples

Description

When you hover over or click a shape on the diagram, and it is part of a step, all the elements that comprise the step use a glowing background color. This visual clue helps you locate all the decisions and actions that comprise each step, and how the processing may branch based on the record's values.

In the approval process definition, if the option was enabled to perform only the rejection actions for this step and send the approval request back to the most recent approver (go back one step), the diagram displays a Go Back circle. When you click the Go Back circle, a message displays in the sidebar. For example:

On rejection send the request back to any one of the following steps, depending on the most recent approver: – list-of-steps. If no approvers are found, the request goes to Final Rejection.

The identified steps depend on where in the approval process the Go Back was defined. The possible steps are highlighted when you hover over the Go Back circle. In the diagram, the Process Visualizer displays the Go Back circle only for a step where its preceding step is defined as a skip.

The Final Approval Actions rectangle leads to a circle labeled Approved, as shown here. The Final Rejection Actions rectangle leads to a circle labeled Rejected. If a

- Review an Approval Process

Print Your Approval Process Diagram

Generate a printed copy or PDF file of your approval process to communicate information about the approval process. Sharing the diagram promotes buy-in from the people who participate in the approval decisions and helps approval process users understand the requirements and flow.

1. Open the approval process in the Process Visualizer.
2. Click Printable View.
   - In this view, the numbers on the diagram correspond to details shown in a table below the diagram.
3. Click Print, and follow your browser's print dialog. If you have an Adobe PDF print driver installed, you can save the printable view as a PDF file.

SEE ALSO:

- Process Visualizer Notation
- Review an Approval Process
Navigate a Large Approval Process Diagram

If you’re reviewing a large approval process in the Process Visualizer, we’ve provided tools to make it easier for you.

Find Specific Text

Find matching text within the diagram and the Approval Process Properties pane, and view the results highlighted in the sidebar. The Find feature is helpful when viewing a diagram with 10 or more steps, complex formulas, or the names of many people or roles on the approvers’ lists. Find is case insensitive and treats the search terms as a phrase in quotes.

• Scroll through the matches by clicking the Previous and Next buttons.
• Limit results by selecting a filter: Approval Steps, Tasks, Email Alerts, Field Updates, and Outbound Messages. If you select a filter but don’t enter any text, all instances of that filter item are highlighted in the diagram and navigation pane. All is the only filter that includes Approval Process Properties, Entry Criteria, and Go Back steps in its search parameters.

Zoom

Change the diagram’s size with the zoom slider. Zoom is visible only for diagrams that are bigger than the display window.

Navigator Window

Quickly view different areas of a large approval process diagram by clicking and dragging the pane around the navigator window. When you use the Find feature, the navigator window changes to highlight the matches and shows items not visible in the main diagram display area. The navigator also reflects changes to the size of the diagram in the main display when you use the zoom slider.

Prepare Your Org for Approvals
Considerations for Managing Approvals
Prepare Your Org for Approvals

Make sure that your users can submit their records for approval, and consider how you can make it easy for approvers to respond to approval requests.

Let Users Submit for Approval
After you activate an approval process for an object, customize the object’s page layouts to support record submission.

Let Users Respond to Approval Requests from the Home Page in Salesforce Classic
Add the Items To Approve related list to your custom home page layouts to give users an instant view of their approval requests.

Let Users Respond to Approval Requests by Email
If the email notification includes all the information that an approver needs to decide, enable email approval response. That way, a user can simply reply to the email notification.

Let Users Respond to Approval Requests from Chatter
If your users don’t need in-depth information to decide how to respond to an approval request, enable Approvals in Chatter. That way, they don’t have to leave their feed to continue with their day-to-day tasks.

SEE ALSO:
- Set Up an Approval Process
- Considerations for Approvals

Let Users Submit for Approval

After you activate an approval process for an object, customize the object’s page layouts to support record submission.

Add the following components to your page layouts.
- Submit for Approval button
- Approval History related list
  The Approval History related list lets users submit approval requests and track a record’s progress through an approval process from the record detail page.

SEE ALSO:
- Page Layouts
- Prepare Your Org for Approvals
Let Users Respond to Approval Requests from the Home Page in Salesforce Classic

Add the Items To Approve related list to your custom home page layouts to give users an instant view of their approval requests.

Do the following for each user receiving approval requests.

1. From Setup, enter Home Page Layouts in the Quick Find box, then select Home Page Layouts.
2. Next to the appropriate home page layout, click Edit.
3. Select Items to Approve.
4. Complete the Home Layout wizard, and save your changes.

SEE ALSO:
- Customizing Home Tab Page Layouts

Let Users Respond to Approval Requests by Email

If the email notification includes all the information that an approver needs to decide, enable email approval response. That way, a user can simply reply to the email notification.

Considerations for Email Approval Response
Before you enable the ability to act on approvals via email, review how email works with your approval processes.

Default Template for Email Approval Response
When you enable email approval response, Salesforce uses a default email template for approval processes—unless you specify a custom email template.

Enable Email Approval Response
After you’ve reviewed the considerations and prepared the right template, flip the switch that lets users respond to approval requests directly from their email.

SEE ALSO:
- Prepare Your Org for Approvals
- Let Users Respond to Approval Requests from Chatter
Considerations for Email Approval Response

Before you enable the ability to act on approvals via email, review how email works with your approval processes.

Compatibility with Approval Processes

Email approval response isn’t supported for approval processes that:

• Assign approval to a queue
• After the first step, let the approver manually select the next approver

Implicit Agreement with Salesforce

By enabling the email approval response feature, you agree to let Salesforce:

• Process email approval responses
• Update approval requests for all active users in your org
• Update the approval object on behalf of your org’s users

SEE ALSO:

Considerations for Approvals
Let Users Respond to Approval Requests by Email

Default Template for Email Approval Response

When you enable email approval response, Salesforce uses a default email template for approval processes—unless you specify a custom email template.

**Requesting User** has requested your approval for the following item.

To approve or reject this item, reply to this email with the word APPROVE, APPROVED, YES, REJECT, REJECTED, or NO in the first line of the email message, or click this link:

**Link to approval request page**

If replying via email you can also add comments on the second line. The comments will be stored with the approval request in Salesforce CRM.

Note: For salesforce.com to process your response the word APPROVE, APPROVED, YES, REJECT, REJECTED, or NO must be in the very first line of the reply email. Also, any comment must be in the second line.
If your org has Approvals in Chatter enabled and the approver opted to receive notifications as Chatter posts, the default email template is appended with:

You can also approve, reject and comment on this request from your Chatter feed:

**Link to approval post in Chatter**

**Note:** If you use a custom email template for your approval process, make sure that it explains both response options: clicking the link and replying by email. If the user doesn’t respond correctly (for example, if the user misspells approve or types it on the wrong line), Salesforce doesn’t register the response.

SEE ALSO:
- Manage Email Templates
- Merge Fields for Approvals
- Let Users Respond to Approval Requests by Email

**Enable Email Approval Response**

After you’ve reviewed the considerations and prepared the right template, flip the switch that lets users respond to approval requests directly from their email.

Before you begin, give the appropriate users the "API Enabled" user permission so that they can respond to approval requests by email.

1. From Setup, enter *Process Automation Settings* in the Quick Find box, then select *Process Automation Settings*.
2. Select *Enable Email Approval Response*.
3. Save your changes.

SEE ALSO:
- Considerations for Email Approval Response
- Let Users Respond to Approval Requests by Email

**Let Users Respond to Approval Requests from Chatter**

If your users don’t need in-depth information to decide how to respond to an approval request, enable Approvals in Chatter. That way, they don’t have to leave their feed to continue with their day-to-day tasks.

**Prepare to Enable Approvals in Chatter**

Because Approvals in Chatter relies on both Chatter and the Approvals feature, getting your org set up involves more than just turning on the feature. Before you enable Approvals in Chatter, understand the limitations and considerations for Approvals in Chatter and post templates.

**Considerations for Approvals in Chatter**

Before you enable Approvals in Chatter, understand how it works.
Enable Approvals in Chatter
If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds.

Where Do Approval Request Posts Appear?
When your org has Approvals in Chatter enabled, approval request posts appear in various Chatter feeds. To see the approval request post, you must have access to the approval record.

Chatter Post Templates for Approval Requests
Approval post templates for Chatter let you customize the information that is included in the approval request post when it displays in a Chatter feed.

Prepare to Enable Approvals in Chatter
Because Approvals in Chatter relies on both Chatter and the Approvals feature, getting your org set up involves more than just turning on the feature. Before you enable Approvals in Chatter, understand the limitations and considerations for Approvals in Chatter and post templates.

Do the following for each object for which you want approval requests to appear in Chatter.
1. Enable feed tracking.
2. Create an approval post template.
   Tip: For each object, create one post template that can apply for all approval processes. Mark that post template the default for the object.

SEE ALSO:
Feed Tracking
Chatter Post Templates for Approval Requests
Where Do Approval Request Posts Appear?
Considerations for Approvals in Chatter
Before you enable Approvals in Chatter, understand how it works.

• When Approvals in Chatter is enabled in your org, it is turned on for all users. Users can then update their own Chatter settings to opt out of receiving approval requests as posts in their Chatter feeds.

• Chatter post approval notifications are available only for approval processes associated with an object that has been enabled for feed tracking.

• If the approval object is a detail object in a master-detail relationship, Owner isn’t available for approval page layouts or approval post templates.

Limitations
• Approvals in Chatter doesn’t support delegated approvers or queues.

• You can’t recall or reassign an approval request from a post. Instead, perform these actions from the approval record.

• Approval requests from Sites or portal users aren’t supported.

Approval Posts
• Approval posts can’t be deleted in the Salesforce user interface; you can only delete them through the API.
• If you don’t select an approval post template, the approval post for the object uses either the system default template or the default template for the object if you created one.

• Only users with access to the approval record can see the approval request post. Comments on approval posts aren’t persisted to the approval record.

• Different users see different configurations of the approval request post.
  – Only approvers see approval action buttons on their posts, and then only in their profile feed or their news feed.
  – Only approvers see approver names in the header.

• If you change the approver, step name, or the routing type on an approval process while it’s in progress, existing approval posts aren’t updated.

• When an approval request is recalled, a new post is generated. It appears on the news feeds of the submitter, all approvers, and followers of the object. It also appears on the record feed.

• If a step requires unanimous approval from multiple approvers, the approval request post for that step doesn’t list all selected approvers in its header. Approvers see only their own name in the post header.

SEE ALSO:
Let Users Respond to Approval Requests by Email
Prepare to Enable Approvals in Chatter
Where Do Approval Request Posts Appear?
Considerations for Approvals

Enable Approvals in Chatter

If your organization has both Approvals and Chatter enabled, administrators can turn on Approvals in Chatter, which lets users receive approval requests as posts in their Chatter feeds.

Before you begin, make sure that all approval processes in your org are properly configured to take advantage of Approvals in Chatter. After turning this on feature, all existing active approval processes start generating Chatter posts.

1. From Setup, enter Chatter Settings in the Quick Find box, then select Chatter Settings.
2. Click Edit.
3. Select Allow Approvals.
4. Save your changes.

Chatter Post Templates for Approval Requests

Approval post templates for Chatter let you customize the information that is included in the approval request post when it displays in a Chatter feed.

Considerations for Chatter Post Templates for Approval Requests
Keep these limitations and dependencies in mind when working with post templates.
- Create a Chatter Post Template
  Identify which fields to display in an approval request post.

SEE ALSO:
- Create a Chatter Post Template
- Manage Deleted Custom Fields

Considerations for Chatter Post Templates for Approval Requests
Keep these limitations and dependencies in mind when working with post templates.

Limitations
- The associated object must be enabled for approvals and feed tracking.
- You can’t delete an approval post template if it’s in use by an approval process.

Dependencies
- Deleting a custom field removes it from any approval post template that references it. Existing posts aren’t affected. Undeleting the custom field restores it to the available fields list, but doesn’t restore it to any approval post templates that previously contained it.
• Deleting (or undeleting) a custom object also deletes (or undeletes) its associated approval post templates and any of its approval request posts that are already in Chatter feeds.

• If you rename a custom object, approval post templates associated with it update accordingly.

SEE ALSO:
Create a Chatter Post Template
Considerations for Approvals

Create a Chatter Post Template
Identify which fields to display in an approval request post.

1. From Setup, enter Post Templates in the Quick Find box, then select Post Templates.
2. Click New Template.
3. Select the object for your template.
4. Click Next.
5. Give the template a name and description.
6. If you want this template to be the default for the associated object, select Default.
7. Add up to four fields to display on the approval request post.
   We recommend putting any text-heavy fields—such as Comments or Description—at the bottom.
8. Save your changes.

SEE ALSO:
Choose Approval Request Notification Templates
Considerations for Chatter Post Templates for Approval Requests

Considerations for Approvals
Before you automate something with an approval process, be aware of the limitations of the feature. Educate your users on the criteria for each approval process and what each approval process does. Users can’t see which approval process is triggered when they click Submit for Approval. If the record doesn’t meet the entry criteria or if they’re not an allowed submitter for any approval processes, Salesforce displays an error.

Considerations for Configuring Approvals
When creating or editing an approval process, keep in mind how approvals are compatible with other features. Before you start, draw out the steps of your approval process.

Merge Fields for Approvals
Approval merge fields include {!ApprovalRequest.fieldName} and {!ApprovalRequestingUser.fieldName}. They’re supported in certain email templates and return different values based on the status of the approval process instance.
Considerations for Setting Approvers
When you specify approvers for a given approval step—or for the only step if you’re using the jump start wizard—keep some things in mind.

Considerations for Managing Approvals
Keep these things in mind when maintaining existing approval processes—including activating and deleting them.

SEE ALSO:
- Considerations for Email Approval Response
- Considerations for Approvals in Chatter
- Approvals: What’s Not Available in Salesforce1
- Considerations for Approval History Reports
- Restrictions for Approval Processes in Change Sets

Considerations for Configuring Approvals
When creating or editing an approval process, keep in mind how approvals are compatible with other features. Before you start, draw out the steps of your approval process.

Associated Object
If the approval object is a detail object in a master-detail relationship, Owner isn’t available for approval page layouts or approval post templates.

Compatibility with Other Features
- Flows can delete records that are pending approval.
- Design automated actions so that you can use them for both workflow rules and approval processes.

Field Update Actions in Approvals
- An approval process can specify a field update action that reevaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates are ignored.
- Field updates that are executed as approval actions don’t trigger workflow rules or entitlement processes.

Anticipate Errors
Consider reviewing the content on approvals errors. That way, you can anticipate common issues and configure your approval process so that the error is less likely.

SEE ALSO:
- What Does This Approvals Error Mean?
- Set Up an Approval Process
- Considerations for Automated Actions
- Considerations for Chatter Post Templates for Approval Requests
Merge Fields for Approvals

Approval merge fields include `{!ApprovalRequest.fieldName}` and `{!ApprovalRequestingUser.fieldName}`. They're supported in certain email templates and return different values based on the status of the approval process instance.

Tip: The submitter isn't always the current user. For custom email templates, use `{!ApprovalRequestingUser.fieldName}` instead of `{!User.fieldName}`.

Where Are Approval Merge Fields Supported?

You can use approval process merge fields in email templates, but not mail merge templates. Except for `{!ApprovalRequest.Comments}`, approval merge fields named `{!ApprovalRequest.field_name}` in email templates return values only in approval assignment emails and email alerts for approval processes. When used in other emails—including email alerts for workflow rules—the approval merge field returns `null`.

What Values Does a Merge Field Provide?

The generated value of an ApprovalRequest merge field depends on which step the approval process is in.

- In the approval request email, a merge field returns the submitter’s name and the name of the first step.
- When the request is approved, the merge field returns the most recent approver’s name and the name of the second step, if applicable.
- For subsequent actions, a merge field value returns the previous completed step.
- For an approval step that requires unanimous approval from multiple approvers, `{!ApprovalRequest.Comments}` returns only the most recently entered comment in emails.

SEE ALSO:
- Default Template for Email Approval Response
- Manage Email Templates

Considerations for Setting Approvers

When you specify approvers for a given approval step—or for the only step if you’re using the jump start wizard—keep some things in mind.

- Make sure that the assigned approver has access to read the records for the approval requests. For example, a user who can’t view expense records can’t view expense approval requests.
- Approval processes that let users select an approver manually also let users select themselves as the approver.
- You can assign an approval request to the same user multiple times in a single step. However, Salesforce sends the user only one request.
- After a record enters an approval step, the approvers for that step don’t change—even if the approval process returns to that step and the values of fields that designate the approvers have changed.

For example, an approval process’s first step requests approval from a user’s manager. If the approval request is rejected in the second step and sent back to the first step, the original manager receives the approval request again, even if the user’s manager has changed.
Assigning Approval Steps to Queues

You can assign approval requests to a queue only if the associated object supports queues. Email approval response isn’t supported for approval processes that assign approval to a queue.

When the assigned approver is a queue:

- Any queue member can approve or reject an approval request that is assigned to the queue.
- Approval request emails are sent to the queue email address. If the queue is set up to send email to members, approval request emails are also sent to the queue members, unless their approval user preferences are set to never receive approval request emails.
- Because email notifications to a queue aren’t intended for an external audience, {!ApprovalRequest.External_URL} returns the equivalent internal URL.
- Salesforce1 notifications for approval requests aren’t sent to queues. For each approval step involving a queue, we recommend adding individual users as assigned approvers, so at least those individuals can receive the approval request notifications in Salesforce1. To have both queues and individual users as assigned approvers, select **Automatically assign to approver(s)** instead of **Automatically assign to queue** in the approval step.
- When an approval request is rejected and returned to the previous approver and the previous approver was a queue, the approval request is assigned to the user who approved it instead of the queue.
- The Approval History related list displays the queue name in the Assigned To column and the actual user who approved or rejected the approval request in the Actual Approver column.

SEE ALSO:

- Identify Assigned Approvers for an Approval Step
- Considerations for Approvals

Considerations for Managing Approvals

Keep these things in mind when maintaining existing approval processes—including activating and deleting them.

**Admin Permissions**

Users with one of these permissions are considered approval admins.

- “Modify All” object-level permission for the given object
- “Modify All Data” user permission

Approval admins can:

- Approve or reject pending approval requests without being part of the approval process
- Edit records that have been locked for approval

**Activating Approval Processes**

- An approval process must have at least one step before you can activate it.
- Before you activate your approval process, test it in your Salesforce sandbox.
- After an approval process is activated, you can’t add, delete, or change the order of the steps or change its reject or skip behavior, even if the process is inactive.

**Monitoring In-Flight Approval Processes**

Standard reports for approval requests are included in both the Administrative Reports folder and the Activity Reports folder.

**Deleting Approval Processes**

Before you delete an approval process:
1. Make sure it’s inactive.
2. Delete pending approval requests that are associated with it, and remove them from the Recycle Bin.

Sample Approval Processes
Review samples of common approval processes to help you get started creating your own.

Sample Approval Process: PTO Requests
Most companies require employees to file a PTO (Paid Time Off) request and have their manager approve it. In three phases, here’s how to automate a simple one-step PTO request process using Salesforce.

Sample Approval Process: Expense Reports
If your company requires that employees file expense reports for managers to approve, you can automate this process in Salesforce. Use this example to create a two-step expense report approval process for all employees in your headquarters office. It specifies that expenses less than $50 are automatically approved, expenses $50 and over require manager approval, and expenses over $5,000 require additional approval from two VPs. This example highlights a parallel approval process and the "else" option.

Sample Approval Process: Discounting Opportunities
Opportunities that are discounted more than 40% require a CEO approval. Use this example to create a one-step approval process.

Sample Approval Process: Job Candidates
When your company interviews candidates for a position, you may have several levels of approval before you can send an offer letter. Use this example to create a three-step approval process that requires approval from multiple management levels.

Sample Approval Process: PTO Requests
Most companies require employees to file a PTO (Paid Time Off) request and have their manager approve it. In three phases, here’s how to automate a simple one-step PTO request process using Salesforce.

Prep Your Organization
Before creating the approval process:

- If you do not yet have a custom object to track your PTO requests, create a custom object and tab called PTO Requests. Add the appropriate fields for your PTO Requests such as Start Date, End Date, and Employee Name.
- Create an email template to notify approvers that an approval request needs to be reviewed. Direct users to the approval page in Salesforce by including approval process merge fields.

Create the Approval Process
Use the jump start wizard to create an approval process for the PTO Request custom object and specify the following:
• Select the email template you created for this approval process.
• Don’t specify filter criteria. That way, PTO requests are included in this approval process regardless of their attributes.
• Select the Automatically assign an approver using a standard or custom hierarchy field option, then choose Manager.
• The jump start wizard automatically chooses the record owner as the only person who can submit PTO requests.

Tip: To let the submitter withdraw a submitted PTO request:
1. Click Edit and choose Initial Submitters.
2. Select Allow submitters to recall approval requests.

Wrap Things Up

After creating the approval process, add the Approval History related list to the PTO Request object page layout.

Tip: Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests that are waiting for their response.

If available, use your sandbox to test the approval process, then activate it.

Sample Approval Process: Expense Reports

If your company requires that employees file expense reports for managers to approve, you can automate this process in Salesforce. Use this example to create a two-step expense report approval process for all employees in your headquarters office. It specifies that expenses less than $50 are automatically approved, expenses $50 and over require manager approval, and expenses over $5,000 require additional approval from two VPs. This example highlights a parallel approval process and the “else” option.

Prep Your Organization

Before creating the approval process:

• If you do not yet have a custom object to track your expenses, create a custom object and tab called Expense Reports. Add the appropriate fields such as Amount, Description, Status, Start Date, and End Date.
• Create an email template to notify approvers that an approval request needs to be reviewed. Direct users to the approval page in Salesforce by including approval process merge fields.
• Create a custom field on the user object called Office Location. Assign the “HQ” value to users in the headquarters office location.
Create the Approval Process

Create an approval process using the Expense Report custom object and specify the following:

- The filter criteria for this approval process is **Current User: Office Location equals HQ**. Records must meet this criteria before they can be submitted to this approval process.
- Choose the Manager field as the next automated approver.
- Create an email template to notify approvers that an approval request needs to be reviewed. Direct users to the approval page in Salesforce by including approval process merge fields.
- Choose the record owner or any other user who you want to be able to submit expense reports.
- Create two approval steps:
  1. Create a step named **Step 1: Manager Approval** with the following specifications:
     - Name this step **Step 1: Manager Approval**.
     - Select **Enter this step if the following and choose criteria are met**. Also, choose **approve record** for the else option.
     - Set the filter criteria to: **Expense: Amount greater or equal 50**.
     - In the **Automatically assign to approver(s)** option, select the manager of the user submitting the request.
     - If appropriate, choose **The approver's delegate may also approve this request** if you want to allow the user in the Delegated Approver field to approve requests.
  2. Create a second approval step named **Step 2: Multiple VP Approval** and specify the following:
     - Use the filter criteria **Expense Amount greater or equal 5000**.
     - Choose **Automatically assign to approver(s)** and select two users with a VP role.
     - Select the **Require UNANIMOUS approval from all selected approvers** option. The request isn’t approved unless both designated users approve.
     - If appropriate, choose **The approver's delegate may also approve this request** if you want to allow the user in the Delegated Approver field to approve requests.
     - Choose **Perform ONLY the rejection actions for this step...** so that the request returns to the manager for changes if one of the VPs rejects the request.

**Tip:** Consider creating the following final approval actions:

- Define a field update to automatically change the **Status** field to “Approved.”
- Send an approval notification to the user who submitted the expense report.
- Send an outbound message to your back-office financial system to print a reimbursement check.

Wrap Things Up

After creating the approval process, add the Approval History related list to the Expense Report object page layout.

**Tip:** Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests that are waiting for their response.
If available, use your sandbox to test the approval process, then activate it.

SEE ALSO:

  Create Custom Fields
  Set Up an Approval Process
  Prepare Your Org for Approvals

Sample Approval Process: Discounting Opportunities
Opportunities that are discounted more than 40% require a CEO approval. Use this example to create a one-step approval process.

Prep Your Organization
Before creating the approval process:
  • Create an email template to notify approvers that an approval request needs to be reviewed. Direct users to the approval page in Salesforce by including approval process merge fields.
  • Create the following custom fields for opportunities:
    – A percent field called Discount Percent so that users can enter a percentage discount.
    – A checkbox field called Discount Approved to indicate whether the CEO approved the discount.

Create the Approval Process
Create an approval process on the Opportunity object and specify the following:
  • The filter criteria for this approval process is Discount Percent greater or equal 0.4. Records must meet this criteria before they can be submitted to this approval process.
  • You don’t need to choose a custom field as the next automated approver because you specify later that the CEO must approve all requests.
  • Select the email template you created for this approval process.
  • Choose the record owner as the only user who can submit a discount request for approval.
  • Create one approval step with no filter criteria since all records submitted need to be approved or rejected.
  • Choose Automatically assign to approver(s) and select the name of your CEO.
  • If appropriate, choose The approver’s delegate may also approve this request if you want to allow the user in the Delegated Approver field to approve requests.
  • Consider creating the following final approval actions:
    – Email alert to notify the user who submitted the discount request.
    – Field update to automatically select the opportunity Discount Approved checkbox.

Wrap Things Up
After creating the approval process, add the Approval History related list to the appropriate opportunity page layouts.
Tip: Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests that are waiting for their response.

If available, use your sandbox to test the approval process, then activate it.

SEE ALSO:
- Manage Email Templates

- Set Up an Approval Process
- Prepare Your Org for Approvals

Sample Approval Process: Job Candidates

When your company interviews candidates for a position, you may have several levels of approval before you can send an offer letter. Use this example to create a three-step approval process that requires approval from multiple management levels.

Prep Your Organization

Before creating the approval process:

- If you don’t yet have a custom object to track candidates, create a custom object and tab called Candidates. Add the appropriate fields such as Salary, Offer Extended (checkbox), and Date of Hire.
- Create an email template to notify approvers that an approval request needs to be reviewed. Direct users to the approval page in Salesforce by including approval process merge fields.

Create the Approval Process

Create an approval process on the Candidate custom object using the following specifications:

- Don’t enter filter criteria because you want all submitted offers to be approved.
- Choose the Manager field as the next automated approver.
- Select the email template you created for this approval process.
- Choose the record owner or any other user that you want to be able to submit offer letters.
- Create three approval steps:
  1. Create a step named Step 1: Manager Approval:
     - No filter is necessary as you want all records to advance to this step.
     - In the Automatically assign to approver(s) option, select the manager of the user submitting the request.
     - If appropriate, choose The approver's delegate may also approve this request if you want to allow the user in the Delegated Approver field to approve requests.
  2. Create a second step named Step 2: VP Approval:
     - No filter is necessary as you want all records to advance to this step.
     - Choose Let the user choose the approver to allow the manager to select the appropriate VP to approve the request.
– If appropriate, choose **The approver's delegate may also approve this request if you want to allow the user in the Delegated Approver field to approve requests.**
– Choose **Perform only the rejection actions for this step...** so that the request returns to the manager for changes if the VP rejects the request.

3. Create a third step named **Step 3: CFO Approval:**
– No filter is necessary as you want all records to advance to this step.
– Choose **Automatically assign to approver(s) and select the name of your CFO.**
– If appropriate, choose **The approver's delegate may also approve this request if you want to allow the user in the Delegated Approver field to approve requests.**
– Choose **Perform all rejection actions for this step AND all final rejection actions. (Final Rejection)** so that offer letters rejected by your CFO are completely rejected.

**Tip:**
- Consider creating the following final approval actions:
  – Email alert to notify the user who submitted the offer letter request.
  – Field update to select the **Offer Extended** checkbox.
- Consider creating the following final rejection actions:
  – Email alert to notify the manager that the offer won't be extended.

**Wrap Things Up**

After creating the approval process, add the Approval History related list to the Candidates object page layout.

**Tip:** Consider adding the Items To Approve related list to your custom home page layouts. It gives users an instant view of the approval requests that are waiting for their response.

If available, use your sandbox to test the approval process, then activate it.

Approval History Reports

If you create a custom report type for approval process instances, users can view the historical details of completed and in-progress approval processes and their individual steps.

Fields Available for Approval History Reports

If you create a custom report type with Process Instance as the primary object and Process Instance Node as the related object, you can create approval history reports with various combinations of fields that enable you to view a detailed history of executed and in-progress approval processes and their individual steps.

Examples of Approval History Reports

See sample reports to learn how you can obtain approval history data.

Considerations for Approval History Reports

Understand the limitations and special behaviors when you create or view approval history reports, which provide a detailed history of approval processes and steps.

SEE ALSO:

Create a Custom Report Type for Approval History

Fields Available for Approval History Reports

If you create a custom report type with Process Instance as the primary object and Process Instance Node as the related object, you can create approval history reports with various combinations of fields that enable you to view a detailed history of executed and in-progress approval processes and their individual steps.

Process Instance

A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Process: Name</td>
<td>Name of the approval process.</td>
</tr>
<tr>
<td>Approval Process ID</td>
<td>ID of the approval process instance.</td>
</tr>
<tr>
<td>Completed Date</td>
<td>Date and time when the approval process instance was completed or recalled. If no step criteria are met and the record is auto-approved or auto-rejected, Completed Date and Submitted Date have the same values.</td>
</tr>
<tr>
<td>Elapsed Days</td>
<td>Length of time between when the record was submitted for approval and when the approval process was completed or recalled.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Elapsed Minutes</td>
<td></td>
</tr>
<tr>
<td>Last Actor: Full Name</td>
<td>Full name of the user who most recently participated in the approval process instance. If no step criteria are met and the record is auto-approved or auto-rejected, Last Actor: Full Name and Submitter: Full Name have the same values.</td>
</tr>
<tr>
<td>Object Type</td>
<td>Object type of the record that was submitted for approval.</td>
</tr>
<tr>
<td>Pending Step Name</td>
<td>Name of the approval step at which the record is awaiting approval or rejection.</td>
</tr>
<tr>
<td>Record Name</td>
<td>Name of the record that was submitted for approval.</td>
</tr>
<tr>
<td>Status</td>
<td>Status of the approval process instance.</td>
</tr>
<tr>
<td>Submitted Date</td>
<td>Date and time when the record was submitted for approval.</td>
</tr>
<tr>
<td>Submitter: Full Name</td>
<td>Full name of the user who submitted the record for approval.</td>
</tr>
</tbody>
</table>

**Process Instance Node**

A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn’t meet the step criteria or if the approval process instance is otherwise completed without entering the step.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step: Name</td>
<td>Name of the approval step.</td>
</tr>
<tr>
<td>Step: Completed Date</td>
<td>Date and time when the approval step instance was completed or recalled.</td>
</tr>
<tr>
<td>Step Elapsed Days</td>
<td>Length of time between when the record entered the approval step and when the approval step instance was completed or recalled.</td>
</tr>
<tr>
<td>Step Elapsed Hours</td>
<td></td>
</tr>
<tr>
<td>Step Elapsed Minutes</td>
<td></td>
</tr>
<tr>

- Examples of Approval History Reports
Examples of Approval History Reports

See sample reports to learn how you can obtain approval history data.

**Report Example: Opportunity Approvals Submitted Within a Date Range**

This sample report displays approval process instances that were submitted within a specified date range (1) for the Opportunity object (2). The results are sorted by status (3) and include the last actor (4), submitted date (5), completed date (6), record name (7), approval process instance ID (8), and approval process name (9).

![Opportunity Approvals for Q2FY2014](image)

**Report Example: Approvals—Elapsed Times**

This sample report displays all approval process instances (1) and groups results by the approval process name (2). The results include the record name (3), approval process instance ID (4), status (5), submitted date (6), elapsed minutes (7), and completed date (8).
Report Example: Approval Steps—Elapsed Times

This sample report displays all approval process instances (1) and groups results by approval process name (2) and record name (3). The results are sorted by step name (4) and include step status (5), step start date (6), step elapsed minutes (7), step completed date (8), and approval process instance ID (9).
Notice that the previous sample report doesn’t include the approvers for each step and the elapsed time for each approval request. To get this information, run a SOQL query by using the approval process instance ID from the report. The following sample SOQL query obtains the ActorID (user or queue that received the approval request) and the ElapsedTimeInHours (elapsed time since the approval request was sent) for the first pending step in the report.

```
SELECT ActorId, ElapsedTimeInHours FROM ProcessInstanceWorkitem where processInstanceId = '04gD0000000LvIV'
```
The sample query has only one result, and you can view that approver's user profile page by appending the resulting ActorID to the organization's base URL (https://MyCompany.salesforce.com/005D00000015vGIAY), which gets redirected to the user profile page.

SEE ALSO:
Approval History Reports
Considerations for Approval History Reports

Understand the limitations and special behaviors when you create or view approval history reports, which provide a detailed history of approval processes and steps.

Considerations for Approval Processes That Were Completed Before or Pending During the Summer '14 Rollout

When Summer '14 became available for your organization, the approval history data was automatically populated for completed and pending approval processes. However, some approval history field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

<table>
<thead>
<tr>
<th>Object</th>
<th>When Fields are Populated</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Instance</td>
<td>For approval process instances that were completed before the Summer '14 rollout, all Process Instance fields are automatically populated, with one exception: Completed Date is never populated for approval process instances that were completed before January 1, 2013. For approval process instances that were pending during the Summer '14 rollout, all Process Instance fields are automatically populated, with two exceptions: Completed Date and Last Actor: Full Name are populated only after the approval process instance is complete.</td>
</tr>
<tr>
<td>Process Instance Node</td>
<td>Never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all Process Instance Node fields are populated only after the approval process instance is next acted upon after the Summer '14 rollout.</td>
</tr>
</tbody>
</table>

Considerations for the Sandbox Environment

If you copy approval history data to a sandbox, some field values are overwritten and don’t reflect the actual approval history.

<table>
<thead>
<tr>
<th>Object</th>
<th>Field</th>
<th>When an existing process instance or process instance node record is copied to a sandbox...</th>
</tr>
</thead>
<tbody>
<tr>

Manage Multiple Approval Requests

Transfer multiple approval requests from one user to another or remove multiple approval requests from the approval process.

Transfer Pending Approval Requests
If users move to a new role before they complete all their pending approval requests, transfer the remainder to another user.

Remove Pending Approval Requests
If you want to clean up old approval requests—such as to delete an approval process—remove them from your Salesforce org. After approval requests are removed, the associated records are unlocked and removed from all approval processes, so they no longer appear on the approver’s list of pending approval requests.

SEE ALSO:

- Considerations for Managing Approvals
Transfer Pending Approval Requests

If users move to a new role before they complete all their pending approval requests, transfer the remainder to another user.

1. From Setup, enter Mass Transfer Approval Requests in the Quick Find box, then select Mass Transfer Approval Requests.
2. Search for the approval requests to transfer.
3. Select Mass transfer outstanding approval requests to a new user.
4. Look up and select the user to transfer the requests to. 
   Make sure that the user can view the records that are associated with the approval requests.
5. Add comments.
   The comments you enter display on the Approval History related list.
6. Select each approval request that you want to transfer.
7. Click Transfer.

Approval Requests for Users

Your admin can set up approval processes that let you and other users submit records for approval, which results in *approval requests*.

Submit a Record for Approval
Depending on your org’s customizations, you can submit a record for approval directly from that record.

Withdraw an Approval Request
If you submitted a record for approval but suddenly need to update information in the record, recall the approval request. However, whether you can recall an approval request depends on how your admin configured the approval process that the record was submitted to.

Respond to an Approval Request
When you receive an approval request, respond to it by approving, rejecting, or reassigning it. Depending on which Salesforce experience you’re using, you have different options. Approval request comments are limited to 4,000 characters. In Chinese, Japanese, or Korean, the limit is 1,333 characters.

What Does This Approvals Error Mean?
Here are some errors that you could encounter when submitting a record for approval or responding to an approval request.

Approval History Status
To track where a record is in an approval process, view its Approval History related list.

Approval User Preferences
Identify a delegated approver and control whether you receive approval request emails.

Submit a Record for Approval

Depending on your org’s customizations, you can submit a record for approval directly from that record.

1. Go to the record that you want to submit for approval.
2. Make sure it’s ready to be submitted.
   Before you can submit a record for approval, it must meet the criteria for an active approval process. If you’re not sure what the requirements are, ask your admin.

3. Click **Submit for Approval**.
   If an approval process applies to the record, Salesforce begins the approval process. This button isn’t available after the record has been submitted.

To keep tabs on the progress of your submitted approval, we recommend following the approval record in Chatter.

In-App Notification

Depends on the Receive Approval Request Emails field in your approver preferences. If notifications are enabled for your org, you receive a notification whenever you receive an approval request email.

- Respond from the notification if your admin enabled actionable notifications.
- To open the approval request, click the notification.

Email Notification

Depends on the Receive Approval Request Emails field in your approver preferences.

- To open the approval request, click the link in the email.
- Reply to the email if your admin enabled email approval response.

EDITIONS

Available in: Salesforce Classic

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To withdraw an approval request:
- "Read" on the record

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To respond to an approval request from within Salesforce:
- "Read" on the associated record

To respond to an approval request from an email:
- "API Enabled"
Record
Respond from the Approval History related list.

Chatter
Depends on if your admin has enabled Approvals in Chatter and you haven’t opted out of receiving approval requests through Chatter posts.

- Respond from the post if your admin enabled actionable notifications.
- Click the name of the record, then respond from the Approval History related list.

Home
Depends on if your admin added the Items to Approve component to your home page. From the Home tab, respond from the Items to Approve component.

Tip: From this component, you can respond to multiple requests at once.

Respond to an Approval Request by Replying to the Email Notification
If your admin has enabled email approval response, you can approve or reject requests by responding to the email notification, regardless of which Salesforce experience or mobile email client you’re using. Delegated approvers can also respond to approval requests by email.

Troubleshoot Email Responses to Approval Requests
When email responses aren’t working correctly, review these common issues.

Respond to an Approval Request by Replying to the Email Notification
If your admin has enabled email approval response, you can approve or reject requests by responding to the email notification, regardless of which Salesforce experience or mobile email client you’re using. Delegated approvers can also respond to approval requests by email.

Email approval response works in all languages that Salesforce supports. The response word or phrase is checked using the current user language dictionary. If no matches are found, the response word or phrase is checked in all other language dictionaries.

1. In the first line of your reply to the email notification, enter one of the supported response words.
   Periods and exclamation marks are allowed at the end of the word.

<table>
<thead>
<tr>
<th>Approval Words</th>
<th>Rejection Words</th>
</tr>
</thead>
<tbody>
<tr>
<td>approve</td>
<td>reject</td>
</tr>
<tr>
<td>approved</td>
<td>rejected</td>
</tr>
<tr>
<td>yes</td>
<td>no</td>
</tr>
</tbody>
</table>

2. Optionally, in the second line of your reply, add comments.
3. Send the email.

Troubleshoot Email Responses to Approval Requests

When email responses aren’t working correctly, review these common issues.

I’m not receiving approval requests by email.

Here are a few possible reasons why.

- Your approval preferences opt you out of approval request emails.
- Your mail server thinks the approval request email is spam. Contact your email admin, who can check the logs of all inbound email to see if it’s being delivered, rejected, or marked as spam.
- Your email admin needs to whitelist the Salesforce email addresses that the approval requests come from.
- Email delivery time can vary based on your ISP or connection.

My response wasn’t delivered.

- An email approval request can only be processed once. If another user has responded to the approval request before you do, you get an error.
- You must have the “API Enabled” user permission to respond to approval requests by email.

I received an email that said, “The word used to approve or reject the item was not understood.”

Salesforce doesn’t process replies to error emails. Reply again to the original email notification, but this time use one of the supported response words on page 4327.

I received an email that said, “You are not authorized to update the referenced object.”

The approval request email is tied to your email address. You receive this error if you forward the request to another email address or if your email client lets you respond from multiple email addresses. Reply again to the original email notification, but this time reply from the same email address that received the email approval request.

Approval Requests for Users
What Does This Approvals Error Mean?

Here are some errors that you could encounter when submitting a record for approval or responding to an approval request.

**Manager undefined**

This approval request requires the next approver to be determined by the *Field Name* field. This value is empty.

Salesforce tried to route the approval request based on a hierarchical field, such as Manager. However, the field has no value or specifies an inactive user. This error can occur when a user submits a record for approval or when an approver responds to an approval request.

**Required fields are missing: [FieldName].**

The approval process includes a field update that fails standard validation rules for the identified field. This error can occur even if the field isn’t visible on your page layout.

*Note:* Salesforce doesn’t make sure that field updates pass custom validation rules on fields.

Approval Process Terminology

The following terminology is used for approval processes in Salesforce.

Approval Actions
An approval action occurs when a step is approved by all the required approvers.

Approval Process
An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

Approval Request
An approval request is an email, Salesforce1 notification, Lightning Experience notification, or Chatter post notifying the recipient that a record was submitted for approval and that his or her approval is requested.
Approval Steps
Approval steps define the chain of approval for a particular approval process. Each step determines which records can advance to that step, who to assign approval requests to, and whether to let each approver’s delegate respond to the requests. The first step specifies what to do if a record doesn’t advance to that step. Later steps specify what happens if an approver rejects the request.

Assigned Approver
The assigned approver is the user responsible for responding to an approval request.

Delegated Approver
A delegated approver is a user appointed by an assigned approver as an alternate for approval requests.

Email Approval Response
Email approval response lets users respond to approval requests by replying to an email notification.

Initial Submission Actions
An initial submission action occurs when a user first submits a record for approval. By default, the record is locked.

Final Approval Actions
Final approval actions occur when all required approvals have been given for a record.

Final Rejection Actions
A final rejection action occurs when an approver rejects the request and it goes to the final rejection state.

Outbound Message
An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API.

Process Instance
A process instance represents one instance of an approval process. A new process instance is created each time a record is submitted for approval.

Process Instance Node
A process instance node represents an instance of an approval step. A new process instance node is created each time a record enters a step in an approval process. No process instance node is created when the record doesn’t meet the step criteria or if the approval process instance is otherwise completed without entering the step.

Recall Actions
A recall action occurs when a submitted approval request is recalled. By default, the record is unlocked.

Record Locking
Record locking prevents users from editing a record, regardless of field-level security or sharing settings. By default, Salesforce locks records that are pending approval. Only admins can edit locked records.

Visual Workflow

Visual Workflow lets you automate business processes by building flows and distributing them to the right users or systems. A flow is an application that can execute logic, interact with the Salesforce database, call Apex classes, and collect data from users. You can build flows by using the Cloud Flow Designer.

Flows can either require user interaction—perhaps a wizard or guided UI for data entry—or run in the background on their own—perhaps something that automatically transfers records when a user’s role changes.

Limits and Considerations for Visual Workflow
When designing, managing, and running flows, consider the permissions, use limits, and data issues.

Create a Flow
Once you understand the process that you want to automate, design a flow in the Cloud Flow Designer for that process.

Manage Your Flows
Use the flow detail page to do anything with your flow outside of designing it—such as activating a flow, testing it, or viewing its properties.

Distribute Your Flow
Once you’ve created and activated a flow version, distribute it to users so that they can run it. The right distribution method depends on the users that you want to distribute the flow to: internal users, external users, systems, or other organizations.

Why Did My Flow Interview Fail?
To troubleshoot a failed flow interview, use the flow fault email. You can also set up temporary Screen or Send Email elements to identify the problem.

Flow Interviews
A flow interview is a running instance of a flow. A flow is an application built by your administrator that asks you for inputs and does something in Salesforce based on those inputs.

Visual Workflow Terminology

Which Automation Tool Do I Use?
Flow Building Blocks

What’s the Difference Between Workflow and Visual Workflow?
Despite their similar names, Workflow and Visual Workflow are separate Salesforce features for automating business processes.

Workflow
Workflow enables you to set up workflow rules. A workflow rule identifies what kinds of record changes or additions trigger specified workflow actions, such as sending email alerts and updating record fields.

Workflow rules and actions are associated with a specific object (and can cross objects only to update fields on a related master record).
Visual Workflow

Visual Workflow enables you to create flows, which are triggered by users rather than events. Unlike Workflow, which always executes rules and actions behind the scenes, Visual Workflow offers screens for displaying and collecting information from the user running the flow.

Note: You can, however, participate in a pilot program that enables workflow rules to execute flows behind the scenes. The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.

Flows aren’t tied to any one object. They can look up, create, update, and delete records for multiple objects.

In case you’re wondering, the “visual” in Visual Workflow refers to the ability to visually build flows using the Cloud Flow Designer. Its drag-and-drop user interface lets you build flows without writing any code.

Limits and Considerations for Visual Workflow

When designing, managing, and running flows, consider the permissions, use limits, and data issues.

- Limits for Visual Workflow
  When using Visual Workflow, keep flow limits and Apex governor limits in mind.
- Considerations for Designing Flows
  When you design flows, keep certain guidelines in mind.
- Considerations for Managing Flows
  When managing flows, consider the administration and activation limits.
- Considerations for Running Flows
  When you run or test a flow, keep certain limits and guidelines in mind.
- Flow Accessibility
  Visual Workflow is 508-compliant with a few exceptions.

Apex Governor Limits that Affect Flows
Salesforce strictly enforces limits to ensure that any runaway flows don’t monopolize shared resources in the multitenant environment. Per-transaction limits, which Apex enforces, govern flows. If an element causes the transaction to exceed governor limits, the system rolls back the entire transaction. The transaction rolls back even if the element has a defined fault connector path.

Flows in Transactions
Each flow interview runs in the context of a transaction. A transaction represents a set of operations that are executed as a single unit. For example, a transaction can execute Apex triggers and escalation rules in addition to a flow interview. If one interview in a transaction fails, all the interviews in the transaction are rolled back, as well as anything else the transaction did. The transaction doesn’t retry any of the operations—including the flow interview.

Flow Bulkification in Transactions
Programmers can design their code so that similar actions are performed together in one batch. For example, one operation to create 50 records rather than 50 separate operations that each create one record. This process is called bulkification, and it helps your transaction avoid governor limits. If you’re working with flows, you don’t even have to think about bulkification. Flow interviews bulkify actions for you automatically.

</tr>
</tbody>
</table>

¹ Autolaunched flows are part of the larger transaction through which they were launched. For example, flows launched from a process are executed with the process actions as part of the larger transaction. Flows with Screen elements can span multiple transactions. A new transaction begins each time the user clicks Next in a screen. Flows with Wait elements span multiple transactions. A transaction ends when a flow interview begins to wait for an event. When the flow interview resumes, a new transaction begins. Everything after the Wait element is executed as part of a batch transaction that includes other resumed interviews.

**SEE ALSO:**
- Apex Developer Guide: Execution Governors and Limits
- Limits for Visual Workflow

**Flows in Transactions**

Each flow interview runs in the context of a transaction. A transaction represents a set of operations that are executed as a single unit. For example, a transaction can execute Apex triggers and escalation rules in addition to a flow interview. If one interview in a transaction fails, all the interviews in the transaction are rolled back, as well as anything else the transaction did. The transaction doesn’t retry any of the operations—including the flow interview.

In each transaction, Salesforce enforces governor limits to prevent shared resources from being depleted. Because multiple Salesforce organizations share the same resources, Salesforce prevents one organization from depleting all the resources and leaving the other organizations high and dry. It’s similar to an apartment building that uses one cache of water to service every tenant. If your neighbor
uses all the water, you can’t take a shower. (It’s trite, but hopefully you get the idea.) Per-transaction governor limits help prevent such things from happening.

**When Does a Flow’s Transaction Start?**

Depending on how the flow was distributed, a transaction that runs an interview for that flow starts in different ways.

**When Does a Flow’s Transaction End?**

When a transaction ends depends on whether the flow contains certain elements and whether it originally started because a record was changed.

**SEE ALSO:**

*Flow Bulkification in Transactions*

### When Does a Flow’s Transaction Start?

Depending on how the flow was distributed, a transaction that runs an interview for that flow starts in different ways.

<table>
<thead>
<tr>
<th>Distribution Method</th>
<th>Transaction starts when...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process Builder</td>
<td>A record is created or updated.</td>
</tr>
<tr>
<td>Flow URL</td>
<td>The URL is accessed.</td>
</tr>
<tr>
<td>Custom button or link</td>
<td>The button or link is clicked.</td>
</tr>
<tr>
<td>Visualforce page</td>
<td>The page is accessed.</td>
</tr>
<tr>
<td><code>Interview.start()</code> method</td>
<td>If the method starts via a <em>before</em> or <em>after</em> trigger, the transaction starts when a record is created or updated. Otherwise, the transaction starts when the method (or a parent method) is invoked. The <code>start()</code> method shares its limits with other operations in the transaction and other methods in the class.</td>
</tr>
<tr>
<td>REST API (Custom Actions or Flows resource)</td>
<td>When the REST call is made. Depending on how the REST call is implemented, the limits can be shared with other operations.</td>
</tr>
</tbody>
</table>

1The same also applies if the flow is distributed through a workflow rule. The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.

**Note:** When a Screen or Wait element is executed, the existing transaction ends and a new one begins.

### When Does a Flow’s Transaction End?

When a transaction ends depends on whether the flow contains certain elements and whether it originally started because a record was changed.

The transaction ends when:

- A Screen or Wait element is executed
• The order of execution has completed—if the flow was triggered when a record was created or updated
• All the interviews in the transaction have finished

Tip: If you think that a flow’s interview is likely to hit governor limits within its transaction, consider adding a Wait element or a Screen element.

If the interview is one of many things being done in a given transaction, that interview shares the transaction’s governor limits with the other operations.

Example: You update 100 cases through Data Loader. Due to the order of execution in a transaction and the customizations in your organization, here’s what happens.

<table>
<thead>
<tr>
<th>Transaction Operation</th>
<th>DML Statement Used</th>
<th>SOQL Query Used</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Cases are saved to the database, but aren’t committed yet.</td>

<td></td>
</tr>
<tr>
<td>2 Case assignment rules are executed. Each case’s owner is updated.</td>
<td></td>
<td>✔</td>
</tr>
<tr>
<td>3 Case escalation rules are executed. If any case has been open for 10 days, an email is sent to the owner.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4 Process is started.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>5 Process looks up the case’s account.</td>
<td></td>
<td>✔</td>
</tr>
<tr>
<td>6 If the account is hot, process uses Chatter to notify the account owner that there’s a new case associated with the account.</td>
<td></td>
<td>✔</td>
</tr>
<tr>
<td>7 Process launches a flow interview.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>8 Flow interview looks up the parent account and how many cases it has.</td>
<td></td>
<td>✔</td>
</tr>
<tr>
<td>9 Flow interview checks whether the account has more than five open cases.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>10 If it does, flow interview looks up the account’s division manager then posts on the account’s Chatter feed to notify the division manager and account owner.</td>
<td></td>
<td>✔</td>
</tr>
<tr>
<td>11 If it doesn’t, flow interview posts on the account’s Chatter feed to notify only the account owner.</td>
<td></td>
<td>✔</td>
</tr>
</tbody>
</table>

**Flow Bulkification in Transactions**

Programmers can design their code so that similar actions are performed together in one batch. For example, one operation to create 50 records rather than 50 separate operations that each create one record. This process is called *bulkification*, and it helps your transaction avoid governor limits. If you’re working with flows, you don’t even have to think about bulkification. Flow interviews bulkify actions for you automatically.
How Does Flow Bulkification Work?
Interview operations are bulkified only when they execute the same element. That means that the interviews must all be associated with the same flow.

Which Flow Elements Can Be Bulkified?
Flows can bulkify any element that performs a DML statement or SOQL query or does something else external to the flow, like sending an email.

Example of Flow Bulkification
This example demonstrates how operations are bulkified for a flow when 100 cases are updated through Data Loader.

SEE ALSO:
Flows in Transactions

How Does Flow Bulkification Work?
Interview operations are bulkified only when they execute the same element. That means that the interviews must all be associated with the same flow.

When multiple interviews for the same flow run in one transaction, each interview runs until it reaches a bulkifiable element. Salesforce takes all the interviews that stopped at the same element and intelligently executes those operations together. If other interviews are at a different element, Salesforce then intelligently executes those operations together. Salesforce repeats this process until all the interviews finish.

If, despite the bulkification, any interview hits a governor limit, all the interviews in the transaction fail. Any operations that the interviews performed are rolled back, and the transaction doesn’t try to perform the operations again.

Example: When you upload 100 cases, the flow MyFlow_2 triggers one interview for each case.

- 50 interviews stop at Record Create element Create_Task_1.
- The other 50 interviews stop at Record Create element Create_Task_2.

The result? At least two groups of bulk operations to execute.

- One for the 50 interviews that execute Create_Task_1
- One for the 50 interviews that execute Create_Task_2

Which Flow Elements Can Be Bulkified?
Flows can bulkify any element that performs a DML statement or SOQL query or does something else external to the flow, like sending an email.

Elements that create, update or delete records
When a record is created, updated, or deleted, the transaction performs a DML statement.

- Create elements (Record Create, Fast Create)
- Update elements (Record Update, Fast Update)
- Delete elements (Record Delete, Fast Delete)
- Quick Action elements
- Post to Chatter elements
- Submit for Approval elements
• Apex elements—depending on your organization (invocable Apex only)

Elements that look up records
When fields on a record are looked up, the transaction performs a SOQL query.
• Lookup elements (Record Lookup, Fast Lookup)
• Record Update elements
• Record Delete elements
• Apex elements—depending on your organization (invocable Apex only)

Elements that send emails
• Send Email elements
• Email Alert elements
• Apex elements—depending on your organization (invocable Apex only)

Note:
• Unlike invocable Apex, Apex Plug-in elements aren’t bulkified.
• Although invocable Apex is bulkified, the flow has no way of knowing what the invoked methods’ operations are. If you want those operations to also be bulkified, make sure the code follows bulkification best practices.

SEE ALSO:
Apex Developer Guide: Running Apex within Governor Execution Limits

Example of Flow Bulkification
This example demonstrates how operations are bulkified for a flow when 100 cases are updated through Data Loader.

The Associated Flow
You’ll understand the concepts better if you understand the design of the associated flow.
The flow:

1. Looks up the case’s parent account and how many open cases that account has.
2. Checks whether the account has more than five cases open.
3. If the account has more than five open cases:
   a. Looks up the division manager for the account.
   b. Posts on the account’s Chatter feed to notify the division manager and the account owner.
4. If the account has five or fewer open cases, posts on the account’s Chatter feed to notify only the account owner.

The Bulkified Interviews

When you update the records, one flow interview is created for each case simultaneously. All of the interviews are associated with the same flow. Each interview runs until it gets to a bulifiable element.

The first interview goes through the Record Lookup element (1). Because Record Lookups can be bulified, the interview waits there until all the other interviews have done the same. Then, Salesforce executes all the Record Lookup operations together (because they’re all for the same element in the same flow). Instead of 100 SOQL queries, the transaction issues one SOQL query.

The first interview is evaluated by the Decision element (2). The account has six cases, so the interview is routed down the “More than 5” path. The interview proceeds to the second Record Lookup element (3a). Because it’s a bulifiable element, the interview waits there.

The second interview is evaluated by the Decision element (2). This account has one case, so the interview is routed down the “5 or fewer” path. The interview proceeds to the Post to Chatter element (4). This element is also bulifiable, so the interview waits there.

After all the interviews have been processed, 30 are waiting to execute the second Record Lookup element (3a) and the remaining 70 are waiting to execute the Post to Chatter element (4).

Salesforce executes all the Record Lookup (3a) operations for the first 30 interviews together. Instead of 30 separate SOQL queries, the transaction issues one.
Next, the transaction returns to the Post to Chatter element (4), where the 70 interviews are ready to execute their Post to Chatter operations. Remember, these are the interviews whose accounts don’t have more than five cases. Salesforce executes the Post to Chatter operations together. Instead of 100 separate DML statements to create each Chatter post, the transaction issues one DML statement to create all 100 posts at one time. Because the Post to Chatter element isn’t connected to a subsequent element, those 70 interviews finish.

The 30 interviews—which looked up the relevant division manager—proceed to the final Post to Chatter element (3b). When all 30 interviews are ready, Salesforce executes all 30 Post to Chatter operations together. Instead of issuing 30 separate DML statements for the individual Chatter posts, it issues one. Because the Post to Chatter element isn’t connected to another element, those 30 interviews finish.

Considerations for Designing Flows

When you design flows, keep certain guidelines in mind.

Deleting Variables

If you delete an sObject variable or sObject collection variable, any variable assignments that use the deleted variable are set to null.

Manipulating Percentage Values

Test your flows carefully if they use sObject variables to manipulate percentage values. When you insert a value into an sObject variable’s percentage field and then reference that field in a formula, the value is automatically divided by 100.

For example, an opportunity’s Probability field is set to 100. If you assign that value to sObject variable {!Opportunity.Probability}, the value is still 100. But if you create a formula whose expression is {!Opportunity.Probability}, the value is 1.

Referring to Blank Fields or Resources

If you leave any field or resource value blank, that value is null at run time. To treat a text value as an empty string instead of null, set it to {!$GlobalConstant.EmptyString}.

Boolean Types Treat null Differently than false

Flow treats null as a different value than false. For example, if you try to find a record whose checkbox field is set to null, no records are returned. Instead, look for records where the checkbox field is set to false. If you’re using a variable (such as myCheckbox = {!varBoolean}), make sure that the variable isn’t set to null before you reference it in your record filter or condition.

Setting the Record Type

To set the record type for a record, use the ID of the record type. Look up the record type by its name and then store its ID in the flow.

For example, use a Record Lookup element to find the RecordType record whose Name is “Reduction Order”. Then store that record type’s ID in a variable. You can then use the variable to set the Order Record Type field on an order record.

Working with Person Accounts

If your org uses person accounts, reference Contact.Salutation instead of Account.Salutation.

External Objects

External objects aren’t supported in flows.

Considerations for the Cloud Flow Designer

When you create a flow in the Cloud Flow Designer, familiarize yourself with its limitations and behaviors. For example, it supports a handful of locales and can’t open flows from managed packages.
Guidelines for Working with Large Flows
Business processes can be complex. When your flow is too large for the canvas, control the zoom, search in the Explorer tab, or collapse the left side panel.

Limitations for Multi-Select Choice Fields
Multi-select checkboxes and multi-select picklist fields let flow users select multiple choices in a screen field. Before you start using multi-select choice fields, understand how they work in flows, both when you design the flows and when your users run them.

Limitations for Flow Formulas
When you create a formula resource or add validation to a screen input field, understand the limitations of formulas in Visual Workflow.

Limitations for Time-Based Flows
Before you design flows that contain one or more Wait elements, understand the limitations and guidelines.

SEE ALSO:
Create a Flow
Flow Operators
Limits and Considerations for Visual Workflow
Cross-Object Field References in Flows

Considerations for the Cloud Flow Designer
When you create a flow in the Cloud Flow Designer, familiarize yourself with its limitations and behaviors. For example, it supports a handful of locales and can’t open flows from managed packages.

- At run time, time zones for date/time values can differ from what you see in the Cloud Flow Designer. During run time, date/time values reflect the running user's time zone settings in Salesforce. In the Cloud Flow Designer, date/time values reflect the time zone set on your computer. The Cloud Flow Designer appends the GMT offset to your date/time value.
- The Cloud Flow Designer doesn’t support UTF-8 encoding for text in user input fields.
- The Cloud Flow Designer contains embedded fonts for all locales it supports. The supported locales are:
  - English (US)
  - French (France)
  - German (Germany)
  - Spanish (Spain)
  - Japanese (Japan)
  - Chinese (Traditional)
  - Chinese (Simplified)
If you enter unsupported characters for a supported locale, they're displayed using system fonts instead of the embedded fonts. In unsupported locales, your system font settings are used to display all characters in the Cloud Flow Designer.

- The Cloud Flow Designer can’t open flows that are installed from managed packages.
- Don’t enter the string null as the value of a text field in the Cloud Flow Designer.
- The Cloud Flow Designer has access to information that exists when you open it. If you modify data or metadata in your organization and need to refer to it in a flow, close and reopen the Cloud Flow Designer. For example, if you add a custom field or modify an Apex class with the Cloud Flow Designer open, close and reopen the Cloud Flow Designer.
• The Cloud Flow Designer uses the permissions and locale assigned to the current user.
• If you open a flow that was last opened in Winter ’12 or earlier, each Boolean decision is converted to a multi-outcome Decision element that:
  – Uses the same name as the old decision.
  – Takes the unique name of the old decision, appended with "_switch".
  – Has an outcome labeled “True”. This outcome’s unique name matches that of the old decision, and its conditions are migrated from the True outcome of the old decision.
  – Has a default outcome labeled “False”.

Guidelines for Working with Large Flows

Business processes can be complex. When your flow is too large for the canvas, control the zoom, search in the Explorer tab, or collapse the left side panel.

Zoom
To zoom in and out of your flow, use the + and - buttons on the right side of the canvas.

Search in the Explorer tab
Looking for a specific element or resource? Search for it in the Explorer tab.

• To find an element with a specific name, type in the search box.
• To find all instances of a certain element or resource, click the magnifying glass and select the type.

Once you find the right resource in the Explorer tab, see which elements are using the resource. In the Description pane, click the Usage tab.
Once you find the right element in the Explorer, find that element in your canvas. Hover over the element, and click the magnifying glass.

The element is highlighted in green in your canvas.

If the element wasn’t in view, the Cloud Flow Designer automatically scrolls to show the element.

**Collapse the left side panel**

To hide the Palette, Resources, and Explorer tabs from your view, click the left arrow next to the side panel. That way, you get even more space in the canvas.

**Limitations for Multi-Select Choice Fields**

Multi-select checkboxes and multi-select picklist fields let flow users select multiple choices in a screen field. Before you start using multi-select choice fields, understand how they work in flows, both when you design the flows and when your users run them.

**Configuring a Multi-Select Resource Field**

- A multi-select choice field can have only one default value.
- A dynamic record choice resource can be configured to assign field values from a user-selected record to variables in the flow. When a multi-select choice field uses a dynamic record choice, only values from the last record that the user selects are stored in the flow.
variables. If multiple multi-select choice fields on one screen use the same dynamic record choice, the variable assignments obey the first of those fields.

**Using Values from a Multi-Select Resource Field**
- At run time, a multi-select field’s value is a concatenation of the user-selected choice values, separated by semicolons. If any of the selected choices’ values included semi-colons, those semi-colons are removed.
- If you referenced multi-select choice fields in flow conditions, follow these best practices.
  - Configure a stored value for each choice that you use in multi-select choice fields.
  - Don’t use the same choice in multiple multi-select choice fields on the same screen.

SEE ALSO:
- Flow Screen Element: Choice Fields

**Limitations for Flow Formulas**
When you create a formula resource or add validation to a screen input field, understand the limitations of formulas in Visual Workflow.
- Flow formulas can’t contain more than 3,000 characters.
- A formula returns null if:
  - The value that the formula returns doesn’t match its data type.
  - The formula contains an unsupported function.

For example, if your formula resource has a data type of Number, the output must be numeric.
- These functions aren’t supported in a flow formula.
  - GETRECORDIDS
  - IMAGE
  - INCLUDE
  - ISCHANGED
  - ISNEW
  - PARENTGROUPVAL
  - PREVGROUPVAL
  - PRIORVALUE
  - REQUIRE SCRIPT
  - VLOOKUP

For a complete list of operators and functions for building formulas in Salesforce, see Formula Operators and Functions on page 4106.
- In a flow, the CONTAINS function checks all characters within its parentheses. For cross object field references, CONTAINS works like it does in the rest of Salesforce. It checks only the first 250 characters in the reference.

Here’s an example. `varContract` refers to an sObject variable that contains the values of a contract record. This formula expression checks only the first 250 characters.

```
CONTAINS({!varContract.Account.Description}, "description")
```

This formula expression checks all characters in the field.

```
CONTAINS({!varContract.Description}, "description")
```
• If a Display Text screen field contains an invalid formula resource, the flow displays an empty string at run time.
• If a flow contains an invalid formula resource, you can’t activate the flow.

SEE ALSO:
  Flow Formula Resource
  Flow Resources

Limitations for Time-Based Flows
Before you design flows that contain one or more Wait elements, understand the limitations and guidelines.
• After you deactivate a flow or flow version, the associated waiting interviews continue as usual. You can’t delete a flow or flow version if it has associated waiting interviews.
• An interview can execute only one event path per Wait element. After one of its events is processed, the remaining events are removed from the queue.
• An organization can process up to 1,000 events per hour. When an event is processed, the interview that it’s associated with is resumed and any other events for that interview are removed from the queue. If an organization exceeds this limit, Salesforce processes the remaining events in the next hour.

  For example, an organization has 1,200 events scheduled to be processed between 4:00 PM and 5:00 PM. Salesforce processes 1,000 events between 4:00 PM and 5:00 PM and the additional 200 events between 5:00 PM and 6:00 PM.
• An organization can have up to 30,000 interviews waiting at a given time.
• If the user who started the interview is deactivated when Salesforce tries to execute an event path, the interview fails to resume.

Transactions and Waiting Interviews
A transaction ends as soon as a flow interview begins to wait for an event. When the flow interview resumes, a new transaction begins. Everything after the Wait element is executed as part of a batch transaction that includes other resumed interviews.

Interviews aren’t resumed independently. They’re grouped into a single batch that starts resuming within one hour after the first interview enters the batch. Any actions that fire as a result of those grouped interviews are also executed in that transaction. This behavior can cause you to exceed your Apex governor limits if the resumed interview executes DML operations or SOQL queries through:
• Flow elements such as Record Create or Fast Lookup
• Apex Plug-in elements
• Apex triggers
• Immediate workflow actions

For details on Apex governor limits, see Limits for Visual Workflow on page 4335.

If a Wait element precedes any flow elements that execute DML operations or SOQL queries:
• Ensure that your flows don’t perform more DML operations or SOQL queries between Wait elements than the Apex governor limits allow.
• Consider using multiple Wait elements so that the DML operations and SOQL queries are performed in multiple transactions.
• Add fault paths for those elements so that the flow returns to the Wait element if the fault message contains:

  Too many SOQL queries
or

Too many DML operations

If an interview fails after it’s resumed:

• Prior interviews in that batch’s transaction are successful.
• Operations that the interview executed before it waited are successful.
• If a fault connector handles the failure, operations that the interview executed between when it resumed and when it failed are successful. The operation that caused the interview to fail isn’t successful.
• If a fault connector doesn’t handle the failure, operations that the interview executed between when it resumed and when it failed are rolled back. The operation that caused the interview to fail isn’t successful.
• The remaining interviews in that batch are tried.

Limitations for General Alarms

• Alarms don’t support minutes or seconds.
• If an interview is waiting for an event that’s set for a time in the past, Salesforce resumes the interview within one hour.

For example, a flow is configured to email an opportunity owner seven days before the close date. An interview is started for an opportunity with the close date set to today. Salesforce resumes the interview within an hour.

Limitations for Absolute Time Alarms

• Absolute time alarms are evaluated based on the time zone of the user who created the flow.

Limitations for Relative Time Alarms

• Relative time alarms are evaluated based on the organization’s time zone.
• Across all your flow versions, your organization can have up to 20,000 defined relative time alarms.
• Alarms can’t reference the following:
  – DATE or DATETIME fields that contain automatically derived functions, such as TODAY or NOW.
  – Formula fields that include related-object merge fields.
• If you change a date field that’s referenced by an unexecuted relative time alarm in a waiting interview, Salesforce recalculates the events associated with the interview.

For example, a flow is configured to email an opportunity owner seven days before the opportunity close date and the close date is 2/20/2014. The following things could happen.

– The close date isn’t updated before the interview resumes. Result: Salesforce resumes the interview on 2/13/2014 and sends the email.
– The close date is updated to 2/10/2014 before the interview resumes. Result: Salesforce reschedules the relative time alarm and the interview resumes on 2/3/2014.
– The close date is updated to a date in the past. Result: Salesforce recalculates the relative time alarm and resumes the interview shortly after you save the record.

• If a relative time alarm references a null date field when the interview executes the Wait element, Salesforce resumes the interview within an hour.
• If a relative time alarm references a date field that’s that has a non-null value when the flow interview executes the Wait element and it’s updated to null before the alarm is processed, Salesforce resumes the interview within an hour after the date field is updated.
• If a waiting interview has a relative time alarm and the referenced record or object is deleted, the alarm is removed from the queue. If the interview has no other events to wait for, the interview is deleted.
• You can’t archive a product or price book that’s referenced in a relative or absolute time alarm in a waiting interview.
• Lead Convert Limitations
  – You can’t convert a lead that has associated relative time alarms in waiting interviews.
  – If Validation and Triggers from Lead Convert is enabled, existing operations on leads after a Wait element aren’t executed during lead conversion.
  – If a campaign member based on a lead is converted before a waiting interview that’s associated with that record finishes, Salesforce still executes the interview.

  Flow Wait Element

Considerations for Managing Flows

When managing flows, consider the administration and activation limits.

Activating Flows
When you activate a new version of a flow, the previously activated version (if one exists) is automatically deactivated. Any running flow interview continues to run using the version with which it was initiated.

Deleting Flows
To delete an active flow version, first deactivate it. If a flow has any paused or waiting interviews, it can’t be deleted until those interviews are finished or deleted. Flows that have never been activated can be deleted immediately.

Flow Properties
The properties for a given flow’s versions automatically match the active version’s properties by default. In other words, if you have three versions and you activate version 2, Salesforce updates the properties for versions 1 and 3 to match version 2. However, if you edit the properties for an inactive version, that version’s properties are no longer automatically updated to match the active version.

The flow’s active (or latest) version determines the flow’s type. For example, if a flow’s active version contains a screen, its type is Flow. It can’t be implemented through a system-based method, like the Process Builder.

Considerations for Installed Flows
Keep these considerations in mind when you distribute, upgrade, or remove a flow that you installed from a package.

SEE ALSO:
  Manage Your Flows
  Limits and Considerations for Visual Workflow
Considerations for Installed Flows

Keep these considerations in mind when you distribute, upgrade, or remove a flow that you installed from a package.

- The Cloud Flow Designer can’t open flows that are installed from managed packages.
- If you install a package that contains multiple flow versions in a fresh destination organization, only the latest flow version is deployed.
- If you install a flow from a managed package, error emails for that flow’s interviews don’t include any details about the individual flow elements. The email is sent to the user who installed the flow.
- If you install a flow from an unmanaged package that has the same name but a different version number as a flow in your organization, the newly installed flow becomes the latest version of the existing flow. However, if the packaged flow has the same name and version number as a flow already in your organization, the package install fails. You can’t overwrite a flow.

Status

An active flow in a package is active after it’s installed. The previous active version of the flow in the destination organization is deactivated in favor of the newly installed version. Any in-progress flows based on the now-deactivated version continue to run without interruption but reflect the previous version of the flow.

Distributing Installed Flows

- When you create a custom button, link, or Web tab for a flow that’s installed from a managed package, include the namespace in the URL. The URL format is /flow/namespace/flowuniquename.
- When you embed a flow that’s installed from a managed package in a Visualforce page, set the name attribute to this format: namespace.flowuniquename.

Upgrading Installed Flows

Upgrading a managed package in your organization installs a new flow version only if there’s a newer flow version from the developer. After several upgrades, you can end up with multiple flow versions.

Removing Installed Flows

- You can’t delete a flow from an installed package. To remove a packaged flow from your organization, deactivate it and then uninstall the package.
- You can’t delete flow components from Managed - Beta package installations in development organizations.
- If you have multiple versions of a flow installed from multiple unmanaged packages, you can’t remove only one version by uninstalling its package. Uninstalling a package—managed or unmanaged—that contains a single version of the flow removes the entire flow, including all versions.

SEE ALSO:

Flows in Change Sets and Packages
Considerations for Deploying Flows with Packages
Install a Package
Considerations for Running Flows

When you run or test a flow, keep certain limits and guidelines in mind.

- Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.
- At run time, time zones for date/time values can differ from what you see in the Cloud Flow Designer. During run time, date/time values reflect the running user’s time zone settings in Salesforce.
- Interviews don’t perform actions—such as sending emails or creating, editing, or deleting records—until the associated transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element. Record and Fast elements aren’t the only ones to create or update records. Post to Chatter, Submit for Approval, and Quick Actions elements do, as well.
- Don’t use your browser’s Back or Forward buttons to navigate through a flow. Doing so can result in inconsistent data between the flow and Salesforce.
- A single flow can have up to 50 different versions. When you run a flow, you see the active version, but your admin could have a more recent version.
- For flows that interact with the Salesforce database, make sure that your users have permission to create, read, edit, and delete the relevant records and fields. Otherwise, users receive an insufficient privileges error when they try to launch a flow. For example, a flow looks up and updates a case record’s status. The flow users must have “Read” and “Edit” permissions on the Status field of the Case object.
- When you distribute a flow, don’t pass a currency field value from a Salesforce record into a flow Currency variable with a URL parameter. When a currency field is referenced through a merge field (such as {!Account.AnnualRevenue}), the value includes the unit of currency’s symbol (for example, $). Flow variables of type Currency can accept only numeric values, so the flow fails at run time. Instead, pass the record’s ID to a flow Text variable with a URL parameter. Then in the flow, use the ID to look up that record’s value for the currency field.

From Salesforce1 or a Lightning page

If you’re running a flow from Paused Flow Interviews in Salesforce1 or from a Lightning page:

- The flow doesn’t validate Currency or Number input fields when the value exceeds 18 digits.
- For choice input fields that require dates, you must enter the date in this format: YYYY-MM-DD

SEE ALSO:

- Test a Flow
- Flow Interviews
- Limits and Considerations for Visual Workflow
Flow Accessibility
Visual Workflow is 508-compliant with a few exceptions.

- The title of the screen doesn’t change when you click Next or Previous, so you might not realize you’re on a new page.
- Radio button fields don’t have labels. Screen readers can’t distinguish between questions.
- Questions without defined prompts can read incorrectly.
- Errors are not noted when reading the fields.

SEE ALSO:
Limits and Considerations for Visual Workflow

Create a Flow
Once you understand the process that you want to automate, design a flow in the Cloud Flow Designer for that process.

Tip: Before you start creating your flow, plan it out. It’s much easier to automate a business process by using Visual Workflow when you fully understand the details of your business process.

If you’re new to the Cloud Flow Designer, we recommend walking through one or more of the sample flow tutorials in the Cloud Flow Designer Workbook. They’re a great way to learn about the tool and discover how it works.

1. Open the Cloud Flow Designer. From Setup, enter Flows in the Quick Find box, then select Flows, and then click New Flow.
2. Drag the appropriate elements onto the canvas.
   Tip: If you’re not sure which element you need for a node, add a Step element as a placeholder until you figure it out. You can always replace the Step later.
3. Connect the elements together so that it’s clear what the order of the elements is.
4. Identify which element the flow should start with when it runs.
5. Save any changes that you made to the flow.
6. Test the flow to make sure it’s working as you expect it to.
7. Activate the flow so that users can run it.
8. Distribute the flow to the appropriate users.

SEE ALSO:
Manage Your Flows
Considerations for Designing Flows
Flow Accessibility
Flow Building Blocks
Flow Building Blocks

Use combinations of elements, connectors, and resources to build flows.

- Each element (1) represents an action that the flow can execute. Examples include reading or writing Salesforce data, displaying information to and collecting data from flow users, executing logic, or manipulating data.
- Each connector (2) defines an available path that the flow can take at run time.
- Each resource (3) represents a value that you can reference throughout the flow.

Flow Elements
Flow Resources
Flow Connectors
Cloud Flow Designer

The Cloud Flow Designer lets you design flows without writing any code.

Watch a Demo: Visual Workflow Cloud Flow Designer Overview

For a collection of useful resources, including videos and sample flows, open the Cloud Flow Designer and click Get Started.

Requirements for the Cloud Flow Designer

To use the Cloud Flow Designer, you need an up-to-date browser and Adobe® Flash® Player.

Tour the Cloud Flow Designer User Interface

Before you use the Cloud Flow Designer to design flows, understand the tool's main components.

Search Within a Flow

As a flow grows and becomes more complex, it becomes more challenging to find things within it. The Cloud Flow Designer offers tools for quickly finding flow elements and resources.

Search Within the Palette

As you add more flows, actions, and Apex classes to your organization, it becomes more challenging to find a specific item in the Palette. You can, however, search in the Palette to quickly find the right element for your flow.

SEE ALSO:
- Flow Elements
- Flow Resources

Requirements for the Cloud Flow Designer

To use the Cloud Flow Designer, you need an up-to-date browser and Adobe® Flash® Player.

We recommend:

- Windows® Internet Explorer® versions 8 through 11, Google® Chrome™, or Mozilla® Firefox®. Internet Explorer 6 and 7 are not supported.
- Adobe® Flash® Player version 10.1 and later. The minimum version required to run the Cloud Flow Designer is 10.0.
- A minimum browser resolution of 1024x768.

Tour the Cloud Flow Designer User Interface

Before you use the Cloud Flow Designer to design flows, understand the tool's main components.
Button Bar (1)

Manage your flow as you build it.

- **Run** runs the most recent saved version of the flow that you have open. If the flow contains subflow elements, each subflow runs the active version of its referenced flow. If the referenced flow has no active version, then the subflow element runs the latest version of its referenced flow.
- The status indicator on the right side displays whether:
  - The flow is active or not
  - The latest changes to the flow are saved or not
  - There are any warnings or errors in the last saved version of the flow

To see a list of the warnings or errors, click the indicator.

Canvas (2)

The canvas is the working area, where you build a flow by adding elements. As you add elements to the canvas and connect them together, you see a visual diagram of your flow.

Palette Tab (3)

Add new elements, like Screens and Record Creates, to your flow from the Palette tab.

Resources Tab (4)

Create resources, like a variable or formula, to use in your flow from the Resources tab.
Explorer Tab (5)

The Explorer tab is a library of all elements and resources that you've added to the flow.

Search Within a Flow

Search Within a Flow

As a flow grows and becomes more complex, it becomes more challenging to find things within it. The Cloud Flow Designer offers tools for quickly finding flow elements and resources.

Open the flow in the Cloud Flow Designer. Then find an element or resource in the flow by using one or more of the following options.

- On the Explorer tab, enter search text. The Explorer tab displays only the elements and resources whose properties contain the entered text.
- Filter the Explorer tab contents to one type of element or resource by clicking . To remove the filter, click and select SEARCH ALL.
- Dim all visible elements on the canvas other than the results by selecting Highlight Results on Canvas.
- Zoom in and out as desired using the controls near the top right corner of the canvas area.
- To see the location of an Explorer item on the canvas, complete one of the following procedures.
  - If the Explorer item is a canvas-visible element or a screen field:
    1. Hover over the item on the Explorer tab.
    2. Click .
  - If the Explorer item is a resource that doesn't appear on the canvas:
    1. Click the item on the Explorer tab.
    2. Click the Usage tab in the Description pane.
    3. Hover over an element listed on the Usage tab.
    4. Click its .
    The canvas shifts to display the element and momentarily highlights it.

SEE ALSO:
Tour the Cloud Flow Designer User Interface
Search Within the Palette

As you add more flows, actions, and Apex classes to your organization, it becomes more challenging to find a specific item in the Palette. You can, however, search in the Palette to quickly find the right element for your flow.

From the Palette tab, use the following options to find a specific item.

- Next to the search icon, enter search text.
  The Palette displays only the items that contain the entered text.
- To filter the Palette tab contents to one type of element, click the filter icon, and select what you want to see.
- To remove the filter, click the filter icon and select SEARCH ALL.

SEE ALSO:
Tour the Cloud Flow Designer User Interface

Set a Flow’s Start Element

Before you can save a flow, indicate which element to execute first.

1. Hover over the starting element in your flow.
2. Click the execution icon.

SEE ALSO:
Save a Flow
Save a Flow

After you create a flow in the Cloud Flow Designer, you have some options for saving the flow.

Initial save
When you save a new flow for the first time, a dialog box appears. Enter values for each of the flow’s properties. Once you save the flow, the unique name can’t be changed.

Quick save
After you’ve saved a flow once, the Save button works as a quick-save, overwriting your previous work. However, the Save button doesn’t work when editing active flows. To save your changes as a new version or new flow, use Save As.

Save As
After you’ve saved your flow once, this button is enabled with two options:

- **Save as new flow** opens a dialog box where you can input a new name, unique name, and description, then save your changes as an entirely new flow.
- **Save as new version** saves the flow as a new version of the current flow. Use this option if you want to change a flow and keep the old configuration as a backup.

Each flow can have up to 50 versions. You can’t update the unique name when you save a new version.

When saving a flow or flow version:

- If you have the flow detail page open in one browser tab, then edit a version in another tab, before you run the edited version:
  1. Save the version.
  2. Close the Cloud Flow Designer.
  3. Refresh the flow detail page in the first tab.
- If you’ve changed the flow properties and for some reason the flow fails to save, the flow properties don’t revert to the previous values.

SEE ALSO:
- Cloud Flow Designer
- Activate or Deactivate a Flow Version

Common Flow Tasks

A handful of tasks are common to multiple flow use cases. For example, you can define conditions in both Decision and Wait elements.

- **Manage Flow Elements, Resources, and Connectors**
  Customize your flow by adding, editing, or removing elements, resources, and connectors.

- **Working with Salesforce Records in a Flow**
  The real power of a flow is that it can automate updates to your organization’s records. In a flow, you can automatically look up values from records, create records, update records, delete records—the whole shebang!

- **Validate Users’ Inputs with Flow Formulas**
  Just like with regular validation rules, you can validate what users enter in flow screens.
Define Flow Conditions
Control when a flow takes a specific decision outcome or waits for a specific wait event.

Define the Path That a Flow Takes
Identify which elements the flow executes and in what order by connecting the elements on your canvas together.

Customize What Happens When a Flow Fails
If your flow contains an element that interacts with the Salesforce database—such as a Record Update or Submit for Approval element, it can fail. Modify the default behavior by adding fault paths to all elements that can fail.

Manage Flow Elements, Resources, and Connectors
Customize your flow by adding, editing, or removing elements, resources, and connectors.

<table>

Flow Connectors

Working with Salesforce Records in a Flow
The real power of a flow is that it can automate updates to your organization’s records. In a flow, you can automatically look up values from records, create records, update records, delete records—the whole shebang!

For each of those operations, the Cloud Flow Designer offers at least two elements to choose from. Review the following topics to understand the differences between those elements and decide which one is best for your use case.

Tip: Be familiar with the API names for the objects and fields that you want to work with. The Cloud Flow Designer displays API names instead of labels.

Pull Values from Salesforce Records into a Flow
Before you can use information from your Salesforce records in a flow, pull that information into variables in your flow. Use either a Record Lookup element or a Fast Lookup element. The right element depends on what the rest of your flow is doing.
Create Salesforce Records from a Flow
To create Salesforce records, use either the Record Create, Quick Action, or Fast Create element. The right element depends on what the rest of your flow is doing.

Update Salesforce Records from a Flow
To update field values on existing Salesforce records, use either the Record Update, Quick Action, or Fast Update element. The right element depends on what the rest of your flow is doing.

Delete Salesforce Records from a Flow
To delete Salesforce records, use either the Record Delete or Fast Delete element. The right element depends on what the rest of your flow is doing.

Pull Values from Salesforce Records into a Flow
Before you can use information from your Salesforce records in a flow, pull that information into variables in your flow. Use either a Record Lookup element or a Fast Lookup element. The right element depends on what the rest of your flow is doing.

Alternatively, pass values in from an element that interacts with the Salesforce database—such as the ID of the post created by a Post to Chatter element.

Example: You need to email a given account’s owner. To do so, the flow needs to know the email address and name of that user.

To pull values into a flow from records in your organization, use either the Record Lookup or Fast Lookup element in the Cloud Flow Designer.

How do I choose between flow lookup elements?
The two flow lookup elements are pretty similar. This table summarizes the two main differences between them.

<table>
<thead>
<tr>
<th>Element</th>
<th>Can store values in ...</th>
<th>To map field values to flow variables ...</th>
<th>Number of records it looks up</th>
</tr>
</thead>
</table>
| Record Lookup | Variables, sObject variables | 1. Identify each field that you want to store.  
2. For each field, identify a flow variable to store that specific value in.  
Because you directly map each field value to a variable, you get more granularity with this element. However, with more granularity comes more clicking. | Exactly one. |
| Fast Lookup   | sObject variables, sObject collection variables | 1. Identify the flow variable in which you want to store all field values.  
2. Identify the fields whose values you want to store in that flow variable. | If an sObject variable: one.  
If an sObject collection variable: at least one. |

Unless you want to map each field to a variable with fewer mouse clicks, it can be hard to choose between the two elements. To choose the right lookup element, figure out what type of variable you need to store the values in.
To store the values in a single-value non-sObject variable, use the Record Lookup element.

To store the values in an sObject collection variable, use the Fast Lookup element.

To store the values in a single-value sObject variable, it’s your choice. (Fast Lookup might save you some clicks!)

**Tip:** It’s best practice to use Fast elements whenever possible, so that you save your org’s limits. For more information, see Flow Bulkification in Transactions.

**Example:** Here’s how you’d store a user’s email and name by using each of the lookup elements.

<table>
<thead>
<tr>
<th>Record Lookup</th>
<th>Field</th>
<th>Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Id</td>
<td>(lVarUserld)</td>
</tr>
<tr>
<td></td>
<td>Email</td>
<td>(lVarUserEmail)</td>
</tr>
<tr>
<td></td>
<td>FirstName</td>
<td>(lVarUser FirstName)</td>
</tr>
<tr>
<td></td>
<td>LastName</td>
<td>(lVarUser LastName)</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Fast Lookup</th>
<th>Variable (lUserFields)</th>
<th>Assign null to the variable if no record exists</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Specify which of the record’s fields to save:**

<table>
<thead>
<tr>
<th>Fields</th>
<th>Id</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Email</td>
</tr>
<tr>
<td></td>
<td>FirstName</td>
</tr>
<tr>
<td></td>
<td>LastName</td>
</tr>
</tbody>
</table>

**SEE ALSO:**

- Flow Record Lookup Element
- Working with Salesforce Records in a Flow
Create Salesforce Records from a Flow

To create Salesforce records, use either the Record Create, Quick Action, or Fast Create element. The right element depends on what the rest of your flow is doing.

**Example:** When the customer’s satisfaction score drops below a certain number, automatically create a case.

To create one or more Salesforce records, your flow:

1. Identifies the field values for the new records.
2. Saves those changes to the Salesforce database. (In other words, until the changes are saved to the database, the changes exist only within the flow.)

How do I choose between flow elements that create records?

The main difference between create elements lies in how many records the element can create and how it knows the field values to apply.

**I need to create more than one record at a time.**

To create more than one record at a time, use a Fast Create element with an sObject collection variable. It’s best practice to use Fast elements whenever possible, so that you stay within your org’s limits. For more information, see Flow Bulkification in Transactions.

Record Create and Quick Action elements can create only one record at a time. Fast Create elements can create either one record (if using an sObject variable) or multiple records (if using an sObject collection variable).

**I need to create exactly one record.**

If you’ve already populated an sObject variable with the values you want your record to have, use a Fast Create element.

If you want to use a combination of the values from an sObject variable and values from other resources (like single-value variables or screen input fields), use either a Record Create or Quick Action element. Those two elements differ in these ways.

- Which fields are available in the elements
- Whether the element provides any required fields for the object
- Whether the element lets you store the new record’s ID

Storing the ID is useful, for example, if you create an account and then want to create a contact that’s associated with that account (which you obviously need the ID for).

<table>
<thead>
<tr>
<th>Field Availability</th>
<th>Required Fields</th>
<th>New Record ID</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Record Lookup</strong></td>
<td>Every field on the object. You manually select the object and every field you want to have a value.</td>
<td>Not indicated</td>
</tr>
<tr>
<td><strong>Fast Lookup</strong></td>
<td>Only fields that are included in the Quick Action layout. If you supplied default values for certain fields when you created the quick action, those values are used when the record is created.</td>
<td>Indicated Requiredness is based on what’s marked required in the quick action layout.</td>
</tr>
</tbody>
</table>
Tip: Use the Quick Actions element when all these statements are true.

1. The action is of type Create.
2. The action’s layout includes all the fields that you want to update.
3. You don’t need to reference the new record’s ID later in the flow.

Otherwise, use the Record Create element.

Example: Here’s how you’d create a case when a customer’s satisfaction score is too low by using each of the create elements.

<table>
<thead>
<tr>
<th>Record Create</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContactId</td>
</tr>
<tr>
<td>Description</td>
</tr>
<tr>
<td>Status</td>
</tr>
<tr>
<td>Subject</td>
</tr>
<tr>
<td>AccountId</td>
</tr>
</tbody>
</table>

You can set any field on the record, but the Record Create element doesn’t know which fields are required for this object.

<table>
<thead>
<tr>
<th>Fast Create</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable: (ivarCase)</td>
</tr>
</tbody>
</table>

Assumes (ivarCase) is already populated with the right fields.

<table>
<thead>
<tr>
<th>Quick Action (of type Create)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Contact ID</td>
</tr>
<tr>
<td>Subject</td>
</tr>
<tr>
<td>Status</td>
</tr>
<tr>
<td>Description</td>
</tr>
</tbody>
</table>

These four fields are the only fields that you can set for this element, because they’re the only ones available from the action layout. Contact ID is required by the associated action layout, so it’s required in this element.

SEE ALSO:
- Flow Fast Create Element
- Working with Salesforce Records in a Flow
- Flow Quick Action Element
- Flow Record Create Element
Update Salesforce Records from a Flow

To update field values on existing Salesforce records, use either the Record Update, Quick Action, or Fast Update element. The right element depends on what the rest of your flow is doing.

**Example:** On an opportunity record, when a user clicks the "Won" button, a flow updates the opportunity’s stage.

To update fields on one or more existing Salesforce records, your flow:

1. Identifies the records to update.
2. Identifies the new field values for those records.
3. Saves those changes to the Salesforce database. (In other words, until the changes are saved to the database, the changes exist only within the flow.)

**How do I choose between flow elements that update records?**

The main difference between the elements lies in these areas: how it knows which records to update, how it knows the new field values to apply, and how many records it can update.

Quick Action elements can update only one record at a time, while Record Update and Fast Update elements can update multiple records.

<table>
<thead>
<tr>
<th>Element</th>
<th>To identify records to update</th>
<th>To identify new field values for the records</th>
<th>Number of records it updates</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record Update</td>
<td>In the same element, use filter criteria.</td>
<td>In the same element, map each field that should be updated with a variable or other resource. All resources are supported, so long as the resource’s data type matches the selected field’s data type.</td>
<td>At least one.</td>
</tr>
<tr>
<td>Quick Action</td>
<td>Populate a single-value variable with the ID in another element. Use this ID for the Related Record ID parameter.</td>
<td>In the same element, map each field that should be updated with a variable or other resource. All resources are supported, so long as the resource’s data type matches the selected field’s data type.</td>
<td>Exactly one.</td>
</tr>
<tr>
<td>Fast Update</td>
<td>Populate an sObject variable or sObject collection variable in another element</td>
<td>In another element, such as an Assignment element, update the values in the sObject variable or sObject collection variable.</td>
<td>If an sObject variable: one. If an sObject collection variable: at least one.</td>
</tr>
</tbody>
</table>

If the following statement is true, use a Fast Update element:

- You’ve already populated an sObject variable or sObject collection variable with the values you want:

**Tip:**

- You can always update the field values in an sObject variable or sObject collection variable by using an Assignment element.
- It’s best practice to use Fast elements whenever possible, so that you save your org’s limits. For more information, see Flow Bulkification in Transactions.
If all the following statements are true, use a Quick Action element:

- You need to update exactly one record
- You’ve already populated a variable with the record’s ID
- The Quick Action’s layout includes all the fields you need to update

If any of those statements aren’t true, use a Record Update element.

**Example:** Here’s how you’d update an opportunity’s stage by using each of the update elements.

| Record Update | Update | Opportunity | that meet the following criteria:
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Field</td>
<td>Operator</td>
<td>Value</td>
<td></td>
</tr>
<tr>
<td>Id</td>
<td>equals</td>
<td>{!varOpportunityId}</td>
<td></td>
</tr>
</tbody>
</table>

Add Row

Update record fields with variable, constant, input, or other values.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>StageName</td>
<td>Closed Lost</td>
</tr>
<tr>
<td>CloseDate</td>
<td>{!$Flow.CurrentDate}</td>
</tr>
</tbody>
</table>

You can update any field on the record, but the Record Update element doesn’t know which fields are required for this object.

### Fast Update

| Variable | {!varOpportunity} |

Assumes {!varOpportunity} is already populated with the right fields.

### Quick Action (of type Update)

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Close Date</td>
<td>{!$Flow.CurrentDate}</td>
</tr>
<tr>
<td>Related Record ID</td>
<td>{!varOpportunityId}</td>
</tr>
<tr>
<td>Stage</td>
<td>Closed - Lost</td>
</tr>
</tbody>
</table>

These three fields are required by the associated action layout, so they’re required in this element. Related Record ID identifies which opportunity to update.

**SEE ALSO:**
- Flow Fast Update Element
- Flow Record Update Element
- Flow Quick Action Element
- Working with Salesforce Records in a Flow
Delete Salesforce Records from a Flow

To delete Salesforce records, use either the Record Delete or Fast Delete element. The right element depends on what the rest of your flow is doing.

**Example:** When a customer accepts a quote, automatically delete the remaining quotes from the opportunity.

To delete one or more records, your flow:

1. Identifies the records that to delete.
2. Saves those changes to the Salesforce database. (In other words, until the changes are saved to the database, the changes exist only within the flow.)

**How do I choose between flow elements that delete records?**

The main difference between elements lies in how the element knows which records to delete.

<table>
<thead>
<tr>
<th>To identify records to delete</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Record Delete</strong></td>
</tr>
<tr>
<td>In the same element, use filter criteria.</td>
</tr>
<tr>
<td><strong>Fast Delete</strong></td>
</tr>
<tr>
<td>In another element, populate an sObject variable or sObject collection variable with the ID of the record to be deleted.</td>
</tr>
</tbody>
</table>

If you’ve already populated an sObject variable or sObject collection variable with the records you want to delete, use a Fast Delete. (sObject collection variables are supported for record deletion only with a Fast Create element.) It’s best practice to use Fast elements whenever possible, so that you save your org’s limits. For more information, see Flow Bulkification in Transactions.

If you haven’t yet identified which records to delete or you’ve stored the IDs in non-sObject resources—such as a single-value variable—use a Record Delete element. sObject collection variables aren’t supported for this element.

**Example:** Here’s how you’d delete remaining quotes from an opportunity by using each of the delete elements.

<table>
<thead>
<tr>
<th>Record Delete</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete * Quote * that meet the following criteria:</td>
</tr>
<tr>
<td><strong>Field</strong></td>
</tr>
<tr>
<td>OpportunityId</td>
</tr>
<tr>
<td>Status</td>
</tr>
</tbody>
</table>

The flow finds all quotes that are associated with a specific opportunity and haven’t been approved, and then deletes them.
Fast Delete

Variable = {i:varQuotesUnnecessary}

Assumes {i:varQuotesUnnecessary} is already populated with the IDs of the quotes to delete. The flow deletes all records whose IDs are included in that variable.

SEE ALSO:
- Flow Fast Delete Element
- Flow Record Delete Element
- Working with Salesforce Records in a Flow

Validate Users’ Inputs with Flow Formulas

Just like with regular validation rules, you can validate what users enter in flow screens.

- The formula expression must return a Boolean value (TRUE or FALSE).
- If the expression evaluates to TRUE, the input is valid. If the expression evaluates to FALSE, the error message is displayed to the user.
- If the user leaves the field blank and the field isn’t required, the flow doesn’t validate the field.

When you configure a screen input field:

1. In the Input Validation section, select Validate.
2. Define the values allowed for the field by entering a Boolean formula expression.

Note:
- The formula expression must return a Boolean value.
- If the formula expression evaluates to TRUE, the input is valid.
- If the formula expression evaluates to FALSE, the error message is displayed to the user.
- If the user leaves the field blank, and the field is not required, the flow doesn’t validate.

3. Customize the error message that appears if the user’s input fails validation.

Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML.

Example:
- Validate the format of an email address:
  
  ```regex
  REGEX({!Email_Address},"[a-zA-Z0-9._%+-]+@[a-zA-Z0-9.-]+\.[a-zA-Z]{2,4}")
  ```

- Validate the format of a zip code:
  
  ```regex
  REGEX({!Zipcode},"\d{5}(-\d{4})?"")
  ```
Define Flow Conditions

Control when a flow takes a specific decision outcome or waits for a specific wait event.
Before you begin, create the Decision or Wait element to add conditions to. To add conditions to a wait event, select **Wait for this event only if additional conditions are met**.

1. Set up the conditions.

   At run time, the conditions are evaluated in the order you specify.

   **Table:**
<table>
<thead>
<tr>
<th>Column Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resource</td>
<td>Flow resource whose value you want to evaluate.</td>
</tr>
<tr>
<td>Operator</td>
<td>The available operators depend on the data type selected for Resource. For details, see <strong>Operators in Flow Conditions</strong> on page 4434.</td>
</tr>
<tr>
<td>Value</td>
<td>The Variable and Value in the same row must have compatible data types. Options:</td>
</tr>
<tr>
<td></td>
<td>• Select an existing flow resource, such as a variable, constant, or user input.</td>
</tr>
<tr>
<td></td>
<td>• Select CREATE NEW to create a flow resource.</td>
</tr>
<tr>
<td></td>
<td>• Manually enter a literal value or merge field.</td>
</tr>
</tbody>
</table>

   **Note:** When you add or subtract a number from a date value, the date adjusts in days, not hours.

2. Identify the logic between the conditions.

   **Table:**
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>All conditions must be true (AND)</td>
<td>If one of the conditions is false, the flow evaluates the next outcome’s conditions.</td>
</tr>
<tr>
<td>One condition must be true (OR)</td>
<td>If one of the conditions is true, the flow immediately takes this outcome’s path.</td>
</tr>
<tr>
<td>Advanced logic (Combination of ANDs and ORs)</td>
<td>Custom logic. When you select this option, provide the customized <strong>Logic</strong> by entering a text string. Use:</td>
</tr>
<tr>
<td></td>
<td>• Numbers to refer to each condition</td>
</tr>
<tr>
<td></td>
<td>• AND or OR to identify whether all or just one of the conditions must true</td>
</tr>
<tr>
<td></td>
<td>• Parentheses to group parts of the string together</td>
</tr>
</tbody>
</table>

   **Tip:** If you enter **AND**, it’s the same as if you selected **All conditions must be true (AND)**. If you enter **OR**, it’s the same as if you selected **One condition must be true (OR)**. If you enter any other logic, make sure that you include a number for each condition.
Option | Description
--- | ---
| For example, for $1 \text{ AND } (2 \text{ OR } 3)$, the flow evaluates whether the first condition is true and either the second or third condition is true.

- What Are Waiting Conditions?
- Flow Wait Element
- Flow Decision Element

Send Email from a Flow

To send email from your flow, either call an email alert workflow action or create the email in the flow.

**Email Alert element**
- Sends an email by using a workflow email alert to specify the email template and recipients. The flow provides only the record ID.

**Send Email element**
- Sends an email by manually specifying the subject, body, and recipients in the flow.

SEE ALSO:
- Flow Elements

Invoke Apex Code from a Flow

The Cloud Flow Designer comes with a lot of functionality, but sometimes your flow needs to do more than the default elements allow. In that case, call an Apex class from your flow by using one of two flow elements: Apex Plug-in and Call Apex.

Developers have two options when they’re trying to make an Apex class available for a flow.

**Tip:** We recommend using the `@InvocableMethod` annotation instead of the `Process.Plugin` interface.

While the `Process.Plugin` interface supports customizing how the class appears in the palette, the `@InvocableMethod` annotation provides more functionality. The following table describes the features supported by each option.

<table>
<thead>
<tr>
<th>Apex data type support</th>
<th>Process.Plugin Interface</th>
<th>@InvocableMethod Annotation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Doesn’t support:</td>
<td></td>
<td>Doesn’t support:</td>
</tr>
<tr>
<td>• Blob</td>
<td>• Generic Object</td>
<td></td>
</tr>
<tr>
<td>• Collection</td>
<td>• Generic sObject</td>
<td></td>
</tr>
<tr>
<td>• sObject</td>
<td>• Sets</td>
<td></td>
</tr>
<tr>
<td>• Time</td>
<td>• Maps</td>
<td></td>
</tr>
<tr>
<td>• Time</td>
<td>• Enums</td>
<td></td>
</tr>
</tbody>
</table>
The Cloud Flow Designer doesn’t support mapping an Apex method’s input or output parameters to an sObject collection variable.

<table>
<thead>
<tr>
<th>Bulk operations</th>
<th>SupportedNot supported</th>
</tr>
</thead>
<tbody>
<tr>
<td>Element name in the Cloud Flow Designer</td>
<td>Class name or the value of the name property.</td>
</tr>
<tr>
<td>Reusability</td>
<td>Classes with this interface implemented are available in flows</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Section in the Cloud Flow Designer</td>
<td>Apex Plug-in or the value of the tag property.</td>
</tr>
</tbody>
</table>

Example: To illustrate the difference between these two implementation methods, here are two classes that do the same thing: get an account name from a flow and return that account’s ID.

This class implements the @InvocableMethod annotation.

```java
@InvocableMethod
public static List<String> getAccountIds(List<String> names) {
List<Id> accountIds = new List<Id>();
List<Account> accounts = [SELECT Id FROM Account WHERE Name in :names];
for (Account account : accounts) {
    accountIds.add(account.Id);
}
return accountIds;
}
```

This class implements the Process.Plugin interface.

```java
global class lookUpAccountPlugin implements Process.Plugin {

global Process.PluginResult invoke(Process.PluginRequest request) {
    String name = (String) request.inputParameters.get('name');
    Account account = [SELECT Id FROM Account WHERE Name = :name LIMIT 1][0];

    Map<String, Object> result = new Map<String, Object>();
    result.put('id', account.Id);
    return result;
}
```
result.put('accountId', account.Id);
return new Process.PluginResult(result);
}

global Process.PluginDescribeResult describe() {
    Process.PluginDescribeResult result = new Process.PluginDescribeResult();
    result.Name = 'Look Up Account ID By Name';
    result.Tag = 'Account Classes';
    result.inputParameters = new
        List<Process.PluginDescribeResult.InputParameter>{
            new Process.PluginDescribeResult.InputParameter('name',
                Process.PluginDescribeResult.ParameterType.STRING, true)
        };
    result.outputParameters = new
        List<Process.PluginDescribeResult.OutputParameter>{
            new Process.PluginDescribeResult.OutputParameter('accountId',
                Process.PluginDescribeResult.ParameterType.STRING)
        };
    return result;
}

Notice that lookupAccountAnnotation is less than half the length (11 lines) of lookupAccountPlugin (28 lines). In addition, because the annotation supports bulk operations, lookupAccountAnnotation performs one query per batch of interviews. lookupAccountPlugin performs one query per interview.

SEE ALSO:
Flow Elements

View Inputs and Outputs of Other Referenced Flow Versions

While configuring a subflow element, view the variables of a specified version of the referenced flow. Doing so lets you configure draft master and referenced flows at the same time.

From a subflow element, you can assign values to only the referenced flow's variables that allow input access. Similarly, you can assign values from only the referenced flow's variables that allow output access. The Input/Output Type of the variable determines this access. To change the variable's Input/Output Type, open the referenced flow to edit the variable.

By default, this drop-down list contains the variables of the currently active version of the referenced flow. If the referenced flow has no active version, the drop-down list contains the variables of the latest version of the referenced flow.

To populate the drop-down lists with the variables of another version of the referenced flow, complete the following steps. Do the same to view the descriptions of the referenced flow's variables.

1. On the subflow overlay, expand the Input/Output Variable Assignments section.
2. Click View input/output of other versions.
3. Use one or more of the following options.
Select a **Version** number in the left pane.
The Inputs and Outputs tabs display the variables in the selected version of the referenced flow.

Select the **Inputs** tab or the **Outputs** tab.
The tab displays:
- The variables available for input or output assignment in the selected **Version** of the referenced flow.
- The data type of each variable.
- The description, if any, of each variable.

Click **OK**.
The subflow overlay's drop-down lists for selecting the referenced flow's variables are populated with the variables of the selected **Version** of the referenced flow.

When you configure subflow input and output assignments, you can specify variables from any version of the referenced flow. This way, you can develop both the master flow and referenced flow in parallel, while keeping another version of the referenced flow active for its users. When you save the master flow, however, the Cloud Flow Designer validates against the currently active version of the referenced flow. If that flow doesn’t have an active version, the latest version is validated. If you see validation messages about variables that couldn’t be found or that were configured differently in the referenced flow, you can still save the flow. Nevertheless, resolve all validation errors before you **activate** the master flow.

**SEE ALSO:**
Flow Subflow Element

---

**Add Values to a Collection Variable**

After you create a collection variable, populate it with values to reference throughout your flow. You can’t use a Record Lookup or Fast Lookup element to populate a collection variable, but there are some workarounds.

To use values from outside the flow, set the collection variable's **Input/Output Type** to "Input" and then use URL parameters, Visualforce controllers, or subflow inputs. When the values are coming from outside the flow, the values can be set only at the start of the flow interview.

<table>
<thead>
<tr>
<th>To add values that are stored in...</th>
<th>Do this...</th>
<th>For more information</th>
</tr>
</thead>
<tbody>
<tr>
<td>A screen field</td>
<td>Add the field’s entered or stored value to a collection variable by using an Assignment element</td>
<td><img src="https://example.com/choice_fields" alt="Choice fields" />, <img src="https://example.com/input_fields" alt="Input fields" />, <img src="https://example.com/output_fields" alt="Output fields" />, <img src="https://example.com/assignments" alt="Assignments" /></td>
</tr>
<tr>
<td>A variable</td>
<td>Add the variable’s stored value to a collection variable by using an Assignment element</td>
<td><img src="https://example.com/variables" alt="Variables" />, <img src="https://example.com/assignments" alt="Assignments" /></td>
</tr>
</tbody>
</table>
## To add values that are stored in…

Remove Connectors from a Flow

You can’t modify a connector’s target or source elements, so to change a path, delete the connector and then add a new one.

If you delete a connector for a specific outcome, the outcome isn’t deleted from the source element. However, if you delete an outcome from a decision element, the outcome’s connector is also deleted.

1. In your flow, select the connector to delete.
   When you select a connector, its color changes from gray to green. If you’re having trouble selecting a connector, click and drag an area on the canvas that includes the connector.

2. Press DELETE.

SEE ALSO:
- Define the Path That a Flow Takes
- Flow Connectors

Customize What Happens When a Flow Fails

If your flow contains an element that interacts with the Salesforce database—such as a Record Update or Submit for Approval element, it can fail. Modify the default behavior by adding fault paths to all elements that can fail.

What Happens When a Flow Fails?
When you’re deciding whether to customize the error handling in your flow, consider how a failed flow behaves by default.

Configure Every Fault Path to Send You an Email (Best Practice)
As a best practice, we recommend configuring the fault connectors in your flow so that you always receive an email when a flow fails. In the email, include the current values of all your flow’s resources. The resource values can give you insight into why the flow failed.

Customize the Error Message for Running Flow Users (Best Practice)
As a best practice, we recommend displaying a better message to your user than “An unhandled fault has occurred in this flow”. Do this only if the distribution method you’re using supports flows that contain screens. In other words, don’t do it if your flow is distributed through a process.

Other Examples of Error Handling in Flows
Examples of using fault connectors to handle flow errors include requesting corrections from the user and bypassing the error.

SEE ALSO:
- Flow Connectors
- Flow Elements
- Define the Path That a Flow Takes
What Happens When a Flow Fails?

When you’re deciding whether to customize the error handling in your flow, consider how a failed flow behaves by default.

Here’s what happens by default.

• This error message displays to the running user—the user who was running the flow.

```
An unhandled fault has occurred in this flow
An unhandled fault has occurred while processing the flow. Please contact your system administrator for more information.
```

• The running user can’t proceed with the flow or return to a previous part of the flow.

• The admin who created the flow receives a fault email. The email details the element that failed, the error message from that element, and which elements were executed during the failed interview. Here’s an example error message that can appear in a fault email.

```
An error occurred at element Fast_Delete_1.
DELETE --- There is nothing in Salesforce matching your delete criteria.
```

SEE ALSO:

Customize What Happens When a Flow Fails

Configure Every Fault Path to Send You an Email (Best Practice)

As a best practice, we recommend configuring the fault connectors in your flow so that you always receive an email when a flow fails. In the email, include the current values of all your flow’s resources. The resource values can give you insight into why the flow failed.

1. Create a text template that includes the values of all the flow resources.

   Doing so lets you see the exact values of flow variables when the interview failed. Also, if the flow contains screens, you see exactly what the user entered and selected.
Here's an example text template for the Customer Satisfaction Survey flow in the Cloud Flow Designer Workbook.

Error: {$Flow.FaultMessage}

RESOURCE VALUES
Customer Response: {$Customer_Response}
Value of Decision's Yes outcome: {$Yes}
Company: {$Company_Name}
Satisfaction Choice Field: {$Satisfaction}
Service Choice Field: {$Service}
Other Comments: {$OtherComments}

2. Configure a Send Email element. Use the text template as the body and your email address as the recipient.
   In this example, Body is set to the text template we created: {$allVariableValues}.

3. From each element that can fail, draw a fault connector to the Send Email element.
   In this example, Record Create is the only element that supports fault connectors.

SEE ALSO:
Flow Text Template Resource
Flow Send Email Element
Customize What Happens When a Flow Fails
Customize the Error Message for Running Flow Users (Best Practice)

As a best practice, we recommend displaying a better message to your user than “An unhandled fault has occurred in this flow”. Do this only if the distribution method you’re using supports flows that contain screens. In other words, don’t do it if your flow is distributed through a process.

1. Create a text template that contains a friendlier error message.

   <FONT FACE="Arial" STYLE="font-size:14px">
   <B>Something went wrong with this flow.</B>
   </FONT>
   <P>Your admin has received an email about this error.</P>

2. Add a Screen element. In a Display Text field, reference the text template.

3. For every element that can fail, draw a fault connector to the Screen element.
   In this example, Record Create is the only element that supports fault connectors. After the flow displays the better error message to the user, it sends an email to the admin with debugging information.

SEE ALSO:

Flow Screen Element: Display Text Fields
Flow Text Template Resource
Customize What Happens When a Flow Fails

Other Examples of Error Handling in Flows

Examples of using fault connectors to handle flow errors include requesting corrections from the user and bypassing the error.

Request Corrections from Users
   Draw a fault connector to a Screen element, where users can verify the values that they entered, make corrections, and proceed.
Display the Error Message
If the flow is used only internally, such as at a call center, use the fault path to display the error message to the running user. In the same Screen element, ask the user to report the error to the IT department. To do so, draw the fault connector to a Screen element with this Display Text field.

Sorry, but you can’t read or update records at this time.
Please open a case with IT and include this error message:
{!$Flow.FaultMessage}

Create a Case
When an error occurs, automatically create a case that includes the error message and assign it to your IT department. Assign the created case’s ID to a Text variable ( {!caseId} , for example). Then, in a Screen, display this message to the running user.

Sorry, but you can’t read or update records at this time.
We filed a case for you.

Ignore Errors
To bypass errors for a given element in your flow, draw the fault connector to the same element as the normal connector.

SEE ALSO:
Customize What Happens When a Flow Fails

Flow Reference
Bookmark this page for quick access to information about flow elements, resources, events, and more.

Flow Elements
Each element represents an action that the flow can execute. Examples of such actions include reading or writing Salesforce data, displaying information and collecting data from flow users, executing business logic, or manipulating data.

Flow Resources
Each resource represents a value that you can reference throughout the flow.

Cross-Object Field References in Flows
When building a flow, you can reference fields for records that are related to the values that are stored in an sObject variable. To do so, manually enter the references.

Flow Connectors
Connectors determine the available paths that a flow can take at run time. In the Cloud Flow Designer canvas, a connector looks like an arrow that points from one element to another.

Flow Operators
Operators behave differently, depending on what you’re configuring. In Assignment elements, operators let you change resource values. In flow conditions and record filters, operators let you evaluate information and narrow the scope of a flow operation.

Flow Event Types
Event Type drives the fields that you use to define an event in a flow Wait element. The available event types are both alarms, which consist of a date/time value—the base time—and an optional offset from that time.
Flow Types
A flow or flow version’s type determines which elements and resources are supported, as well as the ways that the flow can be distributed.

Flow Properties
A flow’s properties consist of its name, description, interview label, and type. These properties drive the field values that appear on a flow or flow version’s detail page. The properties of a flow and its flow versions are separate.

Flow Elements
Each element represents an action that the flow can execute. Examples of such actions include reading or writing Salesforce data, displaying information and collecting data from flow users, executing business logic, or manipulating data.

In the Cloud Flow Designer, the canvas and Explorer tab display the elements that exist in the flow. The Palette tab displays the available element types that you can add to the flow by dragging them onto the canvas.

General Settings for Flow Elements
Every flow element has three settings in common: name, unique name, and description.

Flow Apex Plug-In Element
Calls an Apex class that implements the Process.Plugin interface. If you used the Tag property in the PluginDescribeResult class, the Apex class appears under a customized section. Otherwise, it appears under the Apex Plug-ins section.

Flow Assignment Element
Sets or changes values in variables, collection variables, sObject variables, and sObject collection variables.

Flow Call Apex Element
Calls an Apex class’s invocable method.

Flow Decision Element
Evaluates a set of conditions and routes users through the flow based on the outcomes of those conditions. This element performs the equivalent of an if-then statement.

Flow Email Alert Element
Sends an email by using a workflow email alert to specify the email template and recipients. The flow provides only the record ID.

Flow Fast Create Element
Creates Salesforce records using the field values from an sObject collection variable. Or creates one Salesforce record using the field values from an sObject variable.

Flow Fast Delete Element
Deletes Salesforce records using the ID values that are stored in an sObject collection variable. Or deletes one Salesforce record using the ID value that’s stored in an sObject variable.

Flow Fast Lookup Element
Finds Salesforce records to assign their field values to an sObject collection variable. Or finds one Salesforce record to assign its field values to an sObject variable.

Flow Fast Update Element
Updates Salesforce records using the field values from an sObject collection variable. Or updates one Salesforce record using the field values from an sObject variable. If a record’s ID is included in the variable, its field values are updated to match the other values that are stored in the variable.
Flow Loop Element
Iterates through a collection one item at a time, and executes actions on each item’s field values—using other elements within the loop.

Flow Record Create Element
Creates one Salesforce record by using individual field values that you specify.

Flow Record Delete Element
Deletes all Salesforce records that meet specified criteria.

Flow Record Lookup Element
Finds the first Salesforce record that meets specified criteria. Then assigns the record’s field values to individual flow variables or individual fields on sObject variables.

Flow Record Update Element
Finds all Salesforce records that meet specified criteria and updates them with individual field values that you specify.

Flow Quick Action Element
Calls an object-specific or global quick action that’s already been configured in your organization. Only “Create,” “Update,” and “Log a Call” actions are supported.

Flow Post to Chatter Element
Posts a message to a specified feed, such as to a Chatter group or a case record. The message can contain mentions and topics, but only text posts are supported.

Flow Screen Element
Displays a screen to the user who is running the flow, which lets you display information to the user or collect information from the user.

Flow Send Email Element
Sends an email by manually specifying the subject, body, and recipients in the flow.

Flow Step Element
Acts as a placeholder when you’re not sure which element you need.

Flow Submit for Approval Element
Submits one Salesforce record for approval.

Flow Subflow Element
Calls another flow in your organization. Use this element to reference modular flows and simplify the overall architecture of your flow.

Flow Wait Element
Waits for one or more defined events to occur, which lets you automate processes that require a waiting period.

SEE ALSO:
Flow Resources
Cloud Flow Designer
General Settings for Flow Elements

Every flow element has three settings in common: name, unique name, and description.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Helps you identify the element on the canvas.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>Automatically populated if empty when you fill out the Name field and press TAB. The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
</tbody>
</table>

Description Appears after you click Add Description.

Flow Apex Plug-In Element

Calls an Apex class that implements the Process.Plugin interface. If you used the Tag property in the PluginDescribeResult class, the Apex class appears under a customized section. Otherwise, it appears under the Apex Plug-ins section.

Tip:

- Apex classes appear in the palette as Apex plug-ins only if the Process.Plugin interface has been implemented.
- If you have many plug-ins in your organization, ask your developer to use the tag property. The class appears under a special section header in the palette. Otherwise, the class appears with all the other Apex plug-ins.
- If your developer hasn’t already implemented the Process.Plugin interface on the desired class, we recommend using the @InvocableMethod annotation instead. Unlike the Process.Plugin interface, the @InvocableMethod annotation supports sObject, Collection, Blob, and Time data types and bulkification. It’s also much easier to implement. To see a complete comparison between the interface and the annotation, see Invoke Apex Code from a Flow on page 4369.

Inputs

Pass information from the flow to the invoked Apex method. The method determines the available input parameters and their data types.

Outputs

Pass information from the invoked Apex method to the flow. The method determines the available output parameters and their data types.

The flow assigns the values to the specified variables when the code is executed.
Usage

Note: If the Apex class creates, updates, or deletes a record, the action isn’t performed until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:
- Invoke Apex Code from a Flow
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows
- Apex Developer Guide: Process Namespace

Flow Assignment Element

Sets or changes values in variables, collection variables, sObject variables, and sObject collection variables.

In each row, specify the Variable whose value you want to change and the new Value for that variable. At run time, the variable assignments occur in the order you specify.

<table>
<thead>
<tr>
<th>Column Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Variable whose value you want to change.</td>
</tr>
<tr>
<td>Operator</td>
<td>The available operators depend on the data type selected for the Variable.</td>
</tr>
<tr>
<td>Value</td>
<td>The Variable and Value in the same row must have compatible data types. Options:</td>
</tr>
<tr>
<td></td>
<td>• Select an existing flow resource, such as a variable, constant, or user input.</td>
</tr>
<tr>
<td></td>
<td>• Select CREATE NEW to create a flow resource.</td>
</tr>
<tr>
<td></td>
<td>• Manually enter a literal value or merge field.</td>
</tr>
</tbody>
</table>

Example: Change the value of a customer’s credit score based on how the customer answered questions in the flow.

Editions

Available in: both Salesforce Classic and Lightning Experience

Available in: Enterprise, Performance, Unlimited, and Developer Editions
Flow Call Apex Element

Calls an Apex class’s invocable method.

**Important:** To use this element to call an Apex class from a flow, ask your developer to annotate one of the class’s methods with @InvocableMethod. For details, see “InvocableMethod Annotation” in the Force.com Apex Code Developer’s Guide.

**Inputs**

Pass information from the flow to the invoked Apex method. The method determines the available input parameters and their data types.

**Outputs**

Pass information from the invoked Apex method to the flow. The method determines the available output parameters and their data types.

The flow assigns the values to the specified variables when the method is executed.

**Usage**

**Note:** If the invoked method creates, updates, or deletes a record, that action isn’t performed until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

**SEE ALSO:**

- Invoke Apex Code from a Flow
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows

Flow Decision Element

Evaluates a set of conditions and routes users through the flow based on the outcomes of those conditions. This element performs the equivalent of an if-then statement.

**Outcomes**

Create the outcomes for the decision. To rename the path that the flow takes when none of the other outcome conditions are met, click [Default Outcome]. Set up the conditions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Identifies the connector for this outcome on the canvas.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Determines whether the flow takes this outcome’s path.</td>
</tr>
</tbody>
</table>
Example: Using a Decision element, determine whether:

- To give customers a return shipping address (because an item is definitely faulty) or instructions on how to resolve the problem
- To offer a customer a loan or not (based on results of a credit scoring formula)

Tip: Configure your flow so that it does different things based on which option a user selected for a screen’s drop-down list. To do so, add a decision after the screen to create the branches of the flow based on the choices available in that drop-down list. Then you can represent each choice in your decision and connect it to a branch of your flow.

SEE ALSO:
- Flow Elements
- Define Flow Conditions
- Operators in Flow Conditions
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows

Flow Email Alert Element

Sends an email by using a workflow email alert to specify the email template and recipients. The flow provides only the record ID.

Before you begin:

- Make sure that the email alert you want to call from your flow exists. If not, create the email alert on page 4481.
- Understand the daily limits for emails sent from email alerts.
- Store the ID for the record that you want to reference in this email, such as by using a Fast Lookup element. If the email alert has any merge fields, the referenced record is the starting point for those fields.

The unique name for each email alert is prefixed with its object. The object type of the referenced record must match the object type of the email alert. For example, if you have an email alert with unique name “Owner_Changed” for accounts, that email alert appears in the Palette as Account.Owner_Changed. Because the email alert is associated with the Account object, it can reference only an account record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record ID</td>
<td>Select a variable that contains the ID for the record that you want the email to reference. If the email alert uses any merge fields, this record is the starting point for those merge fields. This field accepts <strong>single-value variables of any type</strong>. The value is treated as text.</td>
</tr>
</tbody>
</table>
Usage

Note: At run time, the email isn’t sent until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:
- Send Email from a Flow
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows

Flow Fast Create Element

Creates Salesforce records using the field values from an sObject collection variable. Or creates one Salesforce record using the field values from an sObject variable.

To create a single record with field values from regular variables and other flow resources, such as constants, formulas, and screen fields, use Record Create.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>The sObject variable or collection that you want to use to create the record or multiple records. The object types must match, and each ID field must not have a value. This field accepts any sObject variable or sObject collection variable.</td>
</tr>
</tbody>
</table>

Example: Take a collection of new cases and use a Fast Create element to create records for each case in the collection. Make sure that your flow populates the sObject variable or collection with all required field values before executing the Fast Create element.

Usage

If you used an sObject variable to create a single record, the sObject variable’s ID field is updated with the new record’s ID value. If you used an sObject collection to create multiple records, the ID field of each collection item is updated with its matching new record ID value.

Note: At run time, records aren’t created until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:
- Create Salesforce Records from a Flow
- Flow Elements
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Flow sObject Variable Resource
- Flow sObject Collection Variable Resource
Flow Fast Delete Element

Deletes Salesforce records using the ID values that are stored in an sObject collection variable. Or deletes one Salesforce record using the ID value that's stored in an sObject variable.

⚠️ Tip: Make sure that the sObject variable or collection is populated with ID values before using the Fast Delete element.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Identifies the sObject variable or collection that you want to use to delete records. The variable must include the IDs of the records that you want to delete. This field accepts any sObject variable or sObject collection variable.</td>
</tr>
</tbody>
</table>

**Usage**

⚠️ Warning:

- Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.
- To prevent deleting records by mistake, be as specific in your filter criteria as possible.
- Records are deleted from your organization the moment the flow executes the delete element.
- Deleted records are sent to the Recycle Bin and remain there for 15 days before they are permanently deleted.
- Flows can delete records that are pending approval.

To delete one or more records that meet filter criteria specified by regular variables and other flow resources, such as constants, formulas, and screen fields, use Record Delete.

⚠️ Note: At run time, the records aren't deleted until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:

- Delete Salesforce Records from a Flow
- Flow Elements
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes

- Flow sObject Collection Variable Resource
Flow Fast Lookup Element

Finds Salesforce records to assign their field values to an sObject collection variable. Or finds one Salesforce record to assign its field values to an sObject variable.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look up</td>
<td>Identifies the object whose records you want to look up.</td>
</tr>
<tr>
<td>Filter criteria</td>
<td>Narrows down the scope of records that the flow looks up. Specify the filter criteria for selecting the record from the database.</td>
</tr>
<tr>
<td><strong>Tip:</strong></td>
<td>Make sure that your filter criteria sufficiently narrows the search. If you use an sObject variable to store the results, the Fast Lookup element returns only the first record from the filtered results. The available filter operators depend on the data type of the selected fields. For details, see Operators in Flow Record Filters. Value must be compatible with the selected field’s data type.</td>
</tr>
<tr>
<td>Sort results by:</td>
<td>Sorts the filtered results before any records are stored in the variable. If you select this field, select the field that you want to sort the results by and the sort order. Only sortable fields are available.</td>
</tr>
<tr>
<td>Variable</td>
<td>The variable to contain the returned field values.</td>
</tr>
<tr>
<td><strong>Note:</strong></td>
<td>This field accepts any sObject variable or sObject collection variable.</td>
</tr>
<tr>
<td></td>
<td>- To contain the field values for the first returned record, use an sObject variable.</td>
</tr>
<tr>
<td></td>
<td>- To contain the field values for all the returned records, use an sObject collection variable.</td>
</tr>
<tr>
<td>Assign null to the variable if no records are found.</td>
<td>Sets the variable to null if no records meet the filter criteria. By default, the variable’s values are left unchanged.</td>
</tr>
<tr>
<td>Specify which of the record’s fields to save in the variable.</td>
<td>Identifies which fields on the records that meet the filter criteria to store in the variable. Values for unselected fields are set to null in the variable.</td>
</tr>
</tbody>
</table>

**Example:**

- Look up a product’s name and description by using the bar code on its product tag.
Look up all customers who live in a particular city.
Look up customer transactions on a particular day.

Usage
To get a single record and store specified field values in regular variables and sObject variables, use Record Lookup.

SEE ALSO:
- Pull Values from Salesforce Records into a Flow
- Flow Elements
- Operators in Flow Record Filters
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Flow sObject Variable Resource
- Flow sObject Collection Variable Resource
- Cross-Object Field References in Flows

Flow Fast Update Element
Updates Salesforce records using the field values from an sObject collection variable. Or updates one Salesforce record using the field values from an sObject variable. If a record’s ID is included in the variable, its field values are updated to match the other values that are stored in the variable.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variable</td>
<td>Identifies the sObject variable or collection that you want to use to update records.</td>
</tr>
<tr>
<td></td>
<td>This field accepts any sObject variable or sObject collection variable.</td>
</tr>
</tbody>
</table>

Example: You’re designing flows for a call center. To automatically update Salesforce with data collected from callers, such as new addresses or product preferences, use a Fast Update element. Have your flow populate the sObject variable or collection before using the Fast Update element. Then make sure that the sObject variable or sObject values within the collection contain the ID for the records that are being updated.

Usage
To update one or more records with field values from regular variables and other flow resources, such as constants, formulas, and screen fields, use Record Update.
Note: At run time, records aren’t updated until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:
- Update Salesforce Records from a Flow
- Flow Elements
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Flow sObject Variable Resource
- Flow sObject Collection Variable Resource

Flow Loop Element
Iterates through a collection one item at a time, and executes actions on each item’s field values—using other elements within the loop.

A collection is a list of items that contain, for example, field values from Salesforce records. A loop uses an sObject variable, referred to as the loop variable, to contain the values for the current item in the collection. Once the loop finishes examining an item, it copies the field values for the next item into the loop variable. Then the loop examines those values. The loop variable must have the same object type as the collection. For example, if your collection contains field values from accounts, your loop variable must also be of type Account.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Loop through</td>
<td>The collection that you want to loop through. This field accepts any sObject variable or sObject collection variable.</td>
</tr>
<tr>
<td>Order</td>
<td>Ascending begins at the start of the collection and moves to the end, while Descending begins at the end and moves to the start.</td>
</tr>
<tr>
<td>Loop Variable</td>
<td>The variable that the flow uses to contain the current item’s values during a loop iteration.</td>
</tr>
</tbody>
</table>

- If Loop through is set to a non-sObject collection variable, this field accepts a single-value variable with the same data type.
- If Loop through is set to an sObject collection variable, this field accepts an sObject variable with the same object type.

Usage
After you add a Loop element and the elements that you want the loop to include, from the Loop element:

- Determine which element to execute first when a new item’s values are copied into the loop variable by adding a “Next element” connector.
• Determine which flow element to execute after the loop has processed all the items in the collection by adding an “End of loop” connector.

SEE ALSO:
- Sample Flow That Loops Through a Collection
- Define the Path That a Flow Takes
- Flow Elements
- Flow sObject Collection Variable Resource

Flow Record Create Element

Creates one Salesforce record by using individual field values that you specify.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create</td>
<td>The object for which you want to create a record</td>
</tr>
<tr>
<td>Field values</td>
<td>Identifies the field values for the new record. Each value must be compatible with the selected field’s data type.</td>
</tr>
<tr>
<td>Variable</td>
<td>Assigns the ID of the new record to a variable so you can reference it later in the flow.</td>
</tr>
</tbody>
</table>

- This field accepts only single-value variables of type Text.

**Important:** Ensure that all required fields are populated with values; otherwise the flow fails at run time. If you don’t know which fields are required, check the object definition.

**Example:** A user enters a name and address into the flow. Verify that a matching user exists by using the Record Lookup element. If a matching contact doesn’t exist, create a record for that user by using the Record Create element.

**Usage**

To create a single record with all field values from one sObject variable, or multiple records with all field values from an sObject collection, use Fast Create.

**Note:** At run time, the record isn’t created until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:
- Create Salesforce Records from a Flow
- Operators in Flow Record Filters
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Flow Elements
Flow Record Delete Element

Deletes all Salesforce records that meet specified criteria.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Identifies the object whose records you want to delete.</td>
</tr>
<tr>
<td>Filter Criteria</td>
<td>Narrows down the scope of records that the flow deletes.</td>
</tr>
</tbody>
</table>

Usage

⚠️ Warning:

- Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.
- To prevent deleting records by mistake, be as specific in your filter criteria as possible.
- Records are deleted from your organization the moment the flow executes the delete element.
- Deleted records are sent to the Recycle Bin and remain there for 15 days before they are permanently deleted.
- Flows can delete records that are pending approval.

To delete a single record identified by the ID in one sObject variable, or delete multiple records identified by the IDs in an sObject collection, use Fast Delete.

🔥 Note: At run time, the record isn’t deleted until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

SEE ALSO:
- Delete Salesforce Records from a Flow
- Operators in Flow Record Filters
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Flow Elements

Flow Record Lookup Element

Finds the first Salesforce record that meets specified criteria. Then assigns the record’s field values to individual flow variables or individual fields on sObject variables.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Look up</td>
<td>Identifies the object whose records you want to look up.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Filter criteria</td>
<td>Narrows down the scope of records that the flow looks up. Specify the filter criteria for selecting the record from the database.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip:</strong> Make sure that your filter criteria sufficiently narrows the search. The Record Lookup element returns only the first record from the filtered results.</td>
</tr>
<tr>
<td></td>
<td>The available filter operators depend on the data type of the selected fields. For details, see <a href="#">Operators in Flow Record Filters</a>. Value must be compatible with the selected field’s data type.</td>
</tr>
<tr>
<td>Sort results by:</td>
<td>Sorts the filtered results before any records are stored in the variable. If you select this field, select the field that you want to sort the results by and the sort order. Only sortable fields are available.</td>
</tr>
<tr>
<td>Assign the record’s fields to variables to reference them in your flow.</td>
<td>Select fields from the returned record, and assign the values to variables in the flow. The values must be compatible with each selected field.</td>
</tr>
<tr>
<td>Assign null to the variable(s) if no records are found.</td>
<td>Sets the variables to null if no records meet the filter criteria. By default, the variable’s values are left unchanged.</td>
</tr>
</tbody>
</table>

**Example:** Use a Record Lookup element to:
- Input (or read) a bar code from a product tag. Use the code to find out the product name or description from the database.
- Look up item details to check your stock for availability.
- Look up a customer record to verify a caller’s identity.

**Usage**
Use a [Fast Lookup](#) element to find:
- A single record and store specified field values in an sObject variable, or
- Multiple records and store specified field values in an sObject collection

**SEE ALSO:**

Flow Record Update Element

Finds all Salesforce records that meet specified criteria and updates them with individual field values that you specify.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Update</td>
<td>Identifies the object whose records you want to update.</td>
</tr>
<tr>
<td>Filter criteria</td>
<td>Narrows down the scope of records that the flow updates.</td>
</tr>
<tr>
<td></td>
<td><strong>Important</strong>: Configure at least one filter, or the flow updates all the</td>
</tr>
<tr>
<td></td>
<td>records for the object.</td>
</tr>
<tr>
<td></td>
<td>The available filter operators depend on the data type of the selected</td>
</tr>
<tr>
<td></td>
<td>fields. For details, see <a href="#">Operators in Flow Record Filters</a>. Value</td>
</tr>
<tr>
<td></td>
<td>must be compatible with the selected field's data type.</td>
</tr>
<tr>
<td>Update record</td>
<td>Identifies which fields to update on the records that meet the filter</td>
</tr>
<tr>
<td>fields ...</td>
<td>criteria, as well as the new values.</td>
</tr>
<tr>
<td></td>
<td>The values must be compatible with each selected field.</td>
</tr>
</tbody>
</table>

**Example:** Automatically update Salesforce with data collected from customers, such as new addresses or product preferences.

**Usage**

Use **Fast Update** to:

- Update a single record with all field values from an sObject variable, or
- Update multiple records with all field values from an sObject collection

**Note:** At run time, the record isn't updated until the interview's transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

**SEE ALSO:**

- [Update Salesforce Records from a Flow](#)
- [Operators in Flow Record Filters](#)
- [Customize What Happens When a Flow Fails](#)
- [Define the Path That a Flow Takes](#)
- [Flow Elements](#)
Flow Quick Action Element

Calls an object-specific or global quick action that’s already been configured in your organization. Only “Create,” “Update,” and “Log a Call” actions are supported.

The unique name for each object-specific action is prefixed with the object it’s associated with. The unique name for each global action has no prefix.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related Record ID</td>
<td>Only for object-specific actions. The ID of the record from which the action executes. For example, the action creates a case that’s associated with a given account. Assign the ID for that account to Related Record ID. This parameter accepts <strong>single-value resources of any type</strong>. That value is treated as text.</td>
</tr>
<tr>
<td>Input Parameter</td>
<td>Varies for each action. The action layout determines which parameters are required. Required parameters appear by default and can’t be removed. If a required field has a default or predefined value, that field is optional in object-specific and global actions in the flow. If you later remove the field’s default or predefined value and you didn’t set a value in the flow, the interview fails at run time. The value must be compatible with the parameter.</td>
</tr>
</tbody>
</table>

**Example:** Your organization has an object-specific action that creates a case record on an account. The flow calls that action at run time and uses input assignments to transfer data from the flow to the action.

**Note:** At run time, the record isn’t created or updated until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

Flow Post to Chatter Element

Posts a message to a specified feed, such as to a Chatter group or a case record. The message can contain mentions and topics, but only text posts are supported.

<table>
<thead>
<tr>
<th>Input Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Community ID</td>
<td>ID of a community to post to. Valid only if Salesforce Communities is enabled. Required if posting to a user or Chatter group that belongs to a Salesforce.com Community. This parameter accepts single-value resources of any type. That value is treated as text.</td>
</tr>
<tr>
<td>Message</td>
<td>The text that you want to post. To mention a user or group, enter @{reference}, where reference is the ID for the user or group that you want to mention. The reference can be a literal value, a merge field, or a flow resource. For example: @{!UserId}. To add a topic, enter #{string}, where string is the topic that you want to add. For example: #{Action Required}. This parameter accepts single-value resources of any type. That value is treated as text and is limited to 10,000 characters.</td>
</tr>
<tr>
<td>Target Name or ID</td>
<td>Reference to the user, Chatter group, or record whose feed you want to post to. To post to a user's feed, enter the user's ID or Username. For example: <a href="mailto:jsmith@salesforce.com">jsmith@salesforce.com</a> To post to a Chatter group, enter the group's Name or ID. For example: Entire Organization To post to a record, enter the record's ID. For example: 001D000000JWBDx This parameter accepts single-value resources of any type. That value is treated as text.</td>
</tr>
<tr>
<td>Target Type</td>
<td>Required only if Target Name or ID is set to a username or a Chatter group name. The type of feed that you want to post to. Valid values are: User—if Target Name or ID is set to a user's Username, enter this value. Group—if Target Name or ID is set to a Chatter group's Name, enter this value.</td>
</tr>
</tbody>
</table>
**Input Parameter** | **Description**
--- | ---
Visibility | Specifies whether this feed item is available to all users or internal users only. Valid only if Salesforce Communities is enabled. Valid values are:
  - allUsers
  - internalUsers

### Outputs

**Output Parameter** | **Description**
--- | ---
Feed Item ID | Assigns the created post’s ID to a resource in the flow. This parameter accepts any single-value variables of type Text, Picklist, or Picklist (Multi-Select).

### Usage

**Note:** At run time, the Chatter post isn’t created until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

Flow Screen Element

Displays a screen to the user who is running the flow, which lets you display information to the user or collect information from the user.

**Flow Screen Element: General Info**
Identifies which navigation buttons are available for a given screen, as well as whether help text is available to the flow user.

**Flow Screen Element: User Input Fields**
Lets users manually enter information. A flow user input field is a text box, long text area, number, currency, date, date/time, password, or checkbox in a Screen element.

**Flow Screen Element: Choice Fields**
Lets users select from a set of choices. A flow choice field is a radio button, drop-down list, multi-select checkbox, or multi-select picklist in a Screen element.

---

**Editions**

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions
Flow Screen Element: Display Text Fields
Displays information to users while they're running the flow.

SEE ALSO:
Flow Elements
Define the Path That a Flow Takes

Flow Screen Element: General Info
Identifies which navigation buttons are available for a given screen, as well as whether help text is available to the flow user.

Navigation Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop-down list</td>
<td>Determines which navigation buttons display for this screen. At run time, the system automatically determines which buttons are relevant, depending on whether any screens precede or follow the screen in the flow path. To restrict the screen from displaying either the Previous or the Finish button, use the drop-down list.</td>
</tr>
<tr>
<td>No navigation restrictions—(Default) The system displays all relevant navigation buttons on the screen.</td>
<td></td>
</tr>
<tr>
<td>Don’t show Previous button—Select this option if revisiting the previous screen triggers an action that must not be repeated, such as a credit card transaction.</td>
<td></td>
</tr>
<tr>
<td>Don’t show Finish button—Select this option if you need the user to go back to a previous screen to continue or complete the flow. For example, suppose the flow prompts the user to enter information to identify an existing contact. The flow then looks up the user-entered information in the database. If no matching contact is found, the flow displays a screen to tell the user to go back and try again. For that screen, select Don’t show Finish button.</td>
<td></td>
</tr>
</tbody>
</table>

Show Pause button
Adds the Pause button to the navigation buttons for this screen, if Let Users Pause Flows is enabled in your organization’s Workflow and Approvals settings. Once a user pauses a flow interview, only that user or an administrator can resume the interview.

Paused Message
The message that’s displayed to flow users when they pause a flow.

Help Text

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text box</td>
<td>Information for users to see when they click Help for this form. This field accepts single-value resources of any type. That value is treated as text.</td>
</tr>
</tbody>
</table>
Usage
If you allow users to pause interviews of this flow:
• Customize the interview label
• Enable Let Users Pause Flows in your organization’s Process Automation Settings
• Add the Paused Flow Interviews component to the Home page layout for relevant users

SEE ALSO:
Flow Screen Element
Design Home Page Layouts

Flow Screen Element: User Input Fields
Lets users manually enter information. A flow user input field is a text box, long text area, number, currency, date, date/time, password, or checkbox in a Screen element.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>User-friendly text that displays to the left of the field. To format the label, click <a href="#">Hi:</a>.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Input Type</td>
<td>Automatically populated based on the type of input field you selected.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Pre-populated value for the input field. If the associated screen isn’t executed, the stored value of the input field is always null. The data type of the default value must be compatible with the field’s data type. For example, a checkbox’s default value must be of type boolean.</td>
</tr>
<tr>
<td>Scale</td>
<td>Controls the number of digits to the right of the decimal point. Can’t exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Available for only Currency and Number input fields.</td>
</tr>
<tr>
<td>Required</td>
<td>Forces users to enter a value before they can move on to the next screen.</td>
</tr>
<tr>
<td>Validate</td>
<td>Enables input validation on this field.</td>
</tr>
<tr>
<td>Formula Expression</td>
<td>Boolean formula expression that evaluates whether the user entered an acceptable value.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Displays underneath the field if the user didn’t enter an acceptable value. This field accepts single-value resources of any type. That value is treated as text.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
Help Text | Adds next to the input field. In the text box, enter helpful information about this field. This field accepts single-value resources of any type. That value is treated as text.

SEE ALSO:
- Flow Screen Element

**Flow Screen Element: Choice Fields**

Lets users select from a set of choices. A flow choice field is a radio button, drop-down list, multi-select checkbox, or multi-select picklist in a Screen element.

**Field** | **Description**
--- | ---
Label | Displays to the left of the field. To format the label, click .
Unique Name | A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Value Data Type | Controls which choices are available in Choice Settings. For example, if you choose Number you can’t use a choice that has a data type of Text.
You can’t change the value data type of multi-select choice fields; only text is supported.
Scale | Controls the number of digits to the right of the decimal point. Can’t exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Available for only Currency and Number choice fields.
Required | Forces users to identify a choice before they progress to the next screen.
Default Value | The choice that’s preselected for the user. If the associated screen isn’t executed, the stored value of the choice field is always null.
Choice | The choice options that the user can choose from. Select configured choices, dynamic record choices, or picklist choices.

**Note:** You can’t rearrange choices.
The choice’s data type must match Value Data Type.

Help Text box | Information that users see when they click . This field accepts single-value resources of any type. That value is treated as text.

SEE ALSO:
- Limitations for Multi-Select Choice Fields
- Options for Choice Fields in Flow Screen Elements
- Flow Screen Element
Options for Choice Fields in Flow Screen Elements

A key part of configuring choice fields in a flow screen is selecting the choice options to display in that field. These options appear as the individual radio buttons or checkboxes or options in a drop-down list. Create choice options with at least one of these resources: choices, dynamic record choices, or picklist choices.

Dynamic record choices and picklist choices are easier to configure and don’t require as much maintenance as choices. We recommend using a flow choice resource (otherwise known as stand-alone choices) only when you can’t use the other two.

<table>
<thead>
<tr>
<th>If you want the user to select...</th>
<th>Use this resource</th>
</tr>
</thead>
<tbody>
<tr>
<td>From a set of filtered records</td>
<td>Dynamic Record Choice</td>
</tr>
<tr>
<td>From a set of values that correspond to an existing picklist or multi-select picklist field</td>
<td>Picklist Choice</td>
</tr>
<tr>
<td>Something that can’t be generated from a record, picklist field, or multi-select picklist field</td>
<td>Choice</td>
</tr>
</tbody>
</table>

SEE ALSO:

- Flow Choice Resource

Flow Screen Element: Display Text Fields

Displays information to users while they’re running the flow.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Text box</td>
<td>The text to display to the flow user. Click to switch between the plain text editor and the rich text editor. Using the rich text editor saves the content as HTML. This field accepts single-value resources of any type. That value is treated as text.</td>
</tr>
</tbody>
</table>

Example: Welcome users to the flow or display terms and conditions.

SEE ALSO:

- Flow Screen Element
Flow Send Email Element

Sends an email by manually specifying the subject, body, and recipients in the flow.

Tip:

- Store the text for the email body in a text template.
- To use an email template that exists in your organization, call an email alert instead.

Specify at least one recipient for the email. You can use both email address parameters, so long as the combined number of addresses is five or fewer.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body</td>
<td>Text for the body of the email. The email is treated as plain text; HTML formatting isn’t respected. This parameter accepts single-value resources of any type. That value is treated as text.</td>
</tr>
<tr>
<td>Subject</td>
<td>Text for the subject of the email. This parameter accepts single-value resources of any type. That value is treated as text.</td>
</tr>
<tr>
<td>Email Addresses (comma-separated)</td>
<td>Optional. Recipients of the email. For the email to send successfully, enter a value for Email Addresses (comma-separated) or Email Addresses (collection). You can use both parameters, so long as the combined number of email addresses is five or fewer. This parameter accepts single-value resources of any type. That value is treated as text.</td>
</tr>
<tr>
<td>Email Addresses (collection)</td>
<td>Optional. Recipients of the email. For the email to send successfully, enter a value for Email Addresses (comma-separated) or Email Addresses (collection). You can use both parameters, so long as the combined number of email addresses is five or fewer. This parameter accepts collection variables of type Text.</td>
</tr>
<tr>
<td>Sender Address</td>
<td>The organization-wide email address that’s used to send the email. Required only if Sender Type is set to OrgWideEmailAddress. This parameter accepts single-value resources of any type. That value is treated as text.</td>
</tr>
<tr>
<td>Sender Type</td>
<td>Optional. Email address used as the email’s From and Reply-To addresses. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>• CurrentUser—Email address of the user running the flow. (Default)</td>
</tr>
<tr>
<td></td>
<td>• DefaultWorkflowUser—Email address of the default workflow user.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
- OrgWideEmailAddress—The organization-wide email address that is specified in Sender Address.

**Usage**

**Note:** At run time, the email isn’t sent until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

**SEE ALSO:**
- Send Email from a Flow
- Flow Text Template Resource
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows

**Flow Step Element**

Acts as a placeholder when you’re not sure which element you need.

**Usage**

Steps aren’t valid elements for active flows. As a flow admin, you can run a draft flow with Step elements in it. Before you activate the flow, replace the Step elements with other elements or delete them entirely.

Convert a Step element into a Screen element at any time by hovering your mouse over the step and clicking 📁.

**Note:**
- If you convert a step that has multiple connectors into a Screen, all its connectors are deleted.
- Once a Step element has been converted, you can’t use its original unique name.

**SEE ALSO:**
- Flow Screen Element
- Flow Elements
- Define the Path That a Flow Takes
Flow Submit for Approval Element

Submits one Salesforce record for approval.

Tip: Before you begin, store the ID for the record that you want to submit for approval.

Inputs

Transfer data from the flow to the approval submission.

<table>
<thead>
<tr>
<th>Input Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record ID</td>
<td>The ID of the record that you want to submit for approval. This parameter accepts <strong>single-value resources of any type</strong>. That value is treated as text.</td>
</tr>
<tr>
<td>Next Approver IDs</td>
<td>The ID of the user to be assigned the approval request when the approval process doesn't automatically assign the approver. This parameter accepts <strong>collection variables of type Text</strong> that include exactly one item.</td>
</tr>
</tbody>
</table>
| Approval Process Name or ID | The unique name or ID of the specific approval process to which you want the record to be submitted. The process must have the same object type as the record you specified in Record ID. Required if Skip Entry Criteria is set to $GlobalConstant.True. If this parameter and Submitter ID aren’t set, the flow succeeds only when:
- The approver on submit is determined automatically, and
- The user who launched the flow is an allowed initial submitter
Make sure that:
- The approver on submit is determined automatically, and
- The initial submitters (for the approval processes related to this object) include all users who could launch this flow
This parameter accepts **single-value resources of any type**. That value is treated as text. |
| Skip Entry Criteria   | If set to $GlobalConstant.True, the record isn’t evaluated against the entry criteria set on the process that is defined in Approval Process Name or ID. This parameter accepts any **single-value resource of type Boolean**. |
| Submission Comments   | Text that you want to accompany the submission. Submission comments appear in the approval history for the specified record. This text also appears in the initial approval request email if the template uses the {!ApprovalRequest.Comments} merge field. |
### Input Parameter

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Submitter ID</strong></td>
<td>The ID for the user who submitted the record for approval. The user receives notifications about responses to the approval request.</td>
</tr>
<tr>
<td></td>
<td>The user must be one of the allowed submitters for the process.</td>
</tr>
<tr>
<td></td>
<td>If you don’t set this field, the user who launched the flow is the submitter. If a workflow rule triggers a flow that includes this element, the submitter is the user who triggered the workflow rule. Workflow rules can be triggered when a user creates or edits a record. When the record is approved or rejected, the user who launched the flow or triggered the workflow rule is notified.</td>
</tr>
<tr>
<td></td>
<td>This parameter accepts <strong>single-value resources of any type</strong>. That value is treated as text.</td>
</tr>
</tbody>
</table>

### Outputs

Transfer data from the approval request to the flow. Assignments occur when the approval request is created.

<table>
<thead>
<tr>
<th>Optional Output Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Instance ID</strong></td>
<td>The ID of the approval request that was submitted.</td>
</tr>
<tr>
<td></td>
<td>This parameter accepts <strong>single-value variables of type Text, Picklist, or Picklist (Multi-Select)</strong>.</td>
</tr>
<tr>
<td><strong>Instance Status</strong></td>
<td>The status of the current approval request. Valid values are “Approved,” “Rejected,” “Removed,” or “Pending”.</td>
</tr>
<tr>
<td></td>
<td>This parameter accepts <strong>single-value variables of type Text, Picklist, or Picklist (Multi-Select)</strong>.</td>
</tr>
<tr>
<td><strong>New Work Item IDs</strong></td>
<td>The IDs of the new items submitted to the approval request. There can be 0 or 1 approval processes.</td>
</tr>
<tr>
<td></td>
<td>This parameter accepts <strong>collection variables of type Text</strong>.</td>
</tr>
<tr>
<td><strong>Next Approver IDs</strong></td>
<td>The IDs of the users who are assigned as the next approvers.</td>
</tr>
<tr>
<td></td>
<td>This parameter accepts <strong>collection variables of type Text</strong>.</td>
</tr>
<tr>
<td><strong>Record ID</strong></td>
<td>The ID of the record that the flow submitted for approval.</td>
</tr>
<tr>
<td></td>
<td>This parameter accepts <strong>single-value variables of type Text, Picklist, or Picklist (Multi-Select)</strong>.</td>
</tr>
</tbody>
</table>
Usage

Note: At run time, the approval request isn’t created until the interview’s transaction completes. Transactions complete either when the interview finishes, executes a Screen element, or executes a Wait element.

- Flow Elements
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows

Flow Subflow Element

Calls another flow in your organization. Use this element to reference modular flows and simplify the overall architecture of your flow.

A subflow element references another flow and calls that flow at run time. When a flow contains a subflow element, we call it the master flow to distinguish it from the referenced flow.

Tip: Create smaller flows that perform common tasks. For example, build utility flows to capture address and credit card information, and authorize a credit card purchase amount. Then call those flows as needed from multiple product-ordering flows.

Assign values to variables in the referenced flow. Variable assignments occur when the master flow calls the referenced flow at run time.

<table>
<thead>
<tr>
<th>Column Header</th>
<th>Description</th>
</tr>
</thead>
</table>
| Target        | Referenced flow’s variable whose value you want to set.  
                 By default, this drop-down list contains the variables of the currently active version of the referenced flow. If the referenced flow has no active version, the drop-down list contains the variables of the latest version of the referenced flow. |
| Source        | Master flow’s resource or value to assign to the target.  
                 Options:  
                 - Select an existing flow resource, such as a variable, constant, or user input.  
                 - Select CREATE NEW to create a flow resource.  
                 - Manually enter a literal value or merge field.  
                 Source’s data type must be compatible with Target. |

Assign values from the referenced flow’s variables to the master flow’s variables. Variable assignments occur when the referenced flow finishes running.
Referenced flow’s variable whose value you want to assign to the target.

By default, this drop-down list contains the variables of the currently active version of the referenced flow. If the referenced flow has no active version, the drop-down list contains the variables of the latest version of the referenced flow.

Target

Master flow’s variable whose value you want to set.

Target’s data type must be compatible with Source.

**Usage**

At run time, the master flow calls the active version of each referenced flow by default. If a referenced flow has no active version, then the master flow calls the latest version of the referenced flow. To run only the latest version of each referenced flow:

- Open the master flow, and click Run with Latest in the button bar, or
- Append the URL for the master flow with ?latestSub=true

**Note:** Only flow admins can run inactive flows. For other users, the flow fails at run time if a subflow element tries to call a flow with no active version.

**SEE ALSO:**

- Flow Elements
- View Inputs and Outputs of Other Referenced Flow Versions
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows

**Flow Wait Element**

Waits for one or more defined events to occur, which lets you automate processes that require a waiting period.

Define the events that the flow waits for before it proceeds.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name appears on the connector that’s associated with this event.</td>
</tr>
<tr>
<td>Unique Name</td>
<td></td>
</tr>
<tr>
<td>Event Type</td>
<td>Determines whether the flow is waiting for:</td>
</tr>
<tr>
<td></td>
<td>• An absolute time (such as 3 days from now), or</td>
</tr>
</tbody>
</table>
### Field Description

- A time relative to a date/time field on a Salesforce record (such as 3 days after an opportunity closes)

<table>
<thead>
<tr>
<th>Event Conditions</th>
<th>Determines the exact event that the flow is waiting for. Parameters vary, based on the selected event type.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Wait for this event only if additional conditions are met</td>
<td>If selected, the flow waits for this event only when certain conditions are met.</td>
</tr>
</tbody>
</table>

**Waiting Conditions**

- Determines which conditions must be true for the flow to wait for this event. Available only if **Wait for this event only if additional conditions are met** is selected.

The flow waits for the event only if the waiting conditions evaluate to **true**. For details, see Define Flow Conditions on page 4368.

**Variable Assignments**

- Assigns the event’s outputs to flow variables. Parameters vary, based on the selected event type.

**[Default Path]**

- Determines what the flow does when all the events have unmet waiting conditions. If at least one event doesn’t have waiting conditions, the default path is never executed.

The name displays on the Wait element’s default connector. Provide a custom name for this path by replacing the predefined value.

### Usage

**Note:**

- Flows that contain Wait elements must be autolaunched. If a flow includes Wait elements and screens, choice, or dynamic choices, you can’t activate or run it.
- Before you add a Wait element to your flow, understand the special behavior and limitations. See Limitations for Time-Based Flows on page 4347 for details.

After you define your events, connect the Wait element to other elements on the canvas to indicate what the flow does when:

- Each event is the first to occur. One connector (1) is available for each event that’s defined in the Wait element.
- There are no more events to wait for, because the waiting conditions for every event are unmet. One connector (2) is available for the Wait element’s default path.
- An error occurs related to the Wait element. One connector (3) is available for the Wait element’s fault path, and it’s always labeled FAULT.
If the flow waits for multiple events, consider returning the flow path to the Wait element again so that the flow waits for the other events. If you return the flow path to the Wait element, consider using waiting conditions to control when the flow waits for each event. For an example, see Sample Flow That Waits for Many Events on page 4456.

**What Are Waiting Conditions?**
Each event that you define in a flow Wait element has optional *waiting conditions*. These conditions must be met for the flow interview to wait for that event at run time.

SEE ALSO:
- Customize What Happens When a Flow Fails
- Define the Path That a Flow Takes
- Cross-Object Field References in Flows
- Flow Elements

**What Are Waiting Conditions?**
Each event that you define in a flow Wait element has optional *waiting conditions*. These conditions must be met for the flow interview to wait for that event at run time.

When an interview encounters a Wait element, it checks the waiting conditions for each event to determine which events to wait for. If the waiting conditions aren’t met for an event, the interview doesn’t wait for that event. If all events have unmet waiting conditions, the interview executes the default path.

**Tip:** Add a default path if:
- All the events have waiting conditions set, and
- You want the flow to proceed when the waiting conditions for all events are met

**Example:** Here are two scenarios in which you would use waiting conditions.
- The flow waits for different events based on a field value on a given record.
  
  For example, send an email reminder to a contract’s owner before the contract’s end date. The date on which you send the email depends, however, on the rating of the contract’s account. If the account is hot, send the email a month before the end date. If the account isn’t hot, send the email two weeks before the end date.

  In this example, you would create two events. The event for hot accounts occurs 30 days before the contract’s end date. Its waiting conditions would check if the Rating for the contract’s account is equal to “Hot.”

  The second event occurs 15 days before the contract’s end date. Its waiting conditions would check if the Rating for the contract’s account is not equal to “Hot.”
When a flow interview executes the Wait element during run time, the interview checks the waiting conditions for each event. It only waits for the events whose waiting conditions are met. If the account is hot, the interview doesn’t wait for the second event.

- The flow waits for multiple events to occur, such as to send periodic email reminders. For an example of this scenario, see Sample Flow That Waits for Many Events on page 4456.

SEE ALSO:
- Operators in Flow Record Filters
- Flow Wait Element
- Flow Event Types

Flow Resources

Each resource represents a value that you can reference throughout the flow.

In the Cloud Flow Designer, the Explorer tab displays the resources that are available in the flow. You can create some types of resources from the Resources tab by double-clicking them. Some resources, such as global constants and system variables, are automatically provided by the system. Other resources are provided by the system when you add an element to the flow. For example, when you add a Decision element to your flow, the system creates a resource for each outcome. Which resources are available depend on the specific field you’re setting. Oftentimes you can create resources from within that field by expanding the CREATE NEW section of its drop-down list.

<table>
<thead>
<tr>
<th>Flow Resource</th>
<th>Description</th>
<th>Creatable from the Resources Tab</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choice</td>
<td>Represents an individual value that can be used in choice screen fields.</td>
<td>Yes</td>
</tr>
<tr>
<td>Collection Variable</td>
<td>Stores multiple updatable values that have the same data type, such as a group of email addresses.</td>
<td>Yes</td>
</tr>
<tr>
<td>Constant</td>
<td>Stores a fixed value.</td>
<td>Yes</td>
</tr>
<tr>
<td>Dynamic Record Choice</td>
<td>Represents a set of choices that’s generated from an object’s records.</td>
<td>Yes</td>
</tr>
<tr>
<td>Element</td>
<td>Any element that you add to the flow is available as a Resource with the was visited operator in outcome criteria. An element is considered visited if the element has already been executed in the flow interview. Any element that you add to the flow that supports a fault connector is available as a Boolean resource. If the element has already been successfully executed in the flow interview, the resource’s value is True. If the element wasn’t executed or was executed and resulted in an error, the resource’s value is False.</td>

Flow Choice Resource

Represents an individual value that can be used in choice screen fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>A user-friendly label for the choice option.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this choice option from other resources.</td>
</tr>
<tr>
<td>Value Data Type</td>
<td>Controls which choice fields this choice can be used in. For example, you can’t use a Text choice in a Currency radio button field.</td>
</tr>
<tr>
<td>Scale</td>
<td>Controls the number of digits to the right of the decimal point. Can’t exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Available for only Currency and Number choices.</td>
</tr>
<tr>
<td>Stored Value</td>
<td>If the user selects this choice, the choice field has this value. If a user leaves a choice blank or unselected, its stored value is set to null.</td>
</tr>
<tr>
<td>Show Input on Selection</td>
<td>Displays a text box below the choice option. This option isn’t available if the choice’s data type is Boolean.</td>
</tr>
</tbody>
</table>

These fields appear only if you select Show Input on Selection.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label</td>
<td>A user-friendly label for the text box.</td>
</tr>
<tr>
<td>Required</td>
<td>Forces users to enter a value in the text box before they can progress or finish the flow.</td>
</tr>
<tr>
<td>Validate</td>
<td>Evaluates whether the user entered an acceptable value.</td>
</tr>
</tbody>
</table>

These fields appear only if you select Validate.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Formula</td>
<td>Boolean formula expression that evaluates whether the user entered an acceptable value.</td>
</tr>
<tr>
<td>Error Message</td>
<td>Displays if the user didn’t enter an acceptable value.</td>
</tr>
</tbody>
</table>
**Example:** If your flow asks users to choose a particular service level, create choices for Gold, Silver, and Bronze. In a screen, display the choices with a description of the features included. Then, in the same screen, let the user pick from a dropdown list.

**Flow Collection Variable Resource**

Stores multiple updatable values that have the same data type, such as a group of email addresses.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this collection variable from other resources.</td>
</tr>
<tr>
<td>Data Type</td>
<td>Determines the type of values that can be assigned to the collection variable.</td>
</tr>
<tr>
<td>Input/Output Type</td>
<td>Determines whether the collection variable can be accessed outside the flow.</td>
</tr>
<tr>
<td></td>
<td>• Private—Can be assigned and used only within the flow</td>
</tr>
<tr>
<td></td>
<td>• Input—Can be set at the start of the flow using Visualforce controllers, or subflow inputs</td>
</tr>
<tr>
<td></td>
<td>• Output—Can be accessed from Visualforce controllers and other flows</td>
</tr>
</tbody>
</table>

This field doesn’t affect how variables are assigned or used within the same flow, for example, through these types of elements: Assignment, Record or Fast Create, Record or Fast Lookup, and Apex Plug-in.

The default value of the field is Private.

**Warning:** Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables

**EDITIONS**

Available in: both Salesforce Classic and Lightning Experience

Available in: [Enterprise](#), [Performance](#), [Unlimited](#), and [Developer](#) Editions
Flow Constant Resource

A flow constant represents a fixed value. Unlike variables, this value can’t change throughout a flow.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this constant from other resources.</td>
</tr>
<tr>
<td>Data Type</td>
<td>Determines the types of values that the constant can store.</td>
</tr>
<tr>
<td>Value</td>
<td>The constant’s value. This value doesn’t change throughout the flow.</td>
</tr>
</tbody>
</table>

Flow Dynamic Record Choice Resource

Represents a set of choices that’s generated from an object’s records.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this resource from other resources.</td>
</tr>
<tr>
<td>Value Data Type</td>
<td>Data type of the choice’s stored value.</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create a choice for each</td>
<td>Determines the object whose records you want to use to generate the choices</td>
</tr>
<tr>
<td>Filter Criteria</td>
<td>Determines which records are included in the generated list of choices. If you don’t apply any filters, a choice is generated for every record of the selected object. For example, to generate a list of all accounts in San Francisco, use filters to include only accounts whose Billing City is San Francisco.</td>
</tr>
</tbody>
</table>
| Choice Label                               | Determines which field is used as the label for each generated choice. Select a field that enables users to differentiate between the generated choices.  
  
  **Tip:** Make sure to choose a field that contains data. If the selected field has no value for a given record, the corresponding choice’s label is blank at run time. |
| Choice Stored Value                        | Determines which field’s value is stored when the user selects this choice at run time. Value Data Type determines the available options. By default, the stored value is null. The stored value is determined by the most recent user selection of a choice within the generated set. |
| Sort results by                            | Controls the order that the choices appear in.  
  
  When Sort results by is selected, also select the field that you want to order the choices by. Then select which order the choices should appear in. |
| Limit number of choices to                 | Controls the number of options that appear in the screen field that uses this dynamic record choice.  
  
  When Limit number of choices to is selected, also enter the maximum number (up to 200) of choices to include. |
| Assign the record fields to variables...   | Takes field values from the record that the user chose and stores them in flow variables that you can reference later.  
  
  **Note:** When a multi-select choice field uses a dynamic record choice, only values from the last record that the user selects are stored in the flow variables. If multiple multi-select choice fields on one screen use the same dynamic record choice, the variable assignments obey the first of those fields. |

**Example:** In a support flow for a computer hardware manufacturer, users identify a product to find its latest updates. You create a dynamic record choice that displays all products whose product ID starts with a specific string of characters. However, the flow users are more likely to know the product’s name than its ID, so for Choice Label select the field that contains the product.
name. Elsewhere in the flow, you want to display the associated product ID and description. To do so, you assign the ID and Description field values from the user-selected record to flow variables.

Flow Formula Resource

Calculates a value by using other resources in your flow and Salesforce functions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this formula from other resources.</td>
</tr>
<tr>
<td>Value Data Type</td>
<td>The data type for the value calculated by the formula.</td>
</tr>
<tr>
<td>Scale</td>
<td>Controls the number of digits to the right of the decimal point. Can’t exceed 17. If you leave this field blank or set to zero, only whole numbers display when your flow runs. Appears when Value Data Type is Number or Currency.</td>
</tr>
<tr>
<td>Formula</td>
<td>The formula expression that the flow evaluates at run time. The returned value must be compatible with Value Data Type.</td>
</tr>
</tbody>
</table>

Note: Some formula operators are not supported in the Cloud Flow Designer.

SEE ALSO:
- Formula Operators and Functions
- Limitations for Flow Formulas
- Flow Resources
- Cross-Object Field References in Flows
Flow Global Constant Resource

Fixed, system-provided values, such as EmptyString, True, and False.

<table>
<thead>
<tr>
<th>Global Constant</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>(!$GlobalConstant.True)</td>
<td>Boolean</td>
</tr>
<tr>
<td>(!$GlobalConstant.False)</td>
<td>Boolean</td>
</tr>
<tr>
<td>(!$GlobalConstant.EmptyString)</td>
<td>Text</td>
</tr>
</tbody>
</table>

**Example:** When you create a Boolean variable, $GlobalConstant.True and $GlobalConstant.False are supported. But when you create a Currency variable, no global constants are supported.

**Null vs. Empty String**

At run time, (!$GlobalConstant.EmptyString) and null are treated as separate, distinct values. For example:

- If you leave a text field or resource value blank, that value is null at run time. If you instead want the value to be treated as an empty string, set it to (!$GlobalConstant.EmptyString).
- For flow conditions, use the is null operator to check whether a value is null. If the condition compares two text variables, make sure that their default values are correctly either set to (!$GlobalConstant.EmptyString) or left blank (null).

SEE ALSO:

Flow Resources

Global Variables in Visual Workflow

System-provided variables that reference information about the organization or running user, such as the user’s ID or the API session ID. In Visual Workflow, global variables are available only in flow formulas.

**Example:** Use ($!User.Id) to easily access the ID of the user who’s running the flow interview.

The following global variables are supported in flow formulas. If a value in the database has no value, the corresponding merge field returns a blank value. For example, if nobody has set a value for your organization’s Country field, (!$Organization.Country) returns no value.

<table>
<thead>
<tr>
<th>Global Variable</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$Api</td>
<td>References API URLs or the session ID. The following merge fields are available.</td>
</tr>
<tr>
<td></td>
<td>• Enterprise_Server_URL_XXX—The Enterprise WSDL SOAP endpoint where XXX represents the version of the API.</td>
</tr>
<tr>
<td></td>
<td>• Partner_Server_URL_XXX—The Partner WSDL SOAP endpoint where XXX represents the version of the API.</td>
</tr>
<tr>
<td></td>
<td>• Session_ID</td>
</tr>
<tr>
<td>Global Variable</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>-------------</td>
</tr>
</tbody>
</table>
| $Label          | References custom labels. This global variable appears only if custom labels have been created in your organization. The returned value depends on the language setting of the contextual user. The value returned is one of the following, in order of precedence:  
  1. The local translation’s text  
  2. The packaged translation’s text  
  3. The master label’s text |
| $Organization   | References information about your company.  
  **Note:** {!$Organization.UiSkin} returns one of these values.  
  - Theme1—Obsolete Salesforce theme  
  - Theme2—Salesforce theme used before Spring ’10  
  - Theme3—Classic “Aloha” Salesforce theme, introduced in Spring ’10  
  - PortalDefault—Salesforce Customer Portal theme  
  - Webstore—Salesforce AppExchange theme |
| $Profile        | References information from the current user’s profile, such as license type or name.  
  **Tip:**  
  - Use profile names to reference standard profiles in $Profile merge fields.  
  - Users don’t need access to their profile information to run a flow that references these merge fields. |
| $Setup          | References custom settings of type “hierarchy”. This global variable appears only if hierarchy custom settings have been created in your organization. You can access custom settings of type “list” only in Apex.  
  Hierarchical custom settings allow values at any of three different levels:  
  - Organization—the default value for everyone  
  - Profile—overrides the Organization value  
  - User—overrides both Organization and Profile values  
  Salesforce automatically determines the correct value for this custom setting field based on the running user’s current context. |
| $System         | $System.OriginDateTime represents the literal value of 1900-01-01 00:00:00. Use this merge field to perform date/time offset calculations. |
| $User           | References information about the user who’s running the flow interview. For example, reference the user’s ID or title.  
  **Tip:**  
  - The current user is the person who caused the flow to start.  
  - When a flow is started because a Web-to-Case or Web-to-Lead process changed a record, the current user is the Default Lead Owner or Default Case Owner. |
### Global Variable

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$User.UITheme and $User.UIThemeDisplayed identify the look and feel the running user sees on a given Salesforce page. The difference between the two variables is that $User.UITheme returns the look and feel the user is supposed to see, while $User.UIThemeDisplayed returns the look and feel the user actually sees. For example, a user may have the preference and permissions to see the Lightning Experience look and feel, but if they are using a browser that doesn't support that look and feel, for example, older versions of Internet Explorer, $User.UIThemeDisplayed returns a different value. These merge fields return one of the following values.</td>
</tr>
<tr>
<td>- Theme1—Obsolete Salesforce theme</td>
</tr>
<tr>
<td>- Theme2—Salesforce Classic 2005 user interface theme</td>
</tr>
<tr>
<td>- Theme3—Salesforce Classic 2010 user interface theme</td>
</tr>
<tr>
<td>- Theme4d—Modern &quot;Lightning Experience” Salesforce theme</td>
</tr>
<tr>
<td>- Theme4t—Salesforce1 mobile Salesforce theme</td>
</tr>
<tr>
<td>- PortalDefault—Salesforce Customer Portal theme</td>
</tr>
<tr>
<td>- Webstore—Salesforce AppExchange theme</td>
</tr>
</tbody>
</table>

### $UserRole

References information about the current user’s role, such as the role name or ID.

**Tip:**
- The current user is the person who caused the flow to start.
- When a flow is started because a Web-to-Case or Web-to-Lead process changed a record, the current user is the Default Lead Owner or Default Case Owner.

### Flow Picklist Choice Resource

Represents a set of choices that’s generated from the values of a picklist or multi-select picklist field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this resource from other resources.</td>
</tr>
<tr>
<td>Value Data Type</td>
<td>Data type of the choice’s stored value.</td>
</tr>
<tr>
<td>Object</td>
<td>The object whose fields you want to select from.</td>
</tr>
<tr>
<td>Field</td>
<td>The picklist or multi-select picklist field to use to generate the list of choices.</td>
</tr>
<tr>
<td>Sort Order</td>
<td>Controls the order that the choices appear in.</td>
</tr>
</tbody>
</table>
Example: In a flow that simplifies the process of creating an account, users need to identify the company’s industry.

Rather than creating one choice for each industry, you add a picklist choice to the flow and populate a drop-down list with it. When users run this flow, the picklist choice finds all the values in the database for the Industry picklist field (1) on the Account object (2).

On top of being easier to configure than the stand-alone choice resource, picklist choices reduce maintenance. When someone adds new options to the Account Industry picklist, the flow automatically reflects those changes; you don’t have to update the flow.

Usage

Unlike with dynamic record choices, you can’t:

Filter out any values that come back from the database.
The flow always displays every picklist value for that field—even if you’re using record types to narrow down the picklist choices in page layouts.

Customize the label for each option.
The flow always displays the label for each picklist value.

Customize the stored value for each option.
The flow always stores the API value for each picklist value.

The following picklists aren’t supported.

- Global picklists
- Picklists for Knowledge Articles

SEE ALSO:
Flow Screen Element: Choice Fields
Options for Choice Fields in Flow Screen Elements
Flow Resources
Flow sObject Collection Variable Resource

Stores updatable field values for one or more Salesforce records.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this sObject collection variable from other resources.</td>
</tr>
<tr>
<td>Input/Output Type</td>
<td>Determines whether the sObject collection variable can be accessed outside the flow.</td>
</tr>
<tr>
<td></td>
<td>• Private—Can be assigned and used only within the flow</td>
</tr>
<tr>
<td></td>
<td>• Input—Can be set at the start of the flow using Visualforce controllers, or subflow inputs</td>
</tr>
<tr>
<td></td>
<td>• Output—Can be accessed from Visualforce controllers and other flows</td>
</tr>
<tr>
<td></td>
<td>The default value is Private.</td>
</tr>
</tbody>
</table>

**Warning:** Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, Visualforce controllers, subflows, and processes.

| Object Type          | Type of Salesforce records that the sObject collection represents in the flow. |

**Usage**

After you populate the sObject collection, reference it to create, update, or delete records in the Salesforce database.

Examine every item in the collection by using a Loop element. When an item is being examined in the loop, the item’s field values are copied into an sObject variable that you specify as the loop variable. If you want the loop to modify a collection item, such as to update an item’s field values:

1. Configure the elements within the loop to update the loop variable.
2. Add the variable’s field values to a separate collection.
You can add new items to the end of the collection (Assignment element) or replace all items in the collection (Fast Lookup element). However, you can’t update existing collection items. To get around this limitation, have the loop iteratively add the contents of the loop variable to another collection. When the loop finishes, you can update the Salesforce records with values from the new collection.

SEE ALSO:

- Sample Flow That Loops Through a Collection
- Flow Loop Element
- Flow Resources

**Flow sObject Variable Resource**

Stores updatable field values for a Salesforce record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>The requirement for uniqueness applies only to elements within the current flow. Two elements can have the same unique name, provided they are used in different flows. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Helps you differentiate this sObject variable from other resources.</td>
</tr>
<tr>
<td>Input/Output Type</td>
<td>Determines whether the sObject variable can be accessed outside the flow.</td>
</tr>
<tr>
<td></td>
<td>- Private—Can be assigned and used only within the flow</td>
</tr>
<tr>
<td></td>
<td>- Input—Can be set at the start of the flow using Visualforce controllers, or subflow inputs</td>
</tr>
<tr>
<td></td>
<td>- Output—Can be accessed from Visualforce controllers and other flows</td>
</tr>
<tr>
<td></td>
<td>This field doesn’t affect how variables are assigned or used within the same flow, for example, through these types of elements: Assignment, Record or Fast Create, Record or Fast Lookup, and Apex Plug-in.</td>
</tr>
<tr>
<td></td>
<td>The default value of the field is Private.</td>
</tr>
<tr>
<td></td>
<td><strong>Warning:</strong> Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, Visualforce controllers, subflows, and processes.</td>
</tr>
<tr>
<td>Object Type</td>
<td>Type of Salesforce record that the sObject variable represents in the flow.</td>
</tr>
</tbody>
</table>
Usage

When an sObject variable is created, its default value is null. Before you reference an sObject variable’s values, make sure that the sObject variable has a value by using the is null operator in a Decision element.

SEE ALSO:
Flow Resources

System Variables in Flows

System-provided values about the running flow interview, such as {!$Flow.CurrentDate}, {!$Flow.CurrentDateTime}, and {!$Flow.FaultMessage}.

<table>
<thead>
<tr>
<th>System Variable</th>
<th>Supported Resource Types</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{!$Flow.CurrentDate}</td>
<td>Text, Date, and DateTime</td>
<td>Date when the flow interview executes the element that references the system variable.</td>
</tr>
<tr>
<td>{!$Flow.CurrentDateTime}</td>
<td>Text, Date, and DateTime</td>
<td>Date and time when the flow interview executes the element that references the system variable.</td>
</tr>
<tr>
<td>{!$Flow.FaultMessage}</td>
<td>Text</td>
<td>System fault message that can help flow administrators troubleshoot run time issues.</td>
</tr>
</tbody>
</table>

**Example:** A flow is used only internally by call center personnel. For each flow element that interacts with the Salesforce database, a fault connector leads to a screen. A Display Text field on the screen displays the system fault message and instructs the flow user to provide that message to the IT department.

Sorry, but you can’t read or update records at this time.
Please open a case with IT, and include the following error message: {!$Flow.FaultMessage}

<td></td>
<td>- Input—Can be set at the start of the flow using Visualforce controllers, or subflow inputs</td>
</tr>
</tbody>
</table>
Field | Description
--- | ---
• Output—Can be accessed from Visualforce controllers and other flows

This field doesn’t affect how variables are assigned or used within the same flow, for example, through these types of elements: Assignment, Record or Fast Create, Record or Fast Lookup, and Apex Plug-in.

The default value of the field depends on the release or API version in which the variable is created:
• Private for a variable created in Summer ’12 and later or in API version 25.0 and later.
• Input and Output for a variable created in Spring ’12 and earlier or in API version 24.0.

**Warning:** Disabling input or output access for an existing variable can break the functionality of applications and pages that call the flow and access the variable. For example, you can access variables from URL parameters, Visualforce controllers, subflows, and processes.

Default Value

Determines the variable value when the flow starts. If you leave this field blank, the value is null. Default values aren’t available for Picklist and Picklist (Multi-Select) variables.

**Usage**

You can delete a variable at any time. Any variable assignments that use the deleted variable are set to null.

Cross-Object Field References in Flows

**Cross-Object Field References in Flows**

When building a flow, you can reference fields for records that are related to the values that are stored in an sObject variable. To do so, manually enter the references.

**Tips for Cross-Object Field References in Flows**

Cross-object field values are valid wherever you can reference a flow resource or manually enter a value. Keep these implementation tips in mind when you use a cross-object field reference.

**Cross-Object Field References in Flows: Simple Relationships**

Most relationships are straightforward. For example, Case.AccountId links directly to the case’s parent account. If you know that a field relationship ties your object to exactly one other object, use this syntax.

**Cross-Object Field References in Flows: Polymorphic Relationships**

Some fields have relationships to more than one object. We call these relationships polymorphic. For example, if you have queues enabled for cases, a case owner can be either a user or queue. If you’re traversing from a case to its owner ID, add special syntax to identify which object you mean when you say “Owner”.

**Example Cross-Object Field References in Flows**

This example demonstrates how to update a contract’s owner to be the contract’s account’s owner.
Tips for Cross-Object Field References in Flows

Cross-object field values are valid wherever you can reference a flow resource or manually enter a value. Keep these implementation tips in mind when you use a cross-object field reference.

When you create an sObject variable to reference fields on related records from, store the ID for the first related record in the variable. For example, to reference an opportunity’s contract, store ContractId in the sObject variable or add a value for ContractId by using an Assignment element.

Unsupported Relationships

The following relationships aren’t supported in cross-object field references.

- Lead ConvertedAccount
- Lead ConvertedContact
- Lead ConvertedOpportunity

Avoiding Null Values

If a flow interview encounters a null value at any point in the cross-object expression, the element containing the reference fails. The reference runs successfully if the last field value in the expression is null. For example, store a contact in {!sObjContact} and try to reference {!sObjContact}.Account.Name. The flow fails if AccountId on the stored contact is null (because there isn’t an account to look at), but it succeeds if Name on the related account is null.

If an element contains a cross-object reference that fails and the element doesn’t have a fault path defined, the entire interview fails. To avoid this situation, you can:

- Make the fields that you want to reference in the expression required in Salesforce. For example, for the expression {!sObjContact}.Account.Name, you could require AccountId on contact page layouts. Then, using another flow, find any records with null values for that field and update them.
- Determine whether each field that’s referenced in the expression has a value by using the wasSet operator in a Decision element.

Cross-Object Field References and Org Limits

Cross-object field references in flows don’t count against your org’s limits for:

- Cross-object relationships per object
- DML operations per transaction

Cross-Object Field References in Flows: Simple Relationships

Most relationships are straightforward. For example, Case.AccountId links directly to the case’s parent account. If you know that a field relationship ties your object to exactly one other object, use this syntax.
To reference a field on a related record, use this syntax.

```
{!sObjectVariable.objectName1.objectName2.fieldName}
```

where:

- `sObjectVariable` is the unique name for the sObject variable that you want to start from.
- `objectName1` is the API name for an object that’s related to sObjectVariable’s object type. The API names for all custom objects end in `__r`.
- (Optional) `objectName2` is the API name for an object that’s related to `objectName1`. Your expression must include at least one object name, but you can add more objects as needed.
- `fieldName` is the name for the field that you want to reference on the last object in the expression. The API names for all custom fields end in `__c`.

For example, `{!sOv.Contact.Account.Id}` references Id of the account that’s related to the contact record represented by an sObject variable in the flow.

Cross-Object Field References in Flows: Polymorphic Relationships

Some fields have relationships to more than one object. We call these relationships *polymorphic*. For example, if you have queues enabled for cases, a case owner can be either a user or queue. If you’re traversing from a case to its owner ID, add special syntax to identify which object you mean when you say “Owner”.

To reference a field on a related record, use this syntax.

```
{!sObjectVariable.polymorphicObjectName1:specificObjectName2.fieldName}
```

where:

- `sObjectVariable` is the unique name for the sObject variable that you want to start from.
- `polymorphicObjectName` is the API name for a polymorphic relationship for sObjectVariable’s object type.
- `specificObjectName` is the API name for the object that you want to select from the polymorphic relationship.
- `fieldName` is the name for the field that you want to reference on the last object in the expression. All custom field API names end in `__c`.

For example: `{!sObj_Case.Owner:User.Id}` references the ID of the user who owns the case, while `{!sObj_Case.Owner:Queue.Id}` references the ID of the queue who owns the case. You can always add the polymorphic reference after several traversals({!sObj_Case.Account.Owner:User.Id}) or in the middle of a reference({!sObj_Case.Owner:User.Manager.Id}).

**Supported Polymorphic Relationships**

Not every relationship is polymorphic, so we recommend using the polymorphic syntax only when you know that the field can link to multiple objects. The following relationships are supported.

- `Case.Source`
- `FeedItem.CreatedBy`

4426
Object.Owner

Where Object lets you set Owner to either a user or a queue. Group.Owner and Queue.Owner aren’t supported.

When you create an sObject variable to reference fields on related records from, store the ID for the first related record in the variable. For example, to reference an opportunity’s contract, store ContractId in the sObject variable or add a value for ContractId by using an Assignment element.

Example Cross-Object Field References in Flows

This example demonstrates how to update a contract’s owner to be the contract’s account’s owner.

Example:

1. Use a Fast Lookup element to store the contract’s fields, including AccountId, in an sObject variable called varContract.
2. Use a Decision element to verify that the value of AccountId was set in varContract.
3. Use a Fast Lookup to store the fields for the contract’s account, including OwnerId, in another sObject variable called varAccount.
4. Use a Decision element to confirm that the value of OwnerId was set in varAccount.
5. Use an Assignment element to specify {!varContract.Account.OwnerId} as the value for {!varContract.OwnerId}.
6. Use a Fast Update element to write the values in varContract, including the updated OwnerId value, to the contract in Salesforce.
Flow Connectors

Connectors determine the available paths that a flow can take at run time. In the Cloud Flow Designer canvas, a connector looks like an arrow that points from one element to another.

<table>

Flow Elements

Flow Operators

Operators behave differently, depending on what you’re configuring. In Assignment elements, operators let you change resource values. In flow conditions and record filters, operators let you evaluate information and narrow the scope of a flow operation.

Operators in Flow Assignment Elements
Use Assignment element operators to change the value of a selected resource.

Operators in Flow Conditions
Use condition operators to verify the value of a selected resource. Conditions are used in Decision elements and Wait elements.

Operators in Flow Record Filters
A flow record filter narrows the scope of records that the flow operates on. For example, use a record filter to update only the contacts that are associated with the Acme Wireless account. When you add a Record Update element, use the record filters to narrow the scope to just the contacts whose parent account is Acme Wireless.
Operators in Flow Assignment Elements

Use Assignment element operators to change the value of a selected resource.

Use this reference, organized by the data type that you select for Resource, to understand the supported operators.

- **Boolean**
- **Collection**
- **Currency**
- **Date**

- **Multi-Select Picklist**
- **Number**
- **Picklist**
- **sObject**
- **Text**

### Boolean

Replace a boolean resource with a new value.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>What you enter or select for Value replaces the value of Variable.</td>
<td>Boolean</td>
<td>Before Assignment: <code>{!varBoolean} is false. Assignment: </code>{!varBoolean} equals <code>{!$GlobalConstant.True} After Assignment: </code>{!varBoolean} is true.</td>
</tr>
</tbody>
</table>

### Collection

Replace the value of a collection variable or sObject collection variable (equals) or add an item to the end of the variable (add).

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>What you enter or select for Value replaces the value of Variable.</td>
<td>Collection of the same data type or object type Text, Picklist, and Multi-Select Picklist data types are compatible with each other.</td>
<td>Before the Assignment: <code>{!collText} is Yellow, Green, Blue </code>{!collPicklist} is Blue, Red, Orange Assignment: <code>{!collText} equals </code>{!collPicklist}. After the Assignment: `{!collText} is Blue, Red, Orange.</td>
</tr>
</tbody>
</table>
### Example Supported Data Types

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>What you enter or select for Value is added as a new item at the end of the collection.</td>
<td>Variable of the same data type or sObject variable of the same object type. Text, Picklist, and Multi-Select Picklist data types are compatible with each other.</td>
<td>Before the Assignment: <code>{!collText}</code> is Yellow, Green, Blue. <code>{!varPicklist}</code> is Red. Assignment: <code>{!collText}</code> add <code>{!varPicklist}</code>. After the Assignment: <code>{!collText}</code> is Yellow, Green, Blue, Red.</td>
</tr>
</tbody>
</table>

### Currency and Number

Replace (equals), add to (add), or subtract from (subtract) the value of a currency or number resource.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>The number that you enter or select for Value replaces the value of Variable.</td>
<td>Currency, Number</td>
<td>Before the Assignment: <code>{!varCurrency}</code> is 10. Assignment: <code>{!varCurrency}</code> equals 7. After the Assignment: <code>{!varCurrency}</code> is 7.</td>
</tr>
<tr>
<td>add</td>
<td>The number that you enter or select for Value is added to the value of Variable.</td>
<td>Currency, Number</td>
<td>Before the Assignment: <code>{!varCurrency}</code> is 10. Assignment: <code>{!varCurrency}</code> add 7. After the Assignment: <code>{!varCurrency}</code> is 17.</td>
</tr>
<tr>
<td>subtract</td>
<td>The number that you enter or select for Value is subtracted from the value of Variable.</td>
<td>Currency, Number</td>
<td>Before the Assignment: <code>{!varCurrency}</code> is 10. Assignment: <code>{!varCurrency}</code> subtract 7. After the Assignment: <code>{!varCurrency}</code> is 3.</td>
</tr>
</tbody>
</table>

### Date

Replace (equals), add to (add), or subtract from (subtract) the value of a date/time resource.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>The date that you enter or select for Value replaces the value of Variable.</td>
<td>Date, Date/Time</td>
<td>Before the Assignment: <code>{!varDate}</code> is 1/16/2016. Assignment: <code>{!varDate}</code> equals 1/15/2016. After the Assignment: <code>{!varDate}</code> is 1/15/2016.</td>
</tr>
<tr>
<td>Operator</td>
<td>Description</td>
<td>Supported Data Types</td>
<td>Example</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
<td>----------------------</td>
<td>---------</td>
</tr>
</tbody>
</table>
| add      | Value is added, in days, to the selected Variable’s value. | • Currency  
          • Number | Before the Assignment: `{!varDate}` is 1/16/2016. Assignment: `{!varDate} add 7`. After the Assignment: `{!varDate}` is 1/23/2016. |
| subtract | Value is subtracted, in days, from the selected Variable’s value. | • Currency  
          • Number | Before the Assignment: `{!varDate}` is 1/16/2016. Assignment: `{!varDate} subtract 7`. After the Assignment: `{!varDate}` is 1/9/2016. |

**Date/Time**

Replace a date/time resource with a new value (equals).

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>
<th>Example</th>
</tr>
</thead>
</table>
| equals   | The date that you enter or select for Value replaces the value of Variable. | • Date  
          • Date/Time | Before the Assignment: `{!varDateTime}` is 1/16/2016 01:00. Assignment: `{!varDateTime} equals 1/16/2016 08:00`. After the Assignment: `{!varDateTime}` is 1/16/2016 08:00. |

**Picklist**

Replace a picklist resource with a new value (equals) or concatenate a value onto the original value (add).

ℹ️ **Note:** Before values are assigned or added to a picklist resource, they’re converted into string values.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>
<th>Example</th>
</tr>
</thead>
</table>

</tbody>
</table>
Example Supported Data Types

**Operator** | **Description** | **Supported Data Types** | **Example**
--- | --- | --- | ---
| | a single space after the semi-colon and don’t include a space before the semi-colon. This way, you can compare the variable’s values to the values of a multi-select picklist field from the Salesforce database. For example: ; Yellow | | Before the Assignment: {!varMSP} is Blue; Green. Assignment: {!varMSP} **add** item Yellow. After the Assignment: {!varMSP} is Blue; Green; Yellow. This value includes three separate selections. |
| **add item** | What you enter or select for Value is added as a new selection to the end of the multi-select picklist. The Assignment automatically adds “;” before the new item. That way, Salesforce reads it as a separate item selected by the multi-select picklist. | • Boolean • Currency • Date • Date/Time • Multi-Select Picklist • Number • Picklist • Text | |

**sObject**
Replace an sObject variable with a new value (equals).

**Operator** | **Description** | **Supported Data Types** | **Example**
--- | --- | --- | ---
| **equals** | The sObject that you select for Value replaces the value of Variable. sObject with the same object type | Before the Assignment:
• {!account1} contains field values for the Acme Wireless account
• {!account2} contains field values for the Global Media account
Assignment: {!account1} **equals** {!account2}. After the Assignment: both {!account1} and {!account2} contain the field values for the Global Media account. | |

**Text**
Replace a text resource with a new value (equals) or concatenate a value onto the end of the original value (add).

**Note:** Before values are assigned or added to a text resource, they’re converted into string values.
<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
<th>Supported Data Types</th>

**EDITIONS**

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited**, and **Developer** Editions
**Boolean**

Check whether a Boolean resource’s value matches another value or resource.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>does not equal</td>
<td>The value of the selected Resource doesn’t match what you enter or select for Value.</td>
<td>Boolean</td>
</tr>
<tr>
<td>equals</td>
<td>The value of the selected Resource matches what you enter or select for Value. An outcome resolves to true if the flow interview took that outcome. A wait event resolves to true if all of the waiting conditions for that event are met.</td>
<td>Boolean</td>
</tr>
<tr>
<td>was set</td>
<td>The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once.</td>
<td>Boolean</td>
</tr>
<tr>
<td>was visited</td>
<td>The selected Resource is an element in the flow, and it has been visited during the flow interview.</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

**Choice**

Every choice resource has a data type and obeys the operator rules for that data type. However, choice resources support one extra operator that other resources don’t, no matter what their data type is.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>was selected</td>
<td>A user selected that choice or dynamic record choice in a screen choice input field. If your flow references the same choice option in multiple screens, was selected always evaluates to the most recent screen that the flow visited. If your flow references the same choice option with a user input in more than one place on the same screen, this operator always evaluates the first usage in the screen.</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

**Collection**

Check whether a Collection resource’s value contains or matches another value or resource.

<table>

<td>Boolean</td>
</tr>
</tbody>
</table>

### Picklist

Check whether a Picklist resource’s value matches or contains another value or resource.

**Note:** These operators treat the resource’s value as a text value.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>contains</td>
<td>The value for Resource contains what’s entered or selected for Value</td>
<td>Boolean</td>
</tr>
<tr>
<td></td>
<td>For example, if the value of <code>{!varPicklist}</code> is yellow-green, the condition <code>{!varPicklist} contains green</code> evaluates to true.</td>
<td>Currency, Date, Date/Time, Multi-select Picklist, Number, Picklist, Text</td>
</tr>
<tr>
<td>does not equal</td>
<td>The value for Resource doesn’t match what’s entered or selected for Value</td>
<td>Boolean</td>
</tr>
<tr>
<td>equals</td>
<td>The value for Resource matches what’s entered or selected for Value</td>
<td>Boolean</td>
</tr>
<tr>
<td>Operator</td>
<td>True if...</td>
<td>Supported Data Types</td>
</tr>
<tr>
<td>-----------</td>
<td>------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>was set</td>
<td>The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

**Multi-Select Picklist**

Check whether a multi-select picklist resource’s value matches or contains another value or resource.

*Note:* These operators treat the resource’s value as a text value. If the resource’s value includes multiple items, the operators treat the value as one string that happens to include semi-colons. It doesn’t treat each selection as a different value. For example, the operators treat `red; blue; green` as a single value rather than three separate values.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>contains</td>
<td>The value for Resource contains what’s entered or selected for Value</td>
<td>Boolean, Currency, Date, Date/Time, Multi-select Picklist, Number, Picklist, Text</td>
</tr>
</tbody>
</table>

**Tip:** When you use this operator for a multi-select picklist resource, be aware of the values that a user can enter. If you want to check that a specific value is included and that value is also included as part of another value, create a flow formula resource that uses the INCLUDES() function.

For example, your organization has a Color multi-select picklist value. Among the possible values are “green” and “yellow-green”. If both “green” and “yellow-green” are acceptable values, use the contains operator in a flow condition. If only “green” is an acceptable value, create a formula that uses the INCLUDES() function.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>does not equal</td>
<td>The value for Resource doesn’t match what’s entered or selected for Value</td>
<td>Boolean, Currency, Date, Date/Time, Multi-select Picklist, Number, Picklist, Text</td>
</tr>
</tbody>
</table>

**Note:** Order matters. If you aren’t sure which order the values that you’re checking for will appear in, use the INCLUDES() function in a flow formula. For example, if you compare “red; blue; green” to “blue; green; red” using the does not equal operator, that condition resolves to true.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>equals</td>
<td>The value for Resource exactly matches what’s entered or selected for Value</td>
<td>Boolean, Currency, Date, Date/Time</td>
</tr>
</tbody>
</table>

**Note:** Order matters. If you aren’t sure which order the values that you’re checking for will appear in, use the INCLUDES() function in a flow formula. For example, if you compare “red; blue; green” to “blue; green; red” using the equals operator, that condition will resolve to false.
### Supported Data Types

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>was set</td>
<td>The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

### sObject

Check whether an sObject resource’s value matches another value or resource.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>does not equal</td>
<td>The value for Resource doesn’t match what’s entered or selected for Value</td>
<td>sObject with the same object type</td>
</tr>
<tr>
<td>equals</td>
<td>The value for Resource matches what’s entered or selected for Value</td>
<td>sObject with the same object type</td>
</tr>
<tr>
<td>is null</td>
<td>Resource isn’t populated with a value</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

### Text

Check whether a Text resource’s value matches, contains, ends with, or starts with another value or resource.

**Note:** Before values are compared to a text resource, they’re converted into string values.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>contains</td>
<td>The value for Resource contains what’s entered or selected for Value</td>
<td>• Boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Currency</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date/Time</td>
</tr>
<tr>
<td></td>

• Text |
Operators in Flow Record Filters

A flow record filter narrows the scope of records that the flow operates on. For example, use a record filter to update only the contacts that are associated with the Acme Wireless account. When you add a Record Update element, use the record filters to narrow the scope to just the contacts whose parent account is Acme Wireless.

Use this reference, organized by the data type of the field that you select, to understand the supported operators.

- Address Fields
- Autonumber Fields
- Checkbox Fields
- Currency Fields
- Date Fields
- Date/Time Fields
- Email Fields
- Encrypted Text Fields
- External Lookup Relationship Fields
- Fax Fields
- Lookup Relationship Fields
- Multi-Select Picklist Fields
- Number Fields
- Parent Fields
- Percent Fields
- Phone Fields
- Picklist Fields
- Text Fields
- Text Area (Long) Fields
- Text Area (Rich) Fields
- URL Fields

**Checkbox Fields**

When you select a checkbox field under Field, these operators are available.

<table>
<thead>
<tr>
<th>Operator</th>
<th>True if…</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>was set</td>
<td>The value for Resource is a field in an sObject variable, and that field has been populated with a value in the flow at least once</td>
<td>Boolean</td>
</tr>
<tr>
<td>Operator</td>
<td>Filters to records where the selected field’s value ...</td>
<td>Supported Data Types</td>
</tr>
<tr>
<td>-------------------</td>
<td>---------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>does not equal</td>
<td>Doesn’t match what you enter or select for Value</td>
<td>Boolean</td>
</tr>
<tr>
<td>equals</td>
<td>Matches what you enter or select for Value</td>
<td>Boolean</td>
</tr>
<tr>
<td>is null</td>
<td>Hasn’t been populated with a value yet (if you select True for Value)</td>
<td>Boolean</td>
</tr>
</tbody>
</table>

**Tip:** Flow treats null as a different value than false. If you filter for records whose checkbox field is null, no records are returned.

### Currency, Number, and Percent Fields

When you select a currency, number, or percent field under Field, these operators are available.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Filters to records where the selected field’s value ...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>does not equal</td>
<td>Doesn’t match what’s entered or selected for Value</td>
<td>Currency, Number</td>
</tr>
<tr>
<td>equals</td>
<td>Matches what’s entered or selected for Value</td>
<td>Currency, Number</td>
</tr>
<tr>
<td>greater than</td>
<td>Is larger than what’s entered or selected for Value</td>
<td>Currency, Number</td>
</tr>
<tr>
<td>greater than or equal</td>
<td>Is larger than what’s entered or selected for Value or is the same</td>
<td>Currency, Number</td>
</tr>
<tr>
<td>is null</td>
<td>Hasn’t been populated with a value yet (if you select True for Value)</td>
<td>Boolean</td>
</tr>
<tr>
<td>less than</td>
<td>Is smaller than what’s entered or selected for Value</td>
<td>Currency, Number</td>
</tr>
<tr>
<td>less than or equal</td>
<td>Is smaller than what’s entered or selected for Value or is the same</td>
<td>Currency, Number</td>
</tr>
</tbody>
</table>

### Date and Date/Time

When you select a date or date/time field under Field, these operators are available.
### Picklist and Text Fields

When you select a picklist or text field under Field, these operators are available.

<table>
<thead>
<tr>
<th>Operator</th>
<th>Filters to records where the selected field’s value ...</th>
<th>Supported Data Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>contains</td>
<td>Contains what’s entered or selected for Value</td>
<td>Boolean, Currency, Date, Date/Time, Multi-select Picklist, Number, Picklist, Text</td>
</tr>
<tr>
<td>does not equal</td>
<td>Doesn’t match what’s entered or selected for Value</td>
<td>Boolean, Currency, Date</td>
</tr>
<tr>
<td>Operator</td>
<td>Filters to records where the selected field’s value ...</td>
<td>Supported Data Types</td>
</tr>
<tr>
<td>-------------------</td>
<td>--------------------------------------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td>equals</td>
<td>Matches what’s entered or selected for Value</td>
<td>• Boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Currency</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date/Time</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Multi-select Picklist</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Picklist</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Text</td>
</tr>
<tr>
<td>ends with</td>
<td>Ends with what’s entered or selected for Value</td>
<td>• Boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Currency</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date/Time</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Multi-select Picklist</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Picklist</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Text</td>
</tr>
<tr>
<td>is null</td>
<td>Hasn’t been populated with a value yet (if you select True for Value)</td>
<td>Boolean</td>
</tr>
<tr>
<td>starts with</td>
<td>Begins with what’s entered or selected for Value</td>
<td>• Boolean</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Currency</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Date/Time</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Multi-select Picklist</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Number</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Picklist</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Text</td>
</tr>
</tbody>
</table>

**Multi-Select Picklist Fields**

When you select a multi-select picklist field under Field, these operators are available.
Tip: Be careful when using these operators to filter records based on a multi-select picklist field. Even if two resources have the same items in a multi-select picklist, they can be mismatched if these cases differ.

- The spacing before or after the semi-colon. For example, one resource’s value is “red; green; blue” and the other’s value is “red; green; blue”
- The order of the items. For example, one resource’s value is “red; green; blue” and the other’s value is “red; blue; green”

For best results, use the INCLUDES function in a flow formula.

<table>
<thead>

</tbody>
</table>

**Flow Event Types**

Event Type drives the fields that you use to define an event in a flow Wait element. The available event types are both alarms, which consist of a date/time value—the base time—and an optional offset from that time.

The base time, which is always required, is the date/time value from which the alarm is based. If there’s no offset for the alarm, the alarm is set to the exact value of the base time. The base time can be composed of one or multiple fields, based on the event type that you choose.

The offset, which is optional, is the amount of time before or after the base time at which the alarm occurs. An offset is always composed of two fields: Offset Number and Offset Unit. For example, if you want your alarm to occur three days after the base time, the number is 3 and the unit is Days.

**Absolute Time Alarms**

An absolute time alarm waits for a defined time that’s based off an absolute date/time value. For example, you can use this event type in a Wait element to do something a day after the flow interview starts to wait.

**Relative Time Alarms**

A relative time alarm waits for a defined time that’s based off a date/time field on a record. For example, you can use this event type to do something three days before a contract ends.

SEE ALSO:

Flow Wait Element
Event Conditions

The following parameters are available to define events with an Event Type of Alarm: Absolute Time.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base Time</td>
<td>A date/time value. If you enter values for Offset Number and Offset Unit, this field value is the base for the offset. You can manually enter a date/time value or reference a merge field or flow resource.</td>
<td>!$Flow.CurrentDate</td>
</tr>
<tr>
<td>Offset Number</td>
<td>Optional. The number of days or hours to offset Base Time. Required if you set a value for Offset Unit. The value must be a manually entered integer. You can't use a merge field or flow resource for this value. To set the alarm to occur before Base Time, use a negative number. To set the alarm to occur after Base Time, use a positive number.</td>
<td>-3</td>
</tr>
<tr>
<td>Offset Unit</td>
<td>Optional. The unit to offset Base Time. Required if you set a value for Offset Number. Manually enter Days or Hours. You can't use a merge field or flow resource for this value.</td>
<td>Days</td>
</tr>
</tbody>
</table>

For an example of a flow that waits for an absolute time alarm, see Sample Flow That Waits for a Single Event.

Event Outputs

Reference information from the event in your flow by assigning its outputs to flow variables.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base Time</td>
<td>The actual time at which the event occurred and the flow interview resumed.</td>
<td>11/26/2014 10:12 AM</td>
</tr>
<tr>
<td>Event Delivery Status</td>
<td>The status of the event when the flow interview resumed. After an event occurs, Salesforce delivers the event to the flow that's waiting for it, so that the flow knows to resume. Valid values are: • Delivered: The event was successfully delivered. • Invalid: An error occurred during delivery, but the flow successfully resumed.</td>
<td>Delivered</td>
</tr>
</tbody>
</table>

SEE ALSO: Flow Event Types
Relative Time Alarms

A relative time alarm waits for a defined time that’s based off a date/time field on a record. For example, you can use this event type to do something three days before a contract ends.

When you configure a Wait element in a flow:
- Define what the flow is waiting for
- Assign information from the event after it occurs to flow variables

Event Conditions

The following parameters are available to define events with an Event Type of Alarm: Relative Time.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object Type</td>
<td>The API name of the object whose field you want to base the alarm on. See Supported Objects on page 4450. You must manually enter a string. You can’t use a merge field or flow resource for this value.</td>
<td>Contract</td>
</tr>
<tr>
<td>Base Date/Time Field</td>
<td>The API name for a date or date/time field on the specified object. If you enter values for Offset Number and Offset Unit, this field value is the base for the offset. Manually enter a string.</td>
<td>EndDate</td>
</tr>
<tr>
<td>Record ID</td>
<td>ID of the record that the alarm is based on. The record’s object type must match Object Type. You can enter a string, merge field, or flow resource.</td>
<td>{!ContractId}</td>
</tr>
<tr>
<td>Offset Number</td>
<td>Optional. The number of days or hours to offset Base Date/Time Field. Required if you set a value for Offset Unit. The value must be a manually entered integer. You can’t use a merge field or flow resource for this value. To set the alarm to occur before Base Date/Time Field, use a negative number. To set the alarm to occur after Base Date/Time Field, use a positive number.</td>
<td>-3</td>
</tr>
<tr>
<td>Offset Unit</td>
<td>Optional. The unit to offset Base Date/Time Field. Required if the Offset Number. Manually enter Days or Hours. You can’t use a merge field or flow resource for this value.</td>
<td>Days</td>
</tr>
</tbody>
</table>

For examples of flows that wait for relative time alarms, see Sample Flow That Waits for Only the First Event or Sample Flow That Waits for Many Events.
**Event Outputs**

Reference information from the event in your flow by assigning its outputs to flow variables.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Base Time</td>
<td>The actual time at which the event occurred and the flow interview resumed.</td>
<td>11/26/2014 10:12 AM</td>
</tr>
<tr>
<td>Event Delivery Status</td>
<td>The status of the event when the flow interview resumed. After an event occurs, Salesforce delivers the event to the flow that's waiting for it, so that the flow knows to resume. Valid values are:</td>
<td>Delivered</td>
</tr>
<tr>
<td></td>
<td>• Delivered: The event was successfully delivered.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Invalid: An error occurred during delivery, but the flow successfully resumed.</td>
<td></td>
</tr>
</tbody>
</table>

Flow Types

A flow or flow version’s type determines which elements and resources are supported, as well as the ways that the flow can be distributed.

Standard Flow Types

The following flow types are supported in the Cloud Flow Designer.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flow</td>
<td>Requires user interaction, because it has one or more screens, steps, choices, or dynamic choices. This flow type doesn’t support wait elements.</td>
</tr>
</tbody>
</table>
### Type | Description
---|---
A flow can be implemented with a custom button, custom link, direct URL, Visualforce page, or Salesforce1 action.

**Autolaunched Flow**

Doesn’t require user interaction.

This flow type doesn’t support screens, steps, choices, or dynamic choices.

An autolaunched flow can be implemented any way that a flow can, as well as with a process action, workflow action (pilot), or Apex code.

**User Provisioning Flow**

Provisions users for third-party services. A user provisioning flow can only be implemented by associating it with a connected app when running the User Provisioning Wizard. Provisions users for third-party services. For example, use this flow type to customize the user provisioning configuration for a connected app to link Salesforce users with their Google Apps accounts.

### Other Flow Types

Not all flow types are supported in the Cloud Flow Designer. Some flow types are used in other parts of Salesforce. You can’t create or edit these flows in the Cloud Flow Designer, so you don’t see them in the list of flows. However, the Paused and Waiting Interviews list on the flow management page can display interviews with one of these types.

For example, when you run a process (from the Process Builder), a flow interview is created. You can monitor that interview in the Paused and Waiting Interviews list by looking for the type "Workflow".

### Workflow

A running instance of a process created in the Process Builder.

---

- Flow Properties
- Flow and Flow Version Fields
- User Provisioning for Connected Apps

---

**Flow Properties**

A flow’s properties consist of its name, description, interview label, and type. These properties drive the field values that appear on a flow or flow version’s detail page. The properties of a flow and its flow versions are separate.

**Tip:** The properties for a given flow’s versions automatically match the active version’s properties by default. In other words, if you have three versions and you activate version 2, Salesforce updates the properties for versions 1 and 3 to match version 2. However, if you edit the properties for an inactive version, that version’s properties are no longer automatically updated to match the active version.

From the Cloud Flow Designer, click ![Edit](edit_icon) to update the properties for a flow or a flow version.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name for the flow or flow version. The name appears in the flow management page and flow detail page. It also appears in the run time user interface. You can edit the name for inactive flows and flow versions.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>The unique name for the flow. The unique name is used to refer to this flow from other parts of Salesforce, such as in a URL or Visualforce page. A unique name is limited to underscores and alphanumeric characters. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. The unique name appears on the flow detail page. You can’t edit the unique name after the flow has been saved.</td>
</tr>
<tr>
<td>Description</td>
<td>The description for the flow or flow version. The description appears in the flow management page and flow detail page. You can edit the description for inactive flows and flow versions.</td>
</tr>
<tr>
<td>Type</td>
<td>The type for the flow or flow version. The type appears in the flow management page and flow detail page. It determines which elements and resources are supported in the flow or flow version, as well as the ways that the flow can be implemented. For details, see Flow Types on page 4452. If the type is Login Flow, you can’t update the type after the flow has been saved.</td>
</tr>
<tr>
<td>Interview Label</td>
<td>The label for the flow’s interviews. An interview is a running instance of a flow. This label appears in:</td>
</tr>
<tr>
<td></td>
<td>• The Paused and Waiting Interviews list on the flow management page</td>
</tr>
<tr>
<td></td>
<td>• The Paused Interviews component on the Home tab</td>
</tr>
<tr>
<td></td>
<td>• The Paused Interviews item in Salesforce1</td>
</tr>
<tr>
<td></td>
<td>You can edit the interview label for inactive flows and flow versions. By default, the interview label contains the flow name and the {!$Flow.CurrentDateTime} system variable.</td>
</tr>
<tr>
<td></td>
<td>Use a text template to reference multiple resources in the label. For example, <strong>Flow Name</strong> - {!Account.Name} - {!$Flow.CurrentDateTime}.</td>
</tr>
</tbody>
</table>

**Sample Flows**

Sometimes showing is better than telling. Check out these sample flows to get a feel for how to work with advanced things like Wait elements and collection variables.

**Sample Flow That Populates a Collection Variable**

Populate a collection variable by populating an sObject collection variable. Then individually assign the sObject collection variable’s values to the collection variable.

**Sample Flows That Wait for Events**

Configure a flow to wait for events in one of three ways.
Sample Flow That Loops Through a Collection

Transfer ownership of accounts from one user to another by using sObject variable collections and loops. The flow already has the required user IDs.

Sample Flow That Populates a Collection Variable

Populate a collection variable by populating an sObject collection variable. Then individually assign the sObject collection variable’s values to the collection variable.

Scenario

In this scenario, you’re designing a flow to send an email to every employee who lives in San Francisco.

The Send Email element allows you to easily send emails from a flow. However, the Recipients parameter only accepts text variables and text collection variables. Since multiple users live in San Francisco, use a collection variable (rather than entering the email address for each individual user).

You can’t use a Fast Lookup or Record Lookup to populate collection variables. First populate a User-based sObject collection variable with field values, including Email, from the employees who live in San Francisco. Then add those emails to the collection variable.

Once the collection variable is populated, you simply use the collection variable as the value for the Send Email element’s Email Addresses (collection) parameter.

Example: This flow already contains these resources.

- A User-based sObject collection variable called employeesInSF
- A User-based sObject variable called loopVariable
- A Text-based collection variable called emails_employeesInSF

The example flow:

1. Finds all user records whose City is "San Francisco" and populates employeesInSF with those records’ Email. Because employeesInSF is an sObject collection variable, use a Fast Lookup element to populate the variable.

2. Loops through the sObject collection variable so that it can look at each individual user record. The loop copies the values of each item in employeesInSF to loopVariable.

3. For each iteration, assigns the user’s Email to a collection variable that has a Data Type of Text.
When the loop ends, the flow sends an email to the users whose emails are now stored in `emails_employeesInSF`.

SEE ALSO:
- Flow Collection Variable Resource
- Add Values to a Collection Variable

Sample Flows That Wait for Events

Configure a flow to wait for events in one of three ways.

Sample Flow That Waits for Many Events
This flow waits for many events to occur, rather than just the first event. The base times for these events are field values, so this example uses relative time alarms.

Sample Flow That Waits for Only the First Event
This flow waits for the first of multiple events to occur before proceeding. The base times for these events are field values, so this example uses relative time alarms.

Sample Flow That Waits for a Single Event
This flow waits for a single event. The base time for the event in this example, which is an absolute alarm, is the `{!$Flow.CurrentDateTime}` system variable.

SEE ALSO:
- Flow Wait Element

Sample Flow That Waits for Many Events

This flow waits for many events to occur, rather than just the first event. The base times for these events are field values, so this example uses relative time alarms.

You’re designing a flow that reminds contract owners to follow up with their customers before the contract ends. Rather than sending just one reminder, however, the flow sends them regularly. This example shows how to use one Wait element to send a reminder two weeks before and then again one week before the contract ends. You could easily extend this flow to send reminders at more intervals, such as three days and one day before the contract ends.

Example

This flow already contains these populated variables.

- `{!contract}` is an sObject variable that contains the contract’s Id and OwnerId
- `{!oneWeekVisited}` is a Boolean variable whose default value is `{!$GlobalConstant.False}`
- `{!twoWeeksVisited}` is a Boolean variable whose default value is `{!$GlobalConstant.False}`

Before the flow executes the Wait element, it looks up and stores the contract’s Id and OwnerId.
Because the flow sends the reminder emails both two weeks and a week before the contract’s end date, the Wait element defines two relative alarm events.

Tip: Every alarm event consists of a base time and an offset. With relative time alarms, the flow needs three pieces of information to determine the base time: the object, the date/time field, and the specific record. The offset for relative time alarms works the same as it does for absolute time alarms. The flow needs to know the unit (either Days or Hours) and the number of those units. To wait for a number of days or hours before the base time, set Offset Number to a negative integer.

For both of these events, the offset is declared in Days, because weeks isn’t an acceptable offset unit.

The base time for the first event (“2 Weeks”) is the value of Contract.EndDate (1) on the record whose ID is stored in {!contract.Id} (2). The offset is -14 days (3) to represent two weeks.

You want to use the same Wait element for every reminder, so after a flow interview sends one email reminder, it returns to the Wait element. But first, to ensure that the interview doesn’t send the same email again and again, use waiting conditions. When an interview executes a Wait element, it first checks the waiting conditions for each event to determine whether to wait for those events. If an event has waiting conditions set and those conditions aren’t met, the interview doesn’t wait for that event.

For the first event, the interview checks whether the Boolean variable {!twoWeekVisited} is set to false. The variable’s default value is set to {!$GlobalConstant.False}, so the flow waits for the event until the variable’s value is changed.
Indicate what the flow does when the “2 Weeks” event occurs by connecting the Wait element to other elements. Then, before you return the flow path to the Wait element, change the value of `{!twoWeeksVisited}` to `{!$GlobalConstant.True}`. You can do so with an Assignment element. If the value for `{!twoWeeksVisited}` isn’t false when the Wait element is executed, the flow doesn’t wait for the “2 Weeks” event to occur. Essentially, the interview checks whether the first event has occurred yet, since the variable is changed to true only in that event’s path. If that event has occurred (and the variable isn’t set to false), the interview knows not to wait for that event.

The second event (“1 Week”) has the same base time as the first event (4); the offset is -7 days (5) to represent a week.

For the second event, the flow checks whether the Boolean variable `{!oneWeekVisited}` is set to false. If it isn’t, the flow doesn’t wait for this event.

Like with the first event, use an Assignment element to change the value of `{!oneWeekVisited}` to `{!$GlobalConstant.True}` before the flow path returns to the Wait element. As long as `{!oneWeekVisited}` isn’t false, the flow doesn’t wait for the “1 Week” event to occur.

Tip: When a flow executes a Wait element and all the events have waiting conditions that aren’t met, the flow executes the default event path. Because this flow is finished after it sends the final reminder, don’t connect the default path to another element.

Just in case something goes wrong, set a fault path. In this example, the fault path sends an email that contains the fault message to the user who created the flow.
Sample Flow That Waits for Only the First Event

This flow waits for the first of multiple events to occur before proceeding. The base times for these events are field values, so this example uses relative time alarms.

You’re designing a flow that reminds account owners to follow up with their customers a week before either the account renews or the contract ends. The flow sends a reminder email for whichever date occurs first.

**Example**

This flow already contains these populated variables.

- {!accountId} contains the ID for the account
- {!contractId} contains the ID for the contract
- {!accountOwner} contains the ID for the account’s owner
- {!ownerEmail} contains the account owner’s email address

Before the flow executes the Wait element, it looks up and stores the contract’s ID, its parent account’s ID and OwnerId, and the account owner’s Email.

The Wait element defines two relative alarm events.

⚠️ **Tip:** Every alarm event consists of a base time and an offset. With relative time alarms, the flow needs three pieces of information to determine the base time: the object, the date/time field, and the specific record. The offset for relative time alarms works the same as it does for absolute time alarms. The flow needs to know the unit (either Days or Hours) and the number of those units. For both of these events, the base time is offset by -7 days, because weeks isn'’t an acceptable offset unit.

The base time for the first event (“Week before account renews”) is the value of `Account.Renewal_Date__c (1)` on the record whose ID is stored in `{!accountId} (2)`. The offset is -7 days (3).
The base time for the second event ("Week before contract expires") is the value of `Contract.EndDate` on the record whose ID is stored in `{!contractId}`. The offset is -7 days.

You only want to send one follow-up reminder and the flow always waits for both events, so neither of these events need waiting conditions. However, just in case something goes wrong, set a fault path. In this example, the fault path sends an email that contains the fault message to the user who created the flow.

SEE ALSO:
- Flow Wait Element
- Relative Time Alarms
- Flow Wait Element
- Relative Time Alarms
- What Are Waiting Conditions?

Sample Flow That Waits for a Single Event

This flow waits for a single event. The base time for the event in this example, which is an absolute alarm, is the `{!$Flow.CurrentDateTime}` system variable.

You’re designing a flow that requests feedback from customers after a contract is activated, but you want to delay the email by a day.

**Example**

This flow already contains the following populated variables.
- `{!customerEmail}` contains the email address for the customer
- `{!creatorEmail}` contains the email address for the flow’s creator

The flow activates a contract (1) and then waits (2).
Within the Wait element, a single event is defined (1 day after activated). The flow sends the feedback request one day after the contract is activated, so use an absolute time alarm. The base time is the `{!$Flow.CurrentDateTime}` system variable (3), and the offset is one day (4).

<table>
<thead>
<tr>
<th>Name</th>
<th>1 day after activated</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique Name</td>
<td>1X1_day_after_activated</td>
</tr>
<tr>
<td>Event Type</td>
<td>Alarm: Absolute Time</td>
</tr>
</tbody>
</table>

Because there's only one event and you only want the feedback request to be sent once, don't set any waiting conditions for this event. However, just in case something goes wrong, don't forget to set a fault path. In this example, the fault path sends an email that contains the fault message to the user who created the flow.

SEE ALSO:
- Flow Wait Element
- Absolute Time Alarms

**Sample Flow That Loops Through a Collection**

Transfer ownership of accounts from one user to another by using sObject variable collections and loops. The flow already has the required user IDs.

First, create an Account-based sObject collection variable called `collAcctJSmith` and populate it with all account records that John Smith owns.

Then create a loop that iterates through the collection. For each item in the collection, the loop does the following:

1. Assigns the collection item to the loop variable.
2. Evaluates whether the account has more than 10,000 employees.
3. If the account has more than 10,000 employees, assigns Madison's user ID to the `OwnerId` field in the loop variable.
4. If the account doesn't have more than 10,000 employees, assigns Amber's user ID to the `OwnerId` field in the loop variable.
5. Adds the loop variable's values as a new item in a second collection called `collReassignedAccts`.

Finally, create a Fast Update element to update the accounts in `collReassignedAccts` with the new `OwnerId` after the loop finishes iterating through the collection.
This section of the flow uses a single query to look up the list of accounts and a single DML statement to update those accounts. If you created a similar flow by using Record Update elements, you would use:

- One Record Update element to find all accounts that John owns and have more than 10,000 employees (1 query). Then update those records’ `OwnerId` to Madison’s Id (1 DML statement).
- One Record Update element to find all accounts that John owns and don’t have more than 10,000 employees (1 query). Then update those records’ `OwnerId` to Amber’s Id (1 DML statement).

**Manage Your Flows**

Use the flow detail page to do anything with your flow outside of designing it—such as activating a flow, testing it, or viewing its properties.

To visit a flow’s detail page, from Setup, enter Flows in the Quick Find box, select Flows, and then click a flow name.

**Flow and Flow Version Fields**

View information about a flow and its versions on the flow detail page, like its name and URL.

**Open and Modify a Flow**

To modify a flow, open it in the Cloud Flow Designer.

**Test a Flow**

Test your flows before you activate them to make sure they’re working as expected.

**Activate or Deactivate a Flow Version**

You can have several different versions of a single flow in Salesforce, but only one version of each flow can be active at a time. To activate or deactivate a version of a flow, go to that flow’s detail page in Setup.

**Delete a Paused or Waiting Flow Interview**

If you no longer need to wait for a long-running flow interview to finish or for a user to resume a paused interview, delete the interview. For example, when you’re updating or deleting the associated flow version.
Delete a Flow Version
To delete an active flow version, first deactivate it. If a flow has any paused or waiting interviews, it can’t be deleted until those interviews are finished or deleted. Flows that have never been activated can be deleted immediately.

Let Users Pause Flows
Enable your users to pause a flow interview that they can’t finish yet by customizing your organization’s workflow and approval settings. A flow interview is a running instance of a flow. For example, a customer service representative can pause a flow interview when the customer doesn’t have all the necessary information.

Manage Your Flows
Flow Properties
Open and Modify a Flow

To modify a flow, open it in the Cloud Flow Designer.

You can’t save changes to an active flow version. You can, however, open an active version of a flow, modify it, and then save as a new version or a new flow.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
2. Click the name of the flow.
3. Open the flow.
   • To open a specific version, click the Open link next to that version number.
   • To open the active version of the flow, click the Open button. If there isn’t an active version, the latest version opens.

SEE ALSO:

  - Considerations for Designing Flows
  - Manage Your Flows
  - Activate or Deactivate a Flow Version

Test a Flow

Test your flows before you activate them to make sure they’re working as expected.

⚠️ Warning: Be careful when testing flows that contain delete elements. Even if the flow is inactive, it triggers the delete operation.

We recommend that you test all possible paths through the flow, so that you can find and fix any errors before activating the flow. For example, incomplete data in the flow can cause a data element (create, update, lookup, or delete) to fail at run time. Add a fault connector to a path that corrects the data and allows the flow to successfully finish.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
2. Click the name of the flow you want to run.
3. Run the flow.
   • To run a specific version, click the Run link for that version.
   • To run the active version of the flow, click the Run button. If there isn’t an active version, the latest version runs.
   • To run a flow version from the Cloud Flow Designer, open that version and then click Run from the button bar.

💡 Tip: If you recently modified the flow that you’re testing, save it. Only the most recently saved changes are included when you run a flow.
Once you're confident that your flow is working as expected, activate the version that you tested and then distribute the flow.

SEE ALSO:
- Activate or Deactivate a Flow Version
- Customize What Happens When a Flow Fails
- Considerations for Running Flows
- Manage Your Flows

Activate or Deactivate a Flow Version

You can have several different versions of a single flow in Salesforce, but only one version of each flow can be active at a time. To activate or deactivate a version of a flow, go to that flow's detail page in Setup.

When you activate a new version of a flow, the previously activated version (if one exists) is automatically deactivated. Any running flow interview continues to run using the version with which it was initiated.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
2. Click the name of the flow.
3. Click Activate or Deactivate next to the relevant version of the flow.

SEE ALSO:
- Considerations for Managing Flows
- Manage Your Flows

Delete a Paused or Waiting Flow Interview

If you no longer need to wait for a long-running flow interview to finish or for a user to resume a paused interview, delete the interview. For example, when you're updating or deleting the associated flow version.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
   If there are waiting interviews for any of your flows, the Paused and Waiting Interviews related list appears underneath the list of flows.
2. For each interview that you want to delete, click Del.
Delete a Flow Version

To delete an active flow version, first deactivate it. If a flow has any paused or waiting interviews, it can’t be deleted until those interviews are finished or deleted. Flows that have never been activated can be deleted immediately.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
2. Click the name of the flow.
3. To delete the flow completely, including all versions, click the Delete button.
4. To delete an individual version, click the Del link for that version.

- Considerations for Managing Flows
- Manage Your Flows

Let Users Pause Flows

Enable your users to pause a flow interview that they can’t finish yet by customizing your organization’s workflow and approval settings. A flow interview is a running instance of a flow. For example, a customer service representative can pause a flow interview when the customer doesn’t have all the necessary information.

1. From Setup, enter Process Automation Settings in the Quick Find box, then select Process Automation Settings.
2. Select Let Users Pause Flows.
3. Click Save.

Screens don’t automatically display the Pause button once Let Users Pause Flows is enabled. If you want your users to be able to pause at a given screen, select “Show Pause button” when you configure that screen.

See Also:
- Flow Screen Element: General Info

Distribute Your Flow

Once you’ve created and activated a flow version, distribute it to users so that they can run it. The right distribution method depends on the users that you want to distribute the flow to: internal users, external users, systems, or other organizations.

Here are the ways that you can distribute your flows, based on the type of user that you’re distributing to.

Internal users
- Distribute a flow URL directly or through a custom button, link, or Web tab.
- Embed the flow in a Visualforce page and incorporate that page into Salesforce with a custom button, link, or Visualforce tab.
External users
Embed the flow in a Visualforce page, and incorporate that page into a Force.com site, Customer Portal, or Partner Portal.

Systems
Start a flow automatically by:
• Using the Apex start() method.
• Using the Invocable Action resource in the Force.com REST API.
• Adding a flow trigger workflow action to a workflow rule—Pilot.
• Adding a flow action to a process in the Process Builder.

Other organizations
Deploy a flow with change sets or a package.

For details about distributing flows with each of these methods, see “Distribute Your Flow” in the Visual Workflow Guide.

SEE ALSO:
Set Flow Variables with the Flow URL
Visualforce Developer Guide: Render Flows with Visualforce
Managing Force.com Site Visualforce Pages
Create Web Tabs

Set Flow Variables with the Flow URL
When you distribute a flow using a URL, you can set variables within that flow using parameters in the URL.

You can’t set the values for sObject variables or sObject collection variables using URL parameters. The variable that you want to set must have its Input/Output Type set to allow input access.

1. From Setup, enter Flows in the Quick Find box, then select Flows.
2. Click the name of the flow.
3. Copy the URL for the flow.
4. At the beginning of the flow URL, prepend
   https://yourInstance.salesforce.com/, where yourInstance is your organization’s instance.
   For example:

   https://yourInstance.salesforce.com/flow/MyFlow

5. At the end of the flow URL, append ?name=value, where name is the unique name of the variable or collection variable in the flow that you want to set and value is the value you want to set it to. If you want to set multiple variable values, append ?name1=value1&name2=value2 to the end of the flow URL. If you want to set the values for multiple items in the same collection variable, append ?name=value1&name=value2.
For example:

https://yourInstance.salesforce.com/flow/MyFlow?varNumber=100&varString=Hello

Here are the valid values for each flow variable and collection variable based on its data type.

<table>
<thead>
<tr>
<th>Variable Type</th>
<th>Acceptable Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>Merge field of type Date or YYYY-MM-DD</td>
</tr>
<tr>
<td>DateTime</td>
<td>Merge field of type Date/Time or YYYY-MM-DDThh:mm:ssZ</td>
</tr>
<tr>
<td>Text</td>
<td>Merge field of any type or a string</td>
</tr>
<tr>
<td>Number</td>
<td>Merge field of type Number or a numeric value</td>
</tr>
<tr>
<td>Currency</td>
<td>Merge field of type Number or a numeric value</td>
</tr>
<tr>
<td>Boolean</td>
<td>Merge field of type Checkbox</td>
</tr>
<tr>
<td></td>
<td>True values: true or 1</td>
</tr>
<tr>
<td></td>
<td>False values: false or 0</td>
</tr>
</tbody>
</table>

**Note:** When you distribute a flow, don't pass a currency field value from a Salesforce record into a flow Currency variable with a URL parameter. When a currency field is referenced through a merge field (such as `{!Account.AnnualRevenue}`), the value includes the unit of currency's symbol (for example, $). Flow variables of type Currency can accept only numeric values, so the flow fails at run time. Instead, pass the record's ID to a flow Text variable with a URL parameter. Then in the flow, use the ID to look up that record's value for the currency field.

**Example:** The following example is a flow URL that is used in a custom button on a case page layout. When a user clicks that button, the flow launches with the varID variable (of type Text) set to the case record's CaseNumber field value.

https://yourInstance.salesforce.com/flow/Case_Management?varID={!Case.CaseNumber}

The following example sets the varUserFirst and varUserLast variables (both of type Text) to the running user's FirstName and LastName field values.

https://yourInstance.salesforce.com/flow/User_Info?varUserFirst={!$User.FirstName}&varUserLast={!$User.LastName}

The following example is a flow URL that is used in a custom button on a contact page layout. When a user clicks that button, the flow launches and adds text values from the contact as items in the {collNames} text collection variable.

https://yourInstance.salesforce.com/flow/Contact_Info?collNames={!Contact.FirstName}&collNames={!Contact.LastName}

SEE ALSO:
- Set Flow Finish Behavior with a Flow URL
- Distribute Your Flow
- Troubleshoot Flow URLs
Set Flow Finish Behavior with a Flow URL

By default, when a flow interview that uses screens finishes, a new interview for that flow begins and the user is redirected to the first screen. If you want users to be redirected to another page within Salesforce when they click Finish, use the retURL parameter in the flow URL.

Format

To redirect users to a specific page in Salesforce after they click Finish:

https://yourInstance.salesforce.com/flow/flowName?retURL=page_name

where page_name is the part of the URL that comes after https://yourInstance.salesforce.com/.

Limitations

- You can’t redirect flow users to a URL that’s external to your Salesforce organization.
- You can’t use a flow variable as the value for the retURL parameter. If you want to use a flow variable to redirect a user, such as to a specific record, distribute the flow by using Visualforce.
- retURL can cause nested top and side navigation bars to render on the destination page.

Examples

The following flow URL redirects the user to the home tab for cases (https://yourInstance.salesforce.com/500/o).

https://yourInstance.salesforce.com/flow/Case_Management?retURL=500/o

The following flow URL sets the varUserFirst and varUserLast variables (both of type Text) to the running user’s FirstName and LastName field values. When the flow interview finishes, the user is redirected to https://yourInstance.salesforce.com/home/home.jsp.

https://yourInstance.salesforce.com/flow/User_Info?varUserFirst={!$User.FirstName}&varUserLast={!$User.LastName}&retURL=home/home.jsp

Flows in Change Sets and Packages

Flows created in the Cloud Flow Designer can be included in change sets and packages. The recipient organization of either the change set or package must have Visual Workflow enabled.

Considerations for Deploying Flows with Change Sets

Before you use change sets to deploy a flow, understand the limits and unexpected behaviors that are related to component dependencies, deployment, and flow triggers.
Considerations for Deploying Flows with Packages

Flows can be included in both managed and unmanaged packages. Before you deploy one, understand the limitations and behaviors of packages that contain flows.

SEE ALSO:
- Considerations for Installed Flows
- Limits and Considerations for Visual Workflow
- Distribute Your Flow

Considerations for Deploying Flows with Change Sets

Before you use change sets to deploy a flow, understand the limits and unexpected behaviors that are related to component dependencies, deployment, and flow triggers.

Component Dependencies

- If you plan to deploy a flow with change sets, consider limitations in migration support. Make sure your flows reference only fields and components that are available in change sets.
- When you view the dependent components for the change set, the Component Dependencies page lists the dependencies for all versions of the flow. Add all interdependent components for the relevant flow version to the outbound change set.
- If a component is referenced by the following flow elements, the Component Dependencies page doesn’t display that component. To deploy the flow successfully, manually add those referenced components to the change set.
  - Apex
  - Email Alerts
  - Post to Chatter
  - Quick Actions
  - Send Email
  - Submit for Approval

For example, if you use an email alert, manually add the email template that is used by that email alert.

Deployment

- You can include only one version of a flow in a change set.
- An active flow in a change set is deployed to its destination as inactive. Activate the flow manually after deployment.
- If the flow has no active version when you upload the outbound change set, the latest inactive version is used.
- Deploying or redeploying a flow with change sets creates a version of the flow in the destination organization.

Flow Triggers

Flow triggers aren’t available in change sets.
The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.

SEE ALSO:
- Change Sets

Considerations for Deploying Flows with Packages
Flows can be included in both managed and unmanaged packages. Before you deploy one, understand the limitations and behaviors of packages that contain flows.

Component Dependencies
- If you plan to deploy a flow with packages, consider limitations in migration support. Make sure your flows reference only packageable components and fields.
- Referential integrity works the same for flows as it does for other packaged elements.
- If any of the following elements are used in a flow, packageable components that they reference aren’t included in the package automatically. To deploy the package successfully, manually add those referenced components to the package.
  - Apex
  - Email Alerts
  - Post to Chatter
  - Quick Actions
  - Send Email
  - Submit for Approval
For example, if you use an email alert, manually add the email template that is used by that email alert.

Flow Status
You can package only active flows. The active version of the flow is determined when you upload a package version. If none of the flow’s versions are active, the upload fails.

Updating Packages
- To update a managed package with a different flow version, activate that version and upload the package again. You don’t need to add the newly activated version to the package. However, if you activate a flow version by mistake and upload the package, you’ll distribute that flow version to everyone. Be sure to verify which version you really want to upload.
- You can’t include flows in package patches.

Other Limitations
- If you register your namespace after you referenced a flow in a Visualforce page or Apex code, don’t forget to add the namespace to the flow name. Otherwise, the package will fail to install.
- If someone installs a flow from a managed package, error emails for that flow’s interviews don’t include any details about the individual flow elements. The email is sent to the user who installed the flow.
- Flow triggers aren’t packageable.

The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.
In a development organization, you can’t delete a flow or flow version after you upload it to a released or beta managed package.

SEE ALSO:
  Considerations for Installed Flows
  Create a Package

Why Did My Flow Interview Fail?

To troubleshoot a failed flow interview, use the flow fault email. You can also set up temporary Screen or Send Email elements to identify the problem.

**Emails About Flow Errors**

Every time a flow interview fails, the admin who created the associated flow gets an email. The email includes the error message from the failure and details about every flow element that the interview executed.

**Limitations of Emails About Flow Errors (Beta)**

The email about errors in flow interviews has some limitations for Screen, Lookup, Create, and Subflow elements—as well as some general limitations.

**Add Temporary Elements to a Flow**

Add Screen or Send Email elements to the flow so you can check what the resources’ values are at any given time. Once you’ve solved the problem, delete temporary Screen elements.

**Troubleshoot Flow URLs**

If you’re distributing a flow and the custom button, custom link, or a direct flow URL isn’t working as expected, verify the referenced flow. In addition, verify its variables if you’re passing values into a flow from the URL.

**Emails About Flow Errors**

Every time a flow interview fails, the admin who created the associated flow gets an email. The email includes the error message from the failure and details about every flow element that the interview executed.

**Note:** This release contains a beta version of the flow error email that is production quality but has known limitations. You can provide feedback and suggestions for the flow error email on the IdeaExchange.

If the interview failed at multiple elements, the admin receives multiple emails, and the final email includes an error message for each failure. If a flow uses fault connectors, its interviews can fail at multiple elements.

**Example:**

```
An error occurred at element Apex_Plug_in_1.
List index out of bounds: 0.

An error occurred at element Fast_Delete_1.
DELETE --- There is nothing in Salesforce matching your delete criteria.
```
An error occurred at element Email_Alert_1. Missing required input parameter: SObjectRowId.

SEE ALSO:
- Limitations of Emails About Flow Errors (Beta)
- Customize What Happens When a Flow Fails
- Why Did My Flow Interview Fail?

Limitations of Emails About Flow Errors (Beta)

The email about errors in flow interviews has some limitations for Screen, Lookup, Create, and Subflow elements—as well as some general limitations.

Note: This release contains a beta version of the flow error email that is production quality but has known limitations. You can provide feedback and suggestions for the flow error email on the IdeaExchange.

General
- If the user who started the flow doesn’t have a first name, null replaces the user’s first name in the “How the Interview Started” section.
- Variable assignments display in this pattern: {!variable} (prior value) = field/variable (new value). If the variable had no prior value, the parentheses display as empty. For example: {!varStatus} () = Status (Delivered)
- If you install a flow from a managed package, error emails for that flow’s interviews don’t include any details about the individual flow elements. The email is sent to the user who installed the flow.

Screen elements
Password fields display in plain text, just like if you reference a password field in a Display Text field.

Lookup elements
The email displays lookup elements as “query” elements. Record Lookup displays as Record Query, and Fast Lookup displays as Fast Query.

Subflow elements
- The merge field annotation ({!variable} as opposed to just variable) is missing for variables in a referenced flow. For example, when an interview enters a subflow and gives details about the inputs, the subflow’s variable is subVariable instead of {!subVariable}.
- If the error occurs in a referenced flow, the email gets sent to the author of the master flow, but the subject references the name of the referenced flow.
- If you see multiple “Entered flow ReferencedFlowName version ReferencedFlowVersion” messages with no “Exited ReferencedFlowName version ReferencedFlowVersion” messages in between them, the flow user navigated backwards. To prevent this scenario, adjust the navigation options in the first screen of the referenced flow so that the user can’t click Previous.

- Why Did My Flow Interview Fail?
Add Temporary Elements to a Flow

Add Screen or Send Email elements to the flow so you can check what the resources’ values are at any given time. Once you’ve solved the problem, delete temporary Screen elements.

1. Create a single text template that contains the values of all resources and the fault message.
2. For each fault path, use the text template to configure one of the following elements.
   - A Screen element that uses the text template in a Display Text Field. (Only if the flow’s type supports Screen elements.)
   - A Send Email element that uses the text template as the body and your email as the recipient.
   - A Post to Chatter element that uses the text template as the message. Consider creating a Chatter group specifically for flow errors.

3. Test the flow.

Example: Here’s a text template for the Calculate Discounts on Opportunities flow in the Cloud Flow Designer Workbook.

<table>
<thead>
<tr>
<th>RESOURCE VALUES for “Calculate Discounts on Opportunities”</th>
</tr>
</thead>
<tbody>
<tr>
<td>opptyID: {!opptyID}</td>
</tr>
<tr>
<td>AccountID: {!AccountID}</td>
</tr>
<tr>
<td>AccountRevenue: {!AccountRevenue}</td>
</tr>
<tr>
<td>Full_Discount outcome: {!Full_Discount}</td>
</tr>
<tr>
<td>Partial_Discount outcome: {!Partial_Discount}</td>
</tr>
<tr>
<td>Discount: {!Discount}</td>
</tr>
</tbody>
</table>

ERROR
{!$Flow.FaultMessage}

After each element in the flow, add a temporary Post to Chatter element. Each Post to Chatter element is configured to use:

- The text template as the post’s message
- The “Flow Troubleshooting” Chatter group as the post’s target

Configure the Record Lookup and Record Update elements’ fault connectors so that they route to the Post to Chatter elements.
This way, the flow posts to the Chatter group after the Record Lookup, Decision, Assignment, and Record Update elements are executed. Each post provides insight into the values of each resource throughout the flow. If the flow fails, the error is included in the Chatter posts.

After you identify and fix the problem with the flow, remove the temporary elements.

- Why Did My Flow Interview Fail?

**Troubleshoot Flow URLs**

If you’re distributing a flow and the custom button, custom link, or a direct flow URL isn’t working as expected, verify the referenced flow. In addition, verify its variables if you’re passing values into a flow from the URL.

To make sure that the URL can find the right flow, verify that:

- The flow that the URL references hasn’t been deleted or deactivated.
- The flow name is spelled and capitalized correctly. It must be an exact, case-sensitive match to the flow’s Unique Name.
If your flow URL references a specific flow version, verify that the version hasn’t been deleted or deactivated.

If you’re using the URL to pass values into the flow and the URL can’t access the variable, the parameter that references the variable is ignored.

To make sure that the URL can find the right flow variable, verify that each variable you’re trying to pass values into:

- Is spelled and capitalized correctly. It must be an exact, case-sensitive match to the variable.
- Allows input access. The variable’s Input/Output Type must be set to “Input Only” or “Input and Output.”
- Hasn’t been renamed in the flow.
- Hasn’t been removed from the flow.
- Isn’t an sObject variable or an sObject collection variable.

In addition, make sure the value that you’re trying to pass into the variable is compatible with the variable’s data type and is correctly formatted.

- Why Did My Flow Interview Fail?

Flow Interviews

A flow interview is a running instance of a flow. A flow is an application built by your administrator that asks you for inputs and does something in Salesforce based on those inputs.

For example, a flow could provide a call script for customer support calls and use the information you provide to create a case. What the flow does with the information you provide is entirely up to your administrator.

When you run a flow interview, whether through a link, button, or tab, you’re running a single instance of a flow. If the terminology is confusing, consider the difference between a record and an object. You create an account record, which is a single instance of the Account object that your administrator customized.

Note: Keep these tips in mind when you run a flow.

- Don’t use your browser’s Back or Forward buttons to navigate through a flow. Doing so can result in inconsistent data between the flow and Salesforce.
- A single flow can have up to 50 different versions. When you run a flow, you see the active version, but your admin could have a more recent version.

Pause a Flow Interview

If your administrator has configured a given flow to do so, you can pause its interviews. Pausing is useful, for example, when a call with a customer drops or the customer can’t find their account number and plans to call you back.

Resume a Flow Interview

If you paused a flow interview, resume it after you have all the necessary information.
Delete a Flow Interview
If you paused a flow interview and don’t plan to resume it, delete it. By removing unnecessary interviews, you make sure that your pending list includes only interviews that you still plan to act on.

SEE ALSO:
Visual Workflow

Pause a Flow Interview
If your administrator has configured a given flow to do so, you can pause its interviews. Pausing is useful, for example, when a call with a customer drops or the customer can’t find their account number and plans to call you back.

1. In an open flow interview, click Pause.
2. Explain why you had to pause the flow.
   This step is optional, but it helps differentiate between the different flow interviews that you’ve paused, especially if you paused multiple interviews of the same flow. This explanation can be up to 255 characters long.
3. Click OK.

The flow interview is saved until you resume or delete it later. Any valid values that you entered before you paused are saved with the interview, so you don’t have to reenter that information when you resume.

SEE ALSO:
Flow Interviews
Resume a Flow Interview

Resume a Flow Interview
If you paused a flow interview, resume it after you have all the necessary information.

Note: If you pause an interview and the associated flow is updated before you resume, the resumed interview doesn’t use the updated flow. Instead, it uses the version of the flow that was active when you paused.

1. Go to a place that lists all of your paused flow interviews.
   Depending on your administrator’s configurations, you can find all the flow interviews that you’ve paused in one of these places.
   • “Paused Flow Interviews” on the Home tab in the full Salesforce site
   • “Paused Flow Interviews” in the left navigation in Salesforce1
   If you paused a flow interview and can’t find the place where you’re supposed to resume the interviews from, contact your administrator.
2. Resume the appropriate flow interview.
   If you entered values before you paused, all valid values are restored to those fields when you resume. If you don’t see something that you entered before you paused, that value was invalid and the flow didn’t save it.

Editions
Available in: both Salesforce Classic and Lightning Experience

User Permissions
To resume a flow interview:
• “Run Flows”
  OR
  Force.com Flow User field enabled on the user detail page
If you enter "Acme, Inc." for a field that only accepts numbers and then pause, that field is blank when you resume the flow interview.

**Warning:** Once you resume a flow interview, that interview is removed from your Paused Flow Interviews list. If you resume an interview and then change your mind, click **Pause**. If you close the interview before pausing, you can’t resume the interview later.

SEE ALSO:
- Flow Interviews
- Pause a Flow Interview
- Delete a Flow Interview

**Delete a Flow Interview**

If you paused a flow interview and don’t plan to resume it, delete it. By removing unnecessary interviews, you make sure that your pending list includes only interviews that you still plan to act on.

1. Go to a place that lists all of your paused flow interviews.
   - Depending on your administrator’s configurations, you can find all the flow interviews that you’ve paused in one of these places.
     - "Paused Flow Interviews" on the Home tab in the full Salesforce site
     - "Paused Flow Interviews" in the left navigation in Salesforce1
   - If you paused a flow interview and can’t find the place where you’re supposed to resume the interviews from, contact your administrator.

2. Delete the flow interview that’s unnecessary.

**Visual Workflow Terminology**

The following terminology is used for Visual Workflow in Salesforce:

- **Cloud Flow Designer**
  - Cloud-based application that lets administrators create a flow for use in Salesforce.

- **Connector**
  - Connectors determine the available paths that a flow can take at run time.

- **Element**
  - Each element represents an action that the flow can execute. Examples of such actions include reading or writing Salesforce data, displaying information and collecting data from flow users, executing business logic, or manipulating data.

- **Flow**
  - A flow is an application that can execute logic, interact with the Salesforce database, call Apex classes, and collect data from users. You can build flows by using the Cloud Flow Designer.
Flow Interview

A flow interview is a running instance of a flow.

Master Flow

A master flow is a flow that contains a subflow element. The term “master” is used to distinguish it from the flow that is referenced and called by the subflow element.

Resource

Each resource represents a value that you can reference throughout the flow.

Subflow

A subflow element references another flow, which it calls at run time. The flow that contains the subflow element is referred to as the master flow.

Automated Actions

An automated action is a reusable component that performs some sort of action behind the scenes—like updating a field or sending an email. Once you create an automated action, add it to a process, milestone, or other automated process.

<table>
<thead>
<tr>
<th>Action Type</th>
<th>Supported In...</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Workflow Rule</td>
</tr>
<tr>
<td>Email Alert</td>
<td>✅</td>
</tr>
<tr>
<td>Field Update</td>
<td>✅</td>
</tr>
<tr>
<td>Flow Trigger (Pilot)</td>
<td>✅ (immediate only)</td>
</tr>
<tr>
<td>Outbound Message</td>
<td>✅</td>
</tr>
<tr>
<td>Task</td>
<td>✅</td>
</tr>
</tbody>
</table>

Considerations for Automated Actions

Before you start working with automated actions, familiarize yourself with relevant limits and special behaviors.
Task Actions

Task actions determine the details of an assignment given to a specified user by an automated process. You can associate task actions with workflow rules, approval processes, or entitlement processes.

From Setup, enter Tasks in the Quick Find box, and select Tasks. Then use these settings to configure your task.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Select an object for your task. Remember, tasks can only be associated with workflow rules or approval processes for the same object type. Choose an object that tracks activities.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: Tasks are not available for article types.</td>
</tr>
<tr>
<td>Assigned to</td>
<td>Select an assignee for your task. An assignee can be in the form of a user, role, record owner, record creator, opportunity team role, or account team role, depending on the type of record you chose.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>:</td>
</tr>
<tr>
<td></td>
<td>• If the assignee of a task is set to the record owner and the owner of a lead or case is a queue, the task is assigned to the person who triggered the rule.</td>
</tr>
<tr>
<td></td>
<td>• If the subject was translated, Salesforce creates the task in the assignee's language. If you checked Notify Assignee for the task, Salesforce sends the email in the assignee's language. However, if only the comments field was translated, Salesforce creates the task and sends the email in the language of the user who triggered the task.</td>
</tr>
<tr>
<td></td>
<td>• If a custom object has a master-detail relationship with a standard object, the owner of the custom object record is automatically set to the owner of the master standard object record. For example, if a custom object called “Expenses” has a master-detail relationship with Accounts, the owner of each expense record is the owner of the account for the expense.</td>
</tr>
<tr>
<td></td>
<td>• If the assignee of a workflow task is a role and more than one user belongs to that role, the record owner becomes the task assignee, regardless of their role. We recommend that you not assign tasks to roles with multiple users. Assigning tasks to roles with one user allows you to easily change the user in that role without modifying the workflow rule. If the assignee of a workflow task is a role and that role is empty, the record owner becomes the task assignee, regardless of their role.</td>
</tr>
<tr>
<td></td>
<td>• When a lead is converted by someone who isn’t the lead owner, all workflow tasks associated with the lead that are assigned to that user, except email alerts, are reassigned to the lead owner. Workflow tasks assigned to users other than the lead owner and lead converter aren’t changed.</td>
</tr>
</tbody>
</table>
**Field** | **Description**
--- | ---
**Subject** | Enter a subject for the task. Distinguish automated tasks from user-created ones by starting the subject with a specific notation, such as adding *(Automated)* at the end.

**Unique Name** | Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the same type with the same unique name, provided they are defined for different objects.

The **Unique Name** field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

**Due Date** | Choose a due date for the task. Due dates appear in the time zone of the assignee.

Configuring a task’s **Due Date** to “Rule Trigger Date” sets time triggers and workflow task due dates based on the date that the workflow time trigger’s action is executed. For example, if the task due date is “Rule Trigger Date plus 10 days” and the time trigger is executed on January 1, Salesforce sets the task due date to January 11.

**Status** | Choose a status for the task.

**Priority** | Choose a priority for the task.

**Comments** | Enter comments for the task.

You may notice that all your tasks include a **Created By** field. For tasks, this field contains the name of the person who saved the record that triggered the rule to assign the task.

Tasks don’t trigger task-based workflow rules if they’re created automatically, such as by clicking the **Send An Email** button or by using the Email to Salesforce BCC address field.

**SEE ALSO:**

*Associate Actions with Workflow Rules or Approval Processes*

### Email Alert Actions

Email alerts are emails generated by an automated process and sent to designated recipients. These actions consist of the standard text and list of recipients for an email. You can associate email alerts with processes, flows, workflow rules, approval processes, or entitlement processes. They’re also available through the Invocable Actions REST API endpoint.

From Setup, enter **Email Alerts** in the **Quick Find** box, and select **Email Alerts**. Then use these settings to configure your email alert.

⚠️ **Tip:** Create a standardized letterhead to use for all the email templates you use for workflow alerts.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>Enter a description.</td>
</tr>
<tr>
<td><strong>Unique Name</strong></td>
<td>Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have actions of the</td>
</tr>
<tr>
<td>Field</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Field</td>
<td>same type with the same unique name, provided they are defined in different objects. The <strong>Unique Name</strong> field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Object</td>
<td>If available, choose an object for this email alert. Salesforce uses this object when generating merge field values for email templates with workflow rules and approval processes. Also, you can define the recipients of this email alert using contact and user lookup fields that are relevant to that object. For example, if you select Contract, you can define the contract signer as a recipient. The object is read-only if the new email alert is associated with an approval process or workflow rule for a particular object.</td>
</tr>
<tr>
<td>Email Template</td>
<td>Choose an email template. Insert merge fields to reference specific information based on the record that triggers the email alert. For example, insert a link to the opportunity. Except for <code>{!ApprovalRequest.Comments}</code>, approval merge fields named <code>{!ApprovalRequest.field_name}</code> in email templates return values only in approval assignment emails and email alerts for approval processes. When used in other emails—including email alerts for workflow rules—the approval merge fields return null. The <code>{!ApprovalRequest.Comments}</code> merge field returns only the most recently entered comment in emails for an approval step that requires unanimous approval from multiple approvers.</td>
</tr>
<tr>
<td>Recipient Type</td>
<td>Select who should receive this email alert. Depending on your organization settings and the object you selected, some options in this list may not be available.</td>
</tr>
<tr>
<td>Recipients</td>
<td>Select who should receive this email alert in the <strong>Available Recipients</strong> list and click <strong>Add</strong>. If you change the object after selecting recipients, Salesforce clears the <strong>Selected Recipients</strong> list. If your email recipient is a role and that role contains multiple people, Salesforce emails each person in that role. If your email recipient is a record owner and the owner of the record is a queue, the queue email receives the email alert. If the queue is set up so that email is sent to all members, queue members are notified as well. If no queue email is specified, only queue members are notified.</td>
</tr>
<tr>
<td>Additional Emails</td>
<td>Enter up to five additional email addresses for recipients who aren’t Salesforce users, leads, or contacts.</td>
</tr>
<tr>
<td>From Email Address</td>
<td>Either the default workflow user or a previously configured and verified organization-wide address. This field lets you use a standard email address for your organization (such as <a href="mailto:support@company.com">support@company.com</a>) instead of the default <strong>From</strong> field, which is the email address of the person who updates the record. If you select <strong>Make this the default From email address for this object’s email alerts</strong>, this email address overrides the <strong>From Email Address</strong> for all email alerts associated with that object. You can still customize individual email alerts to use a different <strong>From Email Address</strong>. The <strong>From Email Address</strong> in a workflow email alert changes to the current user when the email alert is installed by using a managed or unmanaged package. The <strong>From Email Address</strong> doesn’t change when using other types of deployment such as the Metadata API or change sets.</td>
</tr>
</tbody>
</table>

**Note:** The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per org—except for free Developer Edition and trial orgs, where the daily workflow email limit is 15. The overall org limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.
Field Update Actions

Field update actions let you automatically update a field value. You can associate field updates with workflow rules, approval processes, or entitlement processes.

From Setup, enter Field Updates in the Update box, and select Field Updates. Then use these settings to configure your field update.

Before you begin, check the type of the field you want to update. Read-only fields like formula or auto-number fields are not available for field updates.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Enter a name for this field update.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have field updates of the same type with the same unique name, provided they are defined in different objects. The Unique Name field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description for the field update.</td>
</tr>
<tr>
<td>Object</td>
<td>Select the object whose field you want to update.</td>
</tr>
<tr>
<td>Field to Update</td>
<td>Select the field to update. Fields are shown only for the object that you selected. You can select a field on a related object in a master-detail relationship. You can use field updates on encrypted custom fields, but the encrypted field isn’t available in the formula editor.</td>
</tr>
<tr>
<td>Re-evaluate Workflow Rules After Field Change</td>
<td>Select if you want workflow rules on this object to be re-evaluated after the field value is updated. If you select this option, Salesforce re-evaluates all workflow rules on the object if the field update results in a change to the value of the field, triggering any workflow rules whose criteria are met. For more information, see Field Updates That Re-evaluate Workflow Rules on page 4494.</td>
</tr>
<tr>
<td>Specify New Field Value</td>
<td>The value that the field should be updated with. The available options depend on the type of field you are updating. For more information, see Value Options for Field Update Actions on page 4484.</td>
</tr>
</tbody>
</table>

Tip: Avoid associating more than one field update with a rule or approval process that applies different values to the same field.

SEE ALSO:
- Associate Actions with Workflow Rules or Approval Processes
- Value Options for Field Update Actions
- Cross-Object Field Updates
- Field Updates That Re-evaluate Workflow Rules
- Considerations for Field Update Actions

Available in: Lightning Experience and Salesforce Classic
Available in: Enterprise, Performance, Unlimited, and Developer Editions
Value Options for Field Update Actions

When you create a field update action, specify what the new value of the field should be. Available field update options depend on the type of field you’re updating.

- **Choose A specific value**, and enter the value in the space provided.
- **Choose A blank value (null)** if you want Salesforce to remove any existing value and leave the field blank. This option isn’t available for required fields, checkboxes, and some other types of fields.
- For record owners, choose the user to whom the record should be assigned. For case, lead, and custom object records, you can also choose a queue for this field. Select **Notify Assignee** to send an email to the new record owner (option unavailable when user control over task assignment notifications is enabled).
- For checkboxes, choose **True** to select the checkbox and **False** to deselect it.
- For picklists, select a specific value from the drop-down list, or select the value above or below the current value based on the sorting specified in the picklist definition. If you sort values alphabetically, the values above or below may be different for users in other languages.
- **Choose Use a formula to set the new value** to calculate the value based on an expression, merge fields, or other values. For more information about using formulas in Salesforce, see **Formulas** on page 4101.

Outbound Message Actions

An outbound message sends information to a designated endpoint, like an external service. Outbound messages are configured from Setup. You must configure the external endpoint and create a listener for the messages using the SOAP API. You can associate outbound messages with workflow rules, approval processes, or entitlement processes.

For example, automatically initiate the reimbursement process for an approved expense report by triggering an outbound API message to an external HR system.

From Setup, enter **Outbound Messages** in the Quick Find box, and select **Outbound Messages**. Then use these settings to configure your outbound message.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Object</td>
<td>Choose the object that has the information you want included in the outbound message.</td>
</tr>
<tr>
<td>Name</td>
<td>Enter a name for this outbound message.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>Enter a unique name to refer to this component in the API. The requirement for uniqueness is only within the selected object type. You can have outbound messages with the same unique name, provided they are defined for different objects. The <strong>Unique Name</strong> field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Description</td>
<td>Enter a description that makes it easy for other users to tell what the outbound message does.</td>
</tr>
</tbody>
</table>
### Field Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Endpoint URL</td>
<td>Enter an endpoint URL for the recipient of the message. Salesforce sends a SOAP message to this endpoint.</td>
</tr>
<tr>
<td>User to send as</td>
<td>Select the Salesforce user to use when sending the message. The chosen user controls data visibility for the message that is sent to the endpoint.</td>
</tr>
<tr>
<td>Send Session ID</td>
<td>Select Send Session ID if you want the Salesforce session ID included in the outbound message. Include the session ID in your message if you intend to make API calls and you don't want to include a username and password. Never send a username and password in an unencrypted message, especially in a production environment. It isn't secure.</td>
</tr>
<tr>
<td>Priority</td>
<td>Choose a priority for the outbound message.</td>
</tr>
<tr>
<td>Account fields to send</td>
<td>Select the fields to include in the outbound message and click Add.</td>
</tr>
</tbody>
</table>

If your endpoint URL uses a client certificate, see Import a Client Certificate for Your Endpoint URL on page 4494.

**SEE ALSO:**

- Considerations for Outbound Messages
- SOAP API Developer Guide
- Associate Actions with Workflow Rules or Approval Processes
- Considerations for Outbound Messages

### Outbound Message Notifications

You can request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request. Failed messages are deleted from the failed outbound messages related list after seven days. Before they are removed, you can delete them yourself or request that they be retried again.

**Note:** If you don't have this option, your organization doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

**Create an Outbound Message Notification**

Request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request.

**View an Outbound Message Notification Request**
Create an Outbound Message Notification

Request that up to five users receive a notification listing all outbound messages that have failed for at least 24 hours. A fresh notification is sent every 24 hours until you cancel the request.

1. From Setup, enter Outbound Message Notifications in the Quick Find box, then select Outbound Message Notifications.
2. Click New.
3. Enter a full username, or click the icon to select it from a list of usernames.
4. Save the request.

Note: If you don't have this option, your organization doesn't have outbound messages enabled. Contact Salesforce to enable outbound messages.

View an Outbound Message Notification Request

From the detail page of an outbound message notification request:

- Click Edit to change the username for a notification request. This is simpler than deleting the request and then creating a new one.
- Click Delete to delete the notification request.
- Click Clone to create a new notification request with the same username.
Track the Delivery Status of an Outbound Message

To track the status of an outbound message, from Setup, enter Outbound Messages in the Quick Find box, then select Outbound Messages.

- Next items for delivery are awaiting delivery.
- Oldest failures have not yet been deleted because they have not been delivered and are not 24 hours old.
- Failed outbound messages failed to be delivered and are no longer being retried. Messages are listed here only if you configure the message when you create it by selecting Add failures to failed outbound message related list. If you do not see this related list, it has not been enabled for your organization.

You can perform several tasks here.

- Click any workflow or approval process action ID to view the action that triggered it.
- Click Retry to change the Next Attempt date to now. This causes the message delivery to be immediately retried. If you select Retry in the Failed outbound messages related list, the outbound message moves to the Next items for delivery related list and is retried for another 24 hours.
- Click Del to permanently remove the outbound message from the queue.

Note: If you don’t have this option, your organization doesn’t have outbound messages enabled. Contact Salesforce to enable outbound messages.

Import a Client Certificate for Your Endpoint URL

If the endpoint URL of your outbound message uses a client certificate, import it to put your outbound message into action.

1. From Setup, enter API in the Quick Find box, then select API
2. Click Generate Client Certificate.
3. Save the certificate to the appropriate location.
4. Import the downloaded certificate into your application server and configure your application server to request the client certificate.
Define a Flow Trigger for Workflow (Pilot)

Create a flow trigger so that you can launch a flow from workflow rules. With flow triggers, you can automate complex business processes—create flows to perform logic, and have events trigger the flows via workflow rules—without writing code. For example, your flow looks up and assigns the relevant entitlement for a case. Create a flow trigger to launch the flow whenever a case is created, so that all new cases are automatically set with a default entitlement.

Note: The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.

To get started using flow triggers, from Setup, enter Flow Triggers in the Quick Find box, then select Flow Triggers. Before you begin:

- Create and activate the autolaunched flow that you want this workflow action to launch.
- Create the workflow rule that you plan to add this workflow action to.
- Understand the special behavior and limitations of flow triggers. See Flow Trigger Considerations (Pilot) on page 4496.

Complete these steps to create a flow trigger.

1. From Setup, enter Flow Triggers in the Quick Find box, then select Flow Triggers.

2. Click New Flow Trigger.

3. Select the same object as the workflow rule, and then click Next.

4. Configure the flow trigger.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Name of the flow trigger.</td>
</tr>
<tr>
<td>Unique Name</td>
<td>Enter a unique name to refer to this component in the API. The <strong>Unique Name</strong> field can contain only underscores and alphanumeric characters. It must be unique within the selected object type, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</td>
</tr>
<tr>
<td>Protected Component</td>
<td>Reserved for future use.</td>
</tr>
<tr>
<td>Flow</td>
<td>Unique name of the autolaunched flow that this workflow action launches.</td>
</tr>
<tr>
<td>Set Flow Variables</td>
<td>Whether to pass values into the flow’s variables and sObject variables.</td>
</tr>
</tbody>
</table>

5. If you select Set Flow Variables, specify their names and values.

Click Set Another Value to set up to 25 variables.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Select the name of the flow variable or sObject variable.</td>
</tr>
<tr>
<td></td>
<td>Only variables whose Input/Output Type allow input access can be selected.</td>
</tr>
</tbody>
</table>
For a flow variable, you can:

- Enter a literal value.
- Click \( \text{\textendash} \), select a field, and click **Insert**.

For an sObject variable, you can:

- Click \( \text{\textendash} \), select an sObject record, and click **Insert**.

To help you distinguish between sObject records and fields, all sObject record options are marked with an asterisk (*) and appear at the top of each list.

- Enter \( {!\text{this}} \) to use the current values of the record that was created or edited to cause the workflow rule to fire.
- Enter \( {!\text{old}} \) to use the most recent previous values of the record that was edited to cause the workflow rule to fire.

In other words, \( {!\text{old}} \) identifies the same record as \( {!\text{this}} \) but uses the record's values from immediately before it was edited to cause the workflow rule to fire.

**Note:**

- If the record was newly created, \( {!\text{old}} \) is null.
- Unlike \( {!\text{this}} \), \( {!\text{old}} \) can't be selected by clicking \( \text{\textendash} \). You must manually enter \( {!\text{old}} \) in the Value column.

6. To put the flow trigger in test mode, select **Administrators run the latest flow version**.

When selected and an administrator triggers the workflow rule, the flow trigger launches the latest version of the flow. For all other users, the flow trigger always launches the active version of the flow.

The same values are passed into the flow variables and sObject variables whether the flow trigger launches the active or latest flow version.

7. Click **Save**.

Don't forget to **associate the flow trigger to a workflow rule**.

- Flow Trigger Considerations (Pilot)
Considerations for Automated Actions

Before you start working with automated actions, familiarize yourself with relevant limits and special behaviors.

Considerations for Field Update Actions
Learn how to use field update actions to their full potential in workflow.

Considerations for Outbound Messages
Review the considerations for using outbound message actions before implementing them in your workflows.

Daily Limit for Email Alerts
The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per org—except for free Developer Edition and trial orgs, where the daily workflow email limit is 15. The overall org limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

Flow Trigger Considerations (Pilot)
Flow trigger workflow actions have special behaviors and limitations.

Considerations for Field Update Actions
Learn how to use field update actions to their full potential in workflow.

When creating field updates for workflow rules or approval processes, consider the following:

Field Update Processing

- Field updates occur before email alerts, tasks, and outbound messages.
- Field updates occur after case assignment, lead assignment, and auto-response rules.
- Field updates function independently of field-level security. Therefore, a workflow rule can update fields even though they are hidden on the user’s page layout.
- The result of a field update is unpredictable when a single workflow rule includes multiple field updates that apply different values to the same field.
- Field updates may affect the information in a related list. For example, if a field such as the Amount or Close Date of an opportunity is set to be updated, it will affect the Stage History related list on opportunities.
- If a user gets a field update error when saving a record, you can use the debug log to see which field update failed. The debug log stops when a failure occurs.
- For reminder fields on tasks and events:
  - Field updates can set the reminder for a task or event but they can’t use the due date of a task or the scheduled time of an event.
  - Formulas for date/time values are calculated in days. Divide the value by 1440—the number of minutes in a day—to express the value in minutes. For example, the formula \( \text{Now}() - 7 \) means seven days ago, while \( \text{Now}() - 7 / 1440 \) means seven minutes ago.
- If your organization uses multiple currencies, currency fields are updated using the record’s currency. If you choose to update a field based on a formula, any values in your formula are interpreted in the currency of the record.
- Field updates are tracked in the History related list if you have set history tracking on those fields.
- Because updates to records based on workflow rules don’t trigger validation rules, workflow rules can invalidate previously valid fields.
• If you have person accounts enabled, you can use the Is Person Account field as part of the evaluation criteria for workflow rules. However, because the Is Person Account field is read-only, any field updates set up to modify it will fail.

Tip: Salesforce processes rules in the following order:
1. Validation rules
2. Assignment rules
3. Auto-response rules
4. Workflow rules (with immediate actions)
5. Escalation rules

Notes on Cross-Object Field Updates
• For all custom objects and some standard objects, you can create workflow and approval actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships. For more information, see Cross-Object Field Updates on page 11.

• Approval processes can't use cross-object field update actions.
• An approval process can specify a field update action that reevaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates are ignored.
• To create workflow rules so that case comments or emails automatically update fields on associated cases, select Case Comment or Email Message in the Object drop-down list when creating a new workflow rule and select Case in the Field to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule. When cases are updated by an email-triggered workflow rule, the updated case can trigger:
  – Workflow rules
  – Validation rules
  – Updates to roll-up summary fields
  – Escalation rules
  – Apex triggers
  – Entitlement processes
The updated case can't trigger:
  – Assignment rules
  – Auto-response rules

Field Update Actions and Custom Fields
• Before changing a custom field’s type, make sure that it isn't the target of a workflow field update or referenced in a field update formula that would be invalidated by the new type.
• You can't delete a custom field that is referenced by a field update.
• You can use field updates on encrypted custom fields, but if you try to use a formula to set the new value, the encrypted field isn’t available in the formula editor.
Field Update Actions on Opportunities and Contracts

- You can define field updates for the Stage field on opportunities, but be aware of how this field affects the Type and Forecast Category fields.
- You can define field updates using the Amount field on opportunities but it will only apply to those opportunities that don’t have products. Adding products to an opportunity changes the Amount field to a read-only field that is automatically calculated and not affected by that field update.
- You can define field updates for the Status field on contracts. However, the value of this field may affect the value of the Status Category field as well.
- Avoid creating a field update for contracts or orders that changes the Status field to any value other than Approved.

Field Update Action Limitations

- The results of a field update can’t trigger additional rules such as validation, assignment, auto-response, or escalation rules.
- The results of a field update can trigger additional workflow rules if you have flagged the field update to do so. For more information, see Field Updates That Re-evaluate Workflow Rules on page 4494.
- Field updates that are executed as approval actions don’t trigger workflow rules or entitlement processes.
- These fields aren’t available for field update actions:
  - Read-only fields like formula or auto-number fields
  - The Language picklist field on multilingual solutions
  - Some activity fields, such as Related To and Private
- Email message workflow rules can only be associated with field updates.
- If a field update references a specific user, you can’t deactivate that user. For example, if your field update is designed to change the owner of a record to Bob Smith, change the field update before deactivating Bob Smith.
- You can update long text area fields, but the option to insert A specific value restricts you to entering up to the maximum amount of characters allowed in the destination field.
- You can’t make a field universally required if it’s used by a field update that sets the field to a blank value.
- Workflow rules that update owners do not also transfer associated items. To ensure transfer, click Change next to the owner’s name in a record and make your transfer selections.

Cross-Object Field Updates

For all custom objects and some standard objects, you can create actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships.

Field Updates That Re-evaluate Workflow Rules

If Re-evaluate Workflow Rules After Field Change is enabled for a field update action, Salesforce re-evaluates all workflow rules on the object if the field update results in a change to the value of the field.

SEE ALSO:

Cross-Object Field Updates
Cross-Object Field Updates

For all custom objects and some standard objects, you can create actions where a change to a detail record updates a field on the related master record. Cross-object field updates work for custom-to-custom master-detail relationships, custom-to-standard master-detail relationships, and a few standard-to-standard master-detail relationships.

For example, in a custom recruiting application, create a workflow rule that sets the status of an application (the master object) to "Closed" when a candidate (the detail object) accepts the job. Or, for standard objects, create a rule to change the status of a case from "Awaiting Customer Response" to "In Progress" when a customer adds a case comment.

Custom Object to Custom Object

Cross-object field updates are supported for all custom objects that are children of custom objects in a master-detail relationship.

Custom Object to Standard Object

Cross-object field updates are supported for custom objects that are children of certain standard objects in a master-detail relationship. The standard objects which support cross-object field updates from custom objects are:

- Account
- Asset
- Campaign
- Case
- Contact
- Contract
- Contract Line Item
- Entitlement
- Opportunity
- Order
- Question
- Quote
- Service Contract
- Solution

Standard Object to Standard Object

Cross-object field updates are supported for standard objects that are children of standard objects in a master-detail relationship. However, only these standard-to-standard relationships are supported.

- Case Comments updating Case
- Email updating Case

Tip: To create workflow rules so that case comments or emails automatically update fields on associated cases, select Case Comment or Email Message in the Object drop-down list when creating a new workflow rule and select Case in the Field to Update list. Email-to-Case or On-Demand Email-to-Case must be enabled for your organization to use the Email Message in a workflow rule.

- Opportunity Product updating Opportunity
Note: Cross-object field updates to a parent opportunity’s Amount and Quantity fields only work if the opportunity has no opportunity products associated with it.

- Opportunity updating Account—Supported for both business accounts and person accounts.

Note: If you have workflow rules on converted leads and want to use cross-object field updates on the resulting accounts and opportunities, you must enable the lead setting Enable Validation and Triggers from Lead Convert.

Standard-to-standard cross-object field update actions:
- Can’t be used in, or assigned to, approval processes.
- Update a parent record even if the user doesn’t have edit access to it.

Note: If you have Apex code that updates parent fields in the same relationships as a cross-object field update action, consider replacing your code with cross-object field updates. Otherwise, both will fire, and since workflow rules run after Apex triggers, the workflow field update will override any change made by your Apex code.

SEE ALSO:
- Considerations for Field Update Actions
- Object Relationships Overview

Field Updates That Re-evaluate Workflow Rules

If Re-evaluate Workflow Rules After Field Change is enabled for a field update action, Salesforce re-evaluates all workflow rules on the object if the field update results in a change to the value of the field.

- If the field update changes the field’s value, all workflow rules on the associated object are re-evaluated. Any workflow rules whose criteria are met as a result of the field update will be triggered.

- If any of the triggered workflow rules result in another field update that’s also enabled for workflow rule re-evaluation, a domino effect occurs, and more workflow rules can be re-evaluated as a result of the newly-triggered field update. This cascade of workflow rule re-evaluation and triggering can happen up to five times after the initial field update that started it.

- Make sure that your workflow rules aren’t set up to create recursive loops. For example, if a field update for Rule1 triggers Rule2, and a field update for Rule2 triggers Rule1, the recursive triggers may cause your organization to exceed its limit for workflow time triggers per hour.

- In a batch update, workflow is only retriggered on the entities where there is a change.

- Only workflow rules on the same object as the initial field update will be re-evaluated and triggered.

- Only workflow rules that didn’t fire before will be retriggered.

- Cross-object workflow rules aren’t candidates for re-evaluation.

- Cross-object field updates that cause a field value to change don’t trigger workflow rule re-evaluation on the associated object.

- An approval process can specify a field update action that reevaluates workflow rules for the updated object. If, however, the re-evaluated workflow rules include a cross-object field update, those cross-object field updates are ignored.

- Time-dependent actions aren’t executed for a reevaluated workflow rule in the following situations:
  - The reevaluated workflow rule’s immediate actions cause the record to no longer meet the workflow rule criteria.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: Enterprise, Performance, Unlimited, and Developer Editions
An Apex **after** trigger that is executed as a result of a workflow or approvals action causes the record to no longer meet the workflow rule criteria.

SEE ALSO:
Considerations for Field Update Actions
Considerations for Outbound Messages

**Considerations for Outbound Messages**

Review the considerations for using outbound message actions before implementing them in your workflows.

When creating outbound messages for workflow rules or approval processes, consider the following:

- A single SOAP message can include up to 100 notifications. Each notification contains an ID that uniquely identifies a record, and a reference to the data in the record. Therefore, if the information in the record changes after the notification is sent, but before the notification is delivered, only the updated information is delivered.
- Messages are queued until they are sent, to preserve message reliability.
- If the endpoint is unavailable, messages will stay in the queue until sent successfully or until they are 24 hours old. After 24 hours, messages are dropped from the queue.
- If a message can’t be delivered, the interval between retries increases exponentially, up to a maximum of two hours between retries.
- Messages are retried independent of their order in the queue. This may result in messages being delivered out of order.
- You can’t build an audit trail using outbound messages. While each message should be delivered at least once, it may be delivered more than once. Also, it may not be delivered at all if delivery cannot be done within 24 hours. Finally, as noted above, the source object may change after a notification is sent but before it is delivered, so the endpoint will only receive the latest data, not any intermediate changes.

**Daily Limit for Email Alerts**

The daily limit for emails sent through email alerts is 1,000 per standard Salesforce license per org—except for free Developer Edition and trial orgs, where the daily workflow email limit is 15. The overall org limit is 2,000,000. This limit applies to emails sent through email alerts in workflow rules, approval processes, flows, processes, or the REST API.

The limit restriction is based on activity in the 24-hour period starting and ending at midnight GMT. Adding or removing a user license immediately adjusts the limit’s total. If you send an email alert to a group, every recipient in that group counts against your daily workflow email limit.

After your org has reached its daily workflow email limit:

- Any emails in the workflow queue left over and not sent that day are discarded. Salesforce doesn’t try to resend them later.
- If a workflow rule with an action and an email alert is triggered, only the email action is blocked.
- Final approval, final rejection, approval, rejection, and recall email actions are blocked.
- An error message is added to the debug log.

The following items don’t count against the workflow email limit:

- Approval notification emails
- Task assignment notifications
- Lead assignment rules notifications
• Case assignment rules notifications
• Case escalation rules notifications
• Force.com sites usage alerts

When workflow email alerts approach or exceed certain limits, Salesforce sends a warning email to the default workflow user or—if the default workflow user isn’t set—to an active system administrator.

<table>
<thead>
<tr>
<th>When...</th>
<th>Salesforce Sends...</th>
<th>Warning Email Includes...</th>
</tr>
</thead>
<tbody>
<tr>
<td>An email alert isn’t sent because the number of recipients exceeds the limit for a single email</td>
<td>A warning email for each unsent email alert</td>
<td>The unsent email alert’s content and recipients</td>
</tr>
<tr>
<td>The organization reaches 90% of the limit of emails per day</td>
<td>One warning email</td>
<td>The limit and the organization’s usage</td>
</tr>
<tr>
<td>The organization reaches 90% of the limit of workflow emails per day</td>
<td>One warning email</td>
<td>The limit and the organization’s usage</td>
</tr>
<tr>
<td>An email alert isn’t sent because the organization reaches the limit of emails per day</td>
<td>A warning email after every 100 attempted email alerts over the limit</td>
<td>The limit and the organization’s usage</td>
</tr>
<tr>
<td>An email alert isn’t sent because the organization reaches the limit of workflow emails per day</td>
<td>A warning email after every 100 attempted email alerts over the limit</td>
<td>The limit and the organization’s usage</td>
</tr>
</tbody>
</table>

Flow Trigger Considerations (Pilot)

Flow trigger workflow actions have special behaviors and limitations.

Note: The Process Builder has superseded flow trigger workflow actions, formerly available in a pilot program. Organizations that are using flow trigger workflow actions can continue to create and edit them, but flow trigger workflow actions aren’t available for new organizations.

Understand these considerations before you create flow triggers or add them to workflow rules.

• Flow triggers are available only for workflow rules. You can’t use them as actions elsewhere, for example, in approval processes.

• Flow triggers are available on most—but not all—objects that are supported by workflow rules. You can see the list of supported objects when you create a new flow trigger. From Setup, enter Flow Triggers in the Quick Find box, then click Flow Triggers.

• Only active, autolaunched flows can be launched by flow triggers. However, if a flow trigger is in test mode, administrators run the latest flow version while other users run the active flow version.

• Flows that are launched from workflow rules are run in system context, which means that user permissions, field-level security, and sharing rules aren’t taken into account during flow execution.

• If a flow trigger fails at run time, the user who created or edited the record to meet the workflow rule criteria won’t be able to save the record. To troubleshoot run time issues, see the flow action events in the Workflow category of debug logs, which show the flow version and the values passed into flow variables.

• A flow trigger can set the values of up to 25 variables and sObject variables in the flow, with the following limitations.
Flow triggers can’t use multi-select picklist fields to set flow variables or sObject variables.

When a flow trigger uses a currency field to set a flow variable, only the amount is passed into the flow. Any currency ISO code or locale information is ignored. If your organization uses multiple currencies, the flow trigger uses the amount in the currency of the record that contains the specified currency field.

Flow triggers can’t pass values into sObject collection variables in flows.

- Always keep one version of the flow active if it’s referenced by an active workflow rule’s flow trigger.
- Once you activate a workflow rule using the flow trigger, don’t modify or add a version of the flow to include screens or other elements that would violate the run restrictions for an autolaunched flow. If you modify a flow to no longer be autolaunched, it can’t be launched by flow triggers. To work around this situation, you can save the non-autolaunched flow as a new flow and change the new flow to become autolaunched. Then update the flow triggers to launch the new flow.
- Flow triggers aren’t available as time-dependent workflow actions. You can add flow triggers to workflow rules only as immediate workflow actions.
- When the system executes a workflow rule with multiple flow triggers, those flows aren’t run in any particular order.
- In a transaction, flow triggers are executed after all workflow field updates, including any Apex triggers and standard validations that are executed as a result of those workflow field updates. After executing flow triggers, the system executes escalation rules.
- Flows that are launched from workflow rules are governed by the per-transaction limits already enforced by Apex.
- When flows are launched from workflow rules that are triggered by bulk loads or imports, the flows’ data manipulation language (DML) operations are executed in bulk to reduce the number of calls required and to optimize system performance. The execution of any of the following flow elements qualifies as a DML operation: Record Create, Record Update, Record Delete, Fast Create, Fast Update, or Fast Delete.

For example, suppose that you use Data Loader or the Bulk API to update 50 records, and those updates meet the criteria of a workflow rule with a flow trigger action. In response, the system executes 50 instances of the flow within the same transaction. Each instance of a running flow is called an interview. The system attempts to execute each DML operation across all the interviews in the transaction at the same time. Suppose that five of those interviews are executing the same branch of the flow, which has a Record Update element called “SetEntitlement.” The system waits for all five interviews to reach that element, and then executes all five record updates in bulk.

- Flow triggers aren’t available in change sets.
- Flow triggers aren’t packageable.
Customizing Workflow and Approval Settings

To use time-based workflow, allow users to respond to approval requests via email, or allow users to pause flow interviews, update your workflow and approval settings.

From the Workflow and Approvals Settings page, you can:

- Set the Default Workflow User for your Salesforce org
- Enable your users to respond to approval requests via email
- Display the Pause button on flow screens

Creating Websites

Domain Management

Domain Management Overview

The Domain Management page allows you to configure domains and their site associations with a high degree of flexibility.

Sites and domains can have a many-to-many relationship. Each domain can have up to 50 sites, and each site can be associated with up to 100 domains. For example, you might want to set up a single domain to host your Communities, Force.com, and Site.com sites. This simplifies your domain requirements. For Site.com sites, you might want to host them on the same domain as your Force.com sites because you can access Visualforce pages and have easier access to Apex code.

There are also reasons why you would have a site on more than one domain. For example, let's say you have a parent company with two distinct brands. Each brand has its own registered domain, but you want them both to point to the parent website. Because you can have a site exist on more than one domain, you can point both brand domains to a single parent website.

If you plan to host more than one site on a domain, you'll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the sites within that domain. Let's say you have a domain called www.ourdomain.com and you want to host two sites called siteone and sitetwo. You'll need to create custom URLs by associating ourdomain.com to each site using a custom path. This will result in two custom URLs: http://www.ourdomain.com/siteone and http://www.ourdomain.com/sitetwo.
and http://www.ourdomain.com/sitetwo. When a web user accesses the domain using one of the URLs, the custom path determines which site within the domain they see.

SEE ALSO:
- Adding a Domain
- Adding a Custom URL
- Managing Domains and Custom URLs
- Deleting a Domain
- Deleting Custom URLs

Adding a Domain

You can add domains and attach certificates using the Domain Management page in Setup. When you add a domain, you also have the option of attaching a certificate and key for connection security. If you’re going to use a certificate, make sure you’ve already added it using Certificate and Key Management before you try to attach it to your domain. Only CA-signed certificates are supported, and they must be 2048 bits in length. To support all domains that are hosted by sites in your organization, use a wildcard or Subject Alternative Name certificate.

Custom domains are supported only in non-sandbox instances. You can configure a custom domain in a sandbox instance and then migrate it to a production instance, but the custom domain is only active in production.

To add domains in your organization:

1. From Setup, enter Domains in the Quick Find box, then select Domains.
2. Click Add a Domain.
3. Enter the Domain Name.
4. Add a certificate if you have already set up a CA-signed certificate that supports this domain.
5. Click Save. Alternatively, click Save & New to add multiple domains.

Before you switch the CNAME of your domain name to point to a new target name, ensure that the new target name exists in the DNS by using dig or nslookup. When you created your domain names affects the target of your CNAME:

- Domain names that were added before Summer ’13, typically need to have their CNAME adjusted to point to the fully qualified domain followed by .live.siteforce.com instead of to the organization’s force.com sub-domain. For example, if your pre-Summer ‘13 domain is www.example.com, then the target of its CNAME will need to be www.example.com.live.siteforce.com instead of example.force.com before HTTPS will work.
- Domain names that were added in or before Summer ‘13, don’t have the 18-character organization ID in the CNAME target.
- Domain names that were added in or after Summer ‘13, already point to the proper place for setting up HTTPS in a custom domain.
- Domain names that were added in or after Winter ’14, use a CNAME that points to the fully qualified domain followed by your organization’s 18-character ID and .live.siteforce.com. For example, if your domain name is www.example.com...
and your 18-character organization ID is 00dxx0000001ggxeay, then the target of its CNAME will need to be www.example.com.00dxx0000001ggxeay.live.siteforce.com.

- Deleting Custom URLs

Adding a Custom URL

Once you’ve added domains to the Domain Management page, you can select your domain and site relationships by creating a custom URL. A custom URL consists of the domain and a custom path. The same path name can be used on more than one domain, but it can’t be used more than once within the same domain. When adding a custom URL, the / is required and indicates the root. You can add an additional path after the /, but you must at least use the / to indicate the root. For example, if the domain name is https://oursite.com and the path is /products, the site URL is https://oursite.com/products. If you added the custom URL to the root, the URL would be https://oursite.com.

If you want to set a preferred custom URL for authenticated pages and emails that links back to the site or community, then select Site Primary Custom URL. This is only available on the root path for Force.com and Communities sites and not available at all on Site.com sites. For Chatter Communities, if you don’t select a primary URL, then the first https custom domain in the site is used for authenticated pages and emails. If there is no custom https domain, then your Force.com domain is used.

To add a custom URL:

1. From Setup, enter Custom URLs in the Quick Find box, then select Custom URLs. Alternatively, enter Domains in the Quick Find box, select Domains, and click the domain name.
2. Click New Custom URL.
3. Enter a Domain name.
4. Enter a Site name.
5. Enter a unique path.
6. Click Save. Alternatively, click Save & New to add multiple Custom URLs.
**Example:** In the Custom URLs table, even though the domain name and path show in separate columns in the table, it is the combination that make up the actual URL.

- Deleting Custom URLs
Managing Domains and Custom URLs

You can use Domain Management in Setup to manage all the certificates, custom URLs, and sites attached to a domain.

You might want to add a new custom URL to an existing domain, rename a domain, or delete a custom URL from a particular domain. The Domain Detail page allows you to manage the domains and URLs from one page. The top section contains information about the domain and certificates. The lower section contains the a Custom URL related list for the domain. Using this page you can:

- Edit the domain name and certificate — click Edit in the Domain Detail section.
- Delete the domain — click Delete in the Domain Detail section.
- Add new custom URLs — Click New Custom URL.
- Edit existing custom URLs — Click Edit on a custom URL row.
- Delete custom URLs — Click Del on a custom URL row.
- View the site if it is published — Click View on a custom URL row.
- Jump to a site — Click the site name below the Site Label.
- Jump to an attached certificate — click the certificate name next to Certificate and Key.
- See whether the domain has External HTTPS enabled. Only domains that don’t point to the yourdomain.your18characterOrgId.live.siteforce.com CNAME target have this option available.

**Note:** You can’t edit a domain name that is used by a community.

To access the Domain Detail page:

1. From Setup, enter Domains in the Quick Find box, then select Domains.
2. From the Domain Name column, click the domain name.

**Note:** If you have your domain set to use http, and you edit the domain to use https instead, you must republish your Site.com sites.

SEE ALSO:

- Domain Management Overview
- Adding a Custom URL
- Deleting Custom URLs
- Enable External HTTPS on a Domain
Deleting a Domain

You can delete domains from your organization using the Domain Management page. You can’t delete a domain that is attached to a published site. You’ll need to unpublish all sites attached to the domain before you can delete it. For Force.com sites, the domain is deleted immediately, and users no longer have access to any site connected to that domain. But with Site.com sites, the domain remains active until you republish the site.

To delete a domain from your organization:

1. From Setup, enter Domains in the Quick Find box, then select Domains.
2. Click Del next to the domain name.
3. Click OK.

When you delete a domain with an unpublished site attached, it also deletes the custom URL associated with that site.

SEE ALSO:
- Domain Management Overview

Deleting Custom URLs

You can delete custom URLs from your organization using the Domain Management page. You can’t delete a URL that is attached to a published site. You’ll need to unpublish the site attached to the custom URL before you can delete it. For Force.com sites, the URL is deleted immediately, and users no longer have access to any site connected to that URL. But with Site.com sites, the URL remains active until you republish the site.

To delete a URL from a domain:

1. From Setup, enter Custom URLs in the Quick Find box, then select Custom URLs.
2. Click Del next to the URL name.
3. Click OK.

SEE ALSO:
- Domain Management Overview
- Managing Domains and Custom URLs
Enable External HTTPS on a Domain

Enabling External HTTPS on a domain allows Salesforce to use the domain in secure references to the sites that are associated with that domain, such as in URLs that appear within an email message from a Salesforce Community. This feature is useful for sites that require authentication, such as community sites, portal sites, or any type of site where confidentiality, protection from eavesdropping, or protection against spoofing are important.

This option is intended for domains that use a non-Salesforce content delivery network (CDN) or endpoint to serve HTTPS.

You can enable External HTTPS on any domain that doesn’t point to the yourdomain.your18characterOrgId.live.siteforce.com CNAME target.

When enabled, and when the domain’s DNS record is not a CNAME that points to the live.siteforce.com subdomain for that domain, Salesforce assumes that the domain supports secure connections.

When disabled or when the domain’s DNS record is a CNAME that points to the expected live.siteforce.com subdomain for that domain, Salesforce assumes that the domain doesn’t support secure connections.

You can’t enable External HTTPS when you add a new domain, only when editing an existing one.

To enable External HTTPS on a domain, click Edit from the domain list page or from a domain’s detail page, and then select Enable External HTTPS.

If the domain that you’re enabling External HTTPS on comprises only noncommunity Site.com custom URLs, you must manually publish any affected Site.com sites via the Site.com Studio to have this change take effect for those sites. If at least one community site or at least one Force.com site exists on the same domain as a non-Community Site.com site, the publishing of changes to this Enable External HTTPS bit is automatic on that domain.

Managing Domains and Custom URLs
Domain Management Overview

Community Builder (Site.com) and Force.com Sites Overview

Community Builder (Site.com)

Community Builder is an intuitive, convenient tool for customizing your community. Community Builder lets you create a community based on a preconfigured template, and then apply branding, edit pages, update your template, and publish changes all from one user-friendly interface.

Here’s what you can achieve with Community Builder:

• Use one of the self-service templates—Koa, Kokua, or Napili—to easily create a responsive self-service community.
• Use the Aloha template to create a configurable App Launcher.
• Design pixel-perfect, branded pages.
• Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
• Build and iterate quickly using drag-and-drop reusable page elements.
• Use ready-made forms to create web-to-lead forms or gather customer feedback.
• Create data-driven pages, such as product catalogs or other listings, using your organization’s data.
• Set a home page and set up multilingual support for your community in Site.com Studio, a Web content management system that provides extra configuration options. Site.com Studio is easily accessible from Community Management.

**Force.com Sites**

Suitable for developers with experience using Visualforce, Force.com Sites lets you build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you. Here’s what you can achieve with Force.com:

• Create public, branded pages that anyone can access.
• Leverage Visualforce to create private pages that you can add as a tab within your community.
• Write your own controllers, or extensions to controllers, using Apex code.
• Create custom login or self-registration pages.
• Build dynamic web applications, such as an event management application.

Site.com Overview

Site.com is a Web content management system (CMS) that makes it easy to build dynamic, data-driven Web pages quickly, edit content in real time, and manage your websites. From the Site.com tab in the Site.com app, you can launch Site.com Studio, which provides a separate, dedicated environment for creating and editing pixel-perfect, custom websites. Site administrators and designers can create and style Web pages, and add features such as navigation menus, images, and text areas using drag-and-drop page elements, while ensuring the site’s pages match the look and feel of the company’s brand. And content contributors, such as marketing users, can browse and update website content directly in a simplified Site.com Studio environment. Additionally, websites built with Site.com benefit from running on Salesforce’s trusted global infrastructure.

Note: The features available in Site.com Studio vary depending on whether you’re a site administrator, designer, or contributor.

The following examples illustrate a few ways to use Site.com:

• Create an event site—Advertise upcoming events, such as grand openings, launches, or sales kick-offs on a public event site.
• Promote new products—Launch new products into the market with a promotional website that helps drive sales.
• Publish a support FAQ—Provide helpful information on a public website where customers can view solutions to their issues.
• Create microsites and landing pages—Create temporary landing pages or targeted microsites for marketing campaigns.
• Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.
• Publish a catalog of products—List all of your company’s products on a public website, with model numbers and current prices pulled dynamically from your organization.
• Post company press releases—Publish your company’s press releases and sort by publication date.

System Requirements

To use Site.com Studio, we recommend:

• Mozilla® Firefox® or Google® Chrome for best performance. Windows® Internet Explorer® versions 6.0 and 7.0 are not supported.
• Disabling the Firebug extension for Firefox, if installed, as it can impact performance.
• A minimum browser resolution of 1024x768.

Using Site.com Studio as a Contributor
Setting Up Site.com Users

About Site.com Feature Licenses

To access Site.com, each user in your organization must have a Site.com feature license.

- The Site.com Publisher feature license allows the user to access Site.com Studio to create and style websites, control the layout and functionality of pages and page elements, and add and edit content.
- The Site.com Contributor feature license allows the user to access Site.com Studio to edit site content only.

Consider what your users need to do in a site and purchase feature licenses accordingly. See the Site.com feature table for a complete list of the capabilities that come with each feature license. After you purchase feature licenses, you can set up Site.com users.

You can view the number of assigned feature licenses on your organization’s profile.

Note: Organizations using Performance, Unlimited, or Enterprise Editions must purchase Site.com Publisher and Site.com Contributor feature licenses separately. Additionally, a Site.com Published Site license is required for each site that’s published to the Internet. For information on purchasing Site.com licenses, contact Salesforce.

Developer Edition organizations contain two Site.com Publisher feature licenses and one Site.com Contributor feature license. Developer Edition organizations can’t publish sites.

Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

SEE ALSO:

- About Site.com User Roles
- Managing Site.com Users and Roles
Setting Up Site.com Users

Before users can access Site.com, you must allocate a Site.com feature license to each user and assign a user role at the site level. The features available when editing a site in Site.com Studio vary depending on these settings.

First, review the Site.com feature table for detailed information on the feature license, permissions, and role required for each user.

After you've determined the appropriate access level required:

1. **Allocate a feature license to the user by editing the user’s profile.** To allocate:
   - A Site.com Publisher feature license, select the Site.com Publisher User checkbox.
   - A Site.com Contributor feature license, select the Site.com Contributor User checkbox.

   After you allocate a feature license, users can access Site.com in the Force.com app menu in the Salesforce header.

   **Note:** If the checkboxes don’t appear, verify that Site.com is enabled for your organization. See About Site.com Feature Licenses on page 4507.

2. **Ensure the “View Setup and Configuration” permission is enabled.** All users who create or edit websites in Site.com Studio need this permission.

3. **Additionally, ensure that at least one user in your organization has both a Site.com feature license and the “Manage Users” permission.** This way, someone can always reallocate user roles if a site’s users are accidentally deleted.

   **Warning:** The “Manage Users” permission is powerful. It allows a user to manage all other users in your organization and not just Site.com.

4. **Add users and assign user roles within a site.** (When a user with the Site.com Publisher feature license creates a site, the user is automatically allocated the role of site administrator at the site level.)

The feature license, permissions, and user role all determine what a user can do in each site. For example, to create an administrative user who can manage all sites in your organization, assign a Publisher feature license and assign the role of site administrator at the site level.

For users who need only limited access to edit site content, but no administrative access, assign a Contributor feature license and a contributor role at the site level.

Alternatively, to create a user who can manage roles in a site, but without the ability to publish, assign a Publisher feature license, the “Manage Users” permission, and the designer role at the site level.

SEE ALSO:

About Site.com User Roles
About Site.com User Roles

Each Site.com user must have a user role assigned at the site level, which controls what each user can do in a site. Users can have only one role per site, but their roles can vary between sites. For example, a person can be a site administrator on one site and a contributor on another.

To manage user roles in a site, you must either be the site administrator for that site, or have a Site.com feature license and the “Manage Users” permission.

Note: Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.

Users can have one of three roles at the site level:

- **Site administrator**—Site administrators are users who can create and manage all site content. They can create sites, templates, style sheets, and pages, and also set up domains, publish sites, and assign user roles. This role requires the Site.com Publisher feature license.

- **Designer**—Designers have the same control over site content as site administrators, but they can’t manage domains or publish sites. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Publisher feature license.

- **Contributor**—Contributors have the most restricted access to content and can typically just edit page text and images. By default, they can’t assign roles unless they have the “Manage Users” permission. This role requires the Site.com Contributor feature license.

See the Site.com feature table on page 4511 for a detailed list each user role’s capabilities.

SEE ALSO:

- Managing Site.com Users and Roles
- Setting Up Site.com Users
- Setting Up the Contributor’s Studio View
- About Site.com Feature Licenses
Managing Site.com Users and Roles

After you create a site, you can add other users and assign roles to them. If you haven’t assigned Site.com feature licenses to your users, you won’t be able to add them to a site.

Note: Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.

When assigning a user role, be sure to add one that’s compatible with the user’s Site.com license. When users log into Site.com, their licenses are checked against the role assigned to them at the site level. If the license doesn’t allow the permissions associated with the role, then the user is given the permissions associated with the license. For example, if a user has a Site.com Contributor feature license, but is assigned a role of site administrator, they will only have Contributor permissions regardless of the assigned role.

To add users and assign roles:

1. On the Overview tab in Site.com Studio, click Site Configuration > User Roles.
2. Click Add Users.
3. In the Available Users section, highlight the user you want to add.
4. Select the role from the Add as drop-down list.
5. Click the arrow to move the user to the Selected Users section.
6. Click Save.

To delete users:

1. In the User Roles view, select the user.
2. Click Remove.
3. Click OK.

To change a user’s role:

1. In the User Roles view, hover over the user’s role.
2. Click the arrow to display all the roles.
3. Select the new role.

To delete or change the role of a group of users at the same time, use Bulk Actions.

1. In the User Roles view, select the check box beside each user’s name.
2. Click Bulk Actions.
3. Select the action.
4. Click Apply.
When updating the roles of several users at once, you can only assign the same role to all selected users.

**About Site.com Features**

The features available when editing a site in Site.com Studio vary depending on your Site.com feature license and also your user role for that particular site.

This table lists the required feature licenses, permissions, and roles for many of the Site.com Studio features.

**Note:**
- Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site.
- You can’t create, delete, or duplicate community sites in Site.com.

Getting Started with Site.com

Planning and Implementing a Site.com Website

There are many approaches to building a website. The process that best suits you depends on many factors, such as the size of your team and the tasks you’re responsible for.

If you’re a site administrator or designer, you may be involved in every stage, including adding and maintaining the site’s content. Alternatively, you may have contributors who add, edit, and maintain this content. And if you’re a contributor, you may be responsible for editing and updating all of the site’s content, or you may work with other contributors, designers, and site administrators to bring the site to completion.

This topic describes the various stages involved in creating a site with Site.com.

- **Plan the Site Design and Page Layout** (Site administrator or designer)—Before building the pages of the site, spend time planning the site design and basic layout. This stage is key to ensuring a consistent look and feel with the minimum amount of effort. From a hierarchical point of view, think about how many pages you need and whether they’ll have subpages. Also consider how you want site visitors to navigate around your site.

  Next, plan the layout of the pages and identify the common elements that every page will have. In this example, the site has a header section that includes the company’s logo and menu (1), and a footer section (2). However, the main section of the home page (3) differs from the rest of the site pages (4). Take note of these similarities and differences, because they will affect how you create your site pages.
• **Create the Site** (Site administrator or designer)—Once you’ve completed the planning stage, you’re ready to get started! Log into the Site.com app and go to the Site.com tab, where you can create your first site. Your new blank site opens in Site.com Studio, a powerful environment for building the pages of your site.

  **Note:** Only users with the Site.com Publisher User field enabled on their user detail page can create and import sites.

• **Import Assets** (Site administrator or designer)—If you’re working with a design agency, they may provide all of the files and assets you need, including a CSS style sheet. If you’ve created your own design, cut up the design and collect the assets, images, and files you plan to use in the site. Import the assets into Site.com Studio, where they appear in the Assets section of the Overview tab.

• **Create a Page Template** (Site administrator or designer)—Once you’ve decided on the layout, the quickest and most effective method is to use page templates to build the basic layout and then base your site pages on it. Try to keep the design of your main page template simple to make it easier to modify in the future. For more complicated site designs, such as the example graphic, you can use the main page template as the basis for a child template to achieve maximum flexibility. When you create your page template, you can choose from predesigned layouts that include headers, footers, and columns, or you can create a blank page template.

• **Lay Out the Page** (Site administrator or designer)—After you create the page template, you can modify the layout further to match the design of your site.

• **Create the Site Pages** (Site administrator or designer)—Using the template as a base, you can quickly create the site pages, which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn’t follow the site’s overall design, you can create a blank page instead.

• **Add Features and Page Elements** (Site administrator or designer)—Use Site.com’s prebuilt page elements to add features such as navigation menus, images, and data services, and include content blocks that contributors can edit. And add interactive, animated effects using events and actions.

• **Make Your Website Look Good** (Site administrator or designer)—Take advantage of cascading style sheets (CSS) to develop the look and feel of your website. If you’re not completely up to speed with CSS, the Style pane provides an easy, visual way to create and manage styles. Or if you’re a CSS expert who likes to get straight into the code, you can hand-code the site’s style sheets.

• **Add and Edit Content** (Contributor)—At this stage, if you’re a contributor, the site is usually ready for you to add and edit content such as text, images, videos, and hyperlinks. And as you work, you can upload any images or files you need.

• **Review and Test the Site** (Contributor, designer, or site administrator)—Testing the changes to the pages of your site happens throughout the development cycle. As a contributor, designer, or site administrator, you should always preview your changes to ensure they display as expected in a browser. And if you’re a site administrator or designer, you can send a preview link to the site’s reviewers so they can review the finished product before it goes live.
• **Publish the Site** (Site administrator only)—After testing is complete, you're ready to go live with your new site. Just set the site's domain information and then publish your changes to make your site live!

- Setting Up the Contributor's Studio View

**Site.com Tab Overview**

If you can't see the Site.com tab, go to the Site.com app. It's available in the Force.com app menu in the Salesforce header. Then click the Site.com tab to view the list of your Site.com sites. From this page you can:

- Click **New** to create or import a site. Only users with the Site.com Publisher User field enabled on their user detail page can create and import sites.
- Filter the sites you see by selecting a predefined list from the drop-down list. My Sites shows the sites you can access and your role. All Sites shows all the sites in your organization even if you don't have access to some of them.
- Click **Edit** next to a site to open it in Site.com Studio.
- Click **Preview** next to a site to see how it looks when rendered in a browser window.
- Click **｣** next to a site to duplicate, export, or delete it. Only users with the Site.com Publisher User field enabled on their user detail page and the role of site administrator or designer can duplicate, export, and delete sites. If a site has been published, you can't delete it until you take it offline.
- See the status of your site.
  - In Development—The site has never been published.
  - Published—The site has been published at least once.
- Click the title of any column to sort your site list. By default, sites are sorted by name.

**Note:** You can't create, delete, or duplicate community sites in Site.com.

**EDITIONS**

Available in: Salesforce Classic

Available for purchase in: Enterprise, Performance, and Unlimited Editions

Available (with limitations) in: Developer Edition

**USER PERMISSIONS**

To create or import Site.com sites:
- Site.com Publisher User field enabled on the user detail page

To build, edit, and manage Site.com sites:
- Site.com Publisher User field enabled on the user detail page
  AND
  Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:
- Site.com Contributor User field enabled on the user detail page
  AND
  Contributor role assigned at the site level
Using Site.com Studio as a Site Administrator or Designer

Site.com Studio provides a dedicated site-building environment for site administrators and designers. Using the many features available, you can:

- Create page templates to base your site pages on.
- Create site pages.
- Import assets, such as images and files.
- Edit the site’s style sheet or create new style sheets.
- View and edit a page or template.
- Add page elements to your site pages to provide features and functionality.
- Use data services to connect to Salesforce objects to retrieve and display, or to submit data.
- Create custom widgets that you and other users can reuse throughout the site.
- Create a multilingual site that lets site visitors choose their preferred language.
- Create events to add interactive and animated effects to your website.
- Add IP restrictions to control site visitors’ access to the pages, page templates, folders, and assets in your site.
- Add URL redirects to inform users and search engines if site content has moved.
- Create folders to organize your site content.
- Preview your site or generate an anonymous preview link to send to other users.
- Manage the domain information for your site.
- Publish your recent changes to the live site.
- Duplicate, import, and export sites.

Note:

- Designers can’t manage domains or publish content.
- You can’t create, delete, or duplicate community sites in Site.com.

To manage user roles:

- Site.com Publisher User field enabled on the user detail page
  AND
- Site administrator role assigned at the site level
  OR
  “Manage Users”
- Select a view (1) on the Overview tab to view its contents (2).
  
  - All Site Content—Create folders to organize your site content. In this view, you can also create pages, templates, and style sheets, and import assets.
  
  - Site Pages—Create site pages, open and edit pages, access page options, create site map links, and organize the site map. You can also switch between the default site map view ( ) and the list view ( ).
  
  - Page Templates—Create page templates to base your site pages on, open and edit existing templates, and access template options.
  
  - Style Sheets—Edit the site’s style sheet or create new style sheets.
  
  - Assets—Import and manage assets, such as images and files.
  
  - Widgets—Build custom widgets that can you and your team can reuse throughout the site.
  
  - Trash Can—Retrieve deleted items. When you delete a page, template, style sheet, or asset, it goes into the trash can. Deleted items remain in the trash can indefinitely. Retrieved items are restored to their original location. If the original location no longer exists, they are restored to the top-level root directory.
  
  - Change History—View information about recently published files.
  
  - Site Configuration—Configure site properties, add IP restrictions, create URL redirects, manage domain information, manage user roles, and add and manage site languages.

- Use the toolbar (3) to:
  
  - Import assets, such as images and files.
  
  - Publish recent changes.
  
  - Preview your site or generate an anonymous preview link to send to other users.
  
  - Duplicate or export the site, overwrite the site with a version from sandbox, or create a new site ( ).

- Use the site's pull-down menu (4) to:
- Open recently accessed sites.
- View Site.com Studio as your contributors see it to ensure that you set up the view correctly.
- Exit Site.com Studio and return to Salesforce.
- Create a new site.
- Duplicate the site.

**Note:** You can't create, delete, or duplicate community sites in Site.com.

Using Site.com with Communities

Use Community Builder (Site.com) WithoutTemplates

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don’t require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.
Before You Begin

Communities users with the “Create and Set Up Communities” permission automatically have full site administrator access to a community’s Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See About Site.com User Roles on page 4509.

Tips and Considerations

- Communities users with the “Create and Set Up Communities” permission are assigned the role of site administrator in a community’s Site.com site. However, they don’t appear in the User Roles section on the Overview tab of Site.com Studio.
- You can’t create, delete, or duplicate community sites in Site.com.
- When working with data-bound components, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.
- When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click Configure under Field Properties in the Properties pane, select Global Property as the source, and select Current userID as the value.
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under Administration > Pages and Administration > Login & Registration. Community error pages are specified in Force.com Setup, under Error Pages.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.
- The contributor’s view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See About Feature Licenses in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending ?iscontrib to the site’s URL. For example: https://sitestudio.na1.force.com/?iscontrib

Choosing Between Community Builder and Force.com Sites
Use Site.com to Customize Your Community
Salesforce Communities Overview
Use Site.com to Customize Your Community

Communities users can use Site.com to build custom, branded pages for a community. There are many approaches to building custom pages for your community, but these are some of the typical stages involved:

- **Import Assets**—Collect the assets, images, and files you plan to use on your custom page. Import the assets into Site.com Studio, where they appear in the Assets section of the Overview tab.

- **Create Branded Pages**—The quickest and easiest way to create branded pages is to use the Community Template, which is automatically included with all Site.com community sites. When you create a new page based on the Community Template, the page includes all of the branded styles in your community, including the community’s header and footer. If you want even more control over the look and feel of your community page, you can create your own page template, drag community headers and footers to it from the Widgets section of the Page Elements pane, and add other community styles.

  **Note:** As of Spring '15, the Community Template is no longer available for new communities. If you already have a Site.com community that’s based on the Community Template, it will continue to work. For information on creating a community, see Create Communities on page 3025.

- **Use Branded Community Styles**—Develop the look and feel of your custom pages by using the CommunityBranding style sheet, or by creating branded community styles in your own cascading style sheets (CSS). If you’re not completely up to speed with CSS, the Style pane provides an easy, visual way to create and manage styles. Or if you’re a CSS expert who likes to get straight into the code, you can hand-code community styles right in your own style sheets.

- **Create Public Pages**—Using the template as a base, you can quickly create pages, which automatically inherit all the elements of the page template. Or if you need a standalone page that doesn’t follow the overall design, you can create a blank page instead.

- **Make Pages Private**—By default, any page you create in Site.com Studio is publicly available. However, you can make pages private so that only logged-in Communities users can access them.

- **Add Features, Page Elements, and Community Widgets**—Use Site.com’s prebuilt page elements to add features such as navigation menus, images, content blocks, and community widgets. Retrieve data from your organization’s objects and dynamically display it on your site pages using data repeaters and data tables. Alternatively, gather and submit data from visitors using forms.

- **Add and Edit Content**—At this stage, the page is usually ready for you to add and edit content such as text, images, videos, and hyperlinks. And as you work, you can upload any images or files you need.

- **Review and Test the Page**—Testing the changes to your page happens throughout the development cycle. You should always preview your changes to ensure they display as expected in a browser. You can also send a preview link to reviewers so they can review the finished product before it goes live.

- **Publish the Page**—After testing is complete, you’re ready to make the page available to your community by publishing your changes.

- **Add Authenticated Pages to Your Community’s Tab**—Now that the page is tested and published, if you’re working with authenticated pages, the final step is to add the page to a tab in your community.
• **Use Site.com in Sandbox**—Site.com is now available on sandbox. When you create a sandbox copy from a production organization, you can include your Site.com sites. You can also copy your sandbox site back to production using the **overwrite** feature.

**Which Community Template Should I Use?**

Community templates let you quickly and easily build a self-service community that gives customers the same visual and functional experience whether they use a tablet, a mobile device, or their desktop.

Your customers want an easy way to interact with your company whenever and wherever they are. A self-service community gives your customers an easy way to access the information they need when they have questions. With communities built on the Koa and Kokua templates, customers can search for information using knowledge articles and contact support, if necessary. When they’re in a community based on the Napili template, they can search for articles as well as ask questions and get crowd-sourced answers from the community. If they still can’t find what they’re looking for, they can contact support without having to log in. The self-service templates let you extend your community to various devices with a consistent user experience every time.

A wizard guides you through selecting a template and then walks you through the initial setup for your data categories or topics—depending on which template you’re using.

• Kokua is a visually rich self-service template that presents users with knowledge articles organized by data categories. Users can also submit cases to get help from agents.
Koa is a text-based self-service template that’s optimized for mobile devices. It lets users search for and view articles by text representations of data categories, and contact support if they can’t find what they’re looking for.

Napili is a powerful support community template that lets your customers post questions to the community and search for and view articles. If they don’t find what they’re looking for, they can contact a support agent.

Community Builder makes it super easy to customize your community. Simply edit a few of the components to include information about your community, add a few images to extend your branding, and you’re ready to go—without any coding! Additionally, if you want a more custom experience, you can create custom pages, add components to pages, use custom Lightning components, and expose additional Salesforce objects.

Communities are automatically displayed in a logged-in user’s profile language, so you don’t need to create and manage a separate community for each language. With Community Builder, you can extend the support for Guest users in communities so that if their language isn’t supported, they can choose one from a language picker on each community page. And because all languages are maintained within the community, you don’t need to create and manage a separate community for each language.

Configure and Customize Pages in Your Community

Pages are the building blocks of your community. They control how your users see and interact with the community.

Each page contains a collection of components that are organized around a task or function—whether it's opening a case or searching for an article. The pages that comprise each of the preconfigured community templates are ready for you to use with very little configuration or customizing needed. Additionally, you can create new pages or drag and drop other components on to existing pages as needed. If you create custom Lightning components, they appear in the list of available components on the left side of the page.

When you open a page for editing, you can set properties for how information appears, move components to different positions, or delete any components you don’t need.

Note: You can edit components within a page and delete inactive pages, but you can’t rename pages.

For example, the Home page in the Napili template contains components that let customers see trending articles and topics, explore articles organized by category, read discussions from the community, search or information, ask a question, and contact support. If you’re creating a community to deflect cases only and don’t want to let customers open a case within the community, you can remove the component for contacting support.

To edit a page, go to Community Builder

1. From the Page drop-down, select the page to edit.
2. Click to open the Page Editor.
3. Select the component you want to edit.
4. In the Property Editor, edit any of the properties of the component.
5. To add a component to the page, simply drag it from the Lightning Components menu and drop it where you want it on the page.
6. To delete a component from the page, hover over the component and click X.
7. After you’re done configuring the page, click Publish.

Which Community Template Should I Use?
Implementation guide: Community Templates for Self-Service
Creating Branded Pages in Site.com

Create Branded Pages Overview

When you create a Community site, Salesforce automatically creates a new Site.com site and associates it with your community.

With Site.com Community sites you can:

- Use the branded Community template to create Site.com pages for your community.
  
  **Note:** As of Spring ’15, the Community Template is no longer available for new communities. If you already have a Site.com community that’s based on the Community Template, it will continue to work. For information on creating a community, see Create Communities on page 3025.

- Use the CommunityBranding style sheet to style Site.com pages by using CSS.

- Create your own community CSS styles using a number of available Network namespace expressions.

Create Branded Pages from the Community Template

Site.com Community sites include a branded template that you can use to create new community site pages.

The styles for the Community Template come from the CommunityBranding style sheet, which is automatically included for all new Site.com Community sites.

To create branded pages from the Community Template:

1. On the Site.com Overview tab, hover over Site Pages and click New.
2. Type the new community page name. Page names can’t include spaces or special characters, such as #, ?, or @.
3. Make sure Community Template is selected for the page template.
4. Click Create.

**Note:**

- Community branding options, such as headers, footers, and page colors, are set from the Administration > Branding section on the Community Management page.

- Empty community headers and footers, or headers that contain only images, won’t work in Site.com. Be sure to specify customized HTML blocks for your community headers and footers if you’re creating Site.com pages from the Community Template, or creating community headers and footers using Network namespace expressions.
• Community headers and footers are available as widgets in Site.com community pages. To add a community header or footer to a blank page, drag it to the page from the Widgets section of the Page Elements pane.

Apply Community Styles from the CommunityBranding Style Sheet

The CommunityBranding style sheet contains a set of CSS styles created from Network namespace expressions.

The CommunityBranding style sheet is attached to the Community Template and is responsible for the template’s branded look and feel. You can access the styles in the CommunityBranding style sheet and apply them directly to elements on any page.

To apply community styles using the CommunityBranding style sheet:

1. Make sure the CommunityBranding style sheet is attached to the Site.com page you want to brand. (See Creating and Using CSS Style Sheets on page 4598.)

   Note: All Site.com pages based on the Community Template automatically have the CommunityBranding style sheet attached to them.

2. Select the element on the page you want to style.
3. Open the Style pane.
4. Select Class.
5. Start typing “brand”.
   A list of all of the available styles in the CommunityBranding styles sheet appears.
6. Select the style you want to apply.

SEE ALSO:
- Create Branded Pages Overview

- View the CommunityBranding Style Sheet
- Creating and Using CSS Style Sheets
Create Community Styles in a CSS Style Sheet

Branded Community styles are available in Site.com Community sites through Network namespace expressions.

You can access a full list of available Network namespace expressions to create new community styles in any CSS style sheet. When you add an expression to a CSS rule, Site.com “pulls in” the style as it’s defined in the community, and displays it on your page.

To create community styles in a CSS style sheet:

1. Open an existing style sheet or create a new style sheet. (See Creating and Using CSS Style Sheets on page 4598.)
2. Click Edit Style Sheet Code.
3. Add a new community style rule by using any of the available Network expressions. You can create both ID styles and class styles. For example:

```css
#main_content_block {
    background-color: {!Network.primaryColor};
    color: {!Network.primaryComplementColor};
}

.secondary_content_blocks{
    background-color: {!Network.zeronaryColor};
    color: {!Network.zeronaryComplementColor};
}
```

4. Apply the new styles to elements on other pages.

   Note: Remember, the style sheet that contains your community styles must be attached to the page containing your styled elements.

SEE ALSO:
Create Branded Pages Overview
Expressions Available for Community Branding
Creating and Using CSS Style Sheets
Expressions Available for Community Branding

You can use the Network namespace expressions listed on this page to create your own Community styles.

Community branding options, such as headers, footers, and page colors, are set from the Administration > Branding section on the Community Management page.

Note:

- Empty community headers and footers, or headers that contain only images, won’t work in Site.com. Be sure to specify customized HTML blocks for your community headers and footers if you’re creating Site.com pages from the Community Template, or creating community headers and footers using Network namespace expressions.

- Community headers and footers are available as widgets in Site.com community pages. To add a community header or footer to a blank page, drag it to the page from the Widgets section of the Page Elements pane.

<table>
<thead>
<tr>
<th>Network Expression</th>
<th>Corresponding Community Branding Page Element</th>
</tr>
</thead>
<tbody>
<tr>
<td>{!Network.header}</td>
<td>Custom content of the community header.</td>
</tr>
<tr>
<td>{!Network.footer}</td>
<td>Custom content of the community footer.</td>
</tr>
<tr>
<td>{!Network.zeronaryColor}</td>
<td>The background color for the community header.</td>
</tr>
<tr>
<td>{!Network.zeronaryComplementColor}</td>
<td>The font color used with zeronaryColor.</td>
</tr>
<tr>
<td>{!Network.primaryColor}</td>
<td>The color used for active tabs in the community.</td>
</tr>
<tr>
<td>{!Network.primaryComplementColor}</td>
<td>The font color used with primaryColor.</td>
</tr>
<tr>
<td>{!Network.secondaryColor}</td>
<td>The color used for the top border of lists and tables in the community.</td>
</tr>
<tr>
<td>{!Network.tertiaryColor}</td>
<td>The background color for section headers on edit and detail pages in the community.</td>
</tr>
<tr>
<td>{!Network.tertiaryComplementColor}</td>
<td>The font color used with tertiaryColor.</td>
</tr>
<tr>
<td>{!Network.quaternaryColor}</td>
<td>The background color for pages in the community.</td>
</tr>
<tr>
<td>{!Network.quaternaryComplementColor}</td>
<td>The font color used with quaternaryColor.</td>
</tr>
</tbody>
</table>

View the CommunityBranding Style Sheet

The CommunityBranding style sheet contains a set of branded styles from your community. Community branding options, such as headers, footers, and page colors, are set from the Administration > Branding section on the Community Management page.

To see the Community styles in the CommunityBranding style sheet, on the Site.com Overview tab, click Style Sheets, and click the CommunityBranding style sheet. The Community styles are listed on the left. To see the code for the style sheet, click Edit Style Sheet Code.

A total of fourteen Community class styles are provided. These are the default contents of the style sheet:

```
.brandZeronaryBgr {
  background-color: {!Network.zeronaryColor} !important;
}
.brandZeronaryFgr {
  color: {!Network.zeronaryComplementColor} !important;
}
.brandPrimaryBgr {
  background-color: {!Network.primaryColor} !important;
}
.brandPrimaryFgr {
  color: {!Network.primaryComplementColor} !important;
}
.brandPrimaryBrd2 {
  border-color: {!Network.primaryComplementColor} !important;
}
.brandPrimaryFgrBrdTop {
  border-top-color: {!Network.primaryComplementColor} !important;
}
.brandPrimaryBrd {
  border-top-color: {!Network.primaryColor} !important;
}
.brandSecondaryBrd {
  border-color: {!Network.secondaryColor} !important;
}
.brandSecondaryBgr {
  background-color: {!Network.secondaryColor} !important;
}
.brandTertiaryFgr {
  color: {!Network.tertiaryComplementColor} !important;
}
.brandTertiaryBgr {
  background-color: {!Network.tertiaryColor} !important;
  color: {!Network.tertiaryComplementColor} !important;
  background-image: none !important;
}
.brandTertiaryBrd {
  border-top-color: {!Network.tertiaryColor} !important;
}
.brandQuaternaryFgr {
  color: {!Network.quaternaryComplementColor} !important;
}
```
As part of your site design, you might want to control what content is public and private to your site visitors. New sites are initially set so that all site resources, such as folders and pages, are public. You can change the default setting from the Authorization view found under Site Configuration.

The global site authorization options are:

- **No Authorization** (default)—All resources are public.
- **Requires Authorization**—All resources are private.
- **Custom**—All resources are public by default, but can be made private.

The No Authorization and Requires Authorization options let you quickly make your site either all public or all private. But, if you want to control access to individual pages, folders, and other resources, use the Custom option. Selecting Custom enables a Requires Authorization checkbox on the Actions menu for all resources throughout the site. You can define authorization at the site, folder, page, and individual resource level. As you mark items for authorization, a lock icon appears on them. After a resource, like a page, is marked as private, users who aren’t logged into Salesforce are asked to log in when they try to access it.

Resources can inherit their privacy setting from folders. For example, when a resource, such as a site folder, is marked for authorization, anything placed in that folder inherits the folder’s authorization setting and becomes private. If you drag that resource into a public folder, it becomes public again. But, if you explicitly mark a resource as private using the Actions menu, and then drag it into a public folder, it still remains private because the privacy setting at the resource level dominates.

When you use the Custom option, an authorization table appears in the Authorization view that lets you manage your private resources/items marked as private. You can remove authorization from a resource by either deleting it from the authorization table, or by deselecting the Requires Authorization box on the item itself.

**SEE ALSO:**
- Setting Authorization on Your Site
- Setting Custom Authorization

Setting Authorization on Your Site

As part of your site design, you might want to control what content is public and private to your site visitors. New sites are initially set so that all site resources, such as folders and pages, are public. You can change the default setting from the Authorization view found under Site Configuration.

The global site authorization options are:

- No Authorization (default)—All resources are public.
- Requires Authorization—All resources are private.
- Custom—All resources are public by default, but can be made private.

1. Open your site for editing.
2. Click Site Configuration > Authorization.
3. Select an authorization option.

SEE ALSO:

- Site.com Authorization Overview
- Setting Custom Authorization
- Removing Site.com Authorization

EDITIONS

Available in: Salesforce Classic

Available in: Enterprise, Performance, Unlimited, and Developer Editions

USER PERMISSIONS

To manage authorization:

- You must be an administrative user on the site

To build, edit, and manage a community’s custom pages:

- “Create and Set Up Communities”
  OR
  Site.com Publisher User field enabled on the user detail page
  AND
  Site administrator or designer role assigned at the site level
Setting Custom Authorization

When you select Custom authorization, you get a great deal of flexibility in controlling access to your site. Not only can you control who has access to top level resources, like folders and pages, but you can also set access at the individual resource level.

Using Custom authorization at the folder level is a great way to make a large number of resources private without having to mark them individually. Let’s say you periodically run sale offers for your paid users. If you drag all the sale pages into a special folder you mark for authorization, they instantly inherit the folder’s setting. Users will need to log in to access them. Plus, if you decide to make one of the sale pages available to everyone, you can simply drag it back into a public folder, or to the root of the All Site Content area.

1. Open your site for editing.
2. Click Site Configuration > Authorization.
3. Select Custom.
4. Click All Site Content.
5. Create a folder to hold the private pages if it doesn’t already exist.
6. From the folder’s Actions menu, select Requires Authorization. You’ll see the lock appear on the folder. It is now private.
7. Drag any pages you want to make private into the folder. A lock appears on them too.

Example: Let’s take another example. If you have a page that you’d like to keep private no matter where it resides, you can set its authorization using the Actions menu. After you set it at the individual resource level, it remains private even if you drag it into a folder that isn’t set to private. In other words, an resource marked private is always private until you deselect Requires Authorization on the Actions menu.

If you check the Authorization page, you’ll see all folders and resources marked private are listed in the authorization table where you can view and delete them.

SEE ALSO:

Site.com Authorization Overview
Setting Authorization on Your Site
Removing Site.com Authorization
Removing Site.com Authorization

You can remove authorization for a resource by either deleting it from the authorization table under Site Configuration, or by deselecting Requires Authorization from the Action menu.

1. Open your site for editing.
2. Click Site Configuration > Authorization.
3. From the authorization table, click Delete next to the item you want to remove. Alternatively, navigate to the All Site Content view. Select the resource. From the Actions menu, deselect Requires Authorization.

Example: If a resource is explicitly marked as private using the Actions menu, then you must remove authorization from it using the Actions menu. For example, if a page marked private is dragged into a folder that’s public, it remains private. Likewise, if you drag it into a folder that’s already private, and remove the authorization on that folder, the page will still be private.

- Setting Authorization on Your Site
- Setting Custom Authorization
Displaying Current Community User Information in Site.com

Display Current Community User Information

Site.com designers creating authenticated pages for a community site can display the current user’s information by accessing CurrentUser namespace expressions.

1. Open the page on which you want to display the current community user’s information.
2. From the Page Elements pane, drag a **Content Block** or **Custom Code** page element onto the page.
3. Type `{{CurrentUser.`, and the value that you want to display. For example, `{{CurrentUser.firstName}}`.
   Check the list of available expressions for displaying current user information.
4. Add any additional text you require. For example, `Welcome back {{CurrentUser.firstName}}!`.
5. If you’re in a Content Block, click **Save**. If you’re in a Custom Code element, click **Save and Close**.
   
   **Note:** If an unauthenticated user views a page that contains CurrentUser expressions, the current user information does not appear. For example, if an unauthenticated user viewed a page that contained the above example, the user would see “Welcome back!” as the welcome message.

Expressions Available for Displaying Current User Information

Use these CurrentUser namespace expressions to display authenticated user information on a Site.com community page.

<table>
<thead>
<tr>
<th>CurrentUser Expression</th>
<th>Displays</th>
</tr>
</thead>
<tbody>
<tr>
<td>{{CurrentUser.name}}</td>
<td>Combined first and last name of the user, as displayed on the user detail page.</td>
</tr>
<tr>
<td>{{CurrentUser.firstName}}</td>
<td>First name of the user, as displayed on the user edit page.</td>
</tr>
<tr>
<td>{{CurrentUser.lastName}}</td>
<td>Last name of the user, as displayed on the user edit page.</td>
</tr>
<tr>
<td>{{CurrentUser.userName}}</td>
<td>Administrative field that defines the user’s login.</td>
</tr>
</tbody>
</table>
Current User Expression | Displays
--- | ---
{"CurrentUser.email} | Email address of the user.
{"CurrentUser.communityNickname} | Name used to identify the user in a community.

Determine the URL of a Site.com Page

After you create a Site.com page, you can determine the page’s URL to:

- Provide your users with a URL that lets them access a public page directly.
- Create a link to the page from other pages, including Force.com Sites and Visualforce pages.
- Make it the home page for your community using a URL redirect in Force.com Sites.
- Add a private page to a web tab in your community.

1. To determine the correct URL for the page:
   - From the Create Community wizard, click Customize.
   - If you navigated away from the Create Community wizard, click Customize > Communities > All Communities, then click the Manage button next to the community name.

2. Click Administration > Settings.

3. Copy the URL displayed on the page and paste it into a text editor.

4. To create a URL that points to:
   - The Site.com site’s home page, append /s/ to the URL. For example, https://mydomain.force.com/mycommunity/s/.
   - A specific Site.com page, append /s/<page_name>, where <page_name> is the name of the Site.com page. For example, https://mydomain.force.com/mycommunity/s/promotion.

   The URL is case-sensitive and “s” must be lowercase.

SEE ALSO:

- Add Authenticated Site.com Pages to Community Tabs
- Force.com Sites URL Redirects
Add Authenticated Site.com Pages to Community Tabs

After you create a private Site.com page, you can add the page to a tab in your community. In this case, you need to create a Web tab that points to your Site.com page.

1. In the Properties pane for your page, select Show Salesforce Header. Selecting this option ensures that you see tabs in your community.

2. Enter the tab name as it should appear on the tab in your community. The web tab you create must have the same name.

3. Determine the correct URL for the page.
   The URL must be in the following format
   https://mydomain.force.com/mycommunity/s/<pagename>, where pagename matches the name of your page.

4. From Setup, enter Tabs in the Quick Find box, then select Tabs.

5. In Web Tabs, click New and enter the name of the tab as it appears in the Tab Name field in your page properties.

6. On the Step 3 screen, paste the URL you created in the Button or Link URL text box.

7. Return to the Create Community wizard and add the new tab to your community.

To preview the private page in your community, you must publish your Site.com site.

Note: You can't publish your site from sandbox.

SEE ALSO:
Salesforce Communities Overview
Create Web Tabs
Add Chatter News or Group Feeds to Community Site.com Pages

Use the Chatter News Feed to display a Chatter feed on your site pages, or display the feeds of a particular group using the Chatter Group Feed.

1. Drag the **News Feed** or **Group Feed** from the Widgets section of the Page Elements pane onto the page.
   
   When you add a widget to a page, it creates a copy or *instance* of the widget. You can’t edit the content of a widget, but you can edit the properties.

2. If you’re adding a group feed, enter the Group ID in the Properties pane.
   
   The Group ID determines which group feed is displayed on your page. You can include more than one group feed on a page if you want to show the feeds for multiple groups.

3. Preview the page to test the feed, or use Live Mode to see how the feed renders in different mobile devices.

Consider the following limitations when using a news or group feed in your community Site.com sites:

- Chatter news and group feeds only appear if a user is logged in to the community. They don’t appear to guest users or in anonymous preview mode.
- Chatter news and group feeds may not render appropriately on pages less than 700px wide. We recommend a minimum page width of 700px to view full content. We also recommend using a white background.
- Chatter news and group feeds only inherit some page branding elements.
Improve Performance with HTML Page Caching for Communities in Site.com

HTML caching lets you improve the performance and page rendering of your community’s Site.com site by controlling how often the generated markup of the page is reloaded.

Let’s say 100 people visit the page at the same time. Without caching, the page makes 100 separate requests for the same markup, slowing performance considerably. However, with caching enabled, the page markup is requested and retrieved only once—the first time someone visits the page. Any subsequent page requests during a set time period are returned from the cache. When the specified time period expires, the cache is refreshed.

Note: The caching duration applies only to community pages that are accessed by guest users. When a user logs in to access the page, caching is disabled.

1. In Site.com Studio, open the page.
2. In the Cache Duration (Minutes) field of the Cache section of the Properties tab, specify the length of time to cache the page.
   By default, the caching duration of a page is set to 30 minutes.
   To disable caching, set the page’s caching duration to 0.
Creating and Managing Sites

Creating a Site.com Site

To get started with Site.com, create a new blank site:

1. On the Site.com tab in the Site.com app, click New. Alternatively, in Site.com Studio, click Create a New Site in the site’s drop-down menu.

2. Click Create a Blank Website.

3. Enter the site name.

4. Click Create. Your new website opens in Site.com Studio, where you can create page templates and site pages, and add functionality to it.

Note: You can’t create, delete, or duplicate community sites in Site.com.

Deleting a Site.com Site

You can delete any site that isn’t published. If the site is published, you must first unpublish it before you can delete it. See Taking a Site Offline on page 4679.

1. On the Site.com tab in the Site.com app, select the site and click Delete.

2. Click OK.

Note: You can’t create, delete, or duplicate community sites in Site.com.

SEE ALSO:
Exporting a Site.com Site
Duplicating a Site.com Site

To create a copy of a site:

1. On the Site.com tab in the Site.com app, select the site and click [Duplicate]. Alternatively, on the Overview tab in Site.com Studio, click [Duplicate This Site].

2. Enter a name for the site.

3. Click Create.

Note:
- If you’re creating a copy of a site that uses data services, you must set the data access permissions in the new site’s guest user profile.
- You can’t create, delete, or duplicate community sites in Site.com.

Creating a Site.com Site
Exporting a Site.com Site
Importing a Site.com Site
Exporting a Site.com Site

You can export your site from Site.com to your hard drive. The site is exported in a packaged format with a .site extension, which you can import into another Salesforce organization. The maximum site size you can import is 2 GB.

1. On the Site.com tab in the Site.com application, select the site and click Export. Alternatively, on the Overview tab in Site.com Studio, click Export This Site.

2. If the site is:
   - Smaller than 100 MB, select a location to save the exported .site file on your hard drive and click Save.
   - Larger than 100 MB, you’ll receive an email when the export process has completed. Click the link in the email to download the exported .site file.

   **Note:**
   - Exporting a site doesn’t remove it from the current organization.

SEE ALSO:
   - Creating a Site.com Site
   - Importing a Site.com Site

Importing a Site.com Site

You can import an exported Site.com site into your organization. The maximum site size you can import is 2 GB. When you import a site, you are given the site administrator role in the site.

1. On the Site.com tab in the Site.com app, click New. Alternatively, in Site.com Studio, click Create a New Site in the site's drop-down menu.

2. Select Import a Site or Template.

3. Enter the site name.

4. Click Browse to locate the exported site on your hard drive. Exported sites have a .site extension.

5. Click Create.

   **Note:**
   - If you’re importing a site that uses data services, you must set the data access permissions in the imported site’s guest user profile. Additionally, any data repeaters, data tables, data functions, or forms may need to be reconfigured.
   - You can’t create, delete, or duplicate community sites in Site.com.

   - Creating a Site.com Site
   - Exporting a Site.com Site
Configuring Site Properties

Set properties for the site, such as the home page, site name, and error page, and create an anonymous preview URL that allows other users to review the site before it goes live. The URL is always valid (unless you disable it) and shows the latest work in progress. It’s only available to the people you send it to, and can’t be found by search engines.

1. On the Overview tab, click **Site Configuration**.
2. Click **Edit**.
3. In the Site Configuration view, you can:
   - Replace the name in the **Site Name** field to rename the site.
   - See the **Developer Name** of the site. This read-only field may differ from the **Site Name**. The **Developer Name** is used by the Metadata API.
   - Select **Enable Anonymous Preview** to create a URL that allows other users to preview the site before it goes live. (Click the **View Anonymous Preview** option that appears in the **Preview** menu to access the preview URL, which you can copy and send to other users to review and test your changes.) **Enable Anonymous Preview** is also available from the **Preview** menu on the Overview tab.
   - Access the site’s guest user profile.
   - Set the clickjack protection level.
   - Select the home page for your website in the Home Page drop-down list.
   - **Site.com Community sites only:**
     - Select the login page for your Site.com Community site in the Login Page drop-down list.
     - Select the page that you’ve set up for Site.com Community site users who don’t have accounts yet from the Registration Page drop-down list.
     - Select the Forgot Password page you’ve set up for your community using Site.com.
   - Select a user-friendly error page in the 404 Page drop-down list to display when a page can’t be found. It’s a good idea to create a user-friendly error page to assist site visitors if they encounter a broken link.

4. Click **Save**.

**Note:**
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **Administration > Pages** and **Administration > Login & Registration**. Community error pages are specified in Force.com Setup, under **Error Pages**.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under **Pages**.

SEE ALSO:
- Creating a Site.com Site
- Using Site.com Studio as a Site Administrator or Designer
- Enabling Clickjack Protection
Enabling Clickjack Protection

Clickjacking is a type of attack that tries to trick a user into clicking something, maybe a button or link, because they perceive they are clicking something safe. Instead, the button or link performs malicious actions on your site leading to data intrusion, unauthorized emails, changed credentials, or other site-specific actions.

Hidden iframes that load your site’s pages can be placed maliciously by an unrelated page that entices the user to click a button or link that appears below the hidden iframe. With clickjack protection, you can configure whether your browser allows frames or iframes over your site pages. The default clickjack level for Site.com is set to Allow framing by the same origin only.

You can set the clickjack protection for a site to one of these levels:

- Allow framing by any page (no protection)
- Allow framing by the same origin only (recommended)
- Don’t allow framing by any page (most protection)

**Note:** Same-origin framing allows the site’s page to be framed only by pages on the same domain name and protocol security.

1. On the Overview tab, click **Site Configuration**.
2. Click **Edit**.
3. Select the desired level of clickjack protection.

**Note:** Salesforce Communities have two clickjack protection parts—one for the Force.com Communities site which is set from the Force.com site detail page and another for the Site.com Communities site which is set from the Site.com configuration page. It’s recommended that both are set to the same value.

Site.com Versioning Overview

Each time you publish your site, it’s tracked as a version. You can restore your site back to one of the previously published versions. You can’t select individual components when restoring; you must restore the complete site.

When working in Site.com Studio, you’re always working on an unpublished version of your site. It’s your working copy. When you restore a version, you overwrite your working copy, not your live site. You must publish the restored version before you see the change on your live site.

In Site.com Studio, you’ll find your site versions in the Change History view on the Overview tab. Not all items in a site are reverted when you restore a version. Some things, like user roles, remain unchanged even when you restore from a previous version. Everything in a site is under version control except:

- Site name
- Anonymous preview setting
- Guest User Profile settings
Restoring to a Previous Site Version

The Change History list in Site.com Studio tracks all published versions of your site. You can select any previously published version and restore it. You can only restore an entire site, not parts of a site.

When working in Site.com Studio, you’re always working on an unpublished version of your site. It’s your working copy. When you restore a version, you overwrite your working copy, not your live site. You must publish the restored version before you see the change on your live site.

**Warning:** You can’t restore the working copy of your site after you revert to a previous version. Therefore, it’s a good idea to back up the working copy of the site before reverting to ensure you don’t lose any unpublished changes.

To revert to a previously published site version:

1. Select the Overview tab.
2. From the Change History view, select the version you want to restore.
3. Click ✕ > Restore Version.
4. Click OK at the confirmation message.

After you restored your working site to a previous version, you can continue to make additional changes until you’re ready to publish the site.
Creating URL Redirections in Site.com

If you move or reorganize pages in your site, search engines may have trouble finding the new page locations. To avoid this, set up URL redirects to inform users and search engines that site content has moved.

You can use URL redirects to:

- Maintain search engine ranking. For example, if you change a page's name from "Gadgets" to "Widgets," creating a redirect rule from /Gadgets to /Widgets lets you restructure the site without affecting your page ranking.
- Make URLs more readable and memorable. For example, site visitors will find long or numeric page names, such as /widget65AD890004ab9923, difficult to remember. Instead, you can provide them with a short, friendly URL, such as /widget, and create an alias that redirects to the correct page when the user uses the short URL alias.
- Assist with migration from another system to Site.com if you're still using the same domain. For example, if your old site ran on PHP, you can create a redirection rule from an old page, such as /index.php, to a new page in Site.com, such as /myNewPage.

To assign a redirect to a site page:

1. On the Overview tab, click Site Configuration > URL Redirects.
2. Click Create a Redirect.
3. Specify the Redirect type:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Permanent (301)</td>
<td>Select this option if you want users and search engines to update the URL in their systems when visiting the page. Users visiting a page redirected with this type are sent seamlessly to the new page. Using a permanent redirect ensures that your URLs retain their search engine popularity ratings, and that search engines index the new page and remove the obsolete source URL from their indexes.</td>
</tr>
<tr>
<td>Temporary (302)</td>
<td>Select this option if you want users and search engines to keep using the original URL for the page. Search engines interpret a 302 redirect as one that could change again at any time, and though they index and serve up the content on the new target page, they also keep the source URL in their indexes.</td>
</tr>
<tr>
<td>Alias</td>
<td>Select this option if you don't want the URL to change in the user's browser, but you want to redirect to a different page. Search engines won't be aware of the change or update their records.</td>
</tr>
</tbody>
</table>
Alias redirects only work when you redirect from one Site.com page to another. You can't create an alias to an external address.

4. Specify the former page location in the Redirect from field.
   • The page location must be a relative URL.
   • The page can have any valid extension type, such as .html or .php, and can contain parameters. Parameter order is irrelevant.
   • The URL can't contain anchors, such as /siteprefix/page.html#target.
   • You can create just one redirection rule from a particular URL. If you create a new rule with the same Redirect From information, the old rule is overwritten.

5. Specify the new page location in the Redirect to field. This can be a relative URL or a fully-qualified URL with an http:// or https:// prefix. Unlike pages you're redirecting from, pages you're redirecting to can contain anchors.

6. To immediately enable the redirection rule, ensure Active is selected. To enable it at a later stage, deselect the property.

7. Click Save.

The URL Redirects section displays all URL redirection rules you've created for your site.
   • Edit an assigned redirect rule by clicking ➪ Edit Redirect.
   • Delete a redirect rule by clicking ➪ Delete Redirect.

**Importing External Websites into Site.com**

With Site.com Studio, you can import your existing website and recreate it automatically as a Site.com site. This saves you the time of having to re-code existing HTML pages.

Create a zipped file of your website and the content with the desired folder structure. Create a new Site.com site and then import your zipped file.

During the creation of the new Site.com site, all your HTML pages and assets are copied into the new site in the same locations they are in the zipped file. Here are some guidelines for importing assets.

• Some code in style sheets may not convert properly to the Site.com format. If this happens, you'll receive a warning message. You can continue to import the zipped file or stop the import. If you continue, the style sheet imports and you can then manually attach it to your pages.

• You can edit the <head> section of a page using Edit Head Markup in scripts section on the properties pane. This is useful for manually editing the HTML.

• The maximum file size you can import is 50 MB unless you import and unzip a .zip file. In that case, you can import a .zip file of up to 200 MB if you select Unzip files during the import process. If your site is larger than 200MB when zipped, you can create more than one zipped file and import them individually.

• Site.com attempts to format links correctly when importing a page. Links are checked in content blocks, custom code, and head script markup. You can check for any links that might still be broken on your page using the link checker. Open the page, select ➪ Find Broken Links. A dialog displays showing any broken links. To fix the link, click Edit. The link opens in the HTML editor.

   Importing a Site.com Site
Copying and Overwriting a Site

Sometimes, you might want to copy and replace your current production Site.com or Site.com community site with another site.

You’ll first need to export a copy of your site from your. Once you have an exported .site file, import that file into your production organization using the overwrite feature. Overwrite replaces your production site with the imported site. You can only overwrite sites that are the same type. For example, you can’t overwrite a Site.com site with a Site.com community site.

1. Create your .site file using the export feature in Site.com Studio.
2. From Site.com Studio in your production site, click Site Actions > Overwrite This Site.
   Alternatively, if you have access to the Site.com tab in your organization, you can click next to the site name to find Overwrite.
3. Click Browse to find the .site file you exported.
4. Click OK at the overwrite warning.

   Warning: You can’t revert once you have overwritten a site.

Here are a few tips when using overwrite.

- You’ll need to publish the site you overwrote before changes take effect.
- When copying a site, the production site is overwritten. So, be sure to backup your production site by exporting a .site file.
- Overwrite does not copy data changes. For example, if you created a custom object to use in a repeater in the site you are copying from, that repeater won’t work in the production site until you create the same custom object.
- If there are assets that exist in the production site that do not exist in the site you are copying from, they are moved to the trash can during the overwrite process so you can restore them if needed.
- If your copied site has a different name than your production site, the production name is preserved and only the contents are changed. For example, if your site is called Site One and you overwrite your production site called Site Two, the production site is still called Site Two.

SEE ALSO:
- Exporting a Site.com Site
- Using the Metadata API to Deploy a Site

Using the Metadata API to Deploy a Site

As a user, you can migrate a site from sandbox to production. You can use the Metadata API to create a deployable package for Salesforce Communities sites and Site.com sites.

There are several tools that you can use to create a package:

- Change sets (for Site.com and Site.com Communities sites only). The component type is called Site.com.
- Workbench, which works for creating all site types. The metadata type is called SiteDotCom.
- Force.com migration tool for Ant, which works for creating all site types. The metadata type is called SiteDotCom.

If using change sets, select Site.com from the list and follow the prompts to create your package. If using Workbench or Force.com as your tool, you must create a package.xml file. That file is submitted to the Metadata API to create a package.
Note: You can include a Guest User Profile in your `package.xml` file. If you do so, that Guest User Profile is linked to the site during deployment.

The packaging process generates a folder that contains a content file and a metadata xml file. The content file name is `[sitename].site`. The metadata .xml file name is `[sitename].site-meta.xml`.

If you deploy a package that doesn't include a `.site` file, an empty site is created. If the package contains a site file, and the organization already contains a site with the same name, the site is updated.

Note: There is a file size limitation when using the Metadata API to deploy a site from sandbox to production. The assets in the `.site` file can't be larger than 40 MB. The site gets created, but the assets show in the new site as broken. To fix the assets, export the assets from the sandbox environment separately and then import them into your new site.

For help with the Metadata API, see the Metadata API Developer Guide. You can find help for change sets in the online help and for the Force.com Migration Tool Guide at https://developer.salesforce.com/page/Migration_Tool_Guide.

- Sample Package.xml Files

Sample Package.xml Files

Here are some sample Site.com `package.xml` files.

Here is a sample `package.xml` file for a Site.com site.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>xyzsite</members>
    <name>SiteDotCom</name>
  </types>
  <version>30.0</version>
</Package>
```

Here is an example of a `package.xml` for a Salesforce Communities site. The package also includes a Guest User Profile.

```xml
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>xyzsite</members>
    <name>CustomSite</name>
  </types>
  <types>
    <members>xyzsite</members>
  </types>
</Package>
```
Managing Site Assets

Importing and Managing Assets

Contributors, publishers, and site administrators can import a variety of assets, such as images, HTML pages, and PDFs, to use in a website. You can import assets and files individually, or use a zipped file. When importing entire websites or large numbers of assets, it’s easier to create a zipped file of the content with the desired folder structure. When importing the zipped file for a website, Site.com recreates your website and places everything in the same folder structure.

Note:

- The maximum file size you can import is 50 MB unless you import and unzip a .zip file. In that case, you can import a .zip file of up to 200 MB if you select Unzip files during the import process.

The quickest way to import one or more files is to:

1. Select the files from your computer and drag them directly onto the Studio interface. This is supported for Mozilla® Firefox® and Google® Chrome only. You can drag individual files, or a zipped file.

2. Depending on the types of files you’re importing, a dialog box may appear that lets you:
   - Select Unzip files to extract the contents of a .zip file. If the zip file includes folders, this structure is maintained in your site.
   - Select Overwrite existing files to replace a file that already exists in the site.
   - Select Convert CSS files into style sheets, if you’re a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.

   Note: If you import a .zip file that includes CSS files, and they fail to convert, they may not be valid. Try unchecking this option and then re-importing the .zip file.

   - Select Convert HTML files into pages to import HTML pages into your website. The structure of the HTML page is maintained in your site, but the HTML is not validated during import.

Alternatively, to import a single file:

1. Click Import....
2. Click Browse... to locate the file.
3. Select the file and click **Open**.

4. Depending on the type of file you’re importing, you can:
   - Select **Unzip files** to extract the contents of a .zip file. If the .zip file includes folders, this structure is maintained in your site.
   - Select **Overwrite existing files** to replace a file that already exists in the site.
   - Select **Convert CSS files into style sheets**, if you’re a site administrator or designer, to convert a CSS file into a style sheet that you can use to style your website.
     
     ![Note](image)
     
     **Note:** If you import a .zip file that includes CSS files, and they fail to convert, they may not be valid. Try unchecking this option and then re-importing the .zip file.
   - Select **Convert HTML files into pages** to import HTML pages into your website. The structure of the HTML page is maintained in your site, but the HTML is not validated during import.

5. Click **Import**. A message appears indicating whether the file was imported successfully.

6. Click ✗.

You can add **images** and **videos** to the text areas of your site pages, or create a **hyperlink** to any imported asset. If you’re a site administrator or designer, you can also add **images directly** to the page.

View the list of imported assets in the Assets view on the Overview tab. You can also access assets in the All Site Content view, which displays the folder hierarchy of your site.

- To view a thumbnail of an imported image, hover over it.
- To save an asset to your computer, hover over or select it and click ![Download](image). If the asset is being used in your site, you see a confirmation message with a list of locations where that asset is in use.
- To rename an asset on your site if you’re a site administrator or designer, hover over the asset and click ![Rename](image).
Exporting Assets

Designers and site administrators can export all site assets separately from the .site file. You can export assets together or individually.

When you export all assets, the assets are exported to a zipped file that is named after the site name—for example, sitename-Assets.zip.

Export your assets from the Overview tab by clicking Export Site Assets.

To export a single asset, hover over the asset and select Download from the Actions menu.

**Note:** There is a file size limitation when using the Metadata API to deploy a site from sandbox to production. The assets in the .site file can’t be larger than 40 MB. The site gets created, but the assets show in the new site as broken. To fix the assets, export the assets from the sandbox environment separately and then import them into your new site.

SEE ALSO:

Importing and Managing Assets
Creating and Managing Folders

As a site administrator or designer, you can create folders to manage your pages, style sheets, templates, and assets.

To create new folders:

1. In the All Site Content view on the Overview tab, click **New Folder**.
2. Type in the folder name.
3. Click **Create**.

Folders are created at the top level of the folder tree. Once created, you can drag them anywhere in the tree structure. Likewise, you can drag and drop files into the folders you create. To rename, delete, and create sub-folders, right-click the folder or use the Actions menu (⚙️).

**Note:** The site map remains the same regardless of how you arrange folders in the All Site Content view.

Creating and Managing Pages

Editing Site.com Pages as a Designer or Site Administrator

When working with page templates and site pages, you can add content, structure, and style, all in one place. Open a page or template on the Overview tab by double-clicking it or hovering over it and clicking ☰ > Edit. The page opens as a new tab.

EDITIONS
Available in: Salesforce Classic
Available for purchase in: Enterprise, Performance, and Unlimited Editions
Available (with limitations) in: Developer Edition

USER PERMISSIONS
To build, edit, and manage Site.com sites:
- Site.com Publisher User field enabled on the user detail page
  AND
  Site administrator or designer role assigned at the site level
Using the Page Elements and Page Structure panes (1), you can search for and add page elements to a page, and reorder the page element hierarchy.

Using the Properties, Style, and Events panes (2), you can set properties, add style, and create events for a selected page or element.

Using the toolbar (3), you can:
- Undo and redo your actions.
- Cut, copy, or paste page elements.
- Import assets, such as images and files.
- Preview pages to see how they’ll appear when live on different devices.
- Preview your site or generate an anonymous preview link to send to other users.
- Publish your recent changes.
- Access other page actions ( ), such as renaming or deleting the page.

On the page canvas (4), you can lay out the page and select, edit, and move page elements.

Tip:
- Hide the side panes to increase the canvas size by clicking and . To reopen a pane, click its icon.
- As you edit a page, your changes are saved and the status icon ( ) on the page tab is updated automatically.
- If the site page or page template is based on another template, editable page elements are highlighted with a blue border on the page.

Using Site.com Studio as a Site Administrator or Designer

Site.com Page Templates Overview

Before you begin building the pages of your website, take some time to plan the pages you need, and in particular, which pages will have a similar layout. Once you’ve decided on the layout, the quickest method is to use a page template to build the basic layout.

About Page Templates

A page template lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. Page templates don’t appear on your public site.

As the template creator, you specify which elements users can edit in pages based on the template. By default, a page element in a template is “locked,” so users can’t edit its contents in any template-based page unless you mark the page element as “editable.” Conversely, when users edit an editable page element in a template-based page, their changes are specific to that page and don’t affect your template.

For example, this main page template contains a non-editable header and navigation menu that are common to all the pages in the site (1). The main template also has an editable center panel (2) to house the page-specific content of each page that’s based on it.

Editions

Available in: Salesforce Classic

Available for purchase in: Enterprise, Performance, and Unlimited Editions

Available (with limitations) in: Developer Edition
Note:

- Page templates must contain at least one editable page element. Otherwise, users can’t edit site pages that are based on the template.
- Panels are ideal for adding editable areas to page templates.

You can use page templates to:

- Save time and effort by laying out the page structure and using it as a starting point when you create site pages. For example, you could design a template with a fixed header panel and side menu, and an editable center panel, to which you add page-specific page elements and content.
- Quickly make global updates to the layout or style of your website, as any changes you make to the template’s design are reflected immediately in all the pages that use it.
- Control how other users (such as contributors or other site administrators and designers) can modify site pages. For example, you may allow contributors to edit specific content blocks only.
- Ensure your template design remains pixel-perfect. When users edit a page that’s based on a template, their changes don’t affect your template.
- Reuse common design elements by creating child templates.
- Allow contributors to create site pages that are based on the template.

About Child Templates

Child templates are a useful way to reuse common design elements for more complicated page layouts. For example, your website will probably have elements that are the same on every page in your site, such as a navigation menu. However, several pages may have elements that are common only to them, such as pages in a subsection of your site that include a subsection header. By using a child template, which is a template that’s based on another template, you can reuse the main template design.

Using our main page template as a base, the child template inherits the non-editable header and navigation menu (1), and an editable center panel (2) where we add the non-editable subsection header (3). We also need to add a new editable center panel (4) because the center panel of the main template is editable only in pages directly based on the main template.
Now, any page based on the child template includes the non-editable main header, navigation menu, and subsection header, and an editable center panel (5) for that page’s content.

![Diagram of page structure]

**Best Practices**

- Plan your site structure and the layout of your pages. Taking the time to plan your website first saves time when you build your site.
- Identify which elements are common to all the pages of your site, such as navigation menus or headers, as these are the elements you can add to the page template.
- Use page templates wherever possible to promote content reuse and save time.
- Try to keep the design of your main page template as simple as possible to make it easier to modify in the future. For more complicated site designs, use child templates to achieve maximum flexibility.

SEE ALSO:

Creating Site.com Page Templates
Creating Site.com Pages
Setting Up the Contributor’s Studio View
Identifying Which Template a Site.com Page Uses
Creating Site.com Page Templates

A page template lets you define the layout and functionality of site pages in one location. By adding common page elements to the template and then basing site pages on it, you can achieve a consistent look and feel throughout your site. And because a template-based page inherits the template’s elements, you can make site-wide changes from one location.

You can create a page template from a layout, or if you’ve already created a template, you can use it as a base to create a child template, which lets you reuse the design of the main template.

Creating a Page Template from a Layout

To start from scratch with a completely blank template or use a basic page layout:

2. Enter the page template name. Template names can’t include special characters, such as #, ?, or @.
3. Click Layouts and select either a blank page or a predefined page layout, such as a page with a header and footer.
   
   **Note:** Predefined page layouts use panels to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you’re familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane ( ), and clicking Apply.
4. Choose a layout mode:
   - To expand the page to fill the width of the browser window, click Full width.
   - To set the page width, click Fixed width and enter the width.
5. Click Create. The page template opens.

Next, you must complete the template.

**Tip:**
- By default, any template you create is only available to other site administrators and designers in your organization. To let contributors create pages based on the template, select Available to Contributor in the Properties pane ( ).
- You can also create templates by converting or duplicating other pages.

Creating a Child Template

To use an existing template as a base for a child template:

1. Select the template in the Page Templates view on the Overview tab and click Page Actions > Create Child Template. Alternatively, click Page Actions > Create Child Template if the template is open.
2. Enter the page template name. Template names can’t include special characters, such as #, ?, or @.
3. Click Create. The child template opens.

**Tip:**
- Alternatively:
2. Enter the page template name. Template names can't include special characters, such as #, ?, or @.
3. Click Page templates and select the page template.
4. Click Create. The child page template opens.

Completing Your Template
Once you've created a template, you must take the next steps to complete it:

- Lay out the page template
- Add other page elements to the template
- Create editable areas
- Create template-based site pages

Creating Editable Template Areas
As the template creator, you specify which elements users can edit in pages based on the template.

To make a page element editable in derived pages or child templates, select it on the page template or in the Page Structure pane ( ) and click > Make Editable, or select Editable in the Properties pane ( ).

When the page template is open, editable page elements are highlighted with a blue border on the page. They also display a pencil icon ( ) in the Page Structure pane and in the information popup that appears when you hover over the element on the page.

About Editable Page Elements

When you mark a page element as **Editable** on a page template, that page element becomes editable in any child pages or templates derived from the parent template.

Consider these tips when creating editable page elements.

- Editable page elements are highlighted with a blue border in child pages and templates.
- If you make a page element within a panel editable, you can't also make the container panel editable.
- Users can't alter the events, style, or properties of an editable page element in pages based on the template.
- Users can't resize, reposition, or delete editable page elements in pages based on the template. However, if the element's **Auto Height** property is enabled in the template, its height will adjust to fit the content of the template-based page.
- Deleting an editable element from a page template removes it from all child pages and templates.
- When you enable the **Editable** property of a page element, any pages or child templates based on the template also inherit the enabled status. In turn, the enabled status in the child template cascades to any of its children, and so on. If you don't want its editability to cascade to any lower levels, disable the **Editable** property of a page element in a child template.

Editable Page Elements for Contributors

- Contributors can modify editable content blocks in site pages based on the template. They can also edit content blocks that you place in an editable panel in template-based site pages.
  
  **Tip:** To add a content block that only other site administrators or designers can edit, use [custom code](#) instead.

- Contributors can add content blocks to editable panels in site pages based on the template. If you make widgets available to contributors, they can also add them to editable panels.
- Site administrators and designers can edit any page element you make editable.

Default Content in Editable Page Elements

The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won't trickle down to its children. (To return control of the content to the parent template, select the editable page element on the page or in the Page Structure pane and click ![Revert to Parent Content](#). When you do this, any custom content in the editable page element is lost.)

Disabling the **Editable** property of a panel in a parent template overrides any changes made to that panel in child pages or templates. Changes to the panel at the child level disappear, and the panel reflects only the content from the parent template. However, the changes
at the child level aren’t lost. Re-enabling the `Editable` property of the panel in the parent template restores the custom content previously added to its children. Any changes made to the element at the parent level will no longer show up.

Creating Site.com Pages

As a site administrator or designer, when you create a site page, you can choose to base it on a page template. If you’re creating several site pages that have common page elements, such as a navigation menu, you can save time and effort and achieve a consistent look and feel by creating a page template first and then basing your site pages on it. Alternatively, if none of your site pages have a similar structure or if you need to create a one-off site page that doesn’t follow the overall site design, such as a home page, you can create a page based on a basic layout.

Creating Site Pages from a Layout

Start from scratch with a completely blank page or use a basic page layout.

1. Hover over Site Pages on the Overview tab and click New, or click New > Site Page when the Site Pages view is open.
2. Enter the site page name. Page names can’t include spaces or special characters, such as #, ?, or @.
3. Click Layouts and select either a blank page or a predefined page layout, such as a page with a header and footer.
   - **Note:** Predefined page layouts use panels to create columns, headers, and footers. These panels use inline CSS to set their position, so you can easily modify the layout after the page is created. However, if you’re familiar with CSS and prefer using CSS rules, you can remove the inline style by selecting the panel, deleting the code from the Code tab in the Style pane ( ), and clicking Apply.
4. Choose a layout mode:
   - To expand the page to fill the width of the browser window, click Full width.
   - To set the page width, click Fixed width and enter the width.
5. Click Create. The site page opens.

Creating Site Pages from a Page Template

If you created a page template, you can base your site pages on it.

The quickest option is to:

1. Select the template in the Page Templates view and click 📋 > Create Page from Template. Alternatively, click Page Actions > Create Page from Template if the template is open.
2. Enter the site page name. Page names can’t include spaces or special characters, such as #, ?, or @.

3. Click Create. The site page opens.

Alternatively:

1. Hover over Site Pages on the Overview tab and click New, or click New > Site Page when the Site Pages view is open.

2. Enter the site page name. Page names can’t include spaces or special characters, such as #, ?, or @.

3. Click Page templates and select the page template.

4. Click Create. The site page opens.

Tip: You can also create pages by converting or duplicating other pages.

SEE ALSO:

Editing Site.com Pages as a Designer or Site Administrator
Adding Site.com Page Elements

Identifying Which Template a Site.com Page Uses

When you edit a template-based page, you can’t modify its non-editable page elements. You also can’t reposition, resize, or delete editable page elements, or alter the events, properties, or style associated with them. To update these elements or properties, you must edit them in the template the page is based on.

To identify which page template a site page is based on:

- Hover over the site page in the Sites Pages view on the Overview tab. An information popup appears that displays the page template’s name.

- Examine the Page Structure pane when the page is open. The template’s name is displayed as a link that you can click to open the template.
To view and open the site pages associated with a particular page template, select or hover over the page template in the Page Templates view of the Overview tab and click Edit Pages Based on Template. Click a listed site page to open it.

Renaming, Duplicating, and Converting Pages
When working with pages and templates, you can perform common tasks, such as renaming, deleting, or duplicating pages.

To access more page options, select or hover over a page on the Site Pages view of the Overview tab and click .

To access more template options, select or hover over a template in the Page Templates view of the Overview tab and click .

Alternatively, if the page or template is open, click on the toolbar.

The available options vary for pages and templates:

<table>
<thead>
<tr>
<th>Select</th>
<th>To...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Edit</td>
<td>Open the page or template for editing. Alternatively, double-click the page or template.</td>
</tr>
<tr>
<td>Rename</td>
<td>Change the page or template name.</td>
</tr>
<tr>
<td>Preview</td>
<td>View the page in a browser window.</td>
</tr>
<tr>
<td>Duplicate</td>
<td>Create a copy of the page or template. Duplicating a page template doesn’t duplicate the pages or templates based on it.</td>
</tr>
<tr>
<td>Delete</td>
<td>Remove a page or template. You can’t delete a template that has pages based on it.</td>
</tr>
</tbody>
</table>

Changing a Page’s Doctype Property

The Document Type Definition (DTD) or doctype of a page defines which version of HTML it's using. This information is used by some browsers to trigger a standard rendering mode. By default, each page's doctype is set to HTML5, which is the latest version, but you can change it to XHTML 1.0. When the page is open:

1. Select the page in the Page Structure pane.
2. In the Properties pane, select an option in the Doctype drop-down list.

Site.com Page Elements

Page elements are the building blocks of your site pages and page templates. Combined, they provide the page’s structure and content.

When a site page or page template is open in Site.com Studio, these page elements are available to site administrators and designers.

<table>
<thead>
<tr>
<th>Page Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content Block</td>
<td>Contains the page text, and can also house images, media, and hyperlinks. Also available to contributors if the page has editable areas.</td>
</tr>
<tr>
<td>Custom Code</td>
<td>Lets you customize your site by adding markup, such as HTML and JavaScript for elements that aren’t provided in Site.com Studio.</td>
</tr>
<tr>
<td>Image</td>
<td>Adds images directly to the page.</td>
</tr>
<tr>
<td>Breadcrumb</td>
<td>Adds a breadcrumb navigation element to the page.</td>
</tr>
<tr>
<td>Menu</td>
<td>Creates a menu that lets users navigate through the pages of your site.</td>
</tr>
<tr>
<td>Panel</td>
<td>Adds structure to the page and lets you group other page elements together.</td>
</tr>
<tr>
<td>Button</td>
<td>Adds a button to the page. You can use the actions in the Events pane to add functionality to the button.</td>
</tr>
<tr>
<td>Form</td>
<td>Lets you create web-to-lead forms or gather customer feedback, and submit the data to Salesforce objects.</td>
</tr>
<tr>
<td>Input Fields</td>
<td>Provides several field types to add to forms or pages. When added to a form, binds to fields in the form’s object. See Input Field Types on page 4639.</td>
</tr>
<tr>
<td>Data Element</td>
<td>Must be contained in a data repeater. Binds to a field in the data repeater’s object and acts as a placeholder that shows the content of a specified field for the current record.</td>
</tr>
<tr>
<td>Data Function</td>
<td>Connects to a standard or custom Salesforce object, performs calculations on the returned results, and displays the calculation on the page.</td>
</tr>
<tr>
<td>Data Repeater</td>
<td>Connects to a Salesforce object and returns a dataset based on filters that you specify.</td>
</tr>
</tbody>
</table>
### Page Elements

<table>
<thead>
<tr>
<th>Page Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Data Table</strong></td>
<td>Combines with data elements or custom code page elements to display the results on the page. Connects to a standard or custom Salesforce object, retrieves a data set based on the filter criteria that you specify, and displays one or more record as rows in the table.</td>
</tr>
</tbody>
</table>

### Adding Site.com Page Elements

Page elements are the building blocks of your site pages and page templates. Panel elements add structure to your pages. You can think of both pages and panels as “containers” for the page elements that you add to them.

If a site page or page template is based on another page template, you can only add page elements to editable panels, which are highlighted with a blue border on the page.

Pages, panels, data repeaters, and forms are “container” page elements, so you can add other page elements to them when the page is open.

- In the Page Elements pane ( ), either:
  - Drag the page element onto the page canvas or container page element.
  - Click the page element, select where to place it in the popup that appears, and click **Apply**.

- In the Page Structure pane ( ), hover over a container page element and click **Add Page Elements**. Click the item you want to add or drag it onto the container page element.

- Select a container page element on the page and click **Add Page Elements**. Click the item you want to add or drag it into the container page element.

When you drag a page element into an editable panel, the page element displays a permitted icon and a green border shows where you’re placing the element.

If you try dragging a page element into a panel that isn’t editable, the page element displays a not-permitted icon.

Editing and Working With Site.com Page Elements

The Page Structure pane (��) displays the hierarchy of all elements on the page and is a very useful way of selecting, moving, and reordering elements, particularly for more complicated page designs.

- To select a page element, either click it on the page, or select it in the Page Structure pane. This highlights the element on the page and displays the item’s selector bar and Actions menu (מטה).
- To edit a page element, such as a content block, image, or custom code, either:
  - Double-click the element on the page.
  - Select the element on the page and click ✏ > Edit on its selector bar.
  - Select or hover over the element in the Page Structure pane and click ✏ > Edit.
  - Click Edit Content on the toolbar (for content blocks only).

- To move a page element, either:
  - Select the element on the page and drag it to the correct position, or click ✏ > Move on its selector bar.
  - Drag the item to your preferred location in the Page Structure pane, or select it and click ✏ > Move > Direction. You can also drag all page elements other than panels to your preferred location in the Page Structure pane.

- To resize a page element, select it and drag the resize handles to the correct size. If the corner resize handles are grayed out, it means the item’s Auto Height property is enabled, which adjusts the height depending on its contents. To resize it to a set height, disable the property by either deselecting Auto Height in the Properties pane (.RichTextBox), or by clicking one of the bottom resize handles and clicking Disable Auto Height in the popup message that appears.
  
  **Tip:** If you disable the Auto Height property on an image, but you want it to retain its aspect ratio—the relationship of height to width—press and hold down the SHIFT key while you drag to resize it.

  Alternatively, if you’re using CSS to style the page element, adjust the style of the class or ID that styles it.

- To delete an element, select it and either:
  - Click ✏ > Delete on the item’s selector bar.
  - Press DELETE.

About Editable Page Elements
Working with Panels

Laying Out Site.com Pages Using Panels

A panel is a useful layout tool that defines the logical divisions of your page and lets you group page elements together for easy movement and positioning. Think of it as a container for other page elements, including other panels, or as a div that wraps around the content placed within it. Panels are ideal for adding editable areas to page templates.

When you create a page template or site page, you can use predefined page layouts that include headers, footers, and columns, which are created using panels. Once created, you can then further modify the layout to match your site's design.

If you need to add more divisions to the page and you’re not familiar with CSS, the easiest method is to use row and column panels. This feature adds panels with predefined CSS positioning to ensure they align correctly on the page.

Note: Predefined page layouts, and row and column panels use inline CSS to set their position. If you’re familiar with CSS and are using CSS rules to style your site, you can remove the inline CSS by deleting it from the Code tab in the Style pane ( ) and clicking Apply.

To add row and column panels to a page:

1. Select the page (the top folder icon) in the Page Structure pane ( ).
2. Click > Add Rows and Column Panels.
3. Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a row panel:

• Above a panel, select the panel on the page or in the Page Structure pane and click > Add Rows and Column Panels > Insert Row Above
• Below a panel, select the panel on the page or in the Page Structure pane and click > Add Rows and Column Panels > Insert Row Below

To add row and column panels to another panel:

1. Select the panel on the page or in the Page Structure pane.
2. Click > Add Rows and Column Panels.
3. Select the number of row or column panels you require. If the page already contains content, it is placed in the first new panel.

To add a single panel, drag a Panel from the Page Elements pane ( ) onto the page.

By default, the height of a panel automatically adjusts when you add content to it because its Auto Height property is enabled. You can disable the property to resize and reposition panels. If you hover over a panel on the page, an information popup appears that displays the width and height of the panel.
When you drag a page element onto a panel, the edges change color, indicating that the element is now grouped within it. To remove the element from the group, drag it outside the panel.

SEE ALSO:
- Adding Site.com Page Elements
- Positioning Panels Using CSS
- Changing a Page Element’s HTML Tag

Positioning Panels Using CSS

A panel is a useful layout tool that defines the logical divisions of your page. Using CSS, you can position panels and improve the layout of the page.

Adding Padding and Margins to Panels

Two CSS properties—margins and padding—can help with your page layout by creating space between the rows and columns, and the content within. The margin property controls the space outside the panel between its border and outer edge, while the padding property controls the space between the panel’s content and border.

To add margins and padding:

1. Select the panel.
2. Open the Dimensions section of the Style pane.
3. In the Margins section, either:
   - Set the margin width for all four sides by entering a value in the All text box and selecting the unit of measurement.
   - Set the margin widths for the top, right, bottom, or left sides independently by entering a value in the appropriate text box and selecting the unit of measurement.
4. Similarly, in the Padding section, set the padding widths as required. Adding padding increases the total width of the panel. For example, if you have a panel with a width of 500px and you add padding of 20px to all sides, the total width of the panel will be 540px.

   Tip: You can center a panel or block page element using the margin property. Enter 0 in the All text box and select Auto in the drop-down list.

Creating Column Panels Using the Float Property

If you need to add more divisions to the page and you’re not familiar with CSS, the easiest method is to use row and column panels. Alternatively, using the CSS float property, you can position panels to the left or right to create columns. (When you add panels using the row and column panels feature, they’re automatically positioned using the float property.) For example, you could add two single panels to a container panel and set both panel’s float and width properties to create a two-column page layout.

To create a column panel:

1. Select the panel.
2. Open the Layout section of the Style pane.
3. Click to float the panel to the left, or click to float the panel to the right. If you’re creating a two-column layout, for example, ensure you set the float property of both panels.
4. Adjust the width of the panel to ensure the panels align correctly by either setting the width in the Dimensions section or dragging the panel’s border on the page. For example, if you’re creating two columns of equal width, set the width of both panels to 50%.

Tip: When you use the float property, remember to set the overflow property of the container panel to “hidden.” This allows the container panel to grow as the height of the column panels increase. Select the container panel and in the Layout section of the Style pane, select Hidden in the Overflow drop-down list.

Cascading Style Sheets Overview
Laying Out Site.com Pages Using Panels

Adding Images Directly to the Page

As a site administrator or designer, you can add images directly to your site pages and page templates or you can add images to content blocks.

To add an image directly to the page:

1. Open the site page or page template.
2. Drag an Image from the Page Elements pane onto the page.
3. In the Add an Image dialog box, either:
   - Find an existing image by typing its name in the Search Image text box and selecting it from the list.
   - Upload an image from your computer in the Upload tab by browsing to the image, clicking Upload, and selecting it from the list.
4. Click Apply. The image is added to the page.
5. Enter a brief description of the image in the Alternative Text field in the Properties pane. The description is used by screen reader users or as a substitute if the browser can’t display the image. It can also help with search engine optimization (SEO).

SEE ALSO:
Adding Site.com Page Elements
Editing and Working With Site.com Page Elements
Working with Content Blocks

Adding Content Blocks to Pages

Content blocks contain the text of your website pages, and can also house images, videos, and hyperlinks. Designers and site administrators can add content blocks to pages when in Design Mode.

To add a content block when the page is open, either drag it from the Page Elements pane onto the page or target a container page element.

To edit a content block, double-click it. For greater control over the text, you can edit the HTML directly by selecting the content block and clicking Edit HTML.

If you make a content block in a page template editable, contributors can edit the content block in any page based on the template. To add a content block that only other site administrators or designers can edit, use custom code instead.

SEE ALSO:

Adding Images to Content Blocks in Design Mode
Attaching Hyperlinks to Text and Images in Design Mode

Understanding the Content Editing Toolbar

Designers and site administrators can edit content blocks when in Design mode. Content blocks contain the site page’s text, along with images, videos, and hyperlinks.
When in Design Mode, you can use the content editing toolbar to:

- Undo and redo your edits, and remove the formatting of text copied and pasted from Microsoft® Office, which can often include hidden formatting (1).
- Cut, copy, and paste text (2).
- Apply direct formatting (3), such as:
  - Font family and size
  - Bold, italic, underline, subscript, superscript, and strikethrough
  - Font and highlight color
- Control the text style and layout (4) by:
  - Applying paragraph and heading styles
  - Setting paragraph indentation
  - Left-aligning, centering, right-aligning, or justifying text
  - Inserting numbered or bulleted lists
- Insert a table, and add rows, columns, and spacing (5).
- Add images, videos, and special characters (6).
- Add and remove hyperlinks and anchors (7).

⚠️ Tip: Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it’s best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site’s paragraph and heading styles.
Editing Content Blocks in Design Mode

Designers and site administrators can edit content blocks on the page. Content blocks contain the text for site pages, and can also house images, videos, and hyperlinks.

When the page is open in Design Mode:

1. Double-click the content block on the page.
2. Add or edit text and format it using the content editing toolbar.

Tip:
- If you copy and paste text from Microsoft® Office, highlight the text and click to remove any hidden formatting, which can adversely affect how the text appears on the page.
- Avoid applying formatting, such as different fonts or highlighting, directly to text whenever possible. Instead, it’s best practice to use the paragraph and heading styles to quickly apply consistent formatting throughout the site. This also ensures that all page text is updated automatically if a site administrator or designer modifies the site’s paragraph and heading styles.

3. Add images, videos, hyperlinks, or anchors as required.
4. Click Save.

Note: The content of all editable page elements on a child page or template is linked to the content of the editable elements on its parent page template. When you update the content of an editable page element on the parent template, the changes are pushed down to any child pages or page templates. However, if you modify the content of an editable page element at the child page or template level, you break the link between the elements, and any subsequent changes made to the page element on the parent template won’t trickle down to its children.
Adding Images to Content Blocks in Design Mode

Designers and site administrators can add images to content blocks when viewing a page in Design Mode.

When the page is open:

1. Double-click the content block on the page.
2. Position your cursor where you want to insert the image and click 📷.
3. In the Image Properties dialog box, either:
   - Enter a URL to an image in the Image URL field.
   - Select an image from your website by clicking From Website and selecting the image in the list that appears.
   - Upload an image from your computer by opening the Upload tab, browsing to the image, and clicking Upload.
4. Enter a brief description of the image in the Alternative text field. The description is used by screen reader users or as a substitute if the browser can’t display the image. It can also help with search engine optimization (SEO).
5. Optionally, preview how the image appears in relation to the text on the page and set:
   - The width and height of the image
   - How much space surrounds the image (which is controlled by the HSpace and VSpace properties)
   - How it aligns with the text on the page
   - The image border (for example, to set a dotted green border that’s 10 pixels wide, you enter 10px dotted green in the Border field)
6. Click Apply.
7. Click Save.

SEE ALSO:

- Understanding the Content Editing Toolbar
- Importing and Managing Assets
Adding Video to Content Blocks in Design Mode

Designers and site administrators can add YouTube®, Google®, Adobe® Flash®, Windows Media®, and Apple QuickTime® videos to content blocks when viewing a page in Design Mode.

When the page is open:

1. Double-click the content block on the page.
2. Position your cursor where you want to insert the video and click 🎬.
3. In the Video Properties dialog box, select the video type and either:
   - Enter the URL to the video in the Video URL text box—for example, http://www.youtube.com/watch?v=123abc.
   - Select a video from your website by clicking From Website and selecting the video in the list that appears.
   - Upload a video from your computer by opening the Upload tab, browsing to the image, and clicking Upload.

   <Note> You can only select or upload Flash, Windows Media, and QuickTime videos.

4. To specify how the video is displayed on the page, you can set:
   - The width and height of the video
   - How much space surrounds the video (which is controlled by the HSpace and VSpace properties)
   - How it aligns with the text on the page

   You can also preview the video.
5. Click Apply. The video appears as an icon in the content block.
6. Click Save.

   <Note> You can view all video types, other than Windows Media videos, when you preview a page.

SEE ALSO:
   Editing Content Blocks in Design Mode
   Understanding the Content Editing Toolbar
Attaching Hyperlinks to Text and Images in Design Mode

When viewing a page in Design Mode, designers and site administrators can create hyperlinks to:

- External Web pages or websites
- Pages and assets in the site
- Email messages
- Anchors on the page

When the page is open:

1. Double-click the content block on the page.
2. Select the text or image that you want to attach a hyperlink to and click ✉️.
3. Select the link type in the Link to drop-down list. To link to:
   - A Web page:
     a. Select A URL.
     b. Type the address in the URL field—for example, http://www.externalsite.com.
     c. Go to step 4.
   - A page or item in your site:
     a. Select An item in your site.
     b. Select the item type, such as a page or image.
     c. Select the item. (If you can’t see the list of items, place your cursor in the URL field and press the DOWN key on your keyboard.)
     d. Go to step 4.
   - An anchor that you previously added to the page:
     a. Select An anchor on the page.
     b. Select the anchor in the drop-down list. Alternatively, enter a new anchor name and create the anchor afterwards.
     c. Go to step 5.
   - An email message:
     a. Select An email.
     b. Enter the recipient’s email address and the message information.
     c. Go to step 5.

Note: For content blocks in a data repeater, you can use expressions to add a custom link, such as a URL query string, to an item in your site or to a Web page.

4. To select which window the item should open in, select an option in the Target drop-down list:
   - Popup window loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.
   - New window (_blank) loads the item into a new, unnamed browser window.
   - Same window (_self) loads the item into the same frame or window as the link. This is the default setting.
   - Topmost window (_top) loads the item into the topmost parent frameset or window of the frame that contains the link.
• **Parent window (_parent)** loads the item into the parent frameset or window of the frame that contains the link.

5. Optionally, enter a tooltip description for the link. The tooltip displays as a pop-up when the user hovers over the link.

6. Click **Apply**.

7. Click **Save**.

To delete a hyperlink, select it and click 🗑️.

- Understanding the Content Editing Toolbar

### Adding Anchors to Pages in Design Mode

An anchor is an invisible marker that identifies a particular location on a page. If you're a designer or site administrator, you can add an anchor to the page and then create a hyperlink that jumps to that specific location. This can be useful if a page is particularly long; for example, if your page has several sections, you could add links to each section at the top of the page to aid navigation.

When the page is open in Design Mode:

1. Double-click the content block on the page.

2. Place your cursor at the beginning of the line where you want to link to and click 🔗.

3. Enter a name for the anchor and click **Apply**. Ideally, use a name that helps identify the anchor’s location on the page—for example, `top`.

4. Now **create a hyperlink** that links to the anchor.

***SEE ALSO:***

- Attaching Hyperlinks to Text and Images in Design Mode
- Editing Content Blocks in Design Mode
- Understanding the Content Editing Toolbar

---

**EDITIONS**

**Available in:** Salesforce Classic

**Available for purchase in:** Enterprise, Performance, and Unlimited Editions

**Available (with limitations) in:** Developer Edition

---

**USER PERMISSIONS**

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page
  AND
- Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:

- Site.com Contributor User
  AND
  Contributor role assigned at the site level
Adding Custom Code to Pages

Custom code lets you customize your site using markup, such as HTML and JavaScript.

- **Add markup to a specific location on a page** using the Custom Code page element. JavaScript added using the Custom Code page element loads when that part of the page loads.
- **Add markup to the page head**. JavaScript in the page head loads first.
- **Add JavaScript to the page body** on page 4580. JavaScript added to the page body is positioned at the end of the body tag and only loads when the DOM is ready.
- **Add a reference to a JavaScript file or library** on page 4580 in the page head or body.

**Tip:**
- Scripts can’t execute while you’re editing a page in Site.com Studio. To test your code, preview the page.
- If you are building a Site.com site from an existing HTML site, avoid using the Custom Code page element to paste large chunks HTML from the original site. Instead, use the available page elements, such as panels, content blocks, and data tables. This will let you make future updates and design changes much more easily.

Adding Markup Directly to the Page

1. Drag a Custom Code page element from the Page Element pane onto the page.
2. Enter the code in the Edit Code dialog box.
3. Click **Save and Close** to add the code directly to the page.

Adding Markup to the Page **Head**

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Head Markup section.
2. Enter the markup in the Edit HTML Code dialog box.
3. Click **Save and Close** to insert the markup into the page head.

Adding JavaScript to the Page **Body**

1. In the Scripts section of the Properties pane, click **Configure** in the Edit Body Scripts section.
2. Enter the code in the Edit JavaScript Code dialog box. Don’t add `<script>` tags, as they’re already included.
3. Click **Save and Close** to add the code to the bottom of the page body.

Using JavaScript Files or Libraries

Instead of adding JavaScript code directly to a page, you can include links to imported or external JavaScript files, or to an open-source library (via the Google Libraries API).

1. In the Scripts section of the Properties pane, click + in either the Body Scripts or the Head Scripts section.
2. To link to:
   - A JavaScript file that you’ve imported, select **An imported script** and select the file.
   - An open-source JavaScript library, select **A Google AJAX library** and select the library.
   - An external JavaScript file, select **A URL to an external script** and enter the address.
3. Click **Apply**.

### Adding Website Navigation

#### About the Site Map and Page Hierarchy

The Site Pages view on the Overview tab contains the pages and site map links of your website. The Site Map folder reflects the hierarchy or tree structure of your site by housing site pages and links that are included in the site map. When you create new pages or site map links, they're automatically added to this folder. The Landing Pages folder houses standalone pages that are excluded from the site map, making it ideal for temporary pages, such as promotional or competition pages.

**Tip:** If you can’t see the Site Map folder in the Site Pages view on the Overview tab, click ![folder icon].

When adding a navigation menu to your site, it’s important to organize the hierarchy of your site pages and links accurately, because this structure is used to generate the menu. Pages and site map links are displayed in navigation menus in the order you arrange them.

In this representation of the site hierarchy, you can more clearly see the tree structure.

1. The Site Map folder, which contains four site pages.
2. A top-level page in the site hierarchy.
3. A top-level, parent page with two child pages. A child page is a page at a lower level in the site hierarchy than its parent page.
4. Two child pages.

5. The Landing Pages folder, which contains a temporary page that’s not part of the site map or navigation menu.

Tip: If a page has child pages, the ➤ icon appears beside it indicating that you can expand the branch.

By default, when you create a menu, it’s generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that’s generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

You can hide a page in menus, breadcrumbs, and the site map by selecting the Hide Page checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page’s direct URL. By default, all pages are visible.

- Adding a Navigation Menu
- Creating Site.com Pages

Adding Links to a Site Map

Pages aren’t the only things you can assign to your site map. Add internal or external URLs to your site map to customize your navigation menus and breadcrumbs, and achieve greater flexibility and control.

For example, let’s say you have a top-level Products page that has a menu based on its child pages. You also want to include a page called Testimonials in the menu, but it’s not a child page of the Products page. You can create a site map link that points to the Testimonials page and add the link under Products in the site map. Now when visitors view the Products page, they see a menu consisting of its child pages, along with a menu item that takes them directly to Testimonials.

1. On the Overview tab, click New > Site Map Link.
2. Enter a name for the link.
3. Enter a URL. URLs can be either relative or absolute, and are case sensitive.

   Note: You can’t preview absolute site map links in Site.com Studio unless they include a prefix, such as http:// or https://.

4. Click Create.
   The link appears at the bottom of the site map.
5. Drag the link to the correct position in the site map.

   Note: Site map links are automatically included in navigation menus and breadcrumbs. However, you can’t set a site map link as a custom root node in a breadcrumb.

SEE ALSO:
- Adding Breadcrumb Navigation to Pages
- Adding a Navigation Menu
- About the Site Map and Page Hierarchy
Adding Breadcrumb Navigation to Pages

Add a Breadcrumb page element to your page to help users navigate through your site and show the page’s location in the site hierarchy.

Breadcrumb navigation is based on the pages and links in the site map and usually supplements menu navigation. You can hide a page in menus, breadcrumbs, and the site map by selecting the Hide Page checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page’s direct URL. By default, all pages are visible.

Tip: To save time and effort, add a Breadcrumb page element to a page template to automatically include it on every template-based site page. The breadcrumb on each derived page dynamically updates based on its location in your site map.

1. Open the page or page template that you want to add the breadcrumb element to.
2. Drag a Breadcrumb from the Page Elements pane onto the page.
3. In the Properties pane, under Root, specify a custom root node for the breadcrumb. By default, the root value is set to None, which builds the breadcrumb structure based on the page’s location in the site map.
   - Select Home Page to set the site’s home page as the first item in the breadcrumb. To find out how to set a site’s home page, see Configuring Site Properties.
   - Select a specific site page to set it as the first item in the breadcrumb.

Note: You can’t set a site map link as a custom root node in a breadcrumb.

4. In the Properties pane, under Separator, you can customize the separator used between breadcrumb nodes.
   By default, the separator is >. However, you can change it to another text symbol or insert HTML code for an image in your site, such as <img src='/separatorimage.jpg'/>

5. To style the breadcrumb:
   a. Click the Style pane and ensure Class is selected.
   b. Choose an option from the Style drop-down list.
   c. Adjust the values in the Visual tab as desired.

Adding a Navigation Menu
Editing and Working With Site.com Page Elements
Adding a Navigation Menu

By default, when you create a menu, it’s generated from the pages and site map links in the Site Map folder in the Site Pages view. However, you can also create a menu that’s generated from the pages in the Landing Pages folder or from the child or sibling pages of a site page.

1. Arrange site pages and site map links in the Site Map folder or the Landing Pages folder in the order you want them to appear in the menu by dragging them to the desired location. Drag a page or site map link onto another page or link to make it a child of that item. Drag pages or links into the Landing Pages folder to exclude them from the site map.

   Tip: If you can’t see the Site Map folder in the Site Pages view on the Overview tab, click .

2. Open the page template or site page that you want to add the navigation menu to.

3. Drag a Menu from the Page Elements pane onto the page.

4. In the Properties pane, under Menu Source, select the pages that you want to use for the menu. By default, the Site Map folder is used to create the menu. Any site map link in the applicable hierarchy also shows up in your menu.
   - Select Landing Pages to create the menu from the pages in the Landing Pages folder.
   - Select Child Pages to create the menu from the current page’s child pages.
   - Select Sibling Pages to create the menu from all of the pages that share the same parent as the current page.
   - Select a specific site page to create the menu from just its child pages.

   Note: If you add a menu element to a page template, the menu doesn’t display correctly in the template if you select Child Pages or Sibling Pages as the menu source, because page templates aren’t part of the site map hierarchy. However, the menu appears as expected on site pages based on the page template.

5. To alter the appearance of the menu, you can select a different theme from the Theme Name drop-down list. For example, to create a drop-down menu, select Horizontal Drop-down. You can modify the style of any theme to suit your needs.

6. To change the name of a page in the menu, open the associated page and update its Navigation Name field in the Properties pane. Navigation names can include spaces and special characters.
   Alternatively, to change the name of a site map link in your menu, hover over the link in the Site Pages view on the Overview tab, click Edit, and update the name.

   Tip:
   - When you add a new page or site map link, update a page’s Navigation Name property, or rearrange pages or links, the menu updates automatically to reflect the changes.
   - To automatically include a menu on every site page, add the menu to a page template and base the site pages on it.
You can hide a page in menus, breadcrumbs, and the site map by selecting the Hide Page checkbox found on the Properties pane for each page. This setting also prevents website visitors from accessing the page’s direct URL. By default, all pages are visible.

SEE ALSO:
- Styling Navigation Menus
- About the Site Map and Page Hierarchy
- Adding Site.com Page Elements

Styling Navigation Menus

Navigation menus are styled using CSS themes that you can customize to match the design of your website. When you add a navigation menu to a page, it uses a default theme to control its appearance. Choose from other existing themes in the Theme Name drop-down list in the Properties pane.

Alternatively, to customize a theme to suit your needs:

1. Select the navigation menu on the page.
2. Select a theme to use as a base in the Theme Name drop-down list in the Properties pane. Use a theme that most closely matches your site design or select Blank to start with a completely blank theme.
3. Open the Style pane and ensure Class is selected.
4. In the Style drop-down list, select the part of the menu that you want to style. When you select an item, it’s highlighted for a few seconds, so you can easily see which part you’re styling.
   
   Tip: If you’re familiar with CSS, you can also modify the style of the menu in the site’s style sheet.
5. To style the selected menu item, use the Style pane properties. Your changes are immediately reflected in the menu.
6. Repeat as required for each part of the menu.

SEE ALSO:
- Adding a Navigation Menu
- About the Site Map and Page Hierarchy
Adding Custom HTML Attributes

You can add custom HTML attributes to pages and page elements, which are rendered on the HTML tag of the page element. For example, this is useful when working with third-party frameworks that render page elements differently based on certain attributes.

When the page is open:

1. Select the relevant page or page element in the Page Structure pane.
2. In the HTML Attributes section of the Properties pane, click +.
3. Enter a name and value for the HTML attribute.
4. Click Save.

To delete an HTML attribute, select it and click −.

To change the order in which an HTML attribute is rendered, select it and click ↑ or ↓.

SEE ALSO:
- Changing a Page Element’s HTML Tag
- HTML5 Semantic Page-Layout Tags
- Changing a Page’s Doctype Property
Changing a Page Element’s HTML Tag

By default, panels, data repeaters, data elements, custom code, and content blocks are each defined as a `div`, but you can change this to any other HTML tag using the HTML Tag property. This gives you greater flexibility and control over how the page element is displayed on the page.

⚠️ **Warning:** The HTML Tag property provides a powerful way to control how page elements are displayed. However, if you change a page element’s HTML tag, you may generate invalid HTML. Before publishing any changes, test the page thoroughly.

To redefine a panel, data repeater, data element, custom code, or content block:

1. Select the element on the page.
2. In the HTML Tag field in the Properties pane, start typing the tag name.
3. In the auto-complete list that appears, select the relevant HTML tag. Alternatively, you can define your own HTML tag—for example, if you’re working with a JavaScript library or if new HTML5 tags are introduced in the future. You can also remove the HTML tag on a panel, data repeater, data element, custom code, or content block to disable its ID, class, or inline styles.

**Note:** The following tags aren’t included in the auto-complete list:
- `base`
- `body`
- `doctype`
- `head`
- `html`
- `meta`
- `style`
- `title`

SEE ALSO:
- HTML5 Semantic Page-Layout Tags
- Adding Custom HTML Attributes

### HTML5 Semantic Page-Layout Tags

HTML5 defines several semantic page-layout tags that describe the content they contain. These tags make it easier for search engines and screen readers to read and organize your content.

By default, several page elements are defined as a `div`, including panels, data repeaters, data elements, content blocks, and custom code. Using a page element’s HTML Tag property, you can change the tag to a semantic HTML5 block tags, such as:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Article</td>
<td>A section containing an independent item of content, such as a magazine article or a forum post.</td>
</tr>
</tbody>
</table>
### Option | Description
--- | ---
Aside | A section containing content that’s only superficially related to the main page content, such as a sidebar or advertising.
Details | A section containing additional details that the user can view or hide using an interactive widget. It can also include a summary section.
Header | A section containing an introduction, or a group of navigation elements.
Footer | A footer section for the page or parent section. It typically contains information about the parent section and appears at the end of the section.
Nav | A section that contains navigation links.
Section | A generic section of the page.
Summary | A summary or caption section for a details section.

⚠️ **Tip:** If you use a HTML5 semantic tag, it’s good practice to also [change the page’s doctype](#) to HTML5.

Setting Up the Contributor's Studio View

Control what your contributors can do in Site.com Studio.

The contributor's Site.com Studio view lets users browse and update website content. To enable contributors to edit the site's content, however, you must first create template-based pages with editable areas and enable several properties.

To enable your contributors to:

- Edit the text on a page, create template-based pages with editable content blocks
- Add content blocks to the page, create template-based pages with editable panels
- Create site pages based on a page template, select Available to Contributors in the Properties pane when the page template is open
- Add widgets to the page, select Available to Contributors in the Widgets view on the Overview tab or in the Properties pane when the widget is open
- Update the appearance of pages and widgets, set up branding properties

To ensure that the contributor's Site.com Studio view is set up correctly, click View Studio as a Contributor in the site's pull-down menu (on the top toolbar). To exit, click Return to My Studio View.

The contributor's view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See About Feature Licenses in the Site.com help for details. Alternatively, a user can preview the Site.com Community site as a contributor by appending ?iscontrib to the site's URL. For example: https://sitestudio.na1.force.com/?iscontrib

Styling Your Website

Cascading Style Sheets Overview

Cascading Style Sheets (CSS) provide a flexible way to add style to the pages of your website. This collection of formatting rules governs the appearance of your pages, and lets you define the fonts, colors, layout, and other presentation features.

By using CSS to control your fonts, you can ensure greater consistency in the appearance and layout of your pages in multiple browsers. Some of the many text properties that CSS lets you control include font family and size, text and background color, text formatting, and link color.

Using CSS, you can also position, add color to, float text around, and set margins and borders for block-level elements. A block-level element is a standalone piece of content that's visually formatted as a block. For example, content blocks (which are equivalent to p tags) and panels (which are the same as div tags) are both block-level elements.

Site.com supports CSS3, which is the latest specification for CSS.
About Inline Styles Versus Style Sheets

In Site.com Studio, you can:

• Apply styles directly to a selected page or page element using the Inline option in the Style pane ( ). Inline styles apply only to the selected item.

• Add style items such as CSS classes or IDs to a style sheet, and apply the style items to the selected page or page element. This approach separates the content (your web pages) from the presentation (the style sheet).

If you’re not familiar with CSS, you’ll probably find the inline option the easiest to use and understand. However, inline styles lose many of the advantages of style sheets because they mix content with presentation—the inline style is only applied to that individual element. If you need to update the style of your site, you have to update the style properties of every affected page and page element.

By contrast, although style sheets may be more difficult to understand at first, they enable you to make site-wide changes from one convenient location. When you update a style item in your style sheet, it immediately updates the style of every page or page element that uses it.

It’s worth taking the time to become familiar with CSS because it:

• Saves you time and effort when building and designing your site
• Produces cleaner, more consistent site designs
• Simplifies navigation for people with accessibility issues (such as site visitors using screen readers)

For more information about using CSS and creating style sheets, go to the World Wide Web Consortium (W3C) at www.w3.org/Style/CSS. There are also many tutorials available on the Internet that provide in-depth CSS training.

About CSS Classes and IDs

When you use style sheets to style your site, you can redefine the formatting of HTML tags such as body or h1. You can also create CSS classes and IDs to define the style of particular elements, such as headers or repeating content. A CSS class lets you define and apply style properties to many elements on a page, whereas a CSS ID is ideal for targeting a single item on a page. For example, in a page’s structure, IDs are often used to define the header and footer areas, as each page has only one header or footer, but classes are used to define repeating page elements, such as a blog post.

Best Practices

• Include a CSS reset in your style sheet to reset all style items to a baseline value. This helps avoid cross-browser differences due to their built-in default style settings.

• Use CSS classes and IDs instead of inline styles wherever possible. This promotes the separation of presentation and content, and makes it easier to updates the site’s styles.

• Use IDs when there is only one occurrence per page. Once you’ve used the ID, you can’t use it again on that page. Use classes when there are one or more occurrences per page.

• Use groups to organize your CSS logically and make it easier to maintain your style sheet.

• If you’re using CSS3, ensure you preview and test your site in each browser that you want it to support, because some browsers haven’t yet fully implemented CSS3 features.

Using the Style Pane
Understanding the Style Sheet View in Site.com
Creating and Using CSS Style Sheets
Using the Style Pane

The Style pane is a visual CSS editor that lets you modify style properties, such as the background color, font size, and border style, as you work with pages and page elements. If you’re using CSS classes or IDs to style your pages, you can modify or create style items directly from the Style pane, rather than opening the style sheet.

To apply a style to a selected page or page item:

1. Open the Style pane ( ).
2. To apply:
   - An inline style, select Inline. Inline styles affect the selected item only and aren’t included in a style sheet.
   - A CSS class, select Class and start typing the name. If the class already exists in your style sheet, select it in the list that appears. To create a new class, type the name, select it, and click Yes to add it to the style sheet.
   - A CSS ID, select ID and select it in the drop-down list. To create a new ID, click , enter the ID name, and click .

Menu page elements have several components, which you can style individually by selecting your preferences in the Style drop-down list that appears.

3. In the Visual tab, apply style properties as appropriate. Alternatively, in the Code tab, you can type your CSS styles directly and click Apply.

Tip: To view the style properties associated with a selected page or page element, open the Code tab of the Style pane. To remove the style properties, click Clear.

</tr>
</thead>
<tbody>
<tr>
<td>Positioning</td>
<td>Positions page elements outside the normal flow of the document. Usually, elements on a page are rendered in Web browsers in the order they appear in the document. Block elements such as <code>p</code> tags and <code>div</code> tags appear one beneath the other, whereas inline elements such as <code>em</code>, <code>strong</code>, and <code>span</code> tags are rendered next to text or each other.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Absolute</strong></td>
<td>Positions the content using the settings in the <strong>Top</strong>, <strong>Bottom</strong>, <strong>Left</strong>, and <strong>Right</strong> text boxes.</td>
</tr>
<tr>
<td><strong>Relative</strong></td>
<td>Renders the page element in the normal layout flow, but moves the element relative to its normal position depending on the values in the <strong>Top</strong>, <strong>Bottom</strong>, <strong>Left</strong>, and <strong>Right</strong> text boxes. For example, if you set an element’s left position to 20 pixels, the page element will be positioned 20 pixels further to the left.</td>
</tr>
<tr>
<td><strong>Display</strong></td>
<td>Overrides a page element’s default layout behavior. For example, you can hide page elements, make block elements render inline, or make inline elements render as blocks.</td>
</tr>
<tr>
<td>None</td>
<td>Hides the page element.</td>
</tr>
<tr>
<td>Block</td>
<td>Displays the page element as a block-level page element, with a line break before and after the element.</td>
</tr>
<tr>
<td>Inline</td>
<td>Displays the page element as an inline page element without a line break before or after the element.</td>
</tr>
<tr>
<td>Inline-block</td>
<td>Renders the page element as an inline rectangle, but with content that behaves as if it’s inside a block element.</td>
</tr>
<tr>
<td><strong>Position</strong></td>
<td>When used in conjunction with the Absolute or Relative positioning options, these four properties place page elements outside the normal flow of the document. Enter a value in the text boxes as appropriate and select a unit of measurement in the respective drop-down lists.</td>
</tr>
<tr>
<td>Top</td>
<td>Sets how far the top edge of an element is above or below the top edge of the parent element.</td>
</tr>
<tr>
<td>Bottom</td>
<td>Determines how far the bottom edge of an element is above or below the bottom edge of the parent element.</td>
</tr>
<tr>
<td>Right</td>
<td>Sets how far the top edge of an element is to the right or left of the right edge of the parent element.</td>
</tr>
<tr>
<td>Left</td>
<td>Defines how far the left edge of an element is to the right or left of the left edge of the parent element.</td>
</tr>
<tr>
<td><strong>Z-index</strong></td>
<td>Specifies the order in which elements overlap each other when they need to be rendered in the same space. An element with a greater z-index value covers an element with a lower value. The default value is 0.</td>
</tr>
<tr>
<td>Click to increase and decrease the z-index, or enter a value in the text box.</td>
<td></td>
</tr>
<tr>
<td><strong>Float</strong></td>
<td>Floats a page element to the left or right so that subsequent elements—text for example—wrap around the floating page element.</td>
</tr>
<tr>
<td>Floats to the left</td>
<td>Floats the page element to the left.</td>
</tr>
<tr>
<td>Floats to the right</td>
<td>Floats the page element to the right.</td>
</tr>
<tr>
<td>None</td>
<td>Removes an existing float setting.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>Clear</td>
<td>Specifies whether the selected page element allows floating page elements beside it.</td>
</tr>
<tr>
<td>•</td>
<td>moves the page element below any floating page element on its left.</td>
</tr>
<tr>
<td>•</td>
<td>moves the page element below any floating page element on its right.</td>
</tr>
<tr>
<td>•</td>
<td>moves the page element below floating page elements on either side.</td>
</tr>
<tr>
<td>•</td>
<td><strong>None</strong> removes existing float settings.</td>
</tr>
<tr>
<td>Visibility</td>
<td>Specifies whether the selected page element is visible.</td>
</tr>
<tr>
<td>•</td>
<td>Visible is the default value.</td>
</tr>
<tr>
<td>•</td>
<td>Hidden hides the page element and renders an invisible rectangle in its place.</td>
</tr>
<tr>
<td>•</td>
<td>Collapse is used to hide table elements. (For other page elements, it has the same result as hidden.)</td>
</tr>
<tr>
<td><strong>Note:</strong> Invisible page elements still occupy the same space in the page’s layout.</td>
<td></td>
</tr>
<tr>
<td>Overflow</td>
<td>Specifies whether the content of a page element should be clipped when it overflows its area.</td>
</tr>
<tr>
<td>•</td>
<td>Visible does not clip the content.</td>
</tr>
<tr>
<td>•</td>
<td>Hidden clips the content.</td>
</tr>
<tr>
<td>•</td>
<td>Scroll clips the content, but provides scroll bars so that users can view the remaining content.</td>
</tr>
<tr>
<td>•</td>
<td><strong>Auto</strong> is dependent on the browser, but should display a scroll bar to view the rest of the content.</td>
</tr>
</tbody>
</table>

**The Dimensions Section**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width</td>
<td>Sets the width of the selected page element. Enter a value in the <strong>Width</strong> text box and select a unit of measurement. Select <strong>Inherit</strong> to use the width of the parent page element.</td>
</tr>
<tr>
<td>Height</td>
<td>Sets the height of the selected page element. Enter a value in the <strong>Height</strong> text box and select a unit of measurement. Select <strong>Inherit</strong> to use the height of the parent page element.</td>
</tr>
<tr>
<td>Margins</td>
<td>Sets the width of the page element’s margin, which is the space between its border and outer edge. Set the margins for all four sides by entering a value in the <strong>All</strong> text box, or add margins to the top, right, bottom, or left sides as required.</td>
</tr>
<tr>
<td>Padding</td>
<td>Sets the width of the page element’s padding, which is the space between its content and border. Set the padding for all four sides by entering a value in the <strong>All</strong> text box, or add padding to the top, right, bottom, or left sides as required.</td>
</tr>
</tbody>

Using the Style Pane
Understanding the Style Sheet View in Site.com

When working with style sheets, you can add style items, organize them into groups, and edit the CSS code directly. Open a style sheet on the Overview tab by double-clicking it or hovering over it and clicking ➜ Edit. The style sheet opens as a new tab.

• Using the toolbar (1), you can import a style sheet and edit the style sheet’s CSS code directly.
• Using the style sheet pane (2), you can:
  – Create style items and groups
  – Preview, edit, and delete style items
Move style items and groups by dragging them to the correct location

- Add a CSS reset

- Using the Style Preview section (3), you can preview and manually edit a selected style item.

  Note: You can’t preview at-rules, such as @media or @font-face, in the Style Preview section.

- Using the visual CSS editor (4), you can define the CSS properties for the selected style item.

SEE ALSO:
  - Creating and Using CSS Style Sheets
  - Cascading Style Sheets Overview

Creating and Using CSS Style Sheets

A default style sheet called “Site Style Sheet” is included with every site you create. However, if you’re familiar with CSS and need multiple style sheets, you can create new ones to use in your site.

To create a style sheet:

2. Enter a name for the style sheet.
3. Click Apply. The style sheet opens.
4. Add style items and groups to the style sheet.

Note:

- Style sheet names can only contain alphanumeric characters, hyphens, colons, and underscores.
- You can also import a CSS file to use in your site.

After you create a new style sheet, you must attach it to a page to apply its styles to the page.

To attach a style sheet to a page:

1. Select the page in the Page Structure pane ( ).
2. In the Style Sheets section of the Properties pane ( ), click .
3. Select the style sheet in the list that appears.
4. Attach the style sheet to the page by clicking beside the drop-down list.

Tip: If you used a page template to create your site pages, the quickest way to include the new style sheet on every pages is to attach it to the template. This automatically includes a reference to the style sheet in every page that’s based on the template.

SEE ALSO:
  - Understanding the Style Sheet View in Site.com
  - Cascading Style Sheets Overview
Creating Style Sheet Items and Groups

When adding style items to style sheets, you can define CSS classes and IDs, or you can redefine the formatting of HTML tags such as body or h1. When you change the CSS style of an HTML tag, anything formatted with that tag is immediately updated.

Creating Style Items

To open a style sheet, double-click it in the Style Sheets view of the Overview tab, or hover over it and click Edit.

If you're very familiar with CSS and prefer coding by hand, click Edit Style Sheet Code to edit the style sheet directly using the CSS editor. Additionally, to add at-rules (for example, @media), you must edit the style sheet directly.

Alternatively:

1. Select the style sheet and click Insert Style Item.
2. Enter the name of the style item:
   • To redefine the default formatting of a specific HTML tag, enter the HTML tag name—for example, body or h1.
   • To create a CSS class, enter the class name and ensure that you include a period before it—for example, .classname.
   • To create a CSS ID, enter the ID name preceded by #—for example, #contentID.
3. Click Apply.
4. Add style definitions by either:
   • Setting style properties in the visual style editor on the right
   • Typing CSS styles in the text box in the Style Preview section and clicking Save

As you modify the definition of a selected style item, you can see how your changes appear in the Style Preview section.

Tip:

• A class name must begin with a period or it will not be recognized as a CSS class.
• An ID name must begin with # or it will not be recognized as a CSS ID.
• Use IDs when there is only one occurrence per page. Once you've used the ID, you can't use it again on that page. Use classes when there are one or more occurrences per page.
• Class and ID names can contain alphanumeric characters, hyphens, and underscores only, and can't begin with a number or include spaces.

Creating Style Groups

Use groups to organize your CSS logically. This makes it easier to locate and maintain styles.

When the style sheet is open:

1. Select the style sheet and click Insert Style Group.
2. Enter a name for the group and click Apply.
3. To add a new style to the group, select the group and click Insert Style Item. To add an existing style to the group, drag it onto the folder icon.
Assigning Style Items

After you’ve created styles, you can assign them to the pages and page elements of your site.

To assign a class to a page or page element, select it and either:

- Type the class name in the Class field of the Properties pane ( ).
- Select Class in the Style pane ( ), start typing the name, and select it in the list that appears.

To assign an ID to a page or page element, either:

- Type the ID name in the ID field in the Properties pane ( ).
- Select ID in the Style pane ( ) and select it in the drop-down list.

Using CSS Reset

Every browser has set presentation defaults, but unfortunately they aren’t standardized across all browser types. This means that when you use CSS to style your site, it may not render as expected when you view it in different browsers. For example, browsers differ in how they display:

- Unordered and ordered lists
- Top and bottom margins for headings
- Indentation distances
- Default line-heights

A CSS reset cancels the differences between browsers to control how browser elements are presented to the end user. You can either use Site.com’s CSS reset, or you can add your own CSS reset code.

To use Site.com’s CSS reset:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking Edit.
2. Click > Insert CSS Reset.
3. Ensure the CSS reset is positioned at the top of the style sheet. To move it, drag it to the correct location in the pane on the left.

To add your own CSS reset code:

1. In the Style Sheets view on the Overview tab, open the style sheet by double-clicking it, or hovering over it and clicking Edit.
2. Click Edit Style Sheet Code to open the CSS editor.
3. Paste the code at the top of the style sheet code.
4. Click Save and Close.

Branding Your Site

Site Branding Overview

Branding provides a flexible way for you to define different aspects of your website’s brand. Once branding properties are defined, your editors can easily customize everything in one centralized place, the Branding Editor. When your website editors customize the properties, they get a preview of their branding changes immediately.

By adding branding properties to your website, page templates, or widgets, you can easily define and change those aspects of your website’s brand without needing to edit your Cascading Style Sheet.

Here are examples of aspects that you might define that are related to your website’s brand:

- The website’s background, page, or link colors
- Font size and color
- The logo or header background image
- The thickness and color of lines

To use branding in your website, you must:

1. Define the parts of your site that make up your brand by creating a branding property for each aspect such as background color, logo, and fonts. You complete this task from Branding Properties within Site Configuration.

2. Use expression language syntax to replace the current definitions for these properties within your Cascading Style Sheets with the new branding properties.

3. Use the Branding Editor to customize the properties and preview how your website will look.

The branding properties can also be accessed by using expression language syntax directly from within a custom code block or content block.

SEE ALSO:
- Creating Branding Properties
- Setting Up Branding Properties
- Using the Branding Editor
Creating Branding Properties

With branding, you can quickly create style properties that can be reused by editors of your site. When creating your branding properties, you can organize properties into multiple sections to make them easier to find in the Branding Editor. You can also organize your properties within sections.

- Order properties within sections in a logical manner. For example, organize them alphabetically.
- Order sections and properties by dragging and dropping them within the Branding Properties view.

1. From within your site, click Site Configuration > Branding Properties. The Branding Properties editor appears.

2. Click + New Property.

3. Enter a name for the property in the Label field. The expression name is filled in automatically. The expression name is used in style sheets and code blocks.

4. Choose a type.

5. Set the default value.

6. To make the property required, click Required.

Hover over any property and use the menu to edit or delete it. You can double-click any section name to edit it.

EDITIONS

Available in: Salesforce Classic
Available for purchase in: Enterprise, Performance, and Unlimited Editions
Available (with limitations) in: Developer Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:
- Site.com Publisher User field enabled on the user detail page
  AND
  Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:
- Site.com Contributor User
  AND
  Contributor role assigned at the site level
Setting Up Branding Properties

After you create branding properties, the next step is to reference them as expressions in your Cascading Style Sheets (CSS) or Site.com page elements such as content blocks or custom code elements.

The expression syntax for branding properties is {!Site.branding-property-name}. For example, if you create a color property with the name HeaderColor, you can insert the property into a CSS or code block by typing {!Site.HeaderColor}.

Note: The expression names are case-sensitive!

1. Open your CSS or code block.
2. Locate the place where you want to insert the expression.
3. Type {!
   and a drop-down list of available properties appears.
4. Select the property and double-click to enter it on the page.

Example: For example, if part of your website’s brand is to use blue for the background of the header section, you would normally statically set the color’s HEX value in your CSS rules.

```
.site-header {
  background-color: #3793DD;
}
```

With branding, you can create a property that maps directly to the HEX color and then use the property’s expression name in your CSS.

```
.site-header {
  background-color: {!Site.HeaderColor};
}
```

Now the color can be easily changed by any of your site editors by using the Branding Editor instead of editing the CSS.

- Using the Branding Editor
Using the Branding Editor

The Branding Editor provides a centralized place to customize and then preview the changes that you make to the branding properties in your site.

The Branding Editor includes two areas:

- The editor palette, on the left side, contains all of the branding properties that you can edit.
- The preview area on the right side shows a live preview of how your website will appear after you change a style.

1. Open the page that you want to edit.
2. Click 🔔.
3. From the left pane, select the style property that you want to edit. Your results appear immediately in the right pane.

Using Custom Properties

Custom Site Properties Overview

With custom site properties, you can define and store frequently occurring content on your site. For example, you can store your address and phone number as a custom property so that it can be reused by anyone who is editing your site. You can apply stored properties to pages, headers and footers, and widgets quickly by using expression language syntax.

To use custom properties in your website, you must:

1. Define the custom property. You complete this task from Custom Properties within Site Configuration.
2. Use expression language syntax to replace the current definitions for these properties within your Cascading Style Sheets or custom code blocks.
After you create a new property and specify its value and type, you can access the property in custom code or content blocks by using expressions. Expressions are placeholders for data that will be replaced with the custom property when the page loads.

SEE ALSO:
- Creating Custom Site Properties
- Setting Up Custom Properties

Creating Custom Site Properties

You can quickly create Custom Properties that can be reused by editors of your site.

When creating your custom properties, you’ll probably want to organize them logically.

- Organize properties into multiple sections to make them easier to manage and easy to find.
- Order properties within sections in a logical manner. For example, organize them alphabetically.
- Order sections and properties by dragging and dropping them within the Custom Properties view.

1. From within your site, click **Site Configuration > Custom Properties**. The Custom Properties view appears.

2. Click **New Property**.

3. Enter a name for the property in the Label field. The expression name is filled in automatically. The expression name is used in style sheets and code blocks.

4. Choose a type.

5. Set the default value.

6. To make the property required, click **Required**.

To edit or delete properties, hover over any property and use the menu. To edit section names, double-click the name make changes.

SEE ALSO:
- Custom Site Properties Overview
- Custom Property Types
- Setting Up Custom Properties

EDITIONS

Available in: Salesforce Classic

Available for purchase in: Enterprise, Performance, and Unlimited Editions

Available (with limitations) in: Developer Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:
- **Site.com Publisher User field enabled on the user detail page** AND Site administrator or designer role assigned at the site level

To edit only content in Site.com sites:
- **Site.com Contributor User** AND Contributor role assigned at the site level
Setting Up Custom Properties

You can use custom properties in your website by using expression language syntax within a style sheet, code block, widget, or the HTML page editor.

To reference a site custom property in custom code or a content block, use the syntax `{!Site.expression_name}`). For example, create a custom property to store the company phone number with PhoneNumber as the expression name. In a content block, enter *Contact us at* `{!Site.PhoneNumber}`. When the page loads, it replaces the value that is represented by `{!Site.PhoneNumber}` and displays “Contact us at 1-800-667-6389” on the page.

**Note:** The expression names are case-sensitive!

1. Open a website element such as a code block or widget.
2. Locate the place where you want to insert the expression.
3. Type `{!` to see the list of available custom properties.
4. Select the property and double-click to enter it on the page.

**Example:** Setting up custom properties is great for things that might change over time such as your address or a particular product phrase. Because expressions are just placeholders, if you update the value of a property in the Custom Properties view, the value is updated automatically wherever the custom property is referenced on a page.

SEE ALSO:
- Custom Site Properties Overview
- Creating Custom Site Properties

Custom Properties for Page Templates or Widgets Overview

When you create a page template or a widget, you can add custom properties to it and specify the value and type of each property to achieve greater flexibility over how templates and widgets are reused.

Then, by adding custom code or content blocks to the page template or the widget, you can access the property values by using expressions. Expressions serve as placeholders for data that will be replaced with information when the page loads.

In turn, when you or your team create a page from the template, the page is a copy or instance of the template. Similarly, when you add the widget to a page, it creates an instance of the widget. You can’t edit the instance, but you can update its property values.

Because expressions are just placeholders, their values are updated automatically when you update the values in the Properties pane of the page or widget.

You can also create sections to group related properties. These sections control how properties are grouped in the Properties pane.
Example: For example, let’s say you add a content block to a template to contain the page’s heading. In this case, when users create a page from the template, you want to let them replace part of the text to suit their needs, but without letting them edit the entire content block.

By adding a custom property that’s called `pageSubject` and specifying an initial value, you can instead use the following expression in the content block:

```
Learn About {!pageSubject}
```

This action lets team members rename any page that’s derived from the template by updating the `Page Subject` property in the page’s Properties pane, which automatically updates the value that’s represented by the `{!pageSubject}` expression.

Example: Alternatively, let’s say you want to create a YouTube widget using the following embed code:

```
<iframe width="560" height="315" src="//www.youtube.com/embed/hcUaN6XBTz4" frameborder="0" allowfullscreen></iframe>
```

However, you want users to specify which video to display when they add an instance of the widget to the page. In this case, you could create a section called `YouTube`, add a custom property labeled `Video URL` with `videoURL` as the expression name, and instead use the following code:

```
<iframe width="560" height="315" src="{!videoURL}" frameborder="0" allowfullscreen></iframe>
```

Now, when users add the YouTube widget to the page, they can point to any video by updating the `Video URL` property in the YouTube section of the Properties pane, which automatically updates the value represented by the `{!videoURL}` expression.
Adding Custom Properties to Page Templates or Widgets

When you create a page template or a widget, you can add custom properties to it and specify the value and type of each property.

Then, by adding custom code or content blocks to the page template or widget, you can access the property values using expressions, which serve as placeholders for the values. When you or your team create a page from the template or add an instance of the widget to the page, you can update the property values to modify the instance.

When the page template or widget is open:

1. Make sure the template or widget is selected in the Page Structure pane and click **Edit Custom Properties** in the Properties pane.

2. Click **New Property**.
   - Base is the default section, which you can rename. Sections control how properties are grouped in the Properties pane of a widget instance or page.

3. Enter the property label, which appears in the Properties pane of a widget instance or page—for example, **Video URL**.

4. Optionally, update the expression name that was added automatically.
   - Expression names are case sensitive and can’t include spaces.

5. Specify the property type and value.

6. Optionally, mark the property as required.

7. Add additional properties or sections as needed. Reorder items by dragging them to a new location.
8. To use a custom property, drag a Custom Code or a Content Block page element from the Page Element tab onto the page template or widget.

9. Use the syntax {!expression_name} to reference the expression—for example, {!videoURL}. When the page loads, the expression will be replaced by the property value.

10. Add any additional text you require and save your changes.
    For example, Check out our video at {!videoURL}.

    Tip: You can also create a custom property by first typing the name of the property in custom code or a content block using expression language. For example, if you type {!videoHeight} in a content block, a new property called videoHeight is automatically added to the Properties pane of the template or widget, where you can then add a property value.

If you update a widget’s properties, your changes won’t be reflected in any widget instances. Instead, you must replace existing widget instances with the latest version.

If you delete a custom property that’s being used in custom code or a content block, make sure you remove any references to the property.

About Displaying Dynamic Data Using Expressions
Creating Widgets

Custom Property Types

Property types are available when designers or site administrators create site branding properties, site custom properties, widget branding properties, and widget custom properties.

<table>
<thead>
<tr>
<th>Property Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Lets users enter a text value.</td>
</tr>
<tr>
<td>Checkbox</td>
<td>Lets users set a true (selected) or false (deselected) value.</td>
</tr>
<tr>
<td>Color</td>
<td>Lets users specify a color, either by selecting one from the color picker or by entering a hexadecimal value, such as #333333.</td>
</tr>
<tr>
<td>Image</td>
<td>Lets users specify an image, either by browsing to a site image, uploading a new image, or entering the URL to an image.</td>
</tr>
<tr>
<td>HTML</td>
<td>Lets users enter an HTML value.</td>
</tr>
<tr>
<td>Units</td>
<td>Lets users enter a measurement, such as pixels, percentage, or em—for example, 5px.</td>
</tr>
<tr>
<td>Picklist</td>
<td>Lets users select a value from a list you define. To add items to the picklist, create a comma-delimited list of options, where each option has a label and a value—for example, Label 1: Value 1, Label 2: Value 2. If you don’t add a value for an option, the label is used as the value by default.</td>
</tr>
</tbody>
</table>
Property Type | Description
--- | ---
To define a default picklist selection, use the format `label: value: default`—for example, `Small:S:default, Large:L`.
Font | Lets users select a font.

Working with Dynamic Data

Site.com Data Services Overview

Site.com data services combine many features that let you connect to standard and custom Salesforce objects. Retrieve data from your organization’s objects and dynamically display it on your site pages, or alternatively, gather and submit data from your customers. And when you update data in your Salesforce object, the changes are reflected automatically on the live site—no site updates required!

Here are a few ways you can use Site.com data services:

- Publish a catalog of products—List your company’s products and include information, such as model numbers and prices, pulled dynamically from your organization.
- Post company press releases—Publish your company’s press releases and sort by publication date.
- Create a realtor website—Display current listings filtered by city or price.
- Create a recruiting website—Post job openings to a public site and allow visitors to submit applications and resumes.

So how does it all work? Several data-bound page elements let you retrieve and display your data, or collect data from your site visitors. Data tables connect to Salesforce objects, retrieve a data set based on the filter criteria that you specify, and display one or more records as rows in the table.

Data Repeaters and data elements combine to let you connect to standard and custom objects, retrieve data, and dynamically display it on your site’s pages. Together, the data repeater and data elements result in a “repeating template” that offers you the greatest flexibility for displaying one or more records on the page.

Data functions let you perform calculations on data retrieved from objects and display the result on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

Nested repeaters let you retrieve data from objects with a parent-to-child relationship.

Forms and form fields combine to let you collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

Data Services Considerations

- To allow guest users to view the data in or submit data to a Salesforce object, you must set the object’s data access permissions.
When working with assets, the easiest way to take advantage of Site.com data services is to import the files into your website, and store a relative URL to these assets in your standard or custom object. See Storing Assets to Use with Salesforce Objects on page 4613.

If you add a data-bound page element to your site and then subsequently change a field type in the Salesforce object it’s connected to—for example, changing a text field to a picklist—the data-bound page element will no longer work. You must reconfigure the data-bound page element to reference the updated field.

If you update data in an object that’s connected to a data table, data repeater, or data function, the changes are reflected automatically on the live site. To control this, you can add a picklist field to the object to specify when a record is approved to go live. Then you can use the field to filter the records by approved status, so only approved records appear on the live site.

Adding Pagination to Data Repeaters and Data Tables
The Default, Error, and No Data Views
Setting Data Access Permissions for Salesforce Objects

Sites built with Site.com are publicly available, so visitors access the site via the Guest User license that’s associated with the site.

By default, site visitors can access information made available in an active public site, such as the site’s pages and assets. However, to allow guest users to view or submit data to a Salesforce object, you must modify the object’s permission in the site’s guest user profile. Each site has a separate Guest User license, so you can control guest access to Salesforce objects on a per-site basis.

To edit the site’s guest user profile:

1. On the Overview tab of Site.com Studio, click Site Configuration and click Site Name Profile. Alternatively, if you’re adding a data repeater, data table, data function, or form to the page, click go to the guest user profile in the item’s dialog box.

2. In the site’s guest user profile, enable the “Read” permission on the standard or custom objects you want to retrieve data from using data repeaters, data tables, or data functions. Enable the “Create” permission on the objects you want to submit data to using forms. All permissions that aren’t set by default must be set manually.

3. If required, modify the field-level security of an object.

EDITIONS

Available in: Salesforce Classic

Available for purchase in: Enterprise, Performance, and Unlimited Editions

Available (with limitations) in: Developer Edition

USER PERMISSIONS

To build, edit, and manage Site.com sites:
- Site.com Publisher User field enabled on the user detail page
  AND
- Site administrator or designer role assigned at the site level

To edit the guest user profile:
- Site.com Publisher User field enabled on the user detail page
  AND
- Site administrator or designer role assigned at the site level
  AND
- “Manage Profiles and Permission Sets”
  AND
- “Customize Application”
Storing Assets to Use with Salesforce Objects

Because websites built with Site.com are publicly available, site visitors don’t have the security privileges required to view images and documents stored in your Salesforce objects, which are available to authenticated users only.

Therefore, the easiest way to take advantage of Site.com data services is to import the files into Site.com, and instead store a relative URL to these assets in your standard or custom object. Alternatively, if your images or files are hosted elsewhere and readily available on the Internet, you can use an absolute URL.

For example, let’s say you want to use a custom object called “Catalog” to build a Catalog site page that displays product details and images. Before you begin building the Catalog site page, you would:

1. Import the product images into your Site.com site.
2. In the Catalog object, create a field to store the relative URL of the image, such as Image URL.
3. For each product record, add the relative path of the image. This URL is relative to the site, so if you upload widget.png to your site, the relative path is /widget.png. URLs are case sensitive.

Then, when you add a data table, or a data repeater and data elements to the Catalog site page to display the product data, you can reference the Image URL field to dynamically display each product’s image on the page.

- Setting Data Access Permissions for Salesforce Objects
- Site.com Data Services Overview
Dynamically Retrieving and Displaying Data

Dynamically Retrieving Data with Data Repeaters

Use a data repeater to connect to a standard or custom Salesforce object and retrieve a data set based on the filter criteria that you specify. When you combine a data repeater with data elements, custom code, or content blocks, you can create a “repeating template” that displays one or more records on the page.

To add a data repeater to a page:

1. Drag a Data Repeater from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

   **Note:**
   - For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object’s “Read” permission, and refresh the list.
   - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.

3. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.
   a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
   b. Select the operator to control how results are filtered. For example, select Equals to return an exact match.
   c. Select the source of the filter value. For example, to specify an explicit value, select Fixed value, or to use the values passed to the page via a query string, select URL query string.
   d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
   e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

   **Note:** If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click Reload Preview.

4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you’re working with an object that contains user data, you could sort your results by gender first and then by name.

5. In Limits, you can limit the number of returned results. For example, if you’re only interested in the top five results, enter 5 in the Limit results to field.

6. If you’re adding pagination, specify the number of results to display per page in the Results per page field.
7. Click Save.

Next, you must add either data elements, custom code, or content blocks to the data repeater to display the data it retrieves.

Displaying Data Using Data Elements

You can use a data element to display the data retrieved by a page data connection or a data repeater. The data element binds to a field in the object and acts as a placeholder that’s replaced with the field’s data when the page loads.

When combined with a data repeater, data elements result in a “repeating template” that displays one or more records on the page. When used with a page data connection, data elements display data from a single record.

You can use data elements to display plain text, formatted text (for dates and numbers), or images. You can also add hyperlinks to data elements to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed on the page or the data repeater based on their selection. See Data Filtering Examples on page 4634.

When the page is open:

1. Drag a Data Element from the Page Elements pane onto the data repeater. Alternatively, if the page has a page data connection, drag the Data Element page element directly onto the page canvas.

2. Select the field to display. To customize how the field’s data is displayed, click Customize.

   Note: The object’s fields are listed first, followed by the fields of all parent objects, which use the format parent_object_name.field_name.

3. Select the display type.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Lets you display the field’s data as plain text.</td>
</tr>
<tr>
<td>Formatted text</td>
<td>Lets you choose from several text display formats if you’re working with dates, times, or currency.</td>
</tr>
<tr>
<td>Image</td>
<td>Lets you display the field’s data as an image if the field contains an image URL. The URL can be absolute or relative to the site. You can also select a field to use for the alternative text or enter custom text.</td>
</tr>
</tbody>
</table>
4. To create a hyperlink, select Add a hyperlink. Otherwise, go to step 8.

5. Select the link type.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A URL</td>
<td>Lets you link to a Web page by:</td>
</tr>
<tr>
<td></td>
<td>• Choosing a field that you want to reference, such as a field that stores</td>
</tr>
<tr>
<td></td>
<td>the relative URLs of PDFs you uploaded to your site.</td>
</tr>
<tr>
<td></td>
<td>• Choosing a field that you want to reference and clicking Customize to</td>
</tr>
<tr>
<td></td>
<td>add an absolute URL or to create a custom link, such as a URL query</td>
</tr>
<tr>
<td></td>
<td>string.</td>
</tr>
</tbody>
</table>

| An item in your site        | Lets you link to a page, image, or file in the site by selecting the item   |
|                            |   type and then selecting the item. (If you can’t see the list of items,   |
|                            |   place your cursor in the URL field and press the DOWN key on your keyboard.) You can also customize the URL—for example, by creating a URL query string. |

| An email                    | Lets you link to an email message by entering the recipient’s address, and  |
|                            |   the message subject and body.                                            |
|                            | You can use merge fields to access the object’s fields. For example, if an  |
|                            |   object has an Email field, enter the merge field, such as {!email}, in   |
|                            |   the Email address text box.                                              |
|                            | When the link is clicked, it opens a new message window in the user’s email |
|                            |   client and adds the appropriate email address to the To: field.           |

6. Optionally, enter a tooltip by selecting the required field or clicking Customize to add custom text. The tooltip displays as a pop-up when the user hovers over the link.

7. If you’re linking to a URL or an item in your site, specify where the item should open.

<table>

- Displaying Data Using Custom Code
- Displaying Data Using Content Blocks

### Displaying Data Using Custom Code

In addition to data elements and content blocks, you can also use custom code as an alternative way to display data in a data repeater or in a page data connection. It’s particularly useful for displaying field data that’s inline with text.

When the page is open:

1. Drag a **Custom Code** page element from the Page Elements pane onto the data repeater. Alternatively, if the page has a page data connection, drag the **Custom Code** page element directly onto the page canvas.

2. To access the fields of the object that the data repeater or page is connected to, type `{!}` and double-click the expression that you want to display.

   **Note:** The object’s fields are listed first, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.

3. Add any additional expressions or text you require. For example:

   To contact {!Name}, call {!Phone}.

   where `{!Name}` and `{!Phone}` are placeholders for the values of the Name and Phone fields of each record.
4. Click **Save and Close**.

SEE ALSO:
- Dynamically Retrieving Data with Data Repeaters
- Retrieving Data with Page Data Connections

- Data Filtering Examples

**Displaying Data Using Content Blocks**

In addition to data elements and custom code, you can also use content blocks as an alternative way to display data in a data repeater or in a page data connection. It's particularly useful for displaying field data that's inline with text.

When the page is open:

1. Drag a **Content Block** page element from the Page Elements pane onto the data repeater. Alternatively, if the page has a page data connection, drag the **Content Block** page element directly onto the page canvas.

2. Enter the name of the field you want to display using an **expression**. For example, `{!Name}`.

   **Note:** The object's fields are listed first, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.

3. Add any additional expressions or text you require. For example:

   ```
   To contact {!Name}, call {!Phone}.
   ```

   where `{!Name}` and `{!Phone}` are placeholders for the values of the Name and Phone fields of each record.

   You can also use expressions if you're adding a hyperlink to the content block.

4. Click **Save**.

SEE ALSO:
- Dynamically Retrieving Data with Data Repeaters

Dynamically Retrieving Data with Data Tables

Use a data table to connect to a standard or custom Salesforce object, retrieve a data set based on the filter criteria that you specify, and display one or more record as rows in the table. A data table’s columns bind to the fields of the object it’s connected to. Each column cell acts as a placeholder that is replaced with the field’s data when the page loads.

To add a data table to the page:

1. Drag a **Data Table** from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

   - **Note:**
     - For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object’s “Read” permission, and refresh the list.
     - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.
3. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.
   a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
   b. Select the operator to control how results are filtered. For example, select **Equals** to return an exact match.
   c. Select **source** of the filter value. For example, to specify an explicit value, select **Fixed value**, or to use the values passed to the page via a query string, select **URL query string**.
   d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
   e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.
   - **Note:** If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.
4. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you’re working with an object that contains user data, you could sort your results by gender first and then by name.
5. In Limits, you can limit the number of returned results. For example, if you’re only interested in the top five results, enter **5** in the **Limit results to** field.
6. If you’re adding **pagination**, specify the number of results to display per page in the **Results per page** field.
7. Click **Next**.
8. Add available fields to the table by double-clicking a field, or selecting it and clicking **.**
9. Reorder the list of selected fields by clicking Move Up or Move Down.

10. Click Save.

   Note: You can’t add page elements to a data table. However, you can add additional columns to a data table by selecting it and clicking Edit. On the Select Fields screen, select the additional fields and save your changes.

After you’ve added the data table to the page, you can use the Properties pane to:

- Provide a short heading or summary of the table’s purpose in the Caption field. The caption appears above the table, and complies with W3C accessibility standards for screen reader users.
- Hide the column headings by deselecting Show Column Headings in the Table section.
- Make the columns sortable by selecting the jQuery Flexigrid theme in the Theme section and selecting Enable Sorting. The theme also changes the appearance of the table.
- Change the name of a column by selecting the column cell and updating its name in the Column Heading property in the Data Table section.

Editing Columns in a Data Table

A data table’s columns bind to the fields of the object it’s connected to. Each column cell acts as a placeholder that is replaced with the field’s data when the page loads.

You can display plain text, formatted text (for dates and numbers), or images in the column cells. You can also add hyperlinks to column cells to allow site visitors to navigate to another page, such as a detailed description, or to refresh the data displayed in the data table based on their selection. See Data Filtering Examples on page 4634.

To edit a column:

1. Double-click the column cell in the data table.

2. Select the field to display. To customize how the field’s data is displayed, click Customize.

   Note: The object’s fields are listed first, followed by the fields of all parent objects, which use the format parent_object_name.field_name.

3. Select the display type.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text</td>
<td>Lets you display the field’s data as plain text.</td>
</tr>
<tr>
<td>Formatted text</td>
<td>Lets you choose from several text display formats if you’re working with dates, times, or currency.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Image | Lets you display the field’s data as an image if the field contains an image URL. The URL can be absolute or relative to the site. You can also select a field to use for the alternative text or enter custom text.

4. To create a hyperlink, select Add a hyperlink. Otherwise, go to step 8.

5. Select the link type.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| A URL | Lets you link to a Web page by:  
- Choosing a field that you want to reference, such as a field that stores the relative URLs of PDFs you uploaded to your site.  
- Choosing a field that you want to reference and clicking Customize to add an absolute URL or to create a custom link, such as a URL query string. |
| An item in your site | Lets you link to a page, image, or file in the site by selecting the item type and then selecting the item. (If you can’t see the list of items, place your cursor in the URL field and press the DOWN key on your keyboard.)  
You can also customize the URL—for example, by creating a URL query string. |
| An email | Lets you link to an email message by entering the recipient’s address, and the message subject and body.  
You can use merge fields to access the object’s fields. For example, if an object has an Email field, enter the merge field, such as {!email}, in the Email address text box.  
When the link is clicked, it opens a new message window in the user’s email client and adds the appropriate email address to the To: field. |

6. Optionally, enter a tooltip by selecting the required field or clicking Customize to add custom text. The tooltip displays as a pop-up when the user hovers over the link.

7. If you’re linking to a URL or an item in your site, specify where the item should open.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Popup window</td>
<td>Loads the item into a popup window. When you select this option, you can set the title for the popup and control its appearance and size with the options that appear.</td>
</tr>
<tr>
<td>New window (_blank)</td>
<td>Loads the item into a new, unnamed browser window.</td>
</tr>
<tr>
<td>Same window (_self)</td>
<td>Loads the item into the same frame or window as the link. This is the default setting.</td>
</tr>
<tr>
<td>Topmost window (_top)</td>
<td>Loads the item into the topmost parent frameset or window of the frame that contains the link.</td>
</tr>
<tr>
<td>Parent window (_parent)</td>
<td>Loads the item into the parent frameset or window of the frame that contains the link.</td>
</tr>
</tbody>
</table>

8. Click **Save**.

The column is displayed on the page as an expression. To test the output, **preview the page**.

To change the name of a column, select the column cell and update the name in the Column Heading field of the Properties pane.

SEE ALSO:
- Dynamically Retrieving Data with Data Tables
- Site.com Data Services Overview
Adding Pagination to Data Repeaters and Data Tables

Events let you add interactive and animated effects to the pages and page elements of your website. When using data repeaters and data tables, you can add pagination events so users can easily page through the displayed data. This is particularly useful when working with large amounts of data. For example, if you’ve added a data repeater that displays all the users in an organization, you can add pagination to help users navigate through the data. You can add three pagination events:

- Previous Page
- Next Page
- Go To Page

Creating Previous and Next Pagination

You can create previous and next buttons so users can move through the data one page at a time. The process for creating both buttons is the same.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a button to the page.
4. In the Properties pane, change the Button Name to Previous Page or Next Page as appropriate.
5. In the Events pane, select the click event.
6. When the Actions box appears, click + and select the Previous Page or Next Page action.
7. In the Target Element, select the data repeater or data table.
8. Click Save.

Creating GoTo Pagination

Creating GoTo navigation is similar to creating the previous and next buttons, but you must add an input field so users can specify what page they want to go to.

1. Create your data repeater or data table.
2. In the data repeater or data table, be sure to specify how many records to display per page in the Limits section.
3. Drag a Number field onto the page.
4. In the Properties pane, change the field’s Label Name to something that makes sense. For example, Enter Page Number.
5. Drag a Button onto the page.
6. In the Properties pane, change the Button Name to GoTo Page.
7. In the Events pane, select the click event.
8. When the Actions box appears, click + and select the Go To Page action.
9. In the Target Element, select the data repeater or data table.
10. For Input Field ID, select the field you created in step 3.
11. Click Save.

SEE ALSO:
- Dynamically Retrieving Data with Data Repeaters
- Dynamically Retrieving Data with Data Tables
- Creating an Event
- Available Events and Actions

Using Data Functions

A data function lets you connect to a standard or custom Salesforce object, perform calculations on the returned results, and display the calculation on the page. For example, for a particular field in an object, you can use a data function to calculate the total value or the average amount of all returned records.

To add a data function to a page:

1. Drag a Data Function from the Page Elements pane onto the page.
2. Select the object that you want to connect to.

   ![Note]
   - For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object’s “Read” permission, and refresh the list.
   - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.

3. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.
   a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
   b. Select the operator to control how results are filtered. For example, select *Equals* to return an exact match.
   c. Select the source of the filter value. For example, to specify an explicit value, select *Fixed value*, or to use the values passed to the page via a query string, select *URL query string*.
   d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
   e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.

   ![Note]
   - If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click Reload Preview.
4. In Functions, select a function:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Count</td>
<td>Counts the number of records that contain a value for the selected field. For example, if an object contains 30 records, but only 25 records have a value in the field you specify, the result is 25.</td>
</tr>
<tr>
<td>Maximum</td>
<td>Returns the highest value of all the values for the selected field. Applies to numbers, strings, and dates.</td>
</tr>
<tr>
<td>Average</td>
<td>Calculates the average value of all records for the selected field. For example, if you have 20 records with a total value of $20,000 in the Price field, the average is $1,000. Only applicable to fields that contain numbers.</td>
</tr>
<tr>
<td>Minimum</td>
<td>Returns the lowest value of all the values for the selected field. Applies to numbers, strings, and dates.</td>
</tr>
<tr>
<td>Sum</td>
<td>Calculates the total value of all records for the selected field.</td>
</tr>
</tbody>
</table>

5. Select the field it applies to.

6. Click Save.

Page Data Connections Overview

Page data connections make it easy for site administrators and designers to create a detail page for a single record when working with Salesforce objects. When combined with repeater elements, custom code, or content blocks, page data connections let you connect to standard and custom objects, retrieve a specific record, and dynamically display the record on a site page.

Example: For example, let’s say you want to list all of your company’s accounts on a site page called Accounts. When a user clicks a View Details link, you want to open a site page called Account Detail to display information for the selected account.

In this case, you could add a data repeater to the Accounts site page to retrieve a list of records from the Account object (1). Using a data element, you could create a View Details link (2) that, when clicked, uses a URL query string to pass the Account ID field as a unique identifier to the Account Detail page. As the Account Details page loads, the page data connection uses the unique identifier value to dynamically return only that record’s details (3).
With page data connections, you can use expressions to access the returned data anywhere on the page, including the page's properties. For example, let's say you want to use the account name as the title of the Account Detail page. In this case, you would simply enter `{!Name}` in the Title field on the Properties pane. When the page loads, it retrieves the account name for that particular record and displays it in the browser's title bar.

Retrieving Data with Page Data Connections

Use a page data connection to create a detail page for a single record when working with Salesforce objects.

When combined with data elements, custom code, or content blocks, page data connections let you connect to standard and custom objects, retrieve a specific record, and dynamically display the returned data anywhere on the page. You can even use expressions to access the returned data in the page’s properties.

When the page is open:

1. Ensure that the page is selected in the Page Structure pane.
2. Click Add Connection in the Page Data Connection section of the Properties pane.
3. Select the object that you want to connect to.
   
   **Note:**
   - For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object’s “Read” permission, and refresh the list.
   - For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site’s guest user profile.

4. Optionally, in Filters, select criteria to filter which record is returned. If you don’t select any criteria, the first record is returned by default.
   
   a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format parent_object_name.field_name.
   b. Select the operator to control how results are filtered. For example, select Equals to return an exact match.
   c. Select the source of the filter value. For example, to specify an explicit value, select Fixed value, or to use the values passed to the page via a query string, select URL query string.
   d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
   e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.
   
   **Note:** If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click Reload Preview.

5. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, say you want to create a page that displays the most popular movie. You could connect to a custom object that contains movie data, and instead of using filter criteria, you could sort by user rating in descending order. Because a page data connection returns a single record, only the highest rated movie is returned.

6. Click Save.
Next, you must add either data elements, custom code, or content blocks to the page to display the retrieved record data. You can use expressions to access the returned data anywhere on the page, including the page’s properties. For example, let’s say you want to use the account name as the title of the Account Detail page. In this case, you would simply enter `{!Name}` in the Title field on the Properties pane. When the page loads, it retrieves the account name for that particular record and displays it in the browser’s title bar.

Accessing Data in Related Objects Overview

Standard and custom objects have relationships that define how records in one object relate to records in another. For example, the Accounts object has a one-to-many relationship with the Contacts object—that is, each account can have one or more contacts associated with it. This relationship is also known as a parent-to-child or a master-detail relationship.

See Object Relationships for more information about relationships between objects in Salesforce. Data repeaters, data tables, and data functions take advantage of these relationships to let you display data from related objects on the page.

About Accessing Data in Parent Objects

When you add a data repeater, data table, or data function to the page and connect it to a standard or custom object, you can automatically access the fields of any parent object it’s related to.

If you add filter criteria to a data repeater, data table, or data function, the Field drop-down list in the Create Data Connection dialog box displays the object’s fields, followed by the fields of all of its parent objects, which use the format `parent_object_name.field_name`. This lets you filter results based on a field in the parent object. So for example, when retrieving records from the Contacts object, you could decide to return only contacts where the account name `Account.Account.Name` is “ABC Labs.”

Similarly, when you add data elements to a data repeater, or columns to a data table, you can bind them to fields in a parent object. So for example, if you add a data table that’s connected to the Contact object, you can add a column that binds to its `Full Name` field and a column that binds to the Account object’s `Account.Account.Name` field to display the contact’s name along with the name of the account it’s associated with.

About Accessing Data in Child Objects

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a nested data repeater.

Let’s say you want to display a list of accounts along with the names of the associated contacts, similar to this example.
You can achieve this by creating a data repeater (1) that’s connected to Accounts, and adding a data element (2) to it that binds to the `Account Name` field. Then add a nested data repeater (3) that’s connected to Contacts, which is a child of Accounts. Finally, add a data element (4) to the nested data repeater that binds to the Contact object’s `Full Name` field.

Displaying Data from Related Objects Using Nested Data Repeaters

You can retrieve data from any child object of a parent object using a data repeater that contains another data repeater, data table, or data function. The outer or parent data repeater connects to an object, such as Accounts. In turn, the inner data repeater, data table, or data function automatically lets you connect to any child objects, such as Contacts. This is also known as a nested data repeater.

For example, if a data repeater is connected to Accounts, you can add a nested data function to it that’s connected to Contacts to return the number of contacts associated with each account.

To create a nested data repeater:

1. **Add a data repeater** to the page.
2. Drag another **Data Repeater, Data Table, or Data Function** from the Page Elements pane onto the data repeater.
3. Select the related Salesforce object that you want to connect to.
   - **Note:** You can also retrieve data from unrelated objects. However, as this can adversely affect the performance of your site, we recommend retrieving data from related objects only.
4. Optionally, in Filters, select criteria to filter your data set. If you don’t select any criteria, all the data from the item is returned.
   - a. Select the field to which the filter criteria apply. The Field drop-down list displays the object’s fields, followed by the fields of all parent objects, which use the format `parent_object_name.field_name`.
   - b. Select the operator to control how results are filtered. For example, select **Equals** to return an exact match.
   - c. Select the source of the filter value. For example, to specify an explicit value, select **Fixed value**, or to use the values passed to the page via a query string, select **URL query string**.
   - d. Set the value of the filter. If you’re using a query string, you can also specify what should happen if the query string is missing.
   - e. Add additional filter criteria as required to narrow your results further. Each filter item is combined with an AND operator.
   - **Note:** If you’re using a fixed value to filter the results, you can view the returned records in the Connection Preview section. To refresh the list of records, click **Reload Preview**.
5. In Sorting, you can specify whether to sort the results by one or more fields in ascending or descending order. For example, if you’re working with an object that contains user data, you could sort your results by gender first and then by name.
6. In Limits, you can limit the number of returned results. For example, if you’re only interested in the top five results, enter 5 in the **Limit results to** field.
7. If you’re adding pagination, specify the number of results to display per page in the **Results per page** field.
8. If you’re working with a data table, click **Next** and add fields to the table by double-clicking a field, or selecting it and clicking **Add**.
9. Click **Save**.

You can either add **data elements** or **custom code** to the parent repeater to display its fields. Similarly, if you’ve nested a data repeater inside the parent data repeater, add data elements or custom code to the nested data repeater to display the child object’s fields.
Note: You can’t nest data repeaters more than one level deep.

**Improving Performance Using Caching**

When working with data-bound page elements, such as data repeaters, data tables, and data functions, you can improve the performance and page rendering of your website using caching. Caching controls how often a page containing a data connection requests data from Salesforce.

Let’s say 100 people visit the site page at the same time. Without caching, the page makes 100 separate requests for the same data, slowing performance considerably. However, with caching enabled, the data is requested and retrieved only once—the first time someone visits the page. Any subsequent requests for data during a set time period are returned from the cache. When the specified time period expires, the cache is refreshed.

The Cache Duration (Minutes) field in the Properties tab controls the length of time to cache retrieved data for the selected data repeater, data table, or data function.

The default value is 30 minutes. However, the appropriate number of minutes depends on your requirements. For example:

- If the data is updated frequently, such as in a commenting system or a stock ticker, you can disable caching by setting the value to zero to ensure the freshest data displays on the page.
- If the data changes infrequently, say just once a week, you can set the value to a much greater number of minutes. A longer caching period also helps ensure pages can display data even if the data source is momentarily unavailable.

Note: Whenever updates to a site are published, the cache is deleted for all data connections. Caching begins again the next time a site visitor accesses the page.

**Data Filters**

When you add a data repeater, a data table, or a data function to a page, you don’t have to limit the records it retrieves. However, if you’re working with a Salesforce object that has thousands of records, you can limit the returned results using filter criteria.

When you add filter criteria, you need to specify:

- The field to which the filter criteria apply
- The operator
- The source of the filter value
- The filter value
### Filter Operators

<table>
<thead>
<tr>
<th>Operator</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equals</td>
<td>Returns an exact match.</td>
</tr>
<tr>
<td>Not equal to</td>
<td>Returns records that don’t have the value you specify.</td>
</tr>
<tr>
<td>Less than</td>
<td>Returns records that are less than the value you specify.</td>
</tr>
<tr>
<td>Greater than</td>
<td>Returns records that exceed the value you specify.</td>
</tr>
<tr>
<td>Less than or equal to</td>
<td>Returns records that match or are less than the value you specify.</td>
</tr>
<tr>
<td>Greater than or equal to</td>
<td>Returns records that match or exceed the value you specify.</td>
</tr>
<tr>
<td>Starts with</td>
<td>Use when you know what your value starts with, but not the exact text. For example, “california” would return California Travel, but not Surf California.</td>
</tr>
<tr>
<td>Ends with</td>
<td>Use when you know what your value ends with, but not the exact text.</td>
</tr>
<tr>
<td>Contains</td>
<td>Returns records that include your search string but might also include other information. For example, “california” would return California Travel and Surf California.</td>
</tr>
<tr>
<td>Includes</td>
<td>Use for field types that support multiple values to return records that contain one or more of the comma-separated values you specify.</td>
</tr>
<tr>
<td>Includes all</td>
<td>Use for field types that support multiple values to return records that contain all of the comma-separated values you specify.</td>
</tr>
<tr>
<td>Excludes</td>
<td>Use for field types that support multiple values to return records that don’t contain one or more of the comma-separated values you specify. For example, for a Locations category field, “San Francisco,Vancouver” would exclude a record containing “San Francisco,Dallas” and a record containing “Vancouver,New York.”</td>
</tr>
<tr>
<td>Excludes all</td>
<td>Use for a field types that support multiple values to return records that don’t contain all of the comma-separated values you specify. For example, for a Locations category field, “San Francisco,Vancouver” would exclude only records that contain both terms.</td>
</tr>
</tbody>
</table>

### Filter Value Sources

<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fixed value</td>
<td>Use when you want to specify the value.</td>
</tr>
<tr>
<td>URL query string</td>
<td>Use when you want to pass variable content via a URL to the item when the page loads.</td>
</tr>
<tr>
<td>Global property</td>
<td>Use when you want to use a fixed value from the site, such as the current date or current time.</td>
</tr>
<tr>
<td>Request header</td>
<td>Use when you want to use a value from the browser, such as the host header or browser version.</td>
</tr>
</tbody>
</table>
Source | Description
---|---
Parent repeater | Use when you want to create a query between unrelated objects. Available only when a data repeater, data table, or data function is nested inside a parent repeater, but the parent repeater’s object is unrelated to the nested item’s object.

⚠️ Warning: Retrieving data from unrelated objects can adversely affect the performance of your site. We recommend retrieving data from related objects only.

About Displaying Dynamic Data Using Expressions

Site.com uses expression language to display data dynamically. Expressions serve as placeholders for data that will be replaced with information when the page loads. When working with data-bound page elements or custom widget properties, you can use expressions to customize how data is displayed on the page.

In Site.com, expression syntax consists of an open curly brace and exclamation point, the field, custom property name, or namespace name, and a closing curly brace.

For example, if you added a custom property called `URL` to a widget, you can use the syntax `{!URL}` to add the expression to custom code or content blocks. Similarly, to add an expression for the Billing City field, you can use the syntax `{!BillingCity}`. For related objects, the field name is prefixed by the name of the master object: `{!Account.BillingCity}`.

If you’re editing a data element in a data repeater or a data table column, you can access the object’s fields by name in a drop-down list without using expressions. However, if you want to customize how the field is displayed on the page, you can see and edit the expression when you click Customize in the dialog box.

If you’re working with custom code or content blocks in a data repeater, you can only access the object’s fields using expressions.

Expressions let you customize the output by:

- Adding text around the expression. For example, lets say you’re displaying the phone number of each of your business locations. You could enter the text *Contact us at* before the `{!Phone}` expression. When the data is displayed on the page, `{!Phone}` is replaced with the field’s value for each record: *Contact us at 100–200–3000.*

- Formatting the output using HTML tags. For example, you could wrap `H1` tags around the expression to alter how the output is displayed on the page: `<H1>{!Phone}</H1>`.

- Creating a URL query string to pass variable information to a data repeater or data table on another page. The second page, in turn, uses the received variable to retrieve and display the relevant records. For example, you could create a hyperlink, such as `/product_details?productID={!id}`, where `{!id}` is replaced with the product ID for each record. When a particular
product link is clicked, the product ID is passed to the Product Details page, which uses the ID to retrieve the record's information and display it on the page.

Data Filtering Examples
When working with data repeaters, data tables, and data functions, you can filter the data you retrieve in many ways. In this topic, we explore two options—fixed values and URL query strings—to illustrate some common filtering techniques.

Example 1: Using a Fixed Value to Filter Results
In our first example, we have a custom object called “News” that stores company news and events. Each news item has a Status picklist that can be set to either In Progress or Approved. We only want to display approved news items on our Company News page. In this case, we can use a fixed value to filter the data in the News object.

In this scenario you would:
1. Add a data repeater to the page and configure it as follows:
   a. Select the News custom object.
   b. In the Filters section, set the criteria to Status Equals Fixed value.
   c. Enter Approved in the Value text box.

   This tells the data repeater to return only records where the Status field contains the value Approved.
2. Add data elements to the data repeater to display the required fields, such as Title, Description, and Date, on the page.

Example 2: Using a URL Query String to Dynamically Filter and Display Results on Another Page
In our second example, we have a custom object called “Products” that stores product information. However, some products are only available in certain locations, so we’d like to let customers view the products in their nearest city. In this case, we could create a Locations site page that contains links to each available city.

We want each link to open the Products site page, but only display products based on the user’s selection. We can do this using URL query strings, which allow us to pass variable content between HTML pages. The variable information in this case is the product location; the data repeater won’t know which products to return until the user makes a selection.

For this scenario, you would:
1. Add a data repeater to the Products page and configure it as follows:
   a. Select the Products custom object.
   b. In the Filters section, set the criteria to City Equals URL query string.
   c. In the Value text box, enter the variable name—in this case, location.
   d. In the If query string is missing drop-down list, select Don’t apply this filter item. This option is used when a customer wants to view all products without filtering.
   e. Click Save.
2. Add data elements for the fields you want to display, such as Product Name, Description, and Price.

3. On the Locations page, add a data repeater and select the Products custom object.

4. Add a data element to the data repeater to represent the City field and configure it as follows:
   a. Select the City field as the field to display, because we want to use the name of the city as the hyperlink.
   b. Select Text as the display format.
   c. Select Add a hyperlink to display a URL on the page.
   d. In the Link to drop-down list, select An item in your site.
   e. Select Page as the type and select the Products page. (If you can’t see the list of pages, place your cursor in the URL text box and press the DOWN key on your keyboard.)
   f. Change the URL value to /product?location={!City}. In this case, {!City} is a placeholder for the value of a record’s City field. When the page first loads, {!City} is replaced with the correct value, such as Dallas, which creates the following URL for that record:

   /product?location=Dallas

   When clicked, this opens the Products page and passes Dallas as the value of the location variable.

   g. For the tooltip, select the City field and click Customize.
   h. Change the value to Show me products available in {!City}.

   Again, the {!City} placeholder is replaced by the value of the City field for each record when the page loads.

Now, when the Locations page loads, the data repeater displays the location of each product as a link. When a customer clicks a link, such as Dallas, the Locations page passes location=Dallas to the Products page. As the Products page loads, the data repeater uses this value to dynamically return only records where the City field contains the value Dallas.

Collecting and Submitting Data Using Forms

Adding a Form to the Page

Use forms to collect data from your site visitors and submit the data to standard or custom Salesforce objects. Create web-to-lead forms, capture customer details, or gather feedback on your products or services.

To add a form to a page:

1. Drag a Form from the Page Elements pane onto the page.
2. Select the Salesforce object that you want to submit data to.

**Note:**
- For Site.com users, the drop-down list only displays objects that are available to guest users because site visitors access your public site via the Guest User license. To make other objects available, go to the guest user profile, enable the relevant object's "Create" permission, and refresh the list.
- For Communities users, the drop-down list displays objects that may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.

3. Add available fields to the form by double-clicking a field, or selecting it and clicking the [add button].

All required fields are automatically added to the list of selected fields. However, you can hide required fields after you add the form to the page.

4. Reorder the list of selected fields by clicking Move Up or Move Down.
5. Click Save.

**Note:** When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click Configure under Field Properties in the Properties pane, select Global Property as the source, and select Current userID as the value.

After you add a form to the page, you can’t change the object it’s connected to. If you need to connect to a different object, you must replace the form.

You can use the form's Properties pane to:
- See which object the form is connected to.
- Add a title to the top of the form.
- Specify what occurs when a user successfully submits the form.

---

**EDITIONS**

Available in: Salesforce Classic

Available for purchase in: **Enterprise**, **Performance**, and **Unlimited** Editions

Available (with limitations) in: **Developer** Edition

**USER PERMISSIONS**

To add a form to the page:

- Site.com Publisher User field enabled on the user detail page
  AND
  Site administrator or designer role assigned in Site.com Studio

To edit the guest user profile:

- Site.com Publisher User field enabled on the user detail page
  AND
  Site administrator or designer role assigned in Site.com Studio
  AND
  "Manage Users"
  AND
  "Customize Application"
• Change the appearance of the form by selecting a different theme.

   Adding Input Fields to Forms or Pages
   Input Field Types
   Editing Input Fields in a Form

Adding Input Fields to Forms or Pages

Adding Input Fields to a Form
You can add additional input fields to an existing form. Each input field binds to a field in the object the form is connected to.

The quickest option is to:
1. Select the form on the page.
2. Select ☰ > Add Fields.
3. In the Add Fields list, click the fields that you want to add. The Add Fields list displays the available fields in the object that the form is connected to. When you click a field, the correct field type is automatically added to the form, such as a checkbox or picklist field.

Alternatively:
1. Select the form on the page.
2. Select ☰ > Add Page Elements.
3. In the Add Page Elements list, click the input field type that you want to add, such as Checkbox.
4. Choose a field in the Add a Field dialog box and click Save. If no fields of that type exist in the object, you can’t add a field of that type to the form.

Note:
• You can’t add fields to a form by clicking ☰ > Edit Form.
• Formula, encrypted text, geolocation, and lookup field types aren’t supported.
• You can’t configure the default field-level error messages that appear when users enter an incorrect value.

Adding Input Fields to a Page
You can add input fields directly to a page, panel, data repeater, or data table to build your own custom features using custom code. For example, let’s say some of your products are only available in certain locations and you’d like to let customers view the products in their nearest city. You could add a picklist input field to the page that lists the various locations. Using custom code, you could then pass the user’s selection to a data table or data repeater via a query string to display a filtered product list.
To add an input field to the page, drag it from the Page Elements pane onto the page. Alternatively, select the page or container page element in the Page Structure pane, select ☐ ☐ > Add Page Elements, and select the input field.

SEE ALSO:
- Input Field Types
- Input Field Properties
- Editing Input Fields in a Form
- Adding a Form to the Page

Editing Input Fields in a Form

After you’ve added a form to the page, you can edit and reorder its fields.
To reorder fields, drag them to the correct position on the page or in the Page Structure pane. Alternatively, select a field and click ☐ ☐ > Move Up or ☐ ☐ > Move Down.
To hide a field, such as required field that you don’t want your site visitors to see, select Hidden Field in the Properties pane. When you hide a field, you can access it from the Page Structure pane.
To make a field a required field, which means the user must complete the field before submitting the form, select Required Field in the Properties pane. A red asterisk (*) is displayed beside the field to indicate that it’s required. You can’t change the Required Field setting for any fields that are required by the object the form is connected to.
To rename a field, replace the name in the Label Name field in the Properties pane.
To change the appearance of a field on the page, select a different theme in the Properties pane. If the field is in a form, you can only change the form’s theme.

Note:
- You can’t move fields from a form onto the page. However, you can delete non-required fields, or hide both required and non-required fields.
- You can’t drag fields from the page onto a form.

SEE ALSO:
- Adding Input Fields to Forms or Pages
- Input Field Properties
- Setting the Default Value of Input Fields
- Adding a Form to the Page
### Input Field Types

When adding input fields to a form or page, the following field types are available. However, if the object connected to a form doesn’t contain a particular field type, you can’t add that input field type to the form.

<table>
<thead>
<tr>
<th>Page Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checkbox</td>
<td>Lets users set a true (selected) or false (deselected) value on a form or page.</td>
</tr>
<tr>
<td>Currency</td>
<td>Lets users enter a currency amount on a form or page.</td>
</tr>
<tr>
<td>Date</td>
<td>Lets users enter a date on a form or page.</td>
</tr>
<tr>
<td>Date/Time</td>
<td>Lets users enter a date and time on a form or page.</td>
</tr>
<tr>
<td>Email</td>
<td>Lets users enter a valid email address on a form or page.</td>
</tr>
<tr>
<td>Multi-Select Picklist</td>
<td>Lets users select one or more values from a list on a form or page.</td>
</tr>
<tr>
<td>Number</td>
<td>Lets users enter a whole number on a form or page.</td>
</tr>
<tr>
<td>Percent</td>
<td>Lets users enter a percent amount on a form or page.</td>
</tr>
<tr>
<td>Phone</td>
<td>Lets users enter a phone number on a form or page.</td>
</tr>
<tr>
<td>Picklist</td>
<td>Lets users select a value from a list on a form or page.</td>
</tr>
<tr>
<td>Rich Text Area</td>
<td>Lets users enter up to 32,768 characters on a form or page.</td>
</tr>
<tr>
<td></td>
<td>Supports any combination of letters, numbers, or symbols.</td>
</tr>
<tr>
<td></td>
<td>Users can format the text, and add images and hyperlinks.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> A rich text area field can’t be used for image uploads in Site.com sites or Force.com Sites due to security constraints.</td>
</tr>
<tr>
<td>Text</td>
<td>Lets users enter up to 255 characters (depending on the field limit in the Salesforce object) on a form or page.</td>
</tr>
<tr>
<td></td>
<td>Supports any combination of letters, numbers, or symbols.</td>
</tr>
<tr>
<td>Text Area</td>
<td>Lets users enter up to 32,768 characters on a form or page,</td>
</tr>
<tr>
<td></td>
<td>which display on separate lines. Supports any combination of letters, numbers, or symbols.</td>
</tr>
</tbody>
</table>
**Page Element** | **Description**
--- | ---
URL | Lets users enter a valid website address on a form or page.

**SEE ALSO:**
- Adding Input Fields to Forms or Pages
- Input Field Properties
- Adding a Form to the Page

### Input Field Properties

When adding or editing input fields on a form or page, use the options in the Field Properties section of the Properties pane to control how the selected input field functions.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Label Name</td>
<td>The external name of the field. This is displayed as the field name on the form or page.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Sets the field’s default value. This automatically populates the field with the value you specify when the page loads.</td>
</tr>
<tr>
<td>Required Field</td>
<td>When selected, makes the field mandatory, so the user can’t submit a record without entering a value. A red asterisk (*) is displayed beside the field to indicate that it’s required. You can’t change the Required Field setting for any fields that are required by the object the form is connected to.</td>
</tr>
<tr>
<td>Hidden Field</td>
<td>When selected, hides the field from the form or page. For example, you may want to hide a required field from your site visitors, or set the default value for a field that you don’t want users to see or edit. When you hide a field on the page canvas, you can still access it from the Page Structure pane.</td>
</tr>
<tr>
<td>Date/Time Selector</td>
<td>Applies to the Date/Time field only. Sets whether users can select the date and time using a popup calendar.</td>
</tr>
<tr>
<td>Picklist Values</td>
<td>Applies to Picklist and Multi-select Picklist fields only, and only when added directly to the page. Sets the list of items to display in the picklist. (You can’t modify the picklist items if the field is connected to an object.)</td>
</tr>
</tbody>
</table>
Each picklist item consists of a **Label** and a **Value** field. The **Label** field is displayed in the picklist, whereas the **Value** field is an internal value. In most situations, you can use the same value in both fields, unless you want to submit a different value than the one displayed to the user.

Click + to enter values for the **Label** and **Value** fields.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>

### Setting the Default Value of Input Fields

You can set the default value of an input field that you add to a form or page. This automatically populates the input field with the value you specify when the page loads.

When used with a field’s **Hidden Field** property, which hides the field on the form or page, the default value is a useful tool for submitting data that you don’t want your users to see. For example, you could add a hidden field that uses the Global Property option to track when a form is submitted.

**Note:** Default field values that are already set on the object aren’t transferred to Site.com.

To set the default value of a field:

1. Select the field.
2. Click **Configure** in the Properties pane.
3. Select the source of the default value.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Fixed Value</strong></td>
<td>Use when you want to specify the value. For example, for a text field, you could add default text. Alternatively, if the field is a picklist, you can select a default value from the list.</td>
</tr>
<tr>
<td><strong>URL Query String</strong></td>
<td>Use when you want to pass variable content via a URL to the item when the page loads. For example, if you’re working with a picklist field, you could pass variable information, such as location, to filter the list and display only items from that location. See Data Filtering</td>
</tr>
</tbody>
</table>
Examples for similar scenarios using data repeaters.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Property</td>
<td>Use when you want to use a fixed value from the site, such as the current date or current time.</td>
</tr>
<tr>
<td>Request Header</td>
<td>Use when you want to use a value from the browser, such as the host header or browser version.</td>
</tr>
</tbody>
</table>

4. Set the default value.
5. Click **Save**.

**Setting a Form’s Submit Behavior**

When your site visitors submit a form successfully, you can either redirect them to another page or display a message indicating that they were successful.

When the page is open:
1. Select the form in the Page Structure pane.
2. In the Properties pane, select an option in the When Successful drop-down list.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Show another page</td>
<td>Redirects the user to the page that you specify.</td>
</tr>
<tr>
<td>Display a message</td>
<td>Displays a message below the form.</td>
</tr>
</tbody>
</table>

3. As appropriate, specify either:
   - The page to redirect to in the Page URL field. You can enter a relative URL, such as a site page, or an absolute URL. For relative URLs, ensure you include a forward slash (/).
   - The message text in the Message Text field.

Tip: The form’s **Submit** button uses the submit action in the Events pane.

**EDITIONS**

Available in: Salesforce Classic
Available for purchase in: **Enterprise, Performance, and Unlimited** Editions
Available (with limitations) in: **Developer** Edition

**USER PERMISSIONS**

To build, edit, and manage Site.com sites:
- Site.com Publisher User field enabled on the user detail page
  AND
  Site administrator or designer role assigned at the site level
Styling Forms

Forms are styled using CSS themes that you can customize to match the design of your website. When you add a form to a page, the form uses a default theme to control its appearance. To change the form’s theme, select an option in the Theme section in the Properties pane:

- **Default** places the field name above the text box. Required fields are denoted by a red asterisk (*) beside the field name.
- **Salesforce** places the field name to the left of the text box. Required fields are denoted by a red vertical bar (|) in front of the text box.

Alternatively, to customize a theme to suit your needs:

1. Select the form on the page.
2. Select a theme to use as a base in the Theme section of the Properties pane.
3. Open the Style pane and ensure **Class** is selected.
4. In the Style drop-down list, select the part of the form that you want to style. When you select an item, it’s highlighted for a few seconds so you can easily see which part you’re styling.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entire form</td>
<td>Styles the whole form.</td>
</tr>
<tr>
<td>Field rows</td>
<td>Styles each field row.</td>
</tr>
<tr>
<td>Field labels</td>
<td>Styles the labels of each field.</td>
</tr>
<tr>
<td>Fields</td>
<td>Styles the fields (text boxes, drop-down lists, and so on). Only available for the Salesforce theme.</td>
</tr>
<tr>
<td>Required symbol</td>
<td>Styles the asterisk symbol (*) for required fields. Only available for the default theme.</td>
</tr>
<tr>
<td>Error message</td>
<td>Styles the error message that’s displayed when users try to submit an incorrectly completed form. Only available for the default theme.</td>
</tr>
</tbody>
</table>

**Tip:** If you’re familiar with CSS, you can also modify the style of the form in the site’s style sheet.

5. To style the selected part of the form, update the **Style pane properties**. Your theme customizations are reflected immediately in the form, and apply to the selected form only.
6. Repeat as required for each part of the form.

SEE ALSO:

* Adding a Form to the Page
The Default, Error, and No Data Views

When working with data repeaters, data tables, data functions, and forms, you can customize what your site visitors see if an error occurs when connecting to the data source. Additionally, for data tables, data repeaters, data functions, you can customize what’s displayed when no data exists for the current query. For example, if you set up a data repeater to dynamically filter and display results based on the user’s selection, but there are no results for that selection, you can display an appropriate message to explain what happened.

- The Default View (1) is what usually appears on the page. For example, when you add a form to the page, the Default View contains the form’s fields.
- The Error View (2) is displayed if an error occurs when connecting to the data source. It contains a content block with a default message that you can customize. You can also add other page elements to the view.
- The No Data View (3) is displayed when no data exists for the current query. It contains a content block with a default message that you can customize. You can also add other page elements to the view.

Repairing Data Connections

If you or another user modifies the object that an existing data repeater, data table, data function, or form is connected to, the data connection might break. For example, this can happen if a connected object or field is renamed or deleted, or if its permissions are changed.

When you open a site page containing broken data connections, a dialog box that lists the problems appears. Hover over each item’s icon to see the possible solutions.

<table>
<thead>
<tr>
<th>Problem</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>A data repeater, data table, or data function is connected to an object that doesn’t have the correct access permission, or has been renamed or deleted.</td>
<td>Open the guest user profile and ensure the “Read” permission is enabled on the object. If that’s unsuccessful, click Edit beside the listed item to open the Data Connection dialog box, and ensure the correct object is selected. If the object has been renamed, select the renamed object. If the object has been deleted, you must either choose a different object or delete the page element.</td>
</tr>
<tr>
<td>A data repeater, data table, or data function is trying to filter results using fields that are longer visible, or have been renamed or deleted.</td>
<td>Open the guest user profile and ensure the object has the correct field-level security enabled for each field. If that’s unsuccessful, click Edit beside the item to open the Data Connection dialog box, and reset the filter criteria.</td>
</tr>
<tr>
<td>A data element is connected to a field that’s no longer visible, or has been deleted or renamed.</td>
<td>Open the guest user profile and ensure the object has the correct field-level security enabled for the field. If that’s unsuccessful, click Edit beside the item to open the Edit Data Element dialog box, and ensure the correct fields are referenced in all relevant drop-down lists and in any custom text.</td>
</tr>
<tr>
<td>A form is connected to an object that doesn’t have the correct access permission, or has been renamed or deleted.</td>
<td>Open the guest user profile and ensure the “Create” permission is enabled on the object. If that’s unsuccessful, you must replace the form, as you can’t edit a form’s data connection.</td>
</tr>
<tr>
<td>A form is missing one or more required fields, which were added to the object after the form was created.</td>
<td>Add the missing field to the form.</td>
</tr>
<tr>
<td>A form field is pointing to a field that’s no longer visible, or has been renamed or deleted.</td>
<td>Open the guest user profile and ensure the object has the correct field-level security enabled for the field. If that’s unsuccessful, remove the field from the form.</td>
</tr>
</tbody>
</table>

Building Custom Widgets

Widgets Overview

Widgets let you save time by building custom page elements that you and your team can reuse throughout the site.

Using the existing Site.com page elements, such as panels, content blocks, custom code, or data repeaters, you can create widgets to suit your unique requirements. You can add custom properties to allow greater flexibility over how your widgets are reused. And you can even add a widget to another widget!

By using CSS to style the widget, you can ensure it always appears correctly whenever it’s added to site pages or page templates. Additionally, you can let contributors add widgets to site pages and add branding properties that enable contributors to update the widget’s appearance.

With widgets, you can:
- Minimize duplication in your site. You just build once, then reuse.
- Reduce maintenance overheads for you and your team. Any updates you make to a widget are automatically reflected in copies of the widget on the page.
- Improve the load time of your pages.

Example: For example, you could use the custom code page element to create reusable social plug-in widgets, such as Like or Follow buttons from Facebook, or a Twitter feed.

Alternatively, to ensure a consistent look and feel across all of your pages, you could create a corporate header such as this sample header widget. It consists of a panel (1) that contains a company logo (2) and a menu (3). The widget also contains another widget (4) that’s composed of a panel containing custom code for Facebook, Twitter, and RSS plug-ins.

You could also use widgets to store commonly used pieces of text, such as company names, addresses, legal text, and so on. Simply create a widget that contains a content block with the relevant text.
Best Practices for Using Widgets

• Wherever possible, use widgets to reduce duplication in your site design. This is particularly important when working with complex designs or site elements, where maintenance can be time consuming.
• If you plan to use the same widgets across several sites, consider creating a basic site to contain all the required widgets. Then, for each new site, just create a copy of that basic site. That way, each new site automatically includes all of the widgets you created.
• When using CSS to style widgets, add the CSS to the Site Style Sheet, which is the site’s global style sheet. Because every page automatically references the style sheet, you can ensure that each widget will appear correctly on the page.

Creating Widgets
Custom Properties for Page Templates or Widgets Overview
Site Branding Overview

Creating Widgets

Widgets let you create custom, reusable page elements by combining existing Site.com page elements, custom code, and CSS.

When you create a widget, it’s added to the Widgets view on the Overview tab, where you can access and manage all of the site’s widgets. If you make it available, the widget also appears in the Widgets section of the Page Elements tab, where you and your team can easily drag it onto the page. You can also let contributors add widgets to site pages.

1. Hover over Widgets on the Overview tab and click New, or click New Widget when the Widgets view is open.
2. Enter the widget name. This is name that appears in the Page Elements pane.
3. Optionally, add a description.
   The description appears as a tooltip in the Page Elements pane.
4. To add a display icon for the widget, select an image from your imported assets. Use an icon that’s 16 x 16 pixels in size.
5. Optionally, deselect Available in the Page Elements Pane if you don’t want the widget to appear in the Page Elements pane.
   For example, you may not want the widget to appear until you’ve finished building it.
6. Click Apply. Now you’re ready to add page elements to the widget.
7. Click the widget’s name to open it in a new tab.
8. Add the page elements and CSS styles you need.
9. Optionally, add custom properties or branding properties to the widget.

After you finish building the widget, ensure it’s available in the Page Elements tab by selecting Available in Page Elements Pane on the Properties pane.
To let contributor’s add a widget to a site page, select **Available to Contributors** on the Properties pane. This setting controls whether the widget appears in the contributor’s Page Elements pane. You must also ensure that the site includes a template-based site page with at least one editable panel.

- Adding a Widget to a Page

**Adding a Widget to a Page**

Before you can add a widget to a page, you must make sure it’s available for use. Either:

- Select **Available in Page Elements pane** in the Properties pane when the widget is open.
- Hover over the widget in the Widgets view on the Overview tab, select **Edit Properties**, and select **Available in Page Elements pane**.

When the page is open:

1. Drag the widget from the Widgets section of the Page Elements pane onto the page. When you add a widget to a page, it creates a copy or *instance* of the widget. You can’t edit this widget instance.

2. If available, update the properties in the widget instance’s Properties pane.

---

**EDITIONS**

Available in: Salesforce Classic

Available for purchase in: Enterprise, Performance, and Unlimited Editions

Available (with limitations) in: Developer Edition

**USER PERMISSIONS**

To build, edit, and manage Site.com sites:

- Site.com Publisher User field enabled on the user detail page
  
  **AND**
  
  Site administrator or designer role assigned at the site level
Editing and Deleting Widgets

Access the site’s widgets in the Widgets view under All Site Content (on the Overview tab).

To update a widget, hover over it and click 📊. From the 📊 menu, you can:

- Edit the widget. When you edit a widget, it opens in a new tab. Any updates you make are reflected immediately in the site pages or page templates that reference it.
- Update the widget’s properties, including the name, description, display icon, and availability. In the Widgets view, you can also edit the name, description, or availability inline by double-clicking the item.
- Duplicate, preview, or delete the widget. You can’t delete a widget if it’s being used on a site page, page template, or another widget.

Creating Multilingual Sites

Multilingual Sites Overview

Site.com Studio lets you to create different language versions of your site. And because all languages are maintained within the site, you don’t need to create and manage a separate site for each language.

As a site administrator or designer, you can add and manage the languages that you want your site to support. After you add a language to the site, you’ll notice the Site.com Studio language selector on the toolbar, which lets you and your team switch between languages when editing the content of a page. This makes content editing quick and easy because you never have to leave the page to change to another language.

Contributors, designers, and site administrators can each add language-specific content to a page using the language selector.

As a site administrator or designer, you can also export site content as an .xml file and send it to your translation service. After you receive the edited file, simply import it back into your site to populate each page with the translated content.
In turn, to let your site visitors choose their preferred language from those available when viewing the site, you can add a Language Selector page element to your pages. And in case any part of the site content isn’t available in their chosen language, you can specify a fallback language to display instead.

Example: For example, if a site visitor chooses French (CA) from the language selector, but there is no content for that page in French (CA), content in the fallback language—say, French (FR)—is displayed instead.

SEE ALSO:
- Creating a Multilingual Site
- About Editing Language Content

Creating a Multilingual Site

Creating a multilingual site is a multistep process that involves defining the languages you want your site to support, adding translated content for each language, and letting your site visitors choose their preferred language.

1. Set the default site language. It’s important that you set this before you begin adding translated content to your site.
2. Add languages to the site.
3. Set options for each language, such as the display language and fallback language.
4. Add content for each site language one of two ways:
   - Edit the page content for each language directly.
   - Export the content for translation and then import the translated content.
5. Add a Language Selector page element to your site pages so authenticated site users can choose their preferred language.
6. If you have a self-service community built on the Napili template, add the Language Picker component to your community pages so guest users (users who aren’t logged in) can choose their preferred language. For details, see Using Templates to Build Communities.

Tip: After you add language-specific content to your site, you can share a separate preview URL for each language. Just switch to the desired language in the Site.com Studio language selector and click View Anonymous Preview. Then copy the link to send it to your reviewers.

SEE ALSO:
- Multilingual Sites Overview
- About Editing Language Content
Setting the Default Language

The default language is the language in which your site initially displays. By default, it’s set to English (US), and it serves as the starting point when you add new languages.

It’s important to set the default language before you add any language content to your site. This setting is not associated with the default language setting in your Salesforce organization.

1. Click Site Configuration > Languages on the Overview tab.
2. Select a language in the Default Site Language drop-down list.

Note: If you decide to change the default language after you add translated content, you must first export the translated content, then change the default language, and finally, import the content back into your site. Otherwise the translated content won’t appear for the newly selected default language.

For example, let’s say you make English the default site language and add French as a site language. After you add content in both English and French, you decide to change the default site language to French. To preserve the French content, you must first export it. Then, select French as the default site language before importing the French content back into the site.

Adding Languages
Add the languages you want your site to support.

1. Click Site Configuration > Languages on the Overview tab.
2. Click Add Languages.
3. Select the languages you want to add to your site.
4. If necessary, reorder the list as you want it to appear in any language selector.
5. Save your changes.

SEE ALSO:
  Setting the Default Language
  Setting Language Options
  Deleting Languages
Setting Language Options

After you add site languages in the Languages view, you can define separate settings for each one.

1. Click Site Configuration > Languages on the Overview tab.
2. Select a language in Site Languages.
3. Update the options in Language Settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active on Live Site</td>
<td>If you add a language selector element on your active site, this checkbox controls whether the language shows in the drop-down list. Use the property to hide a language until you’re ready to release the associated content to your site visitors.</td>
</tr>
<tr>
<td>Fallback Language</td>
<td>The fallback language displays when there’s no content available for the currently selected language. For example, if a site visitor chooses Japanese from the language selector, but there is no content for that page in Japanese, content in the fallback language is displayed instead.</td>
</tr>
<tr>
<td>Display Label</td>
<td>You can define the display label for each language. It appears in any language selectors you add to your site, and in the Site.com Studio language selector.</td>
</tr>
</tbody>
</table>

SEE ALSO:
- Adding Languages
- Setting the Default Language

About Editing Language Content

The default language is the language in which your site initially displays. By default, it’s set to English (US), and it serves as the starting point when you add new languages. So for example, if you build your site and then add French as a site language, the French version initially contains English (US) content until you replace it with French-specific content.

After you add a language to your site, the Site.com Studio language selector appears on the toolbar. It lets you switch between languages as you edit content on each page. For example, if you add French and Spanish to your site, the language selector displays French, Spanish, and English (US).
Content blocks display icons to let you know whether content for the selected language has been replaced.

- A warning icon (⚠️) indicates that the text that has not yet been replaced.
- A globe icon (🌐) indicates that the content has been replaced.

In addition, several page elements have language aware properties, meaning they can store different values for each language. These properties are indicated in the Properties pane by a globe icon (🌐).

You can add content for each site language one of two ways:

- **Edit the page content** for each language directly using the Site.com Studio language selector.
- **Export the content for translation** and then **import the translated content** back into the site.

### Language Display Order

After you add language-specific content to your site, content on the page is displayed in the following order, depending on which language content is available:

1. Selected language
2. Fallback language
3. Default language

For example, if you delete the French contents of a content block, and Spanish is the fallback language, the Spanish content is displayed rather than the default language content. In turn, if you delete the Spanish content, then the default language content is displayed.

### Language–Aware Page Elements

The following page elements support translated content:

- Content Block
- Custom Code
- Data Element
- Form
- Input Fields
- Image
- Language Selector

SEE ALSO:

- Language-Aware Properties
Editing Language Content on the Page

The Site.com Studio language selector lets you switch between languages as you edit content on each page. Contributors, designers, and site administrators can each add language-specific content to a page using the language selector.

When the page is open:

1. Select a language in the Site.com Studio language selector (the Change Site Language drop-down list on the toolbar).
2. Edit the page content.
   If you're viewing a content block in a specific language:
   - A warning icon (⚠️) indicates that the text that has not yet been replaced.
   - A globe icon (🌐) indicates that the content has been replaced.
3. Optionally, update the language-aware properties as required.

   **Note:** Site.com Studio does not validate languages as you enter content. Take care to add the correct content for the selected language.

To revert translated content, right-click the content block and select **Revert Translation**. Text reverts to the fallback language, if specified, or else to the default site language.

SEE ALSO:

About Editing Language Content

Language-Aware Properties

Several properties in the Properties pane are language aware, meaning they can store different values for each language.

If you don’t specify language-specific properties for a page or page element, the property values of the default languages are used instead.

<table>
<thead>
<tr>
<th>Property</th>
<th>Applies To</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternative Text</td>
