Available in: Salesforce Classic

Available in: **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

View existing milestones in your org on the Milestones page under Entitlement Management in Setup. The Milestones related list on entitlements and entitlement processes also lists associated milestones.

Tip: There are several ways that you can view a list of records with milestones in your org:

- To view work orders with milestones, create a work order report using the Object Milestones custom report type
- To view cases with milestones, create a case report using the Cases with Milestones custom report type
- Create list views that filter on milestone fields

Before using milestones in your support process, review [Milestone Limitations](#) on page 2578.

Tip: The Entitlement Management Trailhead module introduces you to common terms and walks you through the process of creating milestones. And, it's fun! To get started, see [Entitlement Management](#).

- [Milestone Actions](#)

Milestone Statuses

Milestones on support records display one of three statuses.

Status	What It Means	Example
Compliant	Milestones on the record are either complete or not in violation. Important: New records display as compliant because they're not in violation.	The first response on a case is complete or not in violation.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Status	What It Means	Example
 Open Violation	One or more milestones on the record have been violated, and steps in the support process are incomplete.	The assigned agent didn't complete the first response on a case before the milestone expired.
 Closed Violation	One or more milestones on the record were violated, but the steps in the support process were still completed.	The assigned agent completed the first response on a case after the milestone expired.

SEE ALSO:

[Entitlement Processes](#)[Add a Milestone to an Entitlement Process](#)[Milestone Actions](#)

Milestone Actions

Milestone actions are time-dependent workflow actions that occur on milestones in an entitlement process. Actions can be added to milestones after the milestone is added to an entitlement process.

For example, you can create a milestone action that:

- Sends an email alert to certain users an hour before a First Response milestone is near violation
- Updates certain fields on a case one minute after a First Response milestone successfully completes

You can add three types of actions to milestones:

Action Type	Description
 Success Actions	The actions to take when a milestone successfully completes. Success actions still fire on milestones that are closed late.
 Warning Actions	The actions to take when a milestone is near violation.
 Violation Actions	The actions to take when a milestone is violated.

You can automate the following actions for each action type:

Workflow Action	What It Does	Example
New Task	Create a workflow task	Create a task for a support agent to call a customer when a First Response milestone is violated.
New Email	Create an email alert	Notify case owners when a First Response milestone on their case is near violation.
New Field Update	Define a field update	Update the case Priority field to High when a First Response milestone is near violation.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Workflow Action	What It Does	Example
New Outbound Message	Define an outbound message	Send data about parts or services to an external system after a First Response milestone is completed.
Select Existing Action	Select an existing action	Use an existing email alert to notify a case owner when their case is near violation of a first response.

[Entitlement Processes](#)

[How a Record Moves Through an Entitlement Process](#)

Milestone Recurrence Types

When you create a milestone, you must choose its recurrence type. Learn what each recurrence type means and when to use it.

There are three milestone recurrence types in Salesforce:

Recurrence Type	What It Means	How the Start Date is Determined	Examples
No Recurrence	The milestone only occurs once on the support record*.	The Start Date is the time when the milestone criteria are met on the record.	"First Response" "Resolution Time"
Independent	The milestone occurs whenever the milestone criteria match the record criteria.  Note: Only one occurrence of an independently recurring milestone can be active at a time.	The Start Date is the time when the milestone criteria are met on the record, regardless of when the previous occurrence was completed.	"Response Time"
Sequential	The milestone occurs on repeat whenever the milestone criteria	For the first occurrence, the Start Date is the time when the milestone criteria are met on the case.	"Customer Contact Made"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

Recurrence Type	What It Means	How the Start Date is Determined	Examples
	<p>match the record criteria.</p> <p> Note: Only one occurrence of a sequentially recurring milestone can be active at a time.</p>	<p>For future occurrences:</p> <ul style="list-style-type: none"> The Start Date is the time when the milestone criteria are met on the record, as long as it's later than the previous occurrence's Target Date. If an occurrence is completed <i>before</i> its Target Date and the milestone criteria are met on the record again, the next occurrence starts at the previous occurrence's Target Date. If an occurrence is completed <i>after</i> its Target Date, the next occurrence's Start Date is the time when the milestone criteria are met on the record. 	

*In these definitions, a support record includes cases and work orders.

 **Example:**

No Recurrence Type

A milestone named "Resolution Time" is set up to ensure that cases are resolved within 4 hours. The milestone has one criterion: *Case: Status EQUALS New, Working, Escalated.*

Here's how this milestone can be used:

- At 10 a.m., a case is created whose Status is *New*, causing the milestone criteria to match the case criteria.
- The "Resolution Time" milestone is automatically created with these settings:
 - Start Date = 10 a.m. (the current time)
 - Target Date = 2 p.m. (4 hours from the Start Date)
- At 1 p.m., the support agent resolves the customer's issue and closes the case, and the milestone is marked complete.

Independent

A milestone named "Engineer Solution Proposed" is set up to track case escalation to Engineering. When this milestone occurs, the support agent expects a proposed solution from Engineering within 4 hours. The milestone has one criterion: *Case: Status EQUALS Waiting on Engineer* (a custom status).

Here's how this milestone can be used:

- At 10 a.m., the support agent escalates a case to Engineering, causing the milestone criteria to match the case criteria.
- An occurrence of the "Engineer Solution Proposed" milestone is automatically created with these settings:

- Start Date = 10 a.m. (the current time)
 - Target Date = 2 p.m. (4 hours after the Start Date)
3. At 11 a.m., well before the Target Date, an engineer proposes a solution that's sent to the customer. The milestone is marked complete manually or via a workflow.

If the proposed solution works, there may be no other occurrences of the "Engineer Solution Proposed" milestone on the case. However, if the solution doesn't solve the customer's issue, another occurrence would be created:

1. At 1 p.m., the support agent re-escalates the case to Engineering, causing the milestone criteria to match the case criteria.
2. A second occurrence of the "Engineer Solution Proposed" milestone is created with these settings:
 - Start Date = 1 p.m. (the current time)
 - Target Date = 5 p.m. (4 hours after the Start Date)

The case now has two "Engineer Solution Proposed" milestones:

- One completed milestone that started at 10 a.m.
- One incomplete milestone that started at 1 p.m. and has a Target Date of 5 p.m.

The milestone can recur as many times as necessary until the entitlement process is completed.

Sequential

A milestone named "Customer Contact Made" is set up to track daily contact with a customer as part of an SLA. When this milestone occurs, the support agent has 24 hours to communicate with the customer.

Here's how this milestone can be used:

1. At 10 a.m. on Monday, a case is created whose entitlement process includes the "Customer Contact Made" milestone. The milestone has these settings:
 - Start Date = 10 a.m. Monday (the current time)
 - Target Date = 10 a.m. Tuesday (24 hours after the Start Date)
2. At 11 a.m. on Monday, the support agent communicates with the customer. This means that the milestone can be marked complete, and milestone's second occurrence is created. However, because the previous occurrence's Target Date is still in the future, the Start Date of the second occurrence is 10 a.m. Tuesday.

The case now has two "Customer Contact Made" milestones:

- One completed milestone that started at 10 a.m. Monday
- One incomplete milestone that is scheduled to start at 10 a.m. Tuesday with a Target Date of 10 a.m. Wednesday

If the support agent communicates with the customer multiple times on Monday, it doesn't affect the Tuesday milestone.

[Add a Milestone to an Entitlement Process](#)

Milestones: Supported Objects

Milestones represent required support steps that your team must complete to resolve a customer issue. Find out where you can use milestones in Salesforce.

What types of records can I add milestones to?

- Cases
- Work orders

How do I add milestones to a record?

Here are the general steps you'll follow:

1. Create "master" milestones in Setup that represent required steps in your support process.
2. Add the milestones to an entitlement process, which is a customizable timeline of milestones.
3. Apply the entitlement process to a customer entitlement.

When you link a support record, such as a work order, to an entitlement that includes an entitlement process, the process—with its milestones—is automatically applied to the record. To learn more, see [Set Up Milestones](#).

Can I use the same entitlement for work orders and cases?

If the entitlement has an entitlement process associated with it, don't use the entitlement for multiple types of support records. Every entitlement process has a type—Case or Work Order—and a process only works on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process runs only on cases associated with the entitlement. If a work order is also associated with the entitlement, the process doesn't run on the work order.

When I create a milestone, can I add it to both types of entitlement processes?

Yes. For example, if you create a First Response milestone in Setup, you can add it to both Case and Work Order entitlement processes.

How do I set the type of an entitlement process?

You select the type when you create the entitlement process. Entitlement processes created before Summer '16 use the Case type. You can see an entitlement process's type on its detail page.

Can I change the type of an entitlement process?

No. Once an entitlement process is created, all its versions must use the same type. Want to make the most of a particularly awesome entitlement process? Remember that you can easily create a similar process of a different type using the same milestones.

Are milestones supported in Lightning Experience?

Case milestones aren't supported in Lightning Experience. Milestones on work orders are available in Lightning Experience with some limitations:

- The Object Milestones related list and milestone tracker are not available on work orders in Lightning Experience
- Updates to entitlement processes and milestones must be made in Salesforce Classic
- Clicking a milestone-related feed item on a work order in Lightning Experience redirects you to Salesforce Classic

Where do I manage milestones in my org?

- View and create milestones from the Milestones node in Setup under Entitlement Management
- Manage **case** milestone page layouts and validations rules from the Case Milestones node in Setup
- Manage **work order** milestone page layouts and validation rules from the Object Milestones node in Setup

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Set Up Milestones

Milestones represent required steps in your support management process, like first response times. Set up and customize milestones in your org so they can be added to entitlement processes and applied to support records like cases and work orders.

1. [Customize Milestone Page Layouts](#)

Milestones appear in the Case Milestones related list on cases, and the Object Milestones related list on work orders. Customize your page layouts to help support agents and supervisors track support progress.

2. [Enable Milestone Feed Items](#)

Help support agents monitor support activity by enabling milestone feed items. This option posts a notification to the feed and the record owner's profile page when a milestone is completed or violated.

3. [Set Up the Milestone Tracker](#)

The milestone tracker gives support agents a complete view of upcoming and closed milestones, and displays countdowns for active and overdue milestones. Add it to the case feed, work order feed, a custom page, or the service console.

4. [Limit User Updates to Milestones](#)

Add validation rules to milestones to prevent users from updating milestones unless certain criteria are met.

5. [Create a Milestone](#)

Milestones represent required steps in your support process, such as case resolution time and first response time. You'll create "master" milestones in your org, then add them to entitlement processes to enforce different service levels on support records like cases and work orders.

6. [Auto-Complete Case Milestones](#)

Create an Apex trigger that automatically marks milestones Completed on cases that match unique criteria. In your trigger, define which events and related case criteria must be satisfied for a milestone to be marked Completed. You can implement a similar trigger to auto-complete work order milestones.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Customize Milestone Page Layouts

Milestones appear in the Case Milestones related list on cases, and the Object Milestones related list on work orders. Customize your page layouts to help support agents and supervisors track support progress.

1. Add any of the following fields to case and object milestone detail pages.
 - To edit case milestone detail page layouts, from Setup, enter *Case Milestones* in the Quick Find box, then click **Page Layouts** under Case Milestones.
 - To edit object milestone detail page layouts (which apply to work order milestones), from Setup, enter *Object Milestones* in the Quick Find box, then click **Page Layouts** under Object Milestones.

Field	Description
Actual Elapsed Time	<p>The amount of time that it took to complete a milestone.</p> <p>(Elapsed Time) – (Stopped Time) = (Actual Elapsed Time)</p> <p> Note: If you want to be able to display this field, Enable stopped time and actual elapsed time must be selected on the Entitlement Settings page.</p>
Completed	Icon (✓) that indicates a milestone completion.
Completion Date	The date and time the milestone was completed.
Elapsed Time	The time it took to complete a milestone. Automatically calculated to include any business hours on the support record. Elapsed time is calculated only after the Completion Date field is populated.
Entitlement Process	The entitlement process that is being used for the record. Entitlement processes are optional.
Start Date	The date and time that the milestone tracking started.
Stopped Time	<p>How long an agent has been blocked from completing a milestone. For example, an agent might wait for a customer to reply with more information.</p> <p> Note: Enable stopped time and actual elapsed time must be selected on the Entitlement Settings page.</p>
Target Date	The date and time to complete the milestone.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To create and edit page layouts:

- “Customize Application”

To create milestones:

- “Manage Entitlements”
- AND
- “Customize Application”

To enable the “Stopped Time” and “Actual Elapsed Time” fields:

- “Manage Entitlements”

Field	Description
Target Response	The time to complete the milestone. Automatically calculated to include any business hours on the support record.
Time Remaining	The time that remains before a milestone violation. Automatically calculated to include any business hours on the support record.
Time Since Target	The time that has elapsed since a milestone violation. Automatically calculated to include any business hours on the support record.
Violation	Icon (🚫) that indicates a milestone violation.

2. Add milestone elements to case and work order page layouts:

a. Add milestone fields:

Field	Description
Milestone Status	The milestone's status.
Milestone Status Icon	An icon that corresponds to the milestone status: <ul style="list-style-type: none"> •  Compliant •  Open Violation •  Closed Violation
Entitlement Process Start Time	The time the record enters the entitlement process.
Entitlement Process End Time	The time the record exits the entitlement process.

b. Add the Case Milestones or Object Milestones related list to display the record's milestones.

Enable Milestone Feed Items

Help support agents monitor support activity by enabling milestone feed items. This option posts a notification to the feed and the record owner's profile page when a milestone is completed or violated.

Important:

- Chatter and entitlements must be enabled in your org.
 - Enabling milestone feed items doesn't create feed items for milestones that have already been completed or violated.
 - If you add entitlement management to a community, enabling milestone feed items also makes feed items visible to community users.
1. From Setup, enter *Entitlement Settings* in the Quick Find box, then select **Entitlement Settings**.
 2. Select **Enable milestone feed items**. This enables feed items for both cases and work orders.

Set Up the Milestone Tracker

The milestone tracker gives support agents a complete view of upcoming and closed milestones, and displays countdowns for active and overdue milestones. Add it to the case feed, work order feed, a custom page, or the service console.

Often, support agents' performance is measured by how often they meet milestones. The milestone tracker helps agents be prepared for support deadlines by showing them:

- The time remaining until an active milestone reaches its Target Date
- The time passed since an overdue milestone's Target Date
- A list of upcoming milestones
- A list of closed milestones

When a milestone is in progress, the milestone is represented by a green circle. The circle winds down clockwise as time elapses. The remaining time is shown in the center of the circle. When the time to complete the milestone expires, the circle turns red. The amount of time that the milestone is overdue is shown in the center of the circle.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To enable milestone feed items:

- "Manage Entitlements"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To create and edit page layouts:

- "Customize Application"

To assign page layouts:

- "Manage Users"

To set how time displays in the milestone tracker:

- "Manage Entitlements"

If more than 24 hours remain on a milestone, the countdown displays in days (for example, 1d). When fewer than 24 hours remain, the countdown format switches to hours/minutes/seconds.

1. Expose the milestone tracker to support agents.

You can expose the tracker in one of three ways:

- Add it to the case feed. If you plan to use milestones on work orders, follow the same steps to add the tracker to the work order feed.
 - a. From the object management settings for cases, go to Page Layouts.
 - b. In the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - c. In the Other Tools and Components section, select the Milestone Tracker and specify where on the page you want it to appear.
 - d. Click **Save**.
- Add it to a custom Visualforce page using the `<apex:milestoneTracker>` component.
- Add it as a component to the service console.

2. Set how the milestone tracker displays time remaining or time overdue on milestones.

By default, the tracker uses actual hours. To make it display time remaining or time overdue in business hours, follow these steps.

- a. From Setup, enter *Entitlement Settings* in the Quick Find box, then select **Entitlement Settings**.
- b. In the Milestone Tracker section, deselect **Show the time remaining in actual hours, not business hours**.
- c. Click **Save**.

Example: Suppose an active milestone's business hours are 9 a.m. to 5 p.m. Right now, it's 4:30 p.m. and the milestone's Target Date is 11:00 a.m. tomorrow.

- If the milestone tracker shows the remaining time in **business hours** (the default setting), it displays a countdown of 2 hours and 30 minutes (4:30 to 5 p.m. today and 9 to 11 a.m. tomorrow).
- If the milestone tracker shows the remaining time in **actual hours**, it displays a countdown of 18 hours and 30 minutes (4:30 p.m. today to 11:00 a.m. tomorrow).

Limit User Updates to Milestones

Add validation rules to milestones to prevent users from updating milestones unless certain criteria are met.

1. From the object management settings for case milestones, go to Validation Rules.
2. Click **New**.
3. Enter the rule details.
4. Save your changes.

Example: This validation rule prevents users from selecting milestone completion dates that are earlier than the case creation date. You can create a similar validation rule for work orders from the object management settings for Object Milestones in Setup.

Field	Value
Rule Name	<code>milestone_completion_date</code>
Description	<i>A milestone's completion date must be later than the case creation date.</i>
Error Condition Formula	<code>CompletionDate < Case.CreatedDate</code>
Error Message	<i>Error: The milestone completion date must be later than the case creation date.</i>
Error Location	<i>Top of Page</i>

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To define or change field validation rules:

- "Customize Application"

To create or edit milestones:

- "Manage Entitlements"

Create a Milestone

Milestones represent required steps in your support process, such as case resolution time and first response time. You'll create "master" milestones in your org, then add them to entitlement processes to enforce different service levels on support records like cases and work orders.

1. From Setup, enter *Milestones* in the Quick Find box, then select **Milestones** under Entitlement Management.
2. Click **New Milestone**.
3. Enter a name and description. Try to name milestones after common support tasks, like "First Response Time" or "Resolution Time". Descriptive names help users understand milestones when they see them on cases, work orders, or entitlement processes.
4. Select a recurrence type.

Recurrence Type	Description	Example
No Recurrence	The milestone occurs only once on the record.	"First Response" "Resolution Time"
Independent	The milestone occurs whenever the milestone criteria are met on the record.	"Response Time"
Sequential	The milestone occurs <i>on repeat</i> whenever the milestone criteria are met on the record.	"Customer Contact Made"

5. Click **Save**.

You can't apply milestones to a record by themselves; they must be part of an entitlement process. So after you create your milestone, [add it to an entitlement process](#).

Tip: You can add validation rules to milestones so users can only update a milestone if it meets specific standards. For details, see [Limit User Updates to Milestones](#).

To create milestones:

- "Manage Entitlements"
- AND
- "Customize Application"

Auto-Complete Case Milestones

Create an Apex trigger that automatically marks milestones Completed on cases that match unique criteria. In your trigger, define which events and related case criteria must be satisfied for a milestone to be marked Completed. You can implement a similar trigger to auto-complete work order milestones.

The following triggers mark specific types of milestones Completed when the case they are on meets unique criteria. We've also provided a milestone utility Apex class and accompanying unit tests. Define the milestone utility class before you use any of the triggers.

Milestone Utility Apex Class

Apex classes reduce the size of your triggers and make it easier to reuse and maintain Apex code. To define this Apex class in your org:

1. From Setup, enter *Apex Classes* in the Quick Find box, then click **Apex Classes**.
2. Click **New**.
3. Copy the class text and paste it into the text field.
4. Click **Save**.

```
public class MilestoneUtils {
    public static void completeMilestone(List<Id> caseIds,
        String milestoneName, DateTime complDate) {
        List<CaseMilestone> cmsToUpdate = [select Id, completionDate
            from CaseMilestone cm
            where caseId in :caseIds and cm.MilestoneType.Name=:milestoneName
            and completionDate = null limit 1];
        if (cmsToUpdate.isEmpty() == false){
            for (CaseMilestone cm : cmsToUpdate){
                cm.completionDate = complDate;
            }
            update cmsToUpdate;
        }
    }
}
```

Apex Class Unit Test

You can set up Apex unit tests in the developer console to scan your code for any issues. To keep things running smoothly, Salesforce requires at least three-quarters of your Apex code lines to be covered by tests.

```
static testMethod void TestCompleteMilestoneCase() {

    Contact oContact = [select id from Contact limit 1];
    String contactId;
    if (oContact != null)
        contactId = oContact.Id;

    Entitlement entl = [select id from Entitlement limit 1];
    String entlId;
    if (entl != null)
        entlId = entl.Id;

    List<Case> cases = new List<Case>{};
    if (entlId != null){
```

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To define Apex triggers and classes:

- "Author Apex"

```

        Case c = new Case(Subject = 'Test Case with Entitlement ',
            EntitlementId = entlId, ContactId = contactId);
        cases.add(c);
    }
    if (cases.isEmpty()==false){
        insert cases;
        List<Id> caseIds = new List<Id>();
        for (Case cL : cases){
            caseIds.add(cL.Id);
        }
        milestoneUtils.completeMilestone(caseIds, 'First Response', System.now());
    }
}

static testMethod void testCompleteMilestoneViaCase(){
    Entitlement entl = [select id from Entitlement limit 1];
    String entlId;
    if (entl != null)
        entlId = entl.Id;
    List<Case> cases = new List<Case>{};
    for(Integer i = 0; i < 1; i++){
        Case c = new Case(Subject = 'Test Case ' + i);
        cases.add(c);
        if (entlId != null){
            c = new Case(Subject = 'Test Case with Entitlement ' + i,
                EntitlementId = entlId);
            cases.add(c);
        }
    }

    insert cases;

    List<CaseComment> ccs = new List<CaseComment>{};
    for(Case c : cases){
        CaseComment cc = new CaseComment(CommentBody='TestPublic',
            IsPublished=true, ParentId=c.Id);
        ccs.add(cc);
        cc = new CaseComment(CommentBody='TestPrivate',
            IsPublished=false, ParentId=c.Id);
        ccs.add(cc);
    }
    if (ccs.isEmpty()==false)
        insert ccs;

    List<EmailMessage> emails = new List<EmailMessage>();
    for(Case c : cases){
        emails.add(new EmailMessage(parentId = c.id));
    }
    if(emails.isEmpty()==false)
        database.insert(emails);

    for(Case c : cases){
        Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();
        String[] toAddr = new String[] {'user@company.com'};
    }
}

```

```

        mail.setToAddresses(toAddr);
        mail.setSaveAsActivity(false);
        mail.setTargetObjectId(c.ContactId);
        mail.setWhatId(c.Id);
        mail.setHtmlBody('TestHTMLBody');
        mail.setPlainTextBody('TestTextBody');
        Messaging.sendEmail(new Messaging.SingleEmailMessage[] { mail });
    }

    for(Case c : cases){
        c.Status = 'Closed';
    }
    update cases;
    List<Case> insertedCases = [SELECT Subject,
                               Description,
                               (SELECT IsPublished, CommentBody From CaseComments),
                               (SELECT TextBody, Subject, Incoming From EmailMessages)
                               FROM Case
                               WHERE Id IN :cases];
}

```

Sample Trigger 1

You can create a milestone named Resolution Time that requires cases to be closed within a certain length of time. It's a great way to enforce case resolution terms in SLAs. This sample case trigger marks each Resolution Time milestone Completed when its case is closed. This way, the support agent doesn't have to manually mark the milestone completed after closing the case.

Note: This trigger references the milestone utility test class, so be sure to define the test class first.

To define this trigger in your org:

1. From Setup, enter *Case Triggers* in the Quick Find box, then click **Case Triggers**.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```

trigger CompleteResolutionTimeMilestone on Case (after update) {
    if (UserInfo.getUserType() == 'Standard'){
        DateTime completionDate = System.now();
        List<Id> updateCases = new List<Id>();
        for (Case c : Trigger.new){
            if (((c.isClosed == true)|| (c.Status == 'Closed'))&&((c.SlaStartDate
                <= completionDate)&&(c.SlaExitDate == null)))
                updateCases.add(c.Id);
        }
        if (updateCases.isEmpty() == false)
            milestoneUtils.completeMilestone(updateCases, 'Resolution Time', completionDate);
    }
}

```

Sample Trigger 2

You can create a milestone named First Response that requires agents to get in touch with a case contact within X minutes or hours of the case's creation. It's a nice way to ensure that your support team is communicating with case contacts as soon as possible. This

sample email trigger marks a First Response milestone Completed when an email is sent to the case contact. That way, the support agent doesn't have to manually mark the First Response milestone Completed after they email the case contact.

 **Note:** This trigger references the milestone utility test class, so be sure to define the test class first.

To define this trigger in your org:

1. From Setup, enter *Email Triggers* in the Quick Find box, then click **Email Triggers**.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```
trigger CompleteFirstResponseEmail on EmailMessage (after insert) {
    if (UserInfo.getUserType() == 'Standard'){
        DateTime completionDate = System.now();
        Map<Id, String> emIds = new Map<Id, String>();
        for (EmailMessage em : Trigger.new){
            if(em.Incoming == false)
                emIds.put(em.ParentId, em.ToAddress);
        }
        if (emIds.isEmpty() == false){
            Set <Id> emCaseIds = new Set<Id>();
            emCaseIds = emIds.keySet();
            List<Case> caseList = [Select c.Id, c.ContactId, c.Contact.Email,
                c.OwnerId, c.Status,
                c.EntitlementId,
                c.SlaStartDate, c.SlaExitDate
                From Case c where c.Id IN :emCaseIds];
            if (caseList.isEmpty()==false){
                List<Id> updateCases = new List<Id>();
                for (Case caseObj:caseList) {
                    if ((emIds.get(caseObj.Id)==caseObj.Contact.Email)&&
                        (caseObj.Status == 'In Progress')&&
                        (caseObj.EntitlementId != null)&&
                        (caseObj.SlaStartDate <= completionDate)&&
                        (caseObj.SlaStartDate != null)&&
                        (caseObj.SlaExitDate == null))
                        updateCases.add(caseObj.Id);
                }
                if(updateCases.isEmpty() == false)
                    milestoneUtils.completeMilestone(updateCases,
                        'First Response', completionDate);
            }
        }
    }
}
```

Sample Trigger 3

While the previous trigger dealt with email messages, this sample case comment trigger marks a First Response milestone Completed when a public comment is made on the case. You can use it if a public case comment is a valid first response in your support terms.

 **Note:** This trigger references the milestone utility test class, so be sure to define the test class first.

To define this trigger in your org:

1. From Setup, enter *Case Comment Triggers* in the Quick Find box, then click **Case Comment Triggers**.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```
trigger CompleteFirstResponseCaseComment on CaseComment (after insert) {
    if (UserInfo.getUserType() == 'Standard'){
        DateTime completionDate = System.now();
        List<Id> caseIds = new List<Id>();
        for (CaseComment cc : Trigger.new){
            if(cc.IsPublished == true)
                caseIds.add(cc.ParentId);
        }
        if (caseIds.isEmpty() == false){
            List<Case> caseList = [Select c.Id, c.ContactId, c.Contact.Email,
                c.OwnerId, c.Status,
                c.EntitlementId, c.SlaStartDate,
                c.SlaExitDate
                From Case c
                Where c.Id IN :caseIds];
            if (caseList.isEmpty() == false){
                List<Id> updateCases = new List<Id>();
                for (Case caseObj:caseList) {
                    if ((caseObj.Status == 'In Progress')&&
                        (caseObj.EntitlementId != null)&&
                        (caseObj.SlaStartDate <= completionDate)&&
                        (caseObj.SlaStartDate != null)&&
                        (caseObj.SlaExitDate == null))
                        updateCases.add(caseObj.Id);
                }
                if(updateCases.isEmpty() == false)
                    milestoneUtils.completeMilestone(updateCases,
                        'First Response', completionDate);
            }
        }
    }
}
```

Entitlement Processes

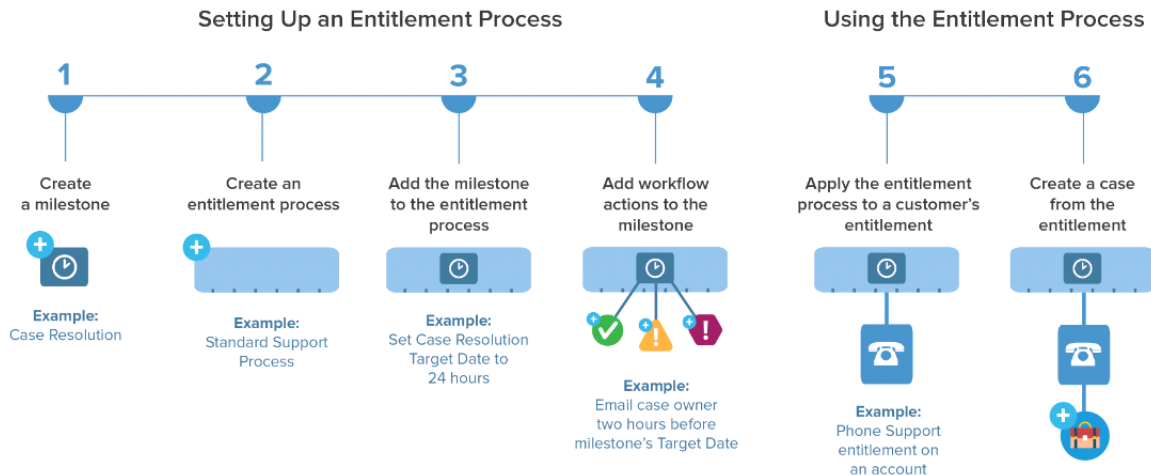

Entitlement processes are timelines that include all the steps (or milestones) that your support team must complete to resolve support records like cases or work orders. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

Not all entitlements require entitlement processes. For example, an entitlement might just state that a customer is eligible for phone support and business hours define phone support to be 24/7. If you need to add more to that definition—for example, if certain people must be emailed after a customer's case goes unresolved for two hours—use an entitlement process.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

You can create up to 1,000 entitlement processes total, with up to 10 milestones per process. If your org was created before Summer '13, its maximum entitlement processes can be lower. Contact Salesforce to increase it.

Note: If you're using entitlement processes, manage customers' work orders and cases on separate entitlements. This is because an entitlement process only runs on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process only runs on cases associated with the entitlement. If a work order is also associated with the entitlement, the process won't run on the work order.

To view or cancel active entitlement processes, from Setup, enter *Entitlement Processes* in the Quick Find box, then select **Entitlement Processes**. You can also use the entitlement process queue to view or cancel active entitlement process actions. (Entitlement process monitoring isn't available in Professional Edition orgs.)

Tip: Entitlement process versioning lets you update existing entitlement processes, even if they're assigned to active entitlements and cases. This can be useful if the business rules behind your entitlement processes change, for example, or if you need to create multiple versions of the same entitlement process that have only minor differences.

[Updating an Entitlement Process](#)

[How a Record Moves Through an Entitlement Process](#)

Set Up an Entitlement Process

Entitlement processes are timelines that include all of the steps (milestones) that your support team must complete to resolve cases or work orders. Set up an entitlement process to apply to entitlements in your Salesforce org.

1. Create an Entitlement Process

Create an entitlement process to give support agents a timeline of required steps to follow when solving support records. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

2. [Customize Entitlement Process Fields](#)

If you intend to use entitlement processes in your Salesforce org, customize page layouts to ensure that support agents can see and interact with entitlement processes.

3. [Add a Milestone to an Entitlement Process](#)

Add milestones to entitlement processes to define required steps in your support process.

4. [Add a Milestone Action to an Entitlement Process](#)

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. After you create an entitlement process and add milestones to it, add milestone actions to the milestones.

5. [Apply an Entitlement Process to an Entitlement](#)

You've created an entitlement process; now it's time to use it! Apply an entitlement process to a customer's entitlement so all support records linked to the entitlement use that process.

SEE ALSO:

[Entitlement Management Setup Checklist](#)

Create an Entitlement Process

Create an entitlement process to give support agents a timeline of required steps to follow when solving support records. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

 **Note:** You must create milestones before you create an entitlement process.

 **Tip:** The Entitlement Management Trailhead module introduces you to common terms and walks you through creating an entitlement process. And, it's fun! To get started, see [Entitlement Management](#).

1. From Setup, enter *Entitlement Processes* in the Quick Find box, then select **Entitlement Processes** under Entitlement Management.
2. Click **New Entitlement Process**.
3. Select an entitlement process type. If you intend to use the process to enforce milestones on cases, select Case. If you intend to use the process to enforce milestones on work orders, select Work Order. (If work orders aren't enabled in your org, you only see the Case option.)

 **Note:** If you're using entitlement processes, manage customers' work orders and cases on separate entitlements. This is because an entitlement process only runs on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process only runs on cases associated with the entitlement. If a work order is also associated with the entitlement, the process won't run on the work order.

4. Enter a name—for example, *Standard Support Process*—and a description.
5. If you want to enable the process, select **Active**.

 **Tip:** We recommend waiting to activate an entitlement process until you add milestone actions to it. You can't update or delete milestone actions on a process after it's activated and applied to a record.

6. Optionally, if entitlement versioning is enabled, select **Default Version** to make this version of the entitlement process the default.
7. Choose the criteria for records to enter and exit the entitlement process.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To view entitlements:

- "Read" on entitlements

To change entitlements:

- "Edit" on entitlements

To create and update entitlement processes:

- "Manage Entitlements"

Field	Description	More Actions to Take?
Record* enters the process	Based on record created date Select if records should enter the process when they're created.	No
	Based on a custom date/time field on the record Select if you want the value of a custom date/time field on the record to determine when the record enters the process.	Yes, a drop-down list displays for selecting the custom date/time. You can only choose a custom date/time, not a custom date.
Record exits the process	Based on when record is closed Select if records should exit the process when they're closed.	No
	Based on custom criteria Select if records should exit the process based on criteria you define.	Yes, select one of the following: <ul style="list-style-type: none"> Choose <code>criteria are met</code> and select the filter criteria that a record must meet for it to exit the process. For example, set a case filter to <code>Priority equals Low</code> if you want cases with the <code>Priority</code> field marked <code>Low</code> to exit the process. Choose <code>formula evaluates to true</code> and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True." Choose <code>formula evaluates to true</code> and enter a formula that returns a value of "True" or "False." Records exit the process if the formula returns "True." For example, the formula <code>(Case: Priority equals Low) AND (Case: Case Origin equals Email, Web)</code> moves cases out of the process if their <code>Priority</code> field is <code>Low</code> and the <code>Case Origin</code> field is marked <code>Email</code> or <code>Web</code>.

*The field names you see will reflect the entitlement process type you selected.

- Optionally, choose the business hours you'd like to apply to the entitlement process. The business hours you set here calculate the Target Date for all the milestones on this entitlement process. To learn more, see [How Business Hours Work in Entitlement Management](#).

9. Save your changes.

Customize Entitlement Process Fields

If you intend to use entitlement processes in your Salesforce org, customize page layouts to ensure that support agents can see and interact with entitlement processes.

1. Add these fields to case and work order page layouts:

Field	Description
Timeline (available only on case page layouts)	<p>How far along a case is to reaching an entitlement process's milestones. You can click or hover your mouse pointer over each milestone to view its details. These icons represent milestones:</p> <ul style="list-style-type: none">  Completed milestone  Violated milestone <p>You can drag the Handle icon () along the Timeline Zoom tool to view past and future milestones. If an entitlement process applies to the case, this field appears.</p>
Stopped	Lets you stop an entitlement process on a record, which might be necessary if you're waiting for a customer's reponse.
Stopped Since	The date and time the entitlement process was stopped on the record.

2. Save your changes.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To edit page layouts:

- "Customize Application"

Add a Milestone to an Entitlement Process

Add milestones to entitlement processes to define required steps in your support process.

1. From Setup, enter *Entitlement Processes* in the Quick Find box, then select **Entitlement Processes**.
2. Click the name of an entitlement process.
3. If you're using versioning, click the name of the entitlement process again under Entitlement Process Versions.
4. Click **New** on the Milestones related list.
5. Choose the milestone.
6. In *Time Trigger (Minutes)*, enter the number of minutes in which users must complete the milestone before it triggers an action.

Or, if you'd like the trigger time for the milestone to be calculated dynamically based on the milestone type and properties of the case or work order, click **Enable Apex Class for the Time Trigger (Minutes)**.

 **Note:** You must have a custom Apex class that implements the `Support.MilestoneTriggerTimeCalculator` Apex interface to use this option.

7. If you selected **Enable Apex Class for the Time Trigger (Minutes)**, use the lookup to specify an Apex class for the dynamically calculated milestone.
8. Choose when the milestone starts:

Select	To	Use If
Milestone Criteria	Calculate the milestone <i>Target Date</i> when the milestone is applied to a support record (matches the record criteria).	A milestone's <i>Target Date</i> is based on when it's applied to a record. Use if the milestone is recurring.  Note: An entitlement process usually starts when the record is created, but its milestones aren't always applied right away.
Entitlement Process	Calculate the milestone <i>Target Date</i> when the entitlement process starts (by default, when a support record is created).	A milestone's <i>Target Date</i> is based on the start of the entitlement process. For example, first response and resolution times on a case always calculate their <i>Target Date</i> when the entitlement process starts.

9. Optionally, select the business hours that you want to apply to the *Target Date* calculation for this milestone. If you don't specify business hours for the milestone, then the Entitlement Process business hours are used. If neither are specified, then the business hours on the case or work order are used.
10. Specify the order in which Salesforce should process the milestones. This applies to situations where a support record matches the criteria of multiple milestones at the same time.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions with the Service Cloud

USER PERMISSIONS

To add milestones to entitlement processes:

- "Manage Entitlements"

11. Enter the criteria a record must match for the milestone to apply to it:

- Choose `criteria are met` and select the filter criteria that a record must meet for a milestone to apply to it. For example, set a case filter to `Priority equals High` if you want the milestone to apply to cases with the `Priority` field marked High.

Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." Salesforce triggers the rule if the formula returns "True."

- Choose `formula evaluates to true` and enter a formula that returns a value of "True" or "False." The milestone applies to records if the formula returns "True." For example, the formula `(Case: Priority equals High) AND (Case: Case Origin equals Email, Web)` applies the milestone to cases where the `Priority` field is High and the `Case Origin` field is marked Email or Web. You can't use the `Case Owner` field in formulas.

12. Click **Save**.

-  **Note:** Milestones are measured in minutes and seconds, but their start and end times are only accurate to the minute. For example, suppose a milestone is triggered at 11:10:40 a.m. and the time to complete the milestone is 10 minutes. In this case, the milestone target time is 11:20:00 am, not 11:20:40. As a result, the remaining time for the agent to complete the milestone is 9 minutes and 20 seconds, not the full 10 minutes.

[Milestone Actions](#)

Add a Milestone Action to an Entitlement Process

Milestone actions are time-dependent workflow actions that occur at every step (milestone) in an entitlement process. After you create an entitlement process and add milestones to it, add milestone actions to the milestones.

- From Setup, enter `Entitlement Processes` in the `Quick Find` box, then select **Entitlement Processes**.
- Click the name of an entitlement process.
- Click the name of a milestone on the Milestones related list.
- If you want to add a warning or violation action, add a time trigger first. After you add a trigger, the option to add a workflow action appears. Success actions use the milestone's time trigger.

-  **Tip:** If you want a violation action to fire immediately after the milestone is violated, set the time trigger to 0 minutes.

- Click **Add Workflow Action** and select an option.

Workflow Action	What It Does	Example
New Task	Create a workflow task	Create a task for a support agent to call a customer when a First Response milestone is violated.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To add milestone actions to entitlement processes:

- "Manage Entitlements"
- AND
- "Customize Application"

Workflow Action	What It Does	Example
New Email	Create an email alert	Notify case owners when a First Response milestone on their case is near violation.
New Field Update	Define a field update	Update the case Priority field to <code>High</code> when a First Response milestone is near violation.
New Outbound Message	Define an outbound message	Send data about parts or services to an external system after a First Response milestone is completed.
Select Existing Action	Select an existing action	Use an existing email alert to notify a case owner when their case is near violation of a first response.

 **Note:** Time-triggered actions only occur during your Salesforce org’s business hours. You can add up to 10 actions and 10 time triggers to each type of milestone action.

[Milestone Actions](#)

Apply an Entitlement Process to an Entitlement

You’ve created an entitlement process; now it’s time to use it! Apply an entitlement process to a customer’s entitlement so all support records linked to the entitlement use that process.

1. Go to the entitlement.
2. In the `Entitlement Process` lookup field, select the process you want to apply.

 **Important:** If you’re using entitlement processes, manage customers’ work orders and cases on separate entitlements. This is because an entitlement process only runs on records that match its type. For example, when a Case entitlement process is applied to an entitlement, the process only runs on cases associated with the entitlement. If a work order is also associated with the entitlement, the process won’t run on the work order.

3. Click **Save**.

 **Tip:** If you’ve set up entitlement templates, you can associate an entitlement process with a template so all entitlements created using that template automatically use the selected entitlement process.

How a Record Moves Through an Entitlement Process

When an entitlement process is applied to an entitlement, the entitlement process runs on all support records linked to the entitlement. Learn how support records like cases and work orders move through an entitlement process.

1. A support agent linked a record to an entitlement that has an entitlement process. This can be done in several ways:
 - The support agent creates the record from the Cases or Work Orders related list on the entitlement.
 - The support agent creates the record, then uses the Entitlement lookup field on the record to select the proper entitlement.
2. The record enters the process based on its creation date or a custom date/time field. A custom date/time field lets users edit a date on the record to trigger when it enters the process.
3. Salesforce assigns milestones with matching criteria to the record. For example, if a milestone's criteria is *Priority equals High*, and a case has a Priority of *High*, Salesforce assigns it to the *Priority equals High* milestone. A record associates with one milestone at a time. It can associate with many milestones as it moves through the process.
4. Milestone actions determine when and if warning, violation, or success workflow actions fire for the record.
5. A support agent updates the record to complete a milestone action.
6. After a record is updated, it cycles through the entitlement process and initiates any milestones that match its criteria.
7. The record exits the process based on custom criteria or when it's closed.

You can view records with assigned entitlements by creating case or work order list views that filter on entitlement process fields.

 **Important:** Milestones are not automatically marked Completed when a record exits an entitlement process. To write an Apex trigger that auto-completes milestones that meet unique criteria, see [Auto-Complete Case Milestones](#).

Report on Entitlements

Use custom report types to define report criteria that users can use to run and create reports on entitlements, service contracts, and contract line items.

After you set up entitlement management, your Salesforce org automatically includes the following custom report types:

Custom Report Type	Description	Report Type Location
Accounts with entitlements with contacts	Lists accounts with entitlements that include contacts (named callers).	Accounts & Contacts
Service contracts with contract line items	Lists service contracts with contract line items (products).	Customer Support Reports
Service contracts with entitlements	Lists service contracts with entitlements.	Customer Support Reports
Cases with milestones	Lists cases with milestones.  Note: This report type can't be customized.	Customer Support Reports

To customize entitlement management custom report types:

1. From Setup, enter *Report Types* in the Quick Find box, then select **Report Types**.
2. From the All Custom Report Types page, you can:
 - Define a new custom report type. You can't select entitlements as a primary object.
 - Update a custom report type's name, description, report type category, and deployment status.
 - Delete a custom report type.

 **Important:** When you delete a custom report type, all the data stored in the custom report type is deleted and cannot be restored from the Recycle Bin.

 **Tip:** If you want to view a list of work orders with milestones in your org, use the Object Milestones custom report type to create a work order report.

How Business Hours Work in Entitlement Management

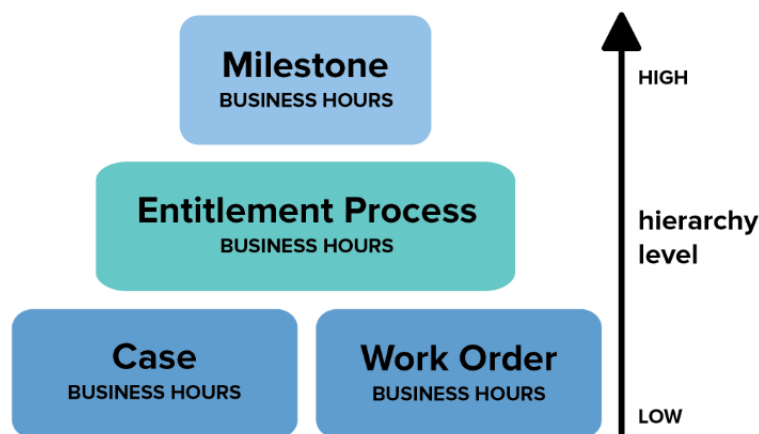

When a support record is linked to an entitlement, the record, its milestones, its entitlement process, and the entitlement itself can each use different business hours. Learn how Salesforce approaches business hours in these situations.

On records that include entitlement processes, business hours are applied according to a hierarchy. Salesforce uses the business hours specified at the highest level.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

So a milestone’s business hours override the entitlement process’ business hours, which override the case or work order’s business hours. If no business hours are set on the milestone, then the entitlement process business hours are used. And if business hours aren’t specified on the milestone or the entitlement process, the case or work order business hours are used.

You can also set business hours on entitlements. If you create a record from an entitlement, it inherits the entitlement’s business hours. However, if the entitlement is part of an entitlement process, we recommend leaving the entitlement’s business hours field blank. Related records automatically use the entitlement process’ business hours.

When setting business hours, follow these best practices:

- If you want to use the same entitlement process for records that have different business hours, set business hours at the entitlement process level. For example, suppose that you set the business hours on an entitlement process to weekdays from 9 to 5. If a customer requests evening and weekend updates to their case, you can create an “Update Customer” milestone with its own 24/7 business hours.
- If you want to use different business hours for different severity levels, set business hours at the milestone level. For example, if the severity level of a case increases, the customer may need to be contacted more frequently. You can create a “Last Touch” milestone that changes business hours according to severity level while the other milestones in the entitlement process remain unchanged.

SEE ALSO:

[Set Up an Entitlement Process](#)

Updating an Entitlement Process

Entitlement versioning lets you create multiple versions of an entitlement process, even if it's assigned to active entitlements and support records.

 [Watch a Demo](#) (2:20 minutes)

Use entitlement versioning if:

- You want to make several versions of an entitlement process that have minor differences
- You want to update an entitlement process to reflect changes in your business processes

You might find that an entitlement process needs to be updated seasonally, or that you need to roll back to a previous version.

 **Note:** To create multiple versions of entitlement processes, entitlement versioning must be enabled in your org. Select **Enable Entitlement Versioning** on the Entitlement Settings page in Setup.

When you create versions of entitlement processes with the same name, the version number and notes help you differentiate between versions. Salesforce prevents you from disabling entitlement versioning so you always know which version you're working with.

When you create a new version of an entitlement process, you can change any of the following:

- Name
- Description
- Whether the process is active
- Whether the version is the default
- Entry criteria
- Exit criteria

You can also add notes about the version. This makes it easy to differentiate between multiple versions of the same process, especially if they have the same name.

On new versions of entitlement processes that are currently in use, you can add new milestones, but you can't edit existing ones. On new versions of processes that aren't currently in use, you can both add new milestones and edit existing ones.

Once you create a new version of an entitlement process, you can choose to apply it to all entitlements and support records assigned to the previously used version, or only to new entitlements and support records. All versions of an entitlement process must be the same type: Case or Work Order.

SEE ALSO:

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Create a New Version of an Entitlement Process

Entitlement versioning lets you create multiple versions of an entitlement process, even if it's assigned to active entitlements and support records. You can use multiple versions of an entitlement process at the same time in your Salesforce org.

 [Watch a Demo](#) (2:20 minutes)

 **Note:** To create multiple versions of entitlement processes, entitlement versioning must be enabled in your org. Select **Enable Entitlement Versioning** on the Entitlement Settings page in Setup.

When you create versions of entitlement processes with the same name, the version number and notes help you differentiate between versions. Salesforce prevents you from disabling entitlement versioning so you always know which version you're working with.

1. From Setup, enter *Entitlement Processes* in the **Quick Find** box, then select **Entitlement Processes**.
2. Click the name of the entitlement process for which you want to create a new version.
3. In the Entitlement Process Versions list, click the version of the process from which you want to create a new version.
4. On the Entitlement Process Detail page, click **Create New Version**.
5. Add details about the new version. Follow these best practices:
 - Use the **Version Notes** field to explain what makes the version you're creating different from others. This makes it easier to differentiate between multiple versions of the same entitlement process.
 - Leave the name as is.
 - Click **Active** to be able to use the new version.
 - Click **Default** if you want to make the new version the default version of the process. This makes it easier to find in lookup field searches.
6. Click **Save**.
After saving, you can modify the entitlement process' milestones if needed.

 **Important:**

- On new versions of entitlement processes that are currently in use, you can add new milestones, but you can't edit existing ones. On new versions of processes that aren't currently in use, you can both add new milestones and edit existing ones.
- All versions of an entitlement process must be the same type.

When you create a new version of an entitlement process, it isn't automatically applied to entitlements that were using the previous version. To learn how to apply a new version of an entitlement process to existing and new entitlements, see [Use a New Version of an Entitlement Process](#).

SEE ALSO:

[Updating an Entitlement Process](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions** with the Service Cloud

USER PERMISSIONS

To create and update entitlement processes:

- "Manage Entitlements"

Use a New Version of an Entitlement Process

After you create a new version of an entitlement process, you can choose to apply it to all entitlements assigned to the previous version, or only to new entitlements. When you apply an entitlement process to an entitlement, it also applies the process to that entitlement's active support records.

 [Watch a Demo](#) (2:20 minutes)

 **Note:** To create multiple versions of entitlement processes, entitlement versioning must be enabled in your org. Select **Enable Entitlement Versioning** on the Entitlement Settings page in Setup.

When you create versions of entitlement processes with the same name, the version number and notes help you differentiate between versions. Salesforce prevents you from disabling entitlement versioning so you always know which version you're working with.

Applying an Entitlement Process to a New Entitlement

Scenario: You're creating a new entitlement and want to apply a particular version of an entitlement process to it.

1. Choose the entitlement process you want in the Entitlement Process lookup field on the entitlement.

 **Tip:** After you click the lookup icon on the Entitlement Process field, select "All Versions" in the lookup dialog box. Otherwise, you can only choose from the default versions of existing entitlement processes.

Applying an Entitlement Process to an Existing Entitlement

Scenario: You made a new version of an entitlement process, and you want to switch all the entitlements that were using the previous version over to your new version.

1. From Setup, enter *Entitlement Processes* in the **Quick Find** box, then select **Entitlement Processes**.
2. Click the name of the entitlement process you want to work with.
The list on the main Entitlement Processes page shows the default version of each process. Click the name of a process to see a list of all available versions of it.
3. On the detail page for the entitlement process, click the name of the new version that you want to apply to existing entitlements (and by default, to cases or work orders linked to those entitlements).
4. Click **New Update Rule**.
5. Choose the version of the entitlement process you want to update from.
You can update from any other version of the process, whether or not it's active.
6. Depending on the differences between the old and new versions of the entitlement process, updating an entitlement to the new version can trigger milestone warning and violation actions on that entitlement's support records (such as cases or work orders). To avoid such warnings and violation actions, select **Don't Trigger New Milestone Warnings and Violations**. We recommend selecting this so you don't trigger violation warnings on old entitlements and support records.
7. Click **Save**.
The update rule detail page shows the estimated number of entitlements and support records that will be updated to use the new process.
8. Click **Start** to begin the update process.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create and update entitlement processes:

- "Manage Entitlements"

Usually the update process completes within an hour, but it depends on the number of entitlements and records being updated. Throughout the update process, the update rule detail page refreshes periodically to show the number of entitlements and records processed. To stop the update at any time, click **Stop**.

[Create a New Version of an Entitlement Process](#)

Set Up Service Contracts

Service contracts are agreements between you and your customers for a type of customer support. Service contracts can represent different kinds of customer support, such as warranties, subscriptions, or service level agreements (SLAs).

 **Note:** Entitlements must be enabled in your org for you to set up service contracts.

From the object management settings for service contracts:

1. Customize service contract fields.

This lets you control what information users add to service contracts. You can create custom service contract fields that are specific to your industry or support process.

2. Customize service contract page layouts.

This lets you specify which fields and related lists users see on service contracts. Consider making the following customizations:

- Add the `Status Icon` field so users can easily see whether the service contract is active, expired, or inactive.
- To let users make one service contract the parent of another, add the `Parent Service Contract` field and `Child Service Contracts` related list. You can also add the read-only `Root Service Contract` field so users can see the top-level service contract in a service contract hierarchy.

3. Set field-level security on service contract fields.

This lets you choose which service contract fields users can access.

4. Set field history tracking on service contracts.

This lets you see when field values were changed. Changes are listed in the `Service Contract History` related list on service contracts. From the object management settings for service contracts, go to the fields section, and then click **Set History Tracking**.

5. Make the Service Contracts tab visible in Salesforce and any custom apps.

The `Service Contracts` tab is where users create and edit service contracts and contract line items. Add the tab to an app or instruct your users to add it to an existing tab set in Salesforce. Users need the “Read” permission on service contracts to see the `Service Contracts` tab.

6. Add the Service Contracts related list to account and contact page layouts.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions** with the Service Cloud

USER PERMISSIONS

To set up service contracts:

- “Manage Entitlements”
AND
“Customize Application”

This lets users create, update, and verify service contracts from accounts and contacts.

SEE ALSO:

[Entitlement Management Setup Checklist](#)

[Set Up Contract Line Items](#)

Set Up Contract Line Items

Set up contract line items to be able to specify which products a service contract covers. Contract line items only display to users on the Contract Line Items related list on service contracts (not on contracts!). You can only use contract line items if your Salesforce org uses products.

Note: Entitlements must be enabled in your org for you to set up contract line items.

From the object management settings for contract line items:

1. Customize contract line item fields.

This lets you control what information users add to contract line items. You can create custom contract line item fields that are specific to your industry or support process.

2. Customize contract line item page layouts.

This lets you specify which fields and related lists users see on contract line items. Consider making the following customizations:

- Add the `Status Icon` field so users can easily see whether the line item is active, expired, or inactive.
- To let users make one line item the parent of another, add the `Parent Contract Line Item` field and `Child Contract Line Items` related list. You can also add the read-only `Root Contract Line Item` field, which lists the top-level line item in a contract line item hierarchy.

3. Customize other objects' page layouts.

This lets you choose how users can associate contract line items with other records. Consider making the following customizations:

- (Required) Add the `Contract Line Items` related list to service contract page layouts. This lets users create, edit, and delete contract line items from service contracts.
- Add the `Contract Line Items` related list to asset layouts. This lets users view and change associations between assets and contract line items.
- Add the `Contract Line Item` lookup field to entitlement page layouts. This lets users associate a line item with a particular entitlement.

4. Set field-level security on contract line items.

This lets you choose which contract line item fields users can access.

5. Set field history tracking on contract line items.

This lets you see when field values were changed. Changes are listed in the `Contract Line Item History` related list on contract line items. From the object management settings for contract line items, go to the fields section, and then click **Set History Tracking**.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions** with the Service Cloud

USER PERMISSIONS

To set up service contracts and contract line items with entitlements:

- "Manage Entitlements"
- AND
- "Customize Application"

 **Note:** Schedules aren't available for contract line items, and community users can't access them.

SEE ALSO:

[Entitlement Management Setup Checklist](#)

Set Up Entitlement Management in Communities

Add entitlement management to your communities to let customers or partners view their entitlements and service contracts. Contract line items don't display in communities.

Follow these steps to expose entitlements and/or service contracts in a community.

1. Update user profiles.
 - a. Clone the Customer Community User, Customer Community Plus User, or Partner Community User profiles and enable the "Read" permission on entitlements and/or service contracts.

 **Note:** Remember to click **Edit Profiles** at the bottom of the detail page to activate the new profiles.
 - b. Optionally, on the profiles of delegated community moderators, enable the "Create" and "Delete" permissions on entitlement contacts. This lets moderators update entitlement contacts.
 - c. Verify that the tab visibility for the Entitlements and/or Service Contracts tabs is Default On.
2. Add the Entitlements and/or Service Contracts tabs to the community.
3. Add the `Entitlement Name` field to case and work order page layouts assigned to community users. This lets users add entitlements to cases and work orders. Work orders are not available in communities built using the self-service community templates.

 **Note:** To avoid exposing your internal support processes, we recommend **not** adding the following fields to case and work order page layouts for community users:

 - `Entitlement Process Start Time`
 - `Entitlement Process End Time`
 - `Stopped`
 - `Stopped Since`
4. Optionally, add the Entitlements related list to account and contact page layouts assigned to community moderators. This lets moderators create cases automatically associated with the right entitlements.

EDITIONS

Available in: Salesforce Classic

Communities are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Entitlement Management is available in **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities" AND is a member of the community they're updating

To set up entitlement management:

- "Manage Entitlements"

To assign user licenses:

- "Manage Internal Users"

Work Orders

Work orders in Salesforce represent a task or series of tasks to be performed on a product, typically in field service. You can use work orders to efficiently track repairs, standard maintenance, and other types of service.

Work orders can be associated with accounts, assets, cases, contacts, entitlements, service contracts, and other work orders. You can also create custom relationships between work orders and other standard or custom objects. And, you can attach Knowledge articles to work orders and work order line items so field technicians can quickly access product specs, instructions, and more.

You can view work orders on the Work Orders tab or the Work Orders related list on supported objects. You can also access work orders in the service console and in the Salesforce1 mobile browser app.

We recommend adding *work order line items* to work orders to provide details about the work to be performed. Work order line items represent specific tasks that must be performed to complete the work order. They can be marked as completed one by one, and make it easier for you to track and improve field service processes. A work order's line items appear in its Work Order Line Items related list.

Example:

- If a customer purchases an asset from you and experiences a problem with it, you can create a work order to repair the asset.
- If a customer purchases an asset from you and covers it with a preventive service contract, you can create a work order that represents a periodic checkup.

SEE ALSO:

[Set Up Work Orders](#)

[Guidelines for Using Work Orders](#)

[Milestones: Supported Objects](#)

Set Up Work Orders

Set up work orders in your org to track work performed on products.

1. Enable work orders.
 - a. From Setup, enter *Work Order Settings* in the Quick Find box and click **Work Order Settings**.
 - b. Click **Enable**.
2. Customize page layouts.
 - a. To let users link work orders to other types of records, add the Work Orders related list to other objects' page layouts. These objects' page layouts can include the related list:
 - Account
 - Asset
 - Case
 - Contact
 - Entitlement
 - Service Contract

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To enable work orders:

- "Customize Application"

To edit page layouts:

- "Customize Application"

- Custom objects
- b. To let users view work order line items that are associated with a particular asset, add the Work Order Line Items related list to Asset page layouts.
 - c. To let users make one work order the parent of another, add the Parent Work Order field and Child Work Orders related list to work order page layouts. To let users see the top-level work order in a work order hierarchy, you can also add the read-only Root Work Order field.
 - d. To let users make one work order line item the parent of another line item, add the Parent Work Order Line Item field and Child Work Order Line Items related list to work order line item page layouts. To let users see the top-level line item in a work order line item hierarchy, you can also add the read-only Root Work Order Line Item field.
3. Assign user permissions.

Users Who Will...	Need These Permissions	Permissions Are Auto-Enabled on These Standard Profiles
Enable work orders	"Customize Application"	System Administrator
View the Work Orders tab, work orders, and work order line items	"Read" on work orders	Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Create or clone work orders	"Create" on work orders	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Edit work orders	"Edit" on work orders	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator
Delete work orders	"Delete" on work orders	System Administrator
Create, clone, edit, or delete work order line items	"Edit" on work orders	Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator

4. Make the Work Orders tab visible to your users.

Users create and manage work orders from the Work Orders tab. You can add the tab to a custom app or instruct users to add the tab in Salesforce.

Note: The Work Orders tab is default ON for the following user profiles: Read Only, Standard User, Solution Manager, Contract Manager, Marketing User, and System Administrator.

5. Optionally, add work orders as a navigation tab item in the service console.
6. If your org was created before Summer '16 and you want to use milestones on work orders, set field-level security on the following work order fields to expose them to specific user profiles:
 - Business Hours
 - Entitlement Process End Time
 - Entitlement Process Start Time
 - Is Closed

- Milestone Status
- Milestone Status Icon
- Stopped
- Stopped Since

 **Tip:** To set field-level security, from Setup, enter *Field Accessibility* in the Quick Find box, then click **Field Accessibility**. Click **Work Order**, then click **View by Fields** and select a field. Click **Hidden** next to a profile to view and update the field visibility settings.

7. If you want your team to be able to attach Knowledge articles to work orders or work order line items, add the Articles related list and the Knowledge One console component to your layouts.
 - a. To let users view and change linked articles from the console, navigate to work order page layouts in Setup. In the layout editor, select Custom Console Components and add the Knowledge One widget to the console sidebar (recommended).
 - b. To let users view and change linked articles from a work order's detail page, add the Articles related list to the work order detail page layout (recommended).
 - c. To let users attach Knowledge articles to work order line items, follow the previous two steps for work order line items layouts.

 **Note:** Knowledge must already be set up in your org.

Guidelines for Using Work Orders

USER PERMISSIONS

To view the Work Orders tab, work orders, and work order line items: "Read" on work orders

To create or clone work orders: "Create" on work orders

To edit work orders: "Edit" on work orders

To delete work orders: "Delete" on work orders

To create, edit, and delete work order line items: "Edit" on work orders

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

Work orders in Salesforce help you track tasks to be performed on a product. Learn how to perform common actions on work orders.

Viewing Work Orders

You can view work orders on the Work Orders tab or the Work Orders related list on:

- Accounts
- Assets
- Cases

- Contacts
- Entitlements
- Service contracts

For a list of the work orders that are associated with a particular record, go to the Work Orders related list on the record.

 **Tip:** If your Salesforce admin has set up the console to include work orders, click the Console tab to view and edit work orders and their associated records in one place.

Creating Work Orders

You can create and edit work orders from the Work Orders tab or the Work Orders related list on supported objects. Depending on how work orders are set up in your organization, this related list may not be available on some records.

 **Tip:** When you create a work order, add line items to the work order. Work order line items represent specific tasks that a technician must perform to complete the work order. They can be marked as completed one by one, and make it easier to track and improve field service processes. In addition, pricing details like discounts and unit price are set at the line item level on work orders.

Deleting Work Orders

You can delete work orders on the work order's detail page or the Work Orders related list. Deleting a work order moves it to the Recycle Bin. Any notes, attachments, activities, and line items associated with the work order are also deleted. If you undelete the work order, the associated items are undeleted.

Sharing Work Orders

You may be able to grant extra access to work orders beyond what your org's default sharing model allows. However, you can't make the sharing model more restrictive than the default.

To see who has access to a work order, click **Sharing** on the work order's detail page. The **Sharing** button takes you to the sharing detail page. There, you can:

- View a list of who has access to the work order
- Click **Add** to grant access to the work order for other users, groups, roles, or territories. You can only share work orders with users who have the "Read" permission on work orders.
- Create, edit, and delete manual sharing rules

Work order line items inherit their parent work order's sharing settings.

Reporting on Work Orders

Use the Object Milestones custom report type to view work orders with milestones in your org.

 **Note:** The `Milestone Status` and `Milestone Status Icon` fields are not available in work order reports.

Attaching Knowledge Articles to Work Orders

You can attach Knowledge articles to work orders and work order line items to ensure that technicians in the fields can access the information they need. To learn more, see [Knowledge Articles and Work Orders](#).

[How to Associate a Work Order with Another Record](#)

Work orders can be associated with accounts, assets, cases, contacts, entitlements, service contracts, and other work orders. You can also create custom relationships between work orders and other standard or custom objects.

[Incorporating Work Orders Into Your Support Process](#)

Work orders are a handy support tool, particularly if you offer field service. You can incorporate work orders into your support process in several ways.

[How Pricing Works on Work Orders](#)

Work orders and work order line items have several price-related fields. Find out how they interact and how to use them.

How to Associate a Work Order with Another Record

Work orders can be associated with accounts, assets, cases, contacts, entitlements, service contracts, and other work orders. You can also create custom relationships between work orders and other standard or custom objects.

When a work order is associated with another record in Salesforce, it appears in the Work Orders related list on the record. That association makes it easier for agents to track the progress of work related to open cases, service contracts, and more.

You can associate a work order with another record in two ways:

- Create the work order from the Work Orders related list on the record's detail page. For example, you can create a work order on an asset's detail page to link the work order to the asset.
- Create the work order from the Work Orders tab or list view, and add the other record to the work order record using a lookup field. For example, Asset, Case, Entitlement, and Service Contract are all standard lookup fields on work orders.

Not sure how—or whether—to associate a work order with another record? Follow these guidelines.

- If a work order is related to a particular asset, link the work order to the asset in Salesforce so you can easily track the work.
- If a case is opened because a customer experiences a problem with an asset, you may need to create a work order to inspect or repair the asset. Link the work order to the case so the case owner can track its progress.
- If you need to track periodic standard maintenance on assets, link the related work order to the entitlement or service contract that includes the maintenance.

Incorporating Work Orders Into Your Support Process

Work orders are a handy support tool, particularly if you offer field service. You can incorporate work orders into your support process in several ways.

Here are some recommended approaches:

Situation	How to Use Work Orders to Address the Situation
<p>Fixing a broken asset: A customer purchases an asset (like a car) from you. They experience a problem with the asset, so they call you to report the problem. An agent creates a case from the call, and determines that a technician must be sent to the customer to repair the asset.</p>	<ol style="list-style-type: none"> 1. The agent creates a "Repair Asset" work order for the asset. 2. The work order includes a description of the problem. 3. The agent assigns the work order to a technician. 4. The technician is dispatched to repair the asset. 5. The technician diagnoses the problem and adds line items to the work order which

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Situation	How to Use Work Orders to Address the Situation
	<p>represent the specific tasks that must be completed to fix it.</p> <ol style="list-style-type: none"> 6. As each line item on the work order is completed, the technician changes the line item status to <i>Completed</i>. When all line items are completed, the technician changes the work order status to <i>Completed</i>. 7. The agent closes the case.
<p>Performing preventive maintenance: A customer purchases an asset from you and covers it with a five-year preventive maintenance contract. The contract entitles the customer to one preventive maintenance checkup each year. The annual maintenance checkup is represented in Salesforce by an entitlement that's linked to the asset record.</p>	<ol style="list-style-type: none"> 1. A service agent creates an "Annual Maintenance Checkup" work order on the asset. 2. The agent adds line items to the work order which represent the maintenance tasks that the technician must complete. 3. The agent assigns the work order to a technician. 4. The technician is dispatched to complete the maintenance check. 5. As each line item on the work order is completed, the technician changes the line item Status to <i>Completed</i>. When all line items are complete, the technician changes the work order status to <i>Completed</i>. 6. For the following annual maintenance on the asset, the agent can quickly create a clone of this work order.

While these approaches reflect typical uses of work orders, there are many ways to customize the way you use work orders. Here are some examples.

- Create a "New Work Order" quick action on assets, cases, and accounts.

Note: Entitlements and service contracts don't support quick actions.

- Set up a quick action on work orders that automatically updates new work orders' account, asset, and contact fields to match their parent record.
- Account for delays and scope changes by making one work order the child of another work order via the `Parent Work Order` field. For example, if a technician doesn't complete all the line items on a work order, the technician can mark that work order as *Completed* and create a child work order that contains the remaining line items. A work order can have up to 2,000 child work orders, and a hierarchy of work orders can have up to 50 levels.

Similarly, make one work order line item the child of another line item via the `Parent Work Order Line Item` field. A work order line item can have up to 2,000 child line items, and a hierarchy of line items can have up to 50 levels.

- If your org uses hierarchical assets, track specific subtasks more accurately by associating work order line items with different assets. For example, a work order linked to the "automobile" asset can have a line item linked to the child "headlight" asset. You can add the Work Order Line Items related list to asset page layouts to let users view all line items associated with an asset.

For Apex code samples that you can use to customize work orders in your org, see [Apex Code Samples for Work Orders](#).

SEE ALSO:

[Guidelines for Using Work Orders](#)

[Apex Code Samples for Work Orders](#)

How Pricing Works on Work Orders

Work orders and work order line items have several price-related fields. Find out how they interact and how to use them.

Work orders contain the following price-related fields. If you intend to use these fields, add them to work order page layouts.

Work Order Field	What It Represents
Discount	(Read only) The weighted average of the discounts on all line items on the work order. It can be any positive number up to 100.
Subtotal	(Read only) The total of the work order line items before discounts and taxes are applied.
Total Price	(Read only) The total of the work order line items' price after discounts but before tax is added.
Grand Total	(Read only) The total price of the work order with tax added.
Price Book	The price book associated with the work order. Adding a price book to the work order lets you link each work order line item to a product included in the price book.
Tax	The total tax on the work order in a currency format. (Do not enter a percentage.) For example, in a work order whose total price is \$100, enter \$10 to apply a 10 percent tax. You can enter a number with or without the currency symbol and you can use up to two decimal places.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

And work order line items contain these price-related fields. If you intend to use these fields, add them to work order line item page layouts.

Work Order Line Item Field	What It Represents
Discount	The percent discount to be applied to the line item's subtotal. You can enter a number with or without the percent symbol and you can use up to two decimal places.

Work Order Line Item Field	What It Represents
Subtotal	(Read only) The line item's unit price multiplied by the quantity.
Total Price	(Read only) The line item's subtotal with discounts applied. This field is blank until you add a unit price and save the line item.
List Price	<p>(Read only) The price of the line item (product) as listed in its corresponding price book entry. If a product isn't selected, the list price defaults to zero.</p> <p> Note: When you select a product to link to the line item, you can see the product's list price next to its name and ID in the lookup window. The list price field populates when you save the line item.</p>
Product	<p>The name of the product that corresponds to the line item. The lookup only lists products that are included in the parent work order's price book. When you select a product and save the line item, the following fields are populated on the line item:</p> <ul style="list-style-type: none"> • List Price • Unit Price • Subtotal • Total Price <p> Note: Inline editing isn't supported on the Product field. To change the product on a line item, click Edit. Adding a product updates the list price, unit price, subtotal, and total price based on the new product's corresponding price book entry.</p>
Unit Price	By default, the unit price for a work order line item is the line item's list price from the price book, but you can change it.

When filling out price fields on work orders and their line items, keep these guidelines in mind:

- To apply a discount to a work order, apply the discount at the line item level. If your work order doesn't have line items, its discount is zero.
- When filling out price fields on a work order, just fill out the `Price Book` and `Tax` fields. The `Discount`, `Subtotal`, `Total Price`, and `Grand Total` fields are all automatically calculated based on line item fields.
- When filling out price fields on a work order line item, just fill out the `Product` and `Discount` fields. The `Subtotal`, `Total Price`, `List Price`, and `Unit Price` fields are all automatically calculated based on other line item fields.
- Work order line items don't have to be linked to a product. For example, you might prefer to use work order line items to track tasks. Just keep in mind that if the `Product` field is blank, you can't use the `List Price`, `Unit Price`, `Discount`, `Quantity`, `Subtotal`, or `Total Price` fields.

 **Note:**

- You can't delete a price book that's linked to a work order.
- You can't delete a product that's linked to a work order line item.

- You can't delete a price book entry that's linked to a work order line item. Price book entries are linked to work order line items via the `Product` lookup field.
- You can't remove a price book from a work order if its line items are linked to products from that price book.

[Set Up Work Orders](#)

[Work Order Fields](#)

Work Order Fields

Work orders contain the following fields. Depending on how work orders are set up in your organization, some fields may not be visible to you.

Field	Description
Account	The account associated with the work order.
Address	The compound form of the address where the work order is completed.
Asset	The asset associated with the work order.
Business Hours	The business hours associated with the work order.
Case	The case associated with the work order.
City	The city where the work order is completed. Maximum length is 40 characters.
Contact	The contact associated with the work order.
Country	The country where the work order is completed. Maximum length is 80 characters.
Currency ISO Code	The ISO code for any currency allowed by the organization. Available only for orgs with the multicurrency feature enabled.
Description	The description of the work order. We recommend describing the steps a user must complete to mark the work order <i>Completed</i> .
Discount	(Read Only) The weighted average of the discounts on all line items on the work order. It can be any positive number up to 100.
End Date	The date when the work order is completed. This field is blank unless you set up automation to configure it. For a sample workflow rule that configures the <code>Start Date</code> field (a similar field), see below.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

Field	Description
Entitlement	The entitlement associated with the work order.
Entitlement Process End Time	The time the work order exits an entitlement process. If an entitlement process applies to a work order, this field appears.
Entitlement Process Start Time	The time the work order entered an entitlement process. If an entitlement process applies to a work order, this field appears.
Geocode Accuracy	(Read Only) The level of accuracy of a location's geographical coordinates compared with its physical address. A geocoding service typically provides this value based on the address's latitude and longitude coordinates.
Grand Total	(Read Only) The total price of the work order with tax added.
Last Modified Date	The date when the work order was last modified.
Last Viewed Date	The date when the work order was last viewed.
Latitude	Used with <code>Longitude</code> to specify the precise geolocation of the address where the work order is completed. Acceptable values are numbers between -90 and 90 with up to 15 decimal places.
Line Items	(Read Only) The number of work order line items on the work order.
Longitude	Used with <code>Latitude</code> to specify the precise geolocation of the address where the work order is completed. Acceptable values are numbers between -180 and 180 with up to 15 decimal places.
Milestone Status	A milestone is a step in an entitlement process. It can have one of three statuses: Compliant, Open Violation, and Closed Violation. If an entitlement process applies to a work order, this field appears. To learn more, see Milestone Statuses .
Milestone Status Icon	An icon that corresponds to the milestone status. <ul style="list-style-type: none"> •  Compliant •  Open Violation •  Closed Violation
Owner	The work order's assigned owner.
Parent Work Order	The work order's parent work order, if it has one. <p> Tip: View, create, and delete a work order's child work orders in the Child Work Orders related list.</p>
Postal Code	The postal code where the work order is completed. Maximum length is 20 characters.
Price Book	The price book associated with the work order. Adding a price book to the work order lets you assign different price book entries

Field	Description
Priority	<p>to the work order's line items. This field is only available if products are enabled.</p> <p>The priority of the work order. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • <i>Low</i> • <i>Medium</i> • <i>High</i> • <i>Critical</i>
Root Work Order	(Read Only) The top-level work order in a work order hierarchy. Depending on where a work order lies in the hierarchy, its root might be the same as its parent.
Service Contract	The service contract associated with the work order.
Start Date	The date when the work order goes into effect. This field is blank unless you set up automation to populate it. For a sample workflow rule that configures this field, see below.
State	The state where the work order is completed. Maximum length is 80 characters.
Status	<p>The status of the work order. The picklist includes the following values, which can be customized:</p> <ul style="list-style-type: none"> • <i>New</i> • <i>Scheduled</i> • <i>Assigned</i> • <i>In Progress</i> • <i>Completed</i> • <i>Closed</i>
Street	The street number and name where the work order is completed.
Subject	The subject of the work order. Try to describe the nature and purpose of the job to be completed. For example, "Annual on-site well maintenance." The maximum length is 255 characters.
Subtotal	(Read Only) The total of the work order line items' subtotals before discounts and taxes are applied.
Tax	The total tax on the work order. For example, in a work order whose total price is \$100, enter \$10 to apply a 10 percent tax. You can enter a number with or without the currency symbol and you can use up to two decimal places.
Total Price	(Read Only) The total of the work order line items' price after discounts but before tax is added.

Field	Description
Work Order Number	An auto-generated number that identifies the work order.

 **Example:** The `Start Date` and `End Date` fields are blank by default, but you can set up workflow rules to configure them. The following rule populates the `Start Date` field with the current date and time when the `Status` field changes to `In Progress`:

1. Create a workflow rule on the Work Order object:
 - Under Evaluation criteria, select **Created**.
 - Under Rule Criteria, enter `Work Order: Status EQUALS In Progress`.
2. Add a New Field Update workflow action:
 - Under Field to Update, select **Start Date**.
 - Under Date Options, select the option to use a formula and enter the formula `NOW()`.
3. Save and activate your rule.

SEE ALSO:

[Work Order Line Item Fields](#)

Work Order Line Item Fields

Work order line items contain the following fields. Depending on how work orders are set up in your organization, some fields may not be visible to you.

Field	Description
Asset	The asset associated with the line item. If your org uses hierarchical assets (available after Spring '16), you may want to link a work order's line items with different assets. For this reason, line items do not automatically inherit their parent work order's asset value.
Currency ISO Code	The ISO code for any currency allowed by the organization. Available only for orgs with the multicurrency feature enabled.
Description	The description of the line item. We recommend describing the steps a user must follow to mark the line item <i>Completed</i> .
Discount	The percent discount to be applied to the line item. You can enter a number with or without the percent symbol and you can use up to two decimal places.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Field	Description
End Date	The date when the line item is completed.
Line Item Number	An auto-generated number that identifies the line item.
List Price	The price of the line item (product) as listed in its corresponding price book entry. If a product isn't specified, the list price defaults to zero. (Read only)
Order	The order associated with the work order line item. For example, you may need to order replacement parts before you can complete the line item.
Parent Work Order Line Item	The line item's parent line item, if it has one.  Tip: View, create, and delete a line item's child line items in the Child Work Order Line Items related list.
Price Book Entry	The price book entry that corresponds with the line item. A price book must be specified on the parent work order.
Product	The product associated with the price book entry.
Quantity	The line item's quantity.
Root Work Order Line Item	The top-level work order line item in a line item hierarchy. Depending on where a line item lies in the hierarchy, its root might be the same as its parent. (Read only)
Start Date	The date when the work order line item goes into effect.
Status	The status of the work order line item. The picklist includes the following values, which can be customized: <ul style="list-style-type: none"> • <i>New</i> • <i>In Progress</i> • <i>Completed</i> • <i>Closed</i>
Subtotal	The line item's unit price multiplied by the quantity. (Read only)
Total Price	The line item's subtotal with discounts applied. (Read only)
Unit Price	By default, the unit price for a work order line item is the line item's list price from the price book, but you can change it.
Work Order	The parent work order of the work order line item. Because work order line items must be associated with a work order, this field is required.

[Work Order Fields](#)

[Incorporating Work Orders Into Your Support Process](#)

Apex Code Samples for Work Orders

Use these Apex samples to customize and automate the role of work orders in your support process.

 **Tip:** New to Apex? Check out the [Force.com Apex Code Developer's Guide](#).

Sample Trigger 1

This trigger prevents users from closing a work order unless all its line items have been closed. It's a good way to ensure that all scheduled tasks are completed.

To define a work order trigger in your org:

1. From Setup, enter *Work Orders* in the Quick Find box, then click **Triggers** under Work Orders.
2. Click **New**.
3. Copy the trigger text and paste it into the text field.
4. Click **Save**.

```
trigger ValidateWorkOrderLineItem on WorkOrder (before update) {
    for(WorkOrder w : Trigger.New) {
        if(w.Status == 'Closed'){
            List<WorkOrderLineItem> woLineItemList = [Select wo.Status
                From WorkOrderLineItem wo where wo.WorkOrderId=:w.Id];
            if(woLineItemList.isEmpty()==false){
                for(WorkOrderLineItem woLineItem : woLineItemList){
                    if(woLineItem.Status != 'Closed'){
                        w.addError('You cannot close a work order until all of its
line items are closed.');
```

Sample Trigger 2

This trigger automatically closes a case when a work order on the case is marked Closed. If a case has multiple work orders, the trigger fires when the first work order is marked Closed. That way, the support agent doesn't have to manually close the case after the related work is complete.

```
trigger CloseCaseWhenWoId on WorkOrder (after update) {
    for (WorkOrder wo: Trigger.new) {
        try {
            if (wo.Status == 'closed') {
                Case ca = [SELECT Status from case where id = :wo.CaseId];
                ca.Status = 'closed';
                update ca;
            }
        } catch (Exception e) {
        }
    }
}
```

EDITIONS

Available in: Salesforce
Classic and Lightning
Experience

Available in: **Enterprise**,
Performance, Unlimited,
and **Developer** Editions with
the Service Cloud

Trigger 2 Unit Test

You can set up Apex unit tests in the developer console to scan your code for any issues. To keep things running smoothly, Salesforce requires at least three-quarters of your Apex code lines to be covered by tests. This unit test applies to Sample Trigger 2.

```
@isTest
private class WOTriggerTest {
    static testMethod void validateWO() {
        Case ca = new Case();
        ca.Origin = 'Phone';
        ca.Status = 'new';
        insert(ca);
        WorkOrder wo = new WorkOrder();
        wo.Subject = 'test';
        wo.Status = 'closed';
        wo.CaseId = ca.Id;
        insert(wo);
        update(wo);
        Case cal = [SELECT Status from Case where id= :ca.Id];
        System.assertEquals('Closed', cal.Status);
    }
}
```

Work Order Apex Class

Apex classes reduce the size of your triggers and make it easier to reuse and maintain Apex code. This class, which you can reference in triggers, creates a work order with one line item.

```
public class CreateWorkOrderLineItem{
public WorkOrderLineItem createWorkOrderLineItem(){
    WorkOrder wo = new WorkOrder();
    wo.subject = 'title';
    insert wo;
    WorkOrderLineItem woli = new WorkOrderLineItem();
    woli.workOrderId = wo.Id;
    woli.description = 'abcd';
    return woli;
}
}
```

Work Order Apex Class Unit Test

This unit test applies to the Work Order Apex Class.

```
@isTest
public class TestWorkOrderLineItem {
    static testMethod void testCreateWorkOrderLineItem()
    {
        CreateWorkOrderLineItem cwoLi = new CreateWorkOrderLineItem();
        cwoLi.createWorkOrderLineItem();
    }
}
```

Knowledge Articles and Work Orders

You can attach Knowledge articles to work orders and work order line items to help field technicians access important procedural info, guidelines, specs, and more. Learn how to make the most of this feature.

Attaching an article

You can attach an article to a work order or work order line item in two ways:

- Navigate to the record to which you want to attach the article. In the Knowledge One widget in the console, search for an article. In the article's action menu, click **Attach to Work Order** or **Attach to Work Order Line Item**.
- Navigate to the record to which you want to attach the article. In the Articles related list, click **Find Articles**. Use the search to locate your article, then click **Attach to Work Order** or **Attach to Work Order Line Item** in the article's action menu.

Viewing an attached article

Articles attached to a work order or work order line item appear in the Knowledge One widget and the Articles related list on the record. View an article by clicking its title. You can also navigate to attached articles from the feed of a work order or work order line item if feed tracking for related lists is enabled.

On article detail pages, the Linked Work Orders and Linked Work Order Line Items related lists show which records an article is attached to.

Detaching an article

You can detach an article from a work order or work order line item in two ways:

- Navigate to the record that the article is attached to. In the Knowledge One widget in the console, click **Detach from Work Order** or **Detach from Work Order Line Item** in the article's action menu.
- Navigate to the record that the article is attached to. In the Articles related list, click **Detach** next to the article.

Updating an attached article

If an article is out of date, you can publish a new version by navigating to the article and clicking **Edit**.

When you attach an article to a record, that version of the article stays associated with the record even if later versions are published. If needed, you can detach and reattach an article to a record to ensure that the record is linked to the latest version of the article. The `Linked Article Version` field on the linked article detail page leads to the attached version.

Managing linked articles

Customize linked articles' page layouts, fields, validation rules, and more from the Linked Articles node in Setup under Knowledge.

To learn how to configure your console and page layouts so articles can be attached to work orders and work order line items, see [Set Up Work Orders](#).

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions with the Service Cloud

USER PERMISSIONS

To attach or detach an article on a work order or work order line item:

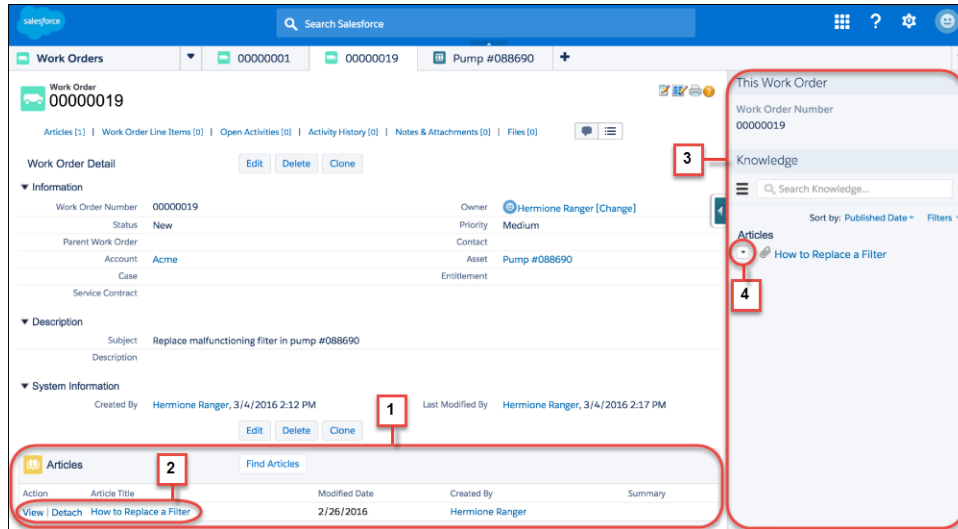

- "Read" on work orders AND "Read" on the article type AND Knowledge enabled

To edit page layouts:

- "Customize Application"

To edit console layouts:

- "Customize Application" AND "Service Cloud User"

- (1) View and change the articles attached to a record from the Articles related list.
- (2) View an article's properties by clicking **View**, or view the article itself by clicking its title. Click **Detach** to remove the article from the record.
- (3) The Knowledge One widget in the console sidebar lets you manage attached articles and search the Knowledge base.
- (4) Each article's action menu contains the option to attach or detach it.

 **Warning:**

- The Article widget and Feed Articles Tool aren't available in the feed view.
- Quick actions and global actions aren't supported for linked articles.
- The Knowledge One widget on work orders and work order line items lets you search for articles, but doesn't offer article suggestions.
- In the Article Toolbar on the Knowledge home page, you can't attach an article to a work order or work order line item.
- The Linked Work Orders and Linked Work Order Line Items related lists on articles aren't available in Lightning Experience or Salesforce1.
- Linked articles are view-only in Lightning Experience and Salesforce1.
- In Lightning Experience, clicking an article link in a feed item redirects you to the article page in Salesforce Classic. In Salesforce1, linked articles can't be accessed from feed items.

[Set Up Work Orders](#)
[Linked Article Fields](#)

Linked Article Fields

A linked article is a Knowledge article that is attached to a work order or work order line item. Learn about the fields that appear on linked article records.

Field	Description
Article ID	The ID of the linked article record, which is created when an article is attached to a record.
Article Title	The title of the attached article.
Article Version	<p>The version of the article that is attached to the record. This field displays the title of the attached version, and links to the version.</p> <p>When you attach an article to a work order, that version of the article stays associated with the work order, even if later versions are published. If needed, you can detach and reattach an article to a work order to link the latest version.</p> <p>For example, if an article was entitled "How to Replace a Filter" when it was attached to the record, this field displays that title and links to the attached version.</p>
Knowledge Article ID	The ID of the article that is attached to the record.
Last Viewed	The date the article was last viewed.
Linked Object Type	(Read only) The type of record that the article is attached to. For example, if the article is attached to a work order, this field displays "Work Order."
Linked Record ID	The ID of the record that the article is attached to. For example, if the article is attached to a work order, this field displays the ID of the work order.
Record Type ID	The record type of the linked article. This field is populated only if record types are used.

Adding a Knowledge Base

Adding Salesforce Knowledge

Welcome to Salesforce Knowledge

Build your knowledge base and give your website visitors, clients, partners, and service agents the ultimate in support. Salesforce Knowledge lets you create and manage your company information and securely share it when and where it is needed.

Your Salesforce Knowledge base is built from knowledge articles, which are documents of information. Articles can include information on process, like how to reset your product to its defaults, or frequently asked questions like, how much storage your product supports.

Experienced service agents and internal writers write the articles. The articles are then published to a range of channels: internal database, customer and partner communities, or public websites. Where and what information is published is based on the article layout profile and the field level security.

Salesforce Knowledge Documentation Overview

Use these lists to find Salesforce Knowledge information in the Salesforce documentation set.

Plan Your Knowledge Base

It's important that you consider your individual company's needs while you develop a strategy for capturing and publishing your support team's expertise. With a robust knowledge base, customers receive service faster or even solve their own problems themselves.

Setting up Salesforce Knowledge is a "choose your own adventure" procedure. There are many features and options and it's up to you to decide which ones are right for your enterprise.

Consideration	Further Information
What information do you need to publish?	Article Types
Who can provide the information?	Knowledge User License, User Setup
Who can approve and manage the information?	Knowledge Management, Validation Rules
Do you need workflow or approval processes to manage article creation and publication?	Workflow and Approvals for Articles
Do you have an existing Knowledge base or documentation that you need to import?	Import Existing Information into Salesforce Knowledge
Who needs to read what information and where?	Knowledge Article Access, Create Public Groups for Knowledge, Assign Article Actions to Public Groups
Do you need to categorize your information?	Data Categories in Salesforce.com
Who has access to which categories?	Data Category Visibility
Are you supporting more than one language?	Support a Multilingual Knowledge Base
Do you need agents to search for articles while working on a case?	Attach PDF versions of articles to case emails.View a list of suggested articles based on case information., Set Up the Knowledge One Widget
Do you need agents to follow articles in Chatter?	Feed Tracking
Do you need to share your knowledge base externally?	Public Knowledge for Mobile, Web, and Facebook
Do you need to enhance searchability?	Improve the Article Search Experience
Do you need guidelines, resources, and current discussions on the evolving world of knowledge base orientated service?	Salesforce Knowledge is "KCS Verified" by the Consortium for Service Innovation, which recognizes best practices in customer support methodologies. By implementing Knowledge-Centered Support (KCS) features, you can create more efficient collaboration within your team and provide pertinent and accurate information to your customers.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Consider the following tips when planning and using Salesforce Knowledge:

- Create [synonym groups](#) in Salesforce Knowledge. Synonyms are words or phrases that are treated as equivalent in article searches, letting you optimize search results.
- Before setting up data categories, carefully plan your category groups and their hierarchies. Also, consider how your category hierarchy maps to your role hierarchy. For more information, see [Data Category Visibility](#).
- Create [custom reports](#) on your Salesforce Knowledge data. You can also install the *Knowledge Base Dashboards and Reports* app from the AppExchange to receive over two dozen helpful reports.
- Multiple agents can edit the same article at the same time. If that occurs, your changes can be overwritten by a colleague without warning, even if you save your work frequently. To avoid accidental data loss, instruct all users who edit articles to edit only the articles they're assigned.
- Know the maximum [limits for articles](#), article types, and data categories.
- Review your usage regularly to avoid storage shortages: from Setup, enter *Storage Usage* in the **Quick Find** box, then select **Storage Usage**.
- Public knowledge base users cannot rate articles.
- The [File custom field type](#) allows agents to attach documents to articles.
- You will lose your data if you convert a custom field on an article type into any other field type. Do not convert custom fields unless no data exists for the field.
- When renaming Salesforce Knowledge labels note that standard field names, like title and type, are fixed. These fields do not change the labels on the article create and edit pages. If the organization is set to another language, these fields remain in the fixed label for that language.
- The Salesforce Knowledge search engine supports lemmatization, which is the process of reducing a word to its root form. With lemmatization, a search can match expanded forms of a search term. For example, a search for *running* matches items that contain *run*, *running*, and *ran*.
- Make sure that you have a clear understanding of the type of articles your organization needs, and how agents interact with these article types. This determines the article type permissions and article actions that you need to assign to Salesforce Knowledge users, which you can then use to create the set of profiles or permission sets required by your organization. For more information, see [Knowledge Article Access](#) on page 2681.
- Determine if you need to create workflow rules for some of your article types. For example, you can create a rule that sends an email to an article manager when an agent creates an article upon closing a case.
- Determine if you need to create approval processes for some of your article types. For example, if you have a type of article that must have legal and management approval before it can be published externally, create an approval process for the article type.

Salesforce Knowledge Limits

Limits for Salesforce Knowledge per edition.

Salesforce Knowledge is a knowledge base for creating and managing content. If Salesforce Knowledge is enabled in the Customer Portal or partner portal, customers and partners can access articles.

Salesforce Knowledge Limits	Details for Performance, Unlimited, Enterprise, and Developer Editions
Maximum number of articles	50,000 articles
Maximum number of article types	100 article types
Maximum number of custom fields per article type	Enterprise, Developer, and Unlimited editions: 500 custom fields per article type Performance editions: 800 custom fields per article type
Maximum file fields	5 file fields

Salesforce Knowledge Limits	Details for Performance, Unlimited, Enterprise, and Developer Editions
Maximum file field size	File fields are counted as attachments and can be up to 25 MB.
Maximum rich text area size	131072 characters
Maximum size of all rich text area fields on an article	1638400 characters
Maximum unique article references (links) in a rich text area field	You can have up to 100 links to different Salesforce Knowledge articles in one rich text field.
Article history tracking	Article events are tracked for up to 18 months.
Maximum number of supported languages	16 supported languages
Article import	<p>The import .zip file must meet the following requirements:</p> <ul style="list-style-type: none"> • There can only be one .csv file and one .properties file. • The .csv file and the .properties file must be in the root directory. • The compression process must preserve the folder and subfolder structure. • The .zip file name can't contain special characters. • The .zip file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB. • .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations. • .csv file rows can't exceed 400,000 characters. • .csv file cells can't exceed 32 KB. • Each article in the .csv file can't have more than 49 translations.
Maximum number of data category groups and active data category groups	5 category groups; 3 active
Maximum number of categories per data category group	100 categories in a data category group
Maximum number of levels in data category group hierarchy	5 levels in a data category group hierarchy
Maximum number of data categories from a data category group assigned to an article	8 data categories from a data category group assigned to an article
Maximum number of promoted search terms	Your organization can create a maximum of 2,000 promoted terms.

Build Your Knowledge Base

If your organization has Knowledge User licenses and one is assigned to you, you are ready to build your knowledge base.

To ensure that your organization has Knowledge User licenses, from Setup, enter *Company* in the Quick Find box, then select **Company Information**. Knowledge User licenses are listed near the bottom of the page, in the Feature Licenses related list.

To ensure that you are a Salesforce Knowledge user, from your personal settings, enter *Personal* in the Quick Find box, then select **Personal Information**. The Knowledge User checkbox is in the second column of the User Detail section.

To enable Salesforce Knowledge, from Setup, enter *Knowledge* in the Quick Find box, then select **Knowledge Settings**. Confirm that you want to enable Salesforce Knowledge and click **Enable Knowledge**. If your org doesn't have an article type, a default article type is created.

 **Note:** If you enabled Knowledge before Spring '16 you must create an article type first. After the Spring '16 release, you no longer need to create an article type first.

Enable Salesforce Knowledge

From the Knowledge Settings page, you can create a Knowledge Base experience for your support agents, partners, and customers.

To set up or edit your knowledge Base, from Setup, enter *Knowledge Settings* in the Quick Find box, select **Knowledge Settings**, then click **Edit**.

Feature or Option	Description
General Settings	
Allow agents to create and edit articles from the Article or Knowledge tab	Enables agents to edit articles without going to the Article Management tab. Agents can click Edit to open the article edit page. If a published version of the article exists, they can view the published version or edit the current version. If a draft version exists, they can continue with editing the existing draft, but must carefully review the draft so that they don't overwrite unpublished changes.
Activate Validation Status field	Adds a Validation Status on page 2691 field to all Salesforce Knowledge articles. Agents can select values to show whether the content of the article has been validated or not.
Allow agents to add external multimedia content to HTML in the standard editor	Allows <iframe> elements in the standard editor to embed multimedia content from the

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To enable Salesforce Knowledge:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Feature or Option	Description
	Dailymotion, Vimeo, and YouTube websites. Agents can simply cut and paste <iframe> HTML into the editor.
Article Summaries	
Show article summaries in article list views	For each channel, decide whether an article's summary details display beneath the article's title in search results.
Knowledge One	
Switch from the Articles tab to the Knowledge Tab	Enable Knowledge One with Profiles Enable Knowledge One with Permission Sets
Suggest related articles on cases	<p>Search on the Knowledge tab suggests articles based on their content similarity and their links to similar cases. If no articles are linked to similar cases, suggested articles have similar titles as the case or have keywords in common with admin-selected case fields. Suggested articles are available in the Salesforce Console for Service and your portals when viewing existing cases and creating ones.</p> <p> Note: By default, the Subject field is selected. Choose up to five of the available short text fields that include a description of the issue, the affected product, or the case topic. We recommend choosing short text fields to return more relevant results. Only the first 100 characters of the content from all admin-selected fields are searched. The Description field is always taken into account when suggesting articles for cases and does not count toward the character limit.</p>
Highlight relevant article text within search results	Search on the Knowledge tab generates a snippet of the relevant article text with the search terms bolded. See Search Highlights and Snippets .
Auto-complete keyword search	<p>Search on the Knowledge tab suggests the three most popular keyword searches performed on the Knowledge tab. Suggestions are based on the channel (internal, customer, partner, or public) the reader is searching.</p> <p> Note: Keyword search history is refreshed once a day.</p>
Auto-complete title search	Search on the Knowledge tab suggests up to 3 articles with matching titles.
Language Settings	
Default Knowledge Base Language	The primary language used for writing articles. It defaults to your organization's language. We recommend that your Default Knowledge Base Language and your organization's language are the same.

Feature or Option	Description
Single or Multiple Language	<p>If you support more than one language, select Multiple Languages and choose the translation settings. For instructions, see Support a Multilingual Knowledge Base.</p> <p> Important: Setting up a Multilingual Knowledge Base. Important: If you enable Multiple Languages, you can't revert to a single language knowledge base.</p>
Case Settings	
Allow agents to create an article from a case	<p>If this checkbox is selected, agents can create a draft article that is attached to the case when the article is published using one of the following options.</p> <ul style="list-style-type: none"> • Create articles using the simple editor only when closing cases. • Create articles using the standard editor any time an agent creates an article. Make sure that users have "Manage Articles," "Read," and "Create" permissions. Designate the following: <ul style="list-style-type: none"> – The default article type, from the drop-down list – For articles created when closing a case, assign the article to a user. – Help agents create articles fast by Selecting an Apex class that pre-populates any of the fields on the draft. By default, the Title field in all draft articles contains the case subject. <p> Note: If you enable this option, also click Layout Properties on each case-close page layout and select "Enable submissions during case close and Submit Articles."</p>
Use a profile to create article PDFs	<p>By default, when a user creates an article PDF directly from a case, the PDF includes all the article fields visible to that user. If you want PDFs generated according to a different profile, for example, a profile that hides certain fields from customers, select Use a profile to create customer-ready article PDFs on cases and choose the profile that determines field visibility.</p>
Enable list of cases linked to an article	<p>Agents and Salesforce Knowledge managers can see a list of cases an article is attached to. This helps validate if the article is the right solution for a case and shows which articles are used most, without running a report. The Linked Cases related list:</p> <ul style="list-style-type: none"> • Is visible on the detail or preview page of any article that has been published at least once. • Shows a maximum of 200 cases • Is sorted in descending order by the date the article was linked to the case. The sort order can't be changed.

Feature or Option	Description
	<ul style="list-style-type: none"> • Doesn't appear on archived articles or a translation's edit and detail pages. • Doesn't appear for external users such as portal or communities users or on Salesforce1.
Share Article via URL Settings	
Allow agents to share articles via public URLs	You can share an article that is available on a public knowledge base with a URL. In the Available Sites list, select the sites you want to allow your agents to send URLs from and add them to the Selected Sites list. Agents can then email customer service clients with a URL to link directly to the article in your public knowledge base.
Answers Settings	
Allow agents to create an article from a reply	If this checkbox is selected, members of an answers community or Chatter Answers community can convert helpful replies into articles. The article type you select determines which fields appear on the draft article. However, on all articles the Title contains the question and the Summary contains the reply. After a reply is promoted to an article, the original reply has a status message indicating its association with the draft article. When the article is published, the message on the reply includes a link to the article.
Chatter Questions Settings	
Display relevant articles as users ask questions in Chatter (also applies to communities with Chatter)	Shows similar questions and relevant Salesforce Knowledge articles when a user enters a question in the Search field.
Knowledge Statistics Settings	
Enable thumbs up or down voting for article	With this option, the article VoteStat report (which by default only contains totals for star ratings) includes totals for the thumbs up or down ratings.

Enable Knowledge One with Permission Sets

To switch users from the Articles tab to the Knowledge tab, add the Knowledge One permission to their permission sets.

To add the Knowledge One permission to a permission set:

1. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.
2. Click the permission set you want to add the Knowledge One permission to.
3. In the  **Find Settings...** box, enter *Knowledge*.
4. Select **Knowledge One** from the list of suggestions.
5. Click **Edit**.
6. Under Knowledge Management, check the Enabled check box for Knowledge One.
7. Click **Save**.
8. Ensure each user has at least a Read permission on at least one article type.

Once Knowledge One is available for your users, define your [external data sources](#). Your external data sources appear under your articles both in the search results and the left-side panel.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create or edit permission sets:

- “Manage Profiles and Permission Sets”

To create and edit external data sources:

- “Customize Application”

Enable Knowledge One with Profiles

To switch users from the Articles tab to the Knowledge tab, add the Knowledge One permission to their profiles.

To add the Knowledge One permission to a profile:

1. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**.
2. Click the profile you want to add the Knowledge One permission to.
3. In the  **Find Settings...** box, enter *Knowledge*.
4. Select **Knowledge One** from the list of suggestions.
5. Click **Edit**.
6. Under Knowledge Management, check Knowledge One.
7. Click **Save**.
8. Ensure each user has at least a Read permission on at least one article type.

Once Knowledge One is available for your users, define your [external data sources](#). Your external data sources appear under your articles both in the search results and the left-side panel.

EDITIONS

To create or edit profiles:

- "Manage Profiles and Permission Sets"

To create and edit external data sources:

- "Customize Application"

Example Apex for Submitting Articles from Cases

If your organization allows customer-support agents to create Salesforce Knowledge articles while closing a case, you can use Apex to pre-populate fields on draft articles. To do so, create an Apex class and assign it to the case article type using the example below as a guide.

For more information on the syntax and use of Apex, see the [Force.com Apex Code Developer's Guide](#).

Set up the example by creating the following article type, field, and data categories. Do not change the default `API Name` assigned to each new object.

1. Create an article type called `FAQ`.
 2. Create a text custom field called `Details`.
 3. Create a category group called `Geography` and assign it a category called `USA`.
 4. Create a category group called `Topics` and assign it a category called `Maintenance`.
- Now, create and assign the Apex class.
5. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes** and click **New**.
 6. To specify the version of Apex and the API used with this class, click **Version Settings**.

If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.

7. In the `Apex Class` text box enter the following script and click **Save**:

```
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController
    as an argument
    public
AgentContributionArticleController(ApexPages.KnowledgeArticleVersionStandardController
ctl) {
    SObject article = ctl.getRecord(); //this is the SObject for the new article.

                                //It can optionally be cast to the proper
article type, e.g. FAQ__kav article = (FAQ__kav) ctl.getRecord();

    String sourceId = ctl.getSourceId(); //this returns the id of the case that was
closed.
    Case c = [select subject, description from Case where id=:sourceId];

    article.put('title', 'From Case: '+c.subject); //this overrides the default
behavior of pre-filling the title of the article with the subject of the closed case.
    article.put('Details__c',c.description);

    ctl.selectDataCategory('Geography','USA'); //Only one category per category
group can be specified.
    ctl.selectDataCategory('Topics','Maintenance');
}
}
```

8. From Setup, enter `Knowledge Settings` in the `Quick Find` box, then select **Knowledge Settings** and click **Edit**.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To edit Salesforce Knowledge settings:

- "Customize Application"

To create an Apex class:

- "Author Apex"

9. Verify the [case settings](#); using our example, the **Default article type** should be FAQ.
10. From the Use Apex Customization menu, select **AgentContributionArticleController** and click **Save**.

As a result of this example, when agents create an article from the case-close screen:

- The data from the `Description` field on the case appears in the `Details` field of the article.
- The title of the article contains `From Case:` and the case subject.
- The article is automatically assigned to the `USA` data category and the `Maintenance` data category.

Knowledge Article Types

Article types, such as FAQs and Tutorials, provide the format and structure to control how an article displays for each audience, known as a channel. For each article type you can create custom fields, customize the layout by adding or removing sections and fields, and choose a template for each channel. You can also create workflow rules and approval processes to help your organization track and manage article creation and publication.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Create Article Types

An article type controls how an article displays and what type of information of fields are included.

 **Note:** Before agents can access article types, you must set object permissions for article types.

1. From Setup, enter *Knowledge Article Types* in the Quick Find box, then select **Knowledge Article Types**.
2. Click **New Article Type** or edit an existing article type.
3. Enter the article types details

Field	Description
Label	A name used to refer to the article type in any user interface pages.
Plural Label	The plural name of the object. If you create a tab for this object, this name is used for the tab.
Gender	If it is appropriate for your organization's default language, specify the gender of the label. This field appears if the organization-wide default language expects gender. Your personal language preference setting does not affect whether the field appears. For example, if the organization's default language is English and your personal language is French, you are not prompted for gender when creating an article type.
Starts with a vowel sound	If it is appropriate for your organization's default language, check if your label should be preceded by "an" instead of "a".
Object Name	(Read only) A unique name used to refer to the article type when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. The Object Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Description	An optional description of the article type. A meaningful description helps you remember the differences between your article types when you are viewing them in a list.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, or delete article types:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Field	Description
Track Field History	Select this option to track the full history of an article and its versions. The system records and displays field updates, publishing workflow events, and language versions for the master article and any translations.
Deployment Status	Indicates whether the article type is visible outside Setup. In Development means that article managers can't choose this article type when creating articles. Only select Deployed after you are done creating the article type.

4. Click **Save**.

On the article type detail page,

- In the Fields related list, [create or modify custom fields](#) as needed.
- In the Fields related list, [edit the article-type layout](#) as needed to rearrange fields and create sections.
- In the Channel Displays related list, [choose a template](#) for the Internal App, Partner, Customer, and Public Knowledge Base.

Add Custom Fields to Article Types

Create custom fields to store information that is important to your articles. The only standard fields provided on article types are: Article Number, Summary, Title, and URL Name. At minimum, you want to create a field where authors can write the body of the article.

Before you begin, determine the [type of custom field](#) you want to create.

 **Note:** Authors can view the URL Name when they create or edit an article. The URL Name does not appear to end users viewing published articles.

1. From Setup, enter *Knowledge Article Types* in the Quick Find box, then select **Knowledge Article Types**.
2. Select an article type.
3. Click **New** in the Fields related list.
4. Choose the type of field to create, and click **Next**.
5. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.

6. Enter any field attributes, such as *Description*, and click **Next** to continue.

 **Note:** You cannot enter a default value for any custom field.

7. Set the [field-level security](#) to determine whether the field is visible and editable or read only for specific profiles, and click **Next**. Field-level security allows you to control which fields are visible in different channels.
8. If you do not want the field to be added automatically to the article-type layout, uncheck *Yes, add this custom field to the layout*.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

9. Click **Save** to finish or **Save & New** to create more custom fields.

10. Optionally [rearrange your custom fields](#) on the article-type layout.

 **Note:** Creating fields can require changing many records at once. To process these changes efficiently, Salesforce might queue your request and send an email notification when the process has completed.

 **Warning:** You lose your data if you convert a custom field on an [article type](#) into any other field type. Do not convert a custom field on an article type unless no data exists for the field.

Custom Fields on Articles

The first step in creating a custom field for articles is choosing the field type. This table describes all available custom field types.

Field Type	Description
Article Currency	In a multiple currency organization, an article can have an article currency field to set the article's currency ISO code.
Currency	<p>Allows agents to enter a currency amount. The system automatically formats the field as a currency amount. This can be useful if you export data to a spreadsheet application. You can make this field required so an agent must enter a value before saving an article.</p> <p> Note: Salesforce uses the round-half-to-even tie-breaking rule for currency fields. For example, 23.5 becomes 24, 22.5 becomes 22, -22.5 becomes -22, and -23.5 becomes -24. Values lose precision after 15 decimal places.</p>
Date	Allows agents to enter a date or pick a date from a popup calendar. In reports, you can limit the data by specific dates using any custom date field. You can make this field required so an agent must enter a value before saving an article.
Date/Time	Allows agents to enter a date or pick a date from a popup calendar, and enter a time of day. They can also add the current date and time by clicking the date and time link next to the field. The time of day includes AM or PM notation. In reports, you can limit the data by specific dates and times using any custom date field. You can make this field required so an agent must enter a value before saving an article.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Field Type	Description
Email	<p>Allows agents to enter an email address, which is validated to ensure proper format. Character limit is 80. If this field is specified for contacts or leads, agents can choose the address when clicking Send an Email. You can't use custom email addresses for mass emails. You can make this field required so an agent must enter a value before saving an article.</p>
File	<p>Allows agents to upload and attach a file to an article. You can make this field required so an agent must enter a value before saving an article. Note the following caveats about File fields:</p> <ul style="list-style-type: none"> • The maximum attachment size is 25 MB. • You can add up to 5 File fields to each article type; contact Salesforce to increase these limits. • If the <code>Disallow HTML documents and attachments</code> security setting is enabled, File fields do not support HTML files. • Text content in a File field attachment is searchable. You can search up to 25 MB of attached files on an article. For example, if an article has six 5-MB file attachments, the first 4.16 MB of each file is searchable. • You cannot attach Salesforce CRM Content files using the File field. • The File field type is not supported in Developer edition. • The filename cannot exceed 40 characters. • You cannot convert a File field type into any other data type.
Formula	<p>Allows agents to automatically calculate values based on other values or fields such as merge fields.</p> <p> Note: Salesforce uses the round half up tie-breaking rule for numbers in formula fields. For example, 12.345 becomes 12.35 and –12.345 becomes –12.34.</p> <p>In Database.com, the Formula editor does not provide a Check Syntax button. Syntax checking occurs when the agent attempts to save the formula.</p>
Lookup Relationship	<p>Creates a relationship between two records so you can associate them with each other. For example, opportunities have a lookup relationship with cases that lets you associate a particular case with an opportunity. A lookup relationship creates a field that allows agents to click a lookup icon and select another record from a popup window. On the associated record, you can then display a related list to show all the records that are linked to it. You can create lookup relationship fields that link to users, standard objects, or custom objects. If a lookup field references a record that has been deleted, Salesforce clears the value of the lookup field by</p>

Field Type	Description
	<p>default. Alternatively, you can choose to prevent records from being deleted if they're in a lookup relationship. You can make this field required so an agent must enter a value before saving an article.</p> <p>Lookup relationship fields are not available in Personal Edition.</p> <p>Lookup relationship fields to campaign members are not available; however, lookup relationship fields from campaign members to other objects are available.</p>
Number	<p>Allows agents to enter any number. This entry is treated as a real number and any leading zeros are removed. You can make this field required so an agent must enter a value before saving an article.</p> <p> Note: Salesforce uses the round half up tie-breaking rule for number fields. For example, 12.345 becomes 12.35 and -12.345 becomes -12.34. Salesforce rounds numbers referenced in merge fields according to the user's locale, not the number of decimal spaces specified in the number field configuration.</p>
Percent	<p>Allows agents to enter a percentage number, for example, '10'. The system automatically adds the percent sign to the number. You can make this field required so an agent must enter a value before saving an article.</p> <p> Note: If the decimal value is greater than 15, and you add a percent sign to the number, a runtime error occurs.</p> <p>Values lose precision after 15 decimal places.</p>
Phone	<p>Allows agents to enter any phone number. Character limit is 40. You can make this field required so an agent must enter a value before saving an article.</p> <p>Salesforce automatically formats it as a phone number.</p>
Picklist	Allows agents to select a value from a list you define.
Picklist (Dependent)	Allows agents to select a value from a list dependent on the value of another field.
Picklist (Multi-select)	Allows agents to select more than one picklist value from a list you define. These fields display each value separated by a semicolon.
Text	Allows agents to enter any combination of letters, numbers, or symbols. You can set a maximum length, up to 255 characters. You can make this field required so an agent must enter a value before saving an article.

Field Type	Description
Text Area	Allows agents to enter up to 255 characters that display on separate lines similar to a <code>Description</code> field. You can make this field required so an agent must enter a value before saving an article.
Text Area (Long)	<p>Allows agents to enter up to 131,072 characters that display on separate lines similar to a <code>Description</code> field. You can set the length of this field type to a lower limit, if desired. Any length from 256 to 131,072 characters is allowed. The default is 32,768 characters. Every time a agents presses <code>Enter</code> within a long text area field, a line break and a return character are added, both count toward the character limit. Also, smart links add more characters than what is displayed.</p> <p> Note: If you lower the character limit and you have articles that surpass the new limit. Those articles can't be edited until the limit is reset higher than their character counts.</p>
Text Area (Rich)	<p>Allows agents to enter up to 131,072 characters of HTML-supported text including code samples () and smart links between Salesforce Knowledge articles.</p> <p>There are two ways to create smart links:</p> <ul style="list-style-type: none"> • Search for the article. • Enter the article URL. <p> Note:</p> <ul style="list-style-type: none"> • You can have up to 100 links to different Salesforce Knowledge articles in one rich text field. • When you convert a text area (rich) field to a text area (long) field, links are displayed as link reference numbers, not URLs. • The upgraded editor doesn't support Internet Explorer version 7 or version 8 in compatibility mode. If you are using these browsers, you use the older editor.
URL	Allows agents to enter up to 255 characters of any valid website address. When agents click the field, the URL opens in a separate browser window. Only the first 50 characters are displayed on the record detail pages. You can make this field required so an agent must enter a value before saving an article.

Field-Level Security on Articles

Field-level security lets administrators restrict readers' access to specific fields on detail and edit pages. For example, you can make a "Comment" field in an article visible for Internal App profiles but not for public Community profiles.

If using both [article-type layout](#) and field-level security to define field visibility, the most restrictive field access setting always applies. For example, if a field is hidden in the article-type layout, but visible in the field-level security settings, the layout overrides security settings and the field aren't visible. Some user permissions override both page layouts and field-level security settings. For example, users with the "Edit Read Only Fields" permission can always edit read-only fields regardless of any other settings.

 **Important:** Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

You can define security via a permission set, profile, or field.

Define field-level security via permission sets or profiles

- For permission sets or profiles, from Setup, either:
 - Enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, or
 - Enter *Profiles* in the **Quick Find** box, then select **Profiles**
- Select a permission set or profile.
- Depending on which interface you're using, do one of the following:
 - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the object you want and select it from the list. Click **Edit**, then scroll to the Field Permissions section.
 - Original profile user interface—In the Field-Level Security section, click **View** next to the object you want to modify, and then click **Edit**.
- Specify the field's access level.

 **Note:** These field access settings override any less-restrictive field access settings on the article-type layouts.
- Click **Save**.

Define field-level security via fields

- For fields, from Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
- Select the article type that contains the field to modify.
- Select the field and click **Set Field-Level Security**.
- Specify the field's access level.

 **Note:** These field access settings override any less-restrictive field access settings on the article-type layouts.
- Click **Save**.

After setting field-level security, you can [modify the article-type layouts](#) to organize the fields on detail and edit pages.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Use Videos from Any Provider with a Custom Visualforce Page

Using a custom Visualforce page and the HTML editor, you can insert videos from any provider into your Salesforce Knowledge articles.

For example, create a Visualforce page:

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create a Visualforce page

- "Customize Application"

To create articles:

- "Manage Articles"

AND

"Read" and "Create" on the article type

To edit draft articles:

- "Manage Articles"

AND

"Read" and "Edit" on the article type

To edit published or archived articles:

- "Manage Articles"

AND

"Create," "Read," and "Edit" on the article type

```
<apex:page showHeader="false" showChat="false" sidebar="false">
  <iframe width="560" height="315"
    src="http://myvideo.provider.com/embed/{!$CurrentPage.parameters.VideoID}"
    frameborder="0" allowfullscreen="true">
  </iframe>
</apex:page>
```

Then, with the HTML editor, authors can reference videos using this code:

```
<iframe frameborder="0" height="315"
  src="https://<salesforce_instance>/apex/Video?videoID=12345"
  width="560">
</iframe>
```

Article Type Page Layouts

Article-type layouts determine which fields agents can view and edit when entering data for an article. They also determine which sections appear when users view articles. The article-type template defines the format of the article, for example whether layout sections display as subtabs or as a single page with links. You can apply a layout per profile per article type. Therefore, you can display more sensitive fields of the same article to only those agents with the correct profile.

 **Tip:** You can also use [field-level security](#) to hide fields on article types. For example, if you publish the same article in the internal app and in a community, you can use field-level security to hide a custom field such as `Internal Comments` from external community users.

1. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Click the article type.
3. Scroll down to the Page Layouts related list or click the Page Layouts link at the top of the page.
4. To create a page layout, click **New** and follow the prompts. To edit an existing layout, click **Edit** and make your changes.

Make your changes. The layout editor consists of two parts: a palette on the upper portion of the screen and the layout on the lower portion of the screen. The palette contains the available fields and a section element. The layout contains an Information section and space for you to add sections. By default, all custom fields are included in the Information section.

 **Important:** If you navigate away from your article-type layout before clicking save, your changes are lost.

 **Note:** The `Article Number`, `Summary`, `Title`, and `URL Name` standard fields do not display in the layout. `Article Number` and `Summary` appear in a read-only Properties section at the top of the published article. Also included in this header are the `First Published`, `Last Modified`, and `Last Published` fields.

Task	Description
Add a section	Drag and drop the section element into the palette.
Change the name of a section	Click its title. You cannot rename the Information section.
Remove a field from a section	Drag it to the right side of the palette or click the  icon next to the field.
Remove a section from the article-type layout	Click the  icon next to the section name.
Save your changes and continue editing the article type layout	Click Quick Save .

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To customize the article-type layout:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

 **Tip:**

- Use the undo and redo buttons to step backwards and forwards, respectively.
- Use the following keyboard shortcuts:
 - Undo = CTRL+Z
 - Redo = CTRL+Y
 - Quick Save = CTRL+S
- To select multiple elements individually, use CTRL+click. To select multiple elements as a group, use SHIFT+click.
- To quickly locate any item in the palette, use the Quick Find box. The Quick Find box is especially useful for article-type layouts that have large numbers of items available in the palette.

5. To assign various layouts to the article type based on a user profile, click **Page Layout Assignments**.

6. Click **Edit Assignment**.

7. Select the profile, or profiles (using SHIFT), you want to change and select the layout from the **Page Layout To Use** drop-down.

When creating multiple article type page layouts, consider the following limitations and functionality changes.

- When creating page layouts, some fields are hidden based on the agent's license. Out of Date, Translation Completed Date, and Translation Exported Date are hidden from users who do not have a Knowledge User license or who are customer portal or partner portal users. In addition, Archived By and Is Latest Version are hidden from customer portal and partner portal users.
- Before Spring '16, preview pages showed the Summary field in the API that contained text values, even if they were not in the page layout. To continue displaying summary fields on preview pages, manually update your page layouts to include them.
- If you want to attach articles as PDFs to emails when solving cases, add **File Attachments** to the `Selected Email Tools` in the Feed View for the article type layout.
- The article edit page only shows the standard fields (Article Number, Title, URL Name, and Summary) and all the custom fields added to the layout, including the side bar fields. Other standard fields added on the page layout are ignored because they are not editable, and the custom fields are displayed in the order specified in the page layout.
- If an article type page layout doesn't include a field with a [validation rule](#), you can't create or edit an article of that article type. Make sure all page layouts assigned to the article type by profile include all fields with validation rules.
- The Communication channel layout doesn't use the page layout to determine which Article fields are inserted into a case email. The fields that are inserted include the fields selected in the Communication Channel mapping.
- You can set up a specific profile to generate a PDF file. When sending articles as PDFs, the pdf is generated based on the sender's profile. Therefore, the receiver might get fields they are not meant to see. Use the `Use a profile to create customer-ready article PDFs on cases` setting on the Knowledge settings page so the fields in PDFs come from the page layout assigned to the configured profile. Also, Field Level Security of both the sender profile and the configured profile are applied.
- Salesforce Classic Mobile actions and related lists are not available on article page layouts in the desktop Salesforce user interface, with the exception of actions on the article feed.

Send Article Content in Email (Beta)

When using Knowledge One, agents can send an email with an article's contents embedded in the body of the email.

 **Note:** Sending article content via email is available through a beta program for articles published on external channels (public knowledge bases, portals, or communities) and is not supported on Internet Explorer 7. For new organizations, the user permission is off on all standard profiles but on for the System Administrator profile. For existing organizations, contact your Salesforce representative to enable the permission on the standard System Administrator profile.

Agents can send article content within an email rather than just sending a URL. Your customers can access the information without going to a website. Your agents send articles that are not published publicly without rewriting or copy and pasting an internal article. Administrators can assign permission to only those agents with a good knowledge of what is acceptable for an external audience.

To enable and setup which article fields go into emails for each article type.

1. From the object management settings for cases, go to Page Layouts.
2. How you access the Case Feed Settings page depends on what kind of page layout you're working with.
 - For a layout in the Case Page Layouts section, click **Edit**, and then click **Feed View** in the page layout editor.
 - For a layout in the Page Layouts for Case Feed Users section, click  and choose **Edit feed view**. (This section appears only for organizations created before Spring '14.)

If you've already opted to use the advanced page layout editor to configure the publisher for a layout, choose **Edit detail view** to add, change, or remove actions.
3. Under **Articles Tool Settings**, check **Enable attaching articles inline**.
4. Click **Save**.
5. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
6. Click the label or name of the article type you'd like to share via email.
7. Under **Communication Channel Mappings**, click **New** or **Edit**.
8. Enter a Label and Name.
9. Select and add **Email** to the Selected Channels list.
10. Select and add the fields you'd like included in the body of an email.

 **Note:** Smart links can't be included in the email and the following fields are not supported:

- ArticleType
- isDeleted
- Language
- MultiPicklist
- Picklist
- Publish Status
- Source

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To administer Salesforce Knowledge and create, edit, and delete page layouts:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

- Validation Status

11. Click **Save**.

 **Example:** While solving customer cases, agents with the permission can insert article content into the body of an email. Anywhere agents can attach articles to cases, such as the Knowledge One sidebar in the Salesforce Console, the Articles list in the case feed, the Article widget, or the suggested articles in a Knowledge One search, they can email any article of that type within the body of an email by selecting **Email article with HTML** in the action drop-down. The article content is inserted at top of email thread or wherever the agent left their cursor. Once an article has been emailed, an envelope icon appears to the left of the title. When the article has files that exceed the 10-mb attachment limit, agents are asked to select which files to attach and retry sending the email.

 **Note:** If rich text is not enabled on your case feed layout for the article type, only article text is embedded into the email and the action changes to **Email article text only**.

Post Site and Community Article URLs

In the Service Console, agents can insert Site or Community URLs for articles into the case feed via the email, community, or social publishers.

To post Site or Community URLs for articles into the case feed, you must have the [Knowledge sidebar enabled in the Service Console](#) and either a [Force.com Site](#) or [Community](#) setup.

1. From Setup, enter *Knowledge* in the *Quick Find* box, then select **Knowledge Settings**.
2. Click **Edit**.
3. In the *Share Article via URL Settings* section, enable **Allow users to share articles via public URLs**.
4. In the *Available Sites* list, select from which sites or communities you want agents to share article URLs and add them to the *Selected Sites* list.
5. Click **Save**.

Your agents can now select **Attach and share article** link from selected sites in the Knowledge sidebar of the console. Email is the default action but agents can change to the Social or Community action in the case feed before they insert the URL.

Important:

- Articles must be published. Draft articles don't show the insert URL option.
- Articles must be shared publicly, meaning their Channel must be Public Knowledge Base, Customer, or Partner.
- All enabled URLs show **Attach and share article** link, even if the article is not visible in that site or community. The agent must confirm that the article is available in the site or community before sharing it with the customer.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To administer Salesforce Knowledge:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

Control Data Integrity with Validation Rules

Ensure that your article content is compliant with your company standards. Create validation rules for each article type to check whether required fields have the appropriate values based on the article's status.

1. From Setup, enter *Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Click the article type.
3. Scroll down to the Validation Rules related list or click the **Validation Rules** link at the top of the page.
4. To create a validation rule, click **New**. To edit an existing rule, click **Edit**.
5. Name the rule.
6. Make the rule active.
7. Optionally, describe what you want to control on articles of this type.
8. Specify an error condition formula and a corresponding error message.

The error condition is written as a Boolean formula expression that returns true or false. When true, the article is not saved, and an error message displays. The author can correct the error and try again. For information on validation rules, see [Define Validation Rules](#) on page 4043.

 **Note:** Knowledge article errors always display at the top of the page, not next to the field. Write your errors descriptively so that authors know how to satisfy the validation rule. For example, identify which field is causing the error.

9. Click **Save**.

When creating validation rules on article types, consider the following limitations and functionality changes.

- If an article type page layout doesn't include a field with a validation rule, you can't create or edit an article of that article type. Make sure all [page layouts assigned to the article type by profile](#) include all fields with validation rules.
- The Article Currency field and the VLOOKUP function don't support validation rules.
- When importing articles, if the import data file has a valid article with an invalid translation, the translation is created, but its translated content isn't imported.
- Only the first validation rule error displays at the top of the page and in the import article log. If multiple errors exist but are not fixed, they are displayed on subsequent saves or imports.
- In the API, KA fields, such as Case Association Count and Archived Date, don't support validation rules. Only KAV (article version) fields are supported in validation rules.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create or edit validation rules for article types:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Article History Tracking

You can track the history of certain fields in articles. If you have history tracking enabled, open an article of that type and click **Version** to see a version history list. You can also set tracking for the article type and track the full history of an article and its versions. Article events are tracked for up to 18 months.

The system records and displays field updates, publishing workflow events, and language versions for the master article and any translations. When you track old and new values, the system records both values as well as the date, time, nature of the change, and the user who made the change. When you track only the changed values, the system marks the changed field as having been edited; it doesn't record the old and new field values. This information is available in the Version History list and the fields are available in the Article Version History report.

Article history respects field, entity, and record-level security. You must have at least "Read" permission on the article type or the field to access its history. For data category security, Salesforce determines access based on the categorization of the online version of an article. If there is no online version, then security is applied based on the archived version, followed by the security of the draft version.

1. From Setup, enter *Knowledge* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Create an article type or edit one from the Article Types list.
3. Click **Set History Tracking**.
4. Choose the fields you want to track.
Salesforce begins tracking history from that date and time. Changes made before that date and time are not tracked.
5. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, or delete article types:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

Article Type Templates

Article types in Salesforce Knowledge require a template for each channel. The standard article-type templates—Tab and Table of Contents—specify how the sections in the article-type layout appear in the published article. For example, if you choose the Tab template, the sections defined in the layout appear as tabs when users view an article. With the Table of Contents template, sections appear on a single page with hyperlinks to each section. You can also create a custom template using Visualforce. Custom templates are not associated with the article-type layout.

1. From Setup, enter *Knowledge Article Types* in the **Quick Find** box, then select **Knowledge Article Types**.
2. Click an article type name.
 - If you are using a default template, continue with Step 12.
 - If you are creating a custom template, make note of the article type's **API Name**. You need this value when you create the Visualforce page.
3. From Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages**.
4. Click **New**.
5. In the **Name** text box, enter the text that appears in the URL as the page name.
This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
6. In the **Label** text box, enter the text that users see when choosing this template from the Channel Displays related list on the article type detail page.
7. Add your Visualforce markup.

The only requirement for custom article-type templates is that the standard controller is equal to the **API Name** of the article type. For example, if the **API Name** of the article type is *Offer__kav*, your markup would be:

```
<apex:page standardController="Offer__kav">
    ... page content here ...
</apex:page>
```

 **Note:** Click **Component Reference** for a list of the Visualforce components, such as *knowledge:articleRendererToolbar* and *knowledge:articleCaseToolbar*, available for use in custom article-type templates.

8. If your article type has a **File field**, you can allow users to download the field's content.

In the following example, the article type is *Offer*, the name of the File field is *my_file*, and the text that appears as a link is *Click me*:

```
<apex:outputLink value="{!URLFOR($Action.Offer__kav.FileFieldDownload,
Offer__kav.id, ['field'=$ObjectType.Offer__kav.fields.my_file__Body__s.name])}">Click
me</apex:outputLink>
```

 **Note:** If the File field is empty (meaning the author didn't upload a file), the link still appears on the published article but has no function. If you do not want the link to appear when the File field is empty, replace *Click me* in the example with the name of the file. For example, *{!Offer__kav.my_file__Name__s}*.

EDITIONS

Available in: **Salesforce Classic**

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, or delete article-type templates:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

9. Click **Save**.

Your custom template can now be assigned to any channel on the article type.

10. From Setup, enter *Knowledge Article Types* in the *Quick Find* box, then select **Knowledge Article Types**

11. Click an article type name.

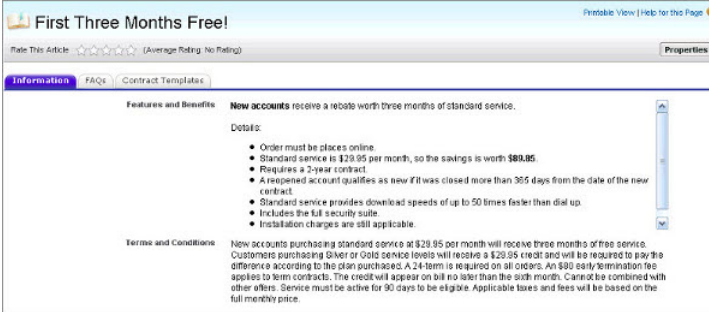

12. For each channel, specify the template.

- For Internal App, Customer and Partner, **Tab** is the default template.
- For Public Knowledge Base, **Table of Contents** is the default template.
- If you created a custom template for this article type, it also appears in the drop-down menu.

13. Click **Save**.

 **Example:** If you choose the Tab template, the sections you defined in the layout appear as tabs when users view an article.

Information | FAQs | Contract Templates

Features and Benefits: New accounts receive a rebate worth three months of standard service.

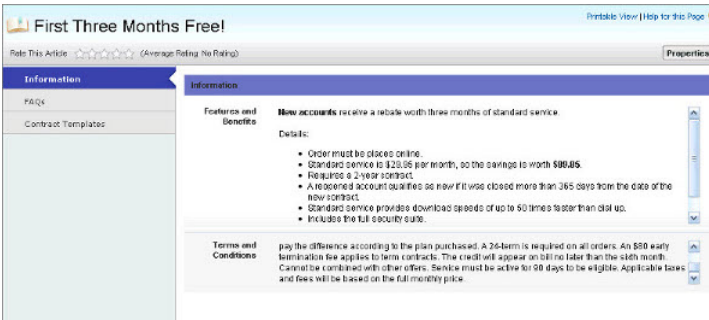

Details:

- Order must be placed online.
- Standard service is \$29.95 per month, so the savings is worth **\$89.85**.
- Requires a 2-year contract.
- A re-opened account qualifies as new if it was closed more than 365 days from the date of the new contract.
- Standard service provides download speeds of up to 50 times faster than dial up.
- Includes the full security suite.
- Installation charges are still applicable.

Terms and Conditions: New accounts purchasing standard service at \$29.95 per month will receive three months of free service. Customers purchasing Silver or Gold service levels will receive a \$29.95 credit and will be required to pay the difference according to the plan purchased. A 24-term is required on all orders. An \$89 early termination fee applies to term contracts. The credit will appear on bill no later than the sixth month. Cannot be combined with other offers. Service must be active for 90 days to be eligible. Applicable taxes and fees will be based on the full monthly price.

If you choose the Table of Contents template, the sections you defined in the layout appear on one page with hyperlinks to each section title.

Example Apex for Submitting Articles from Cases

If your organization allows customer-support agents to create Salesforce Knowledge articles while closing a case, you can use Apex to pre-populate fields on draft articles. To do so, create an Apex class and assign it to the case article type using the example below as a guide.

For more information on the syntax and use of Apex, see the [Force.com Apex Code Developer's Guide](#).

Set up the example by creating the following article type, field, and data categories. Do not change the default `API Name` assigned to each new object.

1. Create an article type called `FAQ`.
 2. Create a text custom field called `Details`.
 3. Create a category group called `Geography` and assign it a category called `USA`.
 4. Create a category group called `Topics` and assign it a category called `Maintenance`.
- Now, create and assign the Apex class.
5. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes** and click **New**.
 6. To specify the version of Apex and the API used with this class, click **Version Settings**.

If your organization has installed managed packages from the AppExchange, you can also specify which version of each managed package to use with this class. Use the default values for all versions. This associates the class with the most recent version of Apex and the API, as well as each managed package. You can specify an older version of a managed package if you want to access components or functionality that differs from the most recent package version. You can specify an older version of Apex and the API to maintain specific behavior.

7. In the `Apex Class` text box enter the following script and click **Save**:

```
public class AgentContributionArticleController {
    // The constructor must take a ApexPages.KnowledgeArticleVersionStandardController
    as an argument
    public
AgentContributionArticleController(ApexPages.KnowledgeArticleVersionStandardController
ctl) {
    SObject article = ctl.getRecord(); //this is the SObject for the new article.

                                //It can optionally be cast to the proper
article type, e.g. FAQ__kav article = (FAQ__kav) ctl.getRecord();

    String sourceId = ctl.getSourceId(); //this returns the id of the case that was
closed.
    Case c = [select subject, description from Case where id=:sourceId];

    article.put('title', 'From Case: '+c.subject); //this overrides the default
behavior of pre-filling the title of the article with the subject of the closed case.
    article.put('Details__c',c.description);

    ctl.selectDataCategory('Geography','USA'); //Only one category per category
group can be specified.
    ctl.selectDataCategory('Topics','Maintenance');
}
}
```

8. From Setup, enter `Knowledge Settings` in the `Quick Find` box, then select **Knowledge Settings** and click **Edit**.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To edit Salesforce Knowledge settings:

- "Customize Application"

To create an Apex class:

- "Author Apex"

9. Verify the [case settings](#); using our example, the **Default article type** should be FAQ.
10. From the Use Apex Customization menu, select **AgentContributionArticleController** and click **Save**.

As a result of this example, when agents create an article from the case-close screen:

- The data from the `Description` field on the case appears in the `Details` field of the article.
- The title of the article contains `From Case:` and the case subject.
- The article is automatically assigned to the `USA` data category and the `Maintenance` data category.

Delete an Article Type

Deleting article types can result in errors and lost data. Read this entire topic carefully before deleting article types.

1. From Setup, enter `Knowledge Article Types` in the `Quick Find` box, then select **Knowledge Article Types**.
2. Next to the article type, click **Del**.
3. Confirm that you want to delete the article type.

Notes on Deleting Article Types

- If your organization has only article type, you cannot delete it. Every Salesforce Knowledge org requires at least one deployed article type. Create an article type and then delete the old one.
- Any articles associated with a deleted article type are automatically removed from all channels, including draft, published, and archived articles.
- Salesforce does not display deleted article types in the Recycle Bin with other deleted records. Instead, deleted article types appear in the Deleted Article Types list on the article list view page for 15 days. During this time, you can restore the article type and its articles, or permanently erase the article type and its articles. After 15 days, the article type and its articles are permanently erased.
- If a reader clicks a bookmark to a deleted article's URL, an Insufficient Privileges message displays.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

Import Existing Information into Salesforce Knowledge

You can import your existing articles or information database into Salesforce Knowledge. This importer is for articles and translations you currently have outside Salesforce Knowledge

 **Note:** If you are looking for instructions on importing translated articles that you've sent to a localization vendor, see [Import Translated Articles](#) on page 2700.

1. [Prepare Articles for Import to Salesforce Knowledge](#)

Each import file must have articles of the same type and columns corresponding to the fields in the article.

2. [Create a .csv File for Article Import](#)

Each .csv file imports articles into one article type and maps the imported articles' content with the article type's fields. For example, a .csv file might map articles' titles with the standard field `title` in an article type, meaning that each article's title is imported into the `title` field.

3. [Set Article Import Parameters](#)

Specify import parameters in a property file using key names and corresponding values. For example, use the key `DateFormat` to specify that a date custom field appears in the `DateFormat=dd/MM/YYYY` format or specify the character encoding to be used for the import.

4. [Create an Article .zip File for Import](#)

To complete your article import, create a .zip file with your `.parameters`, `.csv`, and `.html` files, and upload them into Salesforce Knowledge.

5. [Article and Translation Import and Export Status](#)

Find the status of your article imports and exports on the Article Imports page in Setup.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Prepare Articles for Import to Salesforce Knowledge

Each import file must have articles of the same type and columns corresponding to the fields in the article.

 **Tip:** Test your import using a small set of articles.

1. Sort your existing articles by information type.
For example: FAQ, product information, or offer.
2. Ensure that each information type has a corresponding [Salesforce Knowledge article type](#) that matches its structure and content.

For example, if you are importing FAQs, ensure that Salesforce Knowledge has an FAQ article type with enough question and answer fields to accommodate the largest FAQ article.

If your articles contain .html files, use an article type that contains a rich text area field and ensure that the HTML is compliant with the tags and attributes supported in the rich text area field.

 **Note:** The article importer does not support subfields. If you have fields within fields, adjust your structure and content before importing into Salesforce Knowledge.

3. Verify that the article's [field-level security settings](#) allow you to edit the fields.

For each article type, [create a cvs file](#) to import.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To import articles:

- "Manage Salesforce Knowledge "

AND

"Manage Articles"

AND

"Manage Knowledge Article Import/Export"

AND

"Read," "Create," "Edit," and "Delete" on the article type

Create a .csv File for Article Import

Each .csv file imports articles into one article type and maps the imported articles' content with the article type's fields. For example, a .csv file might map articles' titles with the standard field `Title` in an article type, meaning that each article's title is imported into the `Title` field.

1. Create one .csv file per article type.
 - There can only be one .csv file and one .properties file.
 - The .csv file and the .properties file must be in the root directory.
 - The compression process must preserve the folder and subfolder structure.
 - The .zip file name can't contain special characters.
 - The .zip file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB.
 - .csv files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
 - .csv file rows can't exceed 400,000 characters.
 - .csv file cells can't exceed 32 KB.
 - Each article in the .csv file can't have more than 49 translations.
2. In the first row, specify the article type's fields and metadata, such as language [data categories](#) or channels.

Enter one item in each column. You can use the following fields and metadata to import content.

Field or data	Description
<code>isMasterLanguage</code>	Identifies the article as a master (1) or translation (0). Required to import articles with translations, however, it can't be in a .csv file to import articles without translations. Translations must follow their master articles so that they are associated with the master article preceding it
<code>Title</code>	The article or translation's title. Required for all imports.
Standard and custom fields	Refer to an article type's standard fields using field names and refer to custom fields using API names. Leaving a row cell empty may cause your articles to be skipped if the related article type field is mandatory.
Rich text area field	Use the rich text area custom fields to import .html files or images. Refer to an article type's rich text area field using its API name.
File field	Use the file custom fields to import any file type (.doc, .pdf, .txt, etc.). Refer to an article type's file field using its API name.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To import articles:

- "Manage Salesforce Knowledge "

AND

"Manage Articles"

AND

"Manage Knowledge Article Import/Export"

AND

"Read," "Create," "Edit," and "Delete" on the article type

Field or data	Description
Data category groups	To categorize the imported articles, use category groups; refer to a category group using its unique name prefixed with <code>datacategorygroup.</code> . For example, use <code>datacategorygroup.Products</code> to specify the category group <code>Products</code> .
Channel	To specify where the imported articles are available, use the keyword <code>Channels</code> .
Language	Specify the articles' language. Required to import articles with translations. Optional to import articles without translations. If you don't include this column, the articles automatically belong to the default knowledge base language and you can't import translations along with the master articles.

3. In subsequent rows, specify the articles you want to import.

Use one row per article and enter the appropriate information in each field or metadata column.

Consideration	Notes
Standard or custom fields	<p>Enter the articles' data for each field, except for rich text area fields where you must enter the relative path to the corresponding <code>.html</code> file in your <code>.zip</code> file.</p> <p> Note: The article importer does not support subfields. If you have fields within fields, adjust your structure and content before importing into Salesforce Knowledge.</p>
Rich text area field	<p>Always enter the <code>.html</code> file path relative to the location of the <code>.csv</code> file. Never enter raw text. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing HTML and images.</p> <ul style="list-style-type: none"> • We recommend that you create separate folders for the <code>.html</code> files (for example, <code>/data</code>) and the images (for example, <code>data/images</code>). • To import images, include the images in an <code>.html</code> file using the <code></code> tag and <code>src</code> attribute. Ensure that the <code>src</code> value is a relative path from the <code>.html</code> file to the image folder. • Images must be <code>.png</code>, <code>.gif</code>, or <code>.jpeg</code> files. • Each image file can't exceed 1 MB. • <code>.html</code> files can't exceed the maximum size for their field. • If a date doesn't match the date format specified in the property file, the related article isn't imported. • If an <code>.html</code> file references a file that isn't allowed, the related article isn't imported.

Consideration	Notes
	<ul style="list-style-type: none"> If an .html file references an image that's missing, the related article is imported without the image.
File field	<p>Enter the path relative to the file's location. If the specified path doesn't exist, the related article isn't imported. Note the following information about importing files.</p> <ul style="list-style-type: none"> We recommend that you create a folder for your files (for example, /files). Each file must not exceed 5 MB.
Category groups	<p>Use category unique names to categorize articles. Use the plus symbol (+) to specify more than one category. For example, Laptop+Desktop. Note the following information about data category groups.</p> <ul style="list-style-type: none"> Leaving the cell row empty causes your article to be set to No Categories. If you specify a category and its parent (for example, Europe+France) the import process skips the child category France and keeps the parent category Europe, because application of a parent category implicitly includes the category's children. When importing articles with translations and associated data categories, only the master article retains the data categories. The article translations have no associated data category upon import.
Channels	<p>Specify articles' channels using the keywords.</p> <ul style="list-style-type: none"> application for Internal App. If you don't specify a channel, application is the default. sites for Public Knowledge Base. csp for Customer. prm for Partner. <p>Use the plus (+) symbol to specify more than one channel (for example, application+sites+csp to make an article available in all channels).</p> <p> Note: When importing articles with translations and associated channels, only the master article retains the channels. The article translations have no associated channels upon import.</p>

 **Example:** The following example .csv files import articles in a Product Offer article type. The first example is for imports of articles without translations. The second is for imports with translations. The .csv files contain titles, summaries, and descriptions. They

also classify the articles in the category group Products and make them available for specific channels. The `description__c` field is a rich text area and only supports paths to .html files. The `summary__c` field is a text field and only supports raw text. The “Best Desktop Computer Deals” article has no summary; the cell is left blank because the `summary__c` field is not mandatory.

Title	summary__c	description__c	datacategorygroup .Products	Channels
Free Digital Camera Offer	Get the new Digital Camera.	data/freecam.html	Consumer_Electronics	application+csp
Best Desktop Computer Deals		data/bestdeals.html	Desktop	application+csp
Free Shipping on Laptop and Desktops		data/freeship.html	Laptop+Desktops	application+csp

Example `articlesimport.csv` file:

```
Title,summary__c,description__c,datacategorygroup.Products,Channels
Free Digital Camera Offer, Get the new Digital
Camera., data/freecam.html, Consumer_Electronics, application+csp
Best Desktop Computer Deals,, data/bestdeals.html, Desktop, application+csp
Free Shipping on Laptop and Desktops,, data/freeship.html, Laptop+Desktops, application+csp
```

isMaster Language	Title	summary__c	description__c	datacategorygroup .Products	Channels	Language
1	Free Digital Camera Offer	Get the new Digital Camera.	data/freecam.html	Consumer_Electronics	application+csp	en_US
0	Libérer l'Offre d'Appareil photo digital	Obtenir le nouvel Appareil photo digital.	data/freecam/fr.html			fr
0	Liberte Oferta Digital de Cámara	Consigna la nueva Cámara Digital.	data/freecam/es.html			es
1	Best Desktop Computer Deals		data/bestdeals.html	Desktops	application+csp	en_US
0	Meilleures Affaires d'ordinateurs de bureau		data/bestdeals/fr.html			fr
0	Mejores Tratos de ordenadores		data/bestdeals/es.html			es
1	Free Shipping on Laptops and Desktops		data/freeship.html	Laptops+ Desktops	application+csp	en_US
0	Libérer Affranchissement sur Portables et Ordinateurs		data/freeship/fr.html			fr
0	Liberte Franqueo en Laptops y Ordenadores		data/freeship/es.html			es

Example `articlestranslationsimport.csv` file:

```
isMasterLanguage,Title,summary__c,description__c,datacategorygroup.Products,Channels,Language
1,Free Digital Camera Offer,Get the new Digital
Camera,data/freecam.html,Consumer_Electronics,application+csp,en
0,Libérer l'Offre d'Appareil photo digital,Obtenir le nouvel Appareil photo
digital.,data/freecam/fr.html,,,fr
0,Liberte Oferta Digital de Cámara,Consiga la nueva Cámara
Digital.,data/freecam/es.html,,,es
1,Best Desktop Computer Deals,,data/bestdeals.html,Desktops,application+csp,en
0,Meilleures Affaires d'ordinateurs de bureau,,data/bestdeals/fr.html,,,fr
0,Mejores Tratos de ordenadores,,data/bestdeals/es.html,,,es
1,Free Shipping on Laptop and

0,Libérer Affranchissement sur Portables et Ordinateurs,,data/freeship/fr.html,,,fr
0,Liberte Franqueo en Laptops y Ordenadores,,data/freeship/es.html,,,es
```

Specify your [import parameters](#) in a property file using key names and corresponding values.

Set Article Import Parameters

Specify import parameters in a property file using key names and corresponding values. For example, use the key `DateFormat` to specify that a date custom field appears in the `DateFormat=dd/MM/YYYY` format or specify the character encoding to be used for the import.

1. Create a file with required parameters, as described in this table.

Key	Description	Default Value
<code>DateFormat</code>	Format of the date to read in the .csv file	<code>yyyy-MM-dd</code>
<code>DateTimeFormat</code>	Format of the date and time to read in the .csv file	<code>yyyy-MM-dd HH:mm:ss</code>
<code>CSVEncoding</code>	Character encoding used to read the .csv file	<code>ISO8859_15_FDIS</code>
<code>CSVSeparator</code>	.csv file separator	<code>,</code>
<code>RTAEncoding</code>	Default encoding used for the HTML files (if not specified in the <code>charset</code> attribute from the HTML <code>meta</code> tag).	<code>ISO8859_15_FDIS</code>

 **Note:** Salesforce does not support UTF-32 character encoding. We recommend using UTF-8. If you use specify UTF-16 character encoding, ensure that your HTML files specify the right byte-order mark.

 **Note:** Specify only Java date formats. Make sure the date format is not misleading. For example, if you choose the format `yyyy-M-d`, a date entered as 2011111 can be interpreted as 2011-01-11 or 2011-11-01. Specify at least:

- Two digits for month and day format (MM, dd)
- Four digits for year format (yyyy)

If a date in the .csv file does not match the date format specified in the property file, the related article is not imported.

2. Save the file with the `.properties`.

 **Example:** Example `offerarticlesimport.properties` property file:

```
DateFormat=yyyy-MM-dd
DateTimeFormat=yyyy-MM-dd HH:mm:ss
CSVEncoding=ISO8859_15_FDIS
```

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To import articles:

- "Manage Salesforce Knowledge"

"Manage Knowledge Article Import/Export"

AND

"Read," "Create," "Edit," and "Delete" on the article type

```
CSVSeparator=,
RTAEncoding=UTF-8
```

Create a [.zip file](#) and import into Salesforce Knowledge.

Create an Article .zip File for Import

To complete your article import, create a .zip file with your `.parameters`, `.csv`, and `.html` files, and upload them into Salesforce Knowledge.

1. Create a .zip file containing:

- The `.csv` file.
- The folder containing the `.html` files to import.
- The folder containing the image files referenced in the `.html` files.
- The `.properties` file.

 **Important:** The import .zip file must meet the following requirements:

- There can only be one `.csv` file and one `.properties` file.
- The `.csv` file and the `.properties` file must be in the root directory.
- The compression process must preserve the folder and subfolder structure.
- The `.zip` file name can't contain special characters.
- The `.zip` file can't exceed 20 MB and the individual, uncompressed, files within the zip file can't exceed 10 MB.
- `.csv` files can't have more than 10,000 rows, including the header row. Therefore, you can have a maximum of 9,999 articles and translations.
- `.csv` file rows can't exceed 400,000 characters.
- `.csv` file cells can't exceed 32 KB.
- Each article in the `.csv` file can't have more than 49 translations.

2. From Setup, enter *Import Articles* in the *Quick Find* box, then select **Import Articles**.

3. Select the appropriate **Article Type** for the imported articles.

4. To select the .zip file, click **Browse**, and then click **OK**.

5. If your import contains translations, select the *Contains translations?* checkbox.

 **Note:** If this checkbox is selected, your `.csv` file must contain the `isMasterLanguage`, `Title`, and `Language` columns. If this checkbox is not selected, your `csv` file can't contain the `isMasterLanguage` column but must contain the `Title` column. The `Language` column is optional for imports of articles without translations.

6. Click **Import Now**.

When the import is complete, you receive an email with an attached log that provides details about the import.

Check on the [status of your import](#), on the Article Imports page.

Article and Translation Import and Export Status

Find the status of your article imports and exports on the Article Imports page in Setup.

To check the status of your imports and exports, from Setup, enter *Article Imports* in the **Quick Find** box, then select **Article Imports**. If you've enabled multiple languages for Salesforce Knowledge, you see two tables: one for article and translation imports and another for exports for translation.

Import information includes:

- Possible actions
- .Zip file names
- Who submitted it and when
- Status
- Started and completed dates
- Article types

Export information includes:

- Possible actions
- Zip file names
- Who submitted it and when
- Status
- Started and completed dates

Status descriptions are as follows:

Status	Description	Possible Action
Pending	The import or export will start as soon as the previous pending import or export completes.	You can click Cancel to cancel the import or export.
Processing	The import or export is processing.	If you want to stop the process, or if the process has been stopped, call Salesforce Support. Salesforce may stop an import or export if a maintenance task has to be performed or the import or export exceeds one hour.
Stopping/Stopped	Salesforce Support is stopping or has already stopped the import or export.	Contact Salesforce Support to restart the import or export, or click Cancel to cancel an entry.
Aborted	The import or export has been canceled. The articles that already imported or exported successfully are available in Salesforce.	You can restart an import or export, click Del to delete an entry, or click Email Log to receive the completion email and check the details of your import or export.
Completed	The import or export is complete. Successfully imported articles are visible on the Article Management tab on the	This status doesn't mean the import or export is successful. Click Email Log to see the log file attached to the completion email

Status	Description	Possible Action
	Articles subtab. Successfully imported translations are visible on the Article Management tab on the Translations subtab.	and check the details of your import or export. Click the exported .zip file name to save or open the file on your system.

Knowledge Article Access

Give your knowledge agents access to articles. Specify which agents in your company are Salesforce Knowledge users, those who can create, edit, archive, and delete articles. Create user profiles with the appropriate user permissions, and then assign users to these profiles.

By default all internal users can read articles except with the Salesforce Platform, Force.com - One App, Force.com App Subscription, and Knowledge Only User licenses. With those licenses, to view articles, a user must have the "AllowViewKnowledge" permission on their profile. However, this permission is off for default profiles. To give a user the "AllowViewKnowledge" permission on their profile, activate the permission on a cloned profile and assign the cloned profile to the user.

 **Note:** To do more than read articles, agents need the Knowledge User license.

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Click **Edit** next to the user's name or click **New** to create a user.
3. If you are creating a user, complete all the required fields.
4. Select the *Knowledge User* checkbox.
5. Click **Save**.

See

User permissions control access to different tasks Salesforce Knowledge. We recommend using permission sets or custom profiles to grant users the permissions they need. For example, you can create a permission set called "Article Manager" that includes the permissions to create, edit, publish, and assign articles.

Refer to this table for details on permissions associated with Salesforce Knowledge tasks.

Salesforce Knowledge Task	User Permissions Needed
To create article types:	"Manage Salesforce Knowledge" (This permission is on by default in the System Administrator profile.)
To manage article actions:	"Manage Salesforce Knowledge" This permission is on by default in the System Administrator profile.
To create articles from cases using the simple editor:	"Read" and "Create" on the article type

EDITIONS

	AND A translate article action, set on the Article Actions Setup page
To import articles:	“Manage Salesforce Knowledge” (This permission is on by default in the System Administrator profile.) AND “Manage Articles” AND “Manage Knowledge Article Import/Export” AND “Read”, “Create”, “Edit”, and “Delete” on the article type
To import and export translated articles:	“Manage Salesforce Knowledge” (This permission is on by default in the System Administrator profile.) AND “Manage Articles” (This permission is on by default in the System Administrator profile.) AND “Manage Knowledge Article Import/Export” (This permission is on by default in the System Administrator profile.) AND “Read”, “Create”, “Edit”, and “Delete” on the article type
To create data categories	“Manage Data Categories” permission. This permission is on by default in the System Administrator profile.

To enable agents to perform their specific tasks, create [public groups](#) for each role and assign only the necessary [article actions](#) to those groups.

 **Example:** Your Salesforce Knowledge agents are a mixture of different levels of job experience and expertise in the products and services your company offers. These examples outline four basic types of users and some of the permissions they need to perform their jobs.

Scott: The Reader

Scott Jackson is relatively new to the company, so he’s a basic agent of the knowledge base. Currently, he has read-only access to articles, so he can search and view articles. Readers don’t author or publish, so he won’t belong to a public group or need to submit articles for approval. He needs the following permissions to perform his job.

Scott	Permission	Article Type-Specific Permissions			
Salesforce Knowledge Functionality	Manage Articles	Read	Create	Edit	Delete
Search articles from and attach articles to cases		<input checked="" type="checkbox"/>			

Scott	Permission	Article Type-Specific Permissions			
		Read	Create	Edit	Delete
Search for and read articles from the Articles tab	Manage Articles	✓			

Amber: The Candidate

Amber Delaney is a candidate-level agent and can create and publish articles with statuses of either `Work in Progress` or `Not Validated`. If Amber works on an article with a different validation status, she must send it to a queue for approval before it's published.

Amber is part of the KCS Candidate public group and submits the articles she can't publish to the Publishing External queue. She needs the following permissions to perform her job duties.

Amber	Permission	Article Type-Specific Permissions			
		Read	Create	Edit	Delete
Search articles from and attach articles to cases		✓			
Search for and read articles from the Articles tab		✓			
Create or edit article from the Article Management tab	Manage Articles	✓	✓	✓	✓
Edit draft articles from the Article Management tab		✓	✓	✓	
Edit published or archived articles		✓	✓	✓	✓

Anne: The Contributor

As a contributor, Anne Murphy is a more advanced Knowledge user. She understands the standards for articles in the organization and can create articles and publish articles with `Validated Internal` status. She can also work on articles authored by other users if they have either `Work in Progress` or `Not Validated` statuses, and can change them to `Validated Internal`. Since she doesn't have permission to publish articles to an external audience, she must submit those customer-facing articles to the Publishing External queue.

 **Note:** Article approvers require the "Manage Articles" permission and at least the "Read" permission on the article type associated with articles they review. These permissions let them access the article in a draft state. Without these permissions, approvers can reassign but not approve articles.

Anne is a member of the Contributor public group and she needs the following permissions to perform her job duties.

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions			
	Manage Articles	Read	Create	Edit	Delete
Create articles from cases using the simple editor		✓	✓		
Create articles from cases using the standard editor	✓	✓	✓		
Search articles from and attach articles to cases		✓			
Create articles from answers		✓	✓		
Search for and read articles from the Articles tab		✓			
Create or edit article from the Article Management tab	✓	✓	✓	✓	
Edit draft articles from the Article Management tab	✓	✓		✓	
Delete articles (version or entire) from Article Management tab	✓	✓		✓	✓
Assign articles from Article Management tab	✓	✓		✓	
Edit published or archived articles	✓	✓	✓	✓	
Archive articles from the Article Management tab	✓	✓	✓	✓	✓

Pat: The Publisher

Pat Brown is Knowledge domain expert and is responsible for reviewing and publishing articles to an external audience. He is a member of the Publisher public group. Pat also belongs to the Publishing External queue. He needs the following permissions to perform his job duties.

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions			
	Manage Articles	Read	Create	Edit	Delete
Create articles from cases using the simple editor		✓	✓		
Create articles from cases using the standard editor	✓	✓	✓		
Search articles from and attach articles to cases		✓			
Create articles from answers		✓	✓		

Salesforce Knowledge Functionality	Permission	Article Type-Specific Permissions			
	Manage Articles	Read	Create	Edit	Delete
Search for and read articles from the Articles tab		✓			
Create or edit article from the Article Management tab	✓	✓	✓	✓	
Edit draft articles from the Article Management tab	✓	✓		✓	
Delete articles (version or entire) from Article Management tab	✓	✓		✓	✓
Publish article from Article Management tab	✓	✓	✓	✓	✓
Assign articles from Article Management tab	✓	✓		✓	
Edit published or archived articles	✓	✓	✓	✓	
Archive articles from the Article Management tab	✓	✓	✓	✓	✓

How they all work together

Each user profile defines an agent's permission to perform different job duties and functions. To enable agents to perform these functions, you create [public groups](#) for each role and assign only the necessary [article actions](#) to that group. The criteria you create in the [approval process](#) defines which [validation status](#) can be automatically approved and published and which article must be approved and published by a domain expert.

For example, Anne, the Contributor, can create a `Validated External` article, but based on the article actions assigned to her public group, the approval process sends her article to Pat, the Publisher, to be published. Pat, as a Publisher, can publish his own articles without submitting them to a queue.

The following table lists the job functions that each role needs to perform on articles in the organization

Job Function	Reader	Candidate	Contributor	Publisher
Create and publish <code>Work in Progress</code>	No	Automatically approved and published	Automatically approved and published	Yes
Create and publish <code>Not Validated</code>	No	Automatically approved and published	Automatically approved and published	Yes
Create and publish <code>Validated Internal</code>	No	Needs approval	Automatically approved and published	Yes

Job Function	Reader	Candidate	Contributor	Publisher
Create and publish Validated External	No	Needs approval	Needs approval	Yes
Update and publish Work in Progress	No	No	Automatically approved and published	Yes
Update and publish Not Validated	No	No	Automatically approved and published	Yes
Update and publish Validated Internal	No	No	Automatically approved and published	Yes
Update and publish Validated External	No	No	Needs approval	Yes

Create Public Groups for Knowledge

Salesforce Knowledge uses public groups as a way to assign users to specific tasks related to articles. When you assign article actions to a public group, you can grant users in that group the ability to do things like publish articles with a specified validation status. Public groups are also used in approval processes to manage the publishing workflow.

For example, when a member of the [Candidate](#) public group submits an article with the status `Work in Progress` for approval, it is automatically approved and published. If the same agent submits an article with `Validated Internal` status, it moves to the Publishing External queue to be reviewed before being published.

1. From Setup, enter *Public Groups* in the **Quick Find** box, then select **Public Groups**.
2. Click **New**, or click **Edit** next to the group you want to edit.
3. Enter the following information:

Field	Description
Label	The name used to refer to the group in any user interface pages.
Group Name (public groups only)	The unique name used by the API and managed packages.

EDITIONS

Available in: **Salesforce Classic**

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create or edit a public group:

- "Manage Users"

To create or edit another user's personal group:

- "Manage Users"

Grant Access Using Hierarchies
(public groups only)

Select **Grant Access Using Hierarchies** to allow automatic access to records using your role hierarchies. When selected, any records shared with users in this group are also shared with users higher in the hierarchy.

Deselect **Grant Access Using Hierarchies** if you're creating a public group with All Internal Users as members, which optimizes performance for sharing records with groups.

 **Note:** If **Grant Access Using Hierarchies** is deselected, users that are higher in the role hierarchy don't receive automatic access. However, some users—such as those with the “View All” and “Modify All” object permissions and the “View All Data” and “Modify All Data” system permissions—can still access records they don't own.

Search

From the `Search` drop-down list, select the type of member to add. If you don't see the member you want to add, enter keywords in the search box and click **Find**.

 **Note:** For account owners to see child records owned by high-volume portal users, they must be members of any portal share groups with access to the portal users' data.

Selected Members

Select members from the Available Members box, and click **Add** to add them to the group.

Selected Delegated Groups

In this list, specify any delegated administration groups whose members can add or remove members from this public group. Select groups from the Available Delegated Groups box, and then click **Add**. This list appears only in public groups.

4. Click **Save**.

 **Note:** When you edit groups, sharing rules are automatically reevaluated to add or remove access as needed. If these changes affect too many records at once, a message appears warning that the sharing rules aren't automatically reevaluated, and you must manually recalculate them.

Now [assign only the necessary actions](#) to your groups so the selected members can perform their tasks while keeping the integrity of your knowledge base.

Assign Article Actions to Public Groups

Article actions allow agents to participate in the article publishing process. By default, all article actions are assigned to users with the “Manage Articles” user permission. Agents can complete an action as long as they have the correct article type permission. You can control article action access by assigning public groups to article actions and adding agents the relevant public groups. To further restrict actions like publishing, you can create approval processes that allow agents to publish only those articles that have specific validation statuses. For example, many contributors can write many articles but you can create an approval process so no articles are published until they are reviewed and validated by a qualified author.

 **Note:** Although you can add any user to a public group, only agents with the “Manage Articles” user permission and the appropriate object permissions can perform article actions.

This table summarizes the article type permissions that are required for each article action.

Article Action	Create	Read	Edit	Delete
Publish Articles				
Archive Articles				
Delete Articles				
Edit Published and Archived Articles				
Submit Articles for Translation				
Publish Translation				
Edit Translation				

1. From Setup, enter *Knowledge Article Actions* in the Quick Find box, then select **Knowledge Article Actions**.
2. Click **Edit**.
3. For the action you want to assign, select the appropriate radio button and choose a public group.
If you don't modify an article action, all agents with the “Manage Articles” permission can perform that action.
4. Click **OK** and then click **Save**.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create public groups and assign them to article actions:

- “Customize Application”
AND
“Manage Users”
AND
“Manage Salesforce Knowledge”

Define Validation Status Picklist Values

When the `Validation Status` field is enabled on the Knowledge Settings page, you can create picklist values that show the state of the article. For example, values could be `Validated`, `Not Validated`, or `Needs Review`.

 **Note:** Validation status picklist values aren't retained when you export articles for translation. Articles with picklist values can be imported, however, and their values are retained as long as the values exist in your organization.

1. From Setup, enter `Validation Statuses` in the `Quick Find` box, then select **Validation Statuses**.
2. On the picklist edit page, click **New** to add new values to the validation status field. You can also edit, delete, reorder, and replace picklist values.
When you replace a picklist value, the system replaces it in all versions of the article, including any archived versions.
3. Add one or more picklist values (one per line) in the text area.
4. To set the value as the default for the picklist, be sure to select the `Default` checkbox.
5. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create or change validation status picklist values:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Workflow and Approvals for Articles

Ensuring that the content in your articles is accurate and helpful is foundational to getting accurate information to those who need it most. Creating processes where Knowledge experts review, validate, and approve articles for publication is critical to creating a trustworthy knowledge base. Implementing approval processes with Salesforce Knowledge gives you additional control over the content and publication of your articles.

Creating workflow rules and approval processes lets your organization automate many of the tasks involved with managing its knowledge base. When implementing Salesforce Knowledge, you can create workflow rules and approval processes for some or all the article types used by your organization.

Workflow rules let you create email alerts, update fields, or send outbound API messages when an article meets certain criteria. For example, you could create a workflow rule that sends an email alert to the article owner when a new article is created from a case. Tasks are not supported by article type workflow.

Approval processes automate the approval of articles. When implemented with Salesforce Knowledge, approval processes give you additional control over the content of your articles and the process used to approve them. For example, you can create a process that requires legal and management teams to approve articles containing sensitive information.

 **Note:** Tasks aren't available for article type workflow rules. For more information about creating workflow rules, see [Set the Criteria for Your Workflow Rule](#) on page 4254. For more information about creating an approval process, see [Create an Approval Process with the Standard Wizard](#) on page 4282.

1. From Setup, enter *Workflow Rules* in the **Quick Find** box, then select **Workflow Rules** to access the workflow rules list page.
2. On the workflow rules list page, click **New Rule**.
3. Select the article type from the **Select object** drop-down list.
4. Click **Next**.
5. Enter a rule name. Optionally, enter a description for the rule.
6. Select the evaluation criteria and choose how criteria are met.
7. Enter criteria for the rule.
8. Click **Save & Next**.
9. Click **Add Workflow Action**, select the type of action for the rule, and enter the information required by the action.
10. Click **Save**.
11. Optionally, add a time-dependent workflow action by clicking **Add Time Trigger**. Provide time trigger information and then click **Save**.
12. Click **Done**.
13. From Setup, enter *Approval Processes* in the **Quick Find** box, then select **Approval Processes**.
14. Choose the Approval Process Wizard.

Two wizards are available to help you through the approval setup process. Choose the one that better meets your requirements. See [Choose the Right Wizard to Create an Approval Process](#) on page 4281.
15. Provide a name, unique name, and description for the process.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To view workflow rules and approval processes:

- "View Setup and Configuration"

To create or change workflow rules and approval processes:

- "Customize Application"

16. Specify criteria for entering the process.

For example, you could specify that if the article is published on a public site it requires approval: *Visible on public site equals True*.

17. Specify approvers for the process.**Let the submitter choose the approver manually. (default)**

Prompts the user to select the next approver.

Automatically assign an approver using a standard or custom hierarchy field.

Assigns the approval request to the user in the field displayed next to this option. You select this field when you configure the approval process.

Automatically assign to a queue.

Available only for objects that support queues. Assigns approval requests to a queue.

Automatically assign to approver(s).

Assigns the approval request to one or more specific users, specific queues, or users related to the submitted record. You can add up to 25 approvers per step per step.

18. Select the email template that the process uses to notify approvers.

When an approval process assigns an approval request to a user, Salesforce automatically sends the user an approval request email. The email contains a link to the approval page in Salesforce, where the agent can approve or reject the request and add comments.

19. Configure the approval request page layout.

The approver approves or rejects the article from this page. You can add as many fields to this page as you think your agents need to reasonably assess an article's content. For example, you might choose to include information such as a summary of the article's content, the product discussed, and the author's name.

20. Specify which users are allowed to submit articles for approval.

For example, for articles that require editing before approval, you could create a public group containing editors, and then specify that only members of that group can submit articles for approval.

21. Activate the approval process.

 **Example:** When an approval process is associated with an article type, agents with the "Manage Articles" permission might see both the **Publish...** and **Submit for Approval** buttons from an article's detail page. Which buttons they see is determined by both permissions and article actions. These agents can publish an article without submitting it for approval. To limit this ability to certain users, assign the "Publish Articles" article action to a select group of users instead of giving it to all users with the "Manage Articles" permission. The ability to publish articles without prior approval is governed by an approval process that is specific to each user's public group.

Keep the following in mind when creating approval processes for article types.

- Adding an approval process to an article type lets your organization ensure that the required reviewers approve the article before it's published. When an approval process is enabled for an article's article type, the Approval History related list displays on the article details page.
- When creating an approval process, change the final approval action to "Unlock the record for editing" to allow agents to publish the article.
- Articles aren't published automatically at the end of an approval process. Agents must click **Publish...** to make the article available in the publishing channels.
- When an approval process is associated with an article type, agents with the "Manage Articles" permission might see both the **Publish...** and the **Submit for Approval** buttons on an article's detail page. (Which buttons they see is determined by both permissions and article actions). These agents can publish an article without submitting it for approval. To prevent this from affecting

many users, assign the “Publish Articles” article action to a limited group of users instead of giving it to all users with the “Manage Articles” permission. For more information, see [Assign Article Actions to Public Groups](#) on page 2690. You still need to make sure that the users with direct publishing capability know which articles need approval before publication.

- Article approvers require the “Manage Articles” permission and at least the “Read” permission on the article type associated with articles they review. These permissions let them access the article in a draft state. Without these permissions, approvers can reassign but not approve articles.
- Workflow rules and approval processes apply to the “Draft to Publication” portion of the article publishing cycle. Workflow rules aren’t available for archiving. Approval processes aren’t available for translation or archiving.

Note: When an article is published from the edit page, the article is first saved and then published. Workflow rules apply to the saved draft article but not the published article.

- A user who only has read access to an article type can publish a draft article of that type if there is an approval process associated to the article type and the approval process is complete (all the approvers have approved) but the article has not been published.

Create Knowledge Actions

Knowledge actions are templates that link a workflow action to an article type. When knowledge actions are enabled, you can use them to link article types to specific workflow article actions, such as publishing. For example, if you want to have each FAQ published as a new version each time it completes the approval process, you can create a knowledge action that links the FAQ article type to the `Publish as New` action. Then, when you create an approval process for FAQs, select the new Knowledge Action.

Important: When you create the approval process, make sure to change the final approval action to `Unlock the record for editing` to let users publish the article.

1. From Setup, enter `Knowledge Action` in the `Quick Find` box, then select **Knowledge Action**.
2. Click **New Knowledge Action**.
3. Select the article type for the action. The workflow rules and approval process that you associate with the action must belong to the same article type.
4. Enter a unique name for the knowledge action.
5. Select the type of action you want to apply to the article type. For example, `Publish as New` publishes the article as a new version.
6. Enter a description.
7. Click **Save**.
The Knowledge Action detail page appears showing you the rules and approval processes that use the knowledge action.
8. When you’re ready to use the knowledge action in an approval or workflow process, click **Activate** on the Knowledge Action detail page.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To enable Salesforce Knowledge Actions:

- “Customize Application”

Modify Default Category Group Assignments for Articles

Salesforce Knowledge uses data categories to classify articles. Data categories are organized in category group. After creating category groups, admins decide which groups to use for Salesforce Knowledge articles. For example, if your org uses both the Answers and Salesforce Knowledge, you might want one category group to be used by the answers community and two other category groups for articles. Answers and articles can use the same category group. Authors can assign up to eight data categories from one category group to an article so that users searching for articles can find and filter by category. By default, all the category groups you create are assigned to Salesforce Knowledge

1. From Setup, enter *Data Category Assignments* in the **Quick Find** box, then select **Data Category Assignments** under Knowledge.

A list of all category groups appears.

2. Click **Edit** and move any category groups that you don't want available for articles from the Selected Category Groups list to the Available Category Groups list.

Later, you can choose to make a hidden category group visible.

Note: The order of category groups is not preserved from the edit page to the data category assignment page.

3. Click **Save**.

You receive an email after the save process completes. Authors can now assign categories in the selected groups to articles on the Article Management tab. Authors can only access categories if the category group is active and the author's [data category visibility settings](#) provide access to the category.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To modify category groups assignments in Salesforce Knowledge:

- "Customize Application"
- AND
- "Manage Salesforce Knowledge"

Filter Articles with Data Category Mapping

Make suggested articles more relevant when solving cases. Map case fields to data categories to filter for articles assigned to those data categories. For example, cases with a field for which product they are about can be mapped to the data category of that product. Articles assigned that category or product, are filtered to the top of the suggested article list.

Important: Filtering articles based on case information is only supported in text and picklist fields.

To implement data category mapping, select which case fields map to which data categories and set a default data category for cases that have no value for the mapped fields. For information on data categories, see [Data Categories in Salesforce.com](#) on page 2722.

1. From Setup, enter *Data Category Mappings* in the **Quick Find** box, then select **Data Category Mappings**.
2. In the **Case Field** column, use the drop-down list to add a field.
3. In the **Data Category Group** column, use the drop-down list to map the information from the lookup field to a data category.
4. In the **Default Data Category** column, use the drop-down list to assign a data category when the field value does not match any categories from the category group.
5. Click **Add**.

Support Articles in Multiple Languages

With multiple languages for Salesforce Knowledge, you can lower support costs by translating articles into the languages your audience prefers. After selecting your language settings, two translation methods are available: translating articles in-house using the editing tool in the knowledge base, or sending articles to a localization vendor. Different languages can use different methods. For example, you may want to export articles to a vendor for French translations, but assign articles to an internal Knowledge user for Spanish translations.

- Before you add languages to your knowledge base, decide for each language whether you want to translate articles directly in Salesforce or export articles to a translation vendor. Communicate your decision to the people involved in the translation process (authors, reviewers, translation managers, publishers).
- When adding a language to your knowledge base, keep in mind that it can't be deleted; however, you can hide a language by making it inactive. Deactivating a language means it no longer appears as a choice in the **New Article** dialog or the **Submit for Translation** dialog. Also, if articles are already published in the language, those articles are no longer visible to readers when the language is deactivated.
- You can only add languages supported by Salesforce to your knowledge base.
- To hide translated articles for a specific language, deactivate the language by unchecking **Active** on the Settings page.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Support a Multilingual Knowledge Base

Reach a global audience by offering your knowledge base in multiple languages.

 **Tip:** For review queues, you can create queues made up of reviewers with different languages of expertise. For translation queues, you can create one queue for each language or combine languages within queues.

1. If you send articles to a vendor for translation, create a translation queue. From Setup, enter *Queues* in the *Quick Find* box, then select **Queues**.
2. Click **New**.
3. Enter the *Label* and *Queue Name*.
For our example, use "Translating External" for the *Label* and "Translating_External" for the *Queue Name*.
4. Choose email notification settings for the queue:

To notify	You must
One email address when new records are added to the queue.	Add an email address to <i>Queue Email</i> . You can add an email address for an individual or an email distribution list.
All queue members individually when new records are added to the queue.	Leave <i>Queue Email</i> blank.
All queue members and the <i>Queue Email</i> individually when new records are added to the queue.	Add an email address to <i>Queue Email</i> and select Send Email to Members .

5. Add *Knowledge Article Version* as the object available to the queue.
6. Choose the queue members (users, roles, or public groups) or objects.
For users, roles, or public groups, only queue members and users above them in the role hierarchy can take ownership of records in the queue, depending on your organization's sharing settings.
7. Click **Save**.
8. In Setup, enter *Knowledge Settings* in the *Quick Find* box, then select **Knowledge Settings** and click **Edit**.
9. Select *Multiple Languages* and add the languages you want to include in your knowledge base. You can only add languages supported by your Salesforce org.

 **Important:** You can't remove a language once you've added it to your knowledge base.

10. Optionally, choose the following settings for each language:

Setting	Description
Active	Only active languages appear in the New Article dialog and the Submit for Translation dialog. Also, active/inactive status determines whether a published article is visible. For example, if articles are published in Spanish to your partner portal and

	then you make Spanish an inactive language, the articles are no longer visible to partners.
Default Assignee	This value appears in the <code>Assign To</code> field of the Submit for Translation dialog. Choose a person or a queue: the individual responsible for translating articles into this language, or the queue used for exporting articles to a localization vendor.
Default Reviewer	Select the person who to review or publish translations imported in this language.

11. Click **Save**.

Export Articles for Translation

If your organization sends Salesforce Knowledge articles to a vendor for translation, use the Export Articles for Translation feature in Setup.

Place the articles to be translated in a translation queue. To enable the article export feature, create one or more queues; authors and reviewers select the queue when they submit an article for translation. Make sure that they know which queue to choose for which language.

 **Note:** You can have up to 50 exports in 24 hours and a maximum of 15 pending exports (exports that have not entered a final state such as Completed, Failed, or Canceled).

1. Create a [translation queue](#) with articles for translation.
2. On the Article Management tab, select the articles you want to translate, and click **Submit for Translation**.
3. In the dialog box, indicate which languages to translate the articles into and assign the translations to their corresponding language translation queue.
4. From Setup, enter *Export Articles for Translation* in the Quick Find box, then select **Export Articles for Translation**.
5. Select the queue that contains the articles you're exporting.
6. Select either:
 - **All articles** to export every article in the queue.
 - **Updated articles** to only export articles that have been modified or added.
7. Click **Continue**.
8. Select the source and target language pairs you want to export.

 **Important:** Salesforce creates a separate .zip file for every article type in each language pair. You must retain the .zip file structure for a successful import. For more information, see [Import Translated Articles](#) on page 2700.

9. To have the files reviewed or published after being translated, select a user or a queue.
10. Select the file character encoding.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To export articles:

- "Manage Salesforce Knowledge"
- AND
- "Manage Articles"
- AND
- "Manage Knowledge Article Import/Export"

To view articles:

- "Read" on the article type

To create articles:

- "Read" and "Create" on the article type

- ISO-8859-1 (General US & Western European, ISO-LATIN-1)
- Unicode
- Unicode (UTF-8) *default*
- Japanese (Windows)
- Japanese (Shift_JIS)
- Chinese National Standard (GB18030)
- Chinese Simplified (GB2312)
- Chinese Traditional (Big5)
- Korean
- Unicode (UTF-16, Big Endian)

11. Select the delimiter for the .csv files.

The delimiter is the separator for columns when the file is converted to table form. Your options are tab (default) or comma.

12. Click **Export Now**.

You're notified by email when your export is complete. You can also check the status of your export by viewing the Article Import and Export Queue. From Setup, enter *Article Imports and Exports* in the **Quick Find** box, then select **Article Imports and Exports**.

Unzip the exported files, but retain the file structure for a successful import.

Import Translated Articles

If your organization sends Salesforce Knowledge articles to a vendor for translation, use the Import Article Translations feature in Setup. You can only import articles that have been exported from the same Salesforce organization. For example, you can't export articles from your test or sandbox organization and import them into your production organization.

1. From Setup, enter *Import Article Translations* in the Quick Find box, then select **Import Article Translations**.
2. Choose how Salesforce handles translations after they're imported.

Option	Description
Review imported translations on the Article Management tab before publishing	Add imported translations to a queue from which agents can review them.
Publish translations immediately on import	Publish imported translations without reviews.

3. Select the language of the articles you're importing.
4. If you chose to have articles reviewed before publishing, select to send the files to a user or a queue.
5. Click **Browse**, choose the translation .zip file to upload, and click **Open**.
You must place all the translation files (meaning, those exported from Salesforce and translated by your vendor) in a folder whose name is the same as the language code. For example, put French articles in an *fr* folder. Zip up this folder to create your import file.

Important: To import translated articles successfully, verify that the file structure and their extensions match the file structure and extensions of files exported from Salesforce Knowledge for translation. For example, if the target language is French, the file structure begins as follows:

```
import.properties
-fr
--articletypearticlename_kv
---articlename.csv
---[Article collateral, html, images, etc.]
```

6. Click **Import Now**.
If you have more translated articles to upload, repeat steps four through six.
7. Click **Finish**.

An email notification is sent to you when your import finishes. You can view the status of your import from Setup by entering *Article Imports and Exports* in the Quick Find box, then selecting **Article Imports and Exports**.

EDITIONS

Improve the Article Search Experience

Enable search highlights and snippets, synonyms, promoted terms, topics, and keywords from cases to improve your article search.

Search Highlights and Snippets

Quickly identify the best article and see how articles match your search terms with relevant text and highlighted search terms in the search results.

Search Synonyms for Articles

Create synonyms so words or phrases are treated as equivalents in searches. When searching Salesforce Knowledge articles, users can enter search terms that don't match any terms in those items but are synonymous with the terms.

Manage Promoted Search Terms

View, edit, and delete—from a single page—all the promoted search terms that are associated with Salesforce Knowledge articles.

Enable Topics for Articles

With topics on articles, you can classify and search articles by assigning topics. Topics can be added from the article view and detail pages. Suggested topics, which are only supported in English, are terms extracted from the article, so that they are more concrete and precise than a data category assignment. When searching, topics can be used to index the article, so the matched articles are more relevant to keyword searches.

Use More Case Keywords to Find Articles

When searching articles from a case, by default, only the case title is used in the search. Often, you want to use information from the case for more accurate search results, or create a custom search button.

Search Highlights and Snippets

Quickly identify the best article and see how articles match your search terms with relevant text and highlighted search terms in the search results.

Search highlights and snippets give your agents and users context as to why the particular result matched their search query. The relevant text appears below the title with the search terms in bold. You can enable search highlights and snippets on the [Salesforce Knowledge Settings page](#) on page 2646.

 **Note:** Search highlights and snippets are not generated for searches with wildcards.

Search highlights and snippets are generated from the following fields:

- Email
- Long text area
- Rich text area
- Text area

Search highlights and snippets aren't generated from the following fields:

- Checkbox
- Currency
- Date
- Date Time

 **Note:** If a snippet is not generated, the article's summary field is shown instead.

Search Synonyms for Articles

Create synonyms so words or phrases are treated as equivalents in searches. When searching Salesforce Knowledge articles, users can enter search terms that don't match any terms in those items but are synonymous with the terms.

To create synonyms and synonym groups, from Setup, enter *Synonyms* in the Quick Find box, then select **Synonyms** under **Customize > Search**. An org can create up to 10,000 synonym groups

A search for one term in synonym group returns results for all terms in the group. For example, if you define a synonym group with these synonyms:

CRM, customer relationship management, Salesforce

then a search for *customer relationship management* matches articles that contain *customer relationship management* and articles that contain *CRM* or *Salesforce*.

Synonyms affect search behavior in the following ways:

Priority

If a search term is part of a synonym group, the search results list items that contain the search term, followed by items that contain other terms in the synonym group.

For example, if this synonym group is defined:

fruit, oranges

Then a search for *oranges* matches a list of items containing *oranges*, followed by items containing *fruit*.

 **Note:** In the Article Management tab, if you sort the list by clicking a column header, the sort order, not priority, persists in the current and additional searches.

Wildcards

If a wildcard is used in a search, the wildcard expands the search term, but the search doesn't match any synonyms, even if the search phrase contains a defined synonym.

For example, if these synonym groups are defined:

fruit, oranges, apples

cabbage, lettuce

Then a search for *orang* lettuce* matches items that contain *orange* and *oranges*, but doesn't match items that contain *fruit*, *apples*, and *cabbage*.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Operators

If a search phrase contains an operator (AND/OR/AND NOT), synonym matches are returned only if the entire search phrase is a defined synonym.

For example, if these synonym groups are defined:

fruit, oranges and apples

vegetables, carrots

Then a search for *oranges and apples* returns matches for all items that contain the literal string *oranges and apples* and items that contain the term *fruit*.

However, if the search phrase is *fruit and vegetables*, which is not a defined synonym, the search matches only those items that contain both the terms, *fruit* and *vegetables*.

In this case, AND functions as an operator and synonym matches are not returned in the search results. In terms of this example, items that contain a synonym of either *fruit* or *vegetables* (items that contain the term *carrots* or the phrase *oranges and apples*) are not returned.

Exact phrase matches

If a defined synonym is only a part of a longer exact phrase search, the search doesn't treat it as a synonym.

For example, if this synonym group is defined:

oranges apples, fruit

Then an exact phrase search for "*raspberries oranges apples*" doesn't match items that contain the word *fruit*.

Lemmatization

Synonyms do not under go lemmatization in search results; rather, they are matched as an exact phrase. However, the search term does under go lemmatization.

For example, if this synonym group is defined:

quench, drink orange juice

Then a search for *quench* matches items that contain *quench*, *quenched*, *quenching*, and *drink orange juice*, but doesn't match items that contain *drinking orange juice*.

Ignored words

Words that are normally ignored in searches, such as *the*, *to*, and *for*, are matched if the word is part of a defined synonym.

For example, if this synonym group is defined:

peel the orange, cut the apple

Then a search for *peel the orange* matches items that contain the exact string *peel the orange*.

Overlapping synonyms

If a search term consists of overlapping synonyms from different groups, the search matches synonyms in all the overlapping synonym groups.

For example, if these synonym groups are defined:

- *orange marmalade, citrus*
- *marmalade recipe, sugar*

Then a search for *orange marmalade recipe* matches items that contain *orange marmalade*, *citrus*, *marmalade recipe*, and *sugar*.

Subsets

If one synonym group includes a synonym that is a subset of a synonym in another group, a search for the subset term doesn't match items that contain synonyms from the subset synonym group.

For example, if these synonym groups are defined:

- *orange, apple*
- *orange marmalade, citrus*
- *marmalade, jam*

Then a search for *orange marmalade* matches items that contain *orange marmalade* and *citrus*, but doesn't match items that contain *apple* or *jam*.

Manage Promoted Search Terms

View, edit, and delete—from a single page—all the promoted search terms that are associated with Salesforce Knowledge articles.

You can [add promoted search terms to articles](#) on the article's detail page in the Promoted Search Terms related list.

1. From Setup, enter *Promoted Search Terms* in the *Quick Find* box, then select **Promoted Search Terms** under **CustomizeSearch**.
2. To view which terms are assigned to an article, sort by the Article column.
3. To edit a term, click **Edit** in its row.
You can only change the term from this page, not the article it is assigned to.
4. To delete a term, click **Delete** in its row.
The term is only deleted from the article associated with this row, not from other articles.
5. Remember to save your changes.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, and delete promoted search terms:

- "Manage Promoted Search Terms"

Enable Topics for Articles

With topics on articles, you can classify and search articles by assigning topics. Topics can be added from the article view and detail pages. Suggested topics, which are only supported in English, are terms extracted from the article, so that they are more concrete and precise than a data category assignment. When searching, topics can be used to index the article, so the matched articles are more relevant to keyword searches.

 **Note:** Contrary to data categories, topics added to an article are not transferred to the same article in another language.

Topics for articles are enabled for each article type.

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**.
2. Click the article type name where you want to enable topics.
3. Check **Enable topics**.
4. Select which fields you want to use for suggestions.
5. Click **Save**.
6. Via profile or permission set, under System Permissions, define which agents can assign, create, delete, and edit topics.

Use More Case Keywords to Find Articles

When searching articles from a case, by default, only the case title is used in the search. Often, you want to use information from the case for more accurate search results, or create a custom search button.

Luckily, Salesforce Knowledge search pages accept other parameters:

- **id=<case id>**: The ID of the current case.
- **search=<keywords>**: The keywords to be searched.
- **articleType_<article type dev name>=on**: multiple parameters possible, article types to select (if no article type is selected, then all article types are selected)
- **ct_<data category group internal name>=<data category internal name>**: multiple parameters possible, filter pre-selection

To take advantage of those parameters, add a custom button to the case detail page containing a few lines of javascript that extract keywords from the case and hide the default article search button.

 **Note:** You can also create a custom article widget with `support:caseArticle`.

1. From the object management settings for cases, go to Buttons, Links, and Actions.
2. Click **New Button or Link**.
3. Enter a unique **Label**, **Name**, and **Description**.
4. Select **Detail Page Button** for **Display Type**.
5. Select **Execute JavaScript** in the **Behavior** drop-down.
6. Select **OnClick JavaScript** in the **Content Source** drop-down.
7. Enter code for extracting case data and setting up parameters for the article search page.

USER PERMISSIONS

To create or change custom buttons or links and create a Visualforce page:

- "Customize Application"

For example:

```
// article search page URL
var url = '/knowledge/knowledgeHome.apexp';

// ID of the current case
url += '?id={!Case.Id}';

// use the case subject as the search keywords
url += '&search={!Case.Subject}';

// read case attributes
var caseType = '{!Case.Type}';
var caseProduct = '{!Case.Product__c}';

// if the case is of a certain type, select only 2 of the article types available
// in other cases, we keep the default behavior (all article types selected)

if (caseType=='Problem' || caseType=='Question') {
    url += '&articleType_FAQ_kav=on';
    url += '&articleType_How_To_kav=on';
}

// preselect a data category for search results based on the category

var product = '';
if (caseProduct=='Home')
    product = 'Home';
if (caseProduct=='SMB')
    product = 'Small_and_Medium_Business';
if (caseProduct=='Large enterprise')
    product = 'Large_Enterprise';

if (product.length>0)
    url += '&ct_Products2=' + product;

// once the logic is executed, we go to the article search page
window.location = url;
```

8. Click **Save**.
9. From the object management settings for cases, go to Page Layouts.
10. Click **Edit** next to Case Layout.
11. Drag your custom button for article search into the case layout.
12. Click **Save**.
13. Create a Visualforce page named *CaseDetailsWithoutStandardKBSearchButton* with the following code:

```
<apex:page standardController="Case">
    <style type="text/css">
        div.knowledgeBlock input {display: none}
    </style>
    <apex:detail/>
</apex:page>
```

14. Back in the Buttons, Links, and Actions area for cases, click **Edit** next to `View`.
15. Select **Visualforce Page** in `Override with`.
16. Select **CaseDetailsWithoutStandardKBSearchButton** from the drop-down.
17. Click **Save**.

Set Up the Knowledge One Widget

Knowledge One is available as a widget you can plug in to the Salesforce Console for Service or Salesforce Console for Sales. If you are using the Knowledge tab, you get the same easy-to-use interface for articles and external sources on cases and within the Salesforce Console for Service. You can search, send, and create articles, all without leaving the case.

Of [all the Salesforce Knowledge article widgets](#), the Knowledge One widget lets you:

- Attach a published Salesforce Knowledge article to the case in one click.
- Share an article as a URL, if it is shared on a public channel.
- Email an article as a PDF, if it is shared on a public channel.
- Create and manage articles.
- Make adjustments based on your window width. In the console, in windows smaller than 600 pixels, the searchable objects are displayed in a drop-down menu.

 **Note:** The article widget in a case feed search doesn't necessarily use the agent's language. If the agent's language isn't a Salesforce Knowledge supported language but their locale language is, the locale language is the search language. If neither the agent's language nor local language are supported, the search language is the default Salesforce Knowledge language, which you can find and set on the Knowledge Settings page.

1. From the object management settings for cases, go to Page Layouts and open your case page layout for edit.
2. Ensure the Email quick action is in the case page layout.
Without the Email quick action, you can't send articles via email.
 - a. Select **Quick Actions** in the left-hand menu.
 - b. Drag **Email** to the `Quick Actions` in the `Salesforce Classic Publisher` line.
3. Disable previous article sidebar components.
 - To disable the Knowledge sidebar, click **Layout Properties** and ensure `Knowledge Sidebar` is unchecked.
 - To disable the case feed article tool, click **Feed View** and ensure `Use Case Feed Article Tool in the Console` is unchecked.
4. In the page layout editor, click **Custom Console Components**.
5. In the sidebar where you want the Knowledge One widget, select `Knowledge One` in the Type drop down and set the sidebar parameters.
Email quick action to be added to the Case page layout in order to show up

 **Tip:** If you can't see the Knowledge One sidebar, increase its width to 250 (height to 150) in the page layout. These are the minimum measurements for the Knowledge One sidebar to display properly.

EDITIONS

Available in: Salesforce Classic

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To administer Salesforce Knowledge and Salesforce Console for Service:

- "Customize Application"
AND
"Manage Salesforce Knowledge"

Compare Article Widgets for Cases at a Glance

Adding Solutions

HTML Solutions Overview

HTML solutions provide a more flexible way to create solutions, by allowing you to easily format paragraphs, and insert images and links. Using HTML solutions, you create solutions with an HTML editor and display those solutions to users in Salesforce, the Self-Service portal, the Customer Portal, and as public solutions.

Using the HTML editor, you can:

- Change fonts
- Increase or decrease font sizes
- Insert images from the Documents tab
- Set text color
- Set the background color of text
- Insert hyperlinks
- Change paragraph alignment
- Create bulleted and numbered lists

 **Note:** By default, solutions are created and displayed in text format. Your administrator must enable HTML solutions.

Before you begin creating HTML solutions for your organization, review the following implementation tips and best practices.

Implementation Tips

- Once you enable HTML solutions, you cannot disable it.
- If you open a text solution with the HTML editor and save it, the solution becomes an HTML solution.
- HTML solutions are presented as such to Self-Service portal, public solutions, Customer Portal, and Salesforce users.
- Any HTML tags entered into the HTML editor will display to users as text when the solution is saved.
- When the HTML solution detail is displayed in list views and search results, only the first 255 characters are displayed. This number includes HTML tags and images that are removed.
- Each HTML solution can contain up to 32000 characters, including HTML tags.
- HTML formatting is preserved in the printable view of a solution.
- Hyperlinks in HTML solutions open in a new browser window when users click on them.
- All images that you want to include in your HTML solutions must be uploaded to the Documents tab. Images in HTML solution details don't show up in list views and reports.
- HTML solutions can be created in any of the languages supported by Salesforce.

Best Practices

The following HTML tags are allowed in HTML solutions imported into Salesforce:

<a>	<dt>	<q>
<abbr>		<samp>
<acronym>		<small>

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create solutions:

- "Create" on solutions

<address>	<h1>	
	<h2>	<strike>
<bdo>	<h3>	
<big>	<h4>	<sub>
<blockquote>	<h5>	<sup>
 	<h6>	<table>
<caption>	<hr>	<tbody>
<cite>	<i>	<td>
<code>		<tfoot>
<col>	<ins>	<th>
<colgroup>	<kbd>	<thead>
<dd>		<tr>
		<tt>
<dfn>	<p>	
<div>	<pre>	<var>
<dl>		

Within the above tags, you can include the following attributes:

alt	face	size
background	height	src
border	href	style
class	name	target
colspan	rowspan	width

The above attributes that can include a URL are limited to URLs that begin with the following:

- http:
- https:
- file:
- ftp:
- mailto:
- #

- / for relative links

[Creating Solutions](#)

Multilingual Solutions Overview

The multilingual solutions feature helps you translate solutions and solution categories into the languages supported by Salesforce so that customers and support reps can find answers to inquiries in the language with which they are most comfortable.

Multilingual solutions can lower support costs by:

- Improving customer satisfaction by answering inquiries in the languages preferred by customers
- Deflecting unnecessary incoming calls by providing solutions in languages that are the most useful for customers
- Managing inquiries in multiple languages from one location, anytime and anywhere

Review the following key terms for multilingual solutions:

Master Solution

A solution created in any language supported by Salesforce. A master solution can have zero or more translations associated with it; it cannot be linked to another master solution.

Translated Solution

A solution translated into another language supported by Salesforce and associated with exactly one master solution. A translated solution cannot have the same language as its master solution or any other translated solutions associated with that master solution. A translated solution cannot have other translated solutions associated with it. Translated solutions are represented by the  icon on solution detail pages, solution edit pages, solution list views, and solution search results.

You can work with multilingual solutions from the following:

Solutions Tab

When creating a new solution, users can choose a language in which to write the solution from the `Language` picklist field. Once the solution is saved, it becomes a master solution. Users can then create a translated solution by clicking **New** on the Translated Solutions related list of the master solution detail page. When a master solution is modified, users can adjust the statuses of its translated solutions to indicate that they may need translating.

Cases Tab

When users search for relevant solutions on a case by entering keywords in the Solutions related list and clicking **Find Solution**, search results include solutions in all languages that have matching keywords. Alternatively, if suggested solutions is enabled for cases, users can click **View Suggested Solutions** to find relevant solutions in multiple languages if they share common words with the case.

Self-Service Portal

If multilingual solution search is enabled for your Self-Service portal, customers automatically view solution search results in their preferred language as specified in their Self-Service user information settings. Customers can also choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, the Login Page of your Self-Service portal displays in your organization's language.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Public Solutions

If multilingual solution search is enabled for your public solutions, customers can choose to view solution search results in a specific language or all supported languages via a language drop-down list. By default, public solutions display in your organization's language.

Solution Categories

Users with the "Manage Translation" permission can use the translation workbench to translate solution categories so that they display in the language of each user on the Solutions tab and in the preferred language of each customer on the Self-Service portal as specified in the customer's user settings. Solution categories are not translated for public solutions.

Reports

You can track translated solutions marked `Out of Date` by choosing the Translated Solutions report. Running this report also lists the title and details of translated solutions. You can also create a custom report for multilingual solutions using the Master and Translated Solutions report type.

List Views

You can see which translated solutions are marked `Out of Date` and may need translating by creating a custom list view on the Solutions tab and entering the following search criteria: "Out of Date equals True".

Import

The Data Import Wizard includes options to import master and translated solutions and associate them with each other.

To learn more about enabling multilingual solutions, see [Enable Multilingual Solutions](#) on page 2719.

SEE ALSO:

[Categorizing Solutions](#)

[Creating Solutions](#)

Suggested Solutions Overview

The suggested solutions feature displays up to ten relevant solutions that may help users and customers solve a particular case from the case detail page, Salesforce Customer Portal, or the Self-Service portal.

Suggested solutions can lower support costs by:

- Reducing the time it takes for customer support reps to solve cases
- Improving customer support reps' productivity by offering them proactive access to all solutions for any case
- Enabling customers to solve and close their own cases

The solutions displayed are not simply found via a keyword search. Rather, the following variables are entered into a formula that automatically scores the relevancy of each solution to the particular case:

- Word frequency in all solutions
- Word frequency in similar cases with related solutions
- Proximity of the keywords within the solutions
- Word similarities to self-closed cases and solutions rated useful by Self-Service users
- The number of additional cases associated with a solution

You can enable suggested solutions for the following:

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable suggested solutions:

- "Customize Application"

To modify Self-Service pages:

- "Manage Self-Service Portal"

AND

"Customize Application"

Cases tab

Users can click **View Suggested Solutions** from the case detail page to view a list of solutions relevant to their case. If multilingual solutions is enabled for your organization, search results return solutions in all languages that have matching keywords. However, search results across all languages might not be reliable because terms searched from one language to another are processed differently.

Customer Portal and Self-Service portal

Customers can view solutions relevant to their case when they submit a case or view cases online.

Customers can self-close their cases using suggested solutions.

When customers log new cases or click the **View Suggested Solutions** button on an existing case in the Customer Portal or Self-Service portal, a list of suggested solutions is displayed, including solutions in multiple languages for organizations with multilingual solutions enabled. When customers select a solution from the list, they can click **Yes** after **Does this Solution help you answer your question?** and then select a reason as to why they closed their case. The case will close with an indication on the `Closed by Self-Service User` case field. If the customer clicks **No**, they will be returned to the list of suggested solutions. If no suggested solutions are found, the Suggested Solutions Page is bypassed, and the customer is directed to their case.

Case auto-response rules and emails

Your support team can help customers solve their own cases without the assistance of customer support reps. Simply create email auto-responses for cases submitted via email, Web-to-Case, or the Self-Service portal. Within the auto-response email template, include the suggested solutions merge field, `{!Case_Suggested_Solutions}`, which provides outbound emails with direct links to the subject and description of each solution that may help customers answer their inquiries.

 **Note:** Sending mass emails using templates with the suggested solutions merge field can take several minutes and isn't recommended.

The `Closed by Self-Service User` field, along with a `Closed When Created` field, can be added to case [page layouts](#). These fields are automatically set by Salesforce and can't be modified. You can run reports on the `Closed by Self-Service User` and `Closed When Created` fields to see how cases have been closed.

- Report on the `Closed by Self-Service User` field to see how many cases have been closed by users via suggested solutions on the Self-Service portal
- Report on the `Closed When Created` field to see how many cases have been immediately saved and closed upon creation by support reps.

 **Note:**

- Suggested solutions don't display [Salesforce Knowledge](#) articles.
- Suggested solutions isn't available for the public solutions because public solutions users don't have an authenticated login that allows them to create or access cases.

SEE ALSO:

[Customize Support Settings](#)

[Multilingual Solutions Overview](#)

Customizing Solution Settings

To customize solution settings:

1. From Setup, enter *Solution Settings* in the Quick Find box, then select **Solution Settings**.
2. Click **Edit**.

3. Select **Enable Solution Browsing** to turn on the ability to browse for and find solutions by category.

This setting enables solution browsing on the Solutions tab, Customer Portal, and when solving a case.

4. Select **Enable Multilingual Solutions** to turn on the ability for users to [translate solutions](#) into multiple languages.

You can deselect the **Enable Multilingual Solutions** checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the **Enable Multilingual Solution Search in Self-Service Portal** and **Enable Multilingual Solution Search for Public Solutions** settings. If you select the **Enable Multilingual Solutions** checkbox again, the associations between master and translated solutions are restored.

5. Select **Enable Multilingual Solution Search in Self-Service Portal** to add a language drop-down list to the Self-Service portal that automatically restricts search results to solutions that match the Self-Service portal user's language. From the language drop-down list, Self-Service portal users can choose whether to search for solutions in a specific language or any language supported by Salesforce.

Deselecting this checkbox removes the language drop-down list from the Self-Service portal, and search results include solutions in all languages, regardless of the Self-Service portal user's language.

6. Select **Enable Multilingual Solution Search for Public Solutions** to add a language drop-down list to public solutions so that public solutions users can choose which language to search for solutions. From the language drop-down list, public solutions users can choose whether to search for solutions in a specific language or any language supported by Salesforce.
- Deselecting this checkbox removes the language drop-down list from public solutions, and search results include solutions in all languages.

7. Select **Enable HTML Solutions** to create and display solutions in HTML. When enabled, solutions appear in HTML in Salesforce, public solutions, Self-Service portal, and Salesforce Customer Portal. Using [HTML Solutions](#) allows users to easily format solution details by changing fonts and colors, and adding images and hyperlinks.

 **Warning:** Once you select **Enable HTML Solutions**, you cannot disable it.

8. Select **Solution Summary** to display up to 150 characters of the solution details in the solution search results. Deselecting this checkbox removes the solution summary from the results.
9. Select **Inline Category Breadcrumbs** to display up to 150 characters of the breadcrumb trail of categories to which the solution belongs in the search results. Deselecting this checkbox removes the breadcrumbs from the results.
10. Click **Save**.
11. To enable solution browsing by customers in public solutions or your Self-Service portal, see [Enabling Public Solutions](#) on page 2721 and [Enable Self-Service Features and Settings](#) on page 2369.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To change solution settings:

- "Customize Application"

In addition, you can customize the top-level category accessible by public solutions and Self-Service users. You do not need to modify this setting if you want customers to view all categories and all solutions that are visible in the Self-Service portal or visible in public solutions.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

SEE ALSO:

[Categorizing Solutions](#)

[Managing Solution Categories](#)

[Enable Multilingual Solutions](#)

Getting Started with Categories

Follow these steps to ensure a successful rollout of solutions:

1. Plan which categories your support team needs.

Keep in mind that you can also allow customers to find solutions by category in public solutions and your Self-Service portal. You can specify that customers can view only solutions in a particular category and all of its subcategories.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

2. Define your categories; see [Defining Solution Categories](#) on page 2718.
3. Categorize your solutions; see [Categorizing Solutions](#) on page 2238. Administrators, and users with the "Manage Categories" permission, can categorize solutions prior to enabling solution categories for the entire organization.
4. Create a custom report of type Solution Categories to verify that all solutions are categorized appropriately. To find any uncategorized solutions, use the advanced report filters; choose the `Category Name` field and the "equals" operator, and leave the third field blank. Administrators, and users with the "Manage Categories" permission, can create solution category reports prior to enabling solution categories for the entire organization.
5. Enable solution category browsing for the Solutions tab; see [Customizing Solution Settings](#) on page 2716.
6. Enable solution category browsing for customers using public solutions and your Self-Service portal. See [Enabling Public Solutions](#) on page 2721 and [Enable Self-Service Features and Settings](#) on page 2369.
7. Specify the top-level category accessible by customers using public solutions and your Self-Service portal. This is useful if you want to have certain categories available only to internal staff.

Leave this blank if you want customers to view all categories and all solutions that are visible in Self-Service portal or visible in public solutions.

SEE ALSO:

[Managing Solution Categories](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or change solution categories:

- "Manage Categories"

Defining Solution Categories

Begin by creating your solution categories. The All Solutions category is automatically created for you as the top of your solution hierarchy. Users cannot add solutions to this category or translate it.

1. From Setup, enter *Solution Categories* in the **Quick Find** box, then select **Solution Categories**.
2. Click **Add Category** to create a subcategory below a specific category.
3. Enter the category name. Category names cannot include the backslash “\” character.
4. Select a different parent category, if desired. The parent category is the category directly above this category in the hierarchy.
5. Select a sort order for any subcategories you create under this category.
 - Choose **Alphabetical Order** to sort subcategories alphabetically.
 - Choose **Custom Order** to sort subcategories in the order you specify; see [Adding and Sorting Subcategories](#) on page 2718.
6. Click **Save**.
7. After creating categories, categorize your solutions. See [Categorizing Solutions](#) on page 2238. Administrators, and users with the “Manage Categories” permission, can categorize solutions prior to enabling solution categories for the entire organization.
8. Then, after categorizing solutions, turn on solution category browsing on the Solutions tab. See [Customizing Solution Settings](#) on page 2716.
9. To enable solution category browsing for the public knowledge base or your Self-Service portal, see [Enabling Public Solutions](#) on page 2721.

Editing and Deleting Categories

From the list of solution categories, you can:

- Click **Edit** to modify the category name, parent category, or sort order.
- Click **Del** to delete the category. The solutions associated with the category are not deleted.
 -  **Note:** You cannot delete a category in use by a Salesforce Customer Portal. For more information, see [Enable Customer Portal Login and Settings](#) on page 2315.
- Click the category name to view the category details.

Adding and Sorting Subcategories

From a category detail page, you can:

- Click **New** to add a subcategory below the category.
- Enter a custom sort order for the subcategories.
 1. Edit the category to set the **Subcategory Sort Order** to **Custom Order**.
 2. Enter numbers in the **Order** column to specify the order of the subcategories.
 3. Click **Reorder**.

SEE ALSO:

[Categorizing Solutions](#)

Managing Solution Categories

Create solution categories so that users can group similar solutions together. Once your solutions are categorized, users can browse for and find solutions by category from the Solutions tab or when solving a case. Customers can also browse solutions by category in public solutions, the Self-Service portal, and the Customer Portal.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

SEE ALSO:

[Getting Started with Categories](#)

[Defining Solution Categories](#)

Enable Multilingual Solutions

You can turn on multilingual solutions so users have the ability to translate solutions into multiple languages.

Preparing for Multilingual Solutions

Before you enable multilingual solutions:

- Run solution reports to locate any existing solutions that are already translated and will need to be converted to translated solutions after you enable multilingual solutions.

When multilingual solutions is enabled for the first time, all existing solutions automatically become master solutions. You can create translated solutions from master solutions by associating a master solution without any translated solutions with a master solution of a different language via the `Master Solution` lookup field.

- Translate any existing solution categories.

Translated solutions inherit the solution categories of their master solution. We recommend that you translate your solution categories before enabling multilingual solutions and then associate solutions with each other. This will help you associate solutions with the correct categories.

Enabling Multilingual Solutions

To enable multilingual solutions:

1. From Setup, enter `Solution Settings` in the `Quick Find` box, then select **Solution Settings**.
2. Click **Edit**.
3. Select `Enable Multilingual Solutions`.

Optionally, select `Enable Multilingual Solution Search in Self-Service Portal` and `Enable Multilingual Solution Search for Public Knowledge Base` to allow customers to view solution search results in a specific language or all supported languages via a language drop-down list.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To create or change solution categories:

- "Manage Categories"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To enable multilingual solutions:

- "Customize Application"

4. Click **Save**.
5. Customize solution page layouts to include the `Master Solution Title` field, `Master Solution Details` field, `Out-of-Date` field, and the Translated Solutions related list. The `Language` picklist and `Master Solution` lookup fields are automatically added to solution page layouts when you enable multilingual solutions.
 -  **Tip:** You can make solution edit pages easier for users to translate multilingual solutions by setting the Detail Information section to two columns and placing the `Master Solution Title` and `Master Solution Details` fields alongside each other. Underneath those fields, place the `Solution Title` and `Solution Details` fields alongside each other so that users can effortlessly compare the master and translated solutions. Note that the `Master Solution Title` and `Master Solution Details` fields display only on the translated solution edit page.
6. Set the field-level security settings of the `Master Solution` lookup field to editable for profiles or permission sets with the "Create" and "Edit" permissions on solutions.

When the `Master Solution` lookup field is editable, users can associate translated solutions with master solutions.

Field-level security is available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.
7. Set the field-level security settings of the `Out of Date` checkbox field to visible for all profiles or permission sets with the "Read" permission on solutions.

Field-level security is available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.
8. As a best practice, add a long text area custom field to solutions called `Translation Comments` and include it on solution page layouts so that users can add any comments regarding the translation of the solution. Users should include a date with their comments so that other users can see when each comment was added.
 -  **Note:** You can deselect the `Enable Multilingual Solutions` checkbox at any time, but deselecting it removes all associations between master and translated solutions and automatically disables the `Enable Multilingual Solution Search in Self Service Portal` and `Enable Multilingual Solution Search for Public Solutions` settings. If you select the `Enable Multilingual Solutions` checkbox again, the associations between master and translated solutions are restored.

Rolling Out Multilingual Solutions

After enabling multilingual solutions:

- Associate any existing translated solutions with the appropriate master solutions.

You can do this manually using the `Master Solution` lookup field, or you can export a report of existing translated solutions and then import those solutions to associate them with a master solution. For each translated solution you import, include the 15 to 18 character `Solution ID` field of its master solution in a master solution column on your import file. To view the `Solution ID` field for master solutions, run the Translated Solution report. If you import solutions by mistake, you can use mass delete to remove them from your organization.

SEE ALSO:

[Multilingual Solutions Overview](#)

[Categorizing Solutions](#)

Enabling Public Solutions

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

Using the Solutions tab, your customer support team can create solutions that people outside of your organization may find helpful. Using HTML code supplied by Salesforce, and with the help of your website administrator, you can add a search box and button to your website that allows your customers to search for solutions. This functionality is known as Public Solutions.

With public solutions, your customers can find answers to frequently asked questions without having to call your customer support center. All solutions with a `Status` of Reviewed and the `Visible in Public Knowledge Base` field checked will be available as public solutions, including any solution attachments.

Public solutions are different from the Self-Service portal and Salesforce Customer Portal because users are not required to log in, and they can only search for solutions, not submit cases. For more information about the Self-Service and Customer Portal, see [Setting Up Self-Service](#) on page 2368 and [Setting Up Your Customer Portal](#) on page 2308.

 **Note:**

- The search box and button are displayed in a frame; your website must support frames in order for the solution search feature to work.
- Suggested solutions don't display [Salesforce Knowledge](#) articles.

To enable Web access to solutions:

1. From Setup, enter `Public Solutions` in the `Quick Find` box, then select **Public Solutions**.
2. Click **Edit**.
3. Check `Public Solutions Enabled`.
4. If your organization uses solution categories, check `Enable Solution Browsing` to allow customers to browse solutions by category. Solution categories cannot be translated into other languages for public solutions.

If multilingual solutions is enabled for your organization, you can add a language drop-down list to public solutions so that customers can choose which language to search for solutions. For more information, see [Customizing Solution Settings](#) on page 2716.
5. If solution category browsing is enabled, select the `Top-Level Category` accessible by customers in public solutions. Customers can view all solutions in this category and its subcategories if they are marked `Visible in Public Knowledge Base`. Leave `Top-Level Category` blank if you want customers to view all solutions in all categories when they are visible as public solutions.
6. If desired, you can change the appearance of the frame on your website by specifying the `Maximum Page Width` and `Minimum Page Height`.
7. Provide the URL of your CSS page in `Style Sheet URL`. The CSS file does not have to exist yet; you can download a sample file as a starting point later, or use your own file.
8. You can change the word or phrase that is used to describe solutions in the frame in `Alternative Term`. Provide singular and plural versions of the term.
9. Click **Save**.
10. If desired, click **Download Sample CSS File** to get the Salesforce style sheet.
11. Click **Generate HTML**.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable web access to solutions:

- "Customize Application"

12. Copy the resulting HTML code and click **Finished**.
13. Send the HTML (and the CSS file, if you downloaded it) to your website administrator to be added to your site as follows:
 - Add the HTML to your Web page.
 - Customize the downloaded style sheet.
 - Host the style sheet in a publicly accessible location on your Web server.

Organizing Articles, Answers, and Ideas into Categories

Data Categories in Salesforce.com

Data categories are used in Salesforce Knowledge (articles and article translations), Ideas, Answers, and Chatter Answers to help classify and find articles, questions, or ideas. You can use data categories to control access to a particular set of articles, questions or ideas.

Salesforce Knowledge supports a five-level hierarchy of data categories within each category group. You can classify articles in the knowledge base according to multiple categories that make it easy for users to find the articles they need. For example, to classify articles by sales regions and business units, create two category groups, Sales Regions and Business Units. The Sales Regions category group could consist of a geographical hierarchy, such as All Sales Regions as the top level, North America, Europe, and Asia at the second level.

In an answers zone, data categories help organize questions for easy browsing. Each answers zone supports one category group. For example, if you're a computer manufacturer you might create a Products category group that has four sibling categories: Performance Laptops, Portable Laptops, Gaming Desktops, and Enterprise Desktops. On the Answers tab, zone members can assign one of the four categories to each question and then browse these categories for answers to specific questions.

Example:

Logical Classification of Articles

As a knowledge base administrator, you can organize your knowledge base articles into a logical hierarchy and tag articles with the attributes that are significant to your business.

Easy Access to Questions

As an answers administrator, you can choose which data categories are visible on the Answers tab. Zone members can tag a question with a category, which makes finding questions and answers easier for other members.

Control of Article and Question Visibility

As a knowledge base or answers community administrator, you can centrally control the visibility articles or questions by mapping roles, permission sets, or profiles to categories in the category groups. When an article or question is categorized, users with visibility can automatically see it.

Article Filtering

As a support agent, when articles are classified into logical categories, you can quickly and easily locate the article you need by filtering your organization's knowledge base. To ensure you see all relevant articles, filtering by category has expansive results that include a category's upward and downward relatives in the category hierarchy. For example, if your category hierarchy for products has the levels All Products > Computers > Laptops

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance and Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise and Unlimited** Editions.

> Gaming Laptops and you are helping a customer with a laptop problem, filtering by Laptops returns articles classified with Laptops as well as articles classified with Computers, All Products, or Gaming Laptops. Effectively, you are made aware of useful related articles like a free shipping offer for all products or an upgrade offer for gaming laptops. (To prevent irrelevant results, category filtering doesn't return nonlinear relatives like siblings and cousins. Articles about Desktops, a sibling of Laptops, would not display.)

Article and Question Navigation

As an end user, you can navigate the categories on the Articles tab or Answers tab to find the information you need to solve your problem.

Managing Category Groups for Articles and Questions

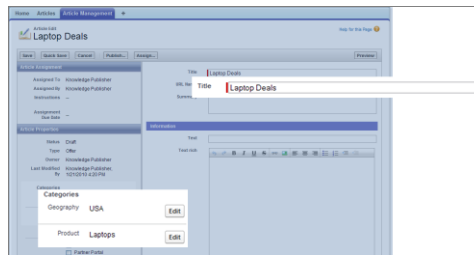

If your organization has Salesforce Knowledge and an answers community, you can create separate category groups or use the same category group for articles and questions.

Data Categories in Articles

A category group is the container for a set of categories. In Salesforce Knowledge it corresponds to the name of the category drop-down menus. For example, if you use the Data Categories page in Setup, (enter *Data Category* in the *Quick Find* box, then select **Data Category Setup**) to create and activate a category group called Products, a Products menu displays on the Article Management tab, the article edit page, the Articles tab in all channels, and the public knowledge base.

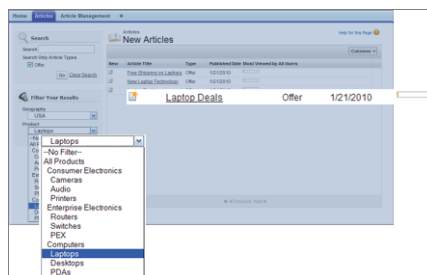

As an illustration, the figure below shows a knowledge base administrator's view of an article about laptop deals; using the article edit page, the administrator has classified the article with Laptops in the Products category group, and USA in the Geography category group.

An Article About Laptop Deals on the Article Management Tab

The next figure now illustrates an agent finding that same article published on the Articles tab; the agent has selected Laptops and USA respectively in the Products and Geography drop-down menus to retrieve an article that is classified with both Laptops and USA.

An Article About Laptop Deals on the Articles Tab

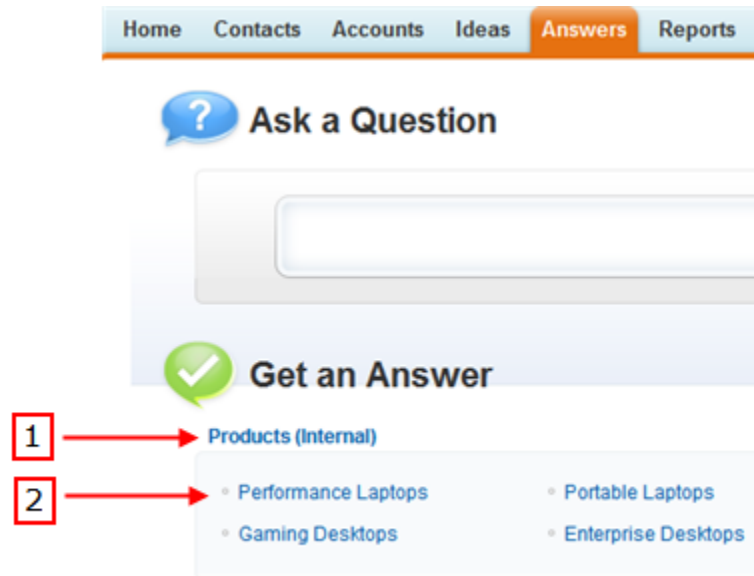

When you add categories to a category group, you build a hierarchy that can contain up to five levels of depth and up to 100 categories total. Each category can have one parent, many siblings, and many children. A robust and well-organized category hierarchy helps users find the articles that are relevant to them quickly and easily.

By default, all Salesforce Knowledge users have access to all categories; however, you can [restrict category visibility by role, permission set, or profile](#).

Data Categories in Answers Zones

An answers zone supports one category group, and members can assign one category to each question. Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. The categories within the group display on the Answers tab below the zone name.

Answers tab displaying categories

By default, all zone members have access to all categories; however, you can [specify category visibility](#).

Data Category Implementation Tips

Consider the following information when planning and implementing data categories for your organization:

- You can create up to three category groups with a maximum of five hierarchy levels in each group. Each category group can contain a total of 100 categories.
- If you want to use data categories with Answers, after creating your category group you must assign it from Setup by entering *Data Category Assignments* in the Quick Find box, then selecting **Data Category Assignments** under Answers. You can only assign one category group to an answers community. Salesforce Knowledge supports multiple category groups.
- Even though you can create up to five hierarchy levels of categories in a category group, only the first level of categories is supported in your answers community. Child categories below the first level are not displayed in the community, and community members can't assign these child categories to questions. Salesforce Knowledge supports a hierarchy of data categories.
- Category groups are hidden from users until they are activated. Do not activate a category group until you have finished defining its categories and their access settings, including their visibility.
- When assigning categories to articles, you can choose up to eight categories in a category group.
- If an article has no categories, it displays only when you choose the *No Filter* option in the category drop-down menu.

- When searching for articles or article translations, selecting a category automatically includes the parent and children of that category and any grandparents, up to and including the top level. Sibling categories are not included. For example, if a category hierarchy has the levels All Products, Switches, Optical Networks, and Metro Core, selecting “Optical Networks” from the category drop-down menu returns articles assigned to any of the four categories. However, if the Switches category has a sibling category called Routers, selecting “Optical Networks” does not return articles classified within Routers. Category visibility settings may limit the specific articles you can find.
- Once [visibility settings](#) have been chosen for the categories:
 - Users who are not assigned visibility can only see uncategorized articles and questions unless [default category visibility](#) has been set up.
 - For role-based visibility, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers by default. You can [change the category group visibility settings](#) for each portal role.
 - If you only have access to one category in a category group, the category drop-down menu for that category group does not display on the Articles tab.
- Deleting a category:
 - Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
 - Permanently deletes its child categories.
 - As applicable, removes the category and its children from the Answers, Article Management, and Knowledge tabs in all channels, and your company's public knowledge base.
 - Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
 - Removes its mapping to visibility. Readers lose their visibility to articles and answers associated with the deleted category.
- Deleting a category group:
 - Moves it to the Deleted Category Groups section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15-day holding period, you can either restore a category group, or permanently erase it immediately.
 - Deletes all categories within that group.
 - Removes all associations between the group's categories and articles or questions.
 - Removes all associations between the group's categories and visibility.
 - As applicable, removes the category drop-down menu from the Articles tab in all channels, the Article Management tab, and your company's public knowledge base.
- You can translate the labels of categories and category groups using the Translation Workbench.

Best Practices for Data Categories

Consider the following tips when using data categories:

- To quickly manage data categories, use [keyboard shortcuts](#).
- After creating or updating categories, set up [category group visibility rules](#).
- Save your changes frequently. The more actions you perform before clicking Save, the longer it takes to save.

Data Category Shortcuts

Use keyboard shortcuts to work quickly with data categories.

Task	Action	Keyboard Shortcut
Adding a category	Add a sibling to the selected category	ENTER
	Add a child to the selected category	ENTER+TAB
	Close the Add Category field	ESC
	Save changes in the Add Category field	ENTER
Modifying a category	Open the Edit Category field for the selected category	SPACEBAR
	Close the Edit Category field	ESC
	Save changes in the Edit Category field	ENTER
Demoting or promoting a category	Demote a category down one level, as a child of the sibling currently above it	TAB
	Promote a category up one level, as a sibling to its current parent	SHIFT+TAB
Deleting a category	Delete the selected category and its children	DELETE
Navigating in the category hierarchy	Move the focus up in the category hierarchy	UP ARROW
	Move the focus down in the category hierarchy	DOWN ARROW
	Collapse children in a parent category	LEFT ARROW
	Expand children in a parent category	RIGHT ARROW
Canceling or repeating an action	Undo the last action	CTRL+Z
	Redo the last action	CTRL+Y
Saving the changes	Save the last changes in the category hierarchy	CTRL+S

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Create and Modify Category Groups

Category groups are used by Salesforce Knowledge (articles), answers (questions), or ideas. In all cases, category groups are containers for individual data categories. For example, a Contracts category group might contain Fixed Price, Cost Reimbursement, and Indefinite Delivery categories.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. To create a category group, click **New** in the Category Groups section.
By default, you can create a maximum of five category groups and three active category groups. To edit an existing category group, hover your cursor over the category group name and then click the **Edit Category Group** icon ().
3. Specify the **Group Name**. This name appears as the title of the category drop-down menu on the Article Management and Articles tabs, and, if applicable, in the public knowledge base. The **Group Name** does not appear on the Answers tab.
4. Optionally, modify the **Group Unique Name** (the unique name used to identify the category group in the SOAP API).
5. Optionally, enter a description of the category group.
6. Click **Save**.
You receive an email after the save process completes.

Activating Category Groups

When you add a category group, it's deactivated by default and only displays on the administrative setup pages for Data Categories, Roles, Permission Sets, and Profiles. Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community. In addition to activating the category group, for answers communities you must assign the category group to a zone before the categories are visible on the Answers tab.

To activate a category group so it is available to users, move the mouse pointer over the name of the category group and click the **Activate Category Group** icon ().

You can now [add categories](#) to your category group. When you create a category group, Salesforce automatically creates a top-level category in the group named **A11**. Optionally, double-click **A11** to rename it.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance and Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise and Unlimited** Editions.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Delete and Undelete Category Groups

Deleting a category group deletes all of its categories and removes all associations between the categories and articles or questions. Read this entire topic carefully to understand the consequences of deleting category groups.

1. From Setup, enter *Data Category* in the *Quick Find* box, then select **Data Category Setup**.

2. Hover your cursor over the category group name.

3. Click the *Delete Category Group* icon ().

4. Select the checkbox in the confirmation dialog, then click **OK**.

The data category group is deleted. Continue to step 5 if you wish to restore the data category group.

5. In the *Removed Category Groups* section, hover your cursor over the category group name.

6. Click the *Undelete Category Group* icon (.

The category group moves to the *Category Groups* section as an inactive category group, and associations with articles, questions, and visibility are restored.

Example: Deleting a category group:

- Moves it to the *Deleted Category Groups* section, which is a recycle bin. You can view items in this section but not edit them. It holds category groups for 15 days before they are permanently erased and cannot be recovered. During the 15-day holding period, you can either restore a category group, or permanently erase it immediately.
- Deletes all categories within that group.
- Removes all associations between the group's categories and articles or questions.
- Removes all associations between the group's categories and visibility.
- As applicable, removes the category drop-down menu from the *Articles* tab in all channels, the *Article Management* tab, and your company's public knowledge base.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To view the *Data Categories* page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Add Data Categories to Category Groups

Once you have category groups, you can add data categories to help agents classify and find articles, questions, or ideas.

Administrators can create data categories for Salesforce Knowledge articles, questions in a zone, or ideas to classify and find articles, questions, or ideas. You can also use data categories to control access to articles, questions, and ideas.

By default, you can create up to 100 categories in a data category group and have up to 5 levels in a data category group hierarchy. To request more categories or hierarchy levels, contact Salesforce.

 **Note:** On the Answers tab, only first-level data categories display. Therefore, when creating data categories for a portal or community, ensure that the categories you want visible have a sibling relationship and not a parent-child relationship.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click the category group name.
3. Click a category that is directly above where you want to add a category (a parent), or at the same level (a sibling).
4. Click **Actions**, then select an action: **Add Child Category** or **Add Sibling Category**.
5. Enter a category name.

If possible, Salesforce automatically reuses the name you entered as the **Category Unique Name**, a system field which the SOAP API requires.

6. Click **Add**. Alternatively, press Enter.
7. Click Save.

Save your changes frequently. The more actions you perform before clicking Save, the longer it takes to save.

 **Tip:** By default, all Salesforce Knowledge users and zone members can see all categories within an active category group. You can [restrict category visibility](#) after you have set up your data categories to ensure that users only access articles and questions that you want them to see.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To view the Data Categories page:

To create, edit, or delete data categories:

- "Manage Data Categories"

Modify and Arrange Data Categories

Modifying and arranging categories can result in long processing times, changes to the visibility and categorization of articles, and other significant consequences. Read this entire topic carefully before modifying categories.

Important: Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it might take a long time to complete. During processing, agents might experience performance issues when searching for articles or questions or using category drop-down lists.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click a category group name.
3. Optionally, click **Expand All** to display the full category hierarchy, or **Collapse All** to display only the top-level categories.
4. To edit a category's name or its unique API name, double-click it.
5. Use drag-and-drop editing to reposition a category in the hierarchy. As you drag, a red icon indicates an invalid destination, while a green icon indicates a valid destination.
 - Drag a category on top of another category to reposition it as a child of the destination category. For example, drag USA on top of North America to make USA one level below North America. After dragging, the category displays below the other child categories at that level.
 - Drag a category to a line that borders another category to reposition it as a sibling of that category. For example, to position USA between Canada and Mexico, drag it to the line between Canada and Mexico.
6. To reorder a category's children in alphabetical order, hover your cursor over its name, then choose *Order Child Categories Alphabetically* from the Actions drop-down list. This reorder only affects the first-level children, not grandchildren or deeper levels.
7. As you modify the category hierarchy, click **Undo** to cancel your last actions. Similarly, click **Redo** to step forward through your flow of performed actions.
8. Click **Save**. You receive an email when the save process completes.

The save process recalculates the following:

- The contents of the category drop-down menu.
- The articles and questions visible to each user.
- The articles and questions associated with categories.

Note: Save your changes frequently. The more actions you perform before clicking Save, the longer it takes to save.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To create, edit, or delete data categories:

- "Manage Data Categories"

 Example:

How Changing the Hierarchy Affects Article Visibility

Changing the category hierarchy potentially changes which articles readers can see. In the example shown in the following graphic, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics.

 **Note:** When a category moves to a new parent category, users that have no visibility on the new parent category lose their visibility to the repositioned category.

To understand how this change affects which readers can see articles classified with the PDAs category, see the following table.

When my role, permission set, or profile is mapped to:	Could I see PDA articles in their old location under Computers?	Can I see PDA articles in their new location under Consumer Electronics?	Why?
All products	Yes	Yes	When your role, permission set, or profile is mapped to the top-level "All products" category, you can see everything in the category hierarchy.
Computers	Yes	No	You don't have access to the branch of the category hierarchy where PDAs is now located.

When my role, permission set, or profile is mapped to:	Could I see PDA articles in their old location under Computers?	Can I see PDA articles in their new location under Consumer Electronics?	Why?
Consumer Electronics	No	Yes	PDA's has moved to the branch of the category hierarchy where you have been granted access.

How Changing the Hierarchy Affects Article Classification

Classifying an article with a parent category implicitly grants access to that category's children. You cannot explicitly apply both a parent category and one of its children to an article. From the article edit page, selecting a parent category grays out its child categories—you cannot select them in addition to the parent category. Salesforce respects this fact when you move a category to a new parent. It prevents explicitly adding a child category to an article when the new parent category is already present.

In the example depicted above, the category PDAs moves from the original parent category Computers to the new parent category Consumer Electronics. As a result, articles' classifications might or might not change:

- Articles formerly classified with both Consumer Electronics and PDAs lose PDAs, because having Consumer Electronics now implies having PDAs.
- Articles formerly classified with only Consumer Electronics but not PDAs do not change. Access to PDAs is now implied.
- Articles formerly classified with only PDAs, but not Consumer Electronics, retain PDAs.

Delete a Data Category

Deleting data categories can result in long processing times, changes to the visibility and categorization of articles and questions, and other significant consequences. Read this entire topic carefully before deleting categories.

Important: Modify the category hierarchy when user activity is low. Because the save process involves potentially large and complex recalculations, it might take a long time to complete. During processing, agents might experience performance issues when searching for articles or questions or using category drop-down lists.

1. From Setup, enter *Data Category* in the **Quick Find** box, then select **Data Category Setup**.
2. Click a category group name.
3. Click a category name. If necessary, click **Expand All** to display all categories in the category group.
4. Press **DELETE**, or choose **Delete Category** from the **Actions** drop-down list.
5. Click **OK** in the confirmation dialog box.
6. Choose how you want to reclassify articles associated with the deleted category or the deleted category's children. In all cases, the articles retain their categories from other category groups.
 - Assign the deleted category's parent category.
 - Assign a different category. You can select any other category in this category group.

 **Note:** The category you select cannot be deleted itself before you save your work.

- Do not assign the articles a new category in this category group.

Deleting a category:

- Permanently removes it. It cannot be restored. It never appears in the Recycle Bin.
- Permanently deletes its child categories.
- As applicable, removes the category and its children from the **Answers**, **Article Management**, and **Knowledge** tabs in all channels, and your company's public knowledge base.
- Removes associations between the category and articles or questions. You can reassign articles and questions to another category.
- Removes its mapping to visibility. Readers lose their visibility to articles and answers associated with the deleted category.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

USER PERMISSIONS

To view the Data Categories page:

- "View Data Categories"

To create, edit, or delete data categories:

- "Manage Data Categories"

Data Category Visibility

Data category visibility can be set with roles, permission sets, or profiles. Data category visibility determines the individual data categories, categorized articles, and categorized questions that you can see.

There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, you can only see the data categories permitted by their role, permission sets, or profile.

Visibility Setting Enforcement

To ensure a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

 **Note:** Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

Category group visibility settings are enforced on the Answers tab, the Article Management tab, the Articles tab in all channels (internal app, partner portal, Salesforce.com Community, and Customer Portal), and the public knowledge base. In the following areas, users only see the categories that their visibility settings allow:

- On the Article Management tab, when creating or editing articles
- On the Article Management tab and the Articles tab, the category drop-down menu for finding articles
- On the Answers tab, the categories listed below the zone name

Initial Visibility Settings

If role, permission set, or profile data category visibility has not been set up, all users can see all data categories. However, if data category visibility is set up, users who are not assigned data category visibility by a role, permission set, or profile, only see uncategorized articles and questions unless you make the associated categories visible by default. Role, permission set, and profile visibility settings restrict default visibility settings. For example, if a data category is visible by default, it is not seen by a user whose role restricts access to that data category.

 **Note:** If data category visibility is defined with roles, permission sets, and profiles, Salesforce uses a logical OR between the definitions to create a visibility rule for each user.

Role-Based Visibility Setting Inheritance

Child roles inherit their parent role's settings and are kept in sync with changes to the parent role. You can customize and reduce the child role's visibility, but you cannot increase it to be greater than that of the parent role. By default, Customer Portal users and partner portal users inherit the category group visibility settings assigned to their account managers. You can change the category

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

group visibility settings for each portal role. Because high-volume portal users don't have roles, you must designate visibility settings by permission set or profile before these users can view categorized articles and questions.

Categorized Article Visibility

User's can see an article if they can see at least one category per category group on the article. For example, consider an article that is classified with *California* and *Ohio* in the Geography category group and *Desktop* in the Products category group:

- If you have visibility on Ohio and Desktop (but not California), you can see the article.
- If you don't have visibility on either California or Ohio but do have visibility on Desktop, you do not see the article.
- If you have visibility on California but not Desktop, you do not see the article.

Revoked Visibility

Data category visibility can be revoked (set to **None**) for a particular category group. Users in the target role, permission set, or profile can only see articles and questions that aren't classified with a category in that category group. For example, if a user's role has revoked visibility in the Geography category group but visibility to the Products category group, he or she can only see articles that have no categories in Geography and are classified with a category in Products. Because an answers zone can only be assigned to one category group, if the Geography category group was assigned to the zone and a member's role visibility was revoked for that group, the member could only see uncategorized questions.

Example: These examples are based on two sample category groups, Products and Geography:

Note: Although category group visibility settings are available with answers communities (questions) and Salesforce Knowledge (articles), the examples below apply to articles only. Answers communities support one category group and one data category per question.

Products Category Group

- All Products
 - Consumer Electronics
 - Cameras
 - Audio
 - Printers
 - Enterprise Electronics
 - Routers
 - Switches
 - PEX
 - Computers
 - Laptops
 - Desktops
 - PDAs

Geography Category Group

- All Countries
 - Americas
 - USA
 - Canada
 - Brazil

- Asia
 - China
 - Japan
 - India
- Europe
 - France
 - United Kingdom
 - Poland

Role Hierarchy Example

In this example, the Acme Electronics organization manufactures hardware and provides customer support for both consumers and enterprises. The Engineering department is organized by products. The Support department is organized geographically. Europe and the Americas are managed by corporate teams, but Asia is outsourced. Within the corporate and outsourced teams, there are subteams dedicated either to consumer or enterprise support.

The table below shows the categories visible to each role in the Acme Electronics organization, and states whether the visibility settings are inherited from the parent role or custom.

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
CEO	All Countries	All Products
VP of Engineering	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
Consumer Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Consumer Electronics <i>Custom</i>
Enterprise Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Enterprise Electronics <i>Custom</i>
Computers Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Computers <i>Custom</i>
VP of Support	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
VP of Corporate Support	Europe, America <i>Custom</i>	All Products <i>Inherit from VP of Support</i>
Director of Corporate Consumer Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Consumer Electronics, Computers <i>Custom</i>
Director of Corporate Enterprise Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Enterprise Electronics, Computers <i>Custom</i>

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
Outsourced Support	Asia <i>Custom</i>	All Products <i>Inherit from VP of Support</i>
Consumer Support Team	Asia <i>Inherit from Outsourced Support</i>	Consumer Electronics, Computers <i>Custom</i>
Enterprise Support Team	Asia <i>Inherit from Outsourced Support</i>	Enterprise Electronics, Computers <i>Custom</i>

Article Visibility Example

The table below is an in-depth example of how [category visibility settings](#) restrict what users see. This example has three sample users whose category settings are noted in parentheses.

Table 44: Example: How Category Visibility Settings Restrict What Users See

Categories	When User 1's visibility is All countries/Computers, the category is:	When User 2's visibility is America/All products, the category is:	When User 3's visibility is France/None, the category is:
All countries/Laptop	VISIBLE	VISIBLE	NOT VISIBLE
Canada/Computers	VISIBLE	VISIBLE	NOT VISIBLE
USA/All products	VISIBLE	VISIBLE	NOT VISIBLE
Europe/Switches	NOT VISIBLE	NOT VISIBLE	NOT VISIBLE
Europe/No Categories	VISIBLE	NOT VISIBLE	VISIBLE

User 1: The user must be granted visibility in each category that classifies the article, or each category that classifies the article must be visible by default. [In this example, User 1](#) can see Europe, because Europe is the child of All Countries, but he cannot see Switches, because Switches does not belong to Computers. That's why [User 1](#) cannot see articles classified with Europe/Switches.

User 2: When a category is made visible to a user through custom settings or is made visible by default, its child and parent categories are implicitly included; therefore, [User 2](#) can see articles categorized with All Countries because it is the parent category of America. He can also see Articles classified with USA because it is the child of America.

User 3: If a user has no access to the whole category group, he can only see articles that are not categorized in that group. [User 3](#) cannot see the articles categorized with All countries/Laptop because he has no visibility in the category group that includes Laptop, but he can see articles categorized with Europe/No categories.

How Category Visibility Differs from Other Salesforce Models

These settings are unique to articles and questions and differ from other Salesforce models

These settings are unique to articles and questions and differ from other Salesforce models:

Exclusive to articles and questions

[Category group visibility settings](#) determine who can access articles and questions. Although they are standard objects, articles and questions do not have organization-wide defaults, sharing rules, or manual record sharing.

Access

Category group visibility settings are based on the user's role, permission set, or profile. Child roles cannot see more categories than their parent role. To change a user's visibility to categories and therefore categorized articles and questions, you must [change the visibility settings for the user's role, permission set, or profile](#), or, if custom data category visibility is not assigned, [make certain categories visible to all users](#).

Broad interpretation of visibility settings

To ensure a wide range of relevant information, category group visibility is broadly interpreted. Setting a category as visible makes that category and its entire directly related family line—ancestors, immediate parent, primary children, other descendants—visible to users. For example, consider a Geography category group with continents such as Asia and Europe at the top level, various countries at the second level, and cities at the third level. If France is the only visible category selected, then you can see articles classified with Europe, France, and all French cities. In other words, you can see categories that have a direct vertical relationship to France but you cannot see articles classified at or below Asia and the other continents.

 **Note:** Only the first-level categories in the category group are visible on the Answers tab. In the Geography example, only the continent categories appear on the Answers tab; therefore, if France is the category selected as visible in category group visibility settings, zone members can see questions classified with Europe.

Category Group Visibility on Roles

USER PERMISSIONS

To view role details:	"View Setup and Configuration"
To edit and delete roles:	"Manage Roles"
To edit and delete permission sets and profiles:	"Manage Profiles and Permission Sets"
To view users:	"View Setup and Configuration"
To edit users:	"Manage Internal Users"
To view categories:	"View Data Categories"
To manage data categories:	"Manage Data Categories" AND "View Data Categories"

The Category Group Visibility Settings related list summarizes which categories users in the role can see, according to category group.

To view a role's category visibility setting, from Setup, enter *Roles* in the *Quick Find* box, then select **Roles**, and select a role. To view the category visibility settings for a Customer Portal or partner portal role, from Setup, enter *Users* in the *Quick Find* box, then select **Users** and click the name of the role.

The following table explains the possible values in the Visibility column of the related list:

Visibility	Description
All Categories	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a category group, its visibility is defaulted to All Categories .
None	Users cannot see any categories in the category group.
Custom	Users can view a selection of categories in the category group.

In the Category Group Visibility Settings, you can:

- To view a category group's setting details, click its name.
- To [modify a category group's visibility settings](#), click **Edit** next to it.

EDITIONS

Available in: Salesforce Classic

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise** and **Unlimited** Editions.

Modify Default Data Category Visibility

You can edit the default data category visibility.

1. From Setup, enter *Default Data Category Visibility* in the Quick Find box, then select **Default Data Category Visibility**.
All active and inactive category groups are listed.
2. Pick a category group and click **Edit**.
3. To make all the categories in the category group visible by default, select **All Categories**. To make none of the categories visible by default, select **None**. To make some of the categories visible by default, select **Custom**.
4. If you chose Custom, move categories from the Available Categories area to the Selected Categories area as needed. Selecting a category implicitly includes its child and parent categories as well. Move categories from the Selected Categories area back to the Available Categories area to remove default visibility.

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance and Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise and Unlimited** Editions.

USER PERMISSIONS

To view categories:

- "View Data Categories"

To manage data categories:

- "Manage Data Categories"

AND

"View Data Categories"

To assign default category groups:

- "Manage Data Categories"

Edit Category Group Visibility

You can edit your data category visibility.

- Go to the data category visibility settings page in Setup.
 - For roles: enter *Roles* in the *Quick Find* box, then select **Roles**.
 - For a role on the Customer Portal or partner portal: enter *Users* in the *Quick Find* box, then select **Users**.
 - For permission sets: enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**.
 - For profiles: enter *Profiles* in the *Quick Find* box, then select **Profiles**.
- Open a data category group for edit.
 - For roles, in the Category Group Visibility Settings related list, click **Edit** next to the category group you want to modify.
 - For permission sets and profiles:
 - Click a permission set or profile name.
 - Click **Data Category Visibility**.
 - Click **Edit** next to the data category group you want to assign.
- Select a visibility setting.

Visibility Setting	Description
All Categories	Users can see all categories in the category group. This option is only available for the topmost role in the role hierarchy. When you create a category group, its visibility is defaulted to <i>All Categories</i> .
None	Users cannot see any categories in the category group.
Custom	<p>Users see your custom selection of categories. For roles, you can choose from the categories that are visible to the parent role. If the parent role's visibility changes to be less than its child's visibility, the child role's category visibility is reset to its parent's category visibility.</p> <p>To select categories, double-click the category in the <i>Available Categories</i> box. Alternatively, select a category and then click Add. Selecting a category implicitly includes its child and parent categories as well. Categories that are grayed out are not available for selection because their parent has already been selected.</p> <p> Note: When you customize a role, permission set, or profile set to <i>All Categories</i>, first remove All from the <i>Selected Categories</i> box before you select specific categories.</p>

- Click **Save**.

AND

"View Data Categories"

To assign default category groups:

- "Manage Data Categories"

Data Category Visibility Best Practices

- When you create a category group, its visibility is defaulted to **All Categories**.
- When you grant visibility to a category, you also grant visibility to its child and parent categories. If you want to give access to all categories in a branch of the category hierarchy, select the top-level category **All Categories**.
- Users who are not assigned to a category's visibility by role, permission set, or profile can only see uncategorized articles and questions unless:
 - The user has the "View all Data" permission.
 - A category group has been made visible to all users on the Default Data Category Visibility page in Setup.
- For role-based visibility, Customer Portal users and partner portal users inherit the role assigned to their account managers by default. You can change the category group visibility settings for each portal role.
- Keep your category groups deactivated to set up your category hierarchy and assign visibility. Until you manually activate a category group, it does not display in Salesforce Knowledge or your answers community
- For role-based visibility, always set up data category visibility in a top-down approach from the top of the role hierarchy down to the bottom. Give the highest roles the most visibility and give subordinate roles reduced visibility.

Category Group Article Visibility Settings Examples

Review examples of category group settings for article visibility permissions.

There are three types of visibility:

- All Categories: All categories are visible
- None: No categories are visible
- Custom: Selected categories are visible

With custom data category visibility, you can only see the data categories permitted by their role, permission sets, or profile.

These examples are based on two sample category groups, Products and Geography:

 **Note:** Although category group visibility settings are available with answers communities (questions) and Salesforce Knowledge (articles), the examples below apply to articles only. Answers communities support one category group and one data category per question.

Example 1: A Role Hierarchy

In this example, the Acme Electronics organization manufactures hardware and provides customer support for both consumers and enterprises. The Engineering department is organized by products. The Support department is organized geographically. Europe and the Americas are managed by corporate teams, but Asia is outsourced. Within the corporate and outsourced teams, there are subteams dedicated either to consumer or enterprise support.

The table below shows the categories visible to each role in the Acme Electronics organization, and states whether the visibility settings are inherited from the parent role or if they are [custom visibility settings](#).

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
CEO	All Countries	All Products

EDITIONS

Available in: **Salesforce Classic**

Data categories and answers are available in **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance and Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in: **Enterprise and Unlimited** Editions.

Acme Electronics Role Hierarchy	Visible Geographic Categories	Visible Product Categories
VP of Engineering	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
Consumer Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Consumer Electronics <i>Custom</i>
Enterprise Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Enterprise Electronics <i>Custom</i>
Computers Engineering Team	All Countries <i>Inherit from VP of Engineering</i>	Computers <i>Custom</i>
VP of Support	All Countries <i>Inherit from CEO</i>	All Products <i>Inherit from CEO</i>
VP of Corporate Support	Europe, America <i>Custom</i>	All Products <i>Inherit from VP of Support</i>
Director of Corporate Consumer Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Consumer Electronics, Computers <i>Custom</i>
Director of Corporate Enterprise Support	Europe, America <i>Inherit from VP of Corporate Support</i>	Enterprise Electronics, Computers <i>Custom</i>
Outsourced Support	Asia <i>Custom</i>	All Products <i>Inherit from VP of Support</i>
Consumer Support Team	Asia <i>Inherit from Outsourced Support</i>	Consumer Electronics, Computers <i>Custom</i>
Enterprise Support Team	Asia <i>Inherit from Outsourced Support</i>	Enterprise Electronics, Computers <i>Custom</i>

Example 2: Article Visibility

The table below is an in-depth example of how [category visibility settings](#) restrict what users see. This example has three sample users whose category settings are noted in parentheses.

Table 45: Example: How Category Visibility Settings Restrict What Users See

Categories	When User 1's visibility is All countries/Computers, the category is:	When User 2's visibility is America/All products, the category is:	When User 3's visibility is France/None, the category is:
All countries/Laptop	VISIBLE	VISIBLE	NOT VISIBLE

Categories	When User 1's visibility is All countries/Computers, the category is:	When User 2's visibility is America/All products, the category is:	When User 3's visibility is France/None, the category is:
Canada/Computers	VISIBLE	VISIBLE	NOT VISIBLE
USA/All products	VISIBLE	VISIBLE	NOT VISIBLE
Europe/Switches	NOT VISIBLE	NOT VISIBLE	NOT VISIBLE
Europe/No Categories	VISIBLE	NOT VISIBLE	VISIBLE

User 1: The user must be granted visibility in each category that classifies the article, or each category that classifies the article must be visible by default. In this example, User 1 can see Europe, because Europe is the child of All Countries, but he cannot see Switches, because Switches does not belong to Computers. That's why User 1 cannot see articles classified with Europe/Switches.

User 2: When a category is made visible to a user through custom settings or is made visible by default, its child and parent categories are implicitly included; therefore, User 2 can see articles categorized with All Countries because it is the parent category of America. He can also see Articles classified with USA because it is the child of America.

User 3: If a user has no access to the whole category group, he can only see articles that are not categorized in that group. User 3 cannot see the articles categorized with All countries/Laptop because he has no visibility in the category group that includes Laptop, but he can see articles categorized with Europe/No categories.

Case Teams and Queues

Create teams of people who work together to resolve cases faster, and create queues to share workloads among teams.

Case Teams

Case teams help groups of people work together to solve a case, such as a support agent, support manager, and a product manager.

Queues

Queues help you prioritize, distribute, and assign records to teams who share workloads. You can access queues from list views, and queue members can jump in to take ownership of any record in a queue. Queues are available for cases, leads, orders, custom objects, service contracts, and knowledge article versions.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Case Teams

Case teams help groups of people work together to solve a case, such as a support agent, support manager, and a product manager.

If your admin has set up case teams, you can add people to the Case Team related list on cases. When adding a team member, choose one of the predefined roles that the person plays on the case. Roles determine the level of access to a case, such as read-only or read and write access.

You can add contacts to case teams, but they can only access cases when they're enabled as customer portal users assigned to case page layouts. Customer portal users can't update case teams or view case team roles. Case teams aren't available for the partner portal.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

 **Note:** Admins can predefine case teams so that you can quickly add people who you frequently work with. Admins can create assignment rules that add predefined teams to cases that match specific criteria. Admins can also create email alerts that notify team members when an action happens on a case.

 **Tip:** To filter case lists when you're a team member, choose **My Case Teams**. To report on case teams that you belong to, run a case report, then choose **My team's cases** from the View filter.

[Set Up Case Teams](#)

Create case teams to help groups of people work together to solve cases. Before you create case teams, define team roles.

[Create Case Team Roles](#)

Before you set up case teams or predefine case teams, create roles to determine team members level of access to cases.

SEE ALSO:

[Queues](#)

Set Up Case Teams

Create case teams to help groups of people work together to solve cases. Before you create case teams, define team roles.

To let people create and work on case teams, add the Case Team related list to case page layouts. Optionally, create email alerts that notify team members when actions happen on a case, such as when a comment is added. Also, if you've predefined case teams, create assignment rules that add teams to cases that match specific criteria, such as when cases originate from emails.

 **Note:** Case teams count toward your org's overall storage limit. Each team member on a case counts as 2 KB of storage space.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up case teams:

- "Customize Application"
- AND
- "Manage Users"

To add team members:

- "Edit" on cases

Create Case Team Roles

Before you set up case teams or predefine case teams, create roles to determine team members level of access to cases.

You can create an unlimited number of case team roles, but we recommend no more than 20 so as not to overwhelm team members.

1. From Setup, enter *Case Team Roles* in the **Quick Find** box, then select **Case Team Roles**.
2. Click **New**, and enter the role's name.
3. From Case Access, choose the role's level of access to cases.

Read/Write

Members can view and edit cases and add related records, notes, and attachments to them.

Read Only

Members can view cases and add related records to them.

Private

Members can't access cases.

4. If you want members in the role visible to customer portal users viewing cases, choose **Visible in Customer Portal**. Even if **Visible in Customer Portal** isn't chosen, customer portal users added to case teams can view themselves on Case Team related lists.
5. Click **Save**.

Note: You can't delete roles, but you can click **Replace** next to a role you want to replace across all cases. If your org has one role, you can't replace it.

Tip: Roles don't change a case owner's access to cases, which is Read/Write by default.

[Predefine Case Teams](#)

After you define case team roles, you can predefine case teams so that support agents can quickly add people who they frequently work with to cases.

[Set Up Email Alerts for Case Teams](#)

Create email alerts for case teams so that each time a case is created or updated, team members are notified.

SEE ALSO:

[Case Teams](#)

[Set Up Case Teams](#)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To set up case teams:

- "Customize Application"
- AND
- "Manage Users"

To add team members:

- "Edit" on cases

Predefine Case Teams

After you define case team roles, you can predefine case teams so that support agents can quickly add people who they frequently work with to cases.

1. From Setup, enter *Predefined Case Teams* in the **Quick Find** box, then select **Predefined Case Teams**.
2. Click **New**, and enter the team's name.
3. Add team members.
 - a. Choose a team member type: User, Contact, or Customer Portal User. Contacts can access cases only when they're enabled as customer portal users and assigned to case page layouts.
 - b. Click **Lookup** (🔍) and select a member.
 - c. Choose a role for the member.
4. Click **Save**.

 **Note:** To delete a predefined case team, remove it from assignment rules first. If you delete a predefined case team, it's removed from all cases it's on, and you can't retrieve it from the Recycle Bin. When you remove members from a predefined case team, they're removed from all cases in which they were members of the team.

[Case Teams](#)

[Set Up Case Teams](#)

Set Up Email Alerts for Case Teams

Create email alerts for case teams so that each time a case is created or updated, team members are notified.

1. Create email templates for notifications.
2. Set up workflow rules that specify which actions on a case send email alerts to team members.
 - a. From Setup, enter *Workflow Rules* in the **Quick Find** box, then select **Workflow Rules**.
 - b. Click **New Rule**.
 - c. From Select object, choose **Case** and click **Next**.
 - d. Enter a rule name.
 - e. Choose the evaluation criteria. To ensure that every case is evaluated for an email alert, we recommend that you set the evaluation criteria to **Evaluate the rule when a record is: created, and every time it's edited**.
 - f. Enter your rule criteria. We recommend that you choose **criteria are met** and select the criteria that a case must match to send email alerts. For example, if you want team members to receive an email alert each time a case's status is set to New, set the criteria to *Case : Status equals New*.
 - g. Click **Save & Next**.
3. Add email alerts to your workflow rule's criteria.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up case teams:

- "Customize Application"
- AND
- "Manage Users"

To add team members:

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set up case teams:

- "Customize Application"
- AND
- "Manage Users"

To create or change workflow rules:

- "Customize Application"

To create or change email alerts:

- "Customize Application"

- a. Click **Add Workflow Action** and choose **New Email Alert**.
 - b. Enter a description and unique name for the email alert. Because you chose Case as the object for the workflow rule, object appears as read only.
 - c. Choose an email template.
 - d. Select who receives email alerts from the workflow rule. To select all members of a case team, choose **Case Team** from Recipient Type, and add the team as selected recipients. You can enter up to five more email addresses.
 - e. Click **Save**.
4. Activate the workflow rule and its email alert.
- a. From Setup, enter *Workflow Rules* in the Quick Find box, then select **Workflow Rules**
 - b. Click **Activate** next to the name of the rule.
-  **Note:** To prevent the rule from sending email alerts, click **Deactivate** at any time. If you deactivate a rule with pending actions, the actions finish as long as the case that triggered the rule isn't updated.

SEE ALSO:

- [Case Teams](#)
- [Set Up Case Teams](#)
- [Manage Email Templates](#)

Queues

Queues help you prioritize, distribute, and assign records to teams who share workloads. You can access queues from list views, and queue members can jump in to take ownership of any record in a queue. Queues are available for cases, leads, orders, custom objects, service contracts, and knowledge article versions.

You can add a record to a queue manually by changing the record's owner. Or, an assignment rule can add cases or leads to a queue based on criteria, such as *Origin equals Email*. Records remain in a queue until they're assigned an owner, or a queue member volunteers to own them. Any queue members or users higher in a role hierarchy can take ownership of records in a queue.

Some examples of queues include lead queues for distributing and sharing leads among salespeople assigned to specific regions, such as western or eastern. Case queues for distributing and sharing cases among support agents assigned to different service levels, such as gold or silver service. Knowledge article version queues for distributing new versions of articles to people who can translate articles into specific languages.

[Create Queues](#)

Create queues to prioritize, distribute, and assign records to teams who share workloads. There's no limit to the number of queues you can create, and you can choose when queue members receive email notifications.

SEE ALSO:

- [Case Teams](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Service contract queues available in: **Professional, Enterprise, Performance, Unlimited**, and **Developer** Editions with the Service Cloud

Lead queues and case queues are not available in **Database.com**

Create Queues

Create queues to prioritize, distribute, and assign records to teams who share workloads. There's no limit to the number of queues you can create, and you can choose when queue members receive email notifications.

1. From Setup, enter *Queues* in the *Quick Find* box, then select **Queues**.
2. Click **New**.
3. Type a label and name. The label appears in the user interface as a list view, and the name is used by the API and managed packages.
4. Choose email notification settings for the queue.

To notify	You must
One email address when new records are added to the queue.	Add an email address to <i>Queue Email</i> . You can add an email address for an individual or an email distribution list.
All queue members individually when new records are added to the queue.	Leave <i>Queue Email</i> blank.
All queue members and the <i>Queue Email</i> individually when new records are added to the queue.	Add an email address to <i>Queue Email</i> and select Send Email to Members .

5. If your org uses divisions, select the queue's default division. Cases inherit the division of the contact they're related to, but when a case doesn't have a contact, it's assigned to the default global division.
6. Add the objects available to the queue. You can add cases, leads, orders, custom objects, service contracts, or knowledge article versions.
7. Add queue members. You can add individuals, roles, public groups, territories, connections, or partner users.

. Depending on your org's sharing settings, only queue members and users above them in the role hierarchy can take ownership of records in the queue.

8. Click **Save**.

Tip: After you create a queue for cases or leads, you can set up assignment rules to route cases or leads to it.

Note: Before you can delete a queue, reassign its records to another owner and remove it from any assignment rules.

Adding Social Customer Service

Welcome to Social Customer Service

Social Customer Service lets you create cases or leads out of social media posts and send personalized responses on the same social media channels.

 **Important:** If you have two or fewer social accounts to track, you can use the free starter pack. Otherwise, you must have sufficient Social Studio accounts.

Watch the following video for a brief overview on getting started with Social Customer Service.  [Support Your Customers on Their Social Networks\(2:58\)](#)

Social Customer Service integrates with Radian6 and Social Studio so service agents and sales representatives can engage customers by responding to cases and leads created from Facebook, Twitter, and other social networks.

Social Network	Release State
Facebook	Generally Available
Twitter	Generally Available
Google+	Pilot Program
Instagram	Pilot Program
LinkedIn	Pilot Program
Sina Weibo	Pilot Program

The social publisher action on the case or lead feed is the primary interface for replying to consumers or prospects. Inbound and outbound social posts appear as items in the feed, making it easy to follow the thread of the conversation. Permission sets allow you to grant access to your managed social accounts to different sets of users. Out of the box, default settings control how inbound social posts are processed. Optionally, you can modify an Apex class to apply your own custom business logic.

 **Note:** When a lead is converted to an account or contact, the social items in the feed are removed.

In Salesforce1, agents can see and reply to social content from mobile devices.

For Twitter accounts, agents can use case and lead feeds to see the content they are responding to, retweet, mark as favorite and follow tweets, send replies to tweets and direct messages, and delete tweets managed by your social accounts.

For Facebook accounts, cases and leads are created from your managed Facebook page and agents can use the feeds to see the content they are replying to, like posts and comments, send posts, comments, replies, and private messages, and delete posts managed by your social accounts.

For both Facebook and Twitter, you can click the View Source link to open an item in its native social media Web site. This allows you to gain context so you can provide a more informed response.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- “Manage Users”
- AND
- “Customize Application”

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

To send and receive social media posts or messages:

- Case Feed enabled
- AND
- Access to a social account

Social Customer Service Limits	Enterprise, Performance, and Unlimited editions.
Maximum number of active managed social accounts	500 accounts
Maximum number of post tags	200 post tags
Maximum number of errors before inbound posts are paused	100 errors. When errors reach 100, inbound posts are stopped until the errors are cleared. This allows administrators to ensure post are processed correctly.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"

AND

"Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

Set up Social Customer Service

Enable Social Customer Service, install the SocialCustomerService package, sync your social accounts, and assign social handles.

Important: If you have two or fewer social accounts to track, you can use the free starter pack. Otherwise, you must have sufficient Social Studio accounts.

Radian6, part of Marketing Cloud's Social Studio, provides social media monitoring. With the free starter pack, you don't need an explicit Radian6 login. Simply connect up to two Facebook or Twitter accounts and Salesforce handles the rest of the details. If you are a Social Studio customer, set up data sources in Social Studio that can be synced with Service Cloud.

Important: Case Feed Tracking for All Related Objects must be enabled for case feed items to be created. See [Set Up Case Feed](#) on page 2527. For Leads, from Setup, enter *Feed Tracking* in the Quick Find box, then select **Feed Tracking** and ensure **Enable Feed Tracking** and **All Related Objects** are checked. When a lead is converted to an account or contact, the social items in the feed are removed.

1. From Setup, enter *Social Media* in the Quick Find box, then select **Social Customer Service**.

Tip: Enter *med* as a shortcut to bring up the Social Media section more quickly.

2. On the Settings tab, check **Enable Social Customer Service**.

3. If you want posts approved before they send, check **Enable approvals for social posts**.

As part of a job training or quality review process, you may require some agents to have their posts approved rather than allowing them to post freely. With approval processes and user permissions, selected agents can submit social posts for approval, recall the posts, and retry or resubmit them. Approvers can approve and reject posts for publication. See [Enable Social Post Approvals](#) on page 2755.

4. If you want to map new posts to parent posts, which are the first posts that generated a case, select **Enable retrieval of parent posts for added context**.

5. Under **Radian6 Credentials**, either create a Social Studio account with the starter pack by clicking **Create Account**, or click **Login** and enter your Social Studio credentials.

Note: With the Social Customer Service Starter Pack, you can enable Social Customer Service and up to two social accounts from any social network. For example, if you add one Twitter account, you can only add one Facebook account. You can't downgrade from a Social Studio account to the starter pack. The starter pack doesn't support the moderation feature (all posts become cases) and the default Apex code can't be customized.

6. On the Social Accounts tab, click **Add Account** and select your social network, for example Twitter or Facebook.

The social network opens and asks you to authenticate the account. Once your account is authenticated, Salesforce returns you to the Social Accounts tab.

Note: If you receive an error "We're sorry, but we currently do not support Facebook business accounts registration." or "Your Facebook account can't be added due to unsupported features.", you might need to set a user name on your Facebook page.

7. Click the refresh icon next to **Add Account**.

Warning: Deleting a Social Account deletes it everywhere, including in Social Studio. This action cannot be undone.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"

AND

"Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

8. If you are using the Starter Pack, check the **Case Creation** box to indicate that you want cases created automatically when posts come from the social account.

For example, if you have two Twitter handles, one for support and one for marketing or brand-focused information, you can have cases created automatically only from the support handle. The tweets from the marketing handle go in a social post queue for review. See [Managing Social Posts](#) on page 2293.

 **Note:** If you are using the full Social Customer Service version, you can set up case moderation through Social Studio. See [Enable Moderation for Social Customer Service](#) on page 2756.

9. If you have a portfolio of managed social accounts, set the **Default Responses From** for each Twitter, Instagram (pilot), and Sina Weibo (pilot) account. This lets you standardize and raise awareness of your brand's support by setting a dedicated support handle, for example @acmehelp or @acmesupport. Also, agents have fewer clicks when they send outbound posts because the chosen account appears as the default value in the account drop-down in the social publisher. The default response handle doesn't apply for Twitter direct messages and doesn't affect Facebook, Google Plus, or LinkedIn, as they are restricted to the page handle itself.
10. On the **Inbound Settings** tab, you can see which Apex class controls how the inbound content is processed in your organization and which user it's set to run under. If you are using the default Apex class, you can select inbound business rules to determine how incoming social data is handled.

Enable Case Reopen

If a new post, from the same social persona, is associated to a closed case, the case is reopened within the designated number of days. The number must be greater than or equal to 1 and less than or equal to 3000.

Use Person Accounts

Assign a person account of the selected type for the social persona parent record.

Create Case for Post Tags

Override the social hub's case creation rules and create a case when selected post tags are present on a social post. Post Tags are used to answer the question "What is the topic of this one post?". Post tags, set in Social Hub, help to provide further context to what the individual post is about.

 **Note:** Social Customer Service only shows 200 post tags. If you have more post tags in Social Studio, you can view them in that program.

The default Apex class creates a social post, social persona, case, contact, and supports common use cases. For information on modifying the default Apex class, see [Modify the Default Apex Class](#).

 **Note:** If you are using the starter pack, the Apex class can't be changed but you can change the user it is run under.

11. To assign social handles to a profile or permission set, still within Setup:
- Enter *Profiles* in the **Quick Find** box, then select **Profiles**.
 - Enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
12. Click an existing profile or permission set or create a new one.
13. In the Apps section, click **Assigned Social Accounts**.
14. Click **Edit**.

15. Assign the social accounts you need to make available to your users with this profile or permission set.

Important: All users must have the profile or permission set you chose or created in step 8.

16. Save your changes.

17. Ensure that the profile or permission set has the correct field visibility.

- For profiles, from Setup, enter *Profiles* in the Quick Find box, select **Profiles**, then select the profile you chose or created earlier. Next, in the Field Level Security section, select **Social Post**.
- For permission sets, from Setup, enter *Permission Sets* in the Quick Find box, select **Permission Sets**, then select the permission set you chose or created earlier. Next, click **Object Settings**, and then select **Social Post**.

18. Click **Edit**. Under Field Permissions, ensure all fields available are set to Visible (not Read-Only) for profiles or Edit for permission sets. Click **Save**.

19. Optionally, set up Quick Text so agents can create ready-to-send responses to social networks. See [Enable Quick Text](#).

20. Optionally, give social post read access to external community and portal users.

There are three requirements to make social posts available in communities and portals.

- Ensure the user has access to cases in the community.
- Give users read permission to social posts on their profiles.
- On your organization's Social Post object, enable visibility to individual fields through the field level security settings.

Note: Once these requirements are met, external users can see all social posts exposed to them. For example, if a case or lead feed is exposed externally, all social posts in the feed are visible. There is no way to limit visibility at the social post object level.

Turning on history tracking on for the Social Persona and Social Post objects is recommended for the first few months of using Social Customer Service. History tracking helps identify who made what changes when and for differentiating between automatic and manual changes.

[Field History Tracking](#)

Enable Social Post Approvals

Social care agents are both problem solvers for your consumers and the voice of your brand on social networks like Facebook and Twitter. You can have guidelines so your agents write with a consistent tone and syntax that's in line with your organization's social media strategy. For example, you require social agents to sign their tweets in a standard manner, such as “~John.”

Salesforce Admins can create approval processes and assign agents and approvers permissions accordingly.

1. From Setup, enter *Social Media* in the Quick Find box, then select **Settings**.
2. Select **Enable approvals for social posts**.
3. Build and activate approval processes for social posts using either the [Jump Start Wizard](#) or the [Standard Setup Wizard](#).

 **Important:** The Jump Start Wizard is a streamlined way to create approval processes in Salesforce. However, the **Let the submitter choose the approver manually** option is not supported in the Jump Start Wizard. Choosing that option results in an error later when an agent submits a post for approval.

4. From Setup, go to **Administer > Manage Users > Permission sets**.
5. Enable the new **Require Social Post Approvals** user permission.
6. Assign the **Require Social Post Approvals** user permission with a [permission set](#) to agents that need their posts reviewed before they are sent.

When assigning user permissions, remember these two points.

- Because approving a post automatically submits it for publishing, approvers must have the same access to social accounts as the agents whose work they're reviewing. Otherwise, the posts they approve result in an error.
- If your user permissions include **Require Social Post Approvals**, then the submit button on the social publisher always reads **Submit for Approval** rather than "Comment," "Tweet," or other words. This is true even if no active approval process applies to the user. In that situation, clicking **Submit for Approval** publishes the social post normally since there is no active approval process in effect.

For more information, see [Create an Approval Process with the Standard Wizard](#) on page 4282, [Prepare to Create an Approval Process](#) on page 4279, and [Sample Approval Processes](#).

 **Tip:** If your agents work with social post record detail pages, rather than in the case feed, we recommend removing the approvals related list from the page layout. The same page layout is shared between inbound and outbound social posts. Removing the approvals related list avoids confusion when viewing an inbound post that is an invalid candidate for an approval process. Approvers can still approve or reject posts through all other normal means such as email, Chatter, and list views.

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To create case feed items:

- Feed Tracking for All Related Objects on the Case object

Enable Moderation for Social Customer Service

Use moderation to triage incoming posts and only create cases for posts that are actionable requests for help. Moderation helps your organization focus on real customer issues and avoid opening unnecessary cases.

Not all posts require a case, for example, a complimentary tweet or post does not need agent assistance. However, when the default social customer service is configured, cases are automatically created from each social post. Using moderation, agents can manage which posts get cases and which are ignored. Moderation is enabled with a Social Hub rule in your Social Studio account to turn off automatic case creation.

 **Note:** With the Starter Pack, you can decide if you want cases created automatically when posts come from a particular social account on the Social Accounts tab. See [Set up Social Customer Service](#) on page 2753.

1. From your Social Hub account, click the **Rules** tab.
2. Create a rule, or use an existing one, to indicate that no case is created in Salesforce. For example, the rule should have the following setup.
 - a. Action: send to Salesforce.
 - b. **Create Case** checkbox unchecked.
3. Save and enable your rule.

 **Note:** You can enable your rule for all social posts or only those coming from certain managed accounts.

Case creation can also be customized by implementing a custom Apex case logic. To do so, from setup, enter *Social Media* in the Quick Find box, then select **Settings**. See [Modify the Default Apex Class](#).

 **Note:** If you started using Social Customer Service before Spring '16 and have a custom Apex class, you may need update your Apex class to benefit from the latest moderation features. If your custom Apex is extended from the default Apex class, you get the update for the default apex functions you call. If your custom Apex isn't extended from the default Apex class (you copied the default and changed it), you must update manually.

To manually update your custom Apex class, add the following code and update your moderation social post list view.

1. Call this method directly before inserting the post, after all the relationships have been set on the post.

```
private void setModeration(SocialPost post) {
    //if we don't automatically create a case, we should flag the post as requiring
    moderator review.
    if(post.parentId == null)
        post.reviewedStatus = 'Needed';
}
```

In the default Apex, see lines 50 and 61-65.

2. Update your moderation social post list filter from:

```
Parent EQUAL TO "" AND ReviewStatus NOT EQUAL TO "ignore"
```

To:

```
Parent EQUAL TO "" AND ReviewStatus EQUAL TO "Needed"
```

EDITIONS

Available in: Salesforce Classic

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

USER PERMISSIONS

To administer Social Customer Service:

- "Manage Users"
- AND
- "Customize Application"

To ensure that you don't lose track of social posts currently in your moderation queue, make a list view with the new filter, and switch to it once the new and old filters show the same results.

Create the Social Action Interface

The social action is created when you install Social Customer Service. You can add, remove, and organize fields to suit your organization.

The social action is created when Social Customer Service is enabled.

1. From the object management settings for cases, go to Button, Links, and Actions.
2. Click **Layout** next to the social action.
3. Edit the desired fields.

 **Note:** Changing field values could invalidate incoming posts against the Social Customer Service [Apex class](#).

To send social content, the social action must have the following fields:

- In Reply To:
- Managed Social Account
- Message Type
- Content

Headline and Name are required fields. To remove them, create a predefined value for each field and remove them from the action. See [Set Predefined Field Values for Quick Action Fields](#).

4. Click **Save**.
5. From the object management settings for cases, go to Page Layouts.
6. In Case Page Layouts, click **Edit** next to Feed-Based Layout.
7. In the palette, click **Quick Actions**.
8. Ensure that the social action is in the Quick Actions in the Salesforce Classic Publisher section of the layout.
9. Optionally, repeat steps 5 through 8 for the Leads object to enable the social action on leads (from the object management settings for leads, go to Page Layouts).

Modify the Default Apex Class

If you aren't using the Starter Pack, you can customize the default Apex class to specify how inbound social content is processed.

 **Note:** You can't modify the default Apex class if you are using the Starter Pack. The free Starter Pack lets you simply connect up to two Facebook or Twitter accounts and Salesforce handles the rest of the details, like a Social Studio account.

The [default Apex class](#) for Social Customer Service creates a social post, social persona, case, contact, and supports common use cases. To customize how information is processed, by create a new Apex class.

 **Important:** If your agents use the Social Customer Service feature to send private messages to Facebook users, prevent or resolve errors by upgrading your Apex classes to the latest

Social Customer Service is available in **Enterprise**, **Performance**, and **Unlimited** editions.

available version of the Salesforce API. In particular, the Apex class that inserts the post must be version 32 or higher.

If you alter the default Apex class, be sure to select your new Apex class on the setup page, where you can also see Apex processing errors. From Setup, enter *Social Media* in the **Quick Find** box, then select **Settings**. An email is sent to the administrator when there are errors and, in most circumstances, the data is saved and can be reprocessed. If too many errors are waiting for reprocessing, the Salesforce Social Hub rules are automatically paused to ensure social content is not missed.

We have provided [tests for the default Apex class](#). If you alter your Apex class, you must alter the tests accordingly.

 **Note:** Social personas created after the Summer '15 release have a field indicating which social network created the persona: `Source App`. This field is set on creation and is not updateable. If your organization uses custom Apex, update it to use this field. Keep in mind that personas created before the Summer 15 release do not have the field. Also, every time new fields are added to the social action you must update your Apex version or the new fields aren't saved.

To create an Apex class, in Setup, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**. You can use the following code to:

- Support person accounts
- Designate a default account ID
- Change the number of days before closed cases are reopened

```
global class MyInboundSocialPostHandlerImpl extends
Social.InboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global override SObject createPersonaParent(SocialPersona persona) {
        String name = persona.Name;
        if (persona.RealName != null && String.isNotBlank(persona.RealName))
            name = persona.RealName;

        String firstName = '';
        String lastName = 'unknown';
        if (name != null && String.isNotBlank(name)) {
            firstName = name.substringBeforeLast(' ');
            lastName = name.substringAfterLast(' ');
            if (lastName == null || String.isBlank(lastName))
                lastName = firstName;
        }

        //You must have a default Person Account record type
        Account acct = new Account (LastName = lastName, FirstName = firstName);
        insert acct;
        return acct;
    }

    global override String getDefaultAccountId() {
        return '<account ID>';
    }

    global override Integer getMaxNumberOfDaysClosedToReopenCase() {
        return 5;
    }
}
```

You can use the following code to implement your own social customer service process.

```
global class MyInboundSocialPostHandlerImpl implements Social.InboundSocialPostHandler {
    global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
```

```

    SocialPersona persona, Map<String, Object> data) {
        Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();

        // Custom process

        return result;
    }
}

```

The [default Apex class](#) sets the contact as the persona parent. To set the persona parent as an account, person account, or lead, create a method to override the persona parent.

If you want a post to go to the error queue, so errors are not lost, your custom apex must do one of two things.

1. Bubble up an exception (recommended).

```

global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
SocialPersona persona, Map<String, Object> rawData) {
    Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();
    result.setSuccess(true);

    try{
        //handle the post here
    } catch(Exception e){
        //log exception, etc
        throw e;
    }
    return result;
}

```

OR

2. Set the success flag on the response object to false.

```

global Social.InboundSocialPostResult handleInboundSocialPost(SocialPost post,
SocialPersona persona, Map<String, Object> rawData) {
    Social.InboundSocialPostResult result = new Social.InboundSocialPostResult();
    result.setSuccess(true);

    try{
        //handle the post here
    } catch(Exception e){
        //log exception, etc
        result.setSuccess(false);
    }
    return result;
}

```

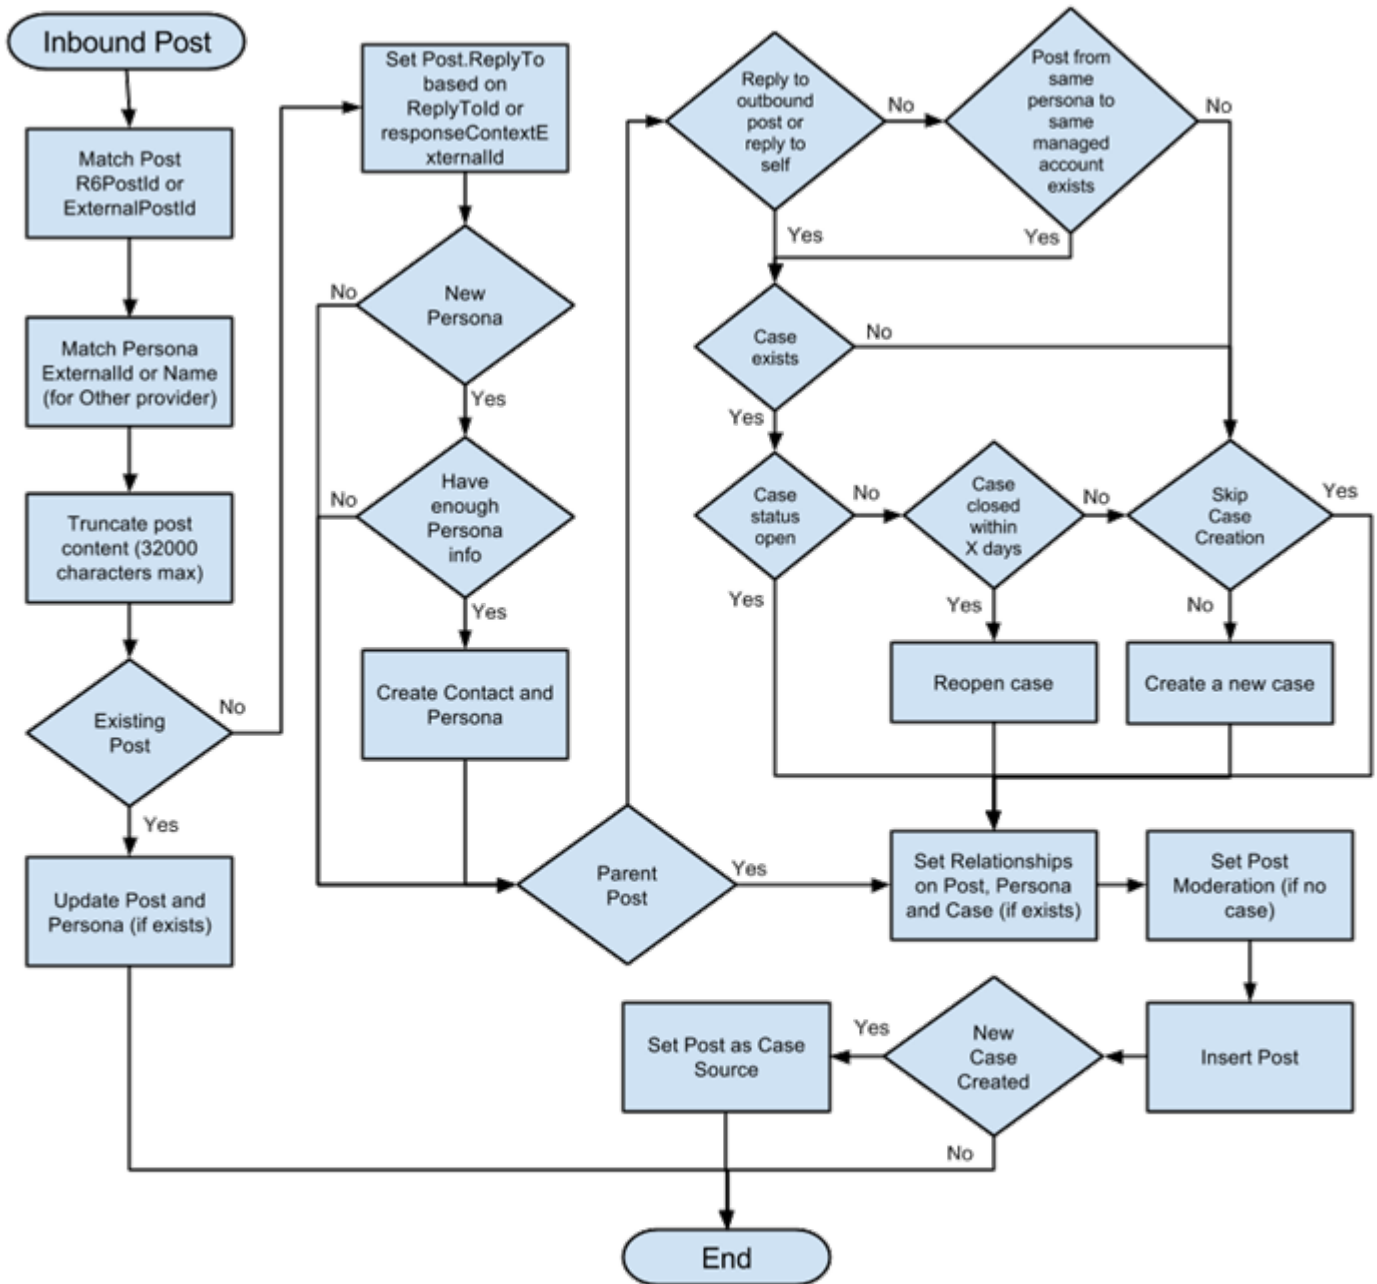

Default Apex Class Process

Data Populated into Social Objects

Details on which fields exist in the standard objects, Social Post and Social Persona, and which fields are currently populated by data from Social Studio.

When Social Studio is configured to work with Social Customer Service (SCS), Social Studio sends data to Salesforce in raw format, which is then decoded by the SCS data intake system and appended to two standard Salesforce objects: Social Post and Social Persona. Social Post contains information that is post specific (posts in this context encompass tweets, Twitter direct messages, Facebook posts, comments, comment replies, etc.). Social Persona stores social identity information gleaned from the author information on posts received by SCS.

Note: If you've modified the default Apex class, you may experience alternate mappings.

Social Post

The following fields exist on the Social Post object.

Table 46: Social Post Fields

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
AssignedTo	assignedTo	"Joe Smith" (user in Social Studio, not Salesforce)	Not updated
Analyzer Score	analyzerScore	5	Score set on a post in the R6 platform
Attachment Type	mediaUrls array	Image, Video	Populated by SCS when new data arrives in Salesforce - only the first attachment is mapped

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
Attachment URL	mediaUrls array	http://some.domain/image.jpg	Populated by SCS when new data arrives in Salesforce - only the first attachment is mapped.
Classification	classification	[Custom value]	Populated as admin defines
CommentCount	commentCount	N/A	Not updated
Content	content	Apple teases the new Mac Pro, what do you think	The actual content of the Social post
ExternalPostId	externalPostId	1111222233334444	Native Social Network Id
Handle	author	thehotclothes	N/A
HarvestDate	harvestDate	2013-06-11T13:07:00Z	Date post collected by Social Studio
Headline	source	N/A	Not updated
Id	salesforcePostId	12345678912345	Populated within Salesforce
InboundLinkCount	inboundLinkCount	N/A	Not updated
IsOutbound	N/A	Yes/No	Populated within Salesforce
KeywordGroupName	keywordGroupName	N/A	Not updated
Language	language	English	Populated in SCS
LikesAndVotes	likesAndVotes	N/A	Not updated
MediaProvider	mediaProvider	TWITTER	Social network
MediaType	mediaType	Twitter	Social network
MessageType	messageType	Tweet	Possible values: <ul style="list-style-type: none"> • Twitter: Tweet, Reply, Direct • Facebook: Post, Comment, Reply, Private
Name	source	TWEET FROM: mysamplehandle	System generated by Social Studio.
Notes	notes	N/A	This includes notes added by all of the following Social Hub actions: <ul style="list-style-type: none"> • Add Note • Translate To • Detect Language • Send Email

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
OutboundSocialAccount	N/A	Northern Trails Outfitters	Populated with Social Account used to publish - only for outbound posts
Parent	N/A	00001728 (linked)	Populated with parent case number if Post associated with case
Persona	N/A	Sample Persona	Populated with author Social Persona if one exists
Posted	postDate	2013-06-11T13:07:00Z	Date-time published on social network.
PostPriority	postPriority	High	Priority set within Social Studio.
PostTags	postTags	post tag 1, post tag 2	Tags are comma-separated.
PostUrl	postUrl	http://www.northerntrails.com	Link to source post
Provider	mediaProvider	Twitter	Set to social network.
R6PostId	r6PostId	12345678	Native Social Studio post ID.
R6SourceId	r6SourceId	1234	Native Social Studio ID for author.
R6TopicId	r6TopicId	1234567890	Native Social Studio ID for either topic profile or managed account
Recipient	recipientId	12345678912345	Native ID of recipient on social network
RecipientType	recipientType	Person	N/A
ReplyTo	N/A	Another Social Post (linked)	Dynamically filled by Salesforce logic based on replyToExternalPostId from Social Studio
Sentiment	sentiment	Neutral	N/A
Shares	shares	N/A	Not updated
SourceTags	sourceTags	source tag 1, source tag 2	Source tags used to track types of authors
SpamRating	spamRating	NotSpam	N/A
Status	status	N/A	Not updated
StatusMessage	statusMessage	N/A	Not updated
ThreadSize	threadSize	N/A	Not updated

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
TopicProfileName	topicProfileName	@my_handle	Name of TP in Social Studio.sd
TopicType	topicType	Keyword Managed	Whether a topic profile or managed account.
UniqueCommentors	uniqueCommentors	N/A	Not updated
Verified	verified	True	This is true or false based on whether the social media account post has come in from a “verified” social media account or not.
ViewCount	viewCount	N/A	Not updated
Who	N/A	Polymorphic relationship	Can be several other types of records, including Lead. Linked.

Social Persona

The following fields exist on the Social Persona object.

 **Note:** The Social Persona object is only updated when you get a post from someone with an existing persona record. Social Persona is not updated via a parallel process.

Table 47: Social Persona Fields

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
AreWeFollowing	areWeFollowing	N/A	Not updated
Bio	bio	Sample Twitter biography	N/A
ExternalId	externalUserId	1234567890	N/A
ExternalPictureURL	profileIconUrl	http://some.domain/image.jpg	N/A
Followers	followers	290	N/A
Following	following	116	N/A
IsBlacklisted	isBlacklisted	N/A	Not updated
IsDefault	N/A	true/false	This value specifies if this record is used to get the avatar image that will be displayed on the contact/account. Its used by Social Contacts.N/A
IsFollowingUs	isFollowingUs	N/A	Not updated
Klout	kloutScore	N/A	Not updated

Salesforce Field	Data Value from Social Studio	Sample Data	Notes
ListedCount	listed	4	N/A
MediaProvider	mediaProvider	Twitter, Facebook etc.	Social network of profile
MediaType	mediaType	Twitter	N/A
Name	author	Joe Smith	N/A
NumberOfFriends	friends	N/A	Not updated
NumberOfTweets	tweets	59546	N/A
Parent	N/A	Contact Name (linked)	Social Persona by default parents to a contact.
ProfileType	authorType	Person	N/A
ProfileUrl	profileUrl	http://twitter.com/mysamplehandle	N/A
Provider	mediaProvider	other	Similar to mediaType but allows fewer values.
R6SourceId	r6SourceId	123456789	Native ID for author
RealName	realName	Joe Smith	N/A
TopicType	topicType	Keyword or Managed	N/A

Additional Data From Social Studio

In addition to the data noted above, certain fields come in the raw data from Social Studio but are not automatically mapped to fields within the Social Post and Social Persona objects. You can access these fields through Visualforce or Apex.

Table 48: Additional Data Fields From Social Studio

Raw Data Field	Notes
authorTags	String
classifiers	Classifier[]
createLead	Boolean
firstName	String
jobId	String
lastName	String
mediaUrls	Raw data comes through as an array of all attachments. SCS matches the first attachment with a known type (image video) to SocialPost.AttachmentType and SocialPost.AttachmentURL
originalAvatar	String
originalFullName	String

Raw Data Field	Notes
originalScreenName	String
origins	String
privacy	String
r6ParentPostId	Long
recipientId	String
replyToExternalPostId	Raw data used to look up 'In Reply To' Social Post but field not directly written into Social Post
skipCreateCase	Used for the moderation feature introduced in the Summer '14 release; if Yes, SCS skips case creation in the default logic. This field can also be used in customer-specific logic

Default Apex Class History

Reporting on Support Activity

Use support reports to track the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of cases.

You can also report on the solutions for your organization, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date. If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

[Using Custom Report Types to Report on Support Activity](#)

Cases and Solutions come with a number of custom report types that you can use to track your team's work with cases and solutions.

[Tips for Effective Support Reporting](#)

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Using Custom Report Types to Report on Support Activity

Cases and Solutions come with a number of custom report types that you can use to track your team's work with cases and solutions.

Use the built-in custom report types to create reports on the number of cases created, case comments, case emails, case owners, case contact roles, cases with solutions, the length of time since the case last changed status or owner, and the history of case fields.

You can also report on your organization's solutions, including solution history, the languages in which solutions have been written, and whether translated solutions are out of date.

Some custom report types become available only when you enable their related features. For example, when you enable historical trend reporting for Cases, you automatically get a Cases with Historical Trending custom report type.

Cases with Historical Trending

Use the Cases with Historical Trending custom report type to analyze changes in case data over time. Available when Historical Trend Reporting is enabled.

Cases and Emails

Create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is available when Email-to-Case or On-Demand Email-to-Case is enabled.

Translated Solutions

Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Contact Role

Choose the Contact Role report to show all cases with their associated contact roles.

Cases with Articles

Choose the Cases with Articles report to see the articles attached to cases. This report is available if Salesforce Knowledge is enabled.

The report displays articles even if they're not marked as available for the internal app channel.

Case Lifecycle

Run case lifecycle reports to view the results of the `Range` field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Service Contracts with Entitlements

Use the Service Contracts with Entitlements report type to report on the services your customers are entitled to. Available when Service Contracts with Entitlements is enabled.

Accounts with Entitlements with Contacts

Lists accounts with entitlements that include contacts (named callers). Available when Service Contracts with Entitlements is enabled.

Service Contracts with Contract Line Items

Lists service contracts with contract line items (products). Available when Service Contracts with Contract Line Items and Entitlements is enabled.

Cases with Milestones

You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is available if entitlements is enabled.

Note: Milestone status in list views and reports is based on the related entitlement process' end time. If a user's profile doesn't include access to the `Entitlement Process End Time` case field, reports and list views that they view may show an incorrect milestone status on cases. The case record and Case Milestones related list will still display the correct milestone status values.

Case History/Solution History

Use the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields' old and new values. You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.

Entitlements and Contracts

Use custom report types to define report criteria from which users can run and create reports on entitlements, service contracts, and contract line items. After entitlement management is enabled, Salesforce automatically includes the following custom report types:

Custom Report Type	Description	Report Type Location
Accounts with entitlements with contacts	Lists accounts with entitlements that include contacts (named callers).	Accounts & Contacts
Service contracts with contract line items	Lists service contracts with contract line items (products).	Customer Support Reports
Service contracts with entitlements	Lists service contracts with entitlements.	Customer Support Reports

Tips for Effective Support Reporting

You can get a lot of useful information out of your cases and solutions data if you keep a few tips and best practices in mind.

- When reporting on cases, add the `Parent Case Number` field to your report. This field indicates if a case is associated with a parent case.
- When reporting on first-call resolution of cases, add the `Closed When Created` field to your report. This field indicates cases that were closed by support reps via the **Save & Close** button during the creation of the case.
- You can create a case report containing contact email addresses, export that data to Excel, and then do a mass mail merge using Microsoft Word.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com** (The edition determines which reports you see.)

Standard Report Types

- Choose the Translated Solutions report to summarize the translated solutions associated with each master solution.
- Choose the Contact Role report to show all cases with their associated contact roles.
- Choose the Cases with Articles report to see the articles attached to cases. This report is only available if Salesforce Knowledge is enabled.

The report displays articles even if they're not marked as available for the internal app channel.

Custom Report Types

- You can create a custom report to view a list of cases with milestones by choosing the Cases with Milestones report type. This report type is only available if entitlements is enabled.
- Choose the Case History and Solution History report types to track the history of standard and custom fields on cases and solutions where field histories are set up for tracking. Use these reports to see tracked fields' old and new values. You can't use filter conditions to search the results of the `Old Value` and `New Value` fields.
- You can create a custom report to view a list of both inbound and outbound emails by case by choosing the Cases and Emails report type. This type of report is only available to organizations with Email-to-Case or On-Demand Email-to-Case enabled.
- You can run case lifecycle reports to view the results of the `Range` field, which indicates the length of time since the case last changed status or owner. Each time the status or owner changes, the counter begins again at zero.

Cases in Portals

If you have enabled the Self-Service portal, you can run reports to track usage of your Self-Service portal.

- When reporting on case comments, use the `Public Case Commented` field to indicate if the comment is private or public. Public comments are indicated with a check mark. To limit report results to public comments, customize the report and add a field filter where `Public Case Commented equals True`. Likewise, the filter `Public Case Commented equals 0` yields only private case comments.
- Choose the `Closed by Self-Service User` field to report on how many cases have been closed by users via suggested solutions on the Self-Service portal.

Solution Categories

Create a custom report that sorts solutions by category. Select the `Category Name` field to display the solution's category and the `Parent Category Name` field to display the category directly above the solution's category.

- If you restrict your report to solutions in a particular category, the report includes only solutions that are directly associated with that category. It does not include solutions in subcategories of the specified category.
- To report on uncategorized solutions, use the advanced report filters. Choose the `Category Name` field and the "equals" operator, and leave the third field blank.

Team Members

- You can report on case teams in which you are a member. After you run a case report, select `My case team's cases` from the `Show` drop-down.
- `Owner Role` for case reports is defined differently than for other objects. For most objects, `Owner Role` is defined in the `Role Name as displayed on reports` field on the user's role. Cases uses the `Label` field instead.
- You can limit any case report to cases owned by users or cases in queues. Choose `User Owned Cases` or `Queue Owned Cases` from the `View` drop-down at the top of a case report.

COLLABORATE WITH EVERYONE

No man is an island, even in Salesforce. Complete tasks quickly and efficiently by collaborating with people either inside or outside of your organization.

Here you'll find information on collaboration tools like Chatter, Salesforce CRM Content, and even documents. There's no limit to what you can accomplish with others—figure out the best way to do it here.

[Collaborate Within Your Company](#)

Stay current with what's happening in your company. Share your knowledge in Chatter posts and comments, collaborate in groups, and access files and data across your organization.

[Collaborate with Partners and Customers](#)

Share updates with customers and partners in Chatter groups.

[Other Resources](#)

Need more info about Chatter? Check out these videos and tipsheets.

Collaborate Within Your Company

Stay current with what's happening in your company. Share your knowledge in Chatter posts and comments, collaborate in groups, and access files and data across your organization.

[Share Updates with People \(Chatter\)](#)

Share updates with coworkers, collaborate in Chatter groups, and view record updates.

[Create, Share, and Organize Files](#)

Post files to feeds and records, share files with customers in the Salesforce cloud, and sync files between your local drive and Salesforce.

Share Updates with People (Chatter)

Share updates with coworkers, collaborate in Chatter groups, and view record updates.

[Chatter Overview](#)

Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

[Get Started with Chatter](#)

Connect with people and share business information securely and in real time.

[Work with Feeds](#)

Stay up to date on posts and comments you and other people make, as well as record changes across your Salesforce organization.

[Work with Posts](#)

Share information and collaborate with other people inside and outside your organization.

[People in Your Organization](#)

Update your personal profile and view the profile of other people in your organization.

[Records and List Views](#)

Configure your follow settings for records, view Chatter feeds on list views, and learn more about record recommendations.

[Collaborate in Chatter Groups](#)

Use public, private, or unlisted Chatter groups to collaborate with specific people in your company.

[Chatter Messenger \(Chat\)](#)

Chat instantly and securely with coworkers. Chatter Messenger is not available in new orgs created after the Spring '16 release.

[Private Messages](#)

Use Chatter messages for secure private conversations with other Chatter users.

[Chatter Questions](#)

Got questions? Use Chatter Questions to post a question in your Chatter feed, then watch the solutions roll in.

Chatter Overview

Use Chatter features like feeds, profiles, groups, and more to share information, collaborate, and keep up with the latest updates in your company.

Chatter works in accordance with all of the security and permission settings in your Salesforce organization. Chatter is enabled by default for organizations created after June 22, 2010. For existing organizations, your administrator must enable Chatter. You can access the Chatter app in the app menu in the top right corner of any page. If your administrator added Chatter tabs to other apps and you previously customized your display, you need to add the tabs manually.

Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Chatter is not supported:

- Using Microsoft® Internet Explorer version 6.0
- For external users in Customer Portals or partner portals
- In the Console tab

Posts and comments that users make in Chatter are retained during the entire time that a customer's applicable org remains provisioned. We reserve the right to enforce limits on:

- The number of system-generated tracked feed updates. Currently tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the audit history for that field is still available.
- The number of email notifications that can be sent per org per hour.

The limits are subject to change. Contact Salesforce for more information.

Get Started with Chatter

Connect with people and share business information securely and in real time.

[Chatter Tab Overview](#)

The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

[The People and Records You Auto-Follow Initially](#)[Liking Posts and Comments](#)

Like posts or comments to show your support and receive email notifications if others comment on that post.

[Replying to Chatter Email Notifications](#)[Navigate to Chatter Email Settings](#)

Find your Chatter email settings so you can change your preferences for receiving email notifications and digests.

[Chatter Email Digests](#)

Email digests conveniently summarize recent activity in Chatter so you don't miss important discussions. You can choose to receive daily or weekly summaries of updates from your personal feed or any group's feed.

[Guidelines for Managing Your Personal Chatter Email Settings](#)

Control the number of Chatter emails you receive by choosing the most important emails and the appropriate frequency of personal and group digests.

[What do "company" and "organization" mean in Chatter?](#)[Can I invite people from my company who don't have Salesforce licenses?](#)

Chatter Tab Overview

The Chatter tab is your collaboration home base and gives you instant access to most of the collaboration features in Chatter.

From the Chatter tab you can:

- [Make a post](#) that's shared with people who follow you, or comment on someone else's post.
- [Like posts or comments](#) to show your support.
- [Share a post](#) to your profile or to a group, or send a link to the post to other Chatter users in an email or instant message.
- [View, filter, and sort your feed](#) on the left side to view posts from people and records you follow and groups you're a member of, posts that mention you, posts you bookmarked, or all posts from your company.
- [Search the feed](#) to quickly find information in the feed posts and comments on the Chatter tab.
- [Bookmark a post](#) to keep track of future comments on the post, or to remember to follow up on the post later.
- [Add topics to a post](#) to categorize the post and give it more visibility.
- Access your [people](#), [groups](#), [files](#), and [topics](#) lists.
- [View or update your profile](#), such as your profile photo or your contact information.
- [Read or send private messages](#) that are only visible to certain people.
- [Access your favorites](#) to see the latest posts and comments for your favorite topics, list views, and Chatter feed searches.
- [View your recommendations](#) for people, groups, files, and records that closely relate to your job and interests.
- [View trending topics](#) that people are discussing in Chatter right now.
- [Invite people to join your Chatter network](#) if they don't have Salesforce licenses to use Chatter.

Chatter Desktop

Chatter Desktop Overview

Chatter Desktop is a free desktop application that lets you collaborate in Chatter without a browser. Use Chatter Desktop to post and comment in Chatter, and receive updates about your groups and the people, records, and files you follow. Chatter Desktop also supports chat, private Chatter messages, and displays Chatter updates and private messages as popup notifications in your Windows taskbar or Mac OS X Dock.

 **Note:** Customer users can install and use Chatter Desktop but can't access all of its functionality. For example, customer users can't follow users or records, chat, or access administration options.

Install Chatter Desktop

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- Windows
 - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
 - Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
 - 512MB of RAM (1GB recommended)
- Mac
 - Intel® Core™ Duo 1.83GHz or faster processor
 - Mac OS X v 10.5, 10.6, or v10.7
 - 512MB of RAM (1GB recommended)

 **Important:** Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The standard version:

- Requires administrator privileges on your machine
- Doesn't require administrator privileges in Salesforce
- Automatically installs the required version of Adobe® Integrated Runtime (AIR®)
- Requires acceptance of an end user license agreement the first time Chatter Desktop launches
- Posts "Installed Chatter Desktop" to Chatter the first time Chatter Desktop launches
- Periodically checks Salesforce for new versions

To install the standard version:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

1. From your personal settings, enter *Chatter Desktop* in the *Quick Find* box, then select **Chatter Desktop**.
2. Click the **Download Now** badge.
3. Follow the on-screen instructions.

 **Note:** Administrators can disable the Chatter Desktop download page and block users from accessing Chatter Desktop.

 **Important:** Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from [Adobe's website](#), install it, and open it at least once to complete the installation.

SEE ALSO:

[Uninstalling Chatter Desktop](#)

Connecting Chatter Desktop

If you have multiple Salesforce or Chatter logins, create a connection for each login. The connection lets Chatter Desktop access the Chatter data you can access with that login on the Web.

1. Click  and select **Settings**.
2. In the Connections section, enter a name for the connection and the URL from which you log in. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection *Europe*.

By default, Chatter Desktop connects to your main instance of Salesforce (Production) or your Force.com sandbox.

3. Click **Authorize** and follow the on-screen instructions to authorize Chatter Desktop to connect using the login. Use the radio buttons on the Settings screen to specify a default connection. To quickly switch connections while using Chatter Desktop, click , select **Switch Connection**, and choose the connection.

 **Note:** You can create multiple connections, but Chatter Desktop can log into only one connection at a time. You cannot use Chatter Desktop to display data from multiple connections simultaneously.

[Configuring Chatter Desktop](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Configuring Chatter Desktop

The default Chatter Desktop configuration is appropriate for most users, but several Chatter Desktop settings are configurable. To access Chatter Desktop settings, click  and select **Settings**. From the Settings screen, you can:

- Configure Chatter Desktop to launch when you start your computer.
- Configure Chatter Desktop to minimize when you close it.
- Turn popup notifications on or off. Popup notifications are enabled by default.
- Manage alerts for new feed posts and comments (advanced settings).
- Configure Chatter Desktop to always display in the foreground (advanced settings).
- Move the chat window to the foreground when you receive a new message.
- Play sounds when someone starts a new chat with you, or play a sound for every chat message when a chat is minimized or out of focus (for example, if you have multiple chats or are using another application).
- Edit your [connections](#).

[Chatter Desktop Troubleshooting Tips](#)

Using Chatter Desktop

In the Chatter Desktop window:

Click: **To:**

Your profile photo Change your chat status. Select  **Available**,  **Away**, or  **Offline**. People can't chat with you when you're  **Offline**.

See feed updates from everyone and everything you follow, and post an update.

- For any feed post, click **Comment** to add a comment, **Like** to receive email notifications if others comment on that post, or **Delete** to delete the post, if you have access.
- To post a file from your computer, drag the file to , or click , which appears when you type a post.
- To post a link, type the link in the text box at the top of your feed, or click , which appears when you type a post.
- Use the **Sort By** filter at the top of a feed to sort updates:
 - Post Date—Sorts feeds by post date. To see comments, you must click **Show All Comments** below a post.
 - Post and Comment Date—Sorts feeds by post and comment date. Each comment appears again when you click **Show All Comments** under its associated post.

EDITIONS

See and comment on updates directed to you.

Chat with people and see their updates. Chat messages are displayed in a separate window.

- Click **Chat Favorites** to see people or chats you've added as favorites. To add a favorite, click next to someone's name or in any active chat with one or more people.
- Click **Following** or **Followers** then click a person's name to see their updates or post to their feed.
- Hover over someone's name:
 - Click to send them a private message.
 - Click to add them as a favorite chat. Their name appears in your **Chat Favorites** list.
 - Click to follow someone or to stop following them.
 - Click to start a chat. You can then add up to 10 people to the same chat by clicking in the chat window and searching for people to add. You can't chat with people who are **Offline**.

Note: Chat is only available if it's enabled in your organization.

Read and reply to private Chatter messages. Click a message to view it, or click **New Message** to send a new message.

Note: Messages are only available if they are enabled in your organization.

See feed updates from groups:

- Click a group name or search for a group to view its feed or to post updates. You can post in all public groups and any private groups that you belong to.
 - Click **Join** to join a group, or **Member** to leave the group.
 - Click to view the group description.
-

See and comment on records you follow. From the drop-down menu at the top, select the type of record you want to view, for example, Account. If you're not following records, there won't be any records in the list. Click a record's name to view its details. Chatter Desktop shows the first eight fields on a record.

Edit your [Chatter Desktop settings](#) or [switch your connection](#).

Instantly synchronize your data. While Chatter Desktop synchronizes your data automatically, it does not always happen instantly.

[Automatically Follow Records You Create](#)

Liking Posts and Comments

Like posts or comments to show your support and receive email notifications if others comment on that post.

Below a post or comment, click **Like**.

After you click **Like** on a post, you receive email notifications if others comment on that post. If you click **Like** on a comment, only the user who posted the comment receives an email notification, but you receive an email notification for any subsequent comments. You can change your [email notification settings](#) on page 2833.

- To stop liking a post or a comment, click **Unlike**. When you stop liking a post or a comment, you don't receive email notifications for subsequent comments or likes.
- View the profiles of others who have liked a post by clicking their name at the bottom of the post or comment, for example, "**John Smith** likes this."
- If more than three people like a post, click the link to see the full list; for example, "You, **John Smith**, and **2 others** like this." From that list, you can follow or stop following people.
- Likes on comments show how many people have liked the comment, for example, "**1 person**" or "**7 people**". To see their names, click the link.

Replying to Chatter Email Notifications

When you receive certain email notifications, you can conveniently perform some actions by replying directly from your email. You can reply to the types of email listed in the table, or any notification that displays a From address of `reply@chatter.salesforce.com`.

 **Note:** To reply to email notifications, your administrator must enable email replies for your organization.

Action	Type of Email	Text to Include in Your Reply	Limits
Bookmark a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	<i>bookmark</i>	N/A
Comment on a post	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	The text of your comment	1,000 characters maximum. Replies that exceed the limit are truncated to the first 1,000 characters.
Follow someone	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	<i>follow</i>	N/A
Like a comment	Someone commented on your post or also commented after you	<i>like</i> or <i>+1</i>	N/A
Like a post	Someone posted to your profile or a group, mentioned you in a post, or shared your post	<i>like</i> or <i>+1</i>	N/A
Mute a post	Any post or comment email when you no longer want to receive notifications for the original post	<i>mute</i>	N/A
Respond to a Chatter message	Someone sent you a message	The text of your response	10,000 characters maximum. Replies that exceed the limit are truncated to the first 10,000 characters.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Action	Type of Email	Text to Include in Your Reply	Limits
Unfollow someone	Someone posted, commented on your post, also commented after you, or mentioned you in a post or comment	<i>unfollow</i>	N/A
Unlike a post	Someone posted, commented on your post, or also commented after you on a post that you previously liked	<i>unlike</i> or <i>-1</i>	N/A

Consider these tips when sending email replies.

- Replies must be sent from the email address specified on your profile. If you use email aliases or email forwarding services that send replies from a different email address, your replies aren't processed.
- Replies to bookmark, mute, like or unlike, and follow or unfollow must contain only the single word or exact text, such as *like* (case insensitive) or *+1*. If you include extra white spaces or the original message that some email applications automatically include, we ignore them and process the reply as a like, bookmark, etc. However, if you include any other text in the body, such as *Like!* or *Like this?*, we process your reply as a comment rather than a like, bookmark, etc.
- If replies contain your personal email signature, the signature text is treated as part of your comment. Default signatures inserted by mobile devices, such as *Sent from my iPhone*, are automatically removed from replies. Before replying, delete custom signatures and any extra text you don't want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
 - Dash (–)
 - Equal sign (=)
 - Underscore (_)

You can also use any combination of these characters.

- Attachments and mentions in replies are ignored.
- Before replying, check the email address that displays in the **To** field of your email. Valid addresses contain tokens, or long character strings, both before and after the @ symbol, such as `w8t27apy1@j321imd9gbs.d8rx.d.chatter.yourInstance.salesforce.com`. Some email applications automatically use the **From** address from the original email, `reply@chatter.salesforce.com`, which is not a valid address for receiving replies. If you see this shortened address in the **To** field of your reply email, replace it with the valid reply-to address in the email header information. For example, in an application such as IBM® Lotus Notes®:
 1. Open the original email.
 2. Click **View > Show > Page Source**.
 3. In the **Reply-To** section, copy the email address that looks like:
`w8t27apy1@j321imd9gbs.d8rx.d.chatter.yourInstance.salesforce.com`.
 4. Paste the reply-to address in the **To** field of your reply email.

Navigate to Chatter Email Settings

Find your Chatter email settings so you can change your preferences for receiving email notifications and digests.

- From your personal settings, enter *Chatter* in the *Quick Find* box, then select **Chatter Email Settings** or **Email Notifications**—whichever one appears.
- Or, from any group page, click **Email Me... > Email Settings**.

To receive Chatter email notifications and digests, your administrator must enable email notifications for your organization. Select *Receive emails* to receive Chatter email.

 **Warning:** Deselecting this option prevents you from receiving all Chatter email notifications.

SEE ALSO:

[Chatter Email Digests](#)

[Guidelines for Managing Your Personal Chatter Email Settings](#)

[Personalize Your Salesforce Experience](#)

Chatter Email Digests

Email digests conveniently summarize recent activity in Chatter so you don't miss important discussions. You can choose to receive daily or weekly summaries of updates from your personal feed or any group's feed.

Personal digests include the updates you see in your own Chatter feed, such as updates about the people, records, and files you follow and your groups. Group digests include the updates you see in a particular group's Chatter feed.

Daily digests include up to the 50 latest posts from the previous day while weekly digests include up to the 50 latest posts from the week. Both include the three latest comments on each post. Chatter sends daily digests at approximately 12:00 a.m. every day, and weekly digests at approximately 12:00 a.m. on Sunday. For user digests, the time is according to the user's time zone. For group digests, the time is according to the organization's time zone. Neither time is configurable.

When you join or are added to a group, you don't receive email notifications initially because they're turned off by default. You can use *Set default frequency for groups I join:* to choose how often you want to receive emails when joining new groups. Changing the default frequency doesn't affect the groups you already belong to. If your organization existed before Summer '11 and is a Professional, Enterprise, Unlimited, or Developer Edition organization, you might still be receiving daily digests by default.

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Guidelines for Managing Your Personal Chatter Email Settings

Control the number of Chatter emails you receive by choosing the most important emails and the appropriate frequency of personal and group digests.

Email Me When Someone

Be selective about your personal email settings. They should help you stay on top of important discussions without becoming overwhelmed by too much email.

Option	Most Important	Recommendations and Notes
Follows me		If you're not already following the person, you can click a link in the email to start following your new follower.
Posts on my profile	✓	People reach out to you directly by posting questions or information on your profile, so make sure that you get notified.
Shares a post I made		
Likes a post or a comment I made		
Comments on my status or a change I made	✓	Get notified so you don't miss follow-up discussions.
Comments on a post on my profile		
Comments after me		After you've commented on an item, get notifications for up to 10 comments after yours. Commenting again later in the post resets the count, so you receive notifications for up to another 10 subsequent comments.
Comments on an item I bookmarked	✓	If you use bookmarks to track items you're interested in, get an email each time someone comments. If you typically use likes to track items of interest, then this option is less important.
Comments on an item I like	✓	After you like an item, get notifications for up to 10 comments after your like.
Mentions me in a post	✓	People use mentions to ask for your input and draw you into discussions, so make sure that you get notified.
Mentions me in a comment	✓	People use mentions to ask for your input and draw you into discussions, so make sure that you get notified.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Option	Most Important	Recommendations and Notes
Sends me a message	✓	Get Sends me a message notifications when people send you private Chatter messages, including notifications about files that have been shared with you.
Endorses me on a topic		

Set Frequency for Personal Digest

Option	Recommended	Recommendations and Notes
Daily	✓	Daily digests include the 50 latest posts from the previous day and the three latest comments on each post.
Weekly		Weekly digests include the 50 latest posts from the week and the three latest comments on each post.
Never		If you're selective about the options in the "Email me when someone" section, you might not need to receive personal digests at all.

Personal digests aren't supported in communities.

Set Default Frequency for Groups I Join

Changing the default frequency for groups you join doesn't affect the groups you already belong to.

Option	Recommended	Recommendations and Notes
Email on every post		In communities, the Email on every post option is disabled once more than 10,000 members choose this setting for the group. All members who had this option selected are automatically switched to Daily digests.
Daily digests		Daily digests include the 50 latest posts from the previous day and the three latest comments on each post.
Weekly digests		Weekly digests include the 50 latest posts from the week and the three latest comments on each post.
Never	✓	Keep this default setting for all new groups. Whenever you join a group that you expect to monitor and contribute to actively, such as one for an important team or project, you can change to more frequent notifications for that specific group only.

[Navigate to Chatter Email Settings](#)

What do “company” and “organization” mean in Chatter?

An organization is a single deployment of Salesforce with a defined set of licensed users who may or may not use Chatter. The words “company” and “organization” are used interchangeably in Chatter. So for example, if you see “share a file with all Chatter users in your company,” it means you're sharing with everyone in a specific Salesforce organization who uses Chatter.

SEE ALSO:

[Chatter Overview](#)

Can I invite people from my company who don't have Salesforce licenses?

If enabled by your administrator, you can invite other people from your company. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

You can [invite users](#) from the People tab or when adding members to a group.

Additionally, you can add customers to private groups you own or manage.

Work with Feeds

Stay up to date on posts and comments you and other people make, as well as record changes across your Salesforce organization.

[Feeds Overview](#)

Follow people and records and see their updates in Chatter feeds on profiles, groups, the Home tab, topic detail pages, and on record detail pages.

[View a Particular Feed](#)

Change your Chatter feed to display a particular subset of posts.

[Filter and Sort Your Feeds](#)

Use the filter and sort options to see updates that are relevant to you.

[Create a Task from a Post](#)

Read a post that you want to follow up on? Use the Create New Task action to create a task directly from that post.

[Viewing Your Recommendations](#)

[Chatter Favorites Overview](#)

Feeds Overview

Follow people and records and see their updates in Chatter feeds on profiles, groups, the Home tab, topic detail pages, and on record detail pages.

Typically, they show updates for:

- Chatter feed comments and posts
- Posts, comments, and files on Chatter groups you're a member of
- Shared files and links
- Tasks and events
- Converted leads
- Record field changes, like changes to record owner and closed opportunities and cases.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Record updates are also called system-generated posts. They are updates that Salesforce automatically generates when someone creates a record or changes a tracked field on a record. The record updates you see depend on how your administrator has configured feed tracking and whether you have access to the record. You don't see tracked feed updates that are older than 45 days and have no likes or comments, because they are deleted automatically.

SEE ALSO:

[Sharing a Chatter Post](#)

View a Particular Feed

Change your Chatter feed to display a particular subset of posts.

By default, you see your What I Follow feed when you go to your Chatter page. Use the feed selections on the left sidebar of the Chatter page to view a subset of posts in your feed. For example, view only posts that mention you, or posts you bookmarked, or all posts in your company.

1. Click  **Feed** to see the available feeds.
2. Click a feed to display the associated subset of posts in your feed.

What I Follow

Shows updates for everything you follow, including posts from people you follow, groups you are a member of, and files and records you're following. Use the drop-down list at the top of your feed to further narrow the subset of posts.

To Me

Shows posts that are made on your profile page, including

- Posts others make on your profile page
- Posts and comments where you have been mentioned
- Posts you made that have comments

Bookmarked

Shows your bookmarked posts in your feed.

All Company

Shows posts and comments from your entire company, including posts and comments from:

- People in your company
- Public groups
- Private groups you are a member of
- Feed tracked changes for records and fields and system-generated posts, if someone liked or commented on the post. You must have access to the record to see the post.

SEE ALSO:

[Filter Your Files List](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Filter and Sort Your Feeds

Use the filter and sort options to see updates that are relevant to you.

Filtering and sorting your feed is useful when you want to view a particular set of posts instead of all posts in your feed.

[Filter Your Feed](#)

Use filters to condense the number of posts that appear in your feed.

[Sort Your Feed](#)

Sort your feed by most recent posts or by most recent comments.

[Available Feed Filters per Feed](#)

The feed filter options vary, depending on how your administrator set up Salesforce and which feed you're viewing. Not all filters are available on all feeds.

Filter Your Feed

Use filters to condense the number of posts that appear in your feed.

The filters you see depend on how your administrator has set up Salesforce. Filter your feed on the Chatter page, your profile, group pages, record detail, and search result pages. Not all filters are available on all feeds.

- Above a feed, click next to Show and select a filter option.

All Updates (Default)

Shows all posts and comments from people and records you follow, posts from groups you're a member of, and all [system-generated posts](#).

Fewer Updates

- Shows all posts and comments from people and records you follow and groups you're a member of
- Hides system-generated posts from records that nobody has commented on

People

Shows the posts and comments from people you follow.

Groups

Shows the posts in groups you're a member of.

Files

Shows posts that include:

- Files you follow
- File posts that someone you follow has commented on

- **Example:** Use the Fewer Updates filter to hide system-generated posts. For example, you're following the Acme account, and the account executive for Acme creates an opportunity. Later, the account executive also changes a tracked field on the Acme account. In both cases, Salesforce automatically generates an update about each change and posts the updates in your Chatter

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

feed and the feed on the Acme account detail page. The Fewer Updates filter hides these system-generated posts in your feed, unless someone has commented on the posts. If you want to see the system-generated posts, select the All Updates filter.

SEE ALSO:

[Available Feed Filters per Feed](#)

Sort Your Feed

Sort your feed by most recent posts or by most recent comments.

1. Above a feed, click  next to Show.
2. Below Sort By, select **Post Date** to sort by most recent posts, or **Most Recent Activity** to sort by posts with the most recent comments, including polls with new comments.

Your feed is sorted by Most Recent Activity by default. You can toggle between sorting by Post Date and Most Recent Activity at any time.

 **Example:** For example, let's say you're following many people and records and bookmarked the posts you're interested in. At the end of your work day, you want to know whether there are any updates for your bookmarked posts. You click **Bookmarked** to view all your bookmarked posts and then sort the posts using the Most Recent Activity filter. The posts are listed in the order of recent comments, starting with the post that has the latest comment.

SEE ALSO:

SEE ALSO:

[Filter Your Feed](#)[Sort Your Feed](#)**Feeds FAQs****I see updates to private groups in my profile feed. Who else can see these updates?**

Only the members of a private group can see updates to that group, even on your profile feed.

SEE ALSO:

[Post Visibility](#)**Can I see a list of records and people I'm following?**

To see people and records you follow, view the Following list on your profile and filter the results by user or by an object type. You can also see a list of people following you in the Followers list on your profile.

SEE ALSO:

[Chatter Profile Overview](#)

Why do I only see certain people and records in my Chatter feed?

You only see updates by people and records that you follow. Follow more records and people to see more updates in your Chatter feed on your Home tab and Chatter tab. Click **People** on the Chatter tab to find a list of people in your organization to follow or unfollow.

SEE ALSO:

[The People and Records You Auto-Follow Initially](#)

Bookmark Posts

Bookmarks Overview

Bookmarking lets you keep track of individual posts you're interested in.

After you bookmarked a post, you can quickly find it using the **Bookmarked** feed on the left sidebar. The **Bookmarked** feed shows you only the posts you bookmarked.

When someone comments on a post you bookmarked, you receive an email notification. Email notifications for bookmarks are enabled by default, but you can change your [email notifications](#) on page 2833.

Bookmarks are private and other users can't see which posts you bookmark. There is no limit on the number of bookmarks you can add. When you are no longer interested in a post you saved, you can remove the bookmark and the post no longer appears in your saved posts when you click **Bookmarked**.

SEE ALSO:

[Liking Posts and Comments](#)

[View a Particular Feed](#)

[Guidelines for Managing Your Personal Chatter Email Settings](#)

Bookmark a Post

Track the posts you're interested in and view your saved posts in your Bookmarked feed.

1. Click  at the top right corner of the post you want to bookmark to expand the drop-down menu.
2. Click **Bookmark**.
The bookmark icon () displays next to the post to indicate that you successfully saved the post to your bookmarks.

Click  **Feed** > **Bookmarked** on the Chatter sidebar to see your saved posts in your feed.

There is no limit for the number of bookmarks. You can add as many bookmarks as you like.

Remove a Bookmark

1. Click **Feed** > **Bookmarked** on the sidebar to see your saved posts in your Chatter feed.
2. Find the saved post in your Chatter feed.
3. Click  at the top right corner of the post to expand the drop-down menu.
4. Click **Remove Bookmark**.

When you remove a bookmark from a post, the post no longer appears in your saved posts when you click **Bookmarked**.

Create a Task from a Post

Read a post that you want to follow up on? Use the Create New Task action to create a task directly from that post.

You can create a task from any post made by you or someone else in your organization, including posts with attachments. You can't create a task from a system-generated post, like a record update.

1. Click  on a post.
2. Click **Create New Task**.
If you don't see the Create New Task action, your Salesforce administrator didn't enable this action for your organization.
3. In the Create New Task dialog, add a subject and a due date. If applicable, associate the task with a contact or lead and an object, like an account. Use the search boxes to find available contacts, leads, and objects.
4. Click **Create**, when you're done.

The task is assigned to you and posted to your profile feed. The task also appears in your My Tasks section on your Home tab.

Click the task subject link (1 or 2) to open the task. Click the post link (3) to display the post from which the task was created.

Viewing Your Recommendations

Chatter provides recommendations to help you identify the people, groups, files, and records that closely relate to your job and interests. The more recommendations you accept, the more updates you see in your feed.

- Click **Follow** next to the person, record, or file you want to follow.
- Click **Join** to become a group member.
- Click **x** to dismiss a recommendation.
- Click **More** to display the Recommendations page where you can use the side filters to narrow your recommendations to people, files, records, or groups.

Find Information in Feeds

Searching in Feeds

Quickly find information in posts and comments across Chatter.

- Use the header search box (Global Search) to find information in feeds across Chatter.
- To find information in a specific Chatter feed, use [feed search](#) () in that context.
- To create a quick shortcut to a frequently performed search in Chatter, [save a feed search as a favorite](#) and click the favorite link from the Chatter page.

Chatter Feed Search Results

Watch a Demo: [▶ Search in Salesforce Classic](#)

Search results for Chatter feeds display posts and comments that include your search terms.

Chatter feed searches aren't affected by your search scope; Chatter feed search results include matches across all objects.

 **Note:** Changes to record fields aren't included in search results. For example, if you've enabled feed tracking on the `Billing Address` field for the Acme account and modified the Acme billing address, search results for `Acme` include **Acme — Suzanne Powell** *Looking for volunteers to help with the Acme account*, but don't include **Acme — Suzanne Powell** *changed Billing Street to 10 Main Road*.

- Sort your search results by posts only or by posts and comments, just as in feeds.
- Comment on, like, share, bookmark, and delete posts in the search results, just as in feeds.
- Add, edit, or delete topics on posts in the search results, just as in feeds.
- Follow, share, download, preview, and upload new versions of files in the search results, just as in feeds.
- View the detail pages for Chatter files, groups, topics, and people by clicking the respective name in the update.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- [View a single feed update](#) by clicking the timestamp below the update, for example, **Yesterday at 12:57 AM**.
- Click **Add to Favorites** to save a Chatter feed search to your [favorites](#) on the Chatter tab.

To view search results for records, such as accounts, contacts as well as Chatter people, groups, topics, and files, click **Records** at the top left of the page.

 **Tip:** For a more focused search of the feeds in a specific group, profile, record, or other Chatter feed, use [feed search](#).

Searching in a Specific Feed

Use feed search to find information in a specific context.

You can search for information in feeds on records, groups, topic pages, user profiles, and on the Chatter and Home tabs. A contextual feed search is helpful when you want to confirm if something was once discussed in that specific feed.

1. Click  above the feed to look for information in that feed. For example, use the feed search on a group's page to find information in that group.

2. Type your search terms and press ENTER or click .

You can search for hashtag topics, mentions, and files posted in the feed, or refine your search using wildcards, operators, and quotation marks to match on exact phrases.

 **Tip:** To search for hashtag topics with multiple words, use brackets after the hashtag and around the words. For example, to find all instances of #Universal Paper, type `#[universal paper]` in the search box.

Search results display with matching terms highlighted. Filters or sorting criteria used in the feed apply to feed search results as well.

Click  to clear your search results and return to the feed.

Feed search behavior may vary slightly depending on where you perform the search.

- Feed search is not supported for feeds on list views.
- You can only search feeds you have access to via sharing rules.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- On the Chatter tab, feed search results are also limited by your [feed type selections](#). For example, if you select the To Me feed type, and select additional [filters](#) and [sorting criteria](#), all of those criteria apply to the feed search results.
- Feed search results are limited to the [posts that are accessible](#) from the context you search within. For example, if you search the feed on a user's profile, the results include the posts and comments accessible from the user's profile. This includes both the posts and comments shared by or with the user.
- Feed search returns matches for file or link names shared in posts, but not in comments.
- Record field changes aren't included in record feed search results.

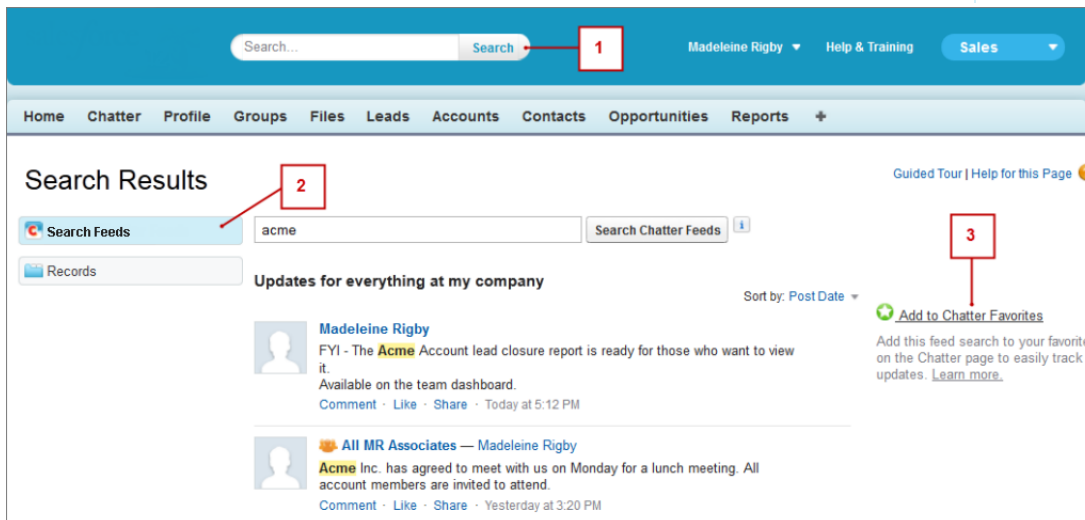

Adding a Chatter Feed Search as a Favorite

Add a Chatter feed search as a favorite to access feed updates quickly without leaving the Chatter tab.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

1. Enter terms in the header search box and click **Search**.
2. Click **Search Feeds** to see the posts and comments that include your search terms.
3. Click **Add to Favorites**.

 **Example:**

The favorite name on the Chatter page is the same as the search terms you entered. For example, if you searched for *competitive analysis*, your favorite is **competitive analysis**.

 **Tip:** Save a search for a Chatter group name as a favorite to quickly access the group feed from the Chatter page. Similarly, save a search for a person's name as a favorite to quickly see that person's posts, comments, and mentions.

SEE ALSO:

[Chatter Feed Search Results](#)

Chatter Favorites Overview

Chatter favorites on the Chatter tab give you easy access to list views, Chatter feed searches, and topics that you want to stay on top of. For example, if you and your coworkers use the hashtag topic #acme to track information about your customer Acme, you might want to add #acme as a favorite so you can easily access these updates without leaving the Chatter tab.

You can have up to 50 favorites. If you haven't added any favorites, the Favorites section doesn't appear on the Chatter tab.

Chatter displays the four favorites most recently added or viewed.

- Click a favorite to see the updates.
- Click **x more** to see all your favorites.
- Click , which appears on hover, to remove a favorite.

Work with Posts

Share information and collaborate with other people inside and outside your organization.

[Posting Overview](#)

Use the Chatter publisher to make posts, delete posts, ask questions, and create polls.

[Post Visibility](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

[Can I prevent people from seeing my posts?](#)

[Do posts that I make on a group appear on my profile where others can see them?](#)

[Mute a Post](#)

Control what appears in your news feed and mute posts you're no longer interested in.

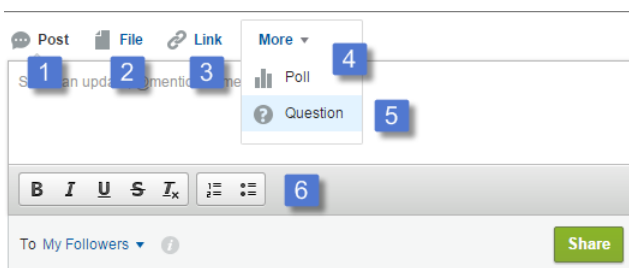

[Who Can See My Attached Files and Links?](#)

Share files and links with people by attaching them to posts or comments.

Posting Overview

Use the Chatter publisher to make posts, delete posts, ask questions, and create polls.

The publisher appears on your Home tab, Chatter tab, user profile page, group, and record detail pages. Use publisher to write a post (1), attach a file (2) or link (3) to your post, add a poll (4) or ask a question (5). Posts and comments can be up to 10,000 characters long. Use the rich text editor to format your posts (6).

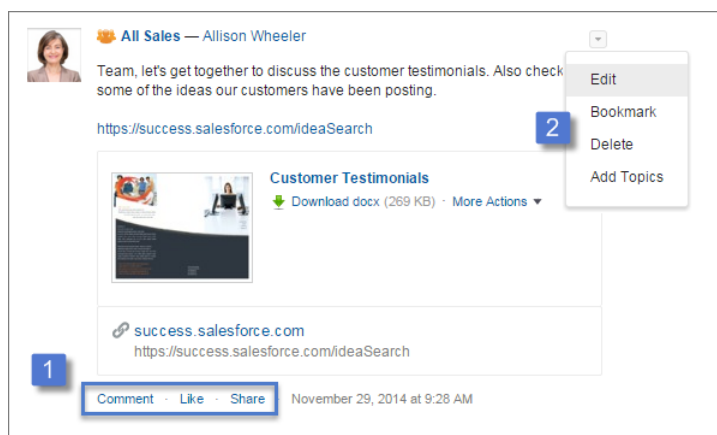

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

By default, the publisher displays the Post, File, Link, Poll, and Question actions. Your Salesforce administrator can change the order of the actions and add more actions. Therefore, which actions you see, depend on how your administrator configured the publisher.

When you post to a feed, everyone with access to the post can comment on the post, like the post, and share it (1). From the drop-down menu (2), they can also bookmark the post and add topics.

Click **Edit** to modify your own posts and comments. If you're a group owner or manager, you can also edit other people's posts on the group feed. Click **Delete** to remove your post from the feed. However, you can't delete other people's posts or posts that are automatically generated by Salesforce. For example, you can't delete record updates like a post about a changed field on an account.

 **Note:** If the Edit option isn't available, your administrator disabled this feature for your organization.

 **Note:** You can't create new posts on archived groups. Comments on existing posts in an archived group follow the same visibility settings as before the group was archived.

Can I prevent people from seeing my posts?

Anyone except [customers](#) can see your posts on your profile, and people following you can see your posts in their Chatter feed. However, if you change a record, only people who have permission to see the record can see the record update a feed.

SEE ALSO:

[Sending Chatter Messages](#)

Do posts that I make on a group appear on my profile where others can see them?

Yes, but who can see the posts depends on the [type of group](#). If you post to a group that is:

- Public, anyone except customers can see the post on your profile.
- Private, only other group members can see the post on your profile.
- Private and allows customers, all members can see the post in the group. Customers who are members of the group can see your posts on the group page but not on your profile.

- Unlisted, only group members and users with the “Manage Unlisted Groups” permission can see the post on your profile. Customers who are members of the group can see your posts on the group page but not on your profile.

[Chatter Groups](#)

Mute a Post

Control what appears in your news feed and mute posts you’re no longer interested in.

You can mute posts from the feed and from a feed post’s detail view. Muting is available on the Home and Chatter tabs, but not on group, profile, or record feeds. If your admin enabled email replies, you can mute posts by replying to post emails with the single word *mute*.

To mute a post in a feed, select **Mute** from the post’s drop-down menu.

To mute a post from its detail view:

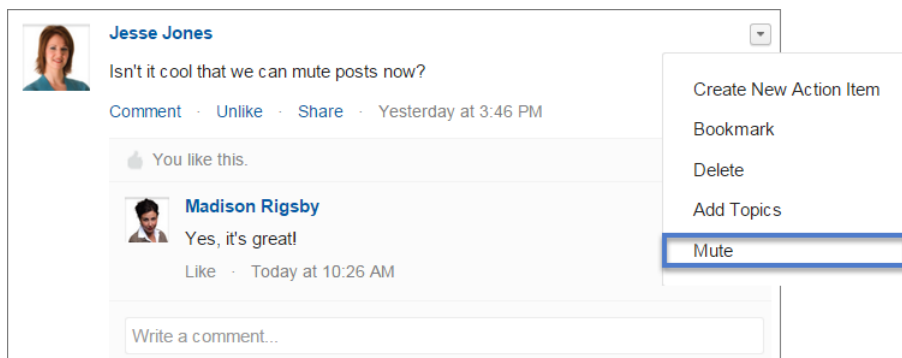

1. Go to detail view in the feed by clicking the post’s date stamp, or, in an email notification, by clicking the **View/Comment** button.
2. From the post’s drop-down menu, select **Mute**.

After you muted a post,

- The post no longer appears in your feed on the Home and Chatter tab.
- You no longer get notifications for updates to that post.
- You can use the Muted filter on the side panel to view your muted posts.
- If someone mentions you on a muted post, the post is automatically unmuted. It reappears in your feed and if you have email notifications enabled, you get a notification about the update.
- If the post was originally posted to a group, profile, or record feed, it still appears on that feed.

For example, someone posts to a group that you’re a member of. The post appears on the group feed and your news feed on the Home and Chatter tab. You can mute the post in your news feed, but the post remains visible in the group feed.

 **Example:** Here’s how you mute a post from the drop-down menu.

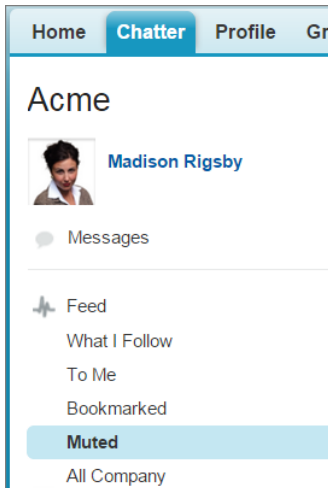

To view all posts you muted, select the Muted filter.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Mention People and Groups

@Mention People and Groups in Posts and Comments

@Mention individual people or a group to keep them informed when you're discussing something relevant to them.

1. When you write a post, type @ followed by the first few letters of the person or group name.
2. Select the person or group from the list of matches.

The list includes all matches for

- People, typically users you interact with the most
- Public groups
- Private groups you're a member of

You can have up to 25 mentions in a single post or comment. You can't mention archived groups, unlisted groups, customer groups, and private groups you're not a member of.

3. Click **Share** to post your update.

After you posted your update,

- The person's name becomes a link to their profile, and the group name becomes a link to the group page.
- For people you mention, your update appears on the mentioned person's profile feed and in their To Me feed.
- For people who choose to receive emails when mentioned, Chatter sends an email notification.

 **Note:** There's an exception: if you @mention yourself, you don't receive a notification.

- For groups you mention,
 - Your update appears on the group feed and each group member's What I Follow feed.
 - Chatter sends an email notification to the group members who enabled the Email Every Post preference for the group.

 **Note:** On mobile devices, we don't currently send push notifications for group mentions.

- If the mention is on a record feed, the record appears in the group records list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

 **Example:** Your coworker Madison posts that she's looking for information about an Acme product feature. You reply to Madison's post with the comment: "Talk to @Bob Smith—he's the Acme account manager. @Acme Products, do you have any additional information for Madison about this feature?" Both Bob Smith (if he chose to receive emails when mentioned) and members of the Acme Products group get an email notification about your post. Madison can click **@Bob Smith** in the update to view Bob's profile, or click @Acme Products to see their group page.

Chatter enforces security and sharing rules in Salesforce. Let's say you make a post to a record or a private or unlisted group and @mention someone who doesn't have access to that record or isn't a member of the group. In this case, the @mention appears as a gray link. The mentioned person can't see your post and doesn't get notified about the post. For example, Madison creates a private group for her project team and forgets to add her coworker Sandy Dunn to the group. When Madison posts an update to this group and @mentions Sandy Dunn, Sandy isn't notified about the update. Sandy also can't see the update because she's not a member of the private group. If Madison later adds Sandy to the group, Chatter doesn't notify Sandy about the previous mentions.

[User and Group @Mentions—Visibility](#)

User and Group @Mentions—Visibility

When you @mention people or groups in an update, anyone who has access to the update can see the post and all comments.

This table describes where you can find posts and comments that mention people, public groups, and private groups. You can't mention private groups with customers and unlisted groups.

If the post was made on	And mentions	Then these people can see the post and comments
A person's profile	Other people	Anyone with access to the person's profile.
	Public group	Anyone with access to the person's profile.
	Private group	Anyone with access to the person's profile, even if they're not a member of the private group.
Public group A	Other people	Anyone with access to public group A.
	Public group B	Anyone with access to public group A.
	Private group	Anyone with access to public group A, even if they're not a member of the private group.
Private group A	Other people	Members of private group A.
	Public group	Members of private group A.
	Private group B	Members of private group A, even if they're not a member of private group B. People who are members of both private groups can also see the post in the feed of private group B.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

If the post was made on	And mentions	Then these people can see the post and comments
Unlisted group A	Other people	Members of unlisted group A and users with the “Manage Unlisted Groups” permission.
	Public group	Members of unlisted group A and users with the “Manage Unlisted Groups” permission.
	Private group B	Members of private group B who are members of unlisted group A or have the “Modify Unlisted Groups” permission.
Record detail page	Other people	People with sharing access to the record.
	Public group	People with sharing access to the record.
	Private group	People with sharing access to the record, even if they’re not a member of the private group.

The visibility of posts and comments depends on sharing access to the post. Anyone with access to the original post also has access to all subsequent comments on the post.

Who Can See My Attached Files and Links?

Share files and links with people by attaching them to posts or comments.

Attach links and files to posts and comments from your device, Salesforce Files, Files Connect external sources, and Salesforce CRM Content libraries.. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.

This table describes who can see a file you attached and where it appears:

If You Attach a File:	Who Can See It?	Where Does it Appear?
On a Chatter feed	All Chatter users in your company	<ul style="list-style-type: none"> In your and your followers' Chatter feeds, and profile On the Files list and Salesforce CRM Content of all Chatter users in your company
On your Chatter profile or on someone else's Chatter profile	All Chatter users in your company	<ul style="list-style-type: none"> In your feed, their feed, your followers' feeds, and their followers' feeds and profiles In the Files Owned list on your profile On the Files list and Salesforce CRM Content of all Chatter users in your company

EDITIONS

Attach Files or Links

Attach a File to a Post or Comment

Share files and links from Salesforce or from your computer with people by attaching them to posts or comments.

You can attach all file types, including Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. The maximum file size is 2 GB.

When you attach a file, consider the following:

- When a file is posted to a feed, everyone in your company can see it even if the file started out as private. Only files posted in a private group stay private within that group.
 - Attaching a file from a group or library creates a reference to the file. If you update a file in Salesforce CRM Content, the updates are also reflected in the feed.
 - You can post a file from an external data source. From the file selector, choose an external source and navigate through the folders to the file you want to post. A new file reference or copy is created in Salesforce for the corresponding external file. If a file reference already exists for the file you select, it will be reused.
1. Click **File** at the top of your feed to attach a file to a post, or **Attach File** below a comment to attach a file to a comment. If you're commenting on an update resulting from feed tracking on a file, the **Attach File** option isn't available.
 2. Do one of the following:
 - Click **Select a file from Salesforce** to attach a file that has already been uploaded to Salesforce, synced from your Salesforce Files Sync folder, or that exists in a Files Connect external data source.
 - Click **Upload a file from your computer** to attach new files from your computer.
 3. Browse for the file you want to attach.

Links, Google docs, documents from the Documents tab, and attachments from the Notes and Attachments related list aren't included in the Select a File to Attach list. For more information about finding files to attach, see [Searching for Files to Attach to a Chatter Feed](#).
 4. Add a post or comment about the file.

If you don't enter any text, a generic update is posted with your attachment.
 5. Below the text box, select **My Followers** to publish the post on your profile. To post to a group, select **A Group**. Type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.
 6. Click **Share**.

Searching for Files to Attach to a Chatter Feed

From the file selector, you can see a list of Salesforce files you own and have access to. In Salesforce Classic, click **File** above the feed, and then select a file from Salesforce. In Lightning Experience, click the paperclip icon below the post to open the Select File window. The 25 most recently viewed files are listed by default.

From the file selector you can see and search a certain group of files by clicking a specific filter on the sidebar.

- **All Files**—All files you own and have access to, including:
 - Files that have been shared with you
 - Files you're following
 - Files in your Chatter groups
 - Files in your libraries
 - Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.

This filter is only available in Salesforce Classic.

- **Recent**—The most recent files you've viewed.
- **MY FILES**—All files you own, files shared with you, and files you follow.
 - **Owned by Me**—Files you have:
 - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, share them, and attach them to Chatter feeds.
 - Attached to Chatter feeds from your computer.
 - Synced using your Salesforce Files Sync folder.
 - Uploaded to Salesforce CRM Content libraries you're a member of and your private library.
 - **Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
 - **Following**—All files that you're following. (*Requires Chatter*)
- **FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your private library. The first five libraries you're a member of, including your private library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.
- **Synced**—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the "Sync Files" permission.
- **EXTERNAL FILES**—All files you have access to in Files Connect external data sources. Search is restricted to the selected external data source.

Note:

- Only files from libraries that you're a member of and where you have `Post Content to Chatter Feeds` or `Manage Library` checked in your library permission definition are listed.
- Users who have the "Sync Files" permission don't see the **All Files**, **MY FILES**, or **FILES IN MY GROUPS** filters. Users who don't have the "Sync Files" permission don't see the **Synced** filter.

To search for files from the search box:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the search box. You can search by file name, description, owner, type, or within the file's text.
3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click  to clear your search terms.

The Select a File to Attach list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.
- Links attached to posts in Chatter
- Files from your personal library

Performing Actions on a File in a Chatter Feed

You can perform the following actions on files in feeds.

- Preview—Click the file thumbnail or click **More Actions > Preview** next to the file.
- Download—Click **More Actions >  Download** next to the file.
- Upload new version—Click **More Actions > Upload New Version** next to the file.
- View file detail page—Click the file name or **More Actions > View File Details** next to the file.
- Follow—Click  **Follow** next to a file to receive updates about the file in the Chatter feed. Click  to stop receiving updates about the file.
- Share—Click **More Actions > File Sharing Settings** next to the file to share the file with people, groups, or via link.
- If you have the “Sync Files” permission and are the owner of the file, click  **Sync** to [sync a file](#) between your Salesforce Files Sync folder on your computer and Chatter. Click  **Unsync** to stop syncing the file.

To learn who can perform which actions on a file, see [Who Can See My File?](#)

Downloading and Previewing a File in a Chatter Feed

Not only can you download and save files posted to Chatter feeds, you can also preview files in your browser without downloading them.

There are several places in Chatter where you can download and preview files:

- On the **Files** page—Click  >  **Download** or click the preview () icon next to the file.
- On any Chatter feed—Click **More Actions** >  **Download** next to the file, or to preview the file, click on the file thumbnail or click **More Actions** >  **Preview**.
- On the Files Owned by list on a profile—Click  >  **Download** or click the preview () icon next to the file.
- On the Files Shared with list on a group—Click  >  **Download** or click the preview () icon next to the file.
- In the Notes and Attachments related list on a record, click **Download** next to the feed attachment, or to preview the file, click **Preview** next to the feed attachment.

Previewing a file opens it in your browser with the enhanced document viewer. The enhanced document viewer provides the following capabilities for viewing documents:

- In addition to using the next page () , previous page () , first page () , and last page () icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available for PowerPoint files.
- You can jump directly to a page by entering the page number in the page field and pressing Enter.
- From the right-click menu you can choose **Fit Width** to expand the width of the document, or **Fit Full Page** to preview the whole page of the document. The fit width icon () and fit full page icon () are also available on the toolbar.
- From the right-click menu you can choose **Full Screen** to preview the document in full screen mode, or **Exit** to exit full screen mode. The full screen icon () and exit icon () are also available on the toolbar.
- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon () and zoom-out icon () are also available on the toolbar.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
 - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
 - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
 - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
 - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Note:

- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- In Internet Explorer 11, the **Preview** option redirects to the file detail page.

SEE ALSO:

- [Who Can See My Attached Files and Links?](#)
- [Delete Files and Links from Feeds](#)

Delete Files and Links from Feeds

To delete a link from a Chatter feed, simply delete its post. To delete a file, go to the file detail page or content detail page. Only a file owner can delete the file. Users with the “Modify All Data” permission can delete all comments, posts, files, and links.

Delete a File from a Chatter Feed on a Record

There are two ways to remove a file on a Chatter feed on a record:

- Remove the file on a Chatter feed by deleting its post. This deletes the post, removes the file from the feed and from the Notes and Attachments related list, but the file remains in its original location. If the file isn't posted anywhere else, it goes back to being private, but can be shared again later.
- Remove the file on a Chatter feed by clicking **Del** next to the feed attachment on the Notes and Attachments related list. This removes the file from all Chatter feeds where it's been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking on the Recycle Bin, selecting the file, and clicking **Undelete**. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list also removes it from the post, but doesn't delete it from its original location.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Deleting a link from a Chatter Feed

To delete a link on a Chatter feed, you must delete its post.

Deleting a File from a File Detail Page

Click **Delete** on a [file's detail page](#) to delete the file and remove it from all locations where it's been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

Deleting a File from a Content Detail Page

When you post a file in Chatter, the file also appears in Salesforce CRM Content. To delete the file from Chatter, Salesforce CRM Content, and all locations where it's been shared, click the name of the file on the Libraries, Content, or Subscriptions tab. From the content details page, click **Edit > Delete Content** to delete the file. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter. Select the checkbox for the content file you want to restore, and click **Undelete**.

SEE ALSO:

- [Post Visibility](#)

Attaching a Link to a Post

Share links with people by attaching them to a post.

If you share a URL for which we provide rich media support, your post shows a preview of the linked content. For information about currently supported URLs, see [Sites That Generate a Preview in Posts](#).

1. Above your feed, click **Link**.

2. Type the URL to share.

3. Optionally, type a `Link Name`.

If you leave the Link Name field blank, the preview shows the title or name from the site URL.

4. Optionally, type a post.

If you don't type any text, a generic update is posted with your link.

5. Below the text box, select **My Followers** to publish the post on your profile. To post to a group, select **A Group**. Type part of the group's name in the Search Groups field, and select the group from the drop-down list. You can only select a group you're a member of.

If you're posting on someone else's profile or on a record, the **My Followers** and **A Group** options aren't available.

6. Click **Share**.

SEE ALSO:

[Sites That Generate a Preview in Posts](#)

Sites That Generate a Preview in Posts

Salesforce provides rich media support for over 400 URLs. When you share a supported URL in a post, your post shows a preview of link content.

Embed.ly, a third-party service, powers file previews, which include thumbnails, descriptions, and video players for links to videos. If a post doesn't render a link as a rich preview, the URL domain isn't supported or Embed.ly was unable to return the preview content.

We don't share any content, user, organization, or account data with Embed.ly. We share only the URLs that are on Embed.ly's custom provider whitelist. The whitelist also includes versions of URLs that are shortened by third-party shorteners, like bitly, goo.gl, and tinyurl.com. All our URL requests pass through a Salesforce proxy. Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

 **Note:** For a look-up list of supported URL domains, see ["URL Domains for Rich Link Previews in Feeds."](#)

Post a Poll

Polls

Use polls to conduct a survey. A poll contains a list of choices in a feed post that lets people cast a vote by selecting one of the choices.

Polls are a great way to get people's opinions. For example, you are in charge of planning an annual sales meeting and need to find out when most people are available to attend the meeting. Instead of emailing everybody in the sales organization, you could create a poll in the Sales Chatter group that lists possible dates and ask people to vote for the date that works best for them.

When you create a poll, anybody with access to the feed or the poll can vote on the poll. So when you post a poll, consider who you want to participate. For example, if you post a poll in a private group, only the members of that group can see the poll and vote. Keep the following in mind about polls:

- When you create a poll, you can add up to ten choices.
- When voting on a poll, you can only select one choice.
- Polls are anonymous. You can see how many people voted, but you can't see who voted.
- Click **Refresh** to see the latest poll result and the number of votes that were cast.
- You can't repost a poll.
- People can only cast one vote, but they can change their vote.
- You can mention someone and include hashtag topics in the poll question.
- You and others can add topics to your poll question after posting.
- The email notification options you enabled in your Chatter Email Settings apply to polls just as they do to posts. For example, if you get a notification whenever someone comments on a post you made, you also get an email notification when someone comments on a poll you posted.

 **Note:** The poll result doesn't always add up to 100 percent due to rounding. For example, if a poll has three choices and each gets one vote, the result adds up to 99 percent.

SEE ALSO:

[Liking Posts and Comments](#)

Create a Poll

Post a poll in your feed to gather people's opinions.

1. Above the feed, click **Poll**.
2. Type a question in the text box.
Add a hashtag or mention someone.
3. Type at least two choices.
Click **Add more choices** to add another choice. You can enter up to ten choices.
4. Select to post the poll to your followers or to a group.
If you're posting the poll to a group, select the name of the group from the drop-down list.

Filters for Sorting the Topics List

Use the topic filters to narrow the topics list to your favorite topics or topics you use, and then sort the topics by the number of people talking about them or alphabetically by name.

On the [Topics list](#), under Show, you can filter the topics.

All

All topics that have been added to posts in your organization

My Favorites

Topics you added to your favorites

Topics I Use

Topics you added to posts and topics on posts that you commented on

Within the topics you filtered, you can sort by the following columns.

People Talking About This

Sorts by the number of people talking about the topic. This includes:

- The number of people adding the topic to updates
- The number of people commenting on posts with the topic

Name

Sorts alphabetically by the topic name.

Viewing Details about a Topic

View a topic detail page to see the topic description and a feed with topic updates from all users and public groups.

To open a topic detail page, click a topic or hashtag. On the topic detail page, you can:

- [Search a topic feed](#) to quickly find relevant information. Or scan the feed to learn about the topic and discover which people and public groups are interested in it.
 - Add a post directly to the topic feed. Your followers automatically see the post, and you can even add the post to a group you're a member of by using an @mention. Because you added the post on the topic feed, the topic is automatically added to your post.
 - Discover [who's knowledgeable](#) about the topic and endorse people you think are knowledgeable. If you appear in the Knowledgeable People list and you don't want to, you can hide yourself.
 - Click  **Follow** to follow the topic and see updates to the topic in your feed.
 - Edit the topic name and description. In the upper right, click , and choose Edit Details. You can change only the capitalization and spacing of topic names.
-  **Note:** Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.
- If available, find out more about a topic using the lists on the right.

Related Topics

Other topics that were added together with the current topic.

Recent Files

Files you have access to that were most recently posted to the topic feed.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To add existing topics to posts and comments:

- "Assign Topics"

To edit topic names and descriptions:

- "Edit Topics"

Groups Talking

Public groups and groups you're a member of that most recently used the topic.

Following Topics

Follow topics so you can see updates in your Chatter feed.

To follow a topic, click  **Follow** on the:

- Topic detail page
- Topics list

You can follow a maximum combined total of 500 people, topics, and records. To see how many items you're following, view the Following list on your profile.

To stop following a topic, click  next to Following. After you stop following a topic, you don't see future updates to the topic in your Chatter feed.

If your administrator disables feed tracking for topics, you can't follow new topics but you continue to follow the ones you followed when feed tracking was enabled. These topics count toward the maximum number of people, topics, and records that you can follow. To stop following a topic after your administrator disables feed tracking, you must use the Chatter REST API.

Find and Endorse People Knowledgeable about a Topic

Discover and recognize experts using the Knowledgeable People section of topic pages and the Overview tab of user profile pages.

The topic page shows the five most knowledgeable people based on their activity on the topic and recognition received for the topic. For example, Chatter considers how often people:

- Were mentioned in posts or in comments on posts with the topic
- Received likes on comments on posts with the topic
- Received endorsements for the topic

Endorsements are a strong signal of knowledge, so if someone endorses you, you're automatically included in the list of knowledgeable people.

 **Note:** Knowledgeable people are calculated and updated once a day.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

To change endorsements:

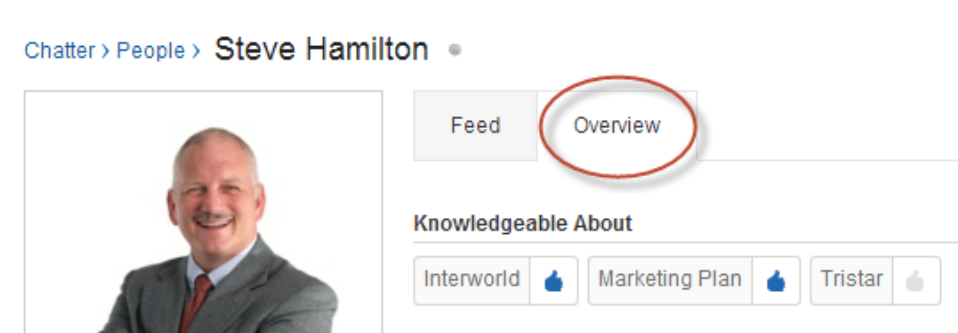

- Endorse someone you think is knowledgeable about a topic by clicking **Endorse** under the person's name. If the person you want to endorse doesn't appear in the Knowledgeable People section, click **Endorse People** to see the full list and to search for other people. (You can't endorse yourself, Chatter Free users, or customers.)
- Remove your endorsement of someone at any time by clicking  next to Endorsed under the person's name. Removing your endorsement of someone doesn't necessarily remove them from the knowledgeable people list; they might be endorsed by other people or have significant activity on the topic.

To remove yourself from the knowledgeable people list:

- Opt out by clicking **Hide me** under your name. No one can see you in the list after you hide yourself. If you change your mind, you can opt back in by clicking **Endorse People** and then **Show me** next to your name.

To see a person's full range of expertise:

- Navigate to their user profile page, and click the Overview tab. Then click topic names to see topic detail pages, or click thumbs-up icons to add or remove your endorsements.

 **Important:** If Work.com Skills are enabled, they replace knowledgeable topics on profile pages. (For Salesforce Communities users, skills replace topics only in the default community.) Self-declared skills are considered when calculating knowledge levels.

SEE ALSO:

[Skills Overview](#)

Add Topics to Posts

Add topics to posts to organize them or to increase their visibility. You can add topics to your own posts immediately after posting, or you can add topics to any posts at any time directly in the feed.

 **Note:** All topic names appear in the topics list and all topic names and descriptions are searchable, including topics used solely in private groups or on records.

 **Note:** When you add topics to posts that contain files, the topics are also added to those files.

1. In the top corner of the post, click .
2. Click **Add Topics** or **Edit Topics**.
3. In the topic editor, start typing your text. As you type, you can pick a topic from the list of suggestions, or keep typing to create your own unique topic. To add more than one topic, type a comma after each topic.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

Posts can have up to 10 topics.

4. When you're done adding topics, click **Done** or press ENTER.

The topics you add become links to the topic detail pages.

SEE ALSO:

[Add Hashtag Topics to Posts and Comments](#)

[Adding a Topic as a Favorite](#)

Add Hashtag Topics to Posts and Comments

Add topics to posts and comments to organize them or to increase their visibility.

For example, if you post that you're working on a sales presentation for your customer Universal Paper, you might want to add the hashtag topic **#Universal Paper** in your update. Anyone can click the topic to find out more information about Universal Paper and to see which people and groups are talking about Universal Paper.

 **Note:** When you add topics to posts that contain files, the topics are also added to those files.

To add a hashtag topic:

1. When writing an update, type # followed by any text. As you type, you can pick a topic from the list of suggestions, or press ENTER at any time to add a new topic that can be up to three words.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

2. Click **Share**.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To add existing topics to posts and comments:

- "Assign Topics"

To add new topics to posts and comments:

- "Create Topics"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To add existing topics to posts and comments:

- "Assign Topics"

To add new topics to posts and comments:

- "Create Topics"

The hashtag topic becomes a link to the topic detail page. The topic (without the hashtag) is also automatically added to the top-level post in the update. For example, if you include **#Universal Paper** in a comment under your coworker’s post, the topic **Universal Paper** is added to your coworker’s post.

Once you post an update, the only way to remove a hashtag topic is to delete the entire post or comment. You can, however, remove the topic from the top-level post.

SEE ALSO:

[Add Topics to Posts](#)

Add Topics to Files

Use topics to make files more visible. Topics added to feed posts are also added to any files in the post or its comments. When you search for those topics, the files are included in results.

To add topics to files posted in feeds, simply [add the topics you want to the feed post](#) on page 2869 where the file is attached. You can add regular topics or [hashtag topics](#) on page 2869. The topics are automatically added to any files attached to the post or its comments.

 **Note:** While Lightning Experience supports adding hashtag topics, searching and viewing topic details are available only in Salesforce Classic.

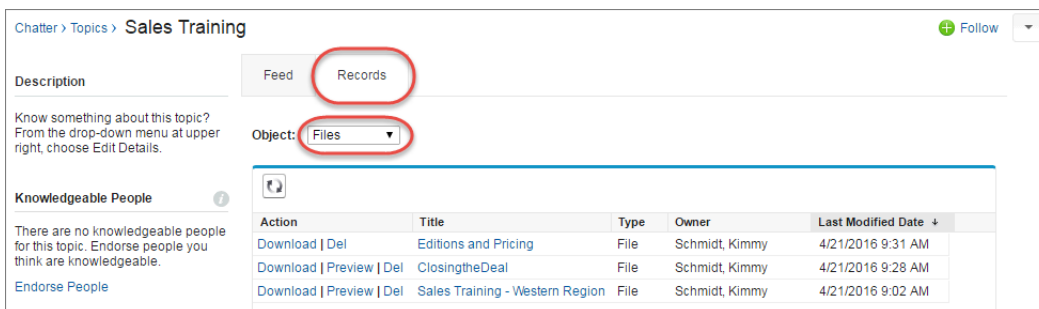

Example:

Since Kimmy added the topics *Sales Training*, *Western Region*, and *Feedback Request* to her post, these topics are also added to the file she attached. Now, her coworkers can click a topic to find other posts, files, and records associated with that topic. If the topic is associated with records other than files, go to the **Records** tab and choose **Files**. Otherwise, use the **Feeds** tab to see all posts and files for the topic.

USER PERMISSIONS

To add topics to files

- “Viewer” access to the file
- AND
- “Assign Topics” (to add existing topics)
- OR
- “Create Topics” (to add new topics)

Remove Topics from Posts

Remove a topic from a post if it no longer applies.

You can remove topics from posts in the feed, whether they're regular topics or hashtag topics. Removing topics doesn't delete them altogether; it only removes them from the post. Deleting the text of hashtags doesn't delete hashtag topics. Before you remove a topic from a post, consider whether you or someone else added it. Someone else may be tracking the update with topics you're not aware of.

1. In the top corner of the post, click .
2. Click **Edit Topics**.
3. Click  next to the topic you want removed from the post.
4. Click **Done** or press ENTER.

Removing a topic from a post removes the post from the topic feed on the topic detail page and from the feeds of any followers.

Adding a Topic as a Favorite

Add a topic as a favorite to quickly see the latest on the topics you're interested in.

1. Click a topic name to navigate to the topic detail page.
2. In the upper-right, click , and choose **Add to Favorites**.
The favorite name is the same as the topic name.

 **Tip:** When viewing a topic favorite, you can click the topic name at the top of the feed to go directly to the topic detail page.

SEE ALSO:

[Viewing All Topics](#)

Viewing the Topics People Are Talking About

The topics you're talking about appear in your Chatter profile in the Recently Talked About section. This section helps people learn which topics you're knowledgeable about or interested in. These are the topics that you and others have frequently and recently (within the last two months) added to your posts and to posts you've commented on. For privacy reasons, Recently Talked About topics don't include topics used solely in private groups or record feeds. You can see up to five topics, with the most frequently and recently added topic appearing first. If you're new to topics or if you haven't used topics in the last two months, the Recently Talked About section doesn't appear until you start using topics more frequently. Click a topic in this section to see the topic detail page.

 **Note:** If the Knowledgeable About list or Work.com Skills are enabled, those features replace the Recently Talked About section on profile pages.

View the Topics Groups Are Talking About

The topics that a group is talking about appear on the group detail page in the Recently Talked About section. This section helps people understand which topics a group is knowledgeable about or interested in. These are the topics most frequently and recently added to group posts over the last two months. You can see up to five topics, with the most frequently and recently added topic appearing first. If a group isn't using topics, the Recently Talked About section doesn't appear until the group starts using topics more frequently. Click a topic in this section to see the topic detail page.

Viewing Your Company's Trending Topics

The Trending Topics area on the Chatter tab shows the topics being discussed right now in Chatter. The more frequently people add a specific topic to their posts and comments and comment on or like posts with the same topic over a short period of time, the more likely it is to become a trending topic. For example, if your coworkers are attending the upcoming Dreamforce conference and have started discussing it in Chatter, you may see a trending topic for Dreamforce. A trending topic is not solely based on popularity and usually relates to a one-time or infrequent event that has a spike in activity, such as a conference or a project deadline. For privacy reasons, Trending Topics don't include topics used solely in private groups or record feeds.

Share Posts

Sharing a Chatter Post

Sharing lets you quickly copy a public post to your profile or a group.

You can share public Chatter posts that contain text, links, or files to your profile, with a group, or using a link to the post.

When you share a post, keep in mind:

- You can share a post to your own profile, but not to another person's profile.
- You can share the original post, including any files and attachments, but you can't share any comments or likes.
- You can comment on the shared post, but you can't edit a shared post.
- You can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.
- You can't share a post from a record feed.
- You can only share posts with a group you're a member of.
- You can share a post to a group that allows customers. However, customers and other group members can't share posts from a private group.

Sharing a Chatter Post to Your Profile

Copy a public post to your profile to share it with the people who follow you.

You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions.

1. Find the post you want to share in your Chatter feed.
2. Click **Share**.
3. Write a comment about the post or leave the comment field blank.
4. In the drop-down list, select **My profile**.
5. Click **Share**.
The shared post appears in the Chatter feed on your profile.

SEE ALSO:

[Post Visibility](#)

Sharing a Chatter Post with a Group

You can share posts with a group that you're a member of.

You can share public posts, but you can't share feed tracked items and custom feed items, such as approvals, dashboard snapshots, or case interactions. You can't share posts with archived or unlisted groups.

1. Find the post you want to share in your Chatter feed.
2. Click **Share**.
3. Type a comment about the post or leave the comment field blank.
4. In the drop-down list, select **A group**.
5. Type part of the group name and select the group from the list.
If you are sharing a post with a file, select **Viewers** to allow group members to only view the file, or select **Collaborators** to allow group members to download and modify the file.
6. Click **Share**.
The shared post appears in the feed of the group.

See your personal Chatter activity statistics, such as how many posts you've made and how many likes you've received, and check your relative Chatter influence.

[Inviting People to Join Chatter](#)

People Overview

The People tab and the People list on the Chatter tab display a list of the users in your organization.

- Click a person's name or photo to view his or her profile.
- Click **Follow** to see a person's updates in the Chatter feed. You can't follow [customers](#).
- Click **Following** to stop seeing a person's updates in the Chatter feed.
- Click a column header to sort the list:
 - **Name** sorts alphabetically by name. By default, the list is sorted alphabetically, in ascending order.
 - **Following** sorts based on who you're following and not following.
- Search for users by typing characters of a first or last name in the search box at the top of the page. The list automatically filters based on what you type.
- At the top of the list, click a letter to list everyone whose last name begins with that letter.
- Your organization's size determines what you see in the people list. For example, in the largest organizations, we don't display any users until you start searching for a person's name. We count all Salesforce user license types when calculating the approximate number of users, including internal users, Communities users, and Chatter users.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

Approximate number of users	Defaults to view	All People filter defaults to
25 or fewer	All People	Everyone in the organization
26 to 25,000	Recently Viewed People	People whose profiles you recently viewed
More than 25,000	Recently Viewed People	No one until you start searching

- [Invite people](#) to join your Chatter network. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.
- View the people that Chatter recommends you follow. Click **More** in the Recommended People section to view all of your recommendations. If no recommendations appear, then you're already following all the recommended people.

Chatter, Profile, People, Groups, and Files tabs are available by default in the Chatter app. Select the Chatter app from the app menu in the top right corner of any page. If your administrator has added these tabs to other apps, you see the tabs in those apps unless you previously customized your display. In that case, add the tabs to those apps.

Profile Best Practices

When using profiles, consider these tips:

- Information in the About Me section is searchable and makes you more visible to others.
- Your posts display in your Feed tab and the feeds of people following you. To delete your posts from feeds, hover over the post and click .
- To change your email address in your contact information, you must click the link in the confirmation email sent to your new email address.
- Not all users have profiles. This includes portal users and the Connection User in organizations using Salesforce to Salesforce.

Using the Following and Followers Lists

View the Following and Followers lists on your profile to see who, what, and how many items you're following, and who is following you. If you're not following anyone, click **Find people to follow** in the Following list to view the People list and start following people. You can also view the Following and Followers lists on other people's profiles.

 **Note:** When your administrator turns on Chatter, you automatically follow some users and records in your organization.

In either list, click **Show All** to view the full list in alphabetical order.

- Use the **Next** and **Previous** links to see more of the list.
- Optionally filter the Following list by people or objects, for example, accounts or files.
- In your Following list, click  to stop following a person or record.
- In another person's Following list, click  **Follow** to follow a person or record.
- In any Followers list, click  **Follow** to follow a person, or  to stop following them.
- Click **Done** to close the window.

People Recommendations

Chatter recommends people in your organization that you might want to follow based on similar interests. For example, Chatter recommends people who:

- Follow the same people as you.
- Are in your management hierarchy, such as your manager, people who report to your manager, and people who report to you.

Salesforce uses the `Manager` field on your personal information page to determine these recommendations. If this field is blank, Chatter won't recommend people based on your management hierarchy. Only your Salesforce administrator can edit the `Manager` field.

- Are popular, which means they have many followers.
- Are new to Chatter.
- Are interested in the same records as you. For example, someone who has looked at or edited an account that you've recently viewed.
- Are often followed together with people you already follow. For example, if you follow Madison Rigsby, you get a recommendation for Suzanne Powell if many people who follow Madison also follow Suzanne.

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you're already following all the recommended people.

SEE ALSO:

Give Thanks to Your Coworkers

Recognize your coworkers with badges and post your thanks directly to their Chatter feed.

-  **Note:** The Chatter Free license has limited functionality with Thanks features. Rewards features require a Work.com license. This includes giving, creating, or receiving badges tied to rewards.

Thank someone if they've done a great job or to recognize an achievement.

[Walk Through It: Give Thanks in Chatter](#)

1. From the Chatter publisher, click **Thanks**.
If **Thanks** isn't displayed, click **More** and select **Thanks** from the publisher's drop-down menu.
2. Type the name of the person you want to thank.
Currently, you can only thank one person at a time, but you can mention other people in your post's message.
3. Select **Change Badge** to select a different badge for your post or keep the default badge.
You can choose from twelve pre-defined badges. Select the badge image to see more information about the badge.
4. Type a message for the person you're thanking.
5. Select your audience.
 - **My Followers** to post to all your followers

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** that have Chatter enabled.

- **A Group** to post to a specific group. Search for the group and select the group from the list. The person you're thanking is @mentioned at the beginning of the post's message. When you post to a private group, only the group's members can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient's profile.

6. Click **Share**.

Your Thanks post appears in your feed and the feed of the person you're thanking. If you're posting to a public group or a record page, the post appears on the group or record feed and their profile. If you're posting to a private group, only members of the private group can see your post to the group. However, the badge will also appear publicly on the Recognition tab of the recipient's profile.

Files Owned Lists on Profile Pages

The Files Owned list on a person's profile shows the files that person most recently attached to a Chatter post.

The list includes files that the profile owner attached to a post on the profile, a group, or record page, or uploaded to Salesforce CRM Content libraries. Hover to see available options or click the file name to go to the file detail page.

Click **Show All** to see a list of all the files the profile owner attached and uploaded. The list doesn't include files you don't have access to, documents from the Documents tab, and attachments from the Notes and Attachments related list. On this list you can:

- Upload private files or share files with people, groups, or via a link
- Preview a file, if a preview is available
- Follow a file to receive updates in your feed
- Click the file name to view the file detail page

SEE ALSO:

[Filter Your Files List](#)

Chatter Activity and Influence

See your personal Chatter activity statistics, such as how many posts you've made and how many likes you've received, and check your relative Chatter influence.

Chatter activity statistics include how many posts and comments you've made, how many comments you've received, and how many people liked your posts and comments. Chatter influence shows how your activity stacks up to other people's.

- Top Influencers lead collaboration efforts by regularly sharing essential content.
- Active Influencers encourage others to get involved and share knowledge.
- Observers are quiet participants or just getting started in Chatter.

You can see your Chatter activity statistics and influence on your profile under your photo. You can also see your coworkers' Chatter activity and influence on their profiles. When viewing a profile, hover over  under the profile photo for details about how that person is uniquely influential.

Inviting People to Join Chatter

You can invite people from your company that don't have Salesforce licenses to use Chatter. Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

To invite people to Chatter:

1. Click **Invite People to Chatter** on the People page or **Invite Coworkers!** on the Chatter page.

 **Note:** You can only invite people with email addresses in your company's domains. Portal users can't send invitations.

2. To send invitations from Chatter, enter email addresses and click **Send**.
3. To send invitations using your own email account, click **send your own email invitation**. If you have a default email client set, an email containing an invitation link opens in your mail program. Otherwise, you see an invitation link that you can copy and paste into an email.

You can also invite coworkers to join a public group even if they don't use Chatter yet. Additionally, owners and managers of private groups can send invitations. If customer invitations are enabled, owners and managers can also invite [customers](#). When someone accepts an invitation to join the group, they join Chatter as well.

1. Click **Groups** and click on a group name.
2. In the Members section on the group detail page, click **Invite People**.

If you are the group owner or manager, you can also click **Add/Remove Members**, then click **Invite them to Salesforce Chatter!**

3. Enter email addresses and click **Send**.

 **Note:** If a user doesn't accept the invitation within the first day, Chatter sends an email reminder the second day. If the user doesn't accept that invitation, Chatter sends another reminder the following day.

A user has up to 60 days to accept an invitation to join Chatter. If during that time, an administrator deselects **Allow Invitations** or removes the user's domain from the list, the user can't accept the invitation.

When delegated authentication single sign-on is enabled in your organization, invited users bypass the password registration page. If their username already exists, they won't be able to accept the invitation.

Moderate Chatter Free Users

Chatter Moderators

A moderator is a Chatter user with some additional privileges such as:

- [Activate or deactivate Chatter Free users](#)
- [Assign a Chatter Free user as moderator or take the privilege away](#)
- Access to details about all users in your org
- Delete posts and comments that they can see

You can tell if someone is a moderator by the special banner on their profile picture.

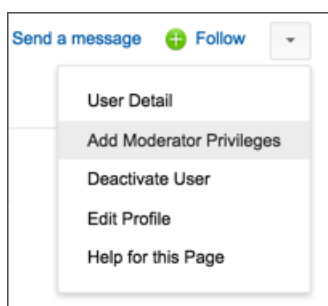

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

Assign Moderator Privileges to Chatter Free Users

As a moderator, you can assign moderator privileges to Chatter Free users in your organization. You can also remove them if needed.

1. Go to the person's profile page by clicking their name in the People tab or on a feed.
2. On the profile page, you can take these actions from the user action menu.

- If you want the person to be a moderator, select **Assign Moderator Privileges**.
- If the person is a moderator and you want to revoke those privileges, select **Remove Moderator Privileges**.

- "Moderate Chatter"

Automatically Follow Records You Create

When you follow records you create, updates are sent to your Chatter feed when you or someone else changes a tracked field on those records.

By default, you don't automatically follow the records you create. If you want to automatically follow the records you create, enable auto-follow in your Chatter Settings.

1. From your personal settings, enter *My Feeds* in the **Quick Find** box, then select **My Feeds**.
2. Select **Automatically follow records I create**.
3. Click **Save**.

Consider the following tips around auto-following records:

- When you create a child record, the owner of the parent record becomes the owner of the child record by default. So you don't automatically follow the child record, unless you're the owner of the parent record.
- The **Account Owner** field of a record is updated to change the account owner. The new account owner only follows the account automatically, if the **Account Owner** field is feed-tracked and the new account owner has auto-follow enabled.
- If a workflow changes the **Account Owner** field while the record is created, the user who created the record doesn't automatically follow the account.

Consider the following scenario. You are creating a record. Saving the record starts a workflow that immediately reassigns the **Account Owner** field to another user and then saves the record. Meaning, the workflow changes the **Account Owner** field before the record is saved. In this case, you don't follow the record automatically, because you never were the record owner, even though you technically created the record.

SEE ALSO:

[Viewing Record Feeds](#)

[Record Recommendations](#)

[Personalize Your Salesforce Experience](#)

Viewing Record Feeds

View the Chatter feed associated with a record you follow to see updates about the record.

Record feeds allow you to track information for records you have access to. On the record detail page, click **Show Feed** to display the record feed above the account details.

- 📌 **Note:** Access is all-important. For example, let's say you reassign a record and then realize it needs an update. Often, you can open and update the record. But if, after the reassignment, you no longer have access, then you won't be able to see or update the record.

In the record feed, you can

- View posts, comments, and tracked field changes.
- Write an update about the record and share it with other people who follow the record.

Updates on the record detail page also appear on the Chatter page of people who follow the record. Anyone who has access to the records can see the update on the All Company feed.

- See who is following the record.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions.

USER PERMISSIONS

To view a record:

- "Read" on the record

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Search the [record feed](#) ().
 **Note:** Record field changes in the feed aren't included in search results.

Can I create a custom report for records I'm following?

Currently, you can't customize a report based on records you're following in Chatter.

SEE ALSO:

[The People and Records You Auto-Follow Initially](#)

Can other people follow records I own?

Yes, provided that they can already see the record. People can only follow records they can see, and by extension, can only see updates to records they can see.

SEE ALSO:

[Record Recommendations](#)

Record Recommendations

Following records helps keep you up-to-date on important changes to accounts, contacts, opportunities, and more. Chatter recommends records that you've viewed or edited, records that you own (and aren't already following), and parent accounts of records that you're following.

Chatter won't recommend records that your Salesforce administrator has disabled feed tracking for. Only opportunities, accounts, leads, contacts, and articles are included in record recommendations.

To see an expanded list of your recommendations, click **More** in the Recommendations section. To see your record recommendations by object, click the object in the side filters. For example, click **Accounts** to view only your account recommendations.

If no recommendations appear, then you're already following all the recommended records.

SEE ALSO:

[Viewing Record Feeds](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Viewing Chatter Feeds on List Views

Switch to an object's Chatter feed directly from a list view to see updates for the records included in the list view.

If Chatter is enabled for your organization, Chatter feeds on list views are available for most feed-tracked objects. Some feed-tracked objects don't have a Chatter feed associated with their list view. Currently, you can view Chatter feeds on list views for opportunities, accounts, cases, leads, campaigns, contacts, and custom objects.

- Click  **Chatter** on a standard or custom object list view to see a Chatter feed with updates from the last 30 days for the records included in the list view.
If drag-and-drop scheduling on list views is enabled, you won't see Chatter feeds on the list views for accounts, contacts, or leads.
- Click **List** to display the list view again.

SEE ALSO:

[Viewing Record Feeds](#)

Adding a List View as a Chatter Favorite

Add a list view as a Chatter favorite to monitor key business processes directly from your Chatter tab.

1. Open an existing list view or create a list view for a set of records, like for example accounts, opportunities, or leads.
2. Click  **Feed** in the top-right corner to see the Chatter updates for the list items.
3. Click **Add to Favorites**.
The favorite name on the Chatter tab is the same as the list view name.

Dashboards and Dashboard Components

Following Dashboard Components

If feed tracking is enabled for dashboards, you can view updates and field changes in the Chatter feed. You can also follow dashboards and certain dashboard components.

Following components isn't supported for dynamic dashboards.

Only unfiltered data is used to generate alerts. This prevents alerts being sent out (incorrectly) because a component's value appeared to cross a breakpoint as a result of filtering.

If you don't see feeds, ask your administrator to enable feed tracking for dashboards.

For example, to receive alerts when total sales for a gauge fall below a certain amount, set conditional highlighting on that component, then follow it.

- Hover over a component to display the  menu. To clear the hover menu, click an empty part of the screen.
- Click **Follow this Component**.

To stop following a component, click  and select **Following**.

SEE ALSO:

[Viewing Record Feeds](#)

About Posting Snapshots to User and Group Feeds

When you post a component snapshot to a Chatter feed, consider who you would like to share and comment on the component.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed. Post a component snapshot to a user or group feed to share and comment on that component. For example, post a snapshot of this month's sales to your team.

Each snapshot has a "Viewing As" label. This is the name of the running user whose dashboard component you're viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they're taken to your filtered view of the dashboard if the filters are still valid. If the filters aren't valid, they see the unfiltered dashboard.

If you don't see the option to post a snapshot, talk to your administrator about enabling dashboard component snapshots.

-  **Important:** Posting a snapshot to a user or group feed makes it potentially visible to the entire organization:
- Posting to a user feed makes the snapshot public. Anyone who views that user's profile can see it.
 - Posting to a public group makes the snapshot public. Anyone who views your profile or the group feed can see it.
 - Posting to a private group shows the snapshot to all group members.

People can see it whether they have access to the dashboard or not. Make sure the component doesn't contain sensitive information!

Posting Snapshots to Chatter

Post a snapshot of a dashboard component to a Chatter feed to help other users follow changes in the data.

A snapshot is a static image of a dashboard component at a specific point in time posted to a Chatter feed.

- Post a component snapshot to its dashboard feed to share information with everyone following the dashboard. For example, post a snapshot of a regional sales chart to let your team know that sales are down in the Midwest.
- Post a component snapshot to a user or group feed to spark comment or action from that user or group.

Each snapshot has a “Viewing As” label. This is the name of the running user whose dashboard component you’re viewing.

You can also post snapshots of filtered components (except Visualforce or s-control components). When viewers click the snapshot title in the feed, they’re taken to your filtered view of the dashboard if the filters are still valid. If the filters aren’t valid, they see the unfiltered dashboard.

If you don’t see feeds, ask your administrator to enable feed tracking for dashboards.

1. Hover over a component to display the  menu.
To clear the hover menu, click an empty part of the screen.
2. Choose where you want your snapshot to appear.
 - a. To show it in a dashboard, click **Post Snapshot to Dashboard Feed**.
 - b. To show it to a user or group, click **Post Snapshot to User or Group Feed**.
3. Write a comment in the text box and click **OK**. If you’re posting a filtered component, you may want to mention that in your comment. The snapshot and comment immediately appear in the dashboard feed.

 **Note:** Snapshot images display in feeds for four months. After four months, only the comments remain.

Collaborate in Chatter Groups

Use public, private, or unlisted Chatter groups to collaborate with specific people in your company.

Chatter Groups

Chatter groups let you collaborate with specific people. For example, if you're working on a team project, you can create a group for your team to share project-related files and information.

Unlisted Groups Overview

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the “Manage Unlisted Groups” permission can access unlisted groups in list views, feeds, and search results.

Broadcast Groups

Broadcast groups are a special type of public, private or unlisted group where only group owners and managers can create new posts. Group members can comment on the posts created by the group owner or manager.

Using the Chatter Groups Page

The Groups page displays a list of the Chatter groups in your company.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view dashboards:

- “Run Reports” AND access to dashboard folder

[Join or Leave Groups](#)

Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

Chatter Groups

Chatter groups let you collaborate with specific people. For example, if you're working on a team project, you can create a group for your team to share project-related files and information.

You can join up to 300 groups, and your company can have a total of 30,000 groups. Chatter groups have different levels of access:

- **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
- **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's [owner or managers](#). Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
- **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
- Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.

After you allow customers in a group, you can't change the group access level.

Additionally, if your administrator has enabled the feature, some groups may be archived. When a group is archived, users can't create new posts but group data is retained for reference.

SEE ALSO:

- [What Your Chatter Group Role Allows You To Do](#)
- [About Chatter Customers in Private Groups](#)

Unlisted Groups Overview

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the "Manage Unlisted Groups" permission can access unlisted groups in list views, feeds, and search results.

Unlisted groups are similar to private groups, in that, only members can view an unlisted group's detail page, feed, or files. However, unlisted groups provide more privacy compared to private groups.

- Unlisted groups don't display in list views, feeds, and search results for nonmembers. Only members and users with the "Manage Unlisted Groups" permission can find and access unlisted groups.
- Nonmembers can't visit the group detail page.

(With private groups, nonmembers can see a truncated version of the detail page, which shows the name, description, and member list, but not the feed or files.)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- You can convert unlisted groups to public or private groups, but not the other way around.
- Only group owners, group managers, and users with the “Manage Unlisted Groups” permission can add group members. Users can’t ask to join them.
- Users can’t see unlisted groups on other user profiles unless they have access to the group.
- Files shared in unlisted groups are visible only to the members of the unlisted group. If the file is shared outside the unlisted group, then other users with permissions can update the file.
- Even users with the “Modify All Data” or “View All Data” permissions can’t access an unlisted group or its files unless they’re members. They also can’t change group settings unless they own or manage the group.
- Only users with the “Manage Unlisted Groups” permission can access or modify unlisted groups and its files and feed content without membership.

Limitations

If you decide to create an unlisted group, make sure that you consider these limitations.

- Custom pages or third-party applications integrated with Salesforce could expose unlisted group information to users who don’t have access via the Salesforce UI. Check in with your administrator about who can access information in unlisted groups in your organization.
- You can’t use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn’t created, and the link won’t work.
- You can’t mention unlisted groups in posts or comments.

SEE ALSO:

[Enable Unlisted Chatter Groups](#)

[Unlisted Group Limitations](#)

Broadcast Groups

Broadcast groups are a special type of public, private or unlisted group where only group owners and managers can create new posts. Group members can comment on the posts created by the group owner or manager.

By restricting the ability to post, group owners and managers can keep group discussions focused and relevant by cutting down noise from off-topic posts. Public, private, and unlisted groups support this feature.

To set a group to broadcast mode, select **Broadcast Only** in the group settings.

 **Example:** Creating broadcast groups are ideal when one person or a fixed set of individuals regularly needs to communicate or share information with a large group of people. Some examples include:

- Organization-wide updates from the executive leadership in the company
- Policy changes from your company’s HR department
- Event updates from the organizer of large events or company conferences
- Important action alerts from key IT personnel, including their awesome Salesforce administrator

Using the Chatter Groups Page

The Groups page displays a list of the Chatter groups in your company.

Click **Groups** on the sidebar of the Chatter page to display the list of Chatter groups. On the Groups page you can

Create a new group

Click **New Group** to access the New Group page and create your group.

Filter and sort the groups list

Use the following filters to filter your groups.

- **Recently Viewed** shows the groups you recently looked at, starting with the group you viewed last
- **My Groups** shows the groups you belong to, own, or manage
- **Active Groups** shows the active groups in your company

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- **My Archived Groups** shows the archived groups you belong to, own, or manage.

Click a column header to sort the list. The Group column sorts by group name; the Last Activity column sorts by the date of the last post or comment on a group; the Membership column sorts based on your membership status.

Search for a group

Search for groups by typing two or more letters of a group name or description in the **Find Groups** box. The list automatically filters based on what you type.

View a group

Click a group name to view the group. You can view all groups, but you'll only see updates and files for public groups, and for private groups you belong to. Groups that [allow customers](#) say (With Customers).

Join a public group or ask to join a private group

Click **Join** to join a public group. For private groups, click **Ask to Join** to email a request to join to the group's owner and managers. Users with the "Modify All Data" permission can directly join private groups, and therefore see **Join** for private groups.

Leave a group or withdraw a request to join a group

Click  to leave a group or to withdraw a request to join a group.

View the group owner's profile

Click a group owner's name to see his or her [profile](#).

Get a group recommendation

View the groups that Chatter recommends you join based on the group's popularity and the number of connections you have in the group in the Recommendations section. Click **More** to see the full list. If you don't see recommendations, you already belong to all the recommended groups.

SEE ALSO:

[Group Files Lists](#)

Join or Leave Groups

Join groups to collaborate with other people on projects or common areas of interest. Share project-related files and information with the group.

1. Go to group's detail page.
2. To join a public group, click **Join** or **Join Group**. To join a private group, click **Ask to Join**. Your request is sent to the private group's owner and managers, who accept or decline your request.

You can join up to 300 groups. All groups count toward this limit, except archived groups. For example, if you're a member of 300 groups, of which 10 are archived, you can join 10 more groups.

To leave a group you joined or withdraw your request to join a private group, go to the group detail page and click  or **Leave Group**. If you don't see these options, ask your Salesforce admin to adjust the page layout.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Create and Manage Groups

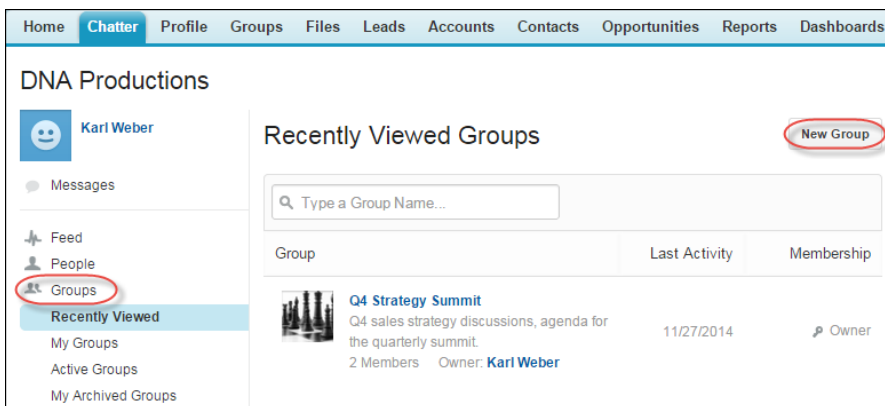

Create Chatter Groups

Create public, private, and unlisted Chatter groups to collaborate with your teams and work together on projects.

1. Navigate to the list of groups.
 - In Salesforce Classic, click the **Groups** tab.
 - In Lightning Experience, click  in the navigation menu.
2. To the upper-right, click **New Group**, and enter a group name and description.

 **Note:** Group names must be unique across public and private groups. Unlisted groups don't require unique names.

If Communities is enabled, public and private group names must be unique within the community.

3. Select an access level:
 - **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
 - **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's [owner or managers](#). Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
 - **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
 - Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo.
After you allow customers in a group, you can't change the group access level.
4. Optionally, if your administrator has enabled group archiving, change the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.
5. Click **Save**.

"To create groups"

- "Create and Own New Chatter Groups"

 **Note:** You **own** groups you create. To assign a new owner, finish creating the group, then [edit the group settings](#).

SEE ALSO:

[Can I change a group's access level, for example, to make a private group public?](#)

Edit Group Settings

Edit the group settings to change the owner, modify archiving settings, group access level, and delete the group.

You can edit settings for Chatter groups you own or manage.

1. Click **Group Settings** on the group detail page in the Salesforce Classic. In the Lightning Experience, click **Edit Group** from the buttons in the group header.
2. Optionally, edit the group name and description.
3. Optionally, type a name or click the lookup icon to search the group members to assign a new **Owner**. Only the current owner or people with the "Modify All Data" permission can change the owner, and you must choose the owner from existing members. Customers can't own groups.
4. Optionally, if your administrator has enabled archiving for groups, edit the automatic archiving settings for the group. Disable automatic archiving only if a group must remain active at all times, despite extended periods of inactivity.
5. Optionally, change the access level for the group. For example, you can convert an unlisted group to a public or private group if you want to open it up to a wider audience.

 **Note:** If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can't be converted to other group types.

- **Public:** Anyone can see and add posts, comments, and files. Anyone can join a public group.
- **Private:** Only group members can see and add posts, comments, and files. People must ask to join or be added by the group's **owner or managers**. Users with the "Modify All Data" and "View All Data" permission can see group posts, updates, and files across the organization. Users with the "Manage All Data" permission can also join private groups directly and change group settings.
- **Unlisted:** Only group members and users with the "Manage Unlisted Groups" permission can see and add posts, comments, and files. People cannot ask to join and must be invited by the group's owner or managers. Unlisted groups offer [more privacy](#) and nonmembers cannot see or access unlisted groups in list views, feeds, and in search results. Unlisted groups aren't available by default; your administrator must enable them for your organization.
- Optionally, select **Allow Customers**. The group owner and managers can invite [customers](#) to join a private or unlisted group. You can easily identify groups with customers by the orange upper left corner of the group photo. After you allow customers in a group, you can't change the group access level.

6. Click **Save**.

If you have the necessary permissions, you can also:

- [Archive the group](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To edit public or private Chatter groups:

- Group owner or group manager role

OR

"Modify All Data" to edit public and private groups

OR

"Manage Unlisted Groups" to edit unlisted groups

- [Delete the group.](#)

SEE ALSO:

[Add and Remove Chatter Group Members](#)

Can I change a group's access level, for example, to make a private group public?

If you're a group owner or manager, you can change groups from private to public, or from public to private by [editing the group settings](#). If you change a private group to public, updates and files are visible to all users, all pending requests to join the group are accepted, and anyone can join the group. Private groups with customers can't be converted to other group types. You can't change the group access level for private groups that allow customers.

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

Add and Remove Chatter Group Members

Own or manage a Chatter group? Here's how you add or remove group members.

1. In Salesforce Classic, on a group detail page, click **Add/Remove Members**. In Lightning Experience, click **Add Member** from the group highlights panel (your administrator must add this quick action to the group publisher).
2. Start typing the name of the user you want to add or remove to filter the list of users.
3. Click **Add** to add a member, or **x** to remove a member. For people who have requested to join, click **Accept** to accept the request, or **x** to decline.
4. Click **Done** when you're finished.

SEE ALSO:

[View Chatter Group Members](#)

Accept or Decline Private Group Requests

z

As the owner or manager of a private Chatter group, you can accept or decline requests to join the group. Additionally, users with the "Modify All Data" permission can view and manage requests for all public and private groups, and users with "Manage Unlisted Groups" can manage group membership requests for all unlisted groups in the organization.

1. View the list of requests by doing one of the following:
 - On a group detail page, click the **Request** link, for example, **3 Requests**
 - On a group detail page, click **Add/Remove Members** and then click the **Requests** filter, or scan for requests in the **Everyone** filter
 - Click the link provided in the email request
2. Accept or decline the requests.

Note: An email is sent to each person to tell them that their request was accepted or declined.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Click **Accept** to accept. If there are more than two requests, you can accept them all by clicking **Accept x of y**, for example, **Accept 3 of 3**.
- Click  to decline. Optionally enter a message that will be included with your decline email and click **Send**. If you change your mind, you can click **Cancel** to go back.

3. Click **Done** to close the window.

If you make a private group public, any pending requests are automatically accepted.

Group Roles

What Your Chatter Group Role Allows You To Do

This table describes the actions that can be performed by members, managers, and owners of public and private Chatter groups. [Customers](#) can be group members and managers, but not owners.

Action	Owner	Manager	Member
Post, comment, and search group feeds	Yes	Yes	Yes
Add and remove records in groups (if configured)	Yes	Yes	Yes
Post group announcements	Yes	Yes	
Delete posts and comments	Yes	Yes	
Add and remove members	Yes	Yes	
Change member roles	Yes	Yes	
Edit group settings	Yes	Yes	
Edit the Information field	Yes	Yes	
Archive groups and activate archived groups	Yes	Yes	
Change group owner	Yes		
Delete group	Yes

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

USER PERMISSIONS

“To create groups”

- “Create and Own New Chatter Groups”

Users with the “Modify All Data” permission can perform all actions on all private and public groups, and users with the “View All Data” permission can view details of all private and public groups, regardless of membership.

Additionally, in unlisted groups:

- Users with the “Manage Unlisted Groups” permission can find and perform all of these actions in unlisted groups, even if they aren’t members.
- Users with the “Modify All Data” or “View All Data” permission can only find and access unlisted groups if they are members. Unlike public and private groups, users with the “Modify All Data” permission can’t perform group owner actions in unlisted groups. They can perform group manager actions if that role is assigned to them in the unlisted group.

SEE ALSO:

[What happens when the owner of a Chatter group is deactivated?](#)

Change Chatter Group Roles

To change Chatter group [roles](#) for groups you own or manage:

1. Click **Change Roles** on a group detail page.
2. To search for members, start typing in the search box. Optionally sort the list by toggling between **Managers** and **All Members**.
3. Select the Manager checkbox for people you want to be managers. If a customer is selected as a manager, they will be able to see people who ask to join the group, even if they aren’t in other common groups, and will be able to approve requests.

 **Note:** To [change the group owner](#), you must own the group. Users with the “Modify All Data” permission can also change the owner in public and private groups, and users with the “Manage Unlisted Groups” permission can do this for unlisted groups. Click the **Group Settings** link next to the current owner to assign a new owner.

4. Click **Done**.

SEE ALSO:

[What happens when the owner of a Chatter group is deactivated?](#)

What happens when the owner of a Chatter group is deactivated?

The deactivated user still owns the group, but a user with the “Modify All Data” permission can assign a new owner for a public or private group. In the case of unlisted groups, a user with the “Manage Unlisted Groups” permission can assign a new owner.

Archiving and Activating Chatter Groups

Archived Chatter Groups

When a Chatter group is archived, group members can no longer make posts or share files with the group. Previous posts, comments, and files remain available in the group for future reference.

Users can still comment on existing posts, mention people, and search the feed in archived groups. Users can also join and leave archived groups, create reports that include archived groups, and use global search to find archived groups and their content. Group owners and group managers can [archive](#) groups, [activate](#) them, and [enable and disable automatic archiving](#) for groups at any time. Users with the “Modify All Data” permission can perform these actions on public and private groups in their organization, while users with the “Manage Unlisted Groups” permission can perform these actions on unlisted groups.

Archived groups allow users to focus on the active groups in your organization:

- Archived groups don't count toward a user's group membership limits.
- Posts from archived groups don't display in Chatter feeds, unless someone adds a new comment. Posts with new comments display in the All Company feed and the feed of each group member.
- File and feed sharing is limited to active groups only, making group searches more efficient.
- Archived groups display only in My Archived Groups and not in the Active Groups list.

Example: Archiving the group is useful for groups that have little or no feed activity, but contain useful information that you want to retain. Some examples include:

- A group that a sales team created while pursuing a deal. Though there probably won't be much group activity after lead conversion, the sales team can still access important information about the customer.
- A group used for planning a company event. It can be archived after the event to reuse vendor information and planning discussions.
- A service desk type group used to track key issues for a major deployment for a customer. Archiving it after deployment issues are ironed out still gives support agents access to relevant information for future troubleshooting.
- When a legacy group is replaced by a new group that serves the same or broader purpose, the legacy group can be archived to redirect traffic to the new group.
- Team groups can be archived when a team changes or team members leave the company, while preserving team discussions for future reference.

Turning off automatic archiving is useful for groups that aren't updated on a regular basis but contain important information, such as a group used for company-wide announcements. This way groups without activity for more than 90 days won't get archived and users won't miss any important posts.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Archive Chatter Groups

Archive a group manually or edit automatic archiving settings.

Feed activity in groups is reviewed on a weekly basis. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. Mentioning a group doesn't count as feed activity and doesn't delay group archiving. Group owners, group managers, and users with the "Modify All Data" permission can manually archive or edit automatic archiving settings for groups at any time.

1. Click **Group Settings** on the group detail page in the Salesforce Classic. In the Lightning Experience, click **Edit Group** from the buttons in the group header.
2. Configure archiving for the group in one of two ways:
 - Click **Archive** to archive the group right away.
 - Select **Archive this group if there are no posts or comments for 90 days** and click **Save** to set up automatic archiving.

After you archive a group:

- The publisher on the group page is hidden and members can't create new posts or share files in the group.
- The group no longer appears in the Active Groups filter on the Groups tab.
- Previous group posts and comments no longer appear in the Chatter feed, unless someone adds a new comment. Posts with new comments display in the All Company feed and the feed of each group member.

Use the **My Archived Groups** filter in the Groups list to find the archived groups that you own, manage, or belong to. You can also use global search to find archived groups or associated content. Note that archived groups don't count toward your group membership limit.

Note:

- Group members don't receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- If your administrator disables archiving for groups, you can't archive groups or edit automatic archiving settings. You can activate archived groups at any time, even if the feature is disabled.

SEE ALSO:

[Archived Chatter Groups](#)

[Activate Archived Chatter Groups](#)

Activate Archived Chatter Groups

Group owners, group managers, and users with the "Modify All Data" permission can activate an archived Chatter group from the group detail page.

1. Navigate to the group you want to activate.
 - Use the **My Archived Groups** filter on the Groups list view to find the archived groups you own, manage, or belong to.
 - To find other archived groups, use global search, run a report, or ask your administrator for help.
2. Click **Activate** on the group detail page. You can also activate an archived group from the group settings page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

After a group is activated, the group detail page displays with the publisher enabled so members can create new posts and share files with the group.

 **Note:**

- Group members don't receive email notifications when a Chatter group they own, manage, or belong to is archived or activated.
- You can only activate one group at a time. To activate multiple groups at once, use the Salesforce API.

SEE ALSO:

[Archived Chatter Groups](#)

[Archive Chatter Groups](#)

Delete Chatter Groups

Only the group owner and users with the "Modify All Data" permission can delete a group.

In Lightning Experience, you can delete the group by clicking **Delete Group** from the buttons in the group highlights panel.

In Salesforce Classic:

1. Edit the group settings. Click **Group Settings** on a group detail page.
2. Click **Delete**.
3. Click **OK**.

Deleting a group permanently deletes the updates of the group, including any links posted to the group. When you delete a group that includes files, you're not deleting the files, just the references to the files. The files remain in their original location, such as in each file owner's **Owned by Me**. If the files were posted to the group and not shared in other locations, deleting the group also removes the references to the files. The files remain in the file owner's **Owned by Me**, where they're private but can be shared again later.

 **Tip:** To retain group data for future reference, [archive groups](#) instead of deleting them.

Working in Chatter Groups

Get Familiar with Your Chatter Group

Click a group's name in a feed, in the Groups list, or on someone's profile to see the group's updates, files, and group members.

How much detail you see and what you can do on a group's page depends on the type of group, whether you're a member, owner or manager of the group, and on your group role.

Non-Members of Public Groups

If you're viewing the group detail page of a public group you're not a member of, you can

Post and comment

Type an update above the feed or comment below a post in the feed and click **Share**.

Join the group

Click **Join** to join the group.

View group description and information

The group description and information display in a separate column next to the feed.

View the group's members

The Group Members section shows the group's current members, including any customers invited to the group.

View, download, and search files posted to the group

Files posted to the group feed or shared with the group appear in the Group Files section.

View the topics the group is talking about

The group's topics display below posts in the group feed.

Search for group information

Click  above the feed to search for information in the group.

Non-Members of Private Groups

If you're viewing the group detail page of a private group you're not a member of, you can only

Ask to join the group

Click **Ask to Join** to send an email to the owner and managers of a private group requesting to join.

View the group's picture and description

The group description displays below the group photo.

View the group's members

The Group Members section shows the group's current members, including any customers invited to the group.

Nonmembers of Unlisted Groups

If you're not a member of an unlisted group, you can't view the group detail page.

Group Members of Public, Private, and Unlisted Groups

When you're a member of a public, private, or unlisted group, you can also

EDITIONS

Change Email Settings and In-App Notifications for Salesforce1 Mobile Apps

In Salesforce Classic, click **Email Me...** to be emailed about activity in the group, either every time someone posts, daily, or weekly. Selecting **Every Post** also turns on in-app notifications for groups in the Salesforce1 mobile apps. To stop receiving email and mobile notifications for the group's activity, click **Turn Off Group Email**. Click **Email Settings** to modify all your Chatter email settings.

In Lightning Experience, click **Email Notifications** from the group highlights panel to modify your group email settings.

Invite People

If your administrator has enabled invitations, click **Invite People** to [invite people not using Chatter](#) to join the group. For private groups, only the group manager, group owner, or users with the "Modify All Data" permission can invite people. For unlisted groups, only the group manager, group owner, or users with the "Manage Unlisted Groups" permission can invite people.

Leave the group

Click , or to withdraw a request to join a private group. To leave a group you own, you must first [assign a new owner](#).

Group Owners and Group Managers

When you're the owner or manager of a public, private, or unlisted group, you can also

[Add or remove group members](#)

[Change the group photo](#)

[Edit group settings](#)

Edit the Information section

Click **Add Information** or  in the Information section to add additional information for the group's members. You can customize this section, including its title, to say anything you want.

Edit the Description section

Click **Add Description** or  in the Description section to add a description of the group.

[Change member roles](#)

- To close the window, click **Done**.

SEE ALSO:

[What Your Chatter Group Role Allows You To Do](#)

View Chatter Group Members

The Members section on a Chatter group page shows all of the members of a group, including customers.

1. Click **Show All** in the Members section to view the full group member list in alphabetical order. In the Members window, you can:
 - Filter the list to see all members, managers, or the owner
 - Use the **Next** and **Previous** links to see more of the list
 - Search using the `Find Members` search box
 - Click **Follow** or  next to a person's name to start or stop following them. You can't follow customers.
2. Click **Done** to close the window.

Chatter Group Recommendations

Chatter recommends groups that you might want to join based on:

- The popularity of the group determined by the number of members.
- The number of people you're following in the group. Chatter recommends groups with the most members you're following.
- If the group is new (created in the last month).

To see an expanded list of your recommendations, click **More** in the Recommendations section. If no recommendations appear, then you already belong to all the recommended groups. Hover over the recommendations and click  to dismiss them, and they won't appear again.

Use Email to Post to Chatter Groups

Email your posts to Chatter groups you have access to.

If your admin has enabled this feature, you can email your posts to any public group. Additionally, your admin can allow you to include attachments. You can email posts to a private or unlisted group only if you're a member. You must use the email address associated with your Salesforce user account.

1. In Salesforce Classic, from the group detail page, click **Post by email** below the group description to launch a blank email to the group using your local email client.
2. Type your message in the email body, including attachments if needed, and send the email. Attachments to the email are added as files in Chatter and shared with the group.

The email content displays as a post on the group detail page. Any hashtags you include in the email body (for example, `#TeamExcellence`) are converted to topics on the post. If more than one attachment is included with the email, the first attachment is included as part of the post. Additional attachments are added in comments.

EDITIONS

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

 **Tip:** Save the group's email address as a contact in your mail client or mobile device for easy access in the future. If you copy and paste the `mailto:` link directly into the contact's email field, some mail clients may consider the link invalid and prevent you from sending email to the contact. Try removing the parenthetical group name from the first part of the email address. For example, remove `(My Group)` from `(My Group) 0f9b000000004cmkaq@post.k-pxyvmac.kp0.chatter.salesforce.com`.

The following limitations apply to posting to a group using email:

- The 10,000 character limit for Chatter posts applies to posts created using email. Any text in your email beyond this limit is not included in the post.
- The maximum message size is 25 MB, including text and attachments.
- The email subject is not included in the post.
- You can create text posts using email and include links in the text. You can also include up to 25 attachments. You can't mention people, create polls, or give titles to links when posting to the group by email.
- Character-level formatting, such as the use of bold or different type sizes, is not supported.
- Email addresses must be unique at the group level. If multiple user profiles in your organization use the same email address, and that email address is used to post to a group, then the user profile associated with that particular group is used for the post in the group feed. If the email address is shared between multiple user profiles in the same group, the email is blocked.
- Signature text is treated as part of your post. Default signatures inserted by mobile devices, such as `Sent from my iPhone`, are automatically removed. Before sending your email, delete custom signatures and any extra text you don't want posted to Chatter. Or, add a separator line to the top of your signature to have it automatically removed. The separator line must have a minimum of one of the following characters:
 - Dash (–)
 - Equal sign (=)
 - Underscore (_)

You can also use any combination of these characters.

Post Announcements in Chatter Groups

Post group announcements to highlight important messages on the group page.

 **Note:** Groups display the global publisher layout by default. If the Announcement action doesn't appear in groups, ask your administrator to override the global publisher and add the Announcement action to a custom group publisher layout.

Only group owners, group managers, and users with the "Modify All Data" permission can post and delete group announcements.

1. On the group page, click **Announcement** in the publisher.
2. Type your message. The character limit is 5,000, and you can include links or mention users and groups in your announcement. Due to space constraints, approximately 137 characters of the announcement displays on the group page. Click **More** to see the rest of the message.
3. Specify an expiration date for the announcement.
4. Click **Share**.

Group announcements display until 11:59 p.m. on the selected expiration date, unless they're replaced by a new group announcement. Users can discuss, like, and post comments on announcements in the group feed. Group members receive an email notification when you post an announcement, same as for other posts, depending on their selected group email notification frequency.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Deleting the feed post deletes the announcement. To remove the announcement from the group page without deleting the feed post, click  in the top corner of the announcement, then select the option to dismiss the banner.

Send Email Notifications for Announcements (Beta)

Group owners and managers can now send email notifications to all group members for group announcements. Previously, only group members who opted to be notified for each post in the group were notified. Group owners and managers require the “Send emails on announcements” permission to do this. If this feature is enabled, select **Email all group members** next to the announcement expiration date to notify all group members.

 **Note:** This release contains a beta version of email notifications for group announcements, which means it's a high-quality feature with known limitations. For information on enabling this feature in your org, contact Salesforce Support. Email notifications for group announcements isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features.

SEE ALSO:

[Customize the Chatter Group Layout and Publisher](#)

Group Files Lists

The Group Files list on a Chatter group page shows the recent files posted to that group.

Hover to see available options or click the file name to go to the file detail page. To see a list of all the files posted to a group, to search for a specific file, or to perform actions on a file, expand the files list **Show All**. The 25 most recently viewed files are listed by default. On this list you can:

- Search for files that have been posted to the group. The list includes files that you and other people have [attached to the Chatter feed on the group](#). The list doesn't include:
 - Documents from the Documents tab.
 - Attachments from the Notes and Attachments related list.
- [Upload private files](#) or upload and share files with [people, groups](#), or via a [file link](#).
- [Preview a file](#) without downloading it.
- [Follow and receive updates about a file](#) in the Chatter feed. Click  next to the file you're following to stop receiving updates about the file. (Requires Chatter.)
- Click  to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the [file detail page](#).
- Click a file owner's name to see his or her profile.

 **Note:**

- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.

EDITIONS

Available in: Salesforce Classic

Records in Chatter Groups

Create Records in Chatter Groups

Use the group publisher to create records in Chatter groups.

The actions available to you in the group publisher depend on your permissions, your role in the group, the type of group, and how your administrator has [configured the group publisher](#).

- Depending on how your administrator configures the groups publisher layout, you can create account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren't supported.
- When you create a record in a group, a record creation post displays several places, including in the group feed, on your profile, in the record feed, and in your company's Chatter feed. Only users with the necessary permissions (via license, profile, permissions, and sharing rules) can view the record and the record creation feed post.

 **Tip:** Filter the group feed to **Show All Updates** to view record creation posts.

- All comments on the record creation post display in the group feed. This includes comments made on the post in the record feed, and those made by users who don't belong to the group.

For example, John creates a record in a private group and the record creation post displays in the group feed and in the record feed. Sally isn't a member of the same private group, but she has access to the record detail page and the record feed. Sally comments on the record creation post in the record feed, and it appears in the private group's feed.

- Record visibility in groups respects user permissions and sharing access rules in your organization. Group members with permissions can view the record and comment on it from any context (in a group, on the owner's profile, on the record detail page, in the company's Chatter feed).

Group members without permissions, such as Chatter Free users, can't see the record or the record feed in the group or anywhere else.

- You can't create records in groups that allow customers.
- If your administrator has enabled the ability to [add records to groups](#), as well:
 - Creating a new record within a group automatically creates a group-to-record relationship, same as when you add an existing record.
 - The group records list displays the records you create, in addition to the records you add.

You can [remove records from Chatter groups](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To create a record in Chatter groups:

- “Create” on the object

Add Existing Records to Chatter Groups

Add records to groups so you can collaborate on and discuss the records as a team.

1. From the group publisher, click **Add Record**.

 **Note:** If you don't see this option, your administrator needs to include the Add Record action to the group publisher. Groups that allow customers don't allow you to add records.

2. Select the type of record from the **Record** list.
You can add account, contact, lead, opportunity, contract, campaign, case, and custom object records. Other objects aren't supported.
3. In the blank search field, type the name of the record you want to search for and click  .
Leave the field blank to search for all available records of the selected type.
4. From the lookup search results list, click the record you want to add to the group to select it.
5. Click **Create**.

A success message confirms when the record is added to the group and the record appears in the Group Records list. If your administrator has added the Groups related list to the record detail page, you can also see the list of groups the record is associated with on the record detail page. There is no limit to the number of records you can add to a group.

 **Note:** Adding a record to a group doesn't affect its visibility. Only users with the necessary permissions (via license, profile, permission sets, or sharing) can see the records in a group. For example, Chatter Free users don't see any records in groups. Or, a user with permissions to view accounts and contacts can't view any case records in the group. This sometimes means that users see fewer records than the actual count indicated on the group records list.

 **Example:** Here are some ways to use Chatter groups as a collaboration space for records that you're working on.

- A sales team working together on an account can track the related opportunities, contacts, and leads in one group. Team members with permissions can access records directly from the group. New team members can use the group as a one-stop reference to familiarize themselves with historical discussions about the account and its child records.
- Customer service teams can use groups to track the cases they handle. The group can become the team's forum to monitor cases, discuss solutions, and analyze trends in common problem areas.
- Marketing teams can use groups to track their campaigns, plan events, and discuss the potential leads and contacts to invite for the event. Groups also make for a great space to collaborate on marketing content or campaign artifacts.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To view a group record or add a record to a group:

- "Read" on the record
- Access to the group

Remove Records from Chatter Groups

Remove records you no longer use from your Chatter groups.

Anyone with access to the record in a group can remove it from the group.

1. On the group detail page, click **Show All** next to the Group Records list.

 **Note:** The group records list appears on the group detail page only if your administrator allows you to add existing records to groups.

2. Optionally, select an option from the **Filter By** list to view records of that type.
3. Find the record you want to remove, then click **Remove** next to the record's name.

Removing a record from a group deletes the group-record relationship, but not the record itself. You can restore the group-record relationship from the Recycle Bin.

- Access to the group

Chatter Messenger (Chat)

Chat instantly and securely with coworkers. Chatter Messenger is not available in new orgs created after the Spring '16 release.

Using Chatter Messenger

Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click  in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

Using the Chat List

Tips for using the chat list.

Adding People to the My Favorites List in Chat

The list of people you follow in Chatter can be long. Add up to 100 chats with one or more people to your My Favorites list and they'll always show up at the top of your chat list.

Removing People from the My Favorites List in Chat

Remove chats with one or multiple people from your My Favorites list if you chat with them less often. People you follow in Chatter will still show up in your People I Follow list.

Changing Your Chat Status

Let people know if you're available to chat, or set your status to **Offline** if you don't want to chat.

Chatting with People

Chat with one or more people in Chatter.

Chat History

View your chat history.

Adding Emoticons to a Chat

Typing certain combinations of letters and punctuation marks inserts a whimsical icon into your chat conversation.

Popping Out Chat Windows

Keep chatting—even when you minimize your browser or use other applications—by popping out a chat or your chat list into a separate browser window.

[Editing Chat Options](#)[Can I change the sounds I hear in chat?](#)

Using Chatter Messenger

Click the Chat header to expand or minimize chat. To get the most out of your chat experience, click  in the chat list to pop it out to a separate browser window. Then, you can easily chat with people while you browse other sites and use other applications.

A few considerations apply to using Chatter Messenger:

- Chatter Messenger is not available in new orgs created after the Spring '16 release.
- Your administrator can disable Chatter Messenger at the organization level. In addition, you can access Chatter Messenger only if your administrator has selected "API enabled" in your profile permissions. If you don't see Chatter Messenger when you log in to Salesforce, ask your administrator if they have disabled the feature and granted the necessary permissions to access Chatter Messenger.
- Chatter Messenger is not available with Communities. It is available for internal users only when the organization-wide default for the user object is set to Public Read Only.
- Chatter Messenger is not supported on Microsoft® Internet Explorer® version 7.0. Internet Explorer 7 users appear offline to other Chatter Messenger users.

With chat, you can:

- [Let people know if you're available](#) to chat.
- [Chat with people](#).
- [Add people to](#) and [remove people from](#) your My Favorites list.
- [Pop out your chat](#) to a separate browser window.
- [Use emoticons when you chat](#) with people.
- [Customize your chat options](#), such as sounds and notifications.
- View your [chat history](#).

Editing Chat Options

 **Note:** Chatter Messenger is not available in new orgs created after the Spring '16 release.

To edit your chat options, click  in the top-right corner of the chat window, then click **Options**.

 **Tip:** When you click , you can also quickly toggle the visibility of **My Favorites**, **People I Follow**, and **Offline People** in your chat list. You can also toggle the options to **Play sounds** and **Show emoticons**.

General Settings

Option	Description
Change status to Idle after 15 minutes	When selected, your status changes to “idle” if you are idle in your Salesforce app for the length of time you specify.
Show emoticons	When selected, graphics such as 😊 or 😞 display when people you chat with type standard textual emoticons such as :-) or :- (.
Show a timestamp only when I hover over a message	When selected, the timestamp for chat messages displays only when you hover over an individual message. When not selected, the timestamp displays inline with each chat message and status change.

Sounds and Notifications

Option	Description
Play a sound for new messages	When selected, a sound plays when someone starts a new chat with you.  Note: Sounds play for all incoming messages when a chat is minimized, a chat is out of focus (for example, if you have multiple chats), or when you're using another application or browser tab.
Alert in browser tab for new messages	When selected, a notification saying “You have new chat messages” displays in your browser tab when someone sends you a new chat message.

[Searching for Chatter Messages](#)

[Sending Chatter Messages](#)

Send messages to communicate privately in Chatter.

Chatter Messages

Send your a question to another person privately, or to communicate with a few select people when a discussion isn't relevant to everyone you work with. Messages also notify people when a file has been shared with them.

Messages don't appear in your feed, your profile, global search results, or any other part of Chatter that's publicly visible.

View your messages by clicking the **Messages** link in the Chatter tab. On the My Messages page, you can:

- See the most recent message in each of your conversations. The most recent message displays at the top of the list.
- See the photo of the person who sent the most recent message in a conversation.
- See if you have unread messages (●).
- See if you sent the most recent reply (↩) in a conversation.
- Click any message to view the full history of messages exchanged in that conversation.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Send a message by clicking **New Message**.

Your messages are organized into conversations, with each conversation defined by the unique combination of people participating in it. For example, let's say you send a message to Sally Smith. When Sally replies, her message continues your one-on-one conversation. Every new message you send to Sally—even if it's about a different topic—also continues the same conversation. Over time, you build a rich conversation history with Sally that contains every message you've ever exchanged with her. At the same time, let's say you send a message to both Sally Smith and Bob Johnson. That message is considered part of a separate conversation between you, Sally, and Bob. When Sally replies, her message continues a separate conversation from your one-on-one conversation with Sally.

Consider these tips for using Chatter messages.

- You can send messages to anyone in your Chatter organization. It doesn't matter who you follow, who's following you, what groups you belong to, or if the recipient is a customer.
- Conversations can involve just one other person, or up to 10 people total, including yourself. You can't send a message to yourself.
- Conversation participants are established when someone sends the first message in the conversation. No one can add people or remove people from the conversation after the first message is sent.
- As others reply, the **Messages** link on the Chatter tab shows the number of conversations with new messages. If you're already receiving Chatter email notifications, you'll automatically be notified of new messages.
- You can't delete messages or conversations.
- If after reading the messages in a conversation you want to mark the conversation unread, you can do so only via the Chatter REST API, not via the user interface.

Searching for Chatter Messages

To search for people and text in your Chatter messages:

1. In My Messages, enter your search terms in the search box above your messages. Keep in mind these simple search tips:
 - If you're viewing your list of conversations, search looks for matches across all conversations. If you're viewing a single conversation, search looks for matches only within that conversation.
 - Searching for a person's name (such as *bob johnson*) finds both the conversations where Bob Johnson is named in the text as well as conversations where he's a participant. If you search for your own name, search results will include all of your messages and conversations because you're a participant in every conversation.
 - Searching for *bob jo* finds both Bob Jones and Bob Johnson. We automatically search for terms starting with *bob jo*, as if you had entered the * (asterisk) wildcard (*bob jo**).
 - If you search for the term *customer*, you'll see matches on that term within the text of messages. Matches don't include people who are identified as customers in a conversation's participant list.
2. Click **Search**.
3. Once you see the search results, you can:
 - Refine your search by entering additional search terms or using wildcards or operators.
 - Click a message to view the full conversation if you initially searched across all conversations.

If there are matches on names in the participant list and the conversation involves lots of people, the match might not be visible because the participant list doesn't show everyone's name. In other words, you'll see the conversation included as a match but the highlighted name match might be hidden from view.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

Clear your search terms by clicking . Chatter automatically clears your search when you enter a reply, send a new message, or leave My Messages.

SEE ALSO:

[Share Files with People in Salesforce Classic](#)

Sending Chatter Messages

Send messages to communicate privately in Chatter.

To send a Chatter message:

1. Start the message from one of these locations:
 - Click the **Messages** link on the Chatter tab, then click **New Message** in My Messages.
 - Click a person's name anywhere in Chatter to view their profile and click **Send a message**.
 - Click **Send a message** on a person's hover.
 - When viewing the full message history of a conversation, use the text box under the most recent message to send a reply.
 - When viewing the email notification about a message you've received, if email replies to Chatter are enabled, reply to the email.

Sharing a file with people is another way to send a Chatter message. When you share a file, recipients automatically receive a message that lets them know the file has been shared, as well as any additional information you provided.

2. If you started in the Send a Message dialog box, you can add people's names to the recipient list. Type a name in the **To** field and click the name to select it. Add more people to the conversation by entering additional names.

If you're replying within a conversation or via email, the conversation participants can't be changed.

3. Write your message. Messages can be up to 10,000 characters.
4. Submit your message using the appropriate method:
 - In the Send a Message dialog box, click **Send**.
 - If you're replying within a conversation, click **Reply** (or **Reply All** if the conversation involves multiple recipients).
 - If you're replying via email, use the Send option in your email application.

If your message continues an existing conversation, your reply is added to the conversation and appears at the top of the list in My Messages. If your message starts a new conversation because you haven't previously exchanged messages with that unique combination of recipients, your message appears at the top of the list in My Messages as a brand new conversation.

[Display Similar Questions and Articles in Chatter](#)

Your users might ask similar questions. Chatter Questions helps reduce duplicate content in your Salesforce organization—and in any communities with Chatter—by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in Chatter.

[Display Similar Questions and Articles in the Napili Search](#)

Your community users may ask similar questions. Chatter Questions helps reduce duplicate content in self-service communities built on the Napili template by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in the Search field.

[Enable Similar Articles for Chatter Questions](#)

When users ask questions in Chatter, similar questions appear as they type. If you'd like relevant Salesforce Knowledge articles to appear as well as questions, enable Similar Articles.

[Selecting a Best Answer for a Question in Chatter](#)

One of the advantages of asking a question in Chatter is that users can select the best answer for a question. When a question has a best answer, your users can quickly resolve their issue by going directly to the best answer.

[Chatter Questions FAQ](#)

Chatter Questions lets users in communities and Salesforce ask questions in the feed. Take a look at some common questions about the feature.

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

Keep tabs on the use and adoption of Chatter Questions in your organization or community with out-of-the-box reports and dashboards.

[Differences Between Q&A Features in Salesforce](#)

Salesforce offers a variety of question-and-answer features that you can implement in your Salesforce organization and communities. Because some of these features use similar terminology, take a moment to review the differences between them.

[Question-to-Case Overview](#)

Question-to-Case lets moderators create cases from questions in Chatter, which makes it easier to track and resolve your customers' issues. Question-to-Case is available in the full Salesforce site and the Salesforce1 mobile browser app, as well as in communities where Chatter Questions is enabled.

[Set Up Question-to-Case](#)

Add Question-to-Case to your communities, your Salesforce organization, or both.

[Enable Question-to-Case](#)

Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers' questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

[Add the Question from Chatter Field to the Case Detail View](#)

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

[Add the Escalate to Case Action to the Feed Item Layout](#)

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

[Confirm Access to the Escalate to Case Action](#)

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

[Customize the Escalate to Case Action Layout](#)

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

[Automatically Assign Cases from Questions to a Queue](#)

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you'd like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

[Automatically Create Cases from Unresolved Questions in Chatter](#)

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

[Create a Case from a Question in Chatter](#)

If a question in Chatter hasn't been resolved, moderators can create a case from the question. Question-to-Case must be enabled in your organization or community.

Chatter Questions

Extend the best possible self-service community by promoting community engagement internally and externally with questions in Chatter.

With Chatter Questions, users can ask questions in their Chatter feed, in groups, and in records by selecting **Question** in the action drop-down menu of the Chatter Publisher. After a question is asked, moderators and the person who asked the question can select a best answer. The best answer is prominently displayed in the feed, allowing other users to quickly and easily find the information they need.

Your users can organize their information with the question title and details about their question. They can ask the question to their followers, to a group, or to a specific person, as they can with other Chatter feed items.

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

[Chatter Questions FAQ](#)

Display Similar Questions and Articles in Chatter

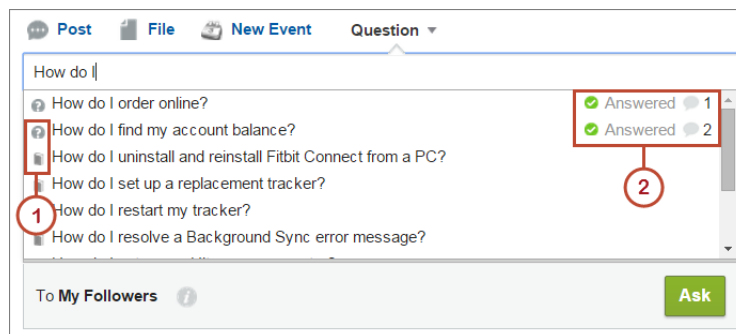

Your users might ask similar questions. Chatter Questions helps reduce duplicate content in your Salesforce organization—and in any communities with Chatter—by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in Chatter.

Note:

- Communities with Chatter include those built with Salesforce Tabs + Visualforce.
- The Similar Questions and Similar Articles search features are also available in communities built on the Napili template. For more information, see [Display Similar Questions and Articles in the Napili Search](#).
- Similar Questions and Similar Articles aren't available in Salesforce1 or mobile browsers.

When a user enters a question in Chatter, similar questions automatically appear in a drop-down list below the question title field. To display relevant Knowledge articles along with similar questions, [enable Similar Articles](#).

Drop-down search results of similar questions and articles:

- **1:** Book and question mark icons indicate whether a search result is an article or a question.
- **2:** Question results show the question title, the number of answers, and a green flag with the text `Answered` if a best answer was selected.

Users see up to 10 results in the drop-down list, with questions appearing before articles. Salesforce displays an equal number of questions and articles, but if there aren't enough of one result type, extra results of the other type are displayed. If no question or article title matches the text entered by the user, the drop-down list doesn't appear.

The drop-down results are based on whether the question or article **title** contains the text entered by the user. The search accounts for partially matching terms and non-adjacent terms; for example, the results for "best backpack" could include a question titled "Which backpack is best for day hikes?", and the results for "backpack" could include an article titled "Backpacking Tips."

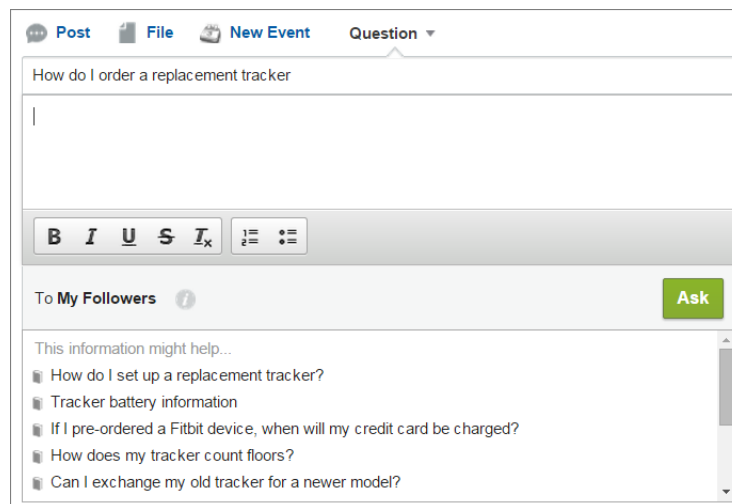

EDITIONS

Available in: Salesforce Classic

Chatter Questions is available in: **Group, Professional, Developer, Performance, Enterprise,** and **Unlimited** Editions

If the user wants to conduct a more in-depth search that also scans question descriptions and article text, they can press TAB or click out of the title field. This displays a separate drop-down list of results below the question publisher.

Advanced drop-down search results of similar questions and articles:

If none of the results answer the user's question, they can post their question by clicking **Ask**.

SEE ALSO:

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

Display Similar Questions and Articles in the Napili Search

Your community users may ask similar questions. Chatter Questions helps reduce duplicate content in self-service communities built on the Napili template by showing similar questions and relevant Salesforce Knowledge articles when a user is entering a question in the Search field.

 **Note:** Similar Questions and Similar Articles are also available in internal Salesforce organizations with Chatter and in communities built with Salesforce Tabs + Visualforce. To learn more, see [Display Similar Questions and Articles in Chatter](#).

When a user in a Napili community enters a question in the Search field, similar questions and Knowledge articles automatically appear in a drop-down list below the field. The drop-down list contains two tabs: **Articles** and **Questions**. To also expose an **All** tab that shows combined results (recommended), [enable Similar Articles](#).

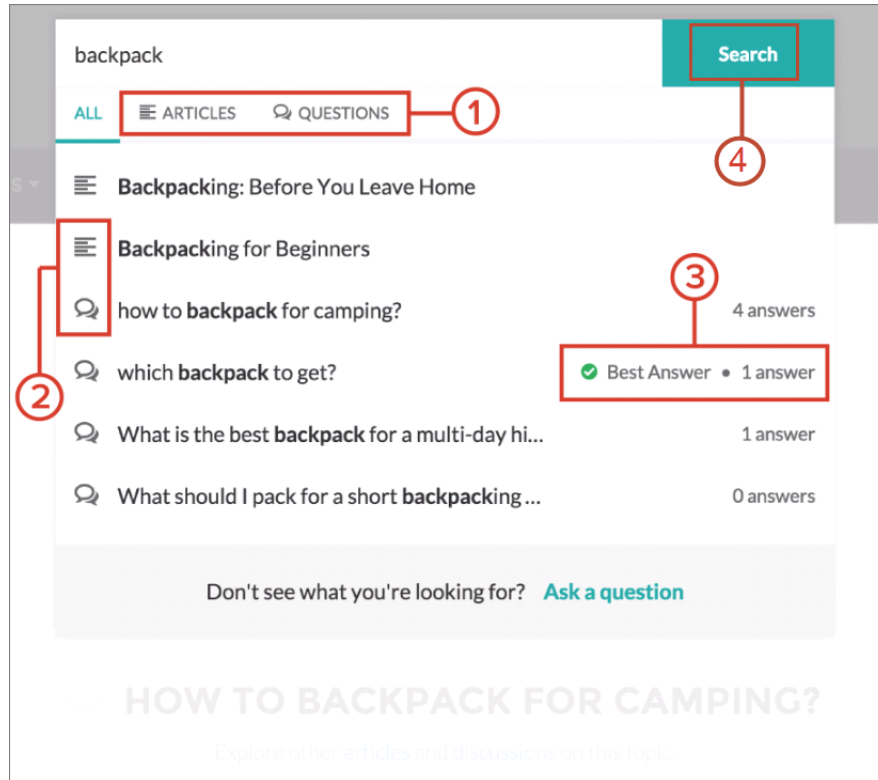

By default, each tab contains up to six results. The **All** tab shows both matching articles and questions, with articles appearing first. It displays an equal number of questions and articles, but if there aren't enough of one type of result, more results of the other type are displayed to reach the maximum. To see results of a particular type, users can click the **Articles** and **Questions** tabs. If a search only returns one result type (for example, questions), users still see all of the tabs.

 **Note:** For a community user to see similar articles, Knowledge must be enabled in the community and the user must have access to it.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

- **1:** The **Articles** and **Questions** tabs let users view results of each type. Users can use the Up and Down arrow keys to navigate between results on any of the tabs. Clicking a question or article in the drop-down list navigates directly to it.
- **2:** Text and chat bubble icons indicate whether a search result is an article or a question.
- **3:** Questions in the list show the number of answers and a green checkmark with the text **Best Answer** if one was selected.
- **4:** The drop-down search results are based on whether the question or article title contains the text entered by the user. When the user performs a full search by clicking **Search**, the search engine also scans question descriptions and article text for matching terms.

You can customize the search settings by editing the properties of the Search Publisher component in Community Builder. For details, see [Using Templates to Build Communities](#).

Enable Similar Articles for Chatter Questions

When users ask questions in Chatter, similar questions appear as they type. If you'd like relevant Salesforce Knowledge articles to appear as well as questions, enable Similar Articles.

 **Note:** Chatter and Salesforce Knowledge must be enabled in your organization.

Enabling Similar Articles turns on the feature in:

- Your internal Salesforce organization
 - Your communities built with Salesforce Tabs + Visualforce or the Napili template
1. From Setup, enter *Knowledge Settings* in the **Quick Find** box, then select **Knowledge Settings**.
 2. Under Chatter Questions Settings, select **Display relevant articles as users ask questions in Chatter (also applies to communities with Chatter)**.

 **Note:** Make sure that the Question action has been added to the desired page layouts. Otherwise, users can't see it.

To learn more about how Similar Articles and Similar Questions work, see:

- [Display Similar Questions and Articles in Chatter](#)
- [Display Similar Questions and Articles in the Napili Search](#)

SEE ALSO:

- [Display Similar Questions and Articles in the Napili Search](#)

Selecting a Best Answer for a Question in Chatter

One of the advantages of asking a question in Chatter is that users can select the best answer for a question. When a question has a best answer, your users can quickly resolve their issue by going directly to the best answer.

Moderators and the person who asked the question can:

- Select the best answer for a question
- Remove the best answer status from an answer

Only one answer can be selected as the best answer. Moderators can be the Chatter moderator, the community moderator, or the Salesforce administrator. If a user doesn't have permission to select the best answer for a question, they don't see the **Select as Best** option.

 **Noah Larkin** asked a question. ▼

What is the best monitor for playing video games?

I was using a Cirrus 27" monitor before, but I want to move to a dual monitor setup. And I want the images to be really sharp. #Monitor #Videogames

Topics: Videogames, Monitor

Answer · Like · Today at 2:29 PM

 **Allison Wheeler**

I've actually found that dual monitors aren't great for video game play. I find it distracting and hard to use. Quite often the graphics card won't keep up. However, if you're set on using a dual-monitor setup, I recommend the AW-PX16 graphics card and any monitor will do.

Chatter Questions FAQ

Chatter Questions lets users in communities and Salesforce ask questions in the feed. Take a look at some common questions about the feature.

Why should I use Chatter Questions instead of asking my question in a Chatter text post?

Asking a question in Chatter saves you time. When you ask a question, similar questions and articles appear as you enter your question. Chances are that someone already asked the same question, and it could have many answers or a best answer. Chatter Questions harnesses the value of content that already exists in Chatter.

Can I filter the Chatter feed to show only questions?

Yes. At the top of your Chatter feed, click  next to **Show** and select **Questions**.

Can I search for questions in Chatter?

Yes. Use the Search This Feed button () at the top of your Chatter feed. Questions are included in the feed search results.

Is Chatter Questions available in Salesforce1?

Currently, Chatter Questions is available in the Salesforce1 mobile browser only.

What happens when someone asks a question?

Their question appears in the Chatter feed for their followers or the person or group they asked the question of. An email notification is also sent to the person or group they asked the question of. After a user asks a question, other users can then answer the question directly in Chatter.

Who can select a best answer for a question?

The person who asked the question and moderators can select the best answer for a question. Moderators can be the Chatter moderator or the community moderator. Your Salesforce administrator can also select the best answer for a question. For details, see [Selecting a Best Answer for a Question in Chatter](#).

Can I track Chatter Questions use and adoption in my Salesforce organization?

Yes. For details, see [Track Chatter Questions Use in Your Salesforce Organization and Communities](#).

SEE ALSO:

[Display Similar Questions and Articles in Chatter](#)

Differences Between Q&A Features in Salesforce

Salesforce offers a variety of question-and-answer features that you can implement in your Salesforce organization and communities. Because some of these features use similar terminology, take a moment to review the differences between them.

Salesforce has released three features that let users post questions and answers in a public forum setting. While these features share a common purpose, they represent an evolution of Salesforce's Q&A features.

Q&A Feature	Description	Structure	How Users Access It
Version 1: Answers	Answers, released in Winter '11, was Salesforce's first Q&A feature for communities. Starting in Summer '13, Answers isn't available in new orgs.	Answers is built on the Question standard object.	Internal users access the Answers feature via the Answers tab in Salesforce.
Version 2: Chatter Answers	Chatter Answers, released in Spring '12, was intended for customers who liked the Answers user experience but wanted additional functionalities. Chatter Answers let companies maintain an out-of-the-box, self-service site where users could help address each other's questions, and provided a feed view of users' questions. Starting in Summer '16, Chatter Answers isn't available in new orgs.	Chatter Answers is built on the Question standard object.	Internal users access Chatter Answers via the Q&A tab, and moderators can view a list of questions in the Questions tab.
Version 3: Chatter Questions	Chatter Questions, released in Winter '15, represents the most advanced developments in Salesforce Q&A functionality. Because it takes advantage of	Chatter Questions is built on the Chatter data model, and uses the Feed Post and Feed Comment objects.	Internal users access Chatter Questions within Chatter. They use the Question action in the Chatter publisher to post a question, and all

Question-to-Case Overview

Question-to-Case lets moderators create cases from questions in Chatter, which makes it easier to track and resolve your customers' issues. Question-to-Case is available in the full Salesforce site and the Salesforce1 mobile browser app, as well as in communities where Chatter Questions is enabled.

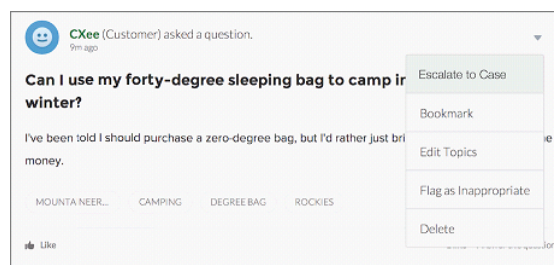

When a customer uses the Question action in Chatter to ask a question, similar questions and Knowledge articles appear below the Chatter publisher. If the similar questions and articles don't address the issue, the customer posts the question.

If a question isn't resolved, you can escalate the question to a case. Users with the "Moderate Chatter" or "Moderate Communities Feeds" user permission can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

When a customer's question is turned into a case, the customer receives an email with the case number and a link to the case. The customer can view the case via a link on the question that's visible only to them, while moderators see a note on the question indicating that a case was created.

 **Note:** The person who asked the question must have access to cases so they can view their case.

Moderator Flag

Add the `Question from Chatter` Field to the Case Detail View

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

First, use field-level security to specify which users can see the `Question from Chatter` field on case detail pages.

1. From the object management settings for cases, go to Fields.
2. Click **Question from Chatter**.
3. Click **Set Field-Level Security**.
4. Select **Visible** for any profile that you want to be able to use Question-to-Case.
5. Click **Save**.

After you make the field visible to users, you can choose to add it to the Case Details view.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to the page layout that you want to customize.
3. Drag the `Question from Chatter` field from the Fields section of the page layout editor palette to the Case Information section of the page.
4. Click **Save**.
5. Click **Page Layout Assignment** to confirm that the user profiles which need Question-to-Case are assigned to the page layout that you customized. In addition, assign internal users who need access to the `Question from Chatter` field on cases to that page layout.

Confirm Access to the Escalate to Case Action

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

First, check which record type is assigned to the profiles that need access to the Escalate to Case action.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the name of a profile.
3. In the Record Type Settings section, make a note of which case record types the profile uses.
4. In the Permissions section, make sure that the user profile has either the **Moderate Chatter** or **Moderate Communities Feeds** permission enabled.

Then, check which record type the Escalate to Case action uses, and change it if necessary.

1. From Setup, enter *Actions* in the **Quick Find** box, then select **Feed Item Actions**.
2. Click **Edit** next to the Escalate to Case action.
3. Confirm that the **Record Type** field shows a record type that's assigned to the profiles that need access to this action. If it doesn't, select an appropriate record type from the drop-down list.
4. Click **Save**.

SEE ALSO:

[Customize the Escalate to Case Action Layout](#)

Customize the Escalate to Case Action Layout

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

Automatically Assign Cases from Questions to a Queue

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you'd like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue if the `Type` field on the case is equal to `Question`. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions will depend on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see [Create Queues](#).

SEE ALSO:

[Automatically Create Cases from Unresolved Questions in Chatter](#)

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

 **Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that's you? See [Differences Between Q&A Features in Salesforce](#) on page 2926.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than 10 likes, and a best answer hasn't been selected.
- Create a case from a question immediately if the question contains the word "competitor."

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- `BestCommentId`: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- `CommentCount`: The number of comments on a question.
- `LikeCount`: The number of likes on a question.

Tip:

- Each flow variable's data type must match the feed item field's data type. `CommentCount` and `LikeCount` are number fields, while `BestCommentId` is a text field.

[Lightning Process Builder](#)

[Cloud Flow Designer](#)

Create a Case from a Question in Chatter

If a question in Chatter hasn't been resolved, moderators can create a case from the question. Question-to-Case must be enabled in your organization or community.

1. Navigate to the question in the feed.
2. Select **Escalate to Case** in the action drop-down menu.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create a case from a question in Salesforce:

- "Moderate Chatter" OR "Modify All Data"

AND

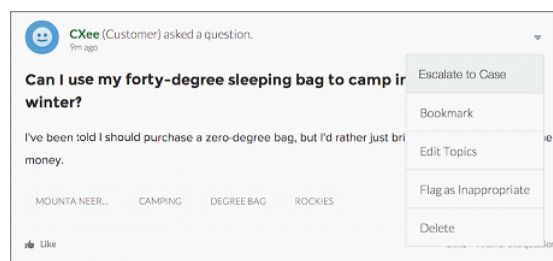

"Create" on cases

To create a case from a question in a community:

- "Moderate Chatter" OR "Modify All Data" OR "Moderate Communities Feeds"

AND

"Create" on cases

A window appears that's pre-populated with the case subject, contact, and description. Unless Question-to-Case has a queue associated with it, the case is automatically assigned to you.

3. If needed, edit the case details.
4. Create the case.

After a case is created from a Chatter question, the customer who asked the question receives an email notifying them that a case was created from their question. The email provides the case number and a link to the case.

Agents can post a response to the question directly from the case feed using the Community action in the publisher. Agents choose who can view the response by selecting either "Customer Only" or "Everyone". They can also navigate to the original question from the case's detail page by clicking the link in the `Question from Chatter` field.

Working with files in Salesforce means:

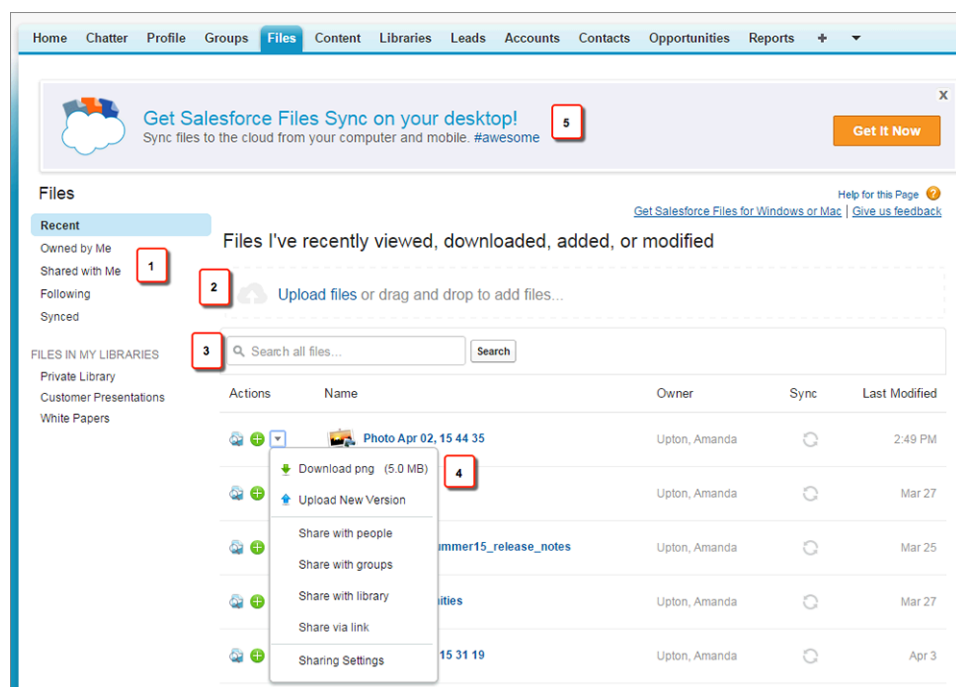

- Collaborating with coworkers by posting files to feeds and directly to records, such as Accounts, Cases, Leads, and more.
- Sharing files with customers in the secure Salesforce cloud.
- Syncing files between your local drive and Salesforce.
- Learning how users work with files by running standard and custom file reports.

The **Files** tab provides a powerful toolset for working with and managing your files.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- Filter your file list (1) so that it only shows the files you want to see. Click any of the filter names to change the scope of your file list.
- Select or drag one or more files to upload (2) them to Salesforce. All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files.
- Use the files-specific search tool (3) to find the files you need. Filtering your file list also filters your search. Search all files you have access to from the Recent filter.
- Preview, follow, download, version, share, and sync files directly from the file list (4). Click on a file name to open the file detail page. On the file detail page, you can run reports about the file, see who is following the file, edit details about the file, and more.
- Download Salesforce Files Sync (5) to sync files between your computer and Salesforce.

Files are automatically added to the file list when:

- You upload a file.
- You attach a file to a record.

- You or someone else attaches a file to a Chatter feed or comment. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.
- You sync a file in your Salesforce Files Sync folder.
- Someone else shares a file privately with you using the Sharing dialog box.
- You upload a file to a Salesforce CRM Content library.
- Someone else uploads a file to a library you're a member of.
- You or someone else creates a content pack or uploads a Web link in Salesforce CRM Content. You only see files from content packs and Web links you have access to.

 **Note:** In Internet Explorer 11, the **Preview** option redirects to the file detail page.

As you work with files in Salesforce, keep these file limits in mind:

Feature	Limit
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048 versions
Maximum number of synced files and folders	Users can sync up to 10,000 files.
Maximum number of users who can sync the same file simultaneously	1,000 users

 **Note:**

- For information about the different file tools and solutions in Salesforce, see [Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).
- To learn who can perform which actions on a file, see [Who Can See My File?](#)
- File syncing functionality, such as the Synced filter, is only available if Salesforce Files Sync is set up for you and your organization.
- Files connected to Salesforce from repositories such as Microsoft® SharePoint® are only available if Salesforce Files Connect is enabled for you and your organization.
- Chatter feeds, groups, and the ability to follow files are only available for organizations that have Chatter enabled.

- If your organization uses profile-based Chatter rollout, users must have Chatter permissions enabled for Files to be available.

Files Home

Files Home

Files home lets you store files privately, share files with others, and view files that have been shared with you.

From **Files** home, you can:

- See all the files you own or have access to and filter your list of files.
- [Search for files](#) using filters and by typing terms in the Files search box, or the search box at the top of the page.
- [Upload private files](#) or upload and share files with [people](#), [groups](#), or via a [file link](#).
- If you have the “Sync Files” permission, [access synced files](#) in your Salesforce Files Sync folder.
- [Preview a file](#) without downloading it.
- [Follow and receive updates about a file](#) in the Chatter feed. Click  next to the file you're following to stop receiving updates about the file. (Requires Chatter.)
- Click  to download, upload a new version, share with people, groups, or via link, and see sharing settings.
- Click a file name to view the [file detail page](#).
- Click a file owner's name to see his or her profile.

SEE ALSO:

- [Filter Your Files List](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager**, and **Developer** Editions

Filter Your Files List

The filters on the **Files** page provide quick access to your files in Salesforce.

The Files page lists all the files you have access to. Filters show you different groups of those files, letting you find what you're looking for quickly.

Filter Name	Description
All Files	All files you own and have access to.
Recent	The most recent files you've viewed.
Owned by Me	Only the files you own.
Shared with Me	Only files that have been shared with you either by a private share or a public post to your profile.
Following	Only the files you're following in Chatter. This filter is available only in organizations that use Chatter.
Synced	All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the "Sync Files" permission.
Libraries	Files anyone has uploaded to libraries you're a member of, as well as all files you uploaded to your private library, grouped by library name.

SEE ALSO:

[View Where a File is Shared](#)

Search for Files

Use the files-specific search field on **Files** home in Salesforce to find just what you're looking for.

Files home lists the files you own and have access to, including files posted to feeds. The 25 most recently viewed files are listed by default. You can see and search a certain group of files by clicking a specific filter on the sidebar. The search results are filtered based on the terms entered.

 **Note:** Users who have the "Sync Files" permission don't see the **All Files**, **MY FILES**, or **FILES IN MY GROUPS** filters. Users who don't have the "Sync Files" permission don't see the **Synced** filter.

- **All Files**—All files you own and have access to, including:
 - Files that have been shared with you
 - Files you're following
 - Files in your Chatter groups
 - Files in your libraries
 - Files attached by other people to a Chatter feed. This includes files attached to all public groups, whether you're a member or not, and private groups you're a member of, but not private groups you're not a member of.

This filter is only available in Salesforce Classic.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- **Recent**—The most recent files you've viewed.
- **MY FILES**—All files you own, files shared with you, and files you follow.
 - **Owned by Me**—Files you have:
 - Uploaded on the Home or Files page. These are private and not shared with anyone, but you can view them, share them, and attach them to Chatter feeds.
 - Attached to Chatter feeds from your computer.
 - Synced using your Salesforce Files Sync folder.
 - Uploaded to Salesforce CRM Content libraries you're a member of and your private library.
 - **Shared with Me**—All files that have been shared with you either by a private share or a public post to your profile.
 - **Following**—All files that you're following. *(Requires Chatter)*
- **FILES IN MY GROUPS**—All files you and other people shared to groups you're a member of. The last five groups you've visited are listed.
- **FILES IN MY LIBRARIES**—All files you and other people uploaded to libraries you're a member of and all files you uploaded to your private library. The first five libraries you're a member of, including your private library, are listed. If you're a member of more than five libraries, click **More** to see a complete list.
- **Synced**—All files that have been synced in your Salesforce Files Sync folder. This filter is available only to users who have the "Sync Files" permission.
- **EXTERNAL FILES**—All files you have access to in Files Connect external data sources. Search is restricted to the selected external data source.

In Salesforce Classic, to search for files using the Files search:

1. Optionally, click a filter on the sidebar to restrict your search to a specific set of files.
2. Enter your search terms in the Search field on the **Files** tab. You can search by file name, description, owner, type, or within the file's text.
3. Click **Search** to see a filtered list of all relevant files based on your search terms. Or click  to clear your search terms.

In Salesforce Classic and Lightning Experience, you can search for files from the header search field. Use [feed search](#) to find files posted in a specific Chatter feed, such as on a profile, on a record, or in a group.

 **Note:** Feed search returns matches for file or link names shared in posts, but not in comments.

The Files list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's name, description, type, and owner are.

File Type	File Extensions	Maximum File Size for Search
HTML	.htm, .html, .xhtml	5 MB
PDF	.pdf	25 MB
PPT	.ppt, .pptx, .pptm	25 MB
RTF	.rtf	5 MB

File Type	File Extensions	Maximum File Size for Search
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .docx, .docm	25 MB
XLS	.xls, .xlsx, .xlsm	5 MB
XML	.xml	5 MB

SEE ALSO:

[Follow a File](#)[Filter Your Files List](#)

Upload and Share Files

Upload Files

Upload files from Files home, in feeds, and on opportunities or other records.

Upload and share files from:

- **Files** home
- Any Chatter feed post or comment field
- **Files** card or list on groups, user profiles, opportunities, and other records

All file types are supported, including everything from Microsoft® PowerPoint presentations and Excel spreadsheets, to Adobe® PDFs, image files, audio files, and video files. Files up to 2 GB can be uploaded by default. However, your maximum file size is determined by your organization.

Files Home

When you upload files, they're added to the **Owned by Me** filter on **Files** home, with you as the owner. Files you upload from **Files** home are automatically uploaded as private.

You can also add files to Salesforce by:

- [Attaching a file to a Chatter feed.](#)
- [Uploading files to Salesforce CRM Content](#) private and shared libraries.
- [Syncing a file in your Salesforce Files Sync folder.](#)
- [Creating content packs](#) or [uploading Web links](#) in Salesforce CRM Content.

The Files list doesn't include:

- Documents from the Documents tab.
- Attachments from the Notes and Attachments related list.

 **Note:** Files without a file extension or with an unrecognized file extension show "unknown" in the Type column.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Private Files

A private file is private, not shared with anyone, and you are the file owner. Only file owners and users with the “View All Data” permission can see private files. Private files show a lock  icon in the Files list and on the file's detail page. You can search for your private files in Chatter and on the Files list.

Sharing Private Files

You can share private files from the file detail page or by [attaching](#) them to a Chatter feed, a profile, a record, or a group. You can also [share a file via a link](#). When you share a private file, it's no longer private. To learn who can perform which actions on a file, see [Who Can See My File?](#).

SEE ALSO:

[File Size Limits in Salesforce](#)

[Prevent Others from Sharing and Unsharing a File](#)

File Size Limits in Salesforce

The following are maximum file size limits for files in Salesforce.

Feature	Details
Attachments related list	<ul style="list-style-type: none"> • 25 MB for file attachments • 2 GB for feed attachments
Documents tab	<ul style="list-style-type: none"> • 5 MB • 20 KB for a custom-app logo
Salesforce CRM Content	<ul style="list-style-type: none"> • 2 GB • 2 GB (including headers) when uploaded via Chatter REST API • 2 GB (including headers) when uploaded via REST API • 38 MB when uploaded via SOAP API • 10 MB when uploaded via Bulk API • 10 MB for Google Docs • 10 MB when uploaded via Visualforce
Salesforce files	2 GB
Salesforce Knowledge	5 MB for attachments

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

The size limit for an attached file is 25 MB when attached directly to the related list.

The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file.

[Upload Files](#)

Upload a New Version of a File

You can upload a new version of a file so your viewers and collaborators always have access to the latest and greatest. If your original file was uploaded via a feed post, use **Upload New Version** to replace the old with the new, without needing to create a whole new post.

Uploading a new version replaces all previous versions, but [previous versions](#) are still available by clicking **Show all versions** on the file detail page.

1. Click **Upload New Version** from any of these locations:
 - The file detail page
 - The file previewer
 - The **Files** page, via the actions arrow for the file
 - On a file in a feed, via the **More Actions** arrow (available in Salesforce Classic only)
2. Click **Choose File**, and select a file from your computer.
3. Optionally, enter a note about what changed in the **What Changed?** field. This information is shown on the [Version History](#) list.
4. Click **Upload New Version** (Salesforce Classic) or **Start Upload** (Lightning Experience).

The file detail page and any previous posts show the updated version.

Note:

- Only file owners, collaborators, and users with the “Modify all Data” permission can upload new versions. To learn who can perform which actions on a file, see [Who Can See My File?](#)
- The file owner doesn't change when a collaborator uploads a new version.
- If the file is from Salesforce CRM Content, you can't upload a new version from the file detail page. You can click **Go to Content Detail Page** and upload a new version there. (Available in Salesforce Classic only.)

Browsers that Support Uploading Multiple Files

These browsers allow you to [upload multiple files](#) on page 2943 from the **Files** tab, the **Files Shared With** list on a group, or the **Files Owned by** list on a profile. If your browser does not support uploading multiple files, you can still upload files one at a time.

Browser	Additional Requirements
Google® Chrome™	Must be the latest stable version
Mozilla® Firefox®	Must be the latest stable version
Internet® Explorer® 9	Must have Flash 11 or later installed
Apple® Safari® for Mac	Version 5.1.x

Who Can See My File?

Your files in Salesforce can be private to you, privately shared, or visible to your entire company. Learn how to identify a file's sharing settings and how you can change them.

This table describes file sharing settings which are determined by how the file is shared. The sharing setting and icon appear on a file's detail page and on the Shared With list on a file detail page.

Sharing Setting	Definition	When Does a File Have This Setting?
 Private	The file is private. It hasn't been shared with anyone else besides the owner. Only the file owner and users with "Modify All Data" permission can find and view this file, unless it is in a private library, then only the file owner has access to it.	A file is private when you: <ul style="list-style-type: none"> • Upload it in Files home • Publish it to your private library • Sync a file in your Salesforce Files Sync folder • Stop sharing it with everyone (Make Private) • Delete posts that include the file and the file isn't shared anywhere else
 Privately Shared	The file has only been shared with specific people, groups, or via link. It's not available to all users in your company. Only the file owner, users with "Modify All Data" or "View all Data" permission, and specific file viewers can find and view this file.	A file is privately shared when it's: <ul style="list-style-type: none"> • Only shared with specific people or a private group • Posted to a private group • Shared via link • Posted to a feed on a record • Published to a shared library
 Your Company	All users in your company can find and view this file.	A file is shared with your company when it's posted to a

Sharing Setting	Definition	When Does a File Have This Setting?
		feed that all users can see, a profile, a record, or a public group.

This table describes the actions that can be performed by users based on their permission:

Action	File Owner	File Collaborator	File Viewer
View/Preview	Yes	Yes	Yes
Download	Yes	Yes	Yes
Share	Yes	Yes	Yes
Attach a File to a Post	Yes	Yes	Yes
Sync a File	Yes	Yes	Yes
Upload New Version	Yes	Yes	
Edit Details	Yes	Yes	
Change Permission	Yes	Yes	
Make a File Private	Yes		
Restrict Access	Yes		
Delete	Yes		

 **Note:**

- **No Access** means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they're a member of.
- Users with "Modify All Data" permission can view, preview, download, share, attach, make private, restrict access, edit, upload new versions, and delete files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users with "View All Data" permission can view and preview files they don't own. However, if the file is in a private library, then only the file owner has access to it.
- Users must have the "Sync Files" permission to sync files.
- Groups (including group members) and records have viewer permission for files posted to their feeds.
- Permissions for files shared with libraries are determined by the library.

SEE ALSO:

[Make a File Private](#)

[View Where a File is Shared](#)

[Prevent Others from Sharing and Unsharing a File](#)

Change File Access

Decide who can view and modify the files you own.

File owners and collaborators can change file permissions for people and groups from viewer to collaborator and vice versa. They can also change file permissions for files shared with their company to viewer, collaborator, or no access.

- **Viewers** can view, download, and share files.
- **Collaborators** can view, download, share, change permission, edit the file, and upload new versions.
- **Set by Library** for a file in a library means that access to the file follows access to the library. This setting can't be toggled.
- **Set by Record** for a file attached to a record means that access to the file follows access to the record. Those with read/write access to the record have **Collaborator** access to the file. Those with read-only access to the record have **Viewer** access to the file. This setting can be toggled in Salesforce Classic only.
- **No Access** means that no one in your company can find or view the file unless the file is specifically shared with them or a private group they're a member of.

To change file access:

1. On a file detail page, click **Share File** > **Sharing Settings**.
2. Find the person or group whose access you want to change. Or change access for `Any Chatter user in your company`.
3. Select **Viewer**, **Collaborator**, or **No Access** (for your company). Or, for files shared with records (Salesforce Classic only), change to **Set by Record**. The change happens immediately.
4. Click **Close**.

Note:

- A file is shared with your company when it's posted to a feed that all users can see, a profile, a record, or a public group. `Any Chatter user in your company` is given viewer permission by default. If you change the permission from viewer or collaborator to no access, you remove the share to company and to public groups.
- When you share a file with someone, they are given `Collaborator` access by default. When you share a file with a group, the group members are given `Viewer` access by default. You can change the default access when you share a file for the first time. File owners and collaborators can change access after a file has been shared.
- File link recipients can only view and download files. They can't be collaborators.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Make a File Private

File owners and users with the “Modify All Data” permission can make a file and file link, if applicable, private (🔒) if they decide they don't want it to be shared anymore. Making a file private removes it from any posts it's attached to and removes it from everywhere it's been shared. Only the owner and users with the “Modify All Data” permission will have access to it. Alternately, file owners and users with the “Modify All Data” permission can restrict access to a file that originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared, except the library.

If the file is shared using a content delivery, the content delivery becomes inaccessible, but is not deleted. If the file is shared using **Share via link** in Chatter, the link to the file is deleted.

1. From the file detail page of the file you want to make private or restrict access, click either  **Share File > Sharing Settings** or **Show All** on the Shared With list.
2. On the Sharing Settings dialog box, click **Make private** (or **Restrict access** if the file originated in a Salesforce CRM Content library).
3. On the confirmation dialog box, click **Make private** (or **Restrict access**).

Share Files with Groups

Share files in Chatter with public or private groups so that members of the groups can view and download the files from their feed.

Share a file with a private or unlisted group so only members of that group can see it, or share a file with a public group so members of that group and all Chatter users in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more Chatter groups:

1. Share the file from one of these locations:
 - On the detail page of the file you want to share—Click  **File Sharing Settings > With group**. Or click **Show All** on the Shared With list then click **Groups** on the Sharing Settings dialog box.
 - Next to the file in a feed—Click **More Actions > File Sharing Settings** then click **Groups** on the Sharing Settings dialog box.
 - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click  **Share with groups**.
 - On a file hover—Click  **Share File** then click **Groups** on the Sharing Settings dialog box.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share with groups**.
2. Type the name of the group you want to share the file with and click the name to select it. Repeat this step to share with more groups.
3. Select access levels for each group. By default, private group access is set to **Collaborator**, while public group access is set to **Viewer**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

4. Optionally, add a message to your post. You can @mention people and groups in your message to notify them and post the file in their feed.
5. Click **Share** and **Close**. The file is posted to each group you shared it with and @mentioned.

A private file shared with a private or unlisted group becomes a privately shared file and displays the privately shared icon (👤). The file is posted to the group's feed and only the file owner and group members can find and view the file. Any file shared with a public group is viewable by all users in your company, displays the your company icon (🏢), and is posted to the group's feed.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

Note:

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
- Content files may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:

[Group Files Lists](#)

[View Where a File is Shared](#)

Share Files with People in Salesforce Classic

Share files with people privately and set **Viewer** or **Collaborator** access for each person you share the file with.

Share a file privately so only specific people in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more users in your company:

1. Start by sharing the file from one of these locations:
 - On the detail page of the file you want to share—Click  **File Sharing Settings** > **Share with people**. Or click **Sharing Settings** and then click **People** on the Sharing Settings dialog box.
 - Next to the file in a feed—Click **More Actions** > **File Sharing Settings** then click **People** on the Sharing Settings dialog box.
 - Next to the file on the Files home page—Click  **Share with people**.
 - On a file hoverClick  **Share File** then click **People** on the Sharing Settings dialog box.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share with people**.
2. Type the name of the person you want to share the file with and click the name to select it. .
3. Choose the file permission you want them to have. By default, they have [collaborator permission](#) which lets them view, download, share, change permission, edit the file, and upload new versions. Select **Viewer** to give them permission to view, download, and share files.
4. If you want to share the file with more people, enter more names.
5. Optionally, add information to the message that recipients receive.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

6. Click **Share** and **Close**. Recipients receive a message that you have shared a file with them, along with a link to the file. Lightning Experience users receive this message as an email notification. Salesforce Classic users get a private Chatter message on their My Messages page on the Chatter tab, and also get an email notification if they have email notifications for Chatter messages enabled.

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon (👤). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon (🏢) and anyone in your company can find and view it.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them. If you don't want others to change who can access the file, select **Prevent others from sharing and unsharing**.

 **Note:**

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
- Content files may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.
- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

SEE ALSO:

[View Where a File is Shared](#)

Share Files with Libraries

Share files with libraries to take advantage of the permission-setting capabilities of content libraries while still using the features of Salesforce Files.

If your administrator has turned on this feature for your organization, you can share any file with a library. The **Libraries** tab in Salesforce lists the libraries in your company along with the permissions assigned to each. The **Share with library** option in Chatter lets you share Chatter files with a library, leveraging the permissions set for the library.

 **Note:** Sharing files with libraries requires that:

- Your user detail page has the **Salesforce CRM Content User** setting enabled. Your administrator can enable this setting.
- Your organization has the **Files user interface allows sharing files with libraries** setting enabled. Your administrator can enable this setting on the Salesforce CRM Content page in Setup.

1. On the **Files** tab, click  next to the file you want to share with a library.
2. Select **Share with library**. Or, for external file references (only applicable for Files Connect users), select **Share a reference**, and choose **Library** in the **Sharing Settings** dialog box.
3. Do one of the following, depending on what happens next:
 - If the **Publish Content to Multiple Libraries** dialog box appears, this means the file is already managed by a library. Select one or more additional libraries, and click **Publish**.
 - If the **Share files with a library** confirmation message appears, it means that the file has been shared with people who have Collaborator access, or it has been synced. If you proceed, Collaborators and those who have synced the file will have only Viewer access. (A library administrator can give them editing access later.) Click **Share** to continue, or **Cancel** if you've changed your mind.
 - If the **Publish Content** dialog box appears, enter a title for the file. Select the library you want to share it with, and enter any tags as metadata. Select a record type, enter any optional information, and click **Publish**.

The file is now listed on the **Libraries** tab and in **Files in My Libraries** on the **Files** tab.

Prevent Others from Sharing and Unsharing a File

You can prevent others from sharing and unsharing a file you own. This doesn't affect existing shares.

1. On **Files** home, find the file you want.
2. Go to **Sharing Settings** or **Share File** for the file. (Or, if the file is in a library, open the Content Detail page from the **Libraries** tab.)
3. Select the **Prevent others from sharing and unsharing** checkbox.
4. Click **Save**.

Example: Let's say I post a file in Chatter, and share it with a private group. I'm okay with members of the group having access to the file, but I don't want them to share it further. I can prevent sharing and unsharing so the existing shares remain but new ones can't be added, except by me or an admin.

You can also prevent others from sharing and unsharing a file in the API by using the `SharingOption` field on `ContentVersion` and other objects.

Share Files with People in Lightning Experience

Share files with people privately and set **Viewer** or **Collaborator** access for each person you share the file with.

Share a file privately so only specific people in your company can see it. By default, anyone who can see a file can share it.

To share a file with one or more users in your company:

1. Start by sharing the file from one of these locations:
 - Next to the file on Files home—Click  **Share**.
 - On the detail page of the file you want to share—Click **Share**.
 - From the file preview player—Click 
2. Type the name of the person you want to share the file with and click the name to select it. Enter additional names if you wish to share with more than one person.
3. Choose the file permission you want them to have. By default, they have [collaborator permission](#) which lets them view, download, share, change permission, edit the file, and upload new versions. Select **Viewer** to give them permission to view, download, and share files.
4. Optionally, add information to the message that recipients receive.
5. Click **Share** and **Close**. Recipients receive a message that you have shared a file with them, along with a link to the file. Lightning Experience users receive this message as an email notification. Salesforce Classic users get a private Chatter message on their My Messages page on the Chatter tab, and also get an email notification if they have email notifications for Chatter messages enabled.

On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

From the Share File window, click **Who Can Access** to see everyone the file has been shared with. Update file permissions or click X next to the name of a person or group to stop sharing the file with them. If you want to prevent others from changing who can access the file, select **Prevent others from sharing and unsharing**.

Note:

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.
- Content files may be shared with more people than shown in **Share with People** if they are part of a content pack or delivery.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

See File Updates in Your Feed

Follow a File

Follow a file to see updates in your Chatter feed, including when a new version of the file is uploaded. If you stop following a file, the file remains in your Files list, but you won't see updates about it in your feed anymore.

Click **+ Follow** to start seeing updates, or click **x Unfollow** to stop seeing updates. In Lightning Experience, follow a file from the file detail page. In Salesforce Classic, follow a file from a feed, file detail page, or files list.

 **Note:** The option to follow files is only available in organizations that use Chatter.

SEE ALSO:

[Upload a New Version of a File](#)

View File Version History

The file detail page shows the current version number of the file. View the Version History list to see all versions of the file that have been uploaded, including the current version. From the list you can download the file, see who updated it and when, and see the description if provided. The file detail page always shows the most current version of a file.

SEE ALSO:

File Previews and Details

View File Details

To open file details, click a file name in a feed, on a files list, on a file hover, or by clicking **More Actions** > **Preview** next to the file in a feed. On the file detail page, you can see details about Salesforce Files.

From a file detail page, you can:

- View the file without downloading it. Use the arrow keys in the document previewer to see each page, zoom in or out, or change the preview width and screen size. Files owners and anyone with access to the file can preview it.
 -  **Note:** Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.
- See if the file is private () , privately shared () , or shared with your company () .
- Click  **Download** to open or save the file. Anyone who can see a file can download it.
- Click  **File Sharing Settings** to share a file with [people](#), [groups](#), or via [file link](#), or see the [Sharing Settings](#). By default, anyone who can see a file can share it.
- Click **Make private** on the Sharing Settings dialog box to remove the file and file link, if applicable, from everywhere it's been shared. Or click **Restrict access** if the file originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared except the library. Only owners and users with the "Modify all Data" permission can [make a file private](#) () or [restrict access](#).
- Click  **Upload New Version** to [update the file with a newer version](#). Only file owners, collaborators, and users with the "Modify all Data" permission can upload a new version of a file.
- Click  **Edit Details** to [edit the name or description of the file](#). Only file owners, collaborators, and users with the "Modify All Data" permission can edit file details.
- If you have the "Sync Files" permission and are the owner of the file, click  **Sync** to [sync a file](#) between your Salesforce Files Sync folder on your computer and Chatter. Click  **Unsync** to stop syncing the file.
- Click  **Delete** to [delete the file](#). Only file owners and users with the "Modify All Data" permission can delete files.
- See who the file is owned by and when it was last modified.
- See the file's description and click the edit icon () to [edit the description](#), or add a description by clicking **Add Description**.
- See the file's current version number and click **Show all versions** to see the file's [version history](#).
- Click  **Show file report** to [see data about the file](#), such as how many times the file has been downloaded, shared, liked, and commented on. **Show file report** is visible only to users with the "Run Reports" and "View Reports in Public Folders" permissions.
- Click  **Follow** to [follow the file](#) or click  to stop following the file.
- See who's following the file.
- See [who and what locations the file is shared with](#).
- If the file originated in Salesforce CRM Content, click **Go to Content Detail Page** to see the [content detail page](#) of that file. Most actions performed on files that originated in Salesforce CRM Content must be done on the file's [content detail page](#) instead of the file detail page.
- Click the **Files** or **Chatter** links at the top of the page to go to the Files list or the Chatter page.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

- See other files that people who viewed this file also viewed. If no other files have been viewed by the same people, the People Also Viewed section doesn't appear on the file detail page.

SEE ALSO:

[View File Version History](#)

[View Where a File is Shared](#)

Edit File Details

To edit a file's name and description:

1. On a file detail page, click  **Edit Details** or click the edit icon () next to the description.
2. Optionally, edit the file name and description.
3. Click **Save**.

If there is no description and you want to add one, click **Add Description** or click the edit icon () next to the description.

File owners, collaborators, and users with the "Modify All Data" permission can edit file details.

SEE ALSO:

[View File Details](#)

View Where a File is Shared

Find out who can see a file, and what level of access they have. From the File Detail page, you can access a full list of every person or object the file is shared with.

The **Shared With** list on a file detail page shows you who the file is shared with, and their level of access.

In Salesforce Classic, click **Show All** to open Sharing Settings, where you can:

- See who the file is shared with and their [permission](#): owner, collaborator, viewer, or no access.
- Click **People** on the Sharing Settings dialog box to [share the file with specific people](#).
- Click **Groups** on the Sharing Settings dialog box to [share the file with specific groups](#).
- Click **Library** to share the file with a library.
- Click **Anyone with link** on the Sharing Settings dialog box to [create and share a file link](#).
- Click **Make private** to remove the file and file link, if applicable, from everywhere it's been shared. Or click **Restrict access** if the file originated in a Salesforce CRM Content library to remove the file from everywhere it's been shared except the library. Only owners and users with the "Modify all Data" permission can [make a file private](#) () or [restrict access](#).
- On the Sharing Settings dialog box, click  next to a person's or group's name to stop sharing the file with them.

File and Content Engagement Report

See how many times a file has been downloaded, shared, liked, and commented on.

From the file detail page, click  **Show file report** to run and view the File and Content Engagement report, which has these fields.

Field	Number of times users...
Total Downloads	Downloaded the file.
Posts	Posted the file to a feed. This number doesn't count the number of times the file has been attached to comments on posts.
Post Comments	Commented on file posts in feeds.
Likes	Liked file posts on feeds. This number doesn't count likes received by comments on the file post.
Shares	Shared the file using Share with people and Share with groups . If a user clicks Share on a file post, it's counted as a post and not as a share.
Links	Shared the file using Share via link . If the file is uploaded to a Salesforce CRM Content library, then content deliveries are also counted.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To run and view a file report

- "Run Reports"

Example: Numbers in the File and Content Engagement report are cumulative for all versions of a file. For example, if there are 2 versions of the file, and version 1 has been downloaded 4 times while version 2 has been downloaded 5 times, then **Total Downloads** reports 9 downloads.

Sync Files

Get Started with Salesforce Files Sync

Salesforce Files Sync makes file management, syncing, and sharing easier than ever!

Watch a Demo: [Get Started with Salesforce Files Sync](#)

Getting started with Salesforce Files Sync is almost effortless. Just save your files in the Salesforce Files Sync folder on your desktop, and Salesforce Files Sync does the rest.

Access your synced files anywhere

Saving a file in Salesforce Files Sync means that the file is automatically available everywhere you need it. Just look in the Synced filter in Files home — it'll be there.

Share files right from the Salesforce Files Sync folder on your desktop

Right-click on a file to share it with people and groups in Chatter, or share the file with anyone using a link.

Always have the latest version of every file

Whenever you or one of your collaborators edit a file saved in the Salesforce Files Sync folder on your desktop, the file is instantly updated for everyone. Salesforce Files Sync supports versioning, so you can access older versions of the file, just in case.

Salesforce Files Sync System Requirements

Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Install Salesforce Files Sync

Install the Salesforce Files Sync client on your desktop to sync files between your computer, Salesforce, and Salesforce1 on mobile devices.

1. From your personal settings, enter *Files Sync* in the **Quick Find** box, then select **Salesforce Files Sync**. Multiple results? Select the one under Personal Setup.
2. Click **Download**.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.

After Salesforce Files Sync is installed, you're notified automatically when an update is available.

 **Note:** Salesforce Files Sync client must run on a local drive. External locations such as network drives or mounted devices are not supported.

Salesforce Files Sync System Requirements

Salesforce Files Sync runs best on systems that meet the minimum recommended system requirements.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later

System Requirement	Windows	Mac
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Connect Salesforce Files Sync to Other Salesforce Organizations

Configure Salesforce Files Sync to connect to other Salesforce organizations.

After disconnecting Salesforce Files Sync from one Salesforce organization, your synced files are backed up in a folder called "Salesforce Files_Old." On Windows, the backup folder is located at `C:\Users\User Name\Salesforce Files_Old` where *User Name* is your Windows user name. On Mac, the backup folder is located at `/Users/User Name/Salesforce Files_Old` where *User Name* is your Mac user name. Your synced files are always accessible online in the Salesforce organization they're synced with.

Warning: Before connecting Salesforce Files Sync to a new Salesforce organization, close all files and folders saved in your Salesforce Files Sync folder. Any files and folders that are open when you disconnect Salesforce Files Sync from a Salesforce organization aren't backed up and automatically sync with the next Salesforce organization that you connect Salesforce Files Sync to.

To sync files with a different Salesforce organization, set up a new connection for Salesforce Files Sync.

1. In your system tray or menu bar, right-click  **Salesforce Files Sync**.
2. Click **Preferences**.
3. If necessary, click **Log out** to disconnect your from your current Salesforce organization.
4. Under New Connection, enter a `Name` for the new connection.
5. Enter the `https://` login URL for your Salesforce organization.
6. Click **Log in**.
7. Enter your login credentials and click **Log in**.
8. Click **Allow** to enable Salesforce Files Sync.

After connecting to the new organization, any files you add to your Salesforce Files Sync folder sync with that organization. If you've already synced files with the organization that you're connecting to, the synced files automatically download to the Salesforce Files Sync folder on your desktop.

Sync Files and Folders

Sync files and folders by saving them in your Salesforce Files Sync folder on your computer or by clicking  **Sync** while viewing a file in a feed post, comment, file list, or file detail page.

Watch a Demo:  [Salesforce Files Sync](#)

Before you can sync files, you must install Salesforce Files Sync on your desktop.

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync folder on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.

USER PERMISSIONS

To sync files:

- "Sync Files"

You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files.

To sync your files:

1. From the Salesforce Files Sync client, either save your files in your Salesforce Files Sync folder or drag and drop the files you'd like to sync into your Salesforce Files Sync folder.

On Windows, your Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, your Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name.

From the **Files** tab, a feed post, or anywhere in the full Salesforce site where a file is posted or listed, click  **Sync**.

2. The files sync.

After your files sync, you can easily access them in Salesforce and in Salesforce1 on mobile devices. If you delete a file from your Salesforce Files Sync folder, you can still access the file in the Owned by Me filter in Files home.

Access Synced Files on Your Computer, Online, and on Mobile Devices

Access synced files in your Salesforce Files Sync folder on your desktop, in Salesforce online, and in Salesforce1 on your mobile device.

Find Synced Files on Your Desktop

On your desktop, your synced files are kept in your Salesforce Files Sync folder. On Windows, the Salesforce Files Sync folder is located at `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, the Salesforce Files Sync folder is located at `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name.

To open your Salesforce Files Sync folder from your system tray or menu bar, right-click  **Salesforce Files Sync** > **Open Salesforce Files Sync Folder**.

 **Warning:** Moving your Salesforce Files Sync folder from its default directory location prevents file syncing. To ensure that your files always sync, don't move your Salesforce Files Sync folder.

Find Synced Files in Salesforce

In Salesforce, your synced files are available in Files home.

From Files home, click **Synced** to view your synced files and folders. Your most recently synced files are listed first.

Find Synced Files on Your Mobile Device

On your mobile device, your synced files are accessible in Salesforce1.

From Files home, tap  and select **Synced** to view a list of your synced files.

Working with Synced Files and Folders

Synced files and folders are just like any other file in Salesforce, but they have a few additional features.

Synced files are private by default. That means that after saving a file in your Salesforce Files Sync on your desktop, only you can access it in Salesforce online. Collaborate with others by sharing your synced files.

You always have the latest version of synced files available in your Salesforce Files Sync folder on your desktop, online in Salesforce, and in Salesforce1 on mobile devices. Just like other files in Salesforce, you can access previous versions of synced files in Chatter.

SEE ALSO:

[Personalize Your Salesforce Experience](#)

Share Synced Files

Synced files can be shared directly from the Salesforce Files Sync folder on your desktop.

Share synced files with people and Chatter groups in your organization, or people outside your organization using a generated link. Synced files are private by default, but when you share them you can assign view-only or collaborator privileges.

If you share a file with a person or group with Collaborator rights, then when collaborators download, edit, and upload a new version of the file, you'll get the latest version automatically synced. When you edit and sync a new version of the file, the people and groups you've shared with will automatically get the latest version too.

To share a file directly from your Salesforce Files Sync folder:

1. On your desktop, in your Salesforce Files Sync folder, right-click the file you'd like to share.
2. Choose a menu option under **Salesforce Files Sync**: share with people in your organization, with Chatter groups, or with people outside your organization via link.
3. When prompted, enter the names of the people or groups in your organization, assign `Viewer` or `Collaborator` permission, and enter an optional message to share the file with them. If you're sharing the file via link, copy the link.
4. Click **Share**.
An email notification is sent to everyone you shared the file with.

Manage Versions of Synced Files

Just like all Salesforce files, you can work with prior versions of a synced file as needed.

After you first sync a file, you see that file as Version 1 in your files list. If you make changes to it on your computer or mobile device, a new version is automatically created each time you save the file. To view previous versions, just visit the file detail page.

Anyone who is following the synced file receives a notification in their Chatter feed when new versions are created. File collaborators can upload new versions of your synced files.

 **Warning:** If a synced file is open on your desktop when a collaborator uploads a new version, then you won't receive the new version until you close the file without saving. If you save your open file, your version will overwrite your collaborator's changes.

Salesforce Files Sync Limits

Be aware of file syncing limits while using Salesforce Files Sync.

Feature	Limit
Organization-wide storage	Storage is based on the number of Salesforce licenses purchased. Additional storage can be purchased. For more information, refer to Salesforce Files Sync Storage Limits .
Maximum number of synced files	Users can sync up to 10,000 files.
Maximum number of synced folders	500 folders

Feature	Limit
File size	<ul style="list-style-type: none"> • 2 GB when uploaded via the Web interface • 2 GB when uploaded via the Salesforce Files Sync desktop client (or 500 MB when using proxy) • 100 MB when uploaded from a mobile device
Maximum number of versions per file	2,048
Maximum number of users who can sync the same file simultaneously	1,000 users
Maximum number of Connect API calls	<p>10,000 per user, per hour, per connected application from the Salesforce Files Sync desktop client</p> <p>Salesforce Files Sync temporarily stops syncing files if you reach the Maximum number of Connect API calls. Syncing resumes automatically in about an hour.</p>

Salesforce Files Sync continues to sync existing files, but won't sync new files if:

- Your Salesforce Files Sync folder exceeds 10 GB of files.
- Your organization reaches its shared file storage limit.
- Your Salesforce Files Sync folder contains more than 10,000 files or 500 folders.
- The new file's file size exceeds the individual file size limit.

Salesforce Files Sync stops syncing files if:

- You move your Salesforce Files Sync folder from its default directory location. On Windows, the default directory location is `C:\Users\User Name\Salesforce Files`, where *User Name* is your Windows user name. On Mac, the default directory location is `/Users/User Name/Salesforce Files`, where *User Name* is your Mac user name. Salesforce Files Sync resumes syncing after the Salesforce Files Sync folder is returned to the default directory location.

Salesforce Files Sync Storage Limits

Two storage limits affect Salesforce Files Sync: shared organization-wide storage and individual storage.

Shared Organization-Wide Storage

Your organization's shared file storage is calculated by multiplying a per-user file storage allocation by the number of users in your organization and adding a per-organization allocation. For example, a Professional Edition org with 10 users receives 11 GB of file storage, or 100 MB per user multiplied by 10 users plus an additional 10 GB. A Professional Edition org with 100 users receives 20 GB of file storage, or 100 MB per user multiplied by 100 users plus an additional 10 GB.

If your organization is using its entire shared storage allocation, then Salesforce Files Sync will continue to sync your existing files, but won't sync new files unless you or your organization removes existing files or purchases more storage from Salesforce.

Salesforce Edition	File Storage Allocation Per Organization	File Storage Allocation Per User License
Contact Manager	11 GB	612 MB

Salesforce Edition	File Storage Allocation Per Organization	File Storage Allocation Per User License
Group	11 GB	612 MB
Professional	11 GB	612 MB
Enterprise	11 GB	2 GB
Performance	11 GB	2 GB
Unlimited	11 GB	2 GB
Developer	20 MB	N/A
Personal	20 MB	N/A

 **Note:** If your organization uses custom user licenses, contact your administrator to determine if these licenses provide additional storage.

Individual Storage

Salesforce Files Sync syncs up to 10 GB of files between the Salesforce Files Sync folder on your desktop, Salesforce on the Web, and mobile devices with Salesforce1. Salesforce Files Sync will continue to sync your existing files, but won't sync your new files if you add more than 10 GB of files to your Salesforce Files Sync folder. If you reach the individual 10 GB storage limit, you must remove existing files to sync new files.

File Names and Extensions that Prevent Syncing

Some file characteristics can prevent files from syncing between your devices and the Web.

- Zero-byte files
- Files without an extension
- Files with names that start with:
 - AUX.
 - CLOCK\$.
 - COM1.
 - COM2.
 - COM3.
 - COM4.
 - COM5.
 - COM6.
 - COM7.
 - COM8.
 - COM9.
 - CON.
 - LPT1.
 - LPT2.

- LPT3.
- LPT4.
- LPT5.
- LPT6.
- LPT7.
- LPT8.
- LPT9.
- NUL.
- PRN.
- ~
- .
- Files with these names:
 - desktop.ini
 - thumbs.db
 - .DSStor
- Files with these extensions:
 - .tmp
 - .conflicted
 - .part
 - .partial
 - .download
 - .crdownload
 - extensions starting with .sb-
- Different operating systems have different file name restrictions. Salesforce Files Sync syncs any file whose name is allowed by your operating system. That means that if you can name a file on your desktop, you can sync it using Salesforce Files Sync. If you sync a file from Mac[®] OS X[®], it will sync to the Web, but if the file name isn't allowed by Microsoft Windows[®], the file won't download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using these characters in file names:

- \ (backslash)
- : (colon)
- * (asterisk)
- ? (question mark)
- ' (apostrophe)
- < (less than sign)
- > (greater than sign)
- / (slash mark)
- | (pipe)
- TM (trademark symbol)
- ∞ (infinity sign)

- § (section)
 - • (bullet point)
 - ≠ (not equal to)
 - ` (grave accent)
 - “ (quotation marks)
 - … (ellipsis)
 - ≥ (greater than or equal to sign)
 - ≤ (less than or equal to sign)
 - & (ampersand)
- Files with names longer than 254 characters

Synced Folder Name Restrictions

Some folders aren't synced by Salesforce Files Sync because of folder name restrictions.

Different operating systems have different folder name restrictions. Salesforce Files Sync syncs any folder whose name is allowed by your operating system. That means that if you can name a folder on your desktop, you can sync it using Salesforce Files Sync. If you sync a folder from Mac® OS X®, it will sync to the Web, but if the folder name isn't allowed by Microsoft Windows®, the folder won't download to your Windows desktop.

To ensure all your files sync between all your computers, avoid using folder names that:

- Contain these characters:
 - / (forward slash)
 - \ (backslash)
 - : (colon)
 - * (asterisk)
 - ? (question mark)
 - “ (quotation marks)
 - < (less than sign)
 - > (greater than sign)
 - | (pipe)
- Exceed 255 characters
- Are identical to another folder name in the same directory

Delete a File from the File Detail Page

Click **Delete** on a [file's detail page](#) to delete the file and remove it from all locations where it's been shared. If the file is shared via link, anyone with the link will no longer have access to the file. To restore the deleted file, click on the **Recycle Bin** link on the **Home** page. Select the file and click **Undelete**. The file is restored as well as all of the shares that were associated with it.

 **Note:** Only file owners and users with the "Modify All Data" permission can delete files. To learn who can perform which actions on a file, see [Who Can See My File?](#)

[Authenticate to Files Connect External Data Sources](#)

If your administrator configured a data source like SharePoint to employ per-user authentication, provide your credentials for that system in Salesforce.

[Access and Share External Files Using Files Connect](#)

After your admin enables Files Connect, you can access files from external sources like Google Drive and SharePoint, or share them via feeds and Files home.

[Search for External Files with Files Connect](#)

Search an external data source like Google Drive, Box, or SharePoint right within Salesforce.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Authenticate to Files Connect External Data Sources

If your administrator configured a data source like SharePoint to employ per-user authentication, provide your credentials for that system in Salesforce.

[Set Up Authentication to an External Data Source](#)

When you connect to a Files Connect external data system for the first time, set up your authentication in just a few clicks.

[Manage Your External Data Source Authentication Credentials](#)

You or your Salesforce admin can set up and manage your authentication settings for external data sources using Files Connect. With valid authentication settings, you can access files from external systems right from Salesforce.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access cloud-based data sources like SharePoint Online:

- "Files Connect Cloud"

To access on-premises data sources like SharePoint 2010:

- "Files Connect On-premises"

Set Up Authentication to an External Data Source

When you connect to a Files Connect external data system for the first time, set up your authentication in just a few clicks.

If you haven't set up your authentication to an external data system in My Settings, you are prompted to authenticate the first time you try to access an external system in Salesforce. Click the link or button to complete most of the authentication automatically.

- If you are connecting to Box, Google Drive, SharePoint Online, or OneDrive for Business:
 1. Select **OAuth 2.0** as the authentication protocol.
 2. When you see a message requesting permission for Salesforce to access information from your external system, click **Allow**.
 3. After the authentication process has finished, you are redirected to Salesforce.
- If you are connecting to SharePoint 2010 or SharePoint 2013:
 1. You are redirected to Authentication Settings for External Systems.
 2. Enter your username and password credentials for the external system.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in:

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in:

Enterprise, Performance, Unlimited, and **Developer** Editions

USER PERMISSIONS

To access cloud-based data sources like SharePoint Online:

- "Files Connect Cloud"

To access on-premises data sources like SharePoint 2010:

- "Files Connect On-premises"

Manage Your External Data Source Authentication Credentials

You or your Salesforce admin can set up and manage your authentication settings for external data sources using Files Connect. With valid authentication settings, you can access files from external systems right from Salesforce.

Your admin defines external systems in external data sources and named credentials. Before you begin, your administrator:

- Sets up the external data source or named credential to use per-user authentication.
- Grants you access to the external data source or named credential.
- Tells you the authentication settings to enter.

If you don't see the expected settings or options, ask your admin for help.

1. From My Settings, enter *Authentication* in the *Quick Find* box, then select *Authentication Settings for External Systems*.
2. Click **New** to set up a new connection. Click **Edit** to modify an existing external data source.
3. From the *External System Definition* menu, select "External Data Source."
4. From the *External Data Source* menu, select a data source created by your administrator.
5. Select the authentication protocol required by the external system.

For SharePoint 2010 or 2013, set the following options.

Field	Description
Authentication Protocol	Choose Password Authentication
Username and password	Enter your SharePoint username and password

For Box, Google Drive, SharePoint Online, or OneDrive for Business, set the following options.

Field	Description
Authentication Protocol	Choose OAuth 2.0
Authentication Provider	Choose the provider created for this data source by your administrator
Scope	Leave blank
Start Authentication Flow on Save	Select to immediately verify your login credentials with the external data source. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org. Redo the OAuth flow when you need a new token—for example, when the token expires—or if you edit the Scope or Authentication Provider fields.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in:

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in:

Enterprise, Performance, Unlimited, and **Developer** Editions

USER PERMISSIONS

To access cloud-based data sources like SharePoint Online:

- "Files Connect Cloud"

To access on-premises data sources like SharePoint 2010:

- "Files Connect On-premises"

- Click **Save**.

SEE ALSO:

[Personalize Your Salesforce Experience](#)

Access and Share External Files Using Files Connect

After your admin enables Files Connect, you can access files from external sources like Google Drive and SharePoint, or share them via feeds and Files home.

Download or Share Files on Files Home

Download external files to your local system or share them with a general set of people in your organization from Files home.

- Navigate to Files home.
- The External Files list in the left column shows available external data sources. Select one and navigate through the folders, or use the search bar to find a file.

 **Note:** Salesforce supports Google documents, spreadsheets, presentations, and drawings. In the Recent list, Google Drive content is limited to the 24 most recently accessed documents from the last 30 days.

- Click  next to the file name, and choose one of the following:
 - Open** the file in the external data source, such as SharePoint.
 - Download** the file to your local system. (From on-premises systems like SharePoint 2010, 2 GB is the maximum download size.)
 - Share** the file either as a copy or as a reference. Your admin has determined which type of sharing is used at your organization. When sharing, you do one of the following:
 - Share a copy** of the external file stored in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system. Salesforce Files won't reflect any revisions to the file in external systems.
 - Share a reference** to the external file stored outside Salesforce. Files can be downloaded only by users with access to the external system. (Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup). Salesforce Files won't reflect any revisions to the file in external systems, but the reference does point to the latest version of the file in those systems.

 **Note:** To download files referenced from an external system, users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup.

When a user selects an external file from the file selector, a file reference or copy is created in Salesforce. If a file reference already exists, it is reused.

Share Files in the Feed

If you want to include external files in a specific Chatter conversation, use the feed. All files shared in the feed are either copies or references, as determined by your administrator.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To access cloud-based data sources like SharePoint Online:

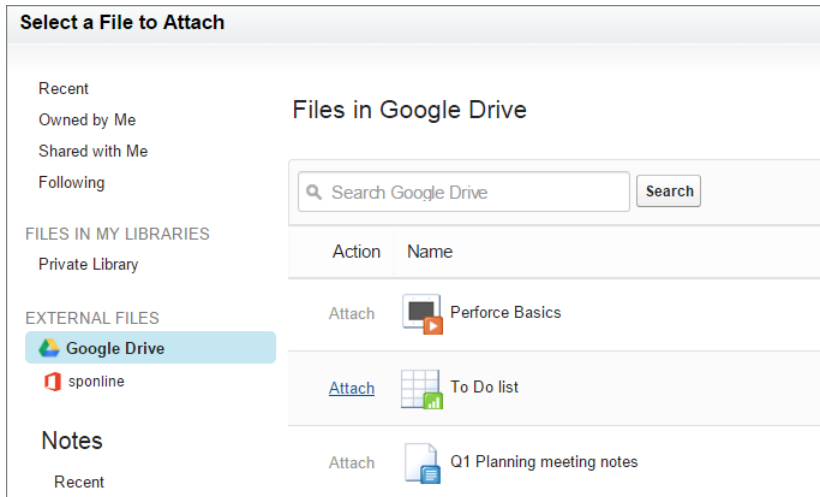

- “Files Connect Cloud”

To access on-premises data sources like SharePoint 2010:

- “Files Connect On-premises”

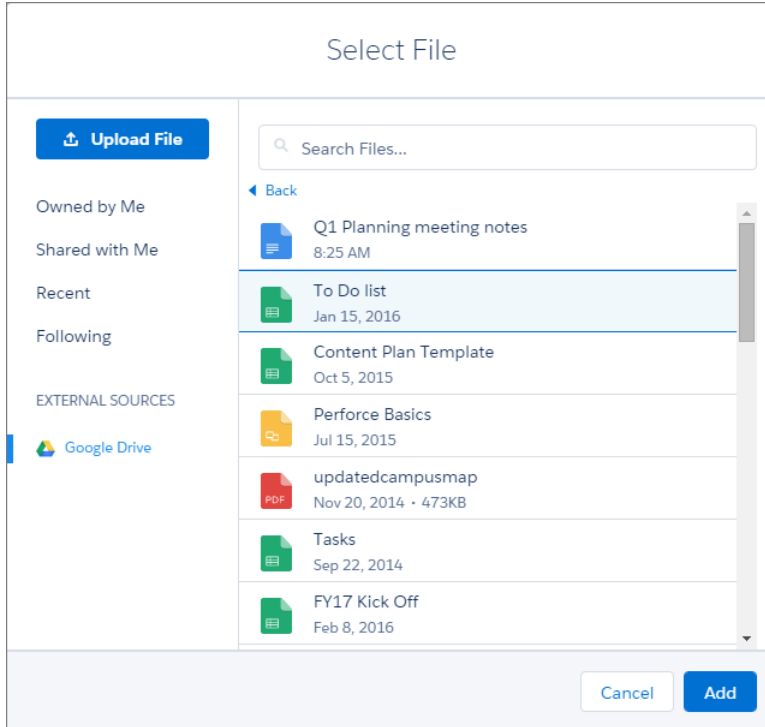

In Salesforce Classic

1. While authoring a post, click **File** above the feed, and then click **Select a file from Salesforce**.
2. In the left column, click the external source, such as SharePoint.
3. Next to the file you want to share, click **Attach**.
4. In the body of your post, @mention the groups or people you want to share with.

In Lightning Experience

1. While authoring a post, click the paperclip icon below the post to open the Select File window.
2. From the left column, click the external source, such as SharePoint or Google Drive.
3. Select the file you want to share and click **Add**.
4. In the body of your post, @mention groups or people that you want to share with.

SEE ALSO:

- [Share Files with Groups](#)
- [Share Files with Libraries](#)

Search for External Files with Files Connect

Search an external data source like Google Drive, Box, or SharePoint right within Salesforce.

Search in a Specific External Data Source

In Salesforce Classic

1. From the left column of Files home or your Chatter feed, click the data source name.
2. In the search box, enter terms such as *document title* or *author*. (The specific information you can search for depends on the configuration of the external data source.)

-  **Note:** You can also search external data sources from the file selector when attaching a file to a Chatter post. In Salesforce Classic, click **File** above the feed, and then select a file from Salesforce. In Lightning Experience, click the paperclip icon below the post to open the Select File window.

Search Globally for Salesforce and External Data

If your administrator enables global search for an external data source, you can conveniently search its contents along with your Salesforce data.

In Salesforce Classic

1. In the global search box at the top of the Salesforce window, enter your search terms.
2. To filter the results down to a specific external data source, click its name in the left column (for example, "SharePoint Online").

-  **Tip:** If you often want to see content from a specific external data source, pin it to the top of global search results: In the left column, hover over the data source name, and click the pin icon. (If you don't see the data source listed, click Search All.)

In Lightning Experience

1. From Files home, enter a search term into the global search box in the header.
2. You can filter your search results to return only Files by selecting "in Files" after entering your search in the global search box, or by doing a global search and then selecting Files from the global search results.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited, and Developer** Editions

Document Library Overview

Each document that is stored in the document library resides in a folder. The folder's attributes determine the accessibility of the folder and the documents within it.

Document libraries store documents that aren't attached to records. Access your library documents via the Documents tab. If your Documents tab is not visible, customize your display to show it.

 **Note:** The Documents tab is not part of Salesforce CRM Content.

SEE ALSO:

[Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#)

Documents Home

Clicking on the Documents tab displays the documents home page.

 **Note:** If the Documents tab is not visible, you can customize your display to show it.

- Under **Find a Document**, enter keywords to search for a document.
- In the **Document Folders** section, select a folder to view all the documents contained in that folder.
- The **Recent Documents** section displays the last ten or twenty-five documents you viewed, with the most recently-viewed document listed first. This list is derived from your recent items and includes records owned by you and other users. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display.
- In the **Recent Documents** section, click **New** to upload a new document.

 **Note:** The Documents tab is not part of Salesforce CRM Content.

View Document Lists

The documents list page displays a list of documents in a selected folder. From this page, you can view detailed document information or manipulate the document.

- Click the document name to [view the document properties](#).
- Click **Edit** next to a document to [edit the document properties](#).
- Click **Del** to [move the document to the Recycle Bin](#).
- Click **View** to open the file in its associated application. If a file type is not recognized or the application is not loaded on your machine, Salesforce displays a standard download dialog prompting you to choose a save option.
- Choose a folder to view a list of documents stored in that folder.
- Click any column heading to sort the documents in ascending or descending order by the information in that column.
- At the top of the list, click a letter to display the contents of the sorted column that begin with that character.
- Click **Next Page** or **Previous Page** to go to the next or previous set of documents.
- At the bottom of the document list, select **fewer** or **more** to view a shorter or longer display list.
- Click **Printable View** to display the current list view in a format that is ready for printing.

 **Note:** If you can't find a document, you may not have access to the folder that contains it.

Upload and Replace Documents

Uploading a New Document

To upload a document:

1. Click **New Document** from the Documents tab or click **New** next to **Recent Documents** on the documents home page. If you do not have a New Document option, check if you have the correct permissions.
2. On the Upload New Document page, specify a descriptive `Document Name`. If you want to use the file name, leave this field blank. The file name will appear automatically when you upload the file.
3. If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.
4. You can check one of the following:
 - `Indicate Document is Internal`: When checked, a flag is added to the document indicating that document viewers should not share the file outside of the organization.

 **Note:** Checking this box does not expressly enforce any security rules.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

To change document properties:

- "Edit" on documents

To replace documents:

- "Edit" on documents

To delete documents:

- "Delete" on documents

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To upload new documents:

- "Create" on documents

To replace documents:

- "Edit" on documents

- **Externally Available Image** if the document is an image, such as a logo, that's not confidential. Check this box to:
 - Make the image available from HTML email templates without requiring a Salesforce username and password
 - Use the image as a custom tab icon or custom app logo, which do require a Salesforce username and password to view
 - Display the image as a custom logo in meeting requests

The **Indicate Document is Internal** and **Externally Available Image** checkboxes are mutually exclusive; you cannot select both.

5. Select a folder for the document.
6. Enter a description to use later as search criteria.
7. Enter keywords that you can use later as search criteria.
8. Select a document or path option.
 - To upload a document, click **Browse**, choose the file, and click **Open**.
 - To store a link to the document, enter the location of the document. Enter a path and file name or a URL such as:
C:\Quotes\quote.doc, \\Server\Departments\Marketing\logo.doc, or
<http://www.salesforce.com>.
9. Click **Save**.

Replacing a Document

To replace a document with an updated version:

1. Display the document you want to replace. For instructions on locating a document in the document library, see [Search for Documents](#).
2. Click **Replace Document**.
3. Select a document or path option.
 - To upload a replacement, click **Browse**, choose the file, and click **Open**.
 - To store a link to the replacement, enter the location of the replacement. Enter a path and file name or a URL such as:
C:\Quotes\quote.doc, \\Server\Departments\Marketing\logo.doc, or
<http://www.salesforce.com>.
4. Click **Replace Document**.

Tips for Uploading or Replacing Documents

- Documents stored as links cannot be attached to emails, but they save space in your document library.
- If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.
- Salesforce stores the most recent upload date as the modified date.
- You can upload documents that have file names of up to 255 characters including the extension.
- The size limit for any document you upload is 5 MB. The maximum size for a custom-app logo is 20 KB.
- Your organization's used file storage includes all files stored in the document library.

- If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`.

SEE ALSO:

[Display and Edit Document Properties](#)

Search for Documents

To find specific documents, use the **Find Document** button on the documents home page.

1. Click the Documents tab.
2. Enter your search terms. Salesforce searches the following fields:
 - Document Name
 - Keywords
 - Description
3. Click **Find Document**.

The search returns a list of documents that match all your search terms. The search results are listed in order of the closest matches. The `Keywords` and `Document Name` fields are used to determine the closest matches. The fields you see are predefined and cannot be changed.

 **Tip:** Use quotation marks around a phrase to search for the words in that sequence. For example, a search for *"my logos"* returns documents whose fields or content contains that exact phrase, as well as *my* and *logos*. Without quotation marks, your search returns any document whose fields or content includes any of the words in the search. For example, *my logos* returns documents whose fields or content contains *my* and *logos*.

4. Select any document to jump directly to the detail page for that document, or click **View** to open the document in a new window.

If your administrator enables document content search, Salesforce also performs a full-text search of the document. When a new document is uploaded or an old one is replaced, its contents are available for searches.

 **Note:** Salesforce automatically determines if the contents of a document can be searched. If the `Document Content Searchable` property is checked on a document, then its contents have been processed successfully and can be searched. If your document is large, it may take several minutes before Salesforce searches the contents of a document and marks the `Document Content Searchable` property.

You can also find documents using global search.

1. Enter your search terms in the header search box.
2. Select **Search Options...** from the drop-down and select `Documents` to narrow your search results.
3. Click **Search**.

The following file types are supported for a document content search.

 **Note:** The contents of documents that exceed the maximum sizes are not searched; however, the document fields are still searched. Only the first 1,000,000 characters of text are searched. Text beyond this limit is not included in the search.

File Type	File Extensions	Maximum Size
HTML (only the text within a <code><body></code> tag)	<code>.htm</code> , <code>.html</code> , <code>.xhtml</code>	5 MB

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To view documents:

- "Read" on documents

File Type	File Extensions	Maximum Size
PDF	.pdf	25 MB
PPT	.pot, .pps, .ppt	25 MB
RTF	.rtf	5 MB
Text	.c, .cpp, .css, .csv, .ini, .java, .log, .sql, .txt	5 MB
Word	.doc, .dot	25 MB
XLS	.xls, .xlt	5 MB, or a maximum cell limit of 100,000 cells
XML	.xml	5 MB

In some instances documents are not searched. These include:

- If a file extension is changed to a different format, it is not searched, even if both extensions are valid. For example, a .txt file that is renamed to .rtf is not searched.
- PDF and Word documents may have security restrictions that prevent them from being searched. To ensure that the content is searchable, the “content extraction” property on your file must be set to “Enabled” when creating your document.

SEE ALSO:

[Search for Content](#)

[Search for Files](#)

Delete Documents

To delete a document, click **Del** next to the document on the documents list page. Alternatively, click **Delete** on the documents detail page.

When you delete a document, Salesforce stores it in the Recycle Bin. You can restore the document to your document library within that time by clicking **Undelete** from the Recycle Bin.

Note:

- You can delete any document in your personal folder but you can only delete a document in a public folder if you have the “Manage Public Documents” permission.
- If you delete a document that's included in a letterhead or HTML email template, any emails using the letterhead or template display a broken link in its place. You can fix the broken link by removing the document from the Recycle Bin.
- You can't delete a document that's being used as a custom logo in meeting requests. To delete it, you must either select another document to use as a logo or uncheck the option to display a custom logo in meeting requests.

[Change Document Authors](#)

Document Properties

Below is a description of the properties in alphabetical order that are stored for each document in the document library.

Field	Description
Author	The main point of contact for a document. Initially, the person uploading the document is the author. Thereafter, the author can be any selected user.
Created By	The name of the person who originally uploaded the file.
Modified By	The name of the person who last uploaded the file.
Folder	The name of the folder that contains the document.
Document Content Searchable	A checkbox that indicates if the content within a document can be searched via the Find Document button on the Documents tab. This checkbox is automatically set by Salesforce.
Document Name	The name of the document including its file extension.
Document Unique Name	A unique name used to refer to the document when using the Force.com API. In managed packages, this name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With this field, a developer can change certain components' names or titles in a managed package and the changes are reflected in a subscriber's organization.
Description	A statement distinguishing this document from others.
Indicate Document is Internal	A checkbox that adds a flag to the document indicating that document viewers should not share the file outside of the organization. Checking this box does not expressly enforce any security rules. The Indicate Document is Internal and Externally

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Field	Description
Externally Available Image	<p data-bbox="820 262 1437 325">Available Image checkboxes are mutually exclusive; you cannot select both.</p> <p data-bbox="820 357 1453 493">A checkbox that indicates if the document is an image available for HTML email templates, such as a logo in a letterhead, and does not require a Salesforce username and password to view in an email.</p> <p data-bbox="820 504 1437 609">This checkbox indicates if the document is an image used as a custom app logo or custom tab icon, which require a Salesforce username and password to view.</p> <p data-bbox="820 619 1453 724">The Indicate Document is Internal and Externally Available Image checkboxes are mutually exclusive; you cannot select both.</p>
Keywords	<p data-bbox="820 756 1453 861">An open text field containing one or more words that describe the document. The program checks for matches in this field when doing a search.</p>
Path	<p data-bbox="820 882 1429 945">Stored in place of Document Name if you prefer to create a link to the document instead of uploading it.</p>

Type	<p data-bbox="820 1029 1437 1260">The file type is determined by the file extension. For example, filename.ppt is recognized as a PowerPoint file. If the Don't allow HTML uploads as attachments or document records security setting is enabled for your organization, you cannot upload files with the following file extensions: .htm, .html, .htt, .htx, .mhtm, .mhtml, .shtm, .shtml, .acgi, .svg.</p>

SEE ALSO:

[Change Document Authors](#)

Change Document Authors

Since documents are stored in folders that control user access, documents do not have owners like other types of records, but they do have authors. The author represents the user that originally uploaded the document file.

To change the author of a document:

1. View the document you want to modify.
2. Click **Change** next to the `Author` field.
The **Change** link displays only on the detail page, not the edit page. If you do not see the **Change** link, you may not have sufficient privileges to change a document author.
3. Enter a new author name. Alternatively, click the lookup icon to choose from a list of users.
4. Check the `Send Notification Email` box if you would like to alert the new author of this change.

 **Note:** When you change document authorship, Salesforce does not change the document's visibility.

[Manage Libraries](#)

Salesforce CRM Content Overview

Organize, share, search, and manage content within your organization and across key areas of Salesforce with Salesforce CRM Content. Content includes all file types, from traditional business documents such as Microsoft® PowerPoint presentations to audio files, video files, Web pages, and Google® docs.

To learn the different ways files are used in Salesforce, see [Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).

Salesforce CRM Content simplifies content management by incorporating user-friendly features into the following tasks:

Organizing

Rather than keep files in folders that make content difficult to find, Salesforce CRM Content stores files in fully searchable file repositories known as libraries. Administrators can create

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To change documents:

- "Edit" on documents

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

multiple libraries based on any classification, such as department name, job function, or team, then configure user permissions within the library to balance content access with security. Authors assign descriptive labels called tags to help classify and organize content across libraries. You can view a list of all content that belongs to a particular tag or filter search results based on a tag or tags. Salesforce CRM Content also provides private libraries, which allow users to reduce the clutter on their desktops while using content-management benefits such as document search and version control.

Searching

The powerful Salesforce CRM Content search engine scans the entire body of the document as well as content properties such as the title, description, tags, categorization data, and author name. You can filter searches by featured content, file format, author, tags, libraries, or custom fields and then view the results with various levels of detail, providing an easy way to find relevant content quickly. If Chatter is enabled for your organization, you can also filter your search results by Chatter files. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare documents within a search result set.

Subscribing

Once a file is located, subscribing to it ensures that you receive an email notification when new versions are published or changes are made to the file's properties. You can also subscribe to authors, tags, and libraries, thus reducing the time spent searching for new or updated content. Notification emails will arrive real-time or once daily, depending on your preferences.

Previewing

In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

Contributing

Uploading new or revised files in Salesforce CRM Content is fast and easy. During the upload process you choose a library and record type for your file or Web link, write a description, assign one or more tags, and fill out any customized fields that help categorize and define your content. Version management does not require checking files in and out, rather, you simply upload a new version of the file and Salesforce CRM Content maintains a version list accessible from the content details page. You can download past versions of a file and read all reason-for-change comments that an author may have included with a new version.

Reviewing Usage and Providing Feedback

Salesforce CRM Content provides several methods for determining whether content is valuable to readers. Featuring a piece of content increases its visibility in search results. Voting thumbs up or thumbs down on a file, Web link, or Google doc and adding comments allow you to participate directly in content improvement. You can also see who has subscribed to a file, link, or doc and how many times files have been downloaded. The Reports tab allows you to create standard or custom reports on Salesforce CRM Content data. If the content delivery feature is enabled, you can send content to colleagues, leads, and contacts and then track how often the content has been previewed or downloaded.

Sharing Content in Salesforce

Salesforce CRM Content is also integrated with leads, accounts, contacts, opportunities, cases, products, and custom objects. If Salesforce CRM Content functionality is enabled on the Opportunity tab, for example, Salesforce CRM Content uses the fields on the opportunity detail page to search for files that may be relevant to that opportunity. You can drill down in the search results as needed or run your own search and then attach one or more files to the opportunity. The most current version of the file will be available on the detail page for the life of the opportunity.

Sharing Content in Salesforce Classic Mobile

Salesforce CRM Content is available in Salesforce Classic Mobile. Users can share content with customers and colleagues from the mobile application when they're away from their desks. Ask your administrator to set up mobile Content.

SEE ALSO:

[Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#)

Contribute Content

Publish Files to Libraries

Publish files to libraries by uploading them from your computer, contributing them from your private library to a shared library, or sharing them from Chatter.

1. On the **Libraries** tab, do one of the following:

- To upload a file, click **Contribute** and choose a file from your local drive.
- To publish files from your private library, click the **My Private Files** tab, select one or multiple files, and click **Publish Selected**.

Or, to share files from Chatter with a library, see [Share Files with Libraries](#) on page 2951 (and skip the rest of these steps).

2. Enter a title for each file. Optionally, enter descriptions.

3. If you are adding a new file that you just uploaded, choose either **Save in my private library** or **Publish to a shared library**. If you choose the second option, select a library. This becomes the managing (home) library, meaning that the content can be shared with another library but only revised by a user with author permissions in the managing library.

4. Optionally, choose a language. The **Language** drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.

5. To publish the content on behalf of another author, choose that author from the drop-down list.

6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:

- If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
- If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
- If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

7. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.

8. After completing the custom fields, click **Publish** or **Save**.

Note:

- Unique values in custom fields that are set for the first version of a file aren't included if you upload a new version. You can set the unique values in the new version as long as they aren't the same as a previous version.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To upload and publish files to a public library:

- **Manage Libraries** checked in your library permission definition

OR

Add Content checked in your library permission definition

To upload and save files to a private library:

- **None**

- Files published to a shared library are added to your Files tab and available to other Chatter users in your organization. Files published to your private library are added to your Files tab, but are private and not shared with anyone. For information about the different file tools and solutions in Salesforce, see [Differences Between Files, Salesforce CRM Content, Salesforce Knowledge, Documents, and Attachments](#).
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

Upload and Publish Content

Add files to libraries to take advantage of the permission setting and content delivery capabilities of Salesforce CRM Content.

The Libraries tab has several publishing-related options at the top of the page that let you upload, classify, and publish files, content packs, Web links, and Google docs in Salesforce CRM Content.

 **Note:** The **Add Google Doc** button on the **Libraries** tab is available only if your Salesforce admin has enabled the Add Google Doc to Salesforce service.

To publish files, Web links, and Google docs in Salesforce CRM Content, or to create content packs, refer to the following topics:

- [Publish Files to Libraries](#)
- [Contribute Web Links to Salesforce CRM Content](#)
- [Create and Modify Content Packs in Salesforce CRM Content](#)

SEE ALSO:

[Update Content Versions](#)

[Creating Content Deliveries](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To upload and publish files and Web links:

- **Manage Libraries** checked in your library permission definition

OR

Add Content checked in your library permission definition

To publish Google docs:

- Google Apps account

Salesforce CRM Content File Size Limits

The following are maximum file size limits for files in Salesforce CRM Content:

- 2 GB
- 2 GB (including headers) when uploaded via Chatter REST API
- 2 GB (including headers) when uploaded via REST API
- 38 MB when uploaded via SOAP API
- 10 MB when uploaded via Bulk API
- 10 MB for Google Docs
- 10 MB when uploaded via Visualforce

SEE ALSO:

[File Size Limits in Salesforce](#)

Contribute Web Links to Salesforce CRM Content

To classify and publish a Web link in Salesforce CRM Content:

1. Click the **Libraries** tab.
2. To add a new link, click **Contribute > Do you want to link to a website instead?**, then enter the URL, and click **Contribute**. To publish a link that is already in your private library, click the **My Private Files** tab, locate the link, and click **Publish**.
3. Assign a title and description to your Web link.
4. Choose a library. This becomes the managing (home) library, meaning that the Web link can be shared with another library but its content details page can only be edited by a user with relevant permissions in the managing library. If you do not want the link to be visible to other users in your organization, choose **Save in my private library**.
5. Optionally, choose a language. The **Language** drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
6. To publish the content on behalf of another author, choose that author from the drop-down list.
7. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.

Update Content Versions

Clicking a file name on any Salesforce CRM Content tab opens the content details page.

Publishing a New Version

To publish a new version of the file and update its properties:

1. Click **Edit** > **Upload New Version**. This option does not appear for Web links, content packs, or Google docs.
 - To add or remove files from a content pack, see [Create and Modify Content Packs in Salesforce CRM Content](#).
2. Click **Browse** to find and select the updated file.
3. As needed, update the **Title** and **Description** fields.
4. Fill out the **Reason for change** field. This text is included on the email notifications sent to subscribers and the version list located on the content details page.
5. To publish the content on behalf of another author, choose that author from the drop-down list.
6. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the **Tags** field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the **Tags** field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the **Tags** field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
7. Update any custom fields as needed.
8. Click **Publish**.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To add a new version:

- **Add Content** checked in your library permission definition

Notes on Content Versions

Consider the following information when creating or modifying a new version:

- You cannot edit a file within Salesforce CRM Content. To edit a file, download it from Salesforce CRM Content to your computer, make your changes, then upload the updated version using the **Upload New Version** button.
- The Versions subtab on the content details page lists all content versions. The Recent Activity list on the Libraries tab also notifies users of new content versions.
- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

SEE ALSO:

[Upload and Publish Content](#)

Delete, Archive, and Restore Content

There are two methods for removing content from libraries: archiving and deleting.

Archiving lets you continue to store files in Salesforce without them being in a library or exposed in search results. Deleting files moves them to the **Recycle Bin**, where files remain for 15 days before being permanently, automatically deleted. Within 15 days of deleting a file, you can restore it from the **Recycle Bin**. You can also restore archived files.

Before you delete or archive content, it's important to know what's similar and different about these two methods:

Effects of Archiving or Deleting Content	Archived Content	Deleted Content
Counts towards file storage limits (storage size as well as number of documents)	✓	
Removed from libraries	✓	✓
New versions can no longer be uploaded	✓	✓
Content can no longer be downloaded (until restored)	✓	✓
Content no longer appears in search results	✓	✓
Content can be restored	✓	✓
Automatically removed from subscription lists (without notifying subscribers)	✓	✓
Permanently deleted by emptying recycle bin		✓

To archive or delete content files:

1. On the **Libraries, Content**, or **Subscriptions** tab, click the name of the file you want to remove.
2. On the **Content Details** page, click **Edit > Archive Content** or **Edit > Delete Content**.

To delete files in content packs:

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To archive and restore any content in the library:

- **Archive Content** checked in your library permission definition

To archive and restore content that you published:

- **Add Content** checked in your library permission definition

To delete content:

- **Delete Content** checked in your library permission definition

- By default, you must first delete the content pack, and then delete the file.
- If your admin has enabled the Salesforce CRM Content setting that allows files to be deleted from content packs, you can delete a file without having to first remove it from a content pack. This removes all versions of that file from all content packs, including content packs you don't have access to, like those in Private Libraries.

To restore archived content files:

1. Do one of the following to open the **Content Details** page for an archived file:
 - Follow a bookmark to the archived content.
 - On the **Libraries** tab, click a library name to open the **Library Details** page. Click the **View Archived Content** link to see a list of archived content on the **Content** tab. Click the name of the content file you want to restore.

 **Note:** The **View Archived Content** link only displays if you have the `Archive Content`, `Add Content`, or `Manage Libraries` privileges in your library permission. If you have the `Archive Content` or `Manage Libraries` privileges, you will see a list of all archived content in the library, regardless of author. If you do not have those privileges but have the `Add Content` privilege, you will only see archived content that you authored and archived.

2. On the **Content Details** page, click **Edit > Restore Content**.

To restore deleted content:

1. On either the **Libraries** or **Subscriptions** tab, or on the **Content Details** page, go to the **Recycle Bin**.
2. Select the checkbox for the content file you want to restore, and click **Undelete**.

 **Note:**

- Authors can always archive and restore their own content. Authors do not require the `Archive Content` library permission option.
- If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.
- Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

SEE ALSO:

[Delete a File from the File Detail Page](#)

Create and Modify Content Packs in Salesforce CRM Content

A *content pack* is a collection of related documents or files that are stored as a group in Salesforce CRM Content. For example, you may want to create a content pack with a product list, price quote, and contract to send to a particular customer. Any file in Salesforce CRM Content can be added to a content pack, from traditional business documents such as Microsoft® PowerPoint presentations and Adobe® PDF files, to audio files, video files, and Google docs. Using email or instant messaging, you can distribute the content pack to colleagues in your organization or leads and contacts outside your organization. The recipient of a *content delivery* can click a single URL to open a preview player with which he or she can preview and download the content. You can then view tracking information to see how often the content pack was viewed and which documents were downloaded. .

 **Note:** Content packs support all files types; however, the preview player launched by the content-delivery URL displays only PowerPoint, Word, Excel, and PDF files. The preview player does not display copy-protected PDFs. Also, working with content packs requires Adobe Flash® Player, version 9.0.11.5 or higher. If you do not have Flash installed, Salesforce provides a link to Adobe's website where you can download Flash for free.

To work with content packs:

1. Depending on whether you want to create, customize, or modify a content pack, use one of the following options:

 **Note:** The following options are available only if `Enable content pack creation` is selected on the Salesforce CRM Content page in Setup . If content pack creation is disabled after packs have been created, Salesforce doesn't delete the packs, but they can't be customized or modified.

- To create a new content pack, click the **Libraries** tab and then choose **Create New > Content Pack**.
 - To create a new content pack by copying an existing pack and adding, removing, or reordering files, open the content details page for the pack and click **Clone & Customize**.
 - To update a content pack and publish a new version, open the content details page for the pack and click **Edit > Edit Content Pack**.
2. Click **Search files** to display all the content in your libraries. To refine your results, select a specific library to search or enter a search term in the text box.

In addition to files and documents, search results also list content packs.

3. Drag the desired content from the search results into the assembly section in the lower half of the window. The following options help you assemble your content pack:
 - In the search results, click a document to preview it in the lower half of the window. Choose **Add to Content Pack** or **Hide preview** as needed.
 - In the search results, hover over a document and click the folder icon () to view the content packs that use the document.
 - In the search results, hover over a content pack and click the folder icon () to view all the documents in the pack.
 - In the assembly section, hover over a document and click the garbage can icon () to remove that document from the pack you are assembling.
 - Click **Clear** at any time to revert your changes; click **Cancel** to return to the Libraries tab.

 **Note:** The maximum number of files that can be included in a content pack is 50.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or modify content packs in Salesforce CRM Content:

- `Manage Libraries` checked in your library permission definition
- OR
- `Add Content` checked in your library permission definition

4. When you are done assembling or modifying your content pack, click **Save** and assign or change the content pack's name.
5. In the Save or Publish Content dialog:
 - a. Select a library. If you do not want the content pack to be visible to other users in your organization, for example if your work is still in progress, choose **Save in my personal library**.
 - b. Optionally, add or modify the content pack's description.
 - c. Optionally, choose a language. The `Language` drop-down list is displayed if multi-language support is enabled. If you do not choose a language, Salesforce associates your content with your personal language setting. If users restrict their content searches to a particular language, only content associated with that language is displayed in the search result set.
 - d. If you are modifying the content pack, complete the `Reason for Change` field.
 - e. To publish the content on behalf of another author, choose that author from the drop-down list.
 - f. Tag your content. Your tagging permission depends on the tagging rule assigned to the library:
 - If the library does not have a tagging rule or if your administrator assigned the open tagging rule, you can enter tags in the `Tags` field. As you type a tag, Salesforce CRM Content autosuggests tags based on your My Recent Tags list and the Popular Tags section on the Libraries tab. The My Recent Tags list on the Contribute window shows the 20 tags you have used most recently. Click a tag to add it to the `Tags` field automatically.
 - If your administrator assigned the guided tagging rule, you can choose from the list of suggested tags or enter a new tag. Click a suggested tag to add it to the `Tags` field automatically.
 - If your administrator assigned the restricted tagging rule, you must choose from the list of suggested tags. When you select a tag it turns green.
 - You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
 - Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
 - g. If multiple record types are available, choose one from the drop-down list. The record type determines which custom fields appear for you to categorize and define your content.
 - h. Click **Publish**. You can then view the content details page, return to the Libraries tab, or publish another file.

Find Content

Find Salesforce CRM Content Related to Records

Quickly find content files that are related to leads, accounts, contacts, opportunities, products, cases, or custom objects by using the related lists on those records.

If your organization has Salesforce CRM Content enabled, you can take advantage of Salesforce CRM Content functionality on detail pages for leads, accounts, contacts, opportunities, products, cases, or custom objects. The Related Content related list allows you to search for files, content packs, Web links, or Google docs and attach them to the record. When you attach a file, the latest version will be available for the life of the record unless the file is removed.

 **Note:** The **Related Content** and **Content Deliveries** related lists are only available on a record if they have been added to the corresponding page layout by an administrator.

From the Related Content related list, you can:

- Click the content's title to view the content details page where you can perform several tasks, such as commenting and voting on content, downloading files, opening Web pages and Google docs, and subscribing to content, authors, tags, or libraries. For more information, see [View and Edit Content Details](#).
- Click **Del** next to a piece of content to remove it from the record. This does not delete the content from the Salesforce CRM Content library.
- If content deliveries are enabled in your organization, click **Deliver Content** to create a content delivery. A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature. For more information, see [Creating Content Deliveries](#).
- Search for related content:
 1. Click **Find Content** or **Search All**. In both cases, Salesforce CRM Content searches within the libraries that you have access to. If you click **Search All**, the search results display all the content in your libraries. For the Find Content search, your search results contain content that is relevant to the record; Salesforce CRM Content searches for content with text or attributes that match the following fields:
 - On an opportunity, the `Opportunity Name`, `Account Name`, and all competitors and products.
 - On an account, the `Account Name` and `Industry`.
 - On a case, the `Case Reason`, `Subject`, `Account Name`, and `Industry`.
 - On a lead, the `Name`, `Company`, `Industry`, and `Title`.
 -  **Note:** On a custom object, clicking **Find Content** returns search results that contain the full custom object name in the document's text or attributes. If no content meets this criterion, the search results will be empty and a Search All search should be used instead.
 2. On the search results page, filter your results as needed by entering search terms or selecting filter criteria from the sidebar.
 3. Click **Attach** for any file that you want to attach to the record.
 4. Click the **Back** link to return to the detail page.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To access Salesforce CRM Content:

- Salesforce CRM Content User checked in your personal information
- AND
- Member of the library

Search for Content

The Content tab displays files, content packs, Web links, and Google docs published in your Salesforce CRM Content libraries. If Chatter is enabled, and your administrator has enabled the setting to show Salesforce Files in Salesforce CRM Content, files posted to Chatter groups, and other files that aren't private or privately shared, are also displayed on the Content tab. The top twenty most recently modified items are listed by default. You can filter the list using the Filter Your Results sidebar.

To search for specific content:

1. From the Search drop-down list, restrict your search to a specific library or choose to search in all libraries. If available, restrict your search to just Salesforce Files or just files in Chatter groups you're a member of.

 **Tip:** To display all the locations where the content appears, click **Display Options** and select **Display Locations**. The locations are listed under each title.

2. Enter your search term(s) and click **Go!**. Salesforce CRM Content performs a full-text search of the following document types: rich text format (RTF), UTF-8 encoded TXT, HTML, XML, Adobe® PDF, and Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files.
3. If your administrator has enabled multi-language support, you can restrict your search to a specific language. By default, Salesforce CRM Content searches all the content in your libraries that is published in your default user language. Searching in all languages also searches the titles, author names, tags, file extensions, and custom fields of content in all languages.

 **Note:** Searching in all languages does not search the text or description of documents that were published in languages other than your default user language.

4. Optionally, in the Filter Your Results sidebar, filter your search results by file format, featured content, author, tag, libraries, language, custom field, or Chatter group (if available). The number in parentheses next to each filter type shows you how many matching files, content packs, Web links, and Google docs are in the search results.

The Content tab provides several options:

- Click **Display Options** to customize your view by adding sortable columns for various content criteria (such as Size and Publication Date), or choosing to display descriptions, tags and locations. **Display Locations** shows the libraries and Chatter groups where the content appears. **My Libraries: none** or **My Chatter Groups: none** means that the file is a Salesforce file and is not part of any libraries or Chatter groups. The “smart bar” graphic for downloads, comments, ratings, and subscribers allows you to compare files, content packs, Google docs, and links within a search result set.

 **Note:** Chatter groups are only included in **Display Locations** if Chatter is enabled, and your administrator has enabled the setting to show files in Salesforce CRM Content.

- Select one or more files and click **Download** to create a zip file with your selected content. Web links and Google docs cannot be included in zip files.
- Hover over a file icon to see a snapshot of information about the specific file, content pack, Google doc, or Web link and options such as subscribing, voting, and downloading.
- Click the subscription icon next to the file name to toggle a subscription on or off. For more information, see [View and Edit Content Subscriptions](#).
- Click the file name to view the content details page. The content details page provides all the available information about a file, content pack, Google doc, or link. For more information, see [View and Edit Content Details](#).

Search supports several file types and has file size limits. If a file exceeds the maximum size, the text within the file isn't searched, but the file's author name, tags, file extension, and custom fields are.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

To deliver content from a shared library:	Deliver Content checked in your library permission definition
To deliver content from a personal library:	Deliver Uploaded Files and Personal Content checked in your library permission definition
To post content from a library to a Chatter feed:	Post Content to Chatter Feeds checked in your library permission definition

Clicking a file name on the Libraries, Content, or Subscriptions tabs opens the content details page, which is a central access point to preview content and gather information about a particular file, Web link, content pack, or Google doc in Salesforce CRM Content. Starting with the Summer '10 release, if Chatter is enabled for your organization, files posted to Chatter are also listed.

The Preview tab displays if your file is one of the following types:

- Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint. Some Microsoft Office 2007 features don't display correctly in previews.
- Adobe® PDF. Copy-protected PDFs can't be previewed.
- JPG, BMP, GIF, and PNG.

The following options may be available on the Content Details page, depending on: the type of content you are viewing; your library permissions; and whether the content is in a public or private library, or from Chatter:

- Click the thumbs up or thumbs down icon to vote for the file, Web link, content pack, or Google doc. To change your vote, click the opposite icon. After you cast a vote, the Recent Activity list on the Libraries tab indicates whether you like or dislike the content.
- Click **Deliver Content** to [create a content delivery](#). Click **Deliver Content** > **Show Content Deliveries** to [view a list of deliveries](#) associated with the content.
- For Web links or Google docs, click the **Open** button to open the Web page in a separate window. For files, click the **Download** button to open or save the file.
- Click **Subscribe** or **Subscribed** to toggle your subscription on or off.
- For files, click the Content Packs subtab to see which content packs include this file.
 - Library administrators can click **Remove from all** to remove the file from all content packs that include the file.
 - Click the name of the content pack that includes the file to view the details of that content pack.
- For content packs, click **Clone & Customize** to create a new pack by adding or removing files and slides. Salesforce CRM Content saves or publishes your customized pack as new content, not a version of the pack you copied.
- Click **Edit** > **Edit Content Details** to modify standard and custom fields.
- Click **Edit** > **Edit Content Pack** to [create a new version of a content pack](#) by adding or removing files.
- For files, click **Edit** > **Upload New Version** to [replace the file](#) with a new version. The version option is not available for Web links, content packs, or Google docs.

Note: If the **Add New Version** button is grayed out, your organization has exceeded its file storage allowance and new content cannot be uploaded.

- Click **Edit** > **Archive Content** to [remove the file, Web link, content pack, or Google doc from the library](#). Authors can archive and restore their own content regardless of library permissions. If a file is in Salesforce CRM Content and also posted in Chatter, archiving it doesn't remove the Chatter post.
- Click **Edit** > **Delete Content** to [delete the file, Web link, content pack, or Google doc from Salesforce CRM Content](#) by moving it to the Recycle Bin. Authors can delete and undelete their own content regardless of library permissions. Deleting a Google doc removes the doc's association with Salesforce CRM Content but does not delete the doc in Google Apps. You cannot delete a file that is

included in a content pack or content delivery. Deleting a Chatter file from the content details page deletes the file from Salesforce CRM Content and from Chatter.

- Click **Edit** > **Library Actions** and choose **Move to Another Library** to move the content to a different managing (or “home”) library. Choose **Share to Another Library** to share content into additional libraries without changing the managing library. Sharing or linking content to other libraries enables members of those libraries to find your content. If the managing library and shared library have different tagging rules, the most restrictive tagging rule applies. If you want to remove content from a library where the content is shared, click **Remove from Libraries**. This option does not remove content from its managing library.
- Click the Comments subtab to view, add, edit, or delete comments.
- Click the Versions subtab to view a list of all file versions and the reason-for-change statements provided by the authors.
- Click the Downloads subtab to view a list of all Salesforce CRM Content users who have downloaded the file. Download data is not available for Web links or Google docs.
- Click the Subscribers subtab to [view a list](#) of all Salesforce CRM Content users subscribed to the file, Web link, or Google doc. To subscribe to an author, click the drop-down button next to the author’s name. To subscribe to a library, click the drop-down button next to the library name.
- Click a tag name to view all the content associated with that tag. Click the arrow next to the tag to remove the tag or to subscribe to all content with that tag.
- To add a new tag, enter a tag name in the **Add Tags** field and click **Save**. As you type a tag, Salesforce CRM Content autosuggests tags based on the tags in your My Recent Tags list in the Save or Publish window and the Popular Tags section on the Libraries tab.
 **Note:** If your administrator applied a library tagging rule, you may not be able to enter new tags. If the guided tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags or enter new tags. If the restricted library tagging rule is applied, you can click **Add Tags** and choose from the list of suggested tags, but you cannot enter your own tags.
- Click the author’s name to see a list of the author’s published content. Click the arrow next to the author’s name and choose **Subscribe to Author** to subscribe to all content published by that author.
- Click **Feature** or **Don’t Feature** to toggle the “feature” designation on or off. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. Featured content is also listed on the library overview and library detail pages for quick access.
- Click a library name to view details about the library. Click the arrow next to the library name and choose **Subscribe to Library** to subscribe to all content in the library or **Show Library Content** to view a list of all files, content packs, Web links, and Google docs published to the library.

Using the Content Related List

The Content related list on a record detail page includes links to all of the content that has been associated with that record in Salesforce CRM Content. Click the file name to open the content details page.

Only Salesforce CRM Content users who are members of the library where the content was published can see the published file in the Content related list. For example, if you select the “Big Deal” opportunity when publishing `BigDealStrategy.doc` into the Sales Collateral library, the Content related list on the “Big Deal” opportunity includes a link to `BigDealStrategy.doc` only for members of the Sales Collateral library. Users who are not members of that library do not see the link.

You can use the Related Content related list to access Salesforce CRM Content from leads, accounts, contacts, opportunities, products, cases, or custom objects. For more information, see [Find Salesforce CRM Content Related to Records](#) on page 2991.

View and Edit Content Subscriptions

Clicking the Subscriptions tab displays the Subscriptions home page, where you can view your Salesforce CRM Content subscriptions and toggle them off or on.

 **Note:** To subscribe to a file, content pack, Web link, or Google doc, [view its content details page](#) and click **Not Subscribed**. From the content details page you can also subscribe to a tag, author, or library by using the drop-down menus next to the tag, author, or library name.

On the Subscriptions tab, click the Content, Tags, Authors, or Libraries subtabs to view your subscriptions. Depending on your notification settings, you are notified of changes to your subscribed content via real-time emails or a once-daily email.

 **Tip:** To configure your notification settings, go to your personal information page, click **Edit**, and select `Receive Salesforce CRM Content email alerts`. If you want to receive a once-daily summary rather than real-time email alerts, also select `Receive Salesforce CRM Content emails as daily digest`.

Subscriptions generate the following notifications:

- If you subscribe to a file, you are notified when a viewer adds comments to the file or when a new version of the file is published. If you subscribe to a Web link or Google doc, you are notified when comments are added but not when the link is changed or the doc is edited.
- If you subscribe to a content pack you are notified when a new version of the pack is published. Unless you are subscribed to the individual files within a content pack, you are not notified when new versions of the files are published.
- If you subscribe to a tag, you are notified of any newly published content that is associated to the subscribed tag. To be notified that new versions of the tagged content are available, subscribe to the content.
- If you subscribe to an author, you are notified when the author publishes new content. To be notified that new versions of an author's content are available, subscribe to the content.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

[Upload a New Version of a File](#)

View and Edit Libraries

Once you have located a Salesforce CRM Content library in the **My Libraries** area of the Libraries tab home page or on a content details page, click the library name to display detailed information. For details about the publishing options at the top of the page, see [Upload and Publish Content](#).

From the library title area, you can click the following quick links:

- **Browse** to [view search results](#) showing all the content in the library.
- **Edit** to change the library name or description.
- **Delete** to delete an empty library. If you want to delete a library that contains content, you must first move the content to another library or delete it and empty the Recycle Bin.
 -  **Note:** If your Recycle Bin is empty and you are unable to delete the library, another user's Recycle Bin may contain deleted content from the same library. A library cannot be deleted until all its content is permanently deleted or moved to another library.
- **Edit Members** to [add or remove library members](#) or change their library permission.
- **Tagging Rules** to [change the tagging method](#) permitted in the library.
- **Record Types** to [restrict the record types](#) available to library contributors.
- **View Archived Content** to [view a list of archived content](#) in the library. If you do not have the `Archive Content` or `Manage Libraries` privilege in your library permission, the archived content list only contains content that you authored and archived, not content that other authors archived.

The library detail page contains the following sections:

Members

This section lists all the Salesforce CRM Content users who are members of the library. To limit the member list, enter a username and click **Filter**. You can filter by the beginning of a username but not the last name.

To add new members to the library:

1. Click **Add Members**.
2. If the member you want to add isn't listed, start to enter their first name in the search box and click **Find**.
3. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.

 **Tip:** If you have many Salesforce CRM Content users, create a public group and add it to a library rather than adding users to the library individually.

4. Click **Add** to add the members to the library.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To edit a library:

- "Manage Salesforce CRM Content"

OR

`Manage Libraries` checked in your library permission definition

To add or remove library members:

- "Manage Salesforce CRM Content"

OR

`Manage Libraries` checked in your library permission definition

5. Click **Next**.
6. Select a library permission for each user or public group and click **Save**.

To remove a member from the library, click **Remove**. To change a member's library permission, click **Edit** and choose a new library permission from the drop-down list.

Featured Content

This section lists the five pieces of content in the library most recently designated as “featured.” If no content has been featured, this section does not display. Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle the feature status on or off, go to its [content details page](#).

Top Content

This section includes lists that summarize content activity in your library. Within a list, click a file icon to download the content or click the title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.
- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

Popular Tags

This “tag cloud” shows you how the content in your library has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your library. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have uploaded content into your library most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

SEE ALSO:

[Update Content Versions](#)

Manage Libraries

On the **Libraries** tab, access your private library, create new libraries, choose libraries to view or edit, and analyze library usage and activity. For details about the publishing options at the top of the page, see [Upload and Publish Content](#). The libraries home page has two tabs: Shared Content, which provides information about shared libraries, and My Private Files, which contains information about your private library.

Shared Content

The Shared Content tab on the libraries home page contains the following sections:

My Libraries

This section lists all the libraries to which you have access. Click a library name to view details about that library or click **Browse** to view a list of all the content in the library. Click the **New** button to create new libraries, add users to a library, or assign library permissions to users.

Featured Content

This section lists the five pieces of content in your libraries most recently designed as “featured.” Featured content receives a higher priority than similar content in search results; for example, if 100 files contain the search criteria term *sales asset*, any featured files with that term will appear at the top of the search results list. To see all featured content, click **Show All**. To toggle a piece of content's feature status on or off, go to its [content details page](#).

Top Content

This section includes lists that summarize content activity across all your libraries. Each list sorts content according to specific criteria. Within a list, click a file icon to download content or click a title to open the associated content details page. In the Top Content section you can choose from the following categories:

- **Publication Date**—This content is sorted in descending order according to the most recent publication date. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the published files, Web links, and Google docs.
- **Num Downloads**—This content is sorted in descending order according to the highest number of downloads. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the downloaded content.
- **Rating**—This content is sorted in descending order according to the highest number of thumbs-up votes. Green and red in the bar graphic represent positive and negative votes, respectively. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with votes.
- **Num Comments**—This content is sorted in descending order according to the highest number of viewer comments. The bar graphic indicates how one record compares to another. Choose the number of records you want to view from the accompanying drop-down list, or click the **Show All** button to list all the content with associated comments.

Popular Tags

This section, commonly referred to as a “tag cloud,” shows you how the content in your libraries has been labeled. Tags are descriptive terms assigned during upload or revision that help classify and organize content. Click a tag name to view search results containing all the files, Web links, and Google docs with that tag. The tag names increase in size within the tag cloud according to popularity, meaning that the largest tags have been assigned to the most content. You can choose to sort the tags alphabetically or by popularity. The tag cloud contains the 30 most popular tags.

Recent Activity

This section is a snapshot of activity within your libraries. It shows the most recent files, Web links, and Google docs to receive comments, votes, or subscriptions. Featured content and newly published content are also included, but new versions of existing content, archived content, and deleted content do not appear in the Recent Activity section. Use the **Older** and **Newer** buttons to scroll through records. The Recent Activity section contains a maximum of 100 records.

Most Active Contributors

This section shows the authors who have published content into your libraries most frequently. The names increase in size according to activity, so the largest names are the authors who have contributed the most content.

My Private Files

The My Private Files tab on the libraries home page is your private library. When you upload or create content and do not select a public library, your content is stored in your private library. You can publish content to a public library at any time or leave content in your private library indefinitely. Content in your private library can be assembled in content packs. It can also be sent to leads and contacts outside your organization using the content delivery feature. See [Set Up Content Deliveries](#) on page 3291 for more information. The My Private Files tab has the following sections:

Private Library

If you choose the **Save to my private library** option when publishing a file, Web link, content pack, or Google doc, your content is saved here. You can publish or delete files from this list or click the file's name to view its content details page. The following options that are available on the content details page for shared content are not available for private-library content: tagging, rating, subscribing, tracking downloads, tracking subscriptions, or using custom fields. If you publish a file from the Private Library list and click **Cancel** during the publishing process, your file is deleted.

Upload Interrupted

If an error occurs when you are uploading a new file, for example your browser crashes or your session times out, the file you were uploading is saved here. Click **Publish** to publish the file to a public library or save it to your private library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

Revision Upload Interrupted

If an error occurs when you are uploading a new version of a file, the file you were uploading is saved here. Users can continue to access the original version. Click **Publish** to publish the file to a public library or save it to your private library. If you click **Cancel** on the Save or Publish Content dialog, your file will be deleted.

Google Apps Overview

Google Apps™ is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. Salesforce integrates key Google Apps services and provides several AppExchange apps that enhance and customize Google-related functionality.

The following services for Google Apps are integrated with Salesforce and require a simple activation by a Salesforce administrator:

Add Google Docs to Salesforce

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators. When the Add Google Docs to Salesforce service is activated, you can:

- Use the Google Docs, Notes, & Attachments or Google Docs & Attachments related list on any Salesforce record to create, edit, or view Google docs and associate them to a record.
- Share a Google doc with any Google Apps user in your organization.
- Associate Google docs with Salesforce records even when you are not working in Salesforce by using the **Add Google Doc to Salesforce** browser button.
- Add Google docs to Salesforce CRM Content, which allows you to manage all types of content in a centralized location.

Gmail to Salesforce

Gmail™ is a Web-based email application that operates on all standard browsers and can be used with your company's domain. Use Gmail to Salesforce to automatically log emails you send from your Gmail account as activities on lead and contact records in Salesforce.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History on leads and contacts. When you select a Gmail link or **Compose Gmail**, Salesforce automatically logs you in to your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

Use Google Docs in Salesforce

Use Google Docs™ to create and share on-demand documents, presentations, and spreadsheets ("Google docs") and see your changes in real time as you collaborate with other users. Because your content is stored within Google, there is no need to manage versions or send attachments by email—simply log in with your Google Apps account and view the current document or its revision history.

Salesforce and Google Apps allows you to integrate Google Docs with Salesforce. The Docs home page in your Google Apps account lists all the Google documents, presentations, and spreadsheets that you have created or that other Google Apps users have shared with you.

For information about Google Docs, refer to [Google's online help](#).

USER PERMISSIONS

Using Google Docs in Salesforce

- "Read" on the appropriate record type
AND
Google Apps account

Add Google Docs to Salesforce

Add an existing Google doc to any record or library in Salesforce.

-  **Note:** To use a Google Apps service in Salesforce, you must be logged in to your Google Apps business account. Business accounts use your organization's domain; for example, *john.doe@company.com*. If you are unsure of your Google Apps username and password, contact your administrator.

Add a Google Doc to a Salesforce Record

1. Open a case, opportunity, or other record.
2. On the Google Docs, Notes, & Attachments related list or the Google Docs & Attachments related list, click **Add Google Doc**.
3. Enter the name of the Google doc.
4. Enter the Google doc URL.
5. Click **Save**.

Add a Google Doc to a Salesforce CRM Content Library

1. On the **Libraries** tab or on a library detail page, click **Add Google Doc**. Log in to Google Apps if prompted.
2. Enter the Google Doc URL.
3. Click **Contribute**.
4. Enter a title and select a library. See [Publish Files to Libraries](#) for detailed instructions on publishing content to a library.
5. Click **Publish**.

-  **Note:** While you have your Google doc open, remember to share it with other Google Apps users in your organization. Only people with access to the Google doc in their Google Apps account can open the doc from Salesforce.

-  **Tip:** For information about using Google Docs, refer to [Google's online help](#).

Chatter Customer Groups

About Chatter Customers in Private Groups

Chatter customers are users outside your company's email domains who can only see groups they're invited to and interact with members of those groups; they can't see any Salesforce information.

Chatter customers:

- Can only be added to Chatter if:
 - A manager or owner of a group that [allows customers](#) invites them to the group.
 - An administrator adds them in Setup by entering *Users* in the **Quick Find** box, then selecting **Users**.
- Can only see:
 - Groups they belong to.
 - People in groups they belong to. Customers only see limited profiles including photo, name, title, email, common group memberships, common files, and activity statistics and influence. They can't post to profiles.
 - Files shared to groups they belong to.
- Can't see:
 - Records or other Salesforce information, even in search results.
 - Topics, including topics in the feed, the topics list, topic detail pages, Recently Talked About, and Trending Topics. (Customers can see hashtag (#) topics.)
 - Recommendations and can't be recommended to others. Additionally, groups that allow customers can't be recommended.
- Are identified as a customer in profiles and groups they belong to. Customers and groups with customers are easily identified by the orange upper left corner of their photo.
- Have limited profiles, including name, photo, title, company, email, feed, group membership, file ownership, and activity statistics and influence.
- Can't be followed. Additionally, customers can't follow people or files.
- Can be group members and managers. If the customer is a manager, they will be able to see users who request to join the group, even if they aren't in other common groups, and approve requests.
- Can't own, create, delete, moderate, join, or ask to join groups.
- Can invite people that they're in common groups with to join groups that they manage.
- Can't invite people inside your company's domain whose profiles they can't see.
- Can't [chat](#) on page 2909 with other users.

Note:

- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.
- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.
- If a customer loses their password, they can use the Forgot Password option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Considerations for Mobile Users

Chatter customers are able to log in and use the Salesforce1 apps and the Chatter Mobile for BlackBerry app. The same restrictions are applied to customer users as when using Chatter on the Web.

SEE ALSO:

[Chatter Groups](#)

[Adding or Removing Customers in Chatter Groups](#)

Adding or Removing Customers in Chatter Groups

If customer invitations are enabled for your organization, you can add, remove, and invite customers in private groups you own or manage that [allow customers](#).

1. Navigate to a group detail page.
2. To add people who aren't already customers in your company, click **Invite People**, or **Add/Remove Members** > **Invite them to Salesforce Chatter!**. Enter email addresses separated by commas, and an optional message, and click **Send**.

When someone accepts your invitation, they join Chatter and become a member of the group.

3. To add people who are already customers in your company, click **Add/Remove Members**, then:
 - Search using the **Find People** search box.
 - Toggle between **Members** of the group and **Everyone** in your company.
 - Use the **Next** and **Previous** links to see more of the list.
 - Click **Add** to add a customer, or **X** to remove a customer.
 - Click **Done** when you're finished.

Note:

- When you invite someone as a customer to your group, they are given a unique username and password to log in to this group within your organization, even if they're already a member of another Salesforce organization. They will not be able to use other Salesforce logins to access your customer group.
- If a customer has an issue logging in to the group, verify that they are using the username and password from the welcome email they received after registering for the group. If the problem persists, ask your administrator for help.
- If a customer loses their password, they can use the **Forgot Password** option to reset it. If they don't have their username, they should contact the administrator of the organization in which they're a customer to recover it.

Share Files via Link

In Salesforce Classic, you can share a file with anyone by creating a file link and sending it via email or IM. Creating a link generates an encrypted URL that you can send to any recipient, such as leads, customers, partners, and coworkers, inside or outside of your company. When your recipients click the link, they see a web-based version of the file that they can easily view and download. Sharing via link is available in Salesforce Classic, and is on by default for most orgs. Administrators can enable sharing via link by enabling these permissions:

1. From Setup, enter *Content Deliveries* in the Quick Find box, then select **Content Deliveries**. Select **Enable content deliveries** and **Enable Creation of Content Deliveries for Salesforce Files**.
2. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**. Select a permission set, click **System Permissions**, and select **Create and Share Content Deliveries for Salesforce Files**.
3. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**. Select a profile, click **Edit**. In **General User Permissions**, select **Create and Share Content Deliveries for Salesforce Files**. You don't need this permission for files in a shared Salesforce CRM Content library. Instead, complete steps 1 and 2 and then ensure that the user is a library member and that **Deliver Content** is checked in the library permission definition.

Create and share a file link:

1. Start by sharing the file from one of these locations:
 - On Files home —Click **Upload files**, select a file from your device, then click **Sharing Settings** and choose **Anyone with Link**. Copy the link provided to share with people inside or outside your company.
 - On the Home page—Click **Create New > File**, click **Choose File** and select a file from your computer, then click **Share via link** from the dropdown menu.
 - On a file detail page—Click  **File Sharing Settings > Via link**.
 - On the Sharing Settings dialog box—Click **Anyone with link** from the Share with list.
 - Next to the file on the Files page, the Files Owned by list, or the Group Files list—Click  **> Share via link**.
 - Next to the file in a feed or on a file hover—Click **More Actions > File Sharing Settings**, then click **Anyone with link** from the Share with list.
 - In your Salesforce Files Sync folder on your desktop—Right-click on a file, hover on **Salesforce Files Sync**, then click **Share via link**.
2. Click **Copy** if available (or copy the link manually), and paste the link into an email or IM. File link recipients can only view and download files. They can't be collaborators.

Unless the file was already shared with your company, it's privately shared and displays the privately shared icon (). It's not posted anywhere and only the people you specifically shared it with can find and view it. If it was already shared with your company, it retains the your company icon () and anyone in your company can find and view it.

On the Sharing Settings dialog box, click  next to a link to stop sharing it. Anyone with the link will no longer be able to access the file.

Note:

- Documents from the Documents tab and attachments from the Notes and Attachments related list aren't listed on Files home and can't be shared as Salesforce Files.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

- The maximum number of times a file can be shared is 100. This includes files shared with people, groups, and via links. If a file is privately shared and nears the 100 share maximum, consider making the file public by posting it to your feed.

[Creating Content Deliveries](#)

Content Deliveries

Creating Content Deliveries

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

A content delivery can be created from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

To create a new content delivery:

1. From the Content Deliveries related list, Related Content related list, or the content details page, click **Deliver Content**.
 2. Upload a file or confirm the file name. If you are a Salesforce CRM Content user, search for the content in your libraries that you want to deliver. Salesforce CRM Content users can search for content in [shared libraries](#) or a [personal library](#).
 3. Optionally, modify the `Delivery Name` field. This is the name that identifies your content delivery in Salesforce. We recommend using a name that will make the delivery easily distinguishable from other deliveries on the same record. The default delivery name includes the file name and today's date.
 4. Select the delivery methods that determine how your content can be viewed. The options that appear depend on the file format you uploaded.
 - Choose `Allow Recipient to View in the Browser` to create an online version of the file that recipients can view in their browser.
 - Choose `Allow Recipient to Download as [file type] file` to allow the recipient of your content delivery to view the content in its original format. For example, if you uploaded a Microsoft® Word file, this field will be `Allow download as .doc file`.
-  **Note:** If a preview of the file doesn't exist in Salesforce, users can download the delivered file regardless of whether or not downloading is allowed. File previews are made the first time they are requested in Salesforce, but not before. Viewing a file's detail page or posting it to a feed generate file previews.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Salesforce CRM Content available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create content deliveries from a shared library in Salesforce CRM Content:

- Member of the library
- AND
- "Deliver Content" checked in your library permission definition

To create content deliveries from a personal library in Salesforce CRM Content:

- "Deliver Uploaded Files and Personal Content" checked in your general permission definition

To create content deliveries (non-Content user):

- "Deliver Uploaded Files and Personal Content" checked in your general permission definition

- Choose `Allow Recipient to Download as PDF` to allow recipients to download a .pdf version of the file. This option is only available for Microsoft® PowerPoint, Word, and Excel files.
5. Select `Notify Me of First View or Download` if you want to receive an email the first time your recipient clicks the content-delivery URL.
 6. If the content you are delivering is time-sensitive, select the `Remove Access to Content on` checkbox and enter an expiration date. By default, the expiration date is 90 days from the current date. After creating your content delivery, you can change the expiration date at any time on the delivery detail page.
 7. Optionally, select `Require a Password to Access Content`. When you create the content delivery you will receive a password to include with the delivery URL that you send to your recipients. The password is available for the life of the delivery on the delivery detail page.
 8. Optionally, use the lookup to associate your content delivery with a Salesforce record. The record you were viewing when you clicked **Deliver Content** is selected by default.
 9. Click **Save & Next**. Your delivery will usually be ready within a few moments, but you can click **Notify Me** to exit the content delivery wizard and be notified via email when your content delivery is ready.
 10. If you did not exit the content delivery wizard, click **Preview** to verify that you are satisfied with the delivery.
 -  **Important:** Formatting in the original file may not display correctly in the online version. If you chose `Allow Recipient to View in the Browser`, preview your content delivery before sending its URL to your recipients. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or a PDF only.
 11. Copy and paste the delivery URL and, if applicable, its password into an email or instant message for delivery. The URL is available on the delivery detail page. For more information, see [Viewing and Editing Content Deliveries](#).

SEE ALSO:

[Share Files via Link](#)

Viewing and Editing Content Deliveries

On the Content Deliveries related list or the Content Deliveries list page, click the name of a content delivery to open the detail page.

Viewing Content Delivery Details

The delivery detail page provides all the information associated with a content delivery, including the number of times the delivery has been viewed, and the delivery settings. The URL providing access to the content delivery is visible only if you have access to the content or to a record associated with the content, or are the content delivery owner. For a description of each field, see [Content Delivery Fields](#).

Editing Content Delivery Details

Click **Expire Now** to immediately remove access to the content delivery. Click **Edit** to modify details such as the delivery methods, expiration date, or the record the delivery is associated with. For a description of each field, see [Content Delivery Fields](#).

Deleting Content Deliveries

Click **Delete** to remove access to the content delivery and delete the delivery record from Salesforce. Salesforce CRM Content users cannot delete files that are associated with a content delivery until the content delivery is deleted.

Tracking Content Deliveries

Each time a content delivery's URL is opened, Salesforce records the event as a *view*. The Views related list on the content delivery detail page lists every view associated with the delivery. Information about the view includes the date and time, whether the view was by an internal (Salesforce) user, and whether the view included a download. If the content delivery provided the ability to download the file in its original file format or as a PDF file, the `FileDownloaded` flag indicates that a download occurred, but you cannot distinguish between file types.

USER PERMISSIONS

To view the delivery detail page:

- Access to the associated content details page in Salesforce CRM Content
- OR

Access to the record associated with the content delivery

To edit, expire, or delete a content delivery:

- Owner of the record
- OR
- "Modify all Data"

Using the Content Deliveries Related List

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

From the Content Deliveries related list on leads, business accounts, contacts, opportunities, cases, campaigns, and custom objects you can:

- Click **Deliver Content** to create a new content delivery and associate it with the record you are viewing. For more information, see [Creating Content Deliveries](#).
- Click **Preview** to open the content delivery. Each time you view a content delivery, it is recorded as one internal view on the Views related list.
- Click the content delivery name to open the detail page for that delivery. For more information, see [Viewing and Editing Content Deliveries](#).

SET UP AND MANAGE SALESFORCE COMMUNITIES

Salesforce Communities Overview

Communities are branded spaces for your employees, customers, and partners to connect. You can customize and create communities to meet your business needs, then transition seamlessly between them.

Communities are a great way to share information and collaborate with people outside your company who are key to your business processes, such as customers or partners.

You can use Communities to:

- Drive more sales by connecting your employees with your distributors, resellers, and suppliers
- Deliver world-class service by giving your customers one place to get answers
- Manage social listening, content, engagement, and workflow all in one place

You can create multiple communities within your organization for different purposes. For example, you could create a customer support community to reduce support costs, or a channel sales community for partner deal support, or you could have a community dedicated to an upcoming event.

Communities can be based on standard Salesforce functionality and tabs, or on one of our preconfigured templates. Communities may contain a subset of features and data available in your internal Salesforce organization and can be customized to use your company branding. In addition, you can choose which members from your company and which customers, partners, or other people outside your company can join.

Communities live inside your org and can be easily accessed from the global header using the drop-down menu in the top left corner of Salesforce or in the Salesforce 1 Mobile Browser App. Use this menu to switch between your communities and your internal Salesforce org.

Plan Your Implementation

Planning Ahead

It helps to make a few key decisions well in advance of setting up your community and customizing it.

- Determine the business requirements of the community. What types of users are you creating the community for? You could start by identifying the main use cases you want to support, such as customer support, self-service, or marketing.
- Estimate the size of the community. This will help determine your licensing requirements.
- Decide if you want your community content to be publicly available to guest users without licenses

- Plan the look-and-feel of your community and then evaluate the available customization options. With Communities, you have the following choices:
 - **Use Visualforce to customize the out-of-the-box community tabs:** Communities comes with some out-of-the-box branding themes that you can use along with standard Salesforce tabs in your community. In addition, you can use Visualforce to extensively customize your community's appearance and leverage all the capabilities of the Force.com platform. This option requires programming capabilities.
 - **Use Community Builder with templates:** Community Builder comes with rich, stylized templates for communities targeted at customer support scenarios. Templates offer easy customization via an intuitive GUI and allow for a quick rollout of your community with minimal configuration in Site.com. This option doesn't require programming experience or knowledge of the Force.com platform. Need help deciding on a template? Check out the [template comparison](#).

For more information about these options, see [Choosing Between Community Builder and Force.com Sites](#)

- Determine if any of the [community limits](#) will affect your implementation.

Set Up and Maintain Your Community

Enable Salesforce Communities

Enabling Salesforce Communities is the first step to creating communities.

Enabling Communities enables the Salesforce Classic 2010 user interface theme, which updates the look and feel of Salesforce.

-  **Note:** Once you enable Communities, you can't turn it off.

If your organization's access to Communities is suspended for non-payment of fees due, all of your communities are deactivated, including those in `Preview` status. When Communities is enabled again, all communities are in `Inactive` status. You can activate these communities, but can't return them to `Preview` status.

1. From Setup, enter `Communities Settings` in the `Quick Find` box, then select **Communities Settings**.

-  **Note:** If you don't see this menu, Communities may not be enabled for your organization. Contact your Salesforce account executive.

2. Select **Enable communities**.
3. Select a domain name to use for your communities, then click **Check Availability** to make sure it's not already being used.

We suggest that you use something recognizable to your users, such as your company name.

Although the domain name is the same for all communities, you create a unique URL for each community during the creation process. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

-  **Important:** Keep in mind that you can't change the domain name after you save it.

You can designate a completely custom domain by entering it in on the Domain Management page. From Setup, enter `Domains` in the `Quick Find` box, then select **Domains**.

4. Click **Save**.

EDITIONS

Salesforce Communities available in: Salesforce Classic

Salesforce Communities Setup available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

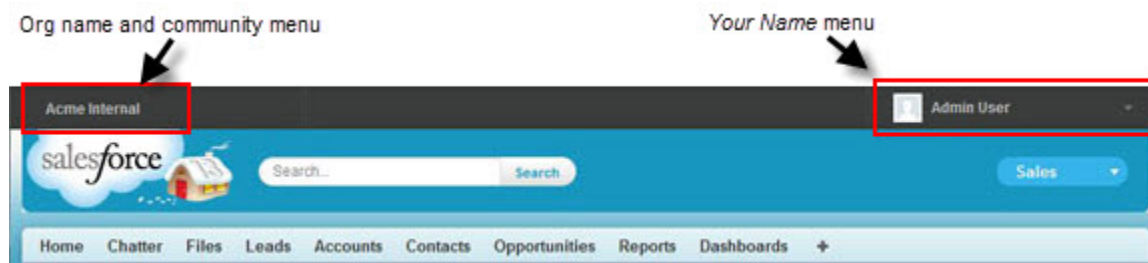

To enable Communities:

- "Customize Application"

You can now [create communities](#).

The “Create and Set Up Communities” permission is required to create and customize communities. It also gives the user the ability to manage the Site.com site associated with the community.

After enabling Communities, we recommend that you give the “View Global Header” permission to internal users who need access to the community. The global header allows users to easily switch between their internal organization and any communities they’re a member of. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the *Switch to Lightning Experience* link in the *Your Name* menu. Communities aren’t supported in Lightning Experience, so to create, manage, or access communities from the global header, you’ll have to switch back to Salesforce Classic.

It also displays an extra menu in Community Management for administrators and community managers that they can use to switch between Community Management, Community Builder, Force.com, and Site.com Studio.

[Can I use the same domain name for my Force.com Sites and my Communities?](#)

[Who Can See What in Communities](#)

Update Org-Wide Community Settings

Set the Default Number of Community Roles

Set the default number of roles created when adding partner or customer accounts to communities.

These settings apply if your community is set up with Partner Community or Customer Community Plus user licenses. The limit is three roles; the system default is one.

For example, if three partner roles are currently created when an account is enabled for your community—Executive, Manager, and User—but you need only the User role for new accounts, you can reduce the number to one role. For better performance, we recommend setting this value to 1. You can then use Super User Access to grant specific users access to data owned by other users in their account.

To set the number of roles:

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. Select the number of roles per account.
 - a. If you're using Partner Community licenses, set the `Number of partner roles`.
 - b. If you're using Customer Community Plus licenses, set the `Number of customer roles`.
3. Click **Save**.

The number of roles for existing accounts isn't affected by this setting.

USER PERMISSIONS

To set the number of default roles:

- "Customize Application"

Enable Super User Access in Communities

When you enable super user access, partner users in communities can access more records and data.

If your community is set up with Partner Community user licenses, this setting applies. You can also grant super user access to users with Customer Community Plus licenses. For more information, see [Grant Super User Access to Customer Users in Your Community](#) on page 3024.

Granting super user access to external users in your community lets them access more data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only. External users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. Select **Enable Partner Super User Access**.
3. Click **Save**.

You can now [assign super user access](#).

To disable super user access, deselect **Enable Partner Super User Access**. If you re-enable this feature, all users who were assigned super user access before the feature was disabled automatically get super user access again.

SEE ALSO:

[Create Communities Users](#)

Enable Report Options for External Users

Allow external users with Partner Community or Customer Community Plus licenses with the “Run Reports” permission, to view and modify report options so that they can summarize and filter reports.

1. From Setup, enter *Communities Settings* in the Quick Find box, then select **Communities Settings**.
2. Select **Enable report options for external users**.
3. Click **Save**.

External users with Partner Community or Customer Community Plus licenses that have the “Run Reports” permission, now see report options on the run report page.

Sharing Set Overview

Grant portal or community users access to records that are associated with their accounts or contacts using sharing sets, based on their user profiles.

Previously, a sharing set granted access to any record that has a lookup field to an account or contact that matches the user's account or contact. With Spring '14, you can also determine how access is granted using an access mapping in the sharing set, which supports indirect lookups from the user and target record to the account or contact. You can determine the objects to use in the access mapping, and they must both either point to an account or contact.

For example, you might want to use a sharing set if you would like to:

- Grant users access to all cases related to their account or contact record.
- Grant users access to all cases related to a parent account or contact that is identified on the user's account or contact record.

You can use sharing sets to grant access to accounts, contacts, cases, service contracts, users, and custom objects. Sharing sets can be used with these user profiles:

- Authenticated Website
- Customer Community User
- Customer Community Login User
- High Volume Customer Portal
- High Volume Portal
- Overage Authenticated Website User
- Overage High Volume Customer Portal User

The following example shows an access mapping on a sharing set, which grants portal or community users access to all cases associated with the entitlements on their account, even if they are not directly associated with the case.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

**Example:**

1. Account lookup on portal or community user
2. Related account on entitlement
3. Entitlement lookup on case

 **Note:** Portal or community users gain access to all order entitlements and order items under an account to which they have access. To share records owned by high-volume portal users, use a share group instead.

- [Granting High-Volume Portal or Community Users Access to User Records](#)
- [About High-Volume Community Users](#)
- [Grant High-Volume Community Users Access to Records](#)
- [Share Records Owned By High-Volume Community Users](#)

About High-Volume Community Users

High-volume community users are limited-access users intended for orgs that have thousands to millions of communities users.

Unlike other community users, high-volume community users don't have roles, which eliminates performance issues associated with role hierarchy calculations. High-volume community users include the Customer Community, High Volume Customer Portal, and Authenticated Website license types.

Characteristics

High-volume community users:

- Are contacts enabled to access a community.
- Are assigned to the Customer Community, High Volume Customer Portal, or Authenticated Website license.
- Only share the records they own with Salesforce users in sharing groups.

Access to Records

High-volume community users can access records if any of the following conditions are met:

- They have "Update" access on the account they belong to.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

- They own the record.
- They can access a record's parent, and the organization-wide sharing setting for that record is Controlled by Parent.
- The organization-wide sharing setting for the object is Public Read Only or Public Read/Write.

Admins can create sharing sets to grant high-volume community users additional access to records; see [Grant High-Volume Community Users Access to Records](#).

Limitations

- High-volume community users can't manually share records they own or have access to.
- You can't transfer cases from non-high-volume community users to high-volume community users.
- High-volume community users can't own accounts.
- You can't add case teams to cases owned by high-volume community users.
- You can't include high-volume community users in:
 - Personal groups or public groups.
 - Sharing rules.
 - Account teams, opportunity teams, or case teams.
 - Salesforce CRM Content libraries.

These limitations also apply to records owned by high-volume community users.

- You can't assign high-volume community users to territories.

SEE ALSO:

[Share Records Owned By High-Volume Community Users](#)

Grant High-Volume Community Users Access to Records

Grant high-volume community users access to records using sharing sets.

A sharing set grants high-volume users access to any record associated with an account or contact that matches the user's account or contact. You can also grant access to records via access mapping in a sharing set, which supports indirect lookups from the user and target record to the account or contact. For example, grant users access to all cases related to an account that's identified on the users' contact records.

Sharing sets apply across all communities a high-volume community user is a member of. High-volume community users have either the Customer Community or High-Volume Portal User license. For more information, see "Sharing Set Overview" in the Salesforce Help.

To grant users access to selected users in the same community, you would typically create a sharing set if you deselected the `Community User Visibility` checkbox on the Sharing Settings page.

1. From Setup, enter `Communities Settings` in the `Quick Find` box, then select **Communities Settings**.
2. In the Sharing Sets related list, click **New** to create a sharing set, or click **Edit** next to an existing sharing set.

EDITIONS

Salesforce Communities available in: **Salesforce Classic**

Salesforce Communities Setup available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To grant high-volume community users access to records:

- "Customize Application"

3. In the Sharing Set Edit page, fill in the **Label** and **Sharing Set Name** fields. **Label** is the sharing set label as it appears on the user interface. **Sharing Set Name** is the unique name used by the API.
4. Enter a description.
5. Select the profiles of the users to whom you want to provide access.
6. Select the objects you want to grant access to.
The Available Objects list excludes:
 - Objects with an organization-wide sharing setting of Public Read/Write
 - Custom objects that don't have an account or contact lookup field
7. In the Configure Access section, click **Set Up** or **Edit** next to an object name to configure access for the selected profiles, or click **Del** to remove access settings for an object.
 **Note:** Objects with **Set Up** in the Action column aren't configured for high-volume user access. Until you configure an object, high-volume users have limited or no access to its records.
8. Grant access based on an account or contact lookup:
 - Select a value in the User drop-down list to determine the account or contact lookup on the user.
 - Select a value in the Target Object field to determine the account or contact lookup on the target object.For example, to grant access to all cases associated with an account identified on the user's contact record, select `Contact.Account` and `Account` respectively.
 **Note:** Both selected fields must point to either an account or contact. For example, `Contact.Account` and `Entitlement.Account` both point to an account.
9. Choose an access level of Read Only or Read/Write. (If the object's organization-wide sharing setting is Public Read Only, then only Read/Write is available.)
10. Click **Update**, then click **Save**.

After creating a sharing set, [create share groups](#) to give other users access to records created by high-volume community users.

SEE ALSO:

[About High-Volume Community Users](#)

Share Records Owned By High-Volume Community Users

Share groups allow you to share records owned by high-volume community users with internal and external users in your communities.

High-volume users are limited-access users intended for organizations with many thousands to millions of external users. Unlike other external users, high-volume users don't have roles, which eliminates performance issues associated with role hierarchy calculations. Because high-volume community users are not in the role hierarchy while Salesforce users are, a *share group* allows you to specify the Salesforce other external users who can access records owned by high-volume community users.

Share groups apply across communities.

To set up share groups for your communities:

1. From Setup, enter *Communities Settings* in the **Quick Find** box, then select **Communities Settings**.
2. In the Sharing Settings for High-Volume Community Users related list, click **Edit** next to an existing sharing set.
3. Click the Share Group Settings tab.
4. Click **Activate** to turn on the share group.

Activating the share group can take a while. An email is sent to you when the process finishes.

Note: Deactivating a share group removes *all* other users' access to records owned by high-volume community users. An email isn't sent to you when the deactivation process finishes.

5. Click **Edit** to add users to the share group. You can add both internal users from your organization as well as external users from the same parent account as the high-volume user.
 - a. From the **Search** drop-down list, select the type of member to add.
 - b. If you don't see the member you want to add, enter keywords in the search box and click **Find**.
 - c. Select members from the Available Members box, and click **Add** to add them to the group.
 - d. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To share records owned by high-volume community users to other users:

- "Customize Application"

Community Setup Basics

Create Communities Users

To allow an external user to access your community, enable the user's contact record as a customer user or partner user, depending on the user's license type. Your community can contain users with Partner Community, Customer Community, and Customer Community Plus licenses.

If your organization has person accounts, you can't use them as partner accounts or create partner users that are associated with them. You can use only business accounts as partner accounts.

1. To create partner users:

- a. View the external account you want to create a user for.
- b. Create a contact. Click **New Contact** from the Contacts related list. Fill in the appropriate details, then click **Save**.

 **Note:** A non-partner account can't own a partner contact.
Person accounts can't own partner users.

- c. On the contact detail page, click **Manage External User**, then **Enable Partner User**.

 **Note:** If you don't see the **Enable Partner User** button, ask your administrator to check whether it's included in the Contact page layout.

- d. Edit the user record for this external user.

- Select the Partner Community user license.
- Select the appropriate profile. Remember that profiles give users access to tabs in your community, so be sure that you choose a profile that has the appropriate tabs exposed.

 **Note:** The available profiles for external users are limited to the Partner Community User profile or profiles cloned from it. Unlike a standard user, the partner user role is automatically assigned based on the account name. The partner user role is a subordinate of the account owner's role. Therefore, all data for the partner user role rolls up to the partner account owner's role. If you disable a partner user, the partner user role becomes obsolete, and the data no longer rolls up to the partner account role.

- Deselect **Generate new password and notify user immediately** so that users don't receive a password before the community is activated. When you activate the community, the user receives a welcome email with the login information, as long as the [Send welcome email](#) option is selected for the community.

 **Note:** If you select this option but your organization doesn't have **Active** communities that the user is a member of, Salesforce doesn't send the email.

If [Send welcome email](#) is disabled for your community, the user doesn't receive an email with the username and password. You must manually send the information.

- e. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create partner users:

- "Manage External Users"

To create customer users:

- "Manage External Users"

OR

"Edit Self-Service Users"

 **Important:** When creating customer users, the account that the new contact is associated with must have an account owner that is assigned a role.

To log in as an external user:

- "Manage Users"

AND

"Edit" on Accounts

 **Note:** Creating an external user with a Customer Community Plus license is similar to creating a partner user. On the contact record, select **Manage External User**, then **Enable Partner User**. Also, when editing the user record, you select the Partner Community User profile or a profile cloned from it.

2. To create customer users:

a. Create a contact.

b. On the contact detail page, click **Manage External User**, then **Enable Customer User**.

 **Note:** If you don't see the **Enable Customer User** button, ask your administrator to check whether it's included in the Contact page layout.

c. Edit the user record for this external user.

- Select the appropriate profile. The available profiles are limited to the Customer Community User profile and any profiles cloned from it.

Remember that profiles give users access to tabs in your community, so be sure that you choose a profile that has the appropriate tabs exposed.

- Deselect **Generate new password and notify user immediately** so that users don't receive a password before the community is activated. When you activate the community, the user receives a welcome email with the login information, as long as the [Send welcome email](#) option is selected for the community.

 **Note:** If you select this option but your organization doesn't have `Active` communities that the user is a member of, Salesforce doesn't send the email.

If `Send welcome email` is disabled for your community, the user doesn't receive an email with the username and password. You must manually send the information.

d. Click **Save**.

 **Note:** Customer Users don't see the Notes & Attachments related list on accounts or contacts.

To troubleshoot issues or ensure that the community is configured appropriately, on the contact detail page, click **Manage External User** and choose **Log in As Partner User** or **Log in as Customer User**. You must have Edit permission on Accounts to log in as a Partner User or Customer User. A new browser window opens and you are logged in to the community on behalf of the external user.

When you log in as an external user, you see the behavior that the external user sees. For instance, external users only see the community drop-down menu if they have access to more than one `Active` community. Also, if an external user who is only a member of one `Active` community is given the URL for `Preview` community, the user doesn't see the drop-down menu when in the `Preview` community.

 **Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.

Consider the following when creating external users.

- External users can't be deleted. If you no longer want an external user to have access to a community, deactivate the user.

SEE ALSO:

[Delegate External User Administration](#)

[Add Members to Your Community](#)

[How do external community members get login information?](#)

[Reset An External User's Password for Communities](#)

Delegate External User Administration

You can delegate user administration to external users so that they can decide who should access the community.

External users who are delegated administrators can:

- Create external users
- Edit external users
- Reset passwords for external users
- Deactivate existing external users

You can grant delegated external user administration rights to users with Partner Community, Customer Community Plus, Gold Partner, Enterprise Administration, and Customer Portal Manager licenses.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** and click a custom profile.

You can't edit standard profiles.

You can add **Delegated External User Administrator** to a permission set that you assign to a standard profile.

2. Click **Edit**.
3. Select **Delegated External User Administrator**.
4. Click **Save**.
5. Click **Edit** in the Delegated External User Profiles related list.
6. Select the profiles you want users with this profile to be able to administer.
7. Click **Save**.

Consider the following when setting up delegated external user administration.

- You can also grant delegated administration rights using permission sets.
- On the profile you're granting delegated administration rights to:
 - Add the "Create" and "Edit" permissions on contacts so that delegated administrators can create and update contacts related to their account.
 - Set the Accounts and Contacts tab settings to Default On so that delegated administrators can view the Accounts and Contacts tabs and easily manage contacts related to their accounts.
- [Add the Accounts and Contacts tabs to your community.](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To manage external users:

- "Manage External Users"

To create, edit, and delete profiles:

- "Manage Profiles and Permission Sets"

- Set field level security and page layouts so that delegated external user administrators can access only the account and contact fields you specify.

SEE ALSO:

[Create Communities Users](#)

[Grant Super User Access to Partner Users in Your Community](#)

Grant Super User Access to Partner Users in Your Community

Partner Super User Access must be enabled in your Communities Settings before you can grant access to users. Use this information to grant super user access to users with Partner Community licenses. You can also grant super user access to users in your community with Customer Community Plus licenses. To learn more, see [Grant Super User Access to Customer Users in Your Community](#).

Granting super user access to external users in your community lets them access more data and records, regardless of sharing rules and organization-wide defaults. Super users have access to data owned by other partner users belonging to the same account who have the same role or a role below them in the role hierarchy. Super user access applies to cases, leads, custom objects, and opportunities only. External users have access to these objects only if you exposed them using profiles or sharing and added the tabs to the community during setup.

1. View the contact record for the user.
2. Click **Manage External Account**, then choose **Enable Super User Access**.
3. Click **OK**.

Grant Super User Access to Customer Users in Your Community

Enable super user access so that external users in communities can access additional records and data.

You can only grant customer super user access to users with Customer Community Plus licenses.

To grant super user access to users with Partner Community licenses, see [Grant Super User Access to Partner Users in Your Community](#).

The “Portal Super User” permission lets delegated external user administrators do the following for their own account:

- View, edit, and transfer all cases
- Create cases for contacts
- View and edit all contacts, whether communities-related or not
- View account details when they’re the contact on a case
- Report on all contacts, whether portal enabled or not, if the Reports tab is added to your community and the user has the “Run Reports” permission

Add the “Portal Super User” permission to a permission set and assign it to Customer Community Plus users so that they have access to their account and can view and edit all of its cases and contacts without having the ability to manage other external users.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Either create or clone a permission set.
3. In the App Permissions section, add the “Portal Super User” permission.
4. Click **Save**.
5. Assign the permission set to your Customer Community Plus users by clicking **Manage Assignments** and then adding the appropriate users.

Create Communities

Create communities using a wizard that helps you choose a community template that meets your business needs.

The number of communities you can create for your organization is listed on the All Communities page in Setup.

1. To start creating communities, from Setup, enter *Communities* in the Quick Find box, select **All Communities**, then click **New Community**. The Community Creation wizard appears, with different template options for you to choose from.
2. Hover over a template to see more information about it.

Kokua

A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Koa

A text-based, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Napili

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication.

Salesforce Tabs + Visualforce

Standard Salesforce structure and tabs that you can customize using Visualforce. Supports most standard objects, custom objects and Salesforce1.

3. Hover over the template you want to use, and then click **Choose**.
4. If you selected Koa or Kokua, specify the categories and Company Name for your template, then click **Next**.

Category Group Name

This is the unique name of the data category group that contains the data categories for your site. The name reflects the hierarchy of categories that you've set up for your community and is used throughout the site to organize articles.

Top Level Category

This is the highest-level category that you want to display. Only the children of this category appear in the community. You can have several nested layers of categories above this category, but the page will show this category as the parent and show its subcategories as children.

Company Name

This is the name of your company as you want it to appear in the community header.

5. Enter a community name.

Note: If you're creating multiple communities, keep in mind that community names may be truncated in the global header drop-down menu. Users can see up to 32 characters of the name, and the **Preview** and **Inactive** status indicators count toward that number. Make sure that the visible part of the name is distinctive enough for users to distinguish between multiple communities.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

6. Enter a unique value at the end of the URL field.

This value is appended to the domain you entered when [enabling communities](#) to create a unique URL for this community. For example, if your domain is `UniversalTelco.force.com` and you're creating a customer community, you can designate the URL as `UniversalTelco.force.com/customers`.

 **Note:** You can create one community in your organization that doesn't have a custom URL.

You can change your community name and URL after the community is activated, but users won't be redirected to the new URL. If these changes are necessary, be sure to inform your community members before making the change.

7. Click **Create Community**.

The community is created in `Preview` status.

8. On the confirmation page, click **Go to Community Management** to customize your community. If you chose a template other than `Salesforce Tabs + Visualforce`, you can customize your community in `Community Builder`.

When you create a community, default pages for login, self-registration, change password, forgot password, and your home page are set based on your community template. You can customize or change these default pages at any time in `Community Management`.

 **Important:** When you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it's `Active`. If you don't want all users with your profile to have access, you can remove the profile and give yourself access through a different profile or permission set.

Create Your Community Using a Preconfigured Template

Create a community and select a template to apply to your community. Define your template and community properties in one place, then use Community Builder to finish designing and organizing your community.

1. From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**, and then click **New Community**.
The Community Creation wizard appears with different template options for you to choose from.

2. Hover over a template to see more information about it.

Kokua

A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Koa

A text-based, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Napili

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication.

Salesforce Tabs + Visualforce

Standard Salesforce structure and tabs that you can customize using Visualforce. Supports most standard objects, custom objects and Salesforce1. Keep in mind that the Salesforce Tabs + Visualforce template is based on the standard Salesforce tab structure and doesn't work with Community Builder.

3. Hover over the template you want to use, and then click **Choose**.
4. If you selected Koa or Kokua, specify the categories and Company Name for your template.

Category Group Name

This is the unique name of the data category group that contains the data categories for your site. The name reflects the hierarchy of categories that you've set up for your community and is used throughout the site to organize articles.

Top Level Category

This is the highest-level category that you want to display. Only the children of this category appear in the community. You can have several nested layers of categories above this category, but the page will show this category as the parent and show its subcategories as children.

Company Name

This is the name of your company as you want it to appear in the header.

5. Click **Next**.
6. Enter the name and optional URL for your community.
Selecting this option automatically updates your community's settings with the URL for the custom pages you create in this step. You can override this login page with another login page in your community's settings. For detailed instructions on creating custom login, logout, and self-registration pages for your community, see [Getting Started with Communities](#).

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

To create article types and article actions:

- "Manage Salesforce Knowledge"

To create data categories:

- "Manage Data Categories"

7. Click [Create Community](#).

The community is created in preview status.

8. On the confirmation page, click [Go to Community Management](#) to customize your community.

If you selected the Napili template, use Community Management to set the topics that appear in the navigation menu or that feature prominently on your home page.

Use Community Management to configure community settings such as your default login and registration pages, header and footer, and email templates.

To try out a different template, go back to Community Management and change your template selection. But don't worry—you can always switch back to the first template you chose. To switch back, set the home page back to its original URL in Site Configuration in Site.com Studio.

 **Important:** When you create a community, your profile is automatically added to the list of profiles that have access. As a result, all users in your organization with this profile can log in to the community once it's [Active](#). If you don't want all users with your profile to have access, you can remove the profile and give yourself access through a different profile or permission set.

Customize Communities

Update basic community settings like your URL, community name, members, login options, and general preferences in the **Administration** section of Community Management.

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

2. Click **Administration**, then select the part of the community you want to customize:

 **Important:** The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to **Administration > Preferences** and enable **Show all settings in Community Management**.

- **Members**
- **Tabs**
- **Branding**
- **Login & Registration**
- **Emails**
- **Pages**
- **Preferences**
- **Settings**

 **Note:** To perform advanced customizations, such as adding custom pages or pages that don't require login, from Community Management click the Community Management menu in the global header, then click either **Go to Force.com** or **Go to Site.com Studio** to go to the site associated with this community. If you used the Aloha, Koa, Kokia, or Napili templates, select **Go to Community Builder** to customize the community.

3. To share the community with stakeholders while it's still in Preview status, copy the URL displayed on the **Administration > Settings** page and share it.

This allows you to get their feedback, and take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

Keep in mind that you can only share the URL with users who you added as members of the community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Community Management:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To customize administration settings or use Community Builder:

- "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

After you finish your customizations, activate the community to make it available to members. If [welcome emails are enabled](#) when you activate, a welcome email is sent to all members. If any of those users are new portal users, their welcome email includes their username and password.

Add Members to Your Community

Use profiles and permission sets to manage community membership during the setup process.

Using profiles and permission sets, you can:

- Grant or remove access for groups of users. Once you add a profile or permission set, all users assigned to that profile or permission set become members of the community.
- Enforce a membership policy. New users added to a profile or permission set that is already associated with a community automatically gain access.

Permission sets allow added flexibility for adding members. You can grant community access to a subset of users from the same profile, without needing to clone the profile.

Standard, Chatter, and portal profiles can be added to communities; Chatter customers, from private groups with customers, can't be added to communities even if they're assigned permission sets that are associated with communities.

 **Note:** Profiles and permission sets associated with communities can't be deleted from Salesforce. You must remove the profiles or permission sets from the communities first.

1. Access Community Management in one of the following ways.

- From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
- From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
- From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

2. Click **Administration > Members**.

3. To add members using profiles:

- a. To filter profiles, select a profile type from the drop-down menu. To search for a specific profile, enter a search term and click **Find**.

Search returns profiles for the selected filter.

 **Note:** Search results include profiles that are already part of the community.

b. Select the user profiles you want to allow access to your community. Press CTRL to select multiple profiles.

c. Click **Add**. To remove a profile, select it and click **Remove**.

If you remove a profile from a community, users with that profile lose access to the community, unless the users are assigned permission sets or other profiles that are still part of the community. Their posts and comments still appear.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

 **Important:** If you're an administrator and accidentally remove yourself from a community, you won't be able to access the Administration settings in Community Management. To add yourself back to the community or make other membership updates, [use the API](#).

4. To add members using permission sets:

- a. To search for a specific permission set, enter a search term and click **Find**.
- b. Select the permission sets you want to allow access to your community. Press CTRL to select multiple permission sets.
- c. Click **Add**.

If you remove a permission set from a community, users with that permission set lose access to the community, unless the users are associated with profiles or other permission sets that are still part of the community. Their posts and comments still appear even after they lose access.

5. Click **Save**.

If the community is **Active** and [welcome emails are enabled](#), users with the profiles or permission sets you added receive a welcome email. The welcome email includes a username and a change password link if it is sent to an external user who hasn't logged in to a portal or community yet.

When the community is **Active**, welcome emails are sent and the community is discoverable by members. When a community is in **Preview** status, only members with the login URL can view the community. If a community is **Inactive**, only users with the "Create and Set Up Communities" permission can access it through the Community menu, regardless of membership.

There are additional options for granting access to your community:

- Enable self-registration so that external users can register on their own
- Enable authentication providers, such as Facebook, so that external users can log into the community without creating an account

For more information about these additional options, see [Customize Login, Logout, and Self-Registration Pages in Your Community](#).

SEE ALSO:

[Customize Communities](#)

[Enable the Global Header for Communities](#)

How do I update community membership using the API?

If you aren't a member of a community, you can't access Community Management to update administration settings, including membership. As an alternative, you can use the API and Data Loader to add yourself and others to a community.

 **Tip:** You can also use other data loaders to update your community membership such as Workbench.

1. Get the `networkId` for your community.

From Setup, enter *All Communities* in the **Quick Find** box, select **All Communities**, and then right-click your community URL and select **Inspect**. The `data-networkId` property provides your `networkId`.

2. Get the `profileId` or `permissionsetId` you want to add.

From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles** or **Permission Sets**. Click on the profile or permission set that you want to add. The ID is the last part of the URL.

For example, at *mycompany.salesforce.com/00aa11bb22*, the ID is *00aa11bb22*.

3. Create a .csv file with columns for `networkId` and `parentId`. For `parentId`, list the `profileId` or `permissionsetId` you want to add.
4. Open Data Loader and select the **Network Member Group** object. Specify the location of the .csv file you created and complete the Data Loader steps.

Once you have successfully added members using Data Loader, the members will be able to access Community Management from the **Manage** link on the **All Communities** page in Setup.

 **Note:** In order to access Community Management, the member must also have “Create and Set Up Communities” or “Manage Communities” permission.

SEE ALSO:

[Insert, Update, or Delete Data Using Data Loader](#)

Add Tabs to Your Community

If you're using the Salesforce Tabs + Visualforce template, you can add tabs to your community.

 **Tip:** If you want to use all custom pages in your community, you can choose to hide tabs. Not sure which option works best for you? Check out [Tabs vs. Community Builder](#) on page 3033.

Before you begin, keep these things in mind:

- The tabs you enable should be required for the type of activity you're performing in this community, whether it be sharing accounts and opportunities with your partners or sharing cases and solutions with customers who need support. Don't clutter your community with tabs that users don't need.
- Profiles control access to tabs, so some tabs you choose may be hidden for profiles associated with the community. In that case, you must manually expose the tabs in the profiles for your community members so that they can see the tabs in the community.
- Lightning Component tabs aren't supported in Communities.
- Chatter Free users in your community don't see any tabs except the Chatter tab.

After you identify the features you want your community members to see, you can expose those features by choosing the corresponding tabs during setup. The tabs that you select also determine community navigation in Salesforce1.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the “Create and Set Up Communities” permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Tabs**.

 **Tip:** If you're using one of the preconfigured templates instead of Salesforce Tabs + Visualforce, the **Tabs** node is hidden by default. To display the node, click **Administration > Preferences**, then select **Show all settings in Community Management**.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- “Create and Set Up Communities”

AND

Is a member of the community whose Community Management page they're trying to access.

3. Select the tabs to include in your community from the Available Tabs list. Press CTRL to select multiple tabs.
4. Click **Add** to add the tab. To remove a tab, select it in the Selected Tabs list and click **Remove**.
5. Click **Up** or **Down** to change the order that the tabs display.

The tab at the top of the list is the landing tab for the community. When members access the community, it is the first tab they see.

If members don't have access to the community landing tab, they see the first tab they have access to from the selected community tabs. If they don't have access to any of the tabs, they see the Home tab.

6. Click **Save**.

Important: Changing from the Salesforce Tabs + Visualforce template to a Community Builder-based template removes all tabs from your community.

[Customize Communities](#)

[Rename the Chatter Tab](#)

Tabs vs. Community Builder

Not sure whether to use standard Salesforce tabs or the Community Builder when setting up your community? Here is some more information about each option to help you decide.

Tabs

Selecting the Salesforce Tabs + Visualforce template when creating your community means you will use out-of-the-box Salesforce tabs or Visualforce pages.

Pros

- Some theming options available out-of-the-box for tabs
- Support for all sales, service, marketing, and platform features
- Full Force.com platform capability

Cons

- Visualforce is the preferred approach for better customization, yet Visualforce requires coding capability
- Requires some knowledge of the Force.com platform

Community Builder

Selecting one of the preconfigured templates when creating your community means that you will use the WYSIWYG user interface of the Community Builder.

Pros

- Out-of-box app targeted at self-service communities
- More CSS styles available
- Great for a quick rollout of simple self-service community use case

Cons

- Limited to self-service functionality (cases, Salesforce Knowledge, and Chatter Questions)
- Doesn't support other sales, service, or platform use cases

- Doesn't have full platform capability

SEE ALSO:

[Add Tabs to Your Community](#)[Community Builder Overview](#)

Rename the Chatter Tab

Most likely, many of your community members will use the Chatter tab as their home base. You can customize it to meet your company's branding.

The Chatter tab is the fastest way for your community members to see what's most important to them: activity feeds, groups, bookmarks, files, and more. Many of your community members will most likely use the Chatter tab as their home base. Customize the name of the Chatter tab in your community to match your company branding—for example, you can use your company's name or any other name that would be recognizable to your members.

1. From Setup, enter *Rename Tabs and Labels* in the *Quick Find* box, then select **Rename Tabs and Labels**.
2. Select your default language from the *Select Language* drop-down list at the top of the page.
3. Under Chatter Tabs in Communities, click **Edit** next to the community you want to edit.
4. Type the singular and plural versions of your preferred tab name, for example, Partner and Partners. Select *Starts with a vowel sound* if appropriate.
5. Click **Save**.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To rename the Chatter tab:

- "Customize Application"

OR

"View Setup and Configuration"

AND

Be designated as a translator

Brand Your Community

If you are using the Salesforce Tabs + Visualforce template, you can customize the look and feel of your community in Community Management by adding your company logo, colors, and copyright. This ensures that your community matches your company's branding and is instantly recognizable to your community members.

Important: If you are using a self-service template or choose to use the Community Builder to create custom pages instead of using standard Salesforce tabs, you can use the Community Builder to design your community's branding too.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

2. Click **Administration > Branding**.

3. Use the lookups to choose a header and footer for the community.

The files you're choosing for header and footer must have been previously uploaded to the Documents tab and must be publicly available. The header can be .html, .gif, .jpg, or .png. The footer must be an .html file. The maximum file size for .html files is 100 KB combined. The maximum file size for .gif, .jpg, or .png files is 20 KB. So, if you have a header .html file that is 70 KB and you want to use an .html file for the footer as well, it can only be 30 KB.

The header you choose replaces the Salesforce logo below the global header. The footer you choose replaces the standard Salesforce copyright and privacy footer.

4. Click **Select Color Scheme** to select from predefined color schemes or click the text box next to the page section fields to select a color from the color picker.

Note that some of the selected colors impact your community login page and how your community looks in Salesforce1 as well.

Color Choice	Where it Appears
Header Background	Top of the page, under the black global header. If an HTML file is selected in the Header field, it overrides this color choice. Top of the login page. Login page in Salesforce1.
Page Background	Background color for all pages in your community, including the login page.
Primary	Tab that is selected.
Secondary	Top borders of lists and tables. Button on the login page.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Color Choice	Where it Appears
Tertiary	Background color for section headers on edit and detail pages.

- Click **Save**.

SEE ALSO:

[Customize Communities](#)

Customize Email Sent from Communities

You can customize email sender information, Chatter email branding, and templates in your community emails. You can perform customizations in either the user interface or the Network object in Salesforce APIs.

- Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.

- Click **Administration > Emails**.

- Enter custom values for the email sender's name and address to replace the default values.

 **Note:** If you change the sender's email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn't take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

If you enter a custom value for the sender's address and you have enabled mail relay, your Chatter emails will use the relay.

- Customize what displays in the footer of Chatter emails.

 **Important:** Both a logo and email footer text are required. Keep in mind that:

- All Chatter emails display the Chatter logo and Salesforce information by default unless you replace them with your organization's own logo and information.
- If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to `null`.

- Choose a logo to replace the default Chatter logo.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

The logo must be an existing document in the Documents tab and must be marked `Externally Available Image`. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

- b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.

The default text includes Salesforce's name and physical address. We strongly recommend including your organization's physical address to comply with applicable anti-spam laws.

5. Select `Send welcome email` to send email to users when they're added to the community.

 **Important:** Welcome emails contain login information for external members. If you don't select this option, you'll have to manually send external members their usernames and passwords.

The link provided in the welcome email is valid for 6 months.

Welcome emails are sent when:

- A community changes from `Preview` status to `Active` status. Emails are not sent when a community is in `Preview` or `Inactive` status.
- An administrator adds a new profile or permission set to a `Active` community.
- A user is assigned a profile or permission set that is part of a `Active` community.

 **Note:** If a profile or permission set is part of multiple communities, users with that profile or permission set receive a welcome email from each community. The first email contains login credentials, but emails from subsequent communities simply contain a link to the community.

6. Use the default email templates or use the lookups to select different templates for welcome emails to new community members, forgotten password emails, and notification emails about reset passwords. If your organization uses email templates to submit case comments, you can select a template (none is provided by default).

User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don't expire. You can customize any default template.

 **Note:** If you customize the contents of an email template, we recommend that you use the `{!Community_Url}` merge field. This custom merge field populates the unique URL for a community, ensuring that emails to users contain URLs with the correct parameters and direct users to the appropriate community to log in or change a password.

7. Click **Save**.

Emails sent as a result of approvals, workflows, and case comments are sent based on community membership. For example, if a workflow triggers an email, all the recipients are grouped based on community membership and then one email is sent to each group. If the user is a member of multiple active communities, the email comes from the oldest active community.

Another way to customize community emails is to use these fields on the API Network object.

- `CaseCommentEmailTemplateId`—ID of the email template used when submitting a comment on a case.
- `ChangePasswordEmailTemplateId`—ID of the email template used when notifying a user that their password has been reset.
- `EmailFooterLogoId`—ID of the Document object that displays as an image in the footer of community Chatter emails.
- `EmailFooterText`—Text that displays in the footer of community Chatter emails.
- `EmailSenderAddress`—Read only. Email address from which community emails are sent.
- `EmailSenderName`—Name from which community emails are sent.
- `ForgotPasswordEmailTemplateId`—ID of the email template used when a user forgets their password.
- `NewSenderAddress`—Email address that has been entered as the new value for `EmailSenderAddress` but has not been verified yet. After a user has requested to change the sender email address and has successfully responded to the verification email,

the `NewSenderAddress` value overwrites the value in `EmailSenderAddress`. This becomes the email address from which community emails are sent.

- If verification is pending for a new email address and you set `NewSenderAddress` to null, this cancels the verification request.
 - `NewSenderAddress` is automatically set to null after `EmailSenderAddress` has been set to the new verified address.
 - If verification is pending for a new email address and you specify a different new address for this field, only the latest value is retained and used for verification.
- `OptionsSendWelcomeEmail`—Determines whether a welcome email is sent when a new user is added to the community.
 - `WelcomeEmailTemplateId`—ID of the email template used when sending welcome emails to new community members.

Merge Fields for Communities

You can add merge fields to Communities email templates.

When you enable Salesforce Communities in your organization, three text-based email templates are created:

- Communities: Changed Password Email
- Communities: Forgot Password Email
- Communities: New Member Welcome Email

These templates use unique merge fields. These merge fields are not available to select and copy when editing a template, but you can enter them manually. These merge fields will only work properly if used in a text or HTML template selected for a community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Field Name	Description
<code>{!Community_Name}</code>	The name of the community, as entered during community creation.
<code>{!Community_Url}</code>	<p>The URL to the login page of a community. For instance, <code>https://acme.force.com/partners/login</code>.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if:</p> <ul style="list-style-type: none"> • The template containing this field is selected as the Welcome New Member template for a community, and Send welcome email is selected, OR • The template containing this field is selected as either the Forgot Password or Change Password template and the user receiving the email is an external user who is a member of the community.

Field Name	Description
<code>{!Receiving_User.Username}</code>	The user name of the user who will receive the welcome email.

You can create custom email templates for communities using Visualforce, which allows you to use custom company branding in your email templates. For Visualforce email template, use the `$Network` global merge field type and its properties, as described in this table.

Field Name	Description
<code>\$Network.Name</code>	The name of the community, as entered during community creation.
<code>\$Network.NetworkUrlForUserEmails</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if it is used in a Visualforce email template for one of three email types supported for Communities.</p>

If your community is using cases, approvals, or workflows, emails created from an email template that use the `{!<any_object>.Link}` or `{!Case.Link}` merge fields include a link to the record in the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

Field Name	Description
<code>{!Case.Link}</code>	<p>Used in:</p> <ul style="list-style-type: none"> Case comment notifications to contacts and owners Case creation and update notifications to contacts
<code>{!<any_object>.Link}</code>	<p>Used in:</p> <ul style="list-style-type: none"> Approval requests sent to approvers and delegated approvers Workflow email alerts

To find out if your email templates use these merge fields, from Setup, enter *Email Templates* in the Quick Find box, then select **Email Templates**, then click **Edit** next to any email template.

Enable Community Preferences

Customize Communities Preferences

Enable or disable nickname display, access to the community without login, Chatter private messages, content flagging, reputation levels, knowledgeable people, and file limits in your community.

To use these settings, Chatter must be enabled in your organization.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Preferences**.
3. Change the desired settings.

General

- Display nicknames instead of full names in your community. Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.
- Enable access to public Chatter content in your community so that guest users can access it without logging in. Allowing this access is a way to boost adoption and helps customers easily find information they need without having to log in, register, or contact your company directly.
- Enable Chatter messages, which allow you to have secure private conversations with other Chatter users. To expose Chatter messages for external users, administrators must also enable the Chatter tab.
- Use custom Visualforce error pages, if you want authenticated users to see your custom branded Visualforce error pages.
- Show all settings available in Community Management that are hidden by default based on how you set up your community. Enabling this setting overrides the dynamic navigation provided in Community Management.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Community Management

- Allow members to flag posts, comments, or files for moderation within your community. Members may want to flag items that contain inappropriate language or sensitive information.
- Enable Reputation to allow community managers to set up a point system that rewards users who participate in the community. Administrators set up corresponding reputation levels that users see on their profile.
- Enable knowledgeable people so you can discover who's knowledgeable on topics and endorse people for their knowledge on a topic.

Files

- Set the maximum size in MB for files uploaded to the community.
- Specify the types of files that can be uploaded in the community.

4. Click **Save**.

SEE ALSO:

[Show Nicknames Instead of Full Names in the Community](#)

[Enable Reputation in Your Community](#)

[Limit Files in Your Community](#)

Show Nicknames Instead of Full Names in the Community

Enabling nickname display in your community allows more privacy and protects member identities. This is especially helpful in a public community where unregistered visitors can access member profiles.

All users have nicknames by default, which they can modify by going to *Your Name* > **Edit Contact Info** in the global header or from their Chatter user profile.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration** > **Preferences**.
3. Select **Enable nickname display**, then click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable nickname display:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Nicknames are shown in place of first and last names in almost all locations in the community, including in feeds, list views, groups, search results, recommendations, and on user profiles and files. Additionally, Salesforce1 and any community sites activated using community templates show nicknames as well.

A few restrictions to keep in mind about nickname display:

- Private messages display full names. You can choose to turn off private messages to avoid this.
- Records and user lookups on records show full names. Keep in mind, though, that you can control record and user visibility with sharing rules.
- Mobile notifications in Salesforce1 show full names. You can turn off mobile notifications in Salesforce1 to avoid this.
- Searches by first, last, and full names aren't restricted and return matches, but the search results display only nicknames. The auto-complete recommendations in global search and the recent items list show any first, last, and full names that the user has already searched by or has accessed via a record or another location.

SEE ALSO:

[Customize Communities Preferences](#)

Enable Public Access to Community Content

Enable access to community content for guest users (unlicensed users) without requiring them to log in or register with the community.

Public communities lend themselves well to business-to-consumer (B2C) type scenarios and allow you to reach a broader audience. Consider the example of a customer support community maintained by a sports equipment manufacturer. A community with public discussions, questions, known issues, and solutions posted by customer support would allow existing and potential customers to view this information without contacting the company directly.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Preferences**.
3. Select **Allow public access to Chatter**, then click **Save**.

Enabling public access allows you to expose groups, topics, user profiles, and feeds for guest users via Chatter in Apex, but it doesn't expose this data in the community. To allow guest users to view this information, do one of the following:

- Use a community template from the Community Builder that allows guest user access for one or more of these objects (Napili, for example). See the [Community Templates for Self-Service Implementation Guide](#) for detailed instructions.
- Use the Chatter in Apex methods and Visualforce pages to expose these objects to guest users. See "Methods Available to Communities Guest Users" in the [Force.com Apex Code Developer's Guide](#) and the [Visualforce Developer's Guide](#) for more information.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable public access to community content:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

 **Note:**

- If you have enabled profile-based rollout for Chatter in your organization, guest users won't be able to access your public community until you enable Chatter access on the guest user profile. For more information, see *Control Chatter Access through User Profiles* in the Salesforce Help.
- You can't attach files to questions in a public community from Internet Explorer 9.

SEE ALSO:

[Customize Communities Preferences](#)

Use Custom Visualforce Error Pages for Authenticated Users

If you have customized Visualforce error pages, you can have those pages display for authenticated community users.

To assign or customize your Visualforce error pages, from Community Management, click the Community Management menu in the global header and select **Go to Force.com**. The **Error Pages** section lists your current page selections.

When **Use custom Visualforce error pages** is selected, users who are logged in to the community will see your custom Visualforce error pages. When **Use custom Visualforce error pages** isn't selected, users logged in to the community see the default Visualforce error pages. Guest users who aren't logged in to the community will always see the custom Visualforce error pages, regardless of whether or not you select the checkbox.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Preferences**.
3. Select **Use custom Visualforce error pages**, then click **Save**.

SEE ALSO:

[Assigning Force.com Site Error Pages](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Limit Files in Your Community

Restrict the size and types of files that your community members can upload. This whitelist of file types lets you control what your community members upload and also prevents spammers from polluting your community with inappropriate files.

Community file moderation must be enabled for your org before you can limit files in your community. If you don't see the option to limit files in Community Management, contact Salesforce.

Your community file limits apply to files uploaded by community members anywhere in the community—in posts and comments, directly in the Files tab, and also from Salesforce1. You can also set community file limits using the SOAP API or Metadata API.

Files uploaded before setting your file limits are unaffected. However, newer versions of those files must meet the limits you specify.

Keep the following things in mind:

- A file must meet the file limits set in the community in which it's uploaded. For example, if a customer uploads a file on a case and then an agent uploads a newer version in your Salesforce internal org, the limits from the customer community still apply.
 - Files uploaded in your internal Salesforce org that are shared in a community aren't subject to community file limits.
1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
 2. Select **Administration > Preferences**, then enter your limits in the Files section on the page.
 - **Maximum file size in MB**—Enter a number between 3 MB and your org's maximum file size. To use the default limit of 2 GB, leave this field empty or enter *0*.
 - **Allow only these file types**—Enter file extensions separated with a comma (for example: *jpg, docx, txt*). You can enter lowercase and uppercase letters. You can enter up to 1,000 characters. To allow all file types, leave this field empty.

3. Click **Save**.

After you set your community's file limits, members receive an error message if their file is larger than the size you set or if their file extension isn't allowed.

When a member tries to upload multiple files at once and a file is found that doesn't meet your limits, none of the files are uploaded.

SEE ALSO:

[Customize Communities Preferences](#)

EDITIONS

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To limit the files in your community:

- "Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Enable the Global Header for Communities

When Communities is enabled, the global header allows you to easily switch between your communities and your internal organization.

Communities must be enabled in your organization to use the global header.

The `View Global Header` permission is disabled by default for all standard profiles. To view the global header, users must be assigned the “View Global Header” permission either by selecting it on standard profiles, creating custom profiles, or by creating a permission set. Create permission sets to easily assign this permission to specific people.

1. From Setup, enter `Permission Sets` in the Quick Find box, then select **Permission Sets**.
2. Click **New** and create a permission set that includes the System Permission `View Global Header`.
3. Assign the permission set to the appropriate users.

Users with this permission set see the global header at the top of all pages. They can use the menu on the left to switch between their internal organization and any communities they have access to.

The `Your Name` menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the `Switch to Lightning Experience` link in the `Your Name` menu. Communities aren’t supported in Lightning Experience, so to create, manage, or access communities from the global header, you’ll have to switch back to Salesforce Classic.

When in a community, users with either the `Manage Communities` or the `Create and Set Up Communities` permission see a gear icon (⚙️) they can use to switch to Community Management. Within Community Management, they see an additional menu that they can use to preview the community or access the community settings via Community Builder, Site.com Studio, or Force.com.

Note: Within Community Management, users see the global header and the Community Management menu, even if they don’t have the “View Global Header” permission. However, we recommend that you still assign the “View Global Header” permission to users who need to switch between your internal organization and communities.

USER PERMISSIONS

To create permission sets:

- “Manage Profiles and Permission Sets”

To assign a permission set to a user:

- “Assign Permission Sets”

Share a Link to Your Community

You can allow members to preview your community before making it active.

You can only share the link for a preview community with users who were added as members of the community.

Sharing a link to a community in *Preview* status allows you to easily gather stakeholder feedback. The community functions just as it will when you make it active, so stakeholders can try out all functionality and review your branding and customizations. Additionally, you can take advantage of having early members who can post, comment, and share records so that members enter an active community from their first login.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the *Create and Set Up Communities* permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Settings**.
3. Copy the URL displayed on the page and share it with your stakeholders.

Keep in mind that you can only share the URL with users who you added as members of the community.

USER PERMISSIONS

To share a preview URL for your community:

- “Create and Set Up Communities”

Make Your Communities Active

Activating a community makes it visible to members. You can customize the community while it's active, or you can deactivate the community to make your changes. Keep in mind that once a community is active, everything in the community is visible to members. Be sure to finish all major customizations while in `Preview` status.

 **Note:** If welcome emails are enabled, an email with a link to the community is sent to each member when you first activate the community. For any members from outside the company who don't have a password or use single sign-on, the welcome email includes a link to set their password and security question.

An external user with access to multiple communities within one organization uses the same login credentials for all communities.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the `Create and Set Up Communities` permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Settings**.
3. Click **Activate Community**.
Your community is active and online.

Update Your Community Settings

Manage your community name, description, URL, community status, and community template all from one spot.

You can change your community name and URL after the community is activated, but users won't be redirected to the new URL. If these changes are necessary, be sure to inform your community members before making the change.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Settings**.
3. Edit your community settings as needed:
 - Edit your community name, description, and URL, by clicking  next to your community name.
 - Manage the status of your community.
 - Change your community template.

AND

Is a member of the community whose Community Management page they're trying to access.

Deactivate a Community

You may want to deactivate a community if you need to:

- Add or remove members
 - Add, remove, or change the order of tabs
 - Change the color scheme
 - Change the community URL
1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
 2. Click **Administration > Settings**.
 3. Click **Deactivate**.

Your community is inactive and offline.

When a community is inactive, members still see it in the menu, but can't access it unless they have the "Create and Set Up Communities" permission.

Change Your Community Template

Change your community template if the requirements of your community evolve from when you first set it up.

 **Tip:** You won't lose any data when you change templates, but make sure to review [Considerations for Changing Your Community Template](#) before performing the steps below.

If your community is already active and you change templates from a Salesforce Tabs + Visualforce template to a Community Builder-based template, or from a Community Builder-based template to another Community Builder-based template, your template change is saved in a draft version that you can further customize in Community Builder. You must publish your changes in Community Builder before your active community is updated.

If your community is already active and you change templates from a Community Builder-based template to a Salesforce Tabs + Visualforce template, your active community is updated immediately. In this scenario, we recommend that you first deactivate your community. Once you have made all of your changes, you can then re-activate it.

If your template is listed as `None`, this means you're not using a predefined Community Builder-based template or you have modified a Community Builder-based template.

If you are using a Community Builder-based template and you customize your template, the **Settings** page shows the name of template you have in draft mode in Community Builder. A warning message reminds you to publish your changes in Community Builder.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Settings**.
3. Click **Change Template**.
4. Choose a template that meets your community's needs.

To learn more about using the Koa, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).
5. When prompted, select **Change Template** to confirm your changes.

After you change the template, you are taken back to Community Management.

Check to make sure your community pages, such as the Login page or Community Home page, are still the best choice for your updated community template. For example, if you previously had a Salesforce Tabs + Visualforce template and switched to a Community Builder-based template, you might want to update your pages to use Community Builder pages instead of Visualforce pages. If required, customize your community in Community Builder and publish any changes you make.

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

- You may need to change your community's template to see some new communities features introduced by Salesforce. If you want to keep your current template, you must switch to another template and then switch back to your current template. For example, let's say you are using the Napili template for your community. Salesforce introduces a feature that requires a change (*not* a simple update) to the template. You must switch your community's template to another template, such as Koa or Kokua, and then switch it back to Napili.
- Salesforce object data carries over, but all branding and component customizations do not. You'll need to redo all customizations.
- Switching between templates updates the navigation in Community Management. To view all available options in Community Management, regardless of template selection, select **Administration > Preferences > Show all settings in Community Management**.
- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to a Community Builder template, or vice versus. For example, in Community Builder-based templates */s* is appended to your URL. Be sure to update any links to your community with the new URL.

To learn more about using the Kokua, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

Manage Communities Users

Reset An External User's Password for Communities

An external user's password can be reset either by the user or by the administrator of the organization hosting the community.

In either case, when someone initiates a reset of an external user's password, an email is sent to the user with a link to reset their password. User-initiated password reset links expire in 24 hours. Administrator-initiated password reset links don't expire. When the user clicks the link, they will be required to reset their password before proceeding.

If a user-initiated password reset request can't be processed, they receive an email telling them why. Password reset requests fail if a user's account is temporarily or permanently locked due to too many unsuccessful login attempts or if the request was sent outside approved login hours, IP ranges, or network locations.

How do external community members get login information?

External users get their login credentials in welcome emails from a community.

When you enable a contact as a customer user or partner user, they don't receive their login credentials until you add them to a community with welcome emails enabled. If welcome emails are disabled for the community, the external user won't receive credentials and you must manually send them. To do so, from Setup, enter *Users* in the **Quick Find** box, select **Users**, select the checkbox next to the user's name, and then click **Reset Password**. An email containing the user's username and a link to reset their password will be sent to the user. The link in this email doesn't expire.

Set Up Search Engine Optimization (SEO) for Your Community

Have search engines, such as *Google*™ or *Bing*®, index your community so that customers, partners, and guest users can easily discover community pages via online searches. SEO can significantly improve discovery for public communities.

Available in: Salesforce Classic

Available in: **Enterprise, Performance, and Unlimited** Editions

There are a few standard files and SEO properties that you need to know about when setting up SEO for your community.

sitemap.xml

`sitemap.xml` contains a list of the URLs of your community. Search engines use this list to find out which pages of your community are available for crawling and indexing. The `sitemap.xml` file is automatically generated at the root level of your community. To view the site map, navigate to `https://<community_URL>/s/sitemap.xml`.

If your community supports multiple languages, the site map automatically includes an entry for each supported language as follows:

```
<xhtml:link rel="alternate" hreflang="language_code"
href="page_URL?language=language_code" />
```

For example, `<xhtml:link rel="alternate" hreflang="fr" href="https://mycommunity.com/s/?language=fr" />`.

You can submit the `sitemap.xml` file directly to search engines, such as [Google™ Webmaster Tools](#) and [Bing® Webmaster Tools](#) to allow users of those search engines to discover content in your community.

robots.txt

`robots.txt` uses include and exclude rules to inform web spiders and robots about which areas of your community to index. This standard file is used across the Web for SEO and gives you complete control over what users can discover via search engines.

`robots.txt` is automatically generated if your community exists at the root level (without a subpath in the URL). To view the file, navigate to `https://<community_URL>/robots.txt`.

The auto-generated file allows your entire community to be indexed. However, you can choose to allow indexing of specific areas only by creating a Visualforce page to host the information.

Page Title and Description properties

The `title` and `description` tags in the page `<head>` are important for SEO because they represent the link title and description that appear in search results pages.

Salesforce.com: The Customer Success Platform To Grow Yo...
<https://www.salesforce.com/> ▾ Salesforce.com ▾
 Build more meaningful and lasting relationships and connect with your customers across sales, customer service, marketing, communities, apps, analytics, and ...

You can customize the title and description for your community's standard pages in the [Page Manager](#) area of Community Builder. However, some pages, such as the Article Detail and Topic Detail pages, set these properties dynamically according to the components on the page. For example, for the Article Detail page, the title and description values are updated according to the article's title and summary, respectively.

[Create a Custom Robots.txt File for Your Community](#)

The `robots.txt` file uses include and exclude rules to inform web spiders and robots about which areas of your community to index. To allow only specific areas of your community to be indexed, create a Visualforce page to host this information. After you specify your rules, search engines use the file to index your community pages.

[Best Practices for Using SEO in Your Community](#)

Follow these guidelines and best practices when using SEO in your community.

Create a Custom `robots.txt` File for Your Community

The `robots.txt` file uses include and exclude rules to inform web spiders and robots about which areas of your community to index. To allow only specific areas of your community to be indexed, create a Visualforce page to host this information. After you specify your rules, search engines use the file to index your community pages.

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To create a Visualforce page and `robots.txt` file for your community:

- "Create and Set Up Communities"

Your custom `robots.txt` file must contain the path to the auto-generated site map—for example, `https://<community_URL>/s/sitemap.xml`. `robots.txt` is placed at the root level of your community.

Here's an example of a Visualforce page with indexing rules for a community:

```
<apex:page contentType="text/plain">
User-agent: *
Disallow: / # hides everything from ALL bots
Allow: /<path-prefix-1>/s # add path you want to open to bots
Allow: /<path-prefix-2>/s # add path you want to open to bots
```

```
Sitemap: http://<community_URL>/s/sitemap.xml
Sitemap: http://<community_URL>/<sub_path>/s/sitemap.xml
</apex:page>
```

 **Note:** You may have more than one community, each with various subpaths. Keep in mind that they all share the same file, so be sure your indexing rules account for the pages in all your communities. The Visualforce page with the robots.txt info must be within the community that has no subpath name at all, so at the root level.

To create and use a custom `robots.txt` file:

1. Create a list of include and exclude rules for the different areas of your community that you want to expose or hide from search engines. Save this information in a text file.
2. In Setup, enter *Visualforce Pages* in the **Quick Find** box, then select **Visualforce Pages** and click **New** to create a Visualforce page. Give it any name; you can even call it `robots`.
3. Paste the list of indexing rules in the Visualforce page. The final contents should look similar to the example above, with more rules as required.
4. Click **Save**.
5. Back on the Community Management page for your community, click **Administration > Pages > Go to Force.com** and then **Edit** on the Site Details page.
6. In the **Site Robots.txt** field, enter the name of the Visualforce page you created, or click  to search for the file.
7. Click **Save**.
8. Optionally, submit your `sitemap.xml` file directly to search engines. For example, submit the file to [Google™ Webmaster Tools](#) and [Bing® Webmaster Tools](#) to allow users of those search engines to discover content in your community.

To confirm that the `robots.txt` file is available for robots and spiders, navigate to `https://<community_URL>/robots.txt`. Similarly, to view the site map, navigate to `https://<community_URL>/s/sitemap.xml`.

- [Set Up Search Engine Optimization \(SEO\) for Your Community](#)
- [Best Practices for Using SEO in Your Community](#)

Best Practices for Using SEO in Your Community

Follow these guidelines and best practices when using SEO in your community.

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, and **Unlimited** Editions

- Don't create a custom site map; use the auto-generated `sitemap.xml` file.
- If you create a custom `robots.txt` file, ensure that it points to the auto-generated site map—for example, `http://<community_URL>/s/sitemap.xml`.
- If your org supports multilingual Knowledge articles, we recommend against replacing the URL of translated articles with language-specific URLs. Instead, retain the same URL as the base language article.

If your community supports multiple languages, the site map automatically includes an entry for each supported language as follows:

```
<xhtml:link rel="alternate" hreflang="language_code"
href="page_URL?language=language_code" />
```

- In Page Manager, ensure that each page's Title and Description fields have meaningful entries, where applicable. The page title is used in the browser tab or window, search engine results, and bookmarks. Content in the Description field is shown in search engine results to help people quickly decide whether it's the page they want.
- Before submitting the `sitemap.xml` file to search engines for crawling, navigate to `https://<community_URL>/s/sitemap.xml` as an unauthenticated user. (We suggest using Google Chrome's incognito mode.) Ensure that the URLs listed in the site map are appropriate for guest users.

If a URL is mistakenly included in the list available to guest users, ensure that the correct permissions are enabled on the guest user profile and that your org is set up correctly. For example, to prevent Case Detail URLs from being included in the site map, from Setup, enter *Sharing Settings* in the *Quick Find* box. Then, click **Edit** and set the Default Internal Access for Case to *Private*.

- Redirecting HTTP requests to HTTPS is an SEO best practice. Therefore, we recommend against disabling the **Require Secure Connections (HTTPS)** setting on the Site Details. To verify that the checkbox is selected, in Community Management, click **Administration > Pages > Go to Force.com**.
- 301 redirects are a great way to ensure that users and search engines are directed to the correct page. For example, for a URL such as `www.my_community.com`, we recommend creating a redirect to `my_community.com`. You can set up these redirects with your DNS provider.

SEO for Communities FAQ

Answers to common questions about using SEO in your community.

Available in: Salesforce Classic

Available in: **Enterprise, Performance,** and **Unlimited** Editions

Why does `sitemap.xml` have references to other site maps?

The auto-generated `sitemap.xml` file is an index file that lists other site maps. `sitemap.xml` can contain only a limited number of URLs, so if your community contains many site map URLs, we partition them into several smaller site map files.

Does the site map include URLs for Salesforce object pages that come with my community template?

If you created a detail page for the object and enabled the object's "Read" permission on the guest user profile, the URLs for the object's pages are included in the site map.

Does the site map include URLs for the custom object pages that I create?

If you created a detail page for the object and enabled the object's "Read" permission on the guest user profile, the URL for the detail page is included in the site map. However, URLs for the list and related list pages aren't included.

How do I exclude the URLs for Case Detail from the site map and prevent them from showing up in search engine results?

To prevent Case Detail URLs from being included in the site map, from Setup, enter *Sharing Settings* in the *Quick Find* box. Then, click **Edit** and set the Default Internal Access for Case to *Private*.

Why doesn't the auto-generated `robots.txt` file appear when I navigate to**`https://<community_URL>/robots.txt`?**

Your community must be at the root level of your custom URL for the auto-generated `robots.txt` file to show up. If you don't have a custom URL set up and are using the *.force.com domain, then a community without the path prefix must exist for `robots.txt` to show up.

How do I override the content of `robots.txt`?

You can override `robots.txt` by [creating a Visualforce page to host the information](#).

Can I remove the `/s/` from the default community URL?

No, the `/s/` is required in the default community URL.

Is URL rewriting for creating custom vanity URLs supported?

No, URL rewriting isn't currently supported for template-based communities.

Does each article have its own URL?

Yes, each article that appears in the Article Detail page has its own URL, which is retrieved from the Knowledge article's `URL Name` field.

If your org supports multilingual Knowledge articles, we recommend against replacing the URL of translated articles with language-specific URLs. Instead, retain the same URL as the base language article.

Can I add titles and descriptions to articles for SEO purposes?

Each Knowledge article has a `URL Name`, a `Title`, and a `Summary` field. When the article is displayed in the Article Detail page in Community Builder, these fields are used for the page URL, and the `title` and `description` tags in the page `<head>`, respectively.

The `title` and `description` tags in the page `<head>` are important for SEO because they represent the link title and description that appear in search results pages.

Optional Community Enhancements

Configure a Custom Domain for Your Community

Set up a custom domain so that your community URLs reflect your company brand.

 **Note:** Custom domains are supported only in non-sandbox instances. You can configure a custom domain in a sandbox instance and then migrate it to a production instance, but the custom domain is only active in production.

When you add a domain, you also have the option of attaching a certificate and key for connection security. If you're going to use a certificate, make sure you've already added it using Certificate and Key Management before you try to attach it to your domain. Only CA-signed certificates are supported, and they must be 2048 bits in length. To support all domains that are hosted by sites in your organization, use a wildcard or Subject Alternative Name certificate.

1. From Setup, enter *Domains* in the **Quick Find** box, then select **Domains**.
2. Click **Add a Domain**.
3. Enter the Domain Name.
4. Add a certificate if you have already set up a CA-signed certificate that supports this domain.
5. Click **Save**. Alternatively, click **Save & New** to add multiple domains.

If you plan to host more than one community on a domain, you'll need to set up custom URLs for each site. Custom URLs are the way to uniquely distinguish the communities within that domain. From Setup, enter *Custom URLs* in the **Quick Find** box, then select **Custom URLs**.

Before you switch the CNAME of your domain name to point to a new target name, ensure that the new target name exists in the DNS by using `dig` or `nslookup`. When you created your domain names affects the target of your CNAME:

- Domain names that were added before Summer '13, typically need to have their CNAME adjusted to point to the fully qualified domain followed by `.live.siteforce.com` instead of to the organization's `force.com` sub-domain. For example, if your pre-Summer '13 domain is `www.example.com`, then the target of its CNAME will need to be `www.example.com.live.siteforce.com` instead of `example.force.com` before HTTPS will work.
- Domain names that were added in or before Summer '13, don't have the 18-character organization ID in the CNAME target.
- Domain names that were added in or after Summer '13, already point to the proper place for setting up HTTPS in a custom domain.
- Domain names that were added in or after Winter '14, use a CNAME that points to the fully qualified domain followed by your organization's 18-character ID and `.live.siteforce.com`. For example, if your domain name is `www.example.com` and your 18-character organization ID is `00dxx000001ggxeay`, then the target of its CNAME will need to be `www.example.com.00dxx000001ggxeay.live.siteforce.com`.

[Adding a Domain](#)

USER PERMISSIONS

To view domains:

- "View Setup and Configuration"

To add domains:

- "Customize Application" or "View Setup and Configuration" plus either a Site.com Publisher license or "Create and Set Up Communities"

To edit or delete domains:

- "Customize Application"

To associate certificates with a domain:

- Contact Salesforce if you aren't using Communities. Organization with Communities can associate certificates with a domain.

Add the Global Search Box to Your Customized Community HTML Header

If you customize your Salesforce Communities with an HTML header, you hide the global search box. To take advantage of this search functionality, add a form to your custom header.

1. In your customized HTML header, embed a form similar to this one.

```
<form action="/<community name>/search/SmartSearch" method="get">
  <input id="phSearchInput" type="text" name="str"/>
  <input type="submit" value="Search"/>
</form>
```

2. Replace `<community name>` with the unique value you used for the URL when creating the community. For example, if you entered `customers` as the unique value for your community URL, the form would look like this example:

```
<form action="/customers/search/SmartSearch" method="get">
  <input id="phSearchInput" type="text" name="str"/>
  <input type="submit" value="Search"/>
</form>
```

Login, Self-Registration, and Password Management In Your Community

Customize Login, Logout, and Self-Registration Pages in Your Community

Configure the standard login, logout, password management, and self-registration options for your community, or customize the behavior with Apex and Visualforce or Community Builder (Site.com Studio) pages.

By default, each community comes with default login, password management, and self-registration pages and associated Apex controllers that drive this functionality under the hood. You can use Visualforce, Apex, or Community Builder (Site.com Studio) to create custom branding and change the default behavior:

- [Customize the branding of the default login page.](#)
- [Customize the login experience](#) by modifying the default login page behavior, using a custom login page, and supporting other authentication providers.
- [Redirect users to a different URL on logout.](#)
- [Use custom Change Password and Forgot Password pages](#)
- [Set up self-registration](#) for unlicensed guest users in your community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Brand Your Community's Login Page

If you selected the Salesforce Tabs + Visualforce template, you can add your company logo and custom footer text to the standard login page that comes out-of-the-box with your community.

The header and page background colors used on the standard login page are inherited from the community's [branding color scheme](#).

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Login & Registration** and make your changes in the Header and Footer section.
3. Upload a logo for the community login page header.

The file can be .gif, .jpg, or .png. The maximum file size is 100 KB. Images larger than 250 pixels wide or 125 pixels high aren't accepted. Uploading a logo automatically creates a Communities Shared Document Folder on the Documents tab and saves the logo there. Once created, you can't delete the folder.

The header logo displays at the top left of the standard login page. It is also used when you access the community in Salesforce1. The header logo doesn't appear on custom login pages.
4. Enter custom text for the community login page footer, up to a maximum of 120 characters.

The footer displays at the bottom of the login page. This footer text doesn't display on custom login pages.
5. Click **Save**.

The logo and custom footer text display to all users (internal, external, and unlicensed guest users) on the login page.

SEE ALSO:

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

[Customize the Login Process with Apex](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Customize Your Community's Login Experience

Customize the default login process for external users in your community. You can also use a custom Community Builder, Site.com Studio, or Visualforce login page, support multiple authentication providers, and configure single sign-on with any template.

External users are users with Community, Customer Portal, or partner portal licenses.

- The login page you select in Community Management overrides other login page assignments in the Site.com or Force.com site settings.
 - If your community uses the Salesforce Tabs + Visualforce template, the login page assigned to the community by default is called `CommunitiesLogin`. Use Visualforce to customize the appearance of this page.
 - If your community uses the Napili template, the login page assigned to the community by default is called `Login`. Use Community Builder (Site.com Studio) to customize its appearance.
 - To update the login behavior for both Visualforce and Community Builder pages, update the `CommunitiesLoginController` Apex controller.
 - Custom Community Builder pages must be published before they can be assigned to the community. Remember to modify the `CommunitiesLoginController` Apex controller and the `Site.Login()` Apex method to use your custom login page.
1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter `All Communities` in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
 2. Click **Administration > Login & Registration** and make your changes under the Login section.
 3. Optionally, choose a custom login page for your community. Select the page type (**Community Builder** or **Visualforce**), enter the name of the page in the search field, and click . In the search results window, click the name of the page to select it.

 **Tip:** To revert to the default login page for your community's template, select **Default Page**.
 4. Optionally, select `Allow internal users to log in directly to the community`. This setting allows your internal users to use their internal credentials on the community login page.

Internal users must be members of the community to log in directly from the community login page. After your internal users log in, they land on the community home page.
 5. Select which login options you want to display.

By default, users log in to the community using the default community username and password. If you want to allow them to log in with other credentials, such as their Facebook[®], Janrain[®], or Salesforce credentials from another organization, select those from the list.

 **Important:** Configure these [authentication provider options](#) in advance to be able to use them for community logins. From Setup, enter `Auth. Providers` in the Quick Find box, then select **Auth. Providers**.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

- Optionally, allow external users to log in with their SAML single-sign on identity.

This option is available only if your organization has successfully [set up SAML for your community](#) on page 3089 including:

- SAML settings for single sign-on, which enables login to Salesforce using your corporate identity provider. Note that you must enter an Identity Provider Login URL.
- A custom domain name, which changes the application URLs for all of your pages, including login pages. Contact Support if you need to enable My Domain.

To offer multiple SAML single sign-on options, enter *Single Sign-On Settings* in the **Quick Find** box, select **Single Sign-On Settings**, and then click **Enable Multiple Configs**. If you already had SAML enabled and you then enable multiple SAML configurations, your existing SAML configuration is automatically converted to work with multiple additional configurations.

Users see the option to **Log In with Single Sign-On**. If you have enabled multiple SAML single sign-on options, each login button displays labeled with the SAML configuration's **Name** field.

- Click **Save**.

 **Note:** Renaming or deleting the default login page can cause problems with the default community login flow.

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

Customize the Login Process with Apex

You can provide community members outside your company with a completely custom login page that reflects your organization's style and branding. Use Visualforce and Apex to either customize the `CommunitiesLogin` page and `CommunitiesLoginController`, or create your own Visualforce page.

To redirect from the default community login page to your custom login page:

- From Setup, enter *Apex Classes* in the **Quick Find** box, then select **Apex Classes**.
- Click **Edit** next to `CommunitiesLoginController`.
- Add the following code:

```
global PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');

    return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' +
        EncodingUtil.urlEncode(startURL, 'UTF-8'));
}
```

- If you created a completely custom login page, replace `SiteLogin` with the name of your Visualforce page.
- Click **Save**.
- Click **Edit** next to `CommunitiesLandingController`.
- Add the following code:

```
public PageReference forwardToCustomAuthPage() {
    String startUrl = System.currentPageReference().getParameters().get('startURL');
```

USER PERMISSIONS

To create and edit Visualforce pages:

- "Customize Application"

To edit Apex classes:

- "Author Apex"

AND

"Customize Application"

```
return new PageReference(Site.getPathPrefix() + '/SiteLogin?startURL=' +
EncodingUtil.urlEncode(startURL, 'UTF-8'));
}
```

8. If you created a completely custom login page, replace `SiteLogin` with the name of your Visualforce page.
9. Click **Save**.
10. From Setup, enter *Visualforce Pages* in the Quick Find box, then select **Visualforce Pages**.
11. Click **Edit** next to `CommunitiesLogin`.
12. In the first line of code, add the following:

```
action="{!forwardToCustomAuthPage}"
```

13. Click **Save**.
14. Click **Edit** next to `CommunitiesLanding`.
15. In the first line of code, add the following:

```
action="{!forwardToCustomAuthPage}"
```

16. Click **Save**.

Redirect Community Members to a Custom URL on Logout

Specify the URL that community members should be redirected to when they log out from your community.

When community members log out, they are taken to the community login page by default. You can choose to point them to a different location, such as your company web site for example.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Login & Registration**.
3. In the Logout section, enter the URL you want to redirect community members to.
4. Click **Save**.

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

Set Up Self-Registration for Your Community

Enable self-registration to allow unlicensed guest users to join your community. You can choose to save them as contacts under a business account or create a person account for each self-registering user.

When you enable self-registration, these Visualforce pages and Apex controllers are associated with your community.

- `CommunitiesSelfReg` page and `CommunitiesSelfRegController`—Provide the form for partners or customers so they can register with your community. You can [modify the `CommunitiesSelfRegController` Apex controller](#) to change the default self-registration process, but it is no longer required starting with the Spring '15 release.

 **Note:** Apex customizations for the self-registration process take precedence over the defaults specified in Community Management. In organizations created prior to the Spring '15 release, existing Apex customizations for self-registration remain in effect as before.

- `CommunitiesSelfRegConfirm` page and `CommunitiesSelfRegConfirmController`—If a user doesn't create a password during self-registration—either because they left the password field blank or your organization customized the self-registration form to omit the password field—this page confirms that a password reset email has been sent. Users landing on this page can't log in until they reset their password.

The default self-registration pages and controllers are shared by all of your organization's communities. If you enable self-registration for multiple communities, you must further customize the self-registration experience to direct users to different pages, assign different profiles or permission sets for different communities, and so on.

 **Note:** Renaming or deleting the default self-registration page can cause problems with the default self-registration flow.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Login & Registration**.
3. In the Registration section, select **Allow external users to self-register**.
4. Optionally, choose a custom self-registration page for your community. Select the page type (**Community Builder** or **Visualforce**), enter the name of the page in the search field, and click . In the search results window, click the name of the page to select it. To revert to the default self-registration page (`CommunitiesSelfReg`), select **Default Page**.
Community Builder pages must be published, else they aren't included in the page lookup search results. Remember to modify the self-registration `CommunitiesSelfRegController` and `CommunitiesSelfRegConfirmController` Apex controllers if you use a custom page.
5. Select the default **Profile** to assign to self-registering users.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

 **Note:** You can only select portal profiles that are associated with the community. If a profile is selected as the default for users who self-register, and you remove it from the community, the self-registration `Profile` is automatically reset to `None`.

6. Select the business **Account** that you want to assign self-registering users to.

The self-registering user is assigned as a contact of the account you specify. To [create a person account \(if enabled\) for each self-registering user](#), leave this field blank.

Ensure that the account you use is enabled as a partner. To do so, go to the account, click **Manage External Account**, then click **Enable as Partner**.

7. Click **Save**.

After you set up self-registration, a **Not a member?** link directs external users to the self-registration page from the login page. When a user self-registers to join your community:

- Salesforce creates a new user record with the information they provide on the self-registration page.
- The user is assigned the profile you specified when you set up self-registration.
- The user is associated with a business account or a person account, depending on how you set it up.
- Customer Community Plus and Partner Community licenses require user records to be associated with a role in your organization. If you don't specify a role in the default self-registration profile, Salesforce assigns them the `Worker` role.

 **Note:** Keep in mind that each time a user self-registers, they consume one of your Communities licenses. When setting up your self-registration page, be sure to add some criteria to ensure that the right people are signing up. Additionally, to prevent unauthorized form submissions, we recommend using a security mechanism, such as CAPTCHA or a hidden field, on your self-registration page.

SEE ALSO:

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

[Customize the Community Self-Registration Process with Apex](#)

[Create Person Accounts for Self-Registering Users](#)

Create Person Accounts for Self-Registering Users

If your business deals mostly with individuals, instead of creating them as contacts under a single business account, you can assign each self-registering user to a person account.

 **Important:** You must have Person Accounts enabled in your organization. Only Customer Community and Customer Community Plus licenses support the creation of person accounts.

In Community Management, under **Administration > Login & Registration**, enable self-registration and leave the **Account** field blank. Specify a default profile to assign self-registering users to.

Salesforce creates separate person accounts for each self-registering user. Each user is assigned the default profile you specified while setting up self-registration, and a default role. If you don't specify a role, either on the profile or via the self-registration Apex controller, Salesforce assigns the `Worker` role to the self-registering users. You can further customize this functionality by using the [self-registration Apex controller](#) (`CommunitiesSelfRegController`), but it's not required.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

You can also manually create person accounts and assign them to community users with Customer Community and Customer Community Plus licenses.

SEE ALSO:

[What Is a Person Account?](#)

[Enable Person Accounts](#)

Customize the Community Self-Registration Process with Apex

Update the `CommunitiesSelfRegController` to customize the default self-registration process for your community. You can use the same controller for the default self-registration page (`CommunitiesSelfReg`) or a custom Visualforce or Community Builder self-registration page.

You can configure self-registration entirely in Community Management. This customization is recommended only if you want to modify the self-registration behavior beyond the defaults, if you have more than one community in your organization, or if you are using a custom self-registration page.

 **Note:** You can add, edit, or delete Apex using the Salesforce user interface only in a Developer Edition organization, a Salesforce Enterprise Edition trial organization, or sandbox organization. In a Salesforce production organization, you can only make changes to Apex by using the Metadata API `deploy` call, the Force.com IDE, or the Force.com Migration Tool. The Force.com IDE and Force.com Migration Tool are free resources provided by Salesforce to support its users and partners, but are not considered part of our Services for purposes of the Salesforce Master Subscription Agreement.

1. From Setup, enter `Apex Classes` in the Quick Find box, then select **Apex Classes**.

2. Click **Edit** next to `CommunitiesSelfRegController`.

3. Optionally, enter a value for `ProfileId` to define the type of profile the user should be assigned.

If you selected a default profile while setting up self-registration in Community Management, the value in the Apex code will override that default.

 **Note:** Note that regardless of which role you enter for the `roleEnum`, the role for new users will default to `None`. Once a user self-registers, you can update their role on the user detail page.

4. Enter the account ID for the partner or customer account that users who self register should be associated with.

If you selected a default account while setting up self-registration in Community Management, the value in the Apex code will override that default.

Ensure that the account you use is enabled as a partner. To do so, go to the account, click **Manage External Account**, then click **Enable as Partner**.

5. If you're enabling self-registration for multiple communities, add code to create appropriate types of users for each community, that is, assigning the correct profile, role, and account ID per community.

6. Click **Save**.

7. Enable access to accounts and contacts for the guest profile. The guest profile is automatically associated with your community's Force.com site.

a. From Setup, enter `All Communities` in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.

b. From Community Management click **Administration > Pages > Go to Force.com..**

c. Click **Public Access Settings**.

d. Click **Edit**.

- e. In the Standard Object Permissions section, select Read and Create next to Accounts and Contacts.
 - f. Click **Save**.
 - g. In the Enabled Apex Class Access related list, click **Edit**.
 - h. Add the `CommunitiesSelfRegController` and click **Save**.
 - i. In the Enabled Visualforce Page Access related list, click **Edit**.
 - j. Add the `CommunitiesSelfReg` and click **Save**.
8. Optionally, if you want to customize the contents of the default self-registration page, edit the `CommunitiesSelfReg` page.
- a. From Setup, enter *Visualforce Pages* in the *Quick Find* box, then select **Visualforce Pages**.
 - b. Click **Edit** next to `CommunitiesSelfReg`.
 - c. Add code to customize the fields required for self-registration or the page's look and feel.
In the default form, all fields except `Password` are required.
 - d. Click **Save**.

Once setup is complete, external users who submit the completed self-registration form (including a password) are logged in to the community.

Note: If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user.

If you're using a custom Visualforce self-registration page instead of the default `CommunitiesSelfReg` page, add the following code to `CommunitiesSelfRegController`. Replace `CommunitiesCustomSelfRegPage` with the name of the custom self-registration page. Then add this to the first line of code in the `CommunitiesSelfReg` page.

Use Other Salesforce Features In Your Community

Enable Cases for Communities Users

Enable cases for external users so that they have access to and can create cases in your communities.

When you enable cases for external users in your community, you can assign cases to those members. Additionally, external members can edit cases, create new cases, add case comments, reassign cases, find case solutions, and create case teams. External users can't edit case comments, associate assets with cases, or delete cases.

Note: Case comments added by external users in communities are public and can be viewed by any user that can view the case.

1. Add the Cases tab to the list of available tabs in your community.
2. Set tab visibility and "Read," "Create," and "Edit" object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.
 - a. If using a profile, such as the Partner Community profile, set the cases tab setting to `Default On` and enable the "Read," "Create," and "Edit" object permissions for cases.
 - b. If using a permission set, create a permission set with the following settings for cases:
 - In the Tab Settings, select Available and Visible.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable cases for Communities users:

- "Manage Profiles and Permission Sets"

- In the Object Settings, select “Read,” “Create,” and “Edit”.

If case comment notification to contacts is enabled, emails sent to external users include a link to the community. Emails sent to contacts for case creation and update notifications also include a link to the community.

SEE ALSO:

[Merge Fields for Communities](#)

[Enable Portal Reply Email Notifications in Case Feed](#)

Set Up the Community Case Feed

Community Case Feed

With the community case feed, agents and community users see the life cycle of a case from start to finish: all case interactions appear in a unified, chronological Chatter case feed. Community users benefit from the added functionalities of Chatter, while support-side features help agents provide efficient, personalized support.

The community case feed gives community users an intuitive, versatile environment where they can manage their cases. Internal and external users see the following interactions in the community case feed:

- Chatter text, file, and link posts
- Questions in Chatter that are associated with the case
- Case emails

Note: To learn more about case email visibility, see [Emails in the Community Case Feed](#).

If the Salesforce administrator exposes read-only social posts on cases, these also appear in the feed.

Community case feed in a community built on the Napili template:

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Using the publisher **(1)**, users create posts and attach files to the case. The feed **(2)** comes fully equipped with Chatter's collaboration tools: users can bookmark, like, and comment on posts, and mention other users. Images and comments appear inline, making it easy to scan the feed for details. The Attachments component **(3)** displays all case attachments.

When the community case feed is enabled, support agents can:

- Use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases
- Expose or hide a published post or email in the community case feed of external users

The community case feed is available in all communities that use the self-service community templates or Salesforce Tabs + Visualforce.

Known Issues

- In communities built on templates, emails in the community case feed don't display inline images or clickable links.

- In communities built on the Koa or Kokua community templates, users' names in the community case feed look like links but don't lead anywhere.

SEE ALSO:

[Community Case Feed Considerations](#)

[Set Up the Community Case Feed](#)

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

Set Up the Community Case Feed

The community case feed lets community users and support agents see all case interactions in a unified feed, and lets agents take more actions directly from the console. To set up the community case feed, enable it in your organization and make sure that the case page in your community is properly configured.

Important: Before setting up the community case feed, read [Community Case Feed Considerations](#).

1. Enable the community case feed:
 - a. From Setup, enter *Support Settings* in the Quick Find box, then select **Support Settings**.
 - b. Select **Enable Community Case Feed**.
 - c. Optionally, select **Enable Email Notifications for Case Posts** (recommended).
 - d. Click **Save**.
2. If your community was built using Salesforce Tabs + Visualforce, make sure that your case page includes a Chatter feed.
3. If your community uses the Koa, Kokua, or Napili template, confirm that your active case detail page supports the community case feed:
 - a. In Community Builder, click .
 - b. Click **Page Management**.
 - c. Find Case Detail in the Name column, and make sure that the active page assigned to it is either Chatter Case Detail (the default) or Record Detail.

If you change the active case detail page, publish your change.

Important: If the community case feed is enabled and you use Basic Case Detail as your active case detail page, external users only see case comments—not Chatter posts or emails—in their case feed. This gives external users far less visibility into their cases. To give users a full view of their case interactions, use Chatter Case Detail or Record Detail as your active case detail page.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable the community case feed:

- “Customize Application”
- Compact case feed enabled in your organization

Community Case Feed Considerations

Before setting up the community case feed, review this essential information.

If the community case feed is enabled:

- Agents can use the Community action in the console case feed to answer community questions and create private and public Chatter posts on cases.
- Agents can expose or hide published Chatter posts and emails in the case feed of external community users.
- External community users with access to a case see associated Chatter posts, questions, and emails in their case feed.

If email notifications for case posts are enabled:

- The case contact is notified by email when someone makes an externally visible post on their case. Users can comment on the post by replying to the email.
- If you're already using custom email notification settings, such as those triggered by workflows, selecting this preference may create duplicate email notifications.
- Users in communities built on the Napili template or Salesforce Tabs + Visualforce can turn off these notifications in their email notification settings by deselecting **Posts on one of my cases** under "Email me when someone..."

SEE ALSO:

[Emails in the Community Case Feed](#)

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

[Set Up the Community Case Feed](#)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Emails in the Community Case Feed

When you enable the community case feed, external users with access to a case see case emails in their feed. Emails in the community case feed include the email's author, recipients, text, and time sent.

By default, if the case contact sends or receives a case email, that email appears in the feed of all users—both internal and external—with access to the case. For an external user to view the case, their profile must include access to cases in the community.

For example, suppose Rita, an external user, posts a question in a community. The question remains unresolved, and a community moderator creates a case from it using the Question-to-Case action. If the support agent assigned to the case emails Rita from the email publisher, Rita and all other users with access to the case see the email in their case feed. Users with access to a case typically include the assigned support agent and the case contact.

If the community case feed is enabled, you can write an Apex trigger or process to hide or expose all case emails in the feeds of external community users. The `IsExternallyVisible` field of the `EmailMessage` object controls the visibility of email messages in the community case feed. When the field is set to `true` emails sent or received by the case contact are visible to external users with access to the case.

 **Example:** The following trigger exposes all case emails in the feeds of external users with access to the case. This means that case emails between internal users will also be visible to external users with access to the case (for example, if the assigned support agent used the email publisher to email their shipping vendor). To *hide* all case emails from external users' case feeds, simply change `true` to `false`:

```
trigger makepublic on EmailMessage (before Insert) {
    for (EmailMessage oe:trigger.new) {
        oe.IsExternallyVisible=true;
    }
}
```

```
}
}
```

SEE ALSO:

[Expose or Hide a Published Post or Email in the Community Case Feed](#)

Expose or Hide a Published Post or Email in the Community Case Feed

When necessary, support agents can expose or hide individual case emails and published Chatter posts in the case feed of community users.

To change the external visibility of a published Chatter post or email on a case:

1. Navigate to the post or email in the compact case feed.
2. In the post or email's drop-down menu:
 - Select **Make Public** to expose an internal Chatter post or email in the case feed of external users with access to the case
 - Select **Make Private** to remove a Chatter post or email from the case feed of external users with access to the case

Make Public option on a case Chatter post:

EDITIONS

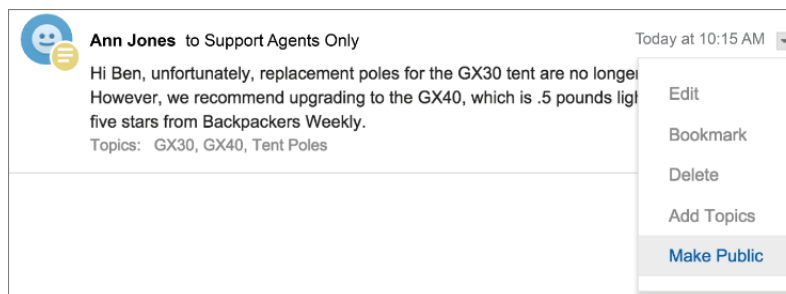

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

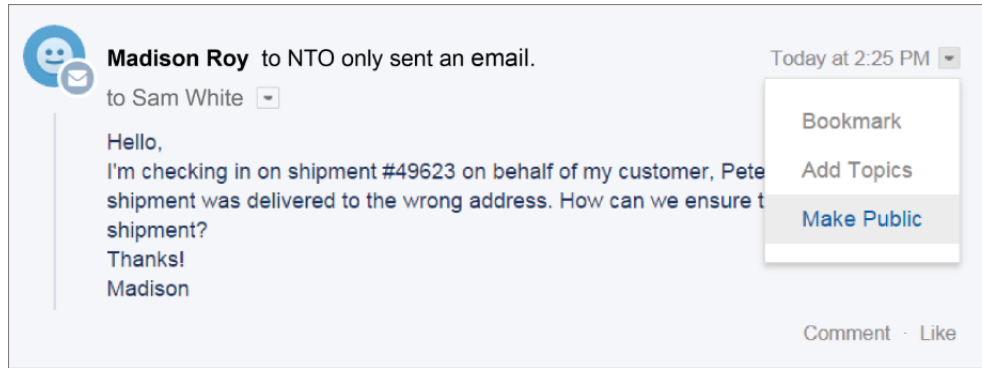

USER PERMISSIONS

To edit the external visibility of a published Chatter post or email on a case:

- "Edit My Own Posts"
- "Edit Posts on Records I Own"
- Compact case feed enabled in your organization
- Community case feed enabled in your organization

Make Public option on a case email:

The agent who owns the case and their superiors see the **Make Public** and **Make Private** options on all case emails and Chatter posts on the case. Internal users who don't own the case also see these options on case posts or emails that they authored.

Making Emails and Chatter Posts *Private*

Clicking **Make Private** on a case Chatter post or email means that the case contact and any other external users with access to the case no longer see the post or email in their case feed. (It still appears in the feeds of internal users with access to the case.) An agent might choose to make an email or post in the community case feed private if they want to hide their correspondence with the case contact from the case feed of other external users with access to the case.

 **Note:** Keep in mind that when you make an email private, the email recipient(s) already received the email. Similarly, when you make a Chatter post private, remember that external users with access to the case may have been notified by email when it was first posted.

Making Emails and Chatter Posts *Public*

Clicking **Make Public** on a case Chatter post or email means that the case contact and any other external users with access to the case now see the post or email in their case feed. An agent might choose to make an email or post in the community case feed public in order to keep the case contact updated about internal progress on the case.

 **Note:**

- The case feed offers handy visual cues to help agents quickly identify which case posts are externally visible. To learn about enabling these visual cues, see “Feed View Options” in [Settings for Feed Views in Case Feed](#).
- You can write an Apex trigger or process to hide or expose all case emails from the community case feed of external users. For more information, see [Emails in the Community Case Feed](#).

SEE ALSO:

[Community Case Feed](#)

Post on Cases and Community Questions with the Community Action in the Case Feed

The Community action in the case feed is your default option for responding to customers on cases that originated from a community or customer portal.

To post on cases in a customer portal or community:

1. Click **Answer Customer** on the Case Feed page.
2. Click and select **Community**.
Depending on how your administrator has set up Case Feed, you may be able to click **Community** without first having to click **Answer Customer**.
3. Enter the message to the customer.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create case posts in customer portals or communities:

- "Edit" on cases

4. If you're working on a case that was escalated from a question in Chatter Questions or Chatter Answers, choose who you want your post to be visible to:
 - Select **Customer Only** to post your answer as a private reply, or **Everyone** to post it as a public reply.
 - Select **Customer Case** to make a post visible to all internal and external users with access to the case, or **Community Question** to post a public answer on the community user's question. If you select **Customer Case** and your Salesforce administrator has enabled the community case feed, you'll be creating a Chatter post instead of a case comment.

5. Optionally, select **Send Email** to send a message to the customer letting them know that a reply to their question has been posted to the case.

 **Note:** This option is only available if your administrator has enabled it, and if the customer you're replying to is associated with the case and has a valid email address. If your organization uses the community case feed and email notifications for Chatter case posts are enabled, users are automatically notified by email about public posts on their cases and this option doesn't appear.

6. Optionally, attach a Knowledge article to the post.
7. Click the button to publish your post.

 **Note:** If the community case feed is enabled in your organization, you can change the visibility of case posts after they are published. For details, see [Expose or Hide a Published Post or Email in the Community Case Feed](#).

SEE ALSO:

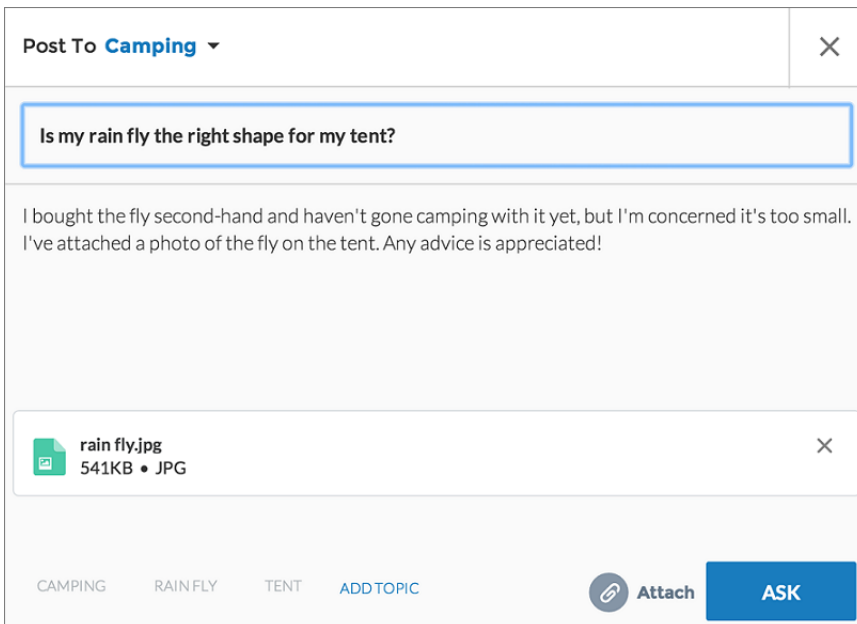

- [Send and Reply to Email from Case Feed](#)
- [Case Feed Overview](#)
- [Community Case Feed](#)

Enable Chatter Questions in Your Community

Chatter Questions helps you promote community engagement by giving users the ability to ask and answer questions in their Chatter feed, in groups, and in records. Members in your users' groups and communities can answer questions in Chatter just as they would comment on a Chatter post. Users in communities built on the Napili template can also attach files to questions.

To set up Chatter Questions in your community, simply add the Question action to the global publisher layout. In organizations created after Summer '14, the Question action is automatically added, but we recommend dragging it to the far left to increase its visibility.

 **Note:** Chatter Questions is not available in communities built on the Koa and Kokuia community templates.

1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select **Publisher Layouts**.
2. Click **Edit** next to the global publisher layout.
3. Drag the Question action from the palette to the global publisher layout. If the Question action already appears in the layout, drag it to the location where you want it.
4. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Chatter Questions is available in: **Group, Professional, Developer, Performance, Enterprise, and Unlimited** Editions.

USER PERMISSIONS

To edit the global publisher layout:

- "Customize Application"

 **Note:** If you're using a customized publisher layout in groups or on records, make sure that the Question action is added to those layouts as well.

SEE ALSO:

[Track Chatter Questions Use in Your Salesforce Organization and Communities](#)

Enable Chatter Answers in Your Community

Chatter Answers is a self-service support community where users can post questions and receive answers and comments from other users or your support agents.

To set up Chatter Answers in Salesforce Communities, follow these high-level steps:

1. Enable Chatter Answers.
 - a. From Setup, enter *Chatter Answers Settings* in the `Quick Find` box, then select **Chatter Answers Settings**.
 - b. Select **Enable Chatter Answers**.
2. Ensure that your community members have access to the following objects within your organization:
 - Questions
 - Knowledge Articles
 - Data Categories
3. Create a zone for Chatter Answers.
 - a. Enable the zone for Chatter Answers.
 - b. Set the `Visible In` setting to the community that you want the zone shown in.
 - c. As a best practice, select a public group from your organization to designate as a Customer Support Agents Group.
4. Add the Q&A tab to your community.
 - a. From Setup, enter *All Communities* in the `Quick Find` box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - b. Click **Administration > Tabs**.
 - c. Add the Q&A tab to the Selected Tabs list.
 - d. Click **Save**.
 - e. Click **Close**.
5. Make the Q&A tab visible on profiles that need access to it.
 - a. From Setup, enter *Profiles* in the `Quick Find` box, then select **Profiles**.
 - b. Click **Edit** for the profile that you want to make the Q&A tab visible for.
 - c. Under Standard Tab Settings, set the Q&A tab to Default On.
 - d. Click **Save**.

After you have enabled Chatter Answers in your community, consider the following extra deployment options:

- A public-facing Force.com site with or without a portal.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable Chatter Answers in Salesforce Communities:

- "Customize Application"

- A Visualforce tab, which provides branding, a customized landing page, and custom access to Chatter Answers within your community.

If a user self-registers for a community with Chatter Answers enabled, the Chatter Answers User permission is not automatically set for the user. Set permissions for Chatter Answers on the community user.

Set Up Question-to-Case

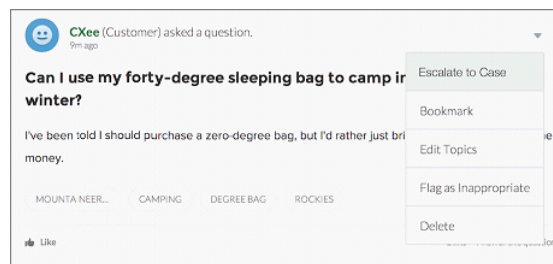

Add Question-to-Case to your communities, your Salesforce organization, or both.

Question-to-Case lets moderators create cases from unresolved questions in Chatter, which makes it easier to track and resolve your customers' issues. Moderators can create cases from questions directly in the feed, or you can set up processes—similar to workflow rules—in the Lightning Process Builder to automatically create cases from questions that meet specified criteria. Cases from questions are added to a queue so support agents can claim them.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Question-to-Case is only available in communities where Chatter Questions is enabled.

1. [Enable Question-to-Case](#)

Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers' questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

2. [Add the Question from Chatter Field to the Case Detail View](#)

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

3. [Add the Escalate to Case Action to the Feed Item Layout](#)

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

4. [Confirm Access to the Escalate to Case Action](#)

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

5. [Customize the Escalate to Case Action Layout](#)

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

6. [Automatically Assign Cases from Questions to a Queue](#)

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you'd like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

7. [Automatically Create Cases from Unresolved Questions in Chatter](#)

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

SEE ALSO:

[Enable Question-to-Case](#)

Enable Question-to-Case

Question-to-Case lets moderators create cases from questions in Chatter to ensure that your customers' questions are quickly resolved. Enable Question-to-Case in your communities, Salesforce organization, or both.

1. From Setup, enter *Support Settings* in the **Quick Find** box, then select **Support Settings**.
2. To enable Question-to-Case in all communities where Chatter Questions is enabled, select **Enable Question-to-Case in Communities**.
3. To enable Question-to-Case in your Salesforce organization, select **Enable Question-to-Case in Salesforce**.
4. Click **Save**.

 **Note:** Make sure your case page layout is feed-based. The feed-based case page layout lets agents and moderators use the Community action to respond to escalated questions. If your organization was created before Spring '14, your case page layout may not be feed-based.

SEE ALSO:

[Add the Question from Chatter Field to the Case Detail View](#)

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable Question-to-Case:

- "Customize Application"

Add the `Question from Chatter` Field to the Case Detail View

When a case is created from a question in Chatter, the `Question from Chatter` field on case detail pages displays a link to the original question. This field helps agents quickly navigate to the feed.

First, use field-level security to specify which users can see the `Question from Chatter` field on case detail pages.

1. From the object management settings for cases, go to Fields.
2. Click **Question from Chatter**.
3. Click **Set Field-Level Security**.
4. Select **Visible** for any profile that you want to be able to use Question-to-Case.
5. Click **Save**.

After you make the field visible to users, you can choose to add it to the Case Details view.

1. From the object management settings for cases, go to Page Layouts.
2. Click **Edit** next to the page layout that you want to customize.
3. Drag the `Question from Chatter` field from the Fields section of the page layout editor palette to the Case Information section of the page.
4. Click **Save**.
5. Click **Page Layout Assignment** to confirm that the user profiles which need Question-to-Case are assigned to the page layout that you customized. In addition, assign internal users who need access to the `Question from Chatter` field on cases to that page layout.

Add the Escalate to Case Action to the Feed Item Layout

Give moderators the ability to create cases from questions by adding the Escalate to Case action to Chatter Questions pages. This action is created automatically when Question-to-Case is enabled in your organization.

1. From Setup, enter `Feed Item` in the `Quick Find` box, then select **Feed Item Layouts**.
2. Click **Edit** next to Feed Item Layout.
3. Drag the Escalate to Case action from the Quick Actions category in the palette to the Quick Actions in the Salesforce Classic Publisher section.
4. Click **Save**.
5. Click **Page Layout Assignments** to confirm that the user profiles that need Question-to-Case are assigned to the Feed Item Layout.

Confirm Access to the Escalate to Case Action

Does your Salesforce org use more than one record type for cases? Make sure that the profiles that need Question-to-Case have access to the record type associated with the Escalate to Case action. If your org has only one record type for cases, skip this process.

First, check which record type is assigned to the profiles that need access to the Escalate to Case action.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click the name of a profile.
3. In the Record Type Settings section, make a note of which case record types the profile uses.
4. In the Permissions section, make sure that the user profile has either the **Moderate Chatter** or **Moderate Communities Feeds** permission enabled.

Then, check which record type the Escalate to Case action uses, and change it if necessary.

1. From Setup, enter *Actions* in the **Quick Find** box, then select **Feed Item Actions**.
2. Click **Edit** next to the Escalate to Case action.
3. Confirm that the **Record Type** field shows a record type that's assigned to the profiles that need access to this action. If it doesn't, select an appropriate record type from the drop-down list.
4. Click **Save**.

SEE ALSO:

[Customize the Escalate to Case Action Layout](#)

Customize the Escalate to Case Action Layout

Choose which fields appear on the Escalate to Case action, and in what order, based on the information you need to track for each case.

1. From Setup, enter *Actions* in the **Quick Find** box, then select **Feed Item Actions**.
2. Click **Layout** next to the Escalate to Case action.
3. Drag any fields you want to add to the action from the action layout editor palette, and reposition them if necessary.
4. Click **Save**.

 **Note:** In public communities, you can't look up a contact when the case is submitted, so we recommend that you remove the **Contact** field from the Case Action layout.

Automatically Assign Cases from Questions to a Queue

Case assignment rules aren't supported in Question-to-Case, so by default, cases created from questions are assigned to the moderator who escalates the question. If you'd like, you can write a workflow rule or process that automatically adds questions that were created from cases to a queue so agents can claim them.

You can assign escalated questions to a queue in several ways. The basic approach is to write a process in the Lightning Process Builder that automatically assigns a case to a specified queue if the `Type` field on the case is equal to `Question`. You can also build the process to accommodate multiple queues. For example, have your process assign cases with a certain topic to a different queue.

The way you use queues in escalated questions will depend on your users, your goals, and more. Find an approach that best fits your business needs.

To learn how to create a queue, see [Create Queues](#).

SEE ALSO:

[Automatically Create Cases from Unresolved Questions in Chatter](#)

Automatically Create Cases from Unresolved Questions in Chatter

As your community or organization develops, ensure that users get speedy answers to their questions. Question-to-Case lets moderators escalate unresolved questions to cases in the feed, but you can make your case resolution process even more efficient by setting up processes—similar to workflow rules—in the Lightning Process Builder. Set up a process that automatically creates a case from questions that meet specified criteria.

 **Important:** These steps apply only to organizations and communities that use Chatter Questions. Not sure if that's you? See [Differences Between Q&A Features in Salesforce](#) on page 2926.

You can use Question-to-Case in processes in several ways. For example, consider setting up processes that:

- Create a case from a question if a week has passed, the question has received more than 10 likes, and a best answer hasn't been selected.
- Create a case from a question immediately if the question contains the word "competitor."

Processes related to Question-to-Case act on the Feed Item object. The process includes a flow that evaluates whether question posts meet your escalation criteria. You can create flow variables based on several Feed Item fields, including:

- `BestCommentId`: The ID of the comment that was selected as the best answer. If no comment has been selected as the best answer, this field is null.
- `CommentCount`: The number of comments on a question.
- `LikeCount`: The number of likes on a question.

Tip:

- Each flow variable's data type must match the feed item field's data type. `CommentCount` and `LikeCount` are number fields, while `BestCommentId` is a text field.

EDITIONS

Available in: Salesforce Classic

Question-to-Case is available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Question-to-Case is available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The Lightning Process Builder is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- The creation of a feed item can trigger a process, but updates to feed items (such as likes and comments) cannot. Depending on your process, you might need to specify how much time must pass before a related flow runs.

Enable Salesforce Knowledge in Your Community

Enable Salesforce Knowledge to let community users view Knowledge articles.

You can use Communities to access your knowledge base articles if your Salesforce organization has a Salesforce Knowledge license. Once Salesforce Knowledge is enabled, complete the following steps to view articles in your communities.

1. Update profiles:
 - Clone the Customer Community User, Customer Community Plus User, or Partner Community User profiles and enable the “Read” permission for article types you want to share with community users.
 - Verify that the tab visibility for the Articles (or Knowledge) tab is Default On.
 - Remember to click **Edit Profiles**, at the bottom of the detail page, and activate the new profile.
2. Add the Knowledge tab to each community.

 **Note:** Community members without the Knowledge One permission cannot access Knowledge through Communities. They also can't access Knowledge in communities via the Salesforce1 mobile browser and downloadable apps.
3. If you want your community users to have different category group visibility settings, change the visibility settings by permission set, profile, or role. For example, you can prohibit users with the Customer Community User profile from seeing articles in a certain category group by changing the data category visibility for that profile.
4. Notify users who create articles that they must select **Customer** for users with Customer Community or Customer Community Plus licenses, or **Partner** for users with Partner Community licenses, as a channel option when creating or modifying an article. If the appropriate channel is not selected, the article is not published in the community.

[Build Your Knowledge Base](#)

EDITIONS

Available in: Salesforce Classic

Communities is available in: **Enterprise, Performance, Unlimited, and Developer** Editions.

Salesforce Knowledge is available in **Performance** and **Developer** Editions and in **Unlimited** Edition with the Service Cloud.

Salesforce Knowledge is available for an additional cost in **Enterprise** and **Unlimited** Edition.

USER PERMISSIONS

To create, customize, or activate a community:

- “Create and Set Up Communities”

AND is a member of the community they're trying to update

To set up Salesforce Knowledge, create article types and article actions, and modify category groups assignments:

- “Customize Application”

AND

“Manage Salesforce Knowledge”

To assign user licenses:

- “Manage Internal Users”

To create data categories:

- “Manage Data Categories”

Enable Ideas in Your Community

Ideas enable a group of users to post, vote for, and comment on ideas. Enabling Ideas in a community provides an online, transparent way for you to attract, manage, and showcase innovation.

To manage organization-wide settings for Ideas, follow these high-level steps:

1. From Setup, enter *Ideas Settings* in the Quick Find box, then select **Ideas Settings**

- a.** To enable Ideas for your organization, select the **Enable Ideas** checkbox.
- b.** Optionally, select **Enable Text-Formatting**, **Images** and **Links** to enable the Ideas HTML editor, which gives users WYSIWYG HTML editing and image referencing capabilities when they post or comment on ideas.

Once you enable the HTML editor, you can't disable it.

- c.** Ensure that the multi-select **Categories** field is enabled by clicking the **Enable** button located below the Categories message at the top of the page. This button is not displayed if your organization already has the **Categories** field enabled.
- d.** To let Ideas members associate more than one category with an idea, select **Enable Categories**. Once you enable multi-select categories, you can't disable it.
- e.** To let users earn points and ratings based on their activity in each zone, select **Enable Reputations**.
- f.** In the **Half-Life (in Days)** field, enter the number of days.

The half-life setting determines how quickly old ideas drop in ranking on the Popular Ideas subtab, to make room for ideas with more recent votes. A shorter half-life moves older ideas down the page faster than a longer half-life.

2. Define and customize fields for Ideas:

- a.** Define picklist values for the **Categories** and **Status** fields.

Make sure that you add the categories and statuses to the zones you'll be including in the community.

- b.** Set field-level security for standard and custom fields.
- c.** Create custom fields and set validation rules on them.

Custom fields appear in the Additional Information section on the Post Idea and Idea Detail pages.

- d.** Optionally, add the **Attachment** field to the layout and set field-level security to enable users to add files to their ideas.

3. To enable experts within your zones, create a public group that includes these users.

4. Optionally, enable Idea Themes in your organization.

5. Create one or more zones to organize ideas into logical groups, and associate the zones with the community.

6. Customize your Ideas page layouts to display the information you want to see.

7. Create validation rules that prevent offensive language from being used in the zone

8. Set up Apex triggers and validation rules for comments on ideas.

9. Enable user profiles for community members and moderators and ensure the profiles can access Ideas.

10. Add the Ideas tab and the Idea Themes tab to the community.

Enable Leads for Partner Users

Enable leads for partner users so that they have access to and can create leads in your communities.

When you enable leads for partner users in your community, you can assign leads to those members. Additionally, partner users can edit leads, create leads, import leads, and also mass update leads in a list view.

1. In Community Management, click **Administration > Tabs**, and add the **Leads** tab to the list of available tabs in your community.
2. In Setup, set tab visibility and object permissions. You can either set them on the profile or using a permission set. We recommend using a permission set if you plan to apply these permissions selectively.
 - a. If using a permission set, use the following settings for leads:
 - In the Tab Settings, select Available and Visible.
 - In the Object Settings, select “Read,” “Create,” and “Edit.”
 - b. If using a profile, such as the Partner User profile, set the leads tab setting to `Default On` and enable the “Read,” “Create,” and “Edit” object permissions for leads.
3. Optionally, you can assign extra permissions that enable advanced features for your partners. If you plan to apply these permissions to only some of your partner users, we recommend creating separate permissions sets.

Note: Partner users with legacy portal licenses can use these advanced features in communities, but not in portals.

Feature	Partner User Permission Needed
To import leads using the Import Leads link on the Leads tab in your community.	“Import Leads”
If your partner user is importing leads, it might also make sense to allow them to import accounts and contacts using the Import My Organization’s Accounts & Contacts link on the Accounts and Contacts tabs in your community.	AND Optionally, “Import Personal Contacts”
To change the status of multiple leads via the Change Status button.	“Manage Leads”
To change the owner of multiple leads via the Change Owner button.	“Transfer Leads”

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable leads for partner users:

- “Manage Profiles and Permission Sets”

Set Up Approvals for External Users in Your Community

Customer and partner users in your community can be assigned as approvers on records or added directly to queues. They can see and take action through the My Approvals and Approval History related lists on the record. Approvals can also be triggered directly from the Chatter feed.

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

Note:

- Users with high-volume licenses, such as High Volume Customer Portal and Authenticated Website, can't approve records.
- External users with legacy portal licenses can approve records in communities, but not in portals.

When setting up approvals or queues, use the lookup fields to find customer and partner users.

For example, when setting up an approval, if you want to automatically assign a customer user as an approver use the lookup list to find and specify the user.

Select Approver

Using the options below, specify the user to whom the approval request should be assigned.

Let the submitter choose the approver manually.
 Automatically assign an approver using a standard or custom hierarchy field: --None--
 Automatically assign to queue.
 Automatically assign to approver(s).

Customer Portal User [lookup icon]

User
Partner User
Customer Portal User (selected)
Related User
Require UNANIMOUS approval from all selected approvers.

If you set up email notifications for your approval workflows, emails are sent based on community membership. If the user is a member of multiple active communities, the email comes from the oldest active community. Any links included in the email point users directly to the approval within the community.

In Salesforce1, users can see and take action from the Approval History related list, but they can't submit requests for approval. To submit requests for approvals, the user must do so from the full Salesforce site.

Enable Wave Analytics in Your Community

Enable Wave for Communities to allow your partner and customer users to view and explore Wave Analytics dashboards in your community.

 **Note:** Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

Complete the following steps to share Wave dashboards in your community.

1. Set up Wave Analytics in your Salesforce org, as described in the [Wave Platform Setup](#) section.
2. Enable Wave for Communities and set up community members. See [Enable Wave Analytics for Communities](#).
3. In Wave, create dashboards and save them in a Wave app. Designate that app for sharing with the community. For more information about working with Wave, refer to the [Wave Analytics Library](#).
4. Embed your Wave dashboards in Visualforce pages in your community. For more information, see [Add a Wave Analytics Dashboard to a Visualforce Page](#). If you embed a dashboard in a new Visualforce page, create a tab for the page and add the tab to your community.
5. From the Wave app containing your dashboards, give access to community members by selecting **Share**. In the Share dialog, select **Enable sharing with Communities**. Invite community partners and customers to share the app.

For information, see [Share Wave with Communities](#).

Community Security and Authentication

You can help keep your community more secure by authenticating users and encrypting some of the community's data.

Authenticate Community Users

You have several options for authenticating users in your community. By default, external users authenticate by logging in with the username and password that Salesforce assigns them for the community. (External users are users with Community, Customer Portal, or partner portal licenses.) Your organization's internal users just follow the employee login flow using their Salesforce username and password.

Encrypt Community Data

You can add a measure of security to your community by encrypting files, attachments, and many popular data fields. After encryption is enabled, only users with the "View Encrypted Data" permission can see that information.

Authenticate Community Users

You have several options for authenticating users in your community. By default, external users authenticate by logging in with the username and password that Salesforce assigns them for the community. (External users are users with Community, Customer Portal, or partner portal licenses.) Your organization's internal users just follow the employee login flow using their Salesforce username and password.

EDITIONS

Available in: Salesforce Classic

Communities is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Wave Analytics is available for an extra cost in: **Enterprise, Performance, and Unlimited** Editions. Also available in: **Developer Edition**

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND is a member of the community they're trying to update

To modify Wave Analytics settings:

- Analytics Cloud - Wave Analytics Platform permission set license with "Manage Wave Analytics" permission

To view, explore, and share embedded Wave dashboards:

- Analytics Cloud - Wave Community Users permission set license with "View Wave Analytics on Communities Pages" permission

 **Note:** All authentication options also work with custom HTTPS web addresses.

[Configure SAML for Communities](#)

If your organization uses an existing single sign-on capability to simplify and standardize your user authentication, you can extend this capability to communities.

[Configure Authentication Providers](#)

External users can log in using their credentials from Facebook®, Janrain®, or another Salesforce organization if you set up authentication providers on the Auth. Providers page in Setup and choose to display them on the community login page.

[Configure Authentication Flows with OAuth](#)

If your organization wants to build integrations between communities and custom-branded apps, such as mobile or desktop apps, you can use OAuth to create a branded login page.

SEE ALSO:

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

Configure SAML for Communities

If your organization uses an existing single sign-on capability to simplify and standardize your user authentication, you can extend this capability to communities.

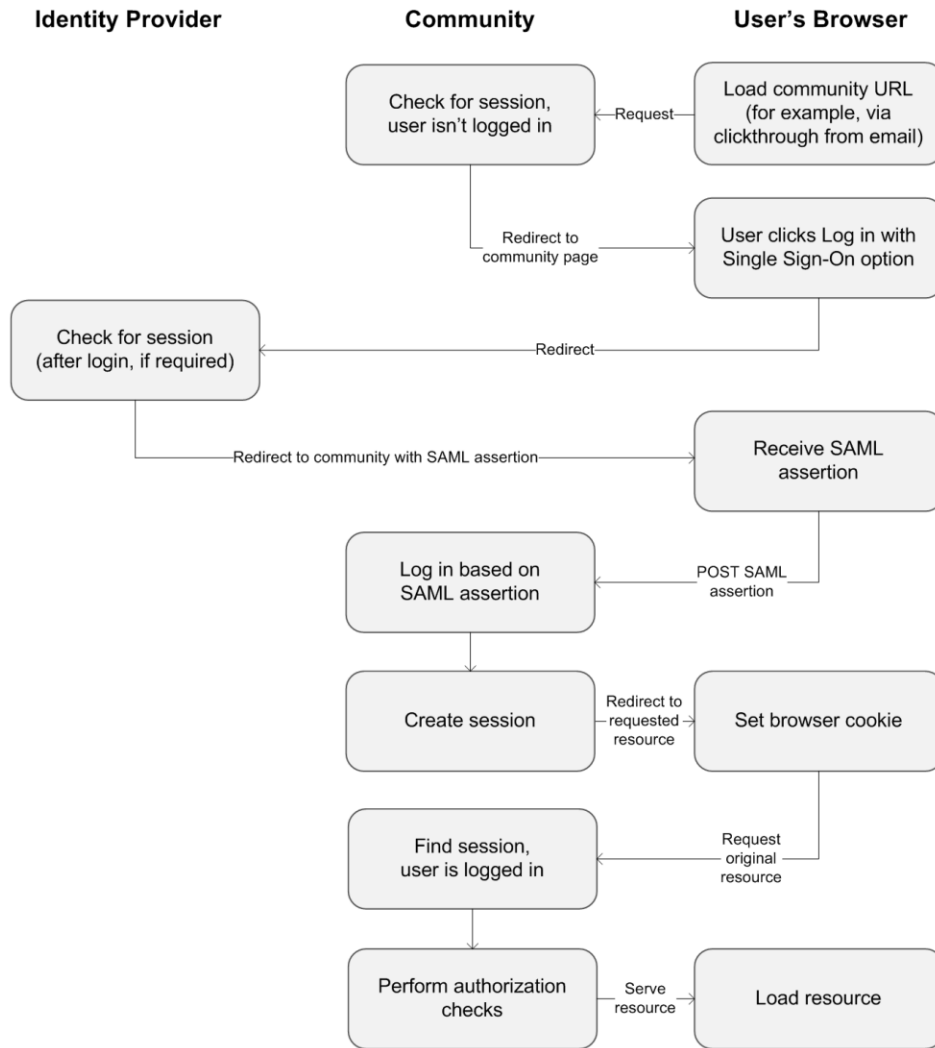

The following information assumes that you are already familiar with Security Assertion Markup Language (SAML) authentication protocols and know how to work with your identity provider to configure single sign-on for your organization. When implementing SAML for communities, the key is to use the community URL associated with login for the single sign-on flow. Also make sure that the community URL in the SAML assertion POST includes `/login`.

Here is a summary of how SAML requests and responses are processed between the user's browser, the community, and your identity provider.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

This table compares what's required for community SAML assertions to what's required for other types of Salesforce domains.

Requirement	Standard	Portal	Force.com Sites	Community
URL where SAML assertion POST is made.	login.salesforce.com	login.salesforce.com	login.salesforce.com	<i>community URL</i>
Are <code>organization_id</code> and <code>portal_id</code> required in assertion?	No	Yes—passed as an attribute	Yes—passed as an attribute	No  Note: Required if using Just-in-Time provisioning to create portal users in the community. Community-specific portal users can be provisioned with <code>portal_id</code> excluded.
Is <code>siteUrl</code> required in assertion?	No	No	Yes—passed as an attribute	No

The following sample SAML assertion shows the community URL specified as the Recipient, for a sample customer community in the Acme organization. This example applies to an organization that has a single SAML configuration.

```
<samlp:Response ID="_f97faa927f54ab2c1fef230eee27cba21245264205456"
  IssueInstant="2009-06-17T18:43:25.456Z" Version="2.0">

          "2009-06-17T18:48:25.456Z"
          Recipient="https://acme.force.com/customers/login/?
saml=02HKiPoin4f49GRMsOdFmhTgi_0nR7BBAflopdnD3gtixujECWpxr9klAw"/>
        </saml:SubjectConfirmation>
      </saml:Subject>

      <saml:Conditions NotBefore="2009-06-17T18:43:25.456Z"
        NotOnOrAfter="2009-06-17T18:48:25.456Z">

        <saml:AudienceRestriction>
          <saml:Audience>https://saml.salesforce.com</saml:Audience>
        </saml:AudienceRestriction>
      </saml:Conditions>

      <saml:AuthnStatement AuthnInstant="2009-06-17T18:43:25.456Z">

        <saml:AuthnContext>
          <saml:AuthnContextClassRef>urn:oasis:names:tc:SAML:2.0:
            ac:classes:unspecified
          </saml:AuthnContextClassRef>
        </saml:AuthnContext>
      </saml:AuthnStatement>

    </saml:Assertion>
  </samlp:Response>
```

If your organization has multiple SAML configurations, the previous sample SAML assertion applies but note these differences in the Recipient.

- The trailing slash after `login` is not required

- The `so` parameter is required and must specify the organization ID

The Recipient would look like this:

```
Recipient="https://acme.force.com/customers/login?so=00DD000000JsCM"
```

When logging out of a community, external users authorized using SAML for single sign-on are redirected to the Identity Provider Logout URL, if one is set in the community's SAML settings. To access the SAML settings, from Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**.

SEE ALSO:

[Example SAML Assertions](#)

[Best Practices for Implementing Single Sign-On](#)

[Single Sign-On with SAML on Force.com](#)

Configure Authentication Providers

External users can log in using their credentials from Facebook®, Janrain®, or another Salesforce organization if you set up authentication providers on the Auth. Providers page in Setup and choose to display them on the community login page.

 **Note:** The following information assumes that you are familiar with the use of authentication providers for single sign-on.

If you're using a custom Visualforce login page instead of the default login page, use the Single Sign-On Initialization URL from an Auth. Provider detail page as the target URL of a custom login button. For example:

```
https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?community=https://acme.force.com/support
```

If you're using Janrain as the authentication provider you can pass the following to the Janrain login widget that's deployed on your site.

```
janrain.settings.tokenUrl='https://login.salesforce.com/services/authcallback/orgID/URLsuffix'+ '?flowtype=sso&community='+encodeURIComponent('https://acme.force.com/customers');
```

SEE ALSO:

[About External Authentication Providers](#)

[Using Request Parameters with Client Configuration URLs](#)

[Customize Login, Logout, and Self-Registration Pages in Your Community](#)

Configure Authentication Flows with OAuth

If your organization wants to build integrations between communities and custom-branded apps, such as mobile or desktop apps, you can use OAuth to create a branded login page.

The following information assumes that you're familiar with OAuth protocols and authentication flows for remote access applications. Communities support all available authentication flows, except for the username-password OAuth authentication flow and the SAML assertion flow. When implementing branded OAuth flows for communities, you configure the authorize URL to use the community URL. The authentication flow then directs users to the application approval page.

 **Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

For example, to authenticate a user using an authorize URL like the following:

```
https://login.salesforce.com/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri
```

Replace the `login.salesforce.com` host name with the full path to the community URL:

```
https://acme.force.com/customers/services/oauth2/authorize?
response_type=token&client_id=your_app_id&redirect_uri=your_redirect_uri
```

When implemented successfully, this URL directs users to the community login page. After they authorize the app, you then set a user access token and refresh token for future authentication. In requests for the token endpoint, replace the host with the community, like this:

```
https://acme.force.com/customers/services/oauth2/token
```

 **Note:** After you acquire the `access_token` you can pass it as a Bearer token in the Authorization header request. Following is an example of a REST API call to communities: `https://acme.force.com/customers/services/data/v32.0/-H "Authorization: Bearer 00D50000000IehZ\!AQcAQH0dMHZfz972Smpkb58urFRkgeBGsxL_QJWwYmFAbUeeG7c1E6LYUfiDUkWe6H34r1AAwOR8B8fLEz6n04NPGRrq0FM"`

["Step Three: Connect to Chatter REST API Using OAuth" in the Chatter REST API Developer Guide](#)

Encrypt Community Data

You can add a measure of security to your community by encrypting files, attachments, and many popular data fields. After encryption is enabled, only users with the "View Encrypted Data" permission can see that information.

Keep the following things in mind:

- You can encrypt data in communities, but not in portals.
- If you are using Classic Encryption, data in encrypted custom fields is still masked.
- Your community's specific settings for personally identifiable information (PII) apply regardless of whether data is encrypted.
- Only licensed community users can have the "View Encrypted Data" permission. You can't assign it to guest users.

For users with the "View Encrypted Data" permission, data encryption doesn't change anything about the community experience. However, encrypting the Account Name field has an effect on how users' roles are displayed to admins. Normally, a community user's role name is displayed as a combination of their account name and the name of their user profile. When you encrypt the Account Name field, the account ID is displayed instead of the account name.

For example, when the Account Name field is not encrypted, a user belonging to the Acme account with the Customer User profile would have a role called `Acme Customer User`. When Account Name is encrypted, the role is displayed as something like `001D000000IRt53 Customer User`.

- Only users with the "View Encrypted Data" permission can create community users from a contact record that contains encrypted standard fields.

Plan Your Community Design Strategy

If you chose to use custom pages in your community instead of out-of-box tabs and branding, you need to [decide whether to use Community Builder or Force.com](#). Once you make the decision, use the following sections to help you customize community pages:

- [Use Visualforce and Force.com Sites](#)
- [Using Community Builder With Templates](#)
- [Use Community Builder \(Site.com\) Without Templates](#)

You can also customize these other areas of your community:

- [Add the Global Search Box to Your Customized Community HTML Header](#) on page 3059
- [Configure a Custom Domain for Your Community](#)
- [Rename the Chatter Tab](#)

Choosing Between Community Builder and Force.com Sites

If you want to add new pages or customize existing pages in your community, you can use Force.com Sites or Community Builder. With either option, you can create branded, publicly available pages such as landing or marketing pages, and private custom pages that only community members can access.

So which option should you use to customize your community? Well, that depends on your skills and the needs of your organization. You can even use a mixture of Force.com pages and Community Builder pages for complete control over your customizations.

Community Builder

[Community Builder](#) is an intuitive, convenient tool for customizing your community. Community Builder lets you create a community based on a preconfigured template, and then apply branding, edit pages, update your template, and publish changes all from one user-friendly interface.

Here's what you can achieve with Community Builder:

- Use one of the self-service templates—Koa, Kokua, or Napili—to easily create a responsive self-service community.
- Use the Aloha template to create a configurable App Launcher.
- Design pixel-perfect, branded pages.
- Create public pages that anyone can access, or add private pages that you can add as a tab within your community.
- Build and iterate quickly using drag-and-drop reusable page elements.
- Use ready-made forms to create web-to-lead forms or gather customer feedback.
- Create data-driven pages, such as product catalogs or other listings, using your organization's data.
- Set a home page and set up multilingual support for your community in Site.com Studio, a Web content management system that provides extra configuration options. Site.com Studio is easily accessible from Community Management.

Force.com Sites

Suitable for developers with experience using Visualforce, Force.com Sites lets you build custom pages and Web applications by inheriting Force.com capabilities including analytics, workflow and approvals, and programmable logic. So if you are looking to create sites programmatically using Apex and APIs, Force.com Sites is the product for you. Here's what you can achieve with Force.com:

- Create public, branded pages that anyone can access.
- Leverage Visualforce to create private pages that you can add as a tab within your community.
- Write your own controllers, or extensions to controllers, using Apex code.
- Create custom login or self-registration pages.
- Build dynamic web applications, such as an event management application.

Features At a Glance

Still unsure which product to choose? Take a look at this table to learn more about each product's features.

Feature	Community Builder	Force.com Sites
Public pages		
Community templates (Koa, Kokua, Napili, Aloha)*		
Authenticated pages*		
Visualforce pages		
Out-of-the-box login, logout, self-registration, and error pages		
Drag-and-drop environment		
Reusable components		
Pixel-perfect designs		
IP restrictions		
Access to data, such as cases, leads, and opportunities		
Ready-made forms		
CMS		
Programmatic page creation (using Apex, APIs, and controllers)		
Web applications		
Analytics, reports, and workflows		
Full Force.com platform capability		

*Available in Community Builder for Communities users only.

To learn more about Community Builder, Force.com, and Site.com technologies, see:

- [Community Builder Overview](#) on page 3107
- [Force.com Sites Overview](#) on page 4679
- [Site.com Overview](#) on page 4506

Use Community Builder With Templates

Community Builder in conjunction with community templates for self-service lets you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company's branding.

With Community Builder and templates you can:

- [Quickly style the community](#) to match your company's branding.
- [Edit community pages and components with the Community Builder](#) to customize their design and content.
- [Preview your community](#) to ensure that it appears correctly on different devices.
- [Publish your changes](#) to make them available to everyone in your community.
- [Apply template updates](#) to your community as soon as they become available.

You can use the Community Builder to customize communities created using these templates:

Kokua

A visually rich, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Koa

A text-based, responsive self-service template that lets users search for and view articles or contact support if they can't find what they're looking for. Supports Knowledge and Cases.

Napili

A powerful, responsive self-service template that lets users post questions to the community, search for and view articles, and contact support agents by creating cases. Supports Knowledge, Cases, and Questions & Answers.

Aloha

A configurable App Launcher template that lets users quickly find applications and access them using single sign-on authentication.

To access Community Builder and continue customizing your community or update its template version:

1. From Setup, enter *All Communities* in the **Quick Find** box, then select **All Communities**.
2. Next to the community name, click **Manage**.
3. Click the Community Management menu in the global header, then click **Go to Community Builder**.
4. In Community Builder, you can:
 - [Brand your community](#) on page 3110
 - [Edit community pages and page components](#).
 - [Update your community template](#).

 **Note:** Community Builder doesn't support branding for sites that weren't created using one of the preconfigured templates. Instead, you must use Site.com Studio. To get there, click Site.com Studio from the Communities menu in the toolbar.

To learn more about using the Kokua, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

SEE ALSO:

[Choosing Between Community Builder and Force.com Sites](#)

Use Community Builder (Site.com) Without Templates

Each community has one associated Site.com site that lets you add custom, branded pages to your community. By default, Site.com pages are publicly available and don't require login, but you can also create private pages that only community members can access.

For more detailed information about using Site.com, check out the online help.

Before You Begin

Communities users with the "Create and Set Up Communities" permission automatically have full site administrator access to a community's Site.com site. To let Communities users without the permission edit the site, you must purchase and assign either a Site.com Publisher or a Site.com Contributor feature license, and assign a user role at the site level.

See [About Site.com User Roles](#) on page 4509.

Tips and Considerations

- Communities users with the "Create and Set Up Communities" permission are assigned the role of site administrator in a community's Site.com site. However, they don't appear in the User Roles section on the Overview tab of Site.com Studio.
- You can't create, delete, or duplicate community sites in Site.com.
- When working with data-bound components, such as data repeaters and forms, keep in mind that the objects listed may not be available to site visitors. For authenticated visitors, object access on public and private pages is controlled by their user profiles. For unauthenticated visitors, object access on public pages is controlled by the site's guest user profile.
- When adding forms to authenticated community pages in Site.com, set the current user for Salesforce objects that require the Owner ID field. Setting the current user (as opposed to the default guest user) lets you identify the authenticated user when the form is submitted. To set the current user for the Owner ID field, select the field in the form, click **Configure** under Field Properties in the Properties pane, select `Global Property` as the source, and select `Current userID` as the value.
- The home page, 404 page, login page, and self-registration page that you specify for Site.com Community sites in Site Configuration set the default pages for the Site.com Community site. These default URLs are used unless you specify different URLs in Community Management under **Administration > Pages** and **Administration > Login & Registration**. Community error pages are specified in Force.com Setup, under Error Pages.
- When your Site.com Community site is inactive, users are redirected to the Service Not Available page defined in Community Management under Pages.
- The contributor's view is not available by default for Site.com Community sites. However, you can use a Site.com Contributor license to grant contributor access to a specific user. See *About Feature Licenses* in the Site.com help for details. Alternatively, a user can

preview the Site.com Community site as a contributor by appending `?iscontrib` to the site's URL. For example:
`https://sitestudio.na1.force.com/?iscontrib`

SEE ALSO:

[Choosing Between Community Builder and Force.com Sites](#)

[Use Site.com to Customize Your Community](#)

[Salesforce Communities Overview](#)

Use Visualforce and Force.com Sites

Each community has one associated Force.com site that lets you make advanced customizations to your community. For example, with Force.com Sites you can:

- Add public pages to your community that don't require login.
- Use branded self-registration and login pages to enable users to register for or log into your community.
- Customize out-of-the-box error pages to reflect the branding of your community, including "Authorization Required (401)" and "Page Not Found (404)" pages.
- Leverage Visualforce pages to create private pages that only community members can access.

For detailed information about using Force.com Sites, refer to the online help.

Tips and Considerations

- Force.com Sites pages automatically include the branding styles you specify in the Create Community wizard. To disable these styles, set the `standardStylesheets` attribute on the `<apex:page>` tag to `false`.
- Consider these limitations when using Force.com Sites with Communities:
 - Out-of-the-box RSS feeds, analytics tracking, and custom portal profile pages aren't available.
 - Custom change-password pages aren't available.
 - Login to custom domains is only available with HTTPS.
- Because Force.com sites are served directly from the Force.com organization, a site's availability is directly related to the organization's availability. During your organization's maintenance window for major releases, your sites will be unavailable; users who try to access a site will see a Force.com-branded maintenance page or your custom Service Not Available Page.
- You can redirect a community home page to its companion Site.com home page. To do this, set a URL Redirect on the Force.com site detail page. Set the Source URL to `/`, which represents the home page for the community, and set the Target URL to `s`, which represents the home page for the Site.com site.

SEE ALSO:

[Choosing Between Community Builder and Force.com Sites](#)

Custom Community Pages

Override Default Pages in Your Community with Custom Pages

Use company-branded Community Home and Service Not Available pages by overriding the standard pages in your community.

- [Use a Custom Community Home Page](#)
- [Use a Custom Page for Service Unavailability](#)

You can override other default community pages in the Site.com or Force.com settings for the community. To do this, click the Community Management menu in the global header and then click **Go to Force.com** or **Go to Site.com Studio**. Page selections in Community Management automatically override any previously specified page selections in the Site.com or Force.com settings.

Use a Custom Page for Service Unavailability

On rare occasions, if your community is not available because of a service outage, Salesforce displays a generic Service Not Available page with Force.com branding. You can replace this page with a custom company-branded static resource page for a personalized user experience for your community members.

The Service Not Available static resource:

- Must be a public .zip file 1 MB or smaller.
- Must contain a page named `maintenance.html` at the root level of the .zip file. Other resources in the .zip file, such as images or CSS files, can follow any directory structure.
- Must contain only files that have file extensions.

For more information, refer to *Assigning Force.com Site Error Pages* in the Salesforce Help.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Navigate to **Administration > Pages**.
3. Click  next to **Service Not Available** to search for and select your custom page.
4. Click **Save**.

If there is a service outage at any time, your community displays your selected page. A couple things to keep in mind:

- This page selection doesn't affect communities that use Site.com Studio pages.
- The Service Not Available page, once customized, is available for all communities in the same domain. Depending on the needs of your organization, this might not be desirable. To avoid using the same page for all the communities in your domain, create and assign separate Service Not Available pages for each community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

For example, consider a scenario where you have two communities in your domain: a customer community (`universaltelco.force.com/customer`) and a partner community (`universaltelco.force.com/partner`). If you use a custom Service Not Available page for only the customer community, then the partner community will display the same page during a service outage, unless you create and assign a separate Service Not Available page to the partner community.

SEE ALSO:

[Override Default Pages in Your Community with Custom Pages](#)

Use a Custom Community Home Page

Personalize the standard community home page with company branding by using a custom Community Builder (Site.com Studio) or Visualforce page.

The community home page is shown to unauthenticated users in a public community and it allows you to specify a landing page for guest users without setting up redirects. This page is also known as your Active Site Home page.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the “Create and Set Up Communities” permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Pages**.
3. For the Community Home page:
 - a. Select the page type: **Community Builder** or **Visualforce**.
 - b. Enter the name of the page or leave the field blank to get a list of available options.
 - c. Click , then click the name of the page in the search results to select it.

 **Note:** Only published Community Builder (Site.com Studio) pages are included in the search results.

4. Click **Save**.

Page selections in Community Management automatically override any previously specified page selections in the Site.com or Force.com site properties.

SEE ALSO:

[Configure the Default Community Login Page to Use a Custom Home Page](#)

[Override Default Pages in Your Community with Custom Pages](#)

EDITIONS

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or activate a community:

- “Create and Set Up Communities”

AND

Is a member of the community whose Community Management page they’re trying to access.

Configure the Default Community Login Page to Use a Custom Home Page

If you're using external authentication providers and a custom home page, ensure that users are accessing the correct home page.

To do so, edit the `CommunitiesLandingController` so that it has the correct `startURL` for your community. The `CommunitiesLandingPage` is the Active Site Home Page for your community, meaning that it is shown when someone enters a direct URL to your community. For instance, if your domain is `universaltelco.force.com` and your community URL is `customers`, the `CommunitiesLandingPage` is shown when someone enters `http://universaltelco.force.com/customers`.

There are 2 methods for using a custom home page:

- Update the `CommunitiesLandingController` code to redirect to the new page:
 1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
 2. Click **Edit** next to `CommunitiesLandingController`.
 3. Replace the code so that it reads:

```
public with sharing class CommunitiesLandingController {
    // Code we will invoke on page load.
    public PageReference forwardToStartPage() {
        String communityUrl = 'https://universaltelcom.force.com';
        String customHomePage = '/apex/hello';
        if (UserInfo.getUserType().equals('Guest')) {
            return new PageReference(communityUrl + '/login?startURL=' +
EncodingUtil.urlEncode(customHomePage, 'UTF-8'));
        }else {
            return Network.communitiesLanding();
        }
    }
    public CommunitiesLandingController() {}
}
```

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To access Community Management:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To customize administration settings:

- "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To edit Apex classes:

- "Author Apex"

4. Replace `https://universaltelcom.force.com` with the URL for your community.
 5. Click **Save**.
- Alternatively, you can replace the Active Site Home Page with a custom Visualforce page.
 1. From Setup, enter *All Communities* in the Quick Find box, then select **All Communities**.
 2. Click the **Manage** button next to the community name.
 3. Click **Administration > Pages > Go to Force.com**.
 4. In the Site Detail section, click **Edit**.
 5. In the *Active Site Home Page* field, select your custom Visualforce page.
 6. Click **Save**.

When a user enters the community URL, they see the new Active Site Home Page.

SEE ALSO:

[Use a Custom Community Home Page](#)

Add Custom Pages That Don't Require Login

Within a community, you can have publicly available pages that are accessible without requiring login, making them ideal for landing or marketing pages.

Communities leverage Force.com Sites technology to set a custom domain for your organization and a URL prefix for each community created in your organization. If you want to further customize your communities beyond what's available in setup, you can use Force.com Sites or Site.com to create completely customized pages.

Tip: Communities can have a combination of Visualforce and Site.com pages. By default, the pages you create don't require login, but you can add authenticated pages if needed.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the "Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
2. Click **Administration > Pages** and then in the Advanced Customizations area, click either:
 - **Go to Force.com** to create pages that don't require login or edit out-of-the-box error pages.
 - **Go to Site.com Studio** to open Site.com Studio, where you can create public, branded pages. (You can also create authenticated pages that require login.)
3. After you create a public page in Site.com Studio, you must publish the Site.com site to allow users to access the page.

For more information about creating pages, refer to these resources:

- [Creating Site.com Pages](#) on page 4562
- [Managing Force.com Site Visualforce Pages](#) on page 4700

- [Managing Force.com Site Standard Pages](#) on page 4701

Community Templates

Which Community Template Should I Use?

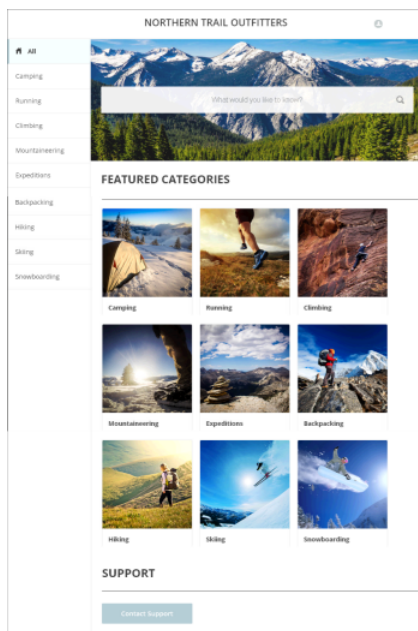

Community templates let you quickly and easily build a self-service community that gives customers the same visual and functional experience whether they use a tablet, a mobile device, or their desktop.

Your customers want an easy way to interact with your company whenever and wherever they are. A self-service community gives your customers an easy way access the information they need when they have questions. With communities built on the Koa and Kokua templates, customers can search for information using knowledge articles and contact support, if necessary. When they're in a community based on the Napili template, they can search for articles as well as ask questions and get crowd-sourced answers from the community. If they still can't find what they're looking for, they can contact support without having to log in. The self-service templates let you extend your community to various devices with a consistent user experience every time.

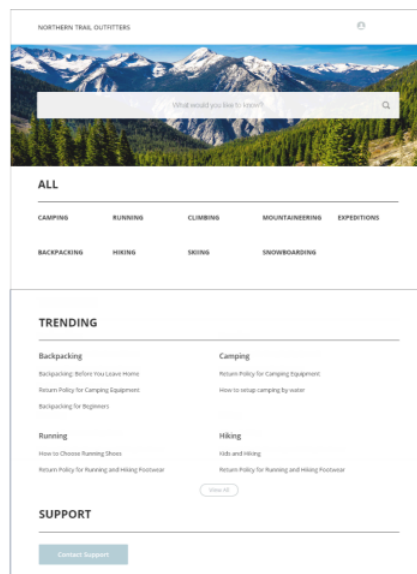

EDITIONS

Available in: Salesforce Classic

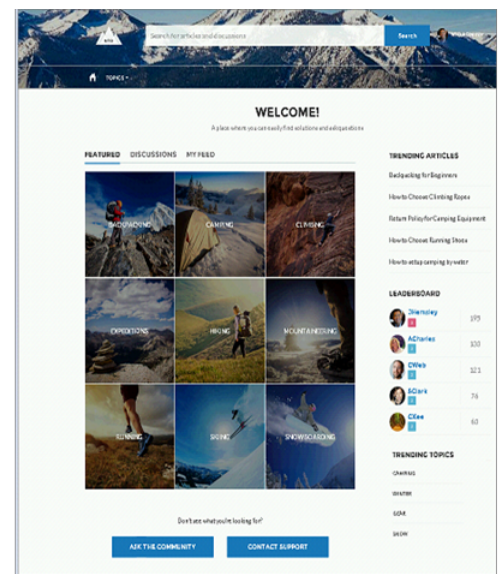

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Kokua

Koa

Napili

A wizard guides you through selecting a template and then walks you through the initial setup for your data categories or topics—depending on which template you're using.

- Kokua is a visually rich self-service template that presents users with knowledge articles organized by data categories. Users can also submit cases to get help from agents.
- Koa is a text-based self-service template that's optimized for mobile devices. It lets users search for and view articles by text representations of data categories, and contact support if they can't find what they're looking for.
- Napili is a powerful support community template that lets your customers post questions to the community and search for and view articles. If they don't find what they're looking for, they can contact a support agent.

Community Builder makes it super easy to customize your community. Simply edit a few of the components to include information about your community, add a few images to extend your branding, and you're ready to go—without any coding! Additionally, if you want a more custom experience, you can create custom pages, add components to pages, use custom Lightning components, and expose additional Salesforce objects.

Communities are automatically displayed in a logged-in user's profile language, so you don't need to create and manage a separate community for each language. With Community Builder, you can extend the support for Guest users in communities so that if their language isn't supported, they can choose one from a language picker on each community page. And because all languages are maintained within the community, you don't need to create and manage a separate community for each language.

Napili Template Community Setup Checklist

Building a community is the result of research, mapping of goals, and defining your audience. At the same time, you must have all your ducks in a row so the actual implementation process is seamless. You know your org best, but use this general checklist to help you organize what you need for a community using the Napili template.

Have you considered everything on these lists?

Before you begin:

Gather your branding assets:

- High-resolution image of your company logo
- Color scheme (or an image to upload to automatically generate one)
- Image to use as a header
- Thumbnail images (385x385 pixels), if you're using [Featured Topics](#)

In your internal Salesforce org:

- [Enable Salesforce Communities](#). Choose a unique URL that works for your business, because you can't change it after it's been set.
- [Set up email templates](#) for any communication between the community and its members (welcome email, resetting password email, etc.).
- [Enable the Global Header for Communities](#) for the system administrator profile, and any other profiles accessing your community from the internal org.
- Enable any Service Cloud features you plan to use in the community, such as Salesforce Knowledge.
- Review [profiles](#) and add [permission sets](#) as needed.
- [Set up Web-to-Case](#).

If you're using Salesforce Knowledge:

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Review your [data categories](#).
- Enable [feed tracking](#) for your Knowledge article types.

As You're Making Your Community:

In your internal Salesforce org:

- [Add members to your community](#).

Configure the Guest User Profile (access using Community Management or the Community Builder):

- Give read and create permissions for the case object.
- If using Salesforce Knowledge, give guests access to your data categories.

In Community Management:

- [Set up navigational topics and subtopics](#), and associate articles to each topic.
- [Set up featured topics and associated images](#)
- [Download the latest Salesforce Communities Management](#) from the AppExchange.
- [Set up moderation criteria and rules](#).
- Enable and set up [reputation](#).

In Community Builder:

- [Customize your community to match your company's branding](#).
- [Add standard and custom Lightning components to customize their design and content](#).

After Making Your Community

- Set up an internal Chatter group for feedback, and invite people to take a test drive while the community is still in preview mode.
- Incorporate their feedback, and then [publish your community](#).
- Seed the community with some initial content: welcome posts, groups, and relevant or fun articles.

Customize Templates with Community Builder

Community Builder Overview

Community Builder in conjunction with community templates for self-service lets you create, brand, and publish a custom community that looks great on any mobile device! Choose a template to quickly start your community, and then style the pages to match your company's branding.

With Community Builder, you can:

- [Quickly style the community](#) to match your company's branding.
- [Edit community pages and components with the Community Builder](#) to customize their design and content.
- [Preview your community](#) to ensure that it appears correctly on different devices.
- [Publish your changes](#) to make them available to everyone in your community.
- [Apply template updates](#) to your community as soon as they become available.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Community Builder works in conjunction with all of the preconfigured templates.

 **Note:** If you don't want to use the preconfigured templates, you can still create a custom community in Site.com Studio. However, you won't be able to use Community Builder for branding.

To try out a different template, go back to Community Management and change your template selection. But don't worry—you can always switch back to the first template you chose. To switch back, set the home page back to its original URL in Site Configuration in Site.com Studio.

Known Limitations

- Community Builder doesn't support branding for sites that weren't created by using one of the preconfigured templates.

SEE ALSO:

[Navigate Community Builder](#)

[Manage Your Community's Settings in Community Builder](#)

[Implementation Guide: Using Templates to Build Communities](#)

Navigate Community Builder

Community Builder lets you quickly create and style your custom community to match your organization's branding.

 **Note:** Community Builder only supports branding for communities that were created with one of the Community Builder-based templates.

Access Community Builder from any of the following:

- From the global header menu in Community Management, click **Community Management > Go to Community Builder**
- From the All Communities page in Setup, click **Builder** next to the community name
- From a community, use the Community Builder link in the profile menu

In Community Builder, you can:

- [Brand the community](#) to match your organization's style (1).
- [Edit your community pages](#) in the Page Editor to add, update, or remove page components (2).
- [Manage, create, delete](#), and [set the visibility](#) of community pages in the Page Manager (3).
- [Accept updates](#) to your community's template and [edit community settings](#) (4).
- Navigate to the community page that you want to style by clicking links and navigation menu items (5).
- Use the Communities menu (6) to:
 - Go to the community, once it has been activated.
 - Access Community Management to manage community analytics, login, registration, reputation, topics, and other settings.
 - Go to Site.com Studio to add advanced community customizations.
- [See how your community appears on different devices](#) (7).
- [Preview the community](#) in a new browser window (8).
- [Publish your changes](#) to make your updates available to everyone in your community (9).

EDITIONS

Available in: Salesforce Classic

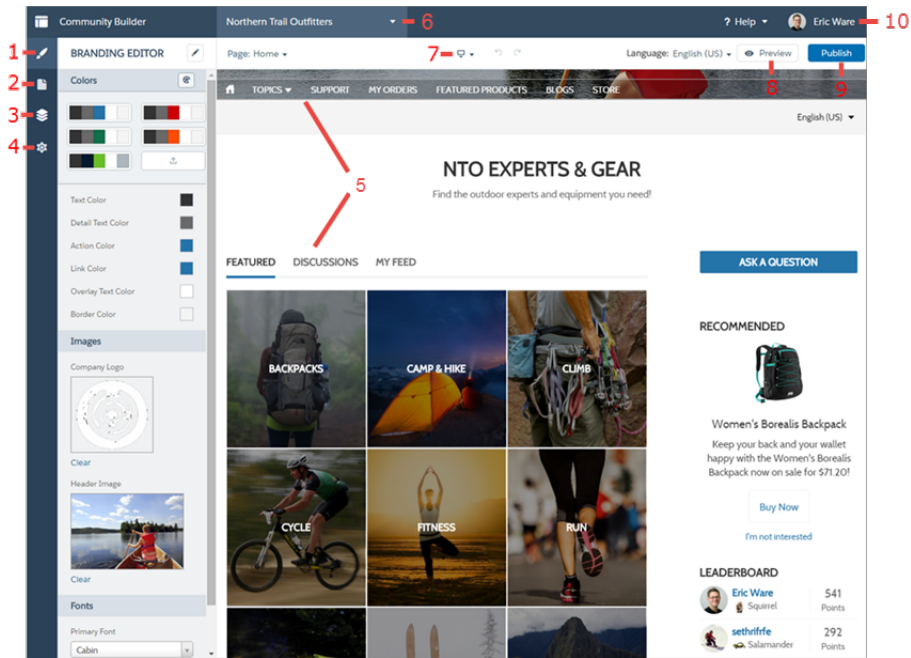

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

- Use the profile menu (10) to:
 - Access My Profile in your internal Salesforce org.
 - Access My Settings in your internal Salesforce org to quickly change your personal settings.
 - Go to the Developer Console integrated development environment.

[Community Builder Overview](#)

[Manage Your Community's Settings in Community Builder](#)

[Implementation Guide: Using Templates to Build Communities](#)

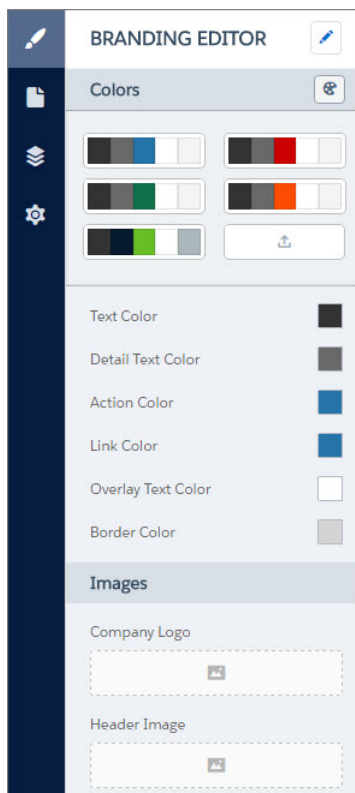

Brand Your Community with Community Builder

Use Community Builder's enhanced Branding Editor to efficiently apply color and style to your community. Choose a color scheme with the color palette, which provides a wide range of colorized text elements for a personalized design. Match your colors precisely by uploading your own logo to automatically generate a custom color palette.

Each template includes predefined styles to control the appearance of the pages. These styles give you a head start with your community, and you can easily customize the styles further to suit your needs. After you've created a community, brand and style your pages with Community Builder's Branding Editor.

Depending on the template that you select, you can use Community Builder to:

- Apply a color scheme that's appropriate for your template with the color palette.
- Choose colors for text, borders, and button backgrounds.
- Upload your own company logo image to generate a custom color palette based on its main colors.
- Maintain your own color palettes by saving or removing them as needed.
- Specify font family, style, and weight.
- Change header and page background color, font family, font size, and font color.
- Use custom CSS to apply your own styles

 **Note:** The available branding options vary depending on the template that you're using and the page that you've selected.

EDITIONS

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

When you upload your own logo to the Branding Editor, Community Builder extracts its colors behind the scenes, and suggests a set of colors based on those. To modify a suggested color, click the color swatch and adjust the color by using the slider or by entering hex values.

To brand your community:

1. Navigate to the pages that you want to view as you brand by using the Page menu in the toolbar.
2. Define styles, such as:
 - The range of colors that are used by the entire site, by selecting a palette swatch.
 - A specific color, by using the relevant color picker or entering a hex value.
 - An image, by clicking the image area and uploading an image.
 - The font type, size, or weight, by selecting an option in the relevant drop-down list.

Your changes are saved automatically and appear instantly on the page canvas.

Alternatively, click  on the Branding Editor toolbar to use your own CSS styles. We recommend using CSS sparingly and only when necessary, because future releases of template components might not support all CSS customizations.

Manage Your Community's Pages in Community Builder

Page Manager centralizes all your page-related needs, from page creation to profile-based page visibility and everything in between.

-  **Note:** This functionality is available in the Winter '16 and later versions of the Koa, Kokua, and Napili templates and the Spring '16 and later versions of the Aloha template.

In Page Manager (1), you can:

- Create custom pages (2).
- Search for a page and select it (3) to edit its properties (4).
- Create alternative variations of the selected page and, in Napili, set profile-based page visibility (5).
- Preview, edit, and delete the selected page and its variations (6).

EDITIONS

USER PERMISSIONS

To customize or publish a community:

- "Create and Manage Communities"

Create Custom Pages with Community Builder

Extend your community template by creating custom pages and adding content that meets your unique business needs. And in the Napili template, you can also create custom record detail, list, and related list pages to get the most from your Salesforce data.

Note: This functionality is available in the Winter '16 and later versions of the Koa, Kokua, and Napili templates and the Spring '16 and later versions of the Aloha template.

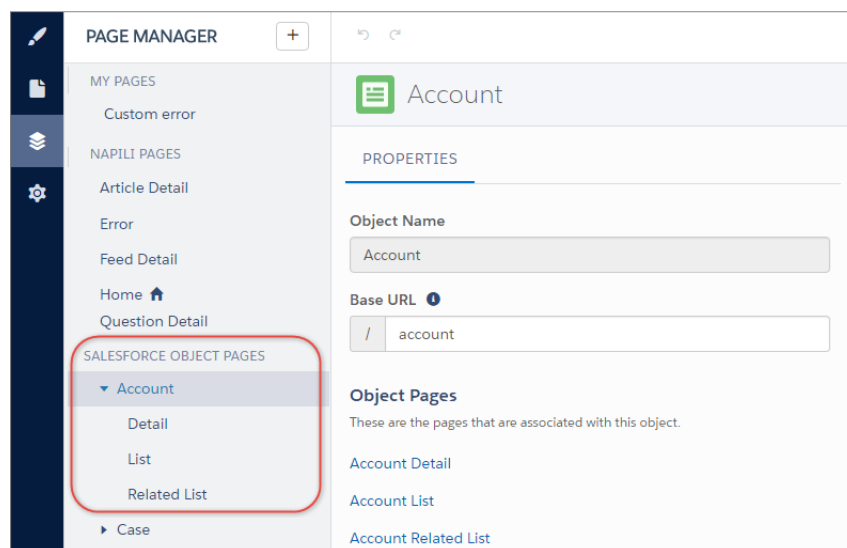

1. In Community Builder, click  on the left sidebar to display the Page Manager.
2. Click  on the toolbar.
3. To create:
 - A blank standard page that's based on a layout or one of the template's pages, click **Create a Page**. For example, you could start with the Home page template and customize it to your needs. Give the page a unique name and specify the static portion of the page's URL.
 - A record detail, a list, and a related list page associated with one of your Salesforce objects, click **Create Object Pages** (in Napili only). Select the object that you want to associate with the page.

4. Click **Create**.

Custom standard pages that are based on a layout appear under My Pages in Page Manager. Pages that are based on a default template page appear under its Page Variations section.

Custom object pages appear under Salesforce Object Pages.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create pages in Community Builder:

- "Create and Manage Communities"

5. Open a standard page by clicking **Edit** on the toolbar, or open an object page by clicking  > **Edit** in the Page Variations section.
6. Add and configure page components.
7. If you're using the Napili template, [set the page's visibility](#).
8. Preview and publish your community when you're done.

Tip:

- When a page is selected in Page Manager, its Page Variations tab lets you quickly create alternative versions of the page. For example, you could create three different Question Detail pages to test out various layouts or styles, or to [assign them to different audiences](#). To create a page variation, click **New Page Variation** in the Page Variations tab.

You can also duplicate a page variation by clicking  > **Duplicate**.

- Use the Navigation Menu component to create custom navigation nodes for new pages. For more information about templates and components, see [Using Templates to Build Communities](#).

Profile-Based Page Visibility in Community Builder

Profile-based page visibility lets you create one version of a page for your customers and another for your partners, and control who sees which page based on their profile.

 **Note:** This functionality is available in the Winter '16 and later versions of the Napili template.

Page Variations

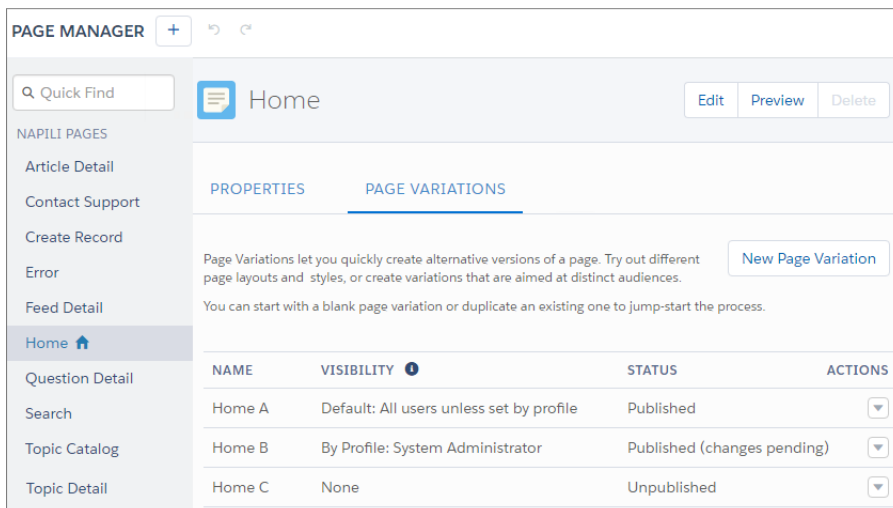

Page variations are alternative versions of a page. You can use them to try out different page layouts and styles, or create variations that are aimed at distinct audiences. Every page in your community, including custom pages, must have one default page variation. You can add as many extra variations as you need on the page's Page Variations tab.

You can also duplicate page variations, which really speeds things up when you're creating page variations that have only minor differences.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

The screenshot shows the 'PAGE MANAGER' interface for a 'Home' page. The 'PAGE VARIATIONS' tab is active, displaying a table of existing variations. The table has columns for NAME, VISIBILITY, STATUS, and ACTIONS.

NAME	VISIBILITY ⓘ	STATUS	ACTIONS
Home A	Default: All users unless set by profile	Published	
Home B	By Profile: System Administrator	Published (changes pending)	
Home C	None	Unpublished	

 **Example:** Let's say you have a financial services community and you want your clients and your brokers to see a different Home page based on their profile. You can create two variations of the Home page, each with content targeting a specific audience—clients and brokers in this case—and set the visibility of each page to different profiles. All members go to the same URL, but your clients see Home A, whereas your brokers see Home B.

Who Exactly Sees What?

After you create the page variations you need in Page Manager, you can set their visibility. Choose from three visibility options that, when combined with a page's published status, determine whether a page is visible to your community members.

Default: All users unless set by profile

When the page is published, it's visible to all valid community members, except members whose profiles are assigned to a different page variation. Each page must have one default page variation.

By Profile

When the page is published, it's visible only to users with the selected profiles.

None

Even if the page is published, it's not visible to users.

 **Example:** Here are several Home page variations with differing visibility and published statuses.

- Home A is visible only to Profile A members.
- Home B is visible only to Profile B members, but they can't see pending changes.
- Home C isn't visible.
- Home D is visible to all members, except Profile A and Profile B members.
- Home E isn't visible.

3. Click > **Manage Visibility**.

Note: If a page variation's visibility is set to Default, you can't access the Manage Visibility dialog box. Every page must have one default page variation.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Manage Communities"

4. Select the profiles that you want.

5. To update the visibility settings of:
 - An unpublished page, click **Save**. The visibility changes don't go live until you publish your community.
 - A published page variation, click **Publish Visibility Changes**. The visibility changes go live immediately, but any other pending changes must be published separately.

To set the visibility of a page variation to Default, click  > **Set Visibility to Default**.

To set the visibility of a page variation to None, remove any assigned profiles or set the visibility of another variation to Default, as appropriate.

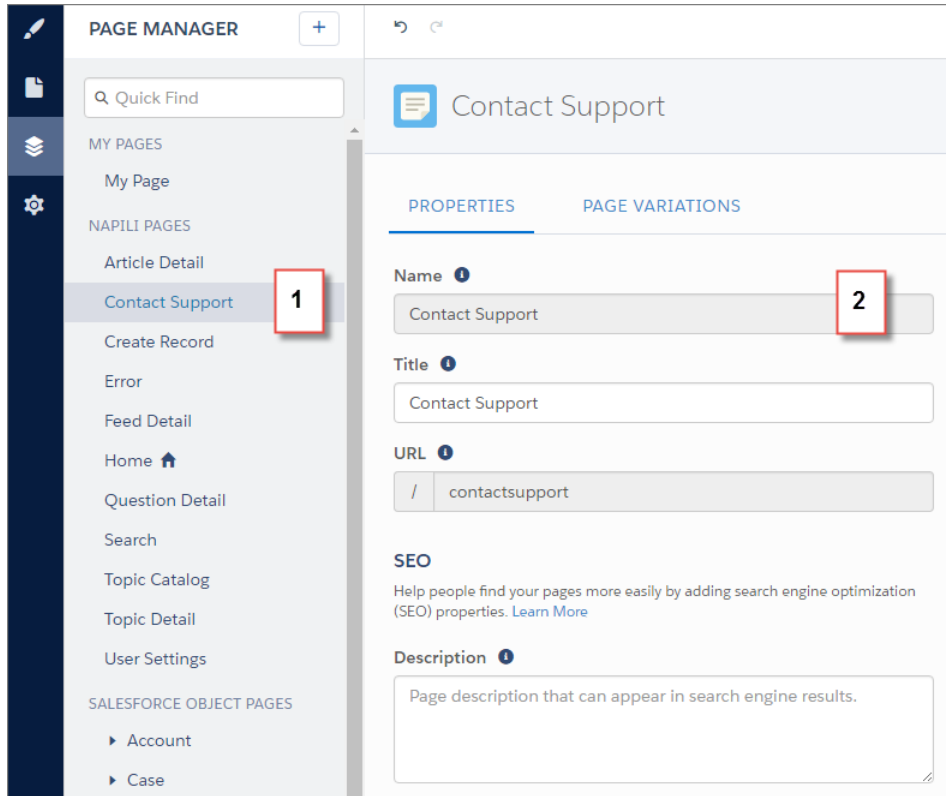

Page Properties and Types in Community Builder

Use Page Manager to view and edit the properties of the various pages that make up your community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Page Types (1)

We've grouped your community's pages by type in Page Manager.

My Pages

The custom standard pages that you create. (Custom object pages appear under Salesforce Object Pages.)

Template Name* Pages

*Napili, Koa, Kookua, or Aloha

The default pages that come with the community template.

Salesforce Object Pages

The pages of the objects in your community, which include the object's record detail, list, and related list pages.

Generic Record Pages

The default record detail, list, and related list pages that come with the Napili template only. These generic pages are used to display record information for a Salesforce object when custom object pages don't exist.

Login Pages

The default login pages that come with the community template.

Page Properties (2)

The properties available to each page depend on the page type selected.

Name

The name of the page as it appears in Community Builder. Editable only in custom standard pages.

Title

The title of the page as it appears in the browser's tab or window title. Used for bookmarking the page and appears in search engine results. Unavailable for pages that set the title dynamically, such as the Article Detail and Topic Detail pages.

URL

The URL of the page. Editable only in custom standard pages.

Base URL

Lets you simultaneously change the URLs for all pages—record detail, list, and related list—associated with an object. Promotes consistency by ensuring all object pages share a common URL prefix. Editable only in custom object pages.

Description

Used for SEO purposes and appears in search engine results. Available for the Contact Support, Error, Home, and Topic Catalog template pages, and all pages listed under My Pages and Login Pages.

Edit Community Pages and Components in Community Builder

You can add new components to your community's pages or edit the properties of existing components to customize each page to suit your needs.

 **Note:** Drag-and-drop components are available in the Winter and Spring '16 versions of the Koa, Kokua, and Napili templates and the Spring '16 version of the Aloha template.

If you're adding components to a new custom page, spend some time planning the composition of the page based on the goals for the page.

1. In Community Builder, click  on the left sidebar to display the Page Editor.
2. From the Page menu in the top toolbar, select the page that you want to edit.

The Lightning Components tab lists only components that are compatible with the selected page. For example, you can't add the User Profile Detail component to the Home page.

3. Drag the required component from the Lightning Components tab onto an editable area of the page.
4. To edit the properties for a component on the page, select it on the main page canvas or on the Page Structure tab. When you select a component, Community Builder highlights the component with a blue border and displays the component's properties in the Property Editor on the right.
5. Update the component as required.

 **Example:** Here's a sample configuration of the Headline component (1) on the Home page with the list of supported Lightning components (2) and properties (3).

EDITIONS

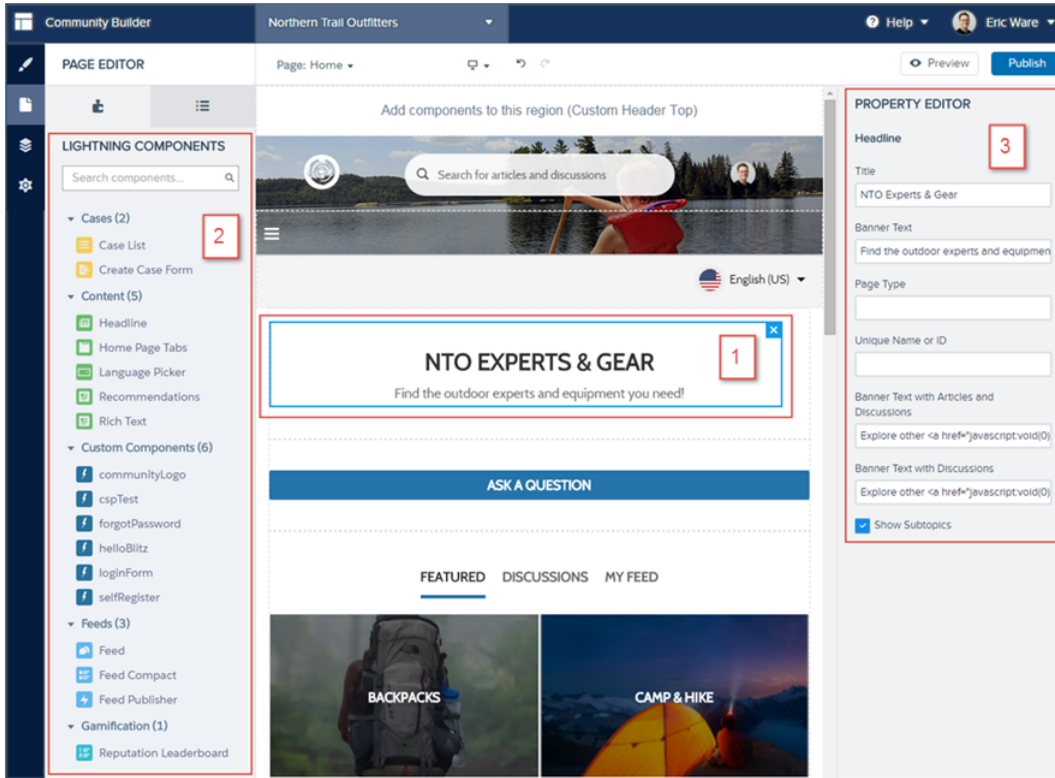

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Manage Communities"

Tip: You can also create custom Lightning components and use them on community pages. For more information on creating custom Lightning components and enabling them for Community Builder, see the [Lightning Components Developer's Guide](#).

Change the Page Layout in Community Builder

Quickly change the look of your community's pages by switching to a different layout. You can even create your own custom layouts in the Developer Console and import them to use in your community.

Note: This functionality is available in the Winter '16 and later versions of the Koa, Kokuu, and Napili templates and the Spring '16 and later versions of the Aloha template.

1. In Community Builder, click  on the left sidebar to display the Page Editor.
2. From the Page menu in the top toolbar, select the page that you want to edit.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Manage Communities"

3. Click **Change Layout** in the Property Editor.

The screenshot shows the 'PROPERTY EDITOR' interface. It includes fields for 'Page Name' (Home), 'URL' (/), and 'Page Layout' (Two Column Layout). A 'Change Layout' button is located at the bottom left and is circled in red.

4. Select the new layout. If you've added a custom layout, you can access it in the Custom tab.

The 'Change Layout' dialog box is shown with the 'STANDARD' tab selected. It displays a grid of layout options. The selected layout is '2 columns with a 1:2 ratio', which is highlighted with a blue glow and a mouse cursor. Other layout options include single column, two columns with equal ratio, and three columns with equal ratio. The dialog also has 'Cancel' and 'Change' buttons at the bottom.

5. Click **Change**.

If the structure of the new layout is different from the current layout, some regions won't be visible. However, the regions are still available and you can switch to a different layout at any time.

 **Note:** If you change the layout of a default template page, the only way to revert to the original layout is to click **Undo**.

For more information on custom layouts, see the [Lightning Components Developer's Guide](#).

Add Markup to the Page <head> to Customize Your Community

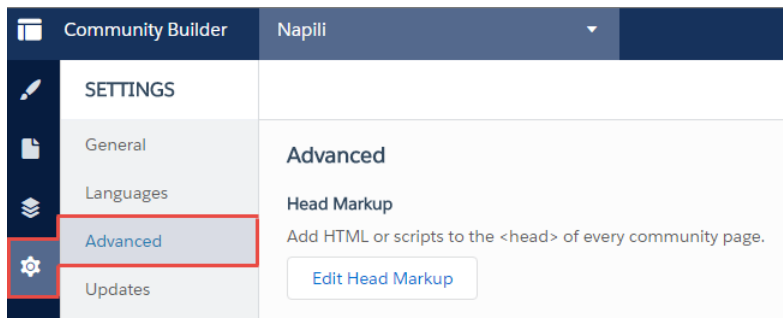

Add custom analytics, improve your SEO results, and more by adding custom markup to the page <head> in Community Builder.

Note: This functionality is available in the Winter '16 and later versions of the Koa, Kokua, and Napili templates and the Spring '16 and later versions of the Aloha template.

For example, you can customize your community's pages to suit your needs by adding:

- Custom analytics code, such as Google Analytics™
- SEO meta tags that are visible only to search engines
- References to external JavaScript files and third-party libraries
- Custom JavaScript blocks
- A *favicon* or web page icon

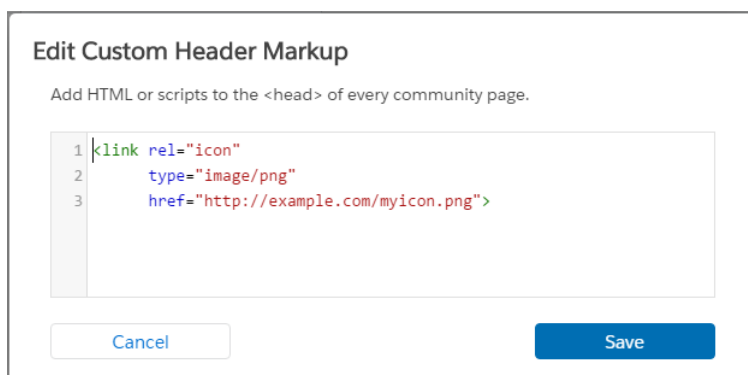

1. In Community Builder, click  on the left sidebar and click **Advanced**.

2. Click **Edit Head Markup**.
3. Enter the required HTML or JavaScript.
4. Save your changes.

When you add custom markup, the code is added to the <head> of every page.

Example: Here we've added HTML to include a favicon on our community's pages.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To customize or publish a community:

- "Create and Manage Communities"

Delete a Page in Community Builder

Remove a community page or page variation that you no longer need by deleting it in Page Manager.

Keep in mind that you can't delete:

- The default pages and objects that come with the template
- A page's default page variation
- A custom object page (detail, list, or related list) but you can delete the entire object

1. In Community Builder, click  on the left sidebar to display the Page Manager.
2. Select the page that you want to remove.
3. Click **Delete** on the toolbar or click  > **Delete** in the Page Variations tab.

Share More Salesforce Object Data in Your Community

Napili allows you to share record data for accounts, cases, contacts, tasks, events, and custom objects with minimal configuration. Record data respects user permissions via licenses, profiles, permission sets, and sharing rules.

 **Note:** This functionality is available in the Winter '16 and later versions of the Napili template.

- Create a [list of records and link to it](#).
- [Display record details in your community](#) with the out-of-the-box Record Detail page or create a custom page.

You can also [add groups to your community](#) in the same way.

Share a List of Records in Your Community

Create record list views for accounts, cases, contacts, and custom objects and link to them from the Napili navigation menu. Use an out-of-the-box or custom page layout to display the list of records.

 **Note:** This functionality is available in the Winter '16 and later versions of the Napili template.

1. In Community Builder, drag and drop the Navigation Menu component to add it to the appropriate page in the template. We recommend adding it to the Home page.
2. Create a navigation menu item pointing to a supported Salesforce object. Currently, Napili supports accounts, cases, contacts, and custom objects.

3. Publish your changes.

 **Note:** If your community is active, your navigation menu item changes will immediately appear to your community members.

That's it! This creates a navigation menu item, which links to a list of the selected object's records. Under the hood, your data is retrieved from Salesforce and displayed using the generic Record List page. This page is available out-of-the-box in Napili and uses the Record Home List View Lightning component to display data in an appropriate layout.

 **Note:** The generic Record List page provides the default list view layout for objects that don't have a predefined or custom list view page assigned. For example, if you create a navigation menu item for another Salesforce object, it uses this same page. If you modify the Record List page, be sure to account for all the affected objects.

 **Example:** A list view page for a custom object called Featured Products.

EDITIONS

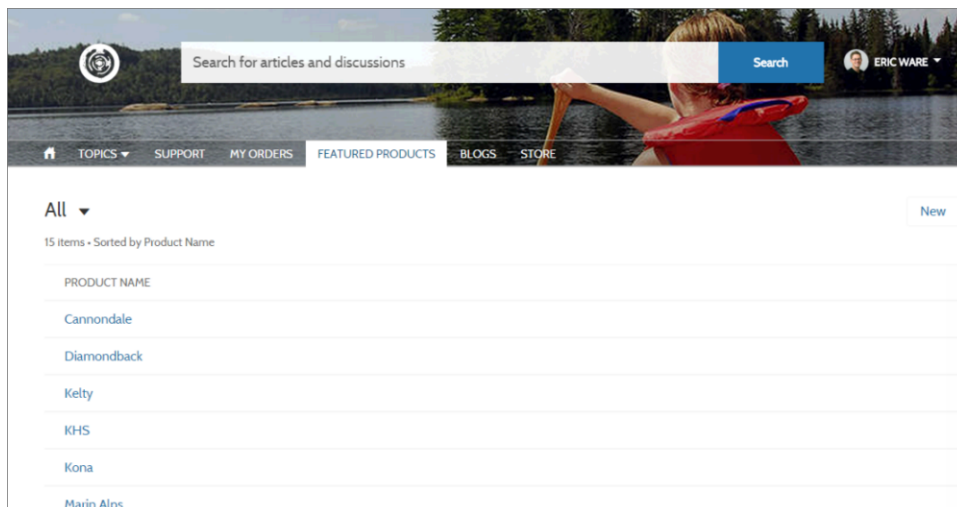

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

- Creating a navigation menu item is the easiest way to link to a list of records for an object. If you prefer to use a custom list view page for an object, you can [create a new page](#) for your community using Community Builder. Choose the Standard page type with a single-column layout. Add the Record Home List View component to the page, configure the component properties to point to the object, and then publish the page. To link to the page, create a custom navigation menu item and use the internal page URL.
- Users can access only records they have access to via licenses, profiles, permissions, and sharing rules, same as in Salesforce. Users with the "Create" permission for the object can create records from the list view page. The ability to create records from this page isn't supported on mobile devices.
- You can hide a navigation menu item from guest users to block access to the associated record list view page.
- When users click a record on this page, the record details are displayed using the layout from the generic Record Detail page. If you create a custom record detail page and assign it to the object, we use that page instead.
- Clicking a record in the list view displays the record details, which are displayed using the Record Detail page that comes out of the box with the Napili template.
- The Record List page and the Record Home List View component are not available in the Koa and Kokua templates.

SEE ALSO:

[Using Templates to Build Communities](#)

Display Record Details in Your Community

Display record details using the generic Record Detail page or create custom record detail pages.

 **Note:** This functionality is available in the Winter '16 and later versions of the Napili template.

Napili supports a record detail page that you can use out of the box with no configuration. All objects in your community without a preassigned record detail page use this generic page, called Record Detail, to display record data. For example, consider the scenario where a user lands on a case detail page (that uses a preassigned case detail layout) and clicks on a contact in the related records. If you haven't created a custom record detail page for contacts, the contact information is displayed using the generic Record Detail page. Under the hood, the Record Detail page uses the Record Headline and Record Information Lightning components to display record data.

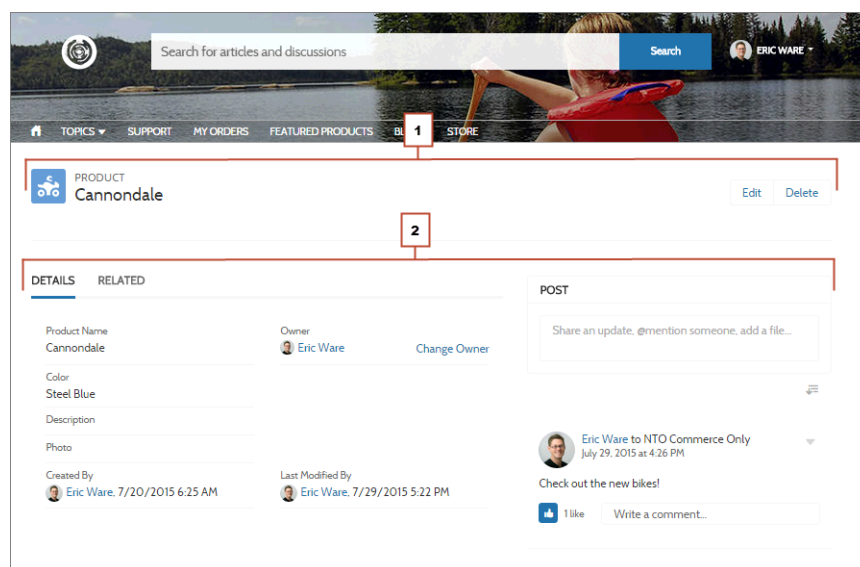

- **Record Headline:** Displays the record name and key record highlights along with buttons to edit and delete the record.
- **Record Information:** Displays all record details including related records and the record feed. It also allows users to create new related records and post to the record feed.

Optionally, you can create custom record detail pages for accounts, contacts, cases, tasks, events, and custom objects.

1. [Create a new Data Detail page](#) in Community Builder and pick a supported object.
2. Add the Record Headline and Record Information components to the page and configure the component properties from the Property Editor on the right.
3. Click  to access Page Management in the Community Builder settings, and then select the custom page as the active page for the object.
4. Publish your changes.

 **Note:** If your community is active, your navigation menu item changes will immediately appear to your community members.

 **Example:** The record detail page for a custom object with the Record Headline (1) and Record Information (2) components.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

- Some objects have preassigned, active record detail pages to display record data (such as cases). You can check the available pages and assignments for each object in Community Builder settings, under Page Management.
- Objects without preassigned record detail pages use the generic Record Detail page. If you modify the Record Detail page layout or configuration, be sure to account for all objects that use this page layout.
- Users without the necessary license, profile, and permissions can't access record data.
- Users with the necessary permissions can create records from the related lists, and edit and delete the record from the record headline. These actions aren't supported on mobile devices.
- Page layouts for each object in Salesforce determine what fields display in the Record Information component, and the fields in the Highlight Panel layout determines what displays in the Record Headline component. This feature includes support for record types.
- You must enable feeds on records in Salesforce to allow users to post on them in communities.
- The Record Detail page, the Record Headline component, and Record Information component are not available in the Koa and Kokua templates.

SEE ALSO:

[Using Templates to Build Communities](#)

Add Groups to Your Community

Want more collaborative communities? Allow community members and guest users to browse and join groups in your Napili community. Use the out-of-the-box design for groups in Napili, or create your own customized version of the group detail page using separate components.

 **Note:** This functionality is available in the Winter '16 and later versions of the Napili template.

1. To enable groups in your community, add groups to the community navigation menu.
This automatically displays a menu item that links to a list of groups in your community. If you make the menu item publicly available, even guest users who aren't logged in to your community can browse through the list of active public groups.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, customize, or publish a community:

- "Create and Manage Communities"

The screenshot shows the 'Edit Navigation Menu' interface. On the left, there is a list of menu items: 'Home' (with a lock icon), 'Topics', and 'GROUPS' (highlighted in blue). Above this list is a '+ Add Menu Item' button. On the right, there are configuration options for the selected 'GROUPS' item: 'Name' (GROUPS), 'Type' (Salesforce Object), 'Object Type' (Group), 'Default List View' (Active Groups), and a checked 'Publicly Available' checkbox. At the bottom, there are 'Cancel' and 'Publish Changes' buttons.

2. Publish your community.
3. If you haven't already, customize the group publisher layout to include the Add Member action. This action allows group owners and managers to add members to the group, and isn't shown in the list of actions in the group by default.

When users click on the name of an active group in the community, they're redirected to the group detail page. If it's a private group, they're asked to log in. Only logged-in group members can view private group content.

A few things to keep in mind:

- When you enable groups in your community, the default Group Detail page is used to display group data. This page uses the Group component under the hood for formatting and layout. The Group component is a composite, one-stop component that includes the group banner, group details, related lists, and the group feed. We recommend using this composite component, especially if you want your community pages to be responsive across desktop and mobile device browsers.
- If you prefer to use a different layout or want more granular control over the placement of group content, create a custom community page and use the Group Banner, Group Details, Group Related List, and Feed components. Depending on how you use the individual components, custom pages might not be responsive across all devices.
- Group announcements aren't supported in communities.

Group list in Napili

The screenshot shows the Napili community interface. At the top, there is a search bar with the text "Search for articles and discussions" and a "Search" button. To the right of the search bar is a user profile for "ERIC W...". Below the search bar is a navigation menu with items: "TOPICS", "GROUPS" (highlighted), "MY ORDERS", "SUPPORT", "FEATURED PRODUCTS", "BLOGS", "STORE", and "TC".

The main content area is titled "GROUPS" and "Active Groups". It includes a "New" button and a summary: "4 items • Sorted by Name • Filtered by Archive • Last updated 12/08/2015 at 17:47:29". Below this is a table with the following data:

NAME	LAST ACTIVITY	MEMBERS	TYPE	NICKNAME
Backpacking	8/7/2015 4:17 AM	3 Members	Public	srirangdew
Extreme Biking Grou	11/24/2015 5:10 PM	6 Members	Public	davidwdd
The Fitness Club	8/7/2015 4:34 AM	1 Member	Public	slicdfd
Trekking	8/7/2015 4:16 AM	9 Members	Public	Sether

Group detail page in Napili

The screenshot shows the Salesforce Community Builder interface for the 'Extreme Biking Group'. At the top, there is a search bar with the text 'Search for articles and discussions' and a 'Search' button. To the right of the search bar is a user profile for 'ERIC W...'. Below the search bar is a navigation menu with items: TOPICS, GROUPS, MY ORDERS, SUPPORT, FEATURED PRODUCTS, BLOGS, STORE, and TC. The main content area is divided into two columns. The left column features a group card for 'Extreme Biking Group' with a 'Member' button, 'Add Member', 'New Contact', and 'New Opportunity' options. Below this is a 'POST' section with a text input field. A post by 'MSmith' is visible, dated 'November 24, 2015 at 5:10 PM', with the text 'Nice shot from my last outing.' and a photo of a person mountain biking. Below the photo are 'Like' and 'Write a comment...' buttons. The right column contains 'Group Details' with an 'INFORMATION' section describing the group, a 'DESCRIPTION' section, and an 'OWNER' section listing 'davidwdd'. Below this are sections for 'Members (3+)' with profile pictures of 'davidwdd', 'MSmith', and 'srirangdev', and 'Files (2)' listing '2012-Bike-Brochure-for-web' and 'mountain biking 2'. At the bottom right, there is a 'Records (0)' section.

Manage Your Community's Settings in Community Builder

Use the Settings area to track which template you're using, view your community's status, and customize your template. If you're using the Napili template, easily access your navigational and featured topic settings.

To access the Settings area in Community Builder, click  on the left sidebar.

EDITIONS

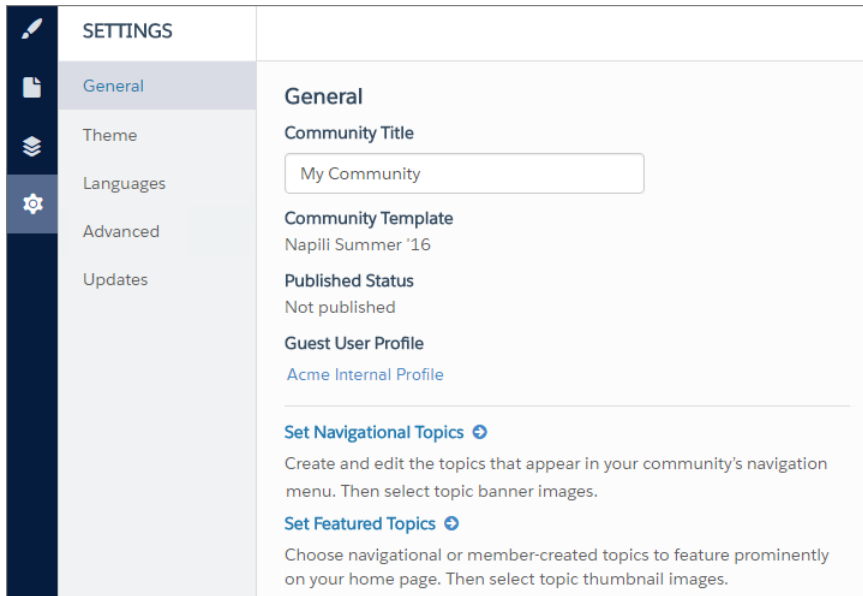

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To modify general settings

- "Create and Manage Communities"

- In the General area, settings include:

Community Title

Lets you set the title for your community. The title briefly appears in the browser's title bar before your community's Home page loads.

Community Template

Displays the name and version of the template that your community is using.

Published Status

Indicates whether your community is published. If it's published, click the link to open the live community in a separate browser tab.

Guest User Profile

Displays the associated guest user profile. Clicking the link takes you to the Profile page in Salesforce Setup, where you can modify profile settings, such as which permissions the guest user has. For more information about configuring the guest user profile, see "Configure the Guest User Profile for Unauthenticated Users" in the [Using Templates to Build Communities Guide](#).

Set Navigational Topics (*Napili template only*)

Click the link to go to Community Management, where you can [define topics to be used for navigation](#).

Set Featured Topics (*Napili template only*)

Click the link to go to Community Management and [define featured topics](#).

- In the Theme area, you can select:

Hide the header region and navigation

(Napili Winter '16 and Koa, Kokua, and Napili Spring '16 versions only)

Hide the defaults community header (which includes the header image, search box, community menu, and user profile navigation menu) in all the pages of your community. Select this option if you want to replace the header with your own custom version.

Show loading indicator as the page loads

(Napili Spring '16 version only)

Displays a ghost version of your community page until the page loads completely, which enhances the loading experience. If the page header is highly customized and the ghost version varies vastly from the real version loading in the browser, you can disable this option.

- In the Languages area, you can access Site.com where you can set the multilingual properties for your community. When set, these properties are used by the Language Picker component, which lets guest users select their preferred language on a page in your community. See "Language Picker" in the [Using Templates to Build Communities Guide](#).
- In the Advanced area, you can [add markup to the page head](#).
- In the Updates area, you can [update your community's template](#) to the latest version.

Update Your Community's Template in Community Builder

We introduce amazing features and enhancements with every release, so don't get left behind! When you update your template, you benefit from the latest Community Builder and template features. Why miss out on better performance and more?

 **Note:** Effective Summer '16 (May 2016), we no longer support Koa, Kokua, or Napili template versions before Winter '16 (October 2015). To continue receiving Salesforce support for your template, update it to Summer '16.

 **Important:** If you don't update your template, it doesn't affect your community. However, if issues arise with outdated templates, Salesforce Customer Support can't assist you.

If your community uses the Spring '16 version of the templates, sit back and relax. We automatically update your template version to Summer '16, so you can start adding the latest features to your community straight away.

If your community uses a Koa, Kokua, or Napili template that is earlier than Winter '16, read on because you have some housekeeping tasks.

 **Tip:** If you're not sure which template version your community uses, check out the Settings area in Community Builder.

The impact of updating a template depends on the version your community is using.

Template Type and Version	What to Expect When Updating to Summer '16
Winter '16 Koa, Kokua, or Napili	<ul style="list-style-type: none"> • Your customizations are maintained for all pages, except login pages. • Login pages retain branding but lose custom code or component customizations.
Before Winter '16 Koa, Kokua, or Napili Before Spring '16 Aloha template	<p>Most component customizations and properties are overwritten. However:</p> <ul style="list-style-type: none"> • For Koa and Kokua, general settings, such as Category Group Name, Top-Level Category, and Company Name, carry over. • For Napili, topic definitions carry over. <p>Most branding properties defined using the Branding Editor in Community Builder are maintained. However, sometimes your community's colors are reset to the default value. After you update</p>

Considerations for Changing Your Community Template

Changing your community template affects the community navigation, branding, and customizations.

- You may need to change your community's template to see some new communities features introduced by Salesforce. If you want to keep your current template, you must switch to another template and then switch back to your current template. For example, let's say you are using the Napili template for your community. Salesforce introduces a feature that requires a change (*not* a simple update) to the template. You must switch your community's template to another template, such as Koa or Kokua, and then switch it back to Napili.
- Salesforce object data carries over, but all branding and component customizations do not. You'll need to redo all customizations.
- Switching between templates updates the navigation in Community Management. To view all available options in Community Management, regardless of template selection, select **Administration > Preferences > Show all settings in Community Management**.
- Your community URL changes when switching from a Salesforce Tabs + Visualforce template to a Community Builder template, or vice versus. For example, in Community Builder-based templates `/s` is appended to your URL. Be sure to update any links to your community with the new URL.

To learn more about using the Kokua, Koa, and Napili templates, see the [Community Templates for Self-Service Implementation Guide](#).

To learn more about using the Aloha template, see the [Getting Started with the Aloha Community Template for Salesforce Identity](#).

[Insights for Community Engagement](#)

Insights are reports that help your community managers monitor activity and take action on that activity. Insights make it easier to manage day-to-day moderation tasks, encourage community engagement, and drive member adoption. You can set up Insights to monitor new members, unanswered questions, newly created groups, trending topics, and even recent Chatter contributions.

[Community Moderation Strategies and Tools](#)

Community moderation allows you to empower members of your community to monitor content and ensure that it's appropriate and relevant. Set up rules to automate moderation and do the heavy lifting for you.

[Organize Self-Service Communities with Topics](#)

Topics are a fantastic way to organize content in any community. Community members can add topics to posts and discussions, and structure content organically. When you set up a self-service community with the Napili template, you can use the Community Management page to quickly guide members to key navigational and featured topics.

[Customize Recommendations in Communities](#)

Create recommendations to drive engagement for your community, encouraging users to watch videos, take trainings, and more. Edit these recommendations in Community Management, where you can target specific audiences and use channels to specify locations for the recommendations.

[Reputation Overview](#)

Your reputation in the community directly corresponds to how active you are. The more you post, comment, and share, the higher your reputation level will be.

Community Managers, Moderators, and Admins Working Together

Communities can thrive when community managers, moderators, and admins understand their unique roles and work together effectively.

A community manager and moderator work hand-in-hand. They are partners and support one another in fostering engagement and harmony in the community. Sometimes, they perform some of the same tasks, but each has unique contributions. While the community manager is typically responsible for monitoring adoption and engagement, the moderator is typically responsible for ensuring the community is a healthy environment and that members feel encouraged to be active and helpful to each other.

Community managers, moderators, and admins all work together to protect, engage, and measure community success.

Measure return on investment (ROI) and key performance indicators (KPI), such as money saved and cases deflected.

Identify and track community trends.

Identify, encourage, groom, and retain MVPs.

[Manage Your Community](#)

Community Management is your one-stop shop for setting up and monitoring your community. Administrators can manage basic setup information including membership and branding. Community managers can view dashboards about groups, members, feed activity, and license usage, and manage the community's reputation system. Moderators can see which items have been flagged for review.

[What's a Community Manager?](#)

Every community needs someone to take an active role in making sure that the community thrives. Community managers spend time every day encouraging member participation, keeping conversations going, and recognizing members for contributing.

[What's a Community Moderator?](#)

Moderators help ensure the success of your community by monitoring user activity and flagged items.

[Access Community Management](#)

Community administrators and managers use Community Management to monitor community activity, and set up other important management features.

Manage Your Community

Community Management is your one-stop shop for setting up and monitoring your community. Administrators can manage basic setup information including membership and branding. Community managers can view dashboards about groups, members, feed activity, and license usage, and manage the community's reputation system. Moderators can see which items have been flagged for review.

You can customize your community at any time, but if you plan on making major changes, we recommend deactivating the community first.

Important: The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to **Administration > Preferences** and enable **Show all settings in Community Management**.

Home

- View your community's home page dashboard. If your home page still displays a message to install the Salesforce Communities Management, your administrator hasn't mapped a dashboard yet.
- Preview the community or access your community's settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header.

Engagement

Monitor recent activity and take immediate action without leaving Community Management.

[Insights are set up by the administrator](#). If the Engagement section doesn't appear, the administrator hasn't mapped any Insights for your community.

Dashboards

View dashboards and monitor information about groups, members, feed activity, moderation, topics, and license usage for this community.

[Dashboards are set up by the administrator](#). If the Dashboards section doesn't appear, the administrator hasn't mapped any dashboards for your community.

Moderation

View reports for flagged posts, comments, messages, and files. You can also see a report of all posts that are pending review and set up moderation rules for your community.

[Moderation is set up by the administrator](#).

Topics

Create a navigation menu and showcase popular topics in your community.

[Navigational topics](#) and [featured topics](#) are set up by the administrator or in the case of self-service templates, they are enabled by default. If the Topics section doesn't appear, your community is not using topics.

Recommendations

Recommendations can help drive engagement in a community. They can be set up to encourage users to watch videos, take trainings, and more.

[Recommendations are set up by the administrator](#). If the Recommendations section doesn't appear, the administrator hasn't set up any.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access Community Management:

- "Manage Communities" OR "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

To customize administration settings or use Community Builder:

- "Create and Set Up Communities"
- AND is a member of the community whose Community Management page they're trying to access

Reputation

Set up reputation levels and points to reward members for activity in the community feed.

[Reputation is set up by the administrator](#). If the Reputation section doesn't appear, the administrator hasn't enabled it.

Administration

On the Administration page, you can update basic setup for the community, including:

- **Members**—Add or remove members based on profiles or permission sets.
- **Tabs**—Select the tabs you want community members to see. Tabs are also used to determine community navigation in Salesforce1. Tab settings aren't used if your community was created with one of the Self-Service templates.
- **Branding**—Select an out-of-box branding theme. This branding is only used if your community uses the Salesforce tabs + Visualforce template.
- **Login & Registration**—Select the default community login page and set up self-registration.
- **Emails**—You can customize email sender information, Chatter email branding, and templates in your community emails.
- **Pages**—Configure page assignments for your community and access the Force.com and Site.com settings for your community.
- **Preferences**—Update important settings such as flagging content, nickname display, public access to Chatter, and file limits.
- **Settings**—Edit your community name, description, and URL. You can also manage the status of your community and change your [community template](#).

Lookups in Community Management initially return the items you most recently viewed from within the community. If an object you're looking for isn't in the Recently Viewed Documents list, try typing all or part of the object name and searching again.

 **Important:** If you're an administrator and accidentally remove yourself from a community, you won't be able to access the Administration settings in Community Management. To add yourself back to the community or make other membership updates, [use the API](#).

[What's a Community Manager?](#)

[What's a Community Moderator?](#)

What's a Community Manager?

Every community needs someone to take an active role in making sure that the community thrives. Community managers spend time every day encouraging member participation, keeping conversations going, and recognizing members for contributing.

Community managers must be employees of your organization; external community members can't be community managers.

A community manager is a member of the community that takes on the extra responsibility of monitoring community engagement. Community managers need access to reports and dashboards that show trends in activity and membership. They also need to be aware if members aren't logging in as frequently as they should be. By monitoring community membership and activity, community managers can figure out how to engage community members and ensure that they participate.

A powerful tool for a community manager is the ability to recognize individual members for their participation, because community managers know that recognition and a little friendly competition usually lead to more active members. Community managers can set up a point system and reputation levels that reward members with points when they perform certain actions. Once members reach the top of the level's point threshold, they move up a level.

What's a Community Moderator?

Moderators help ensure the success of your community by monitoring user activity and flagged items.

In a successful community, members are actively engaged and communicating with one another. A community moderator facilitates knowledge sharing within a community to help members benefit and derive value from their participation. The moderator also helps ensure that all communications and content in the community are appropriate.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the community feed. This person should be accustomed to interfacing with customers and can spend time regularly monitoring the community.

A moderator can:

- Review and act on the list of flagged posts and comments in the community
- Review and act on the list of flagged files in the community
- Remove flags directly in the community
- Delete inappropriate posts, comments, messages, and files

A moderator can also help drive the success of a community in many other ways.

- Sharing relevant and useful information in community posts
- Encouraging members to post and comment on each other's posts
- Setting an example by their activity in the community
- Keeping discussions focused, spam-free, and non-controversial
- Redirecting email conversations to communities when it can benefit other community members
- Establishing the community as a reliable source of information and a forum for transparent discussions

You can choose to designate more than one moderator for a community, especially if the community has a large number of members.

 **Note:** Although they share some similar capabilities, a community moderator is different from a [Chatter moderator](#).

[Which users can moderate?](#)

There are multiple types of users who can moderate a community when flagging is enabled.

[Assign a Community Moderator](#)

Make one or more people moderators in your community so they can keep an eye on its content.

Which users can moderate?

There are multiple types of users who can moderate a community when flagging is enabled.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the community feed. Moderators can continue to flag items even if flagging is disabled for community members, although group owners and group managers can only moderate when flagging is enabled.

Who can moderate items in a community depends on permissions or if the user is a group manager or owner. This table shows who can moderate and what actions they can take in the user interface.

Action	User with "Moderate Communities Feeds"	User with "Moderate Communities Files"	Group Owner or Manager (on items in groups they own or manage)*
Remove flags on a post or comment	✓		✓
Delete a post or comment	✓		✓
Remove flags on a file		✓	✓
Delete a file		✓	✓

*To allow group owners and managers to moderate, the `Allow members to flag content` option must be enabled.

Assign a Community Moderator

Make one or more people moderators in your community so they can keep an eye on its content.

Moderators can be users from your internal organization or external users, but only internal users can moderate from within Community Management. External users who are moderators can moderate within context of the community, such as directly in the community feed.

You can assign moderators by assigning a permission set that includes one or more of following moderation permissions.

Permission	Allows Users To
Moderate Communities Feeds	Review flagged posts and comments and take action, such as removing flags or deleting the post or comment. Moderator options for feed content are available in the community feed and in Community Management.
Moderate Communities Files	Review flagged files they have access to and take action, such as removing flags or deleting the file. Moderator options for

EDITIONS

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To assign permission sets:

- "Assign Permission Sets"

Permission	Allows Users To
	files are available on a file's detail page and in Community Management.
Moderate Communities Chatter Messages	Review flagged messages and take action, such as removing a flag or deleting a message. This permission allows users access to only flagged messages in communities they're a member of.
Can Approve Feed Post	Approve, delete, or edit posts that are pending review.
Moderate Community Users	Freeze external users who are members of the community. Moderators can freeze members on their user profile page or from an Insights report.
Manage Communities	Moderate community content in Community Management.

You can also add these permissions to a profile. These permissions are valid for all communities the user is a member of, but don't apply in your internal organization.

1. From Setup, enter *Permission Sets* in the *Quick Find* box, then select **Permission Sets**, then click **New**.
2. Create a permission set that includes the appropriate permissions.
3. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
4. Find the user you want to be a community moderator and add the permission set to their Permission Set Assignments related list.

After you grant moderator permissions to a user, keep these things in mind:

- The user can now moderate any items they have access to in all communities they're a member of.
- The user can flag items even if *Allow members to flag content* is disabled in a community.
- Moderators can receive an email notification when a post, comment, or file is flagged by selecting the *Flag an item as inappropriate* email notification.

Access to moderator functionality is slightly different depending on user permissions:

- **In the community feed:** Both internal and external users with the "Moderate Communities Feeds" permission can view flag indicators directly in the community feed for posts and comments and decide to either remove the flags or delete the content.
- **In Community Management:** Only internal users with the "Manage Communities" or "Create and Set Up Communities" permission can access the **Moderation** area in Community Management.

Access Community Management

Community administrators and managers use Community Management to monitor community activity, and set up other important management features.

1. Access Community Management in one of the following ways.
 - From the community:
 - In Salesforce Tabs + Visualforce communities, click  in the global header.
 - In Community Builder-based communities, use the drop-down menu next to your name and click **Community Management**.
 - From Setup, enter *All Communities* in the Quick Find box, then select **All Communities** and click the **Manage** link next to a community. To access this page, you need the Create and Set Up Communities" permission.
 - From Community Builder, in the header, use the drop-down menu next to the name of your template and click **Community Management**.
 2. Choose the part of the community you want to manage:
 - Preview the community or access your community's settings in the Community Builder, Force.com, or Site.com Studio from the Community Management menu in the global header.
 - In **Engagement**, you can view Insights reports and take action on activity in your community.
 - In **Dashboards**, you can view community dashboards and reports.
 - In **Moderation**, you can set up moderation rules and monitor flagged feed items.
 - In **Topics**, you can manage navigational and featured topics.
 - In **Recommendations**, you can set up custom recommendations to appear in your community.
 - In **Reputation**, you can set up reputation levels and points.
 - In **Administration**, you can customize your community properties, such as name, description, URL, status, and template. You can also update your community settings, such as members, tabs, branding, login and registration, and emails.
-  **Important:** The options available in Community Management are based on your community template selection, permissions, and preferences. For example, if your community does not use topics, you will not see the Topics node. Some of the options in the following list may not be applicable in your community. To display all nodes, go to **Administration > Preferences** and enable **Show all settings in Community Management**.

Measure Community Success with Dashboards

Use Community Management dashboards to view your community's analytics, such as metrics and trends on activity. Dashboards give you mid-term to long-term views on adoption and engagement, providing you with a high-level view into the health of your community. Dashboards also help you monitor return on investment (ROI) and key performance indicators (KPI).

[Enable and Map Dashboards for Community Managers](#)

Community managers can use dashboards to measure the success of their communities. You can even map a dashboard to the Community Management **Home** page. You can map custom dashboards or use ones provided in an AppExchange package. Each community can have its own dashboards.

[Create a Dashboard to Display in Community Management](#)

While you can show any dashboard in Community Management, we recommend creating them based on the custom report types available for communities.

[View Dashboards in Community Management](#)

Use the dashboards in Community Management to monitor the health of your community.

[What's the difference between Insights and dashboards?](#)

Insights let you take immediate action on recent activity in your community, and dashboards let you see trends.

Enable and Map Dashboards for Community Managers

Community managers can use dashboards to measure the success of their communities. You can even map a dashboard to the Community Management **Home** page. You can map custom dashboards or use ones provided in an AppExchange package. Each community can have its own dashboards.

You can choose to map any dashboard you have access to, but ensure that your community managers have access as well.

All dashboards in Community Management display as Lightning dashboards, regardless of what types of dashboard you're using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard in Community Management. Remember that although dashboards render in a Lightning view in Community Management, the Communities product isn't supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you're using a [supported browser](#).

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Management package](#) available for download on the AppExchange.

If the Salesforce Communities Management package is installed in your organization, each of the dashboard pages has a default mapping to a dashboard from the package. You can overwrite these values as needed.

Use the following steps to map or update your dashboards in Community Management:

1. [Open Community Management](#).
2. Click **Dashboards > Settings**.
3. For each of the pages, select the dashboard you want to show to community managers. The dashboard you map to **Home** displays on your Community Management **Home** page.

USER PERMISSIONS

To map dashboards in Community Management:

- "Create and Set Up Communities" OR "Manage Communities"

AND

"Manage Dashboards in Public Folders"

AND

Is a member of the community whose Community Management page they're trying to access.

4. Click **Save**.

Dashboards are visible to community managers when they expand the **Dashboards** section or visit the home page in Community Management.

Verify the dashboard mappings by clicking **Dashboards** and then clicking each page name. If you mapped a dashboard to the **Home** page, check that out too.

SEE ALSO:

[Create a Dashboard to Display in Community Management](#)

[View Dashboards in Community Management](#)

Create a Dashboard to Display in Community Management

While you can show any dashboard in Community Management, we recommend creating them based on the custom report types available for communities.

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Management package](#) available for download on the AppExchange.

All dashboards in Community Management display as Lightning dashboards, regardless of what types of dashboard you're using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard in Community Management. Remember that although dashboards render in a Lightning view in Community Management, the Communities product isn't supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you're using a [supported browser](#).

Use the following process to create dashboards to display in Community Management:

1. Create custom report types based on the Networks object.

Only reports that are based on the Networks object show community-specific information in Community Management.

 **Note:** You can create reports based on other objects and expose them in Community Management. Just keep in mind that they show data from across your organization, not just for the community in which you're viewing them.

- Select Networks as the primary object.
- Select a child object:
 - Chatter Messages
 - Feed Revisions
 - Groups
 - Network Audits
 - Network Activity Daily Metrics
 - Network Feed Revisions
 - Network Members
 - Network Membership Daily Metrics
 - Network Moderations
 - Network Public Usage Daily Metrics

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create custom report types:

- "Manage Custom Report Types"

To create, edit, and delete reports:

- "Create and Customize Reports"

To create and share dashboards:

- "Manage Dashboards in Public Folders"

- Network Unique Contributor Daily Metrics
- Recommendation Metric
- Topic Assignments
- Topics
- Unpublished Feed Entities

2. Use the custom report type to create a report.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

3. Create a dashboard with components. Select the report as your source type.

- Add a component for each report you want to include in your dashboard.
- Find your report on the Data Sources tab and add it to the component.

In order for a Salesforce Classic dashboard to optimally render in the Lightning view used in Community Management, make sure that your dashboard meets the following requirements:

- Includes only up to 20 reports arranged within three columns
- Doesn't include unsupported charts, such as funnel, scatter, table, multi-metric, pie, and gauge

For a list of dashboard features not supported in the Lightning view, see [Reports and Dashboards: Lightning Experience Limitations](#).

Note: Metrics are supported in the Lightning view, but they display as large tiles. We recommended that you don't include metrics in your dashboards.

4. Share the folder that you save your dashboard in with your community managers.

5. In [Community Management](#), click **Dashboards** > **Settings** to map your dashboard.

When a community manager accesses Community Management, the dashboard appears under **Dashboards**. If you mapped a dashboard to the **Home** page, the dashboard appears there.

Dashboards in Community Management are automatically refreshed every 24 hours. To see the latest data, click **Refresh**. If you access the dashboard after it has been recently refreshed, the dashboard displays the globally cached data from the last refresh. If the dashboard hasn't been refreshed in 24 hours, it's refreshed automatically when you access it in Community Management. All role-based external users in your community can refresh dashboards set up with "Run as specified user" and "Run as logged-in user" up to 1,000 times daily per org. Scheduled and automatic refreshes don't count against the limit. There is no refresh limit for internal users.

Remember that you can customize your dashboards at any time. To edit your dashboard, go to the **Dashboards** > **Settings** page in Community Management and click **Edit dashboard** to open the dashboard in your internal Salesforce org. If you're using a dashboard that was created in Lightning Experience, the edit link won't work.

View Dashboards in Community Management

Use the dashboards in Community Management to monitor the health of your community.

All dashboards in Community Management display as Lightning dashboards, regardless of what types of dashboard you're using or what interface your org is using. For example, a Salesforce Classic dashboard gets displayed as a Lightning dashboard in Community Management. Remember that although dashboards render in a Lightning view in Community Management, the Communities product isn't supported in Lightning Experience. Not all browsers support this Lightning view, so make sure you're using a [supported browser](#).

1. [Open Community Management](#).
2. Click **Dashboards**.

 **Note:** Your administrator maps the dashboards. If the **Dashboards** section isn't visible, they haven't been mapped for your community.

Pages that have dashboards mapped to them appear in the **Dashboards** section or on the **Home** page.

3. Click the dashboard page you want to view.

The dashboard appears. For an immediate refresh of dashboard data, click **Refresh**.

Dashboards in Community Management are automatically refreshed every 24 hours. To see the latest data, click **Refresh**. If you access the dashboard after it has been recently refreshed, the dashboard displays the globally cached data from the last refresh. If the dashboard hasn't been refreshed in 24 hours, it's refreshed automatically when you access it in Community Management. All role-based external users in your community can refresh dashboards set up with "Run as specified user" and "Run as logged-in user" up to 1,000 times daily per org. Scheduled and automatic refreshes don't count against the limit. There is no refresh limit for internal users.

4. To view a related report, click **View Report** on the dashboard.

Remember that the dashboards are configured to display community-specific data.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

Remember that you can customize your dashboard at any time. To edit your dashboard, go to the **Dashboards > Settings** page in Community Management and click **Edit dashboard** to open the dashboard in your internal Salesforce org. If you're using a dashboard that was created in Lightning Experience, the edit link won't work.

Insights for Community Engagement

Insights are reports that help your community managers monitor activity and take action on that activity. Insights make it easier to manage day-to-day moderation tasks, encourage community engagement, and drive member adoption. You can set up Insights to monitor new members, unanswered questions, newly created groups, trending topics, and even recent Chatter contributions.

Example: With an Insights report set up to track new members, community managers can quickly navigate to a new member’s profile to send them a welcome message.

 **Tip:** Let us do the setup work for you! Get out-of-the-box Insights in the [Salesforce Communities Management package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

Insight reports provided in the package are 100% customizable. You can change the default Insights page names, report folder mappings, and even the Insights report columns and filters at any time. So don't be afraid to customize or change what you get in the package. You won't hurt our feelings.

[Enable and Map Insights for Community Managers](#)

Community managers can use Insights reports to monitor recent activity and take action on that activity. To get up and running quickly, use preconfigured Insights from an AppExchange package. You can also create and map your own. Each community can have their own Insights.

[Create Insights to Display in Community Management](#)

You can create your own Insights to display in Community Management. We recommend that you create your Insights reports based on custom report types available for communities.

[Create Custom Actions for Community Management Insights](#)

Do more with community Insights reports with custom actions. Say a spammer attacks your community. You can create and use a custom action to remove all the spammer's posts and comments with just one click. Custom Insights actions work with standard objects and custom objects.

[View and Customize Insights in Community Management](#)

Use Insights in Community Management to monitor recent community activity and immediately take action. Insights help you manage day-to-day moderation tasks and keep up on adoption and engagement in your community.

Enable and Map Insights for Community Managers

Community managers can use Insights reports to monitor recent activity and take action on that activity. To get up and running quickly, use preconfigured Insights from an AppExchange package. You can also create and map your own. Each community can have their own Insights.

Insights pages map to report folders in your internal org. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal org updates the Insights page in Community Management. On the Insights page, links are automatically created for report fields such as `Created By` or `Group Name`. For posts, comments, and messages, you can even see the contents directly on the page.

 **Tip:** Get out-of-the-box Insights in the [Salesforce Communities Management package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

When you install the package, report folders are automatically installed in your internal org. If you have no previous Insights mapped, the package automatically maps them for you. You can change the default mappings at any time.

Use the following steps to map or update your Insights in Community Management:

1. [Open Community Management](#).
2. Click **Engagement** > **Settings**.
3. Provide a name for each Insights page and then select the report folder you want to map to the page.

You can have up to 10 Insights pages mapped in Community Management.

Make sure that you have shared the mapped report folder with your community managers or they won't be able to view the Insights reports.

4. Click **Save**.

Insights pages are visible to community managers when they expand the **Engagement** section of Community Management.

Go check out your changes. Click **Engagement** and then click each Insights page name. Use the drop-down menu to verify the reports mapped to each page.

If you installed the Salesforce Communities Management package, moderation-related Insights reports are also mapped to pages in the **Moderation** section of Community Management. Unlike the page names in the **Engagement** section, the page names in the **Moderation** section can't be renamed or unmapped.

SEE ALSO:

[Share a Report or Dashboard Folder](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To map Insights in Community Management:

- "Manage Communities" OR "Create and Set Up Communities"

AND

"Manage Reports in Public Folders"

AND

Is a member of the community whose Community Management page they're trying to access

Create Insights to Display in Community Management

You can create your own Insights to display in Community Management. We recommend that you create your Insights reports based on custom report types available for communities.

 **Tip:** Get out-of-the-box Insights in the [Salesforce Communities Management package](#) available for download from the AppExchange. To use the preconfigured Insights reports, your community must use Chatter.

Use the following process to create Insights to display in Community Management:

1. Create custom report types based on the Networks object.

Only reports that are based on the Networks object show community-specific information in Community Management.

 **Note:** You can create reports based on other objects and expose them in Community Management. Just keep in mind that they show data from across your organization, not just for the community in which you're viewing them.

- Select Networks as the primary object.
- Select a child object:
 - Chatter Messages
 - Feed Revisions
 - Groups
 - Network Audits
 - Network Activity Daily Metrics
 - Network Feed Revisions
 - Network Members
 - Network Membership Daily Metrics
 - Network Moderations
 - Network Public Usage Daily Metrics
 - Network Unique Contributor Daily Metrics
 - Recommendation Metric
 - Topic Assignments
 - Topics
 - Unpublished Feed Entities

2. Use the custom report type to create an Insights report.

Insights reports are just like any other report, except they must also meet the following requirements:

- The report can only be a tabular-based report.
- The report can't include pagination.
- We recommended that your report only return 2,000 rows or less because only the first 2,000 rows are displayed in Community Management.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create custom report types:

- "Manage Custom Report Types"

To create, edit, and delete reports:

- "Create and Customize Reports"

To create and share report folders:

- "Manage Reports in Public Folders"

3. Save the report to a new report folder that you'll use for mapping in Community Management.

We recommend that you create a separate report folder for each of your Insights pages. For example, create one report folder called *Insights Members* and another called *Insights Moderation*.

Insights pages map to report folders in your internal org. All the reports included in that folder are displayed in the drop-down menu on the Insights page. Adding or removing an Insights report from the report folder in your internal org updates the Insights page in Community Management.

4. Share your Insights report folder with your community managers.
5. In *Community Management*, click **Engagement** > **Settings** to map Insights pages to your report folder.

When a community manager accesses *Community Management*, the Insights reports appear in the drop-down menu on the mapped **Engagement** page.

SEE ALSO:

- [Create a Custom Report Type](#)
- [Create a Report](#)
- [Track Community Activity](#)
- [Share a Report or Dashboard Folder](#)
- [Create Custom Actions for Community Management Insights](#)

Create Custom Actions for Community Management Insights

Do more with community Insights reports with custom actions. Say a spammer attacks your community. You can create and use a custom action to remove all the spammer's posts and comments with just one click. Custom Insights actions work with standard objects and custom objects.

When you click an Insights action in the report, behind the scenes a Visualforce page drives the action. The Visualforce page links to standard or custom objects using standard controllers or standard list controllers.

Here are the high-level steps of how to create a custom Insights action:

1. Create a Visualforce page.

There are a few options you can use:

- Use a standard controller

Choose this option to create a Visualforce page that contains the same functionality and logic used in standard Salesforce pages. For example, if you use the standard Accounts controller, clicking a **Save** button in a Visualforce page results in the same behavior as clicking **Save** on a standard Account edit page.
- Use a standard list controller

Choose this option to create a Visualforce page that can display or act on a set of records. Examples of existing Salesforce pages that work with a set of records include: list pages, related lists, and mass action pages.
- Use a controller extension that uses Apex

Choose this option if you want to expose new functionality, customize the navigation through an application, use callouts or Web services, or if you need finer control for how information is accessed for your page.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and set version settings for Visualforce pages:

- "Customize Application"

To edit custom Visualforce controllers:

- "Author Apex"

All options work with standard objects and custom objects.

For detailed information about these options, see the Visualforce Developer Guide.

2. Add your custom action to the Insights report.

Actions are displayed based on the data returned in the report. Make sure that you have a report that is currently returning the data your action needs.

- a. In Community Management, navigate to the Insights report that you want to apply your new custom action to.
- b. On the report, click  and then add your custom action from the picklist.

3. Ensure that your users have the correct permissions to complete your custom action.

Depending on how you set up your custom action, after the action is executed, the user either stays on the Insights page or is redirected to a page in your internal org. Unlike our standard Insights actions, users don't receive the standard success or failure message for custom actions.

Example: Here's an example of a custom action to delete all activity from a community member. This custom action is great for cleaning up the community after a spam attack.

Create a custom controller extension using an Apex class and use it in your Visualforce page. The following `DeleteAllActivityControllerExtension` class is an example of a custom controller extension.

```
public with sharing class DeleteAllActivityControllerExtension {

    private List<Id> ids;
    private String retURL;
    private Database.DeleteResult[] deleteResult = null;
    private Map<String, String> resultMap;
    private String success = 'success';
    private String failure = 'failure';

    public DeleteAllActivityControllerExtension(ApexPages.StandardController controller)
    {
        resultMap = new Map<String, String>();
        /* The IDs you select on the Insights page are stored in a comma separated
string of IDs.
This string is passed in a parameter called "idsList" */
        String idsList = ApexPages.currentPage().getParameters().get('idsList');
        //The return URL to the Insights page is passed in a parameter called "retURL"

        retURL = ApexPages.currentPage().getParameters().get('retURL');
        ids = idsList.split(',');
    }

    public PageReference deleteAllActivity() {
        deleteFeedPosts();
        deleteFeedComments();
        //Include these two lines of code to be redirected to the Insights page after
you click the action.
        PageReference retPage = new PageReference(retURL);
        retPage.setRedirect(true);
        Integer failureCount = calculateFailureCount();
        Integer successCount = ids.size() - failureCount;
        retPage.getParameters().put(success, String.valueOf(successCount));
    }
}
```

```

        retPage.getParameters().put(failure, String.valueOf(failureCount));
        return retPage;
    }

    private void deleteFeedPosts() {
        List<FeedItem> feedItems = [Select Id, CreatedById FROM FeedItem WHERE
CreatedById IN :ids];
        deleteResult = Database.delete(feedItems, false);
        //Update the resultMap with failures to calculate the failureCount
        if(deleteResult != null) {
            for(Integer i=0;i < deleteResult.size();i++) {
                if (!deleteResult.get(i).isSuccess()) {
                    for(Database.Error error : deleteResult.get(i).getErrors()) {
                        resultMap.put(string.valueOf(feedItems.get(i).CreatedById),
failure);
                    }
                }
            }
        }
    }

    private void deleteFeedComments() {
        List<FeedComment> feedComments = [Select Id, CreatedById FROM FeedComment WHERE
CreatedById IN :ids];
        deleteResult = Database.delete(feedComments, false);
        //Update the resultMap with failures to calculate the failureCount
        if(deleteResult != null) {
            for(Integer i=0;i < deleteResult.size();i++) {
                if (!deleteResult.get(i).isSuccess()) {
                    for(Database.Error error : deleteResult.get(i).getErrors()) {
                        resultMap.put(string.valueOf(feedComments.get(i).CreatedById),
failure);
                    }
                }
            }
        }
    }

    private Integer calculateFailureCount() {
        Integer failureCount = 0;
        for (String result : resultMap.values()) {
            if (failure == result) {
                failureCount++;
            }
        }
        return failureCount;
    }
}

```

This code creates a **Delete All Activity** button in your Insights report. This button deletes all posts and comments for any selected members. If you wanted to delete all private messages and files too, you could expand the code.

 **Note:**

- This code example doesn't include any permission checks. This custom action only works for admins.
- The IDs for the items you selected on the Insights report are passed to the Visualforce page using the `idsList` parameter.

The following Visualforce markup shows how the custom controller extension can be used in a page:

```
<apex:page standardController="User"
extensions="DeleteAllActivityControllerExtension" action="{!deleteAllActivity}"
/>
```

View and Customize Insights in Community Management

Use Insights in Community Management to monitor recent community activity and immediately take action. Insights help you manage day-to-day moderation tasks and keep up on adoption and engagement in your community.

Each Insights page includes multiple Insights reports. You can access these reports using the drop-down menu on the page. On the Insights page, links are automatically created for report fields such as `Created By` or `Group Name`. For posts, comments, and messages, you can even see the contents directly on the page.

Insights are powerful tool that you can use to perform mass-actions. For example, if a spammer attacks your community, you can select all the offending posts and click **Delete Post**.

 **Important:** Some Insights actions require special permissions. If you can't perform an action, let your admin know.

1. [Open Community Management](#).
2. Click **Engagement** or **Moderation**.

 **Note:** Your admin maps Insights pages. If the **Engagement** section isn't visible or the **Moderation** section doesn't include any Insights pages, your admin hasn't mapped them yet.

Pages with mapped report folders appear when you expand the sections.

3. Click the Insights page you want to view.
 - To access other Insights reports, use the drop-down menu.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view Insights in Community Management:

- "Manage Communities" OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access

To customize Insights reports:

- "Create and Customize Reports"

- Take action! Only the first two actions are displayed on the page. To see more actions, click  next to the displayed actions. You can select up to 100 rows at a time.
- To filter the report by relative and custom date ranges, use the drop-down date filter. Select one of the following relative date ranges: All Time, This Week, This Month, Last Month, Today, Yesterday, Last 7 Days, and Last 30 Days. You can also enter your own custom date range.
- To sort the report by a specific column, click the column heading. An arrow on the column indicates whether the report is sorted by ascending or descending order.
- To edit or customize the report, click  to open the report in your internal org. From there you can customize the report to fit your community needs, such as adding or removing columns and updating the report filters.

Be sure not to filter the report by Network ID to ensure that the report dynamically displays data for the community you view it from. Adding a Network ID filter causes the report to only show data for the community with that Network ID, regardless of which community you view it in.

- To edit the actions assigned to a page, click  to open the Edit Insights Actions page.

Actions that appear on the Insights report are displayed based on the data returned in the report. For example, if the report returns data about a user, the **Freeze Member** and **Unfreeze Member** actions are displayed. If the report stops returning data, actions aren't removed. However, when you go to update the actions, we let you know that some are no longer appropriate.

Each Insights report can have its own actions. You can edit these actions at any time, but keep in mind that an Insights report must have at least one action. Actions displayed in the picklist on the Edit Insights Actions page are all the available and appropriate actions for your report, including custom actions.

Insights reports in Community Management are automatically refreshed when you access them. You can also force an update.

Community Moderation Strategies and Tools

Community moderation allows you to empower members of your community to monitor content and ensure that it's appropriate and relevant. Set up rules to automate moderation and do the heavy lifting for you.

Moderation is crucial for a community to thrive. You need active moderators who are willing to spend time ensuring that the members and content in your community are appropriate and helpful. You also need to empower members to speak up when they view something as inappropriate or offensive.

With Communities moderation, you can:

- Designate specific users as moderators so that they can closely monitor the community
- Allow members to flag posts, comments, files, and messages that are inappropriate
- Allow moderators to review and act on flagged items, such as deleting a post, comment, or file
- Allow group owners and managers to moderate within their groups
- Create rules and criteria to automatically block, flag, replace keywords in member-generated content, such as posts or comments
- Create rules to review and approve content from specific members

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Track flagging and moderation activity within your community

To [limit the size and types of files allowed in your community](#), go to the **Administration > Preferences** page.

To report on moderation activity in your communities, you can use the preconfigured Audit Trail Insights report provided in Salesforce Communities Management package. You can also query the flagged content or activity using the API, or create a custom report type using `Networks` as the primary object. For more information about the Salesforce Communities Management package, see [Report on Communities with the Dashboards and Insights Package](#).

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don't require you to allow your members to flag content.

If your org is using Transaction Security, community moderation offers some of the same functionality. Transaction Security and communities moderation can be used at the same time.

[Enable Members to Flag Items in Your Community](#)

Turn on flagging for your community to empower members to flag posts, comments, files, and messages that they deem inappropriate.

[Community Moderation Criteria](#)

Create criteria that define keywords or groups of members. Criteria are used in rules to moderate member-generated content, such as posts and comments.

[Community Moderation Rules](#)

Create and modify rules for your community to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your community from spammers, bots, and offensive or inappropriate content.

[Review and Approve Posts in Your Community \(Beta\)](#)

Pre-moderation rules to review and approve content ensure that non-compliant and inappropriate content isn't immediately visible to everyone in your community. Posts pending review aren't displayed in the community feed; only the author and community moderators can see pending posts in the feed. After you set up the rules, moderators can approve content in two places: directly in the community feed or in Community Management.

[Moderate Flagged Posts and Comments in Your Community](#)

Community moderators can review a list of posts and comments that members of the community have flagged as inappropriate and take action. Group owners or group managers, can view flags and take action on items in their groups.

[Moderate Flagged Files in Your Community](#)

Community moderators can review a list of files that members of the community have flagged as inappropriate and take action. Group owners or group managers can view flags and take action on files in their groups.

[Moderate Flagged Private Messages in Your Community](#)

Community moderators can review and act on a list of Chatter messages that members of the community have flagged as inappropriate or as spam.

[Set Up Apex Triggers for Flagging Items](#)

Use triggers to create custom advanced moderation logic that automatically flags items in your community.

SEE ALSO:

[Assign a Community Moderator](#)

[Assign a Community Manager](#)

Enable Members to Flag Items in Your Community

Turn on flagging for your community to empower members to flag posts, comments, files, and messages that they deem inappropriate.

Community moderation must be enabled for your organization before you can allow members to flag content in the user interface. If you don't see the option to allow flagged content, contact your administrator.

This setting isn't required to flag or moderate items using the API.

Once an item is flagged, your community moderator can review it and take action. Remember that moderators can continue to flag items even if flagging is disabled for community members.

1. [Open Community Management](#).
2. Click **Administration > Preferences**, then select `Allow members to flag content`.
3. Click **Save**.

With this setting enabled in a community:

- Members can flag posts, comments, and files using the `Flag as inappropriate` option.
- Members can flag messages from within the community on their My Messages page in Chatter. If a member has turned on email notification for messages, they can also flag the message directly from their email. Members can only flag messages that are sent from communities they are members of.

 **Note:** Messages can't be flagged in partner or customer portals, your internal organization, or from Salesforce1.

- Group owners and managers can moderate groups they own or manage.

If you want to create custom advanced moderation logic for your community, you can create triggers that flag content. Custom triggers run behind the scenes and don't require you to allow your members to flag content.

SEE ALSO:

[Assign a Community Moderator](#)

Community Moderation Criteria

Create criteria that define keywords or groups of members. Criteria are used in rules to moderate member-generated content, such as posts and comments.

Plan Your Use-Cases

Before creating your member criteria, think about what you want to do.

- Do you want to protect your community from bots and spammers? Most spammers attack shortly after they've joined. Set up member criteria based on a user's creation date.
- Do you want to review members' first posts? Set up member criteria that targets users without community contributions.
- Do you want to moderate your internal users' activity in your community? Set up member criteria to include only your internal users.
- Do you want to be notified when a partner contributes for the first time? Set up member criteria to include only your partner users that don't have community contributions.

Before creating content criteria, think about what you want to moderate.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable users in your community to flag items:

- "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Do you want to moderate profanities and slang? Set up separate keyword lists for each group of related words.
- Do you want to replace competitor product names with asterisks? Create a keyword list just for your competitor products.
- Do you want to monitor content for HIPAA compliance? Create a keyword list that alerts of possible HIPAA violations.

Create Content Criteria to Moderate Your Community

Create and modify content criteria that define offensive language or inappropriate content that you don't want in your community. Content criteria are used in rules to moderate member-generated content, such as posts and comments.

Create Member Criteria to Moderate Your Community

Create and modify member criteria to use in community moderation rules. Target specific groups of members based on their user profile, user type, user creation date, or whether they've posted or previously commented in the community. Use member criteria in your rules to help pin-point specific use-cases, like reviewing posts only from your customer users who were created in the last 7 days.

Create Content Criteria to Moderate Your Community

Create and modify content criteria that define offensive language or inappropriate content that you don't want in your community. Content criteria are used in rules to moderate member-generated content, such as posts and comments.

You can also use the Metadata API or Tooling API to set up keyword lists.

Some things to keep in mind:

- Your org can have up to 30 keyword list criteria. This limit is per org, not per community.
- A keyword list can have up to 2,000 keywords.
- Capitalization and trailing punctuation are ignored when matching your keywords to user-generated content. For example, if your criteria includes *BaDwOrd*, it's matched when a user types *BADWORD* or *badword*.

Set up content criteria to use in your moderation rules:

1. [Open Community Management](#).
2. Click **Moderation > Content Criteria**, then click **New**.
3. Enter a name, unique name, and description for your criteria.
4. Click **Save**.
5. Update the keywords in your criteria.

To add keywords, click **Add**.

- Keywords can only be up to 100 characters and can include letters, numbers, spaces, and special characters.
- Wildcard characters aren't supported.
- Separate keywords with commas or line breaks.
- When adding keywords, you can copy and paste up to 32,000 characters at a time.

 **Tip:** To cover different variations of the same word, you can use special characters and spaces. For example:

bad-word

b@dword

b a d w o r d

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view, create, edit, and delete criteria:

- "Manage Communities" OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

To delete keywords, select the keywords you want to remove, then click **Delete**.

A message indicates how many keywords were added or failed to add, and the number of duplicates that were ignored. If your entire entry failed to save, review the keyword requirements and then submit again. Don't worry about adding duplicates because they're ignored.

To delete criteria, click **Del** from the **Content Criteria** page. If criteria is being used by a rule, you can't delete it.

Create Member Criteria to Moderate Your Community

Create and modify member criteria to use in community moderation rules. Target specific groups of members based on their user profile, user type, user creation date, or whether they've posted or previously commented in the community. Use member criteria in your rules to help pin-point specific use-cases, like reviewing posts only from your customer users who were created in the last 7 days.

Some things to keep in mind:

- Your org can have up to 100 member criteria. This limit is per org, not per community.
- Each member criteria can include up to 100 user conditions.

You can create criteria that includes only user types and user profiles, or just filters. Or if you want it all, your criteria can include user types, user profiles, and filters. Let's get started.

1. [Open Community Management](#).
2. Click **Moderation > Member Criteria**, then click **New**.
3. Enter a name, unique name, and description for your criteria.
4. Select the types of user types or user profiles to include in your criteria.

You can select any combination of types and profiles. Members are included when they belong to *any* one of your selections.

If you delete a profile in your internal org, the profile is also removed from your member criteria.

5. Select to filter your members by:
 - **None**—Select this option if you don't want to filter the criteria using the other options. None is the default selection.
 - **User creation date**—Select this option to include only users that were created within a specific time frame. Enter the number of days since the user was created.
 -  **Note:** A user's creation date might not be the same date they became a member of the community. For example, you can have an internal user that was created 120 days ago who became a member of the community 5 days ago. For users that self-register, their creation date is the date they become a member of the community.
 - **Members without community contributions**—Select this option to include only members that haven't posted or commented in the community. Posts that are pending review don't count as community contributions until they are approved.

If you selected user types or user profiles, and you also select filter conditions, members are included only if they belong to one of the selected user types or profiles *and* the filter condition.

6. Click **Save** to apply your changes.

 **Example:** Let's look at the following conditions:

User Types: Partner

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view, create, edit, and delete criteria:

- "Manage Communities" OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

User Profiles: Customer Community Plus Login User, Customer Community Plus User, and Customer Community User

Filter By: User creation date is set to 7 days since the user was created

This member criteria applies to:

- Partner users created in the last 7 days
- Customer Community Plus Login User created in the last 7 days
- Customer Community Plus User created in the last 7 days
- Customer Community User created in the last 7 days

You can use this member criteria in a rule to:

- Review and approve their posts
- Be notified of their contributions
- Flag all their contributions

To delete criteria, click **Del** from the **Member Criteria** page. If criteria is being used by a rule, you can't delete it.

Community Moderation Rules

Create and modify rules for your community to moderate member-generated content. Each rule specifies the member-generated content the rule applies to, the criteria to enforce the rule on, and the moderation action to take. Moderation rules help protect your community from spammers, bots, and offensive or inappropriate content.

[Create Content Rules to Moderate Your Community](#)

Create and modify rules for your community to moderate member-generated content. Content rules protect your community from offensive language and inappropriate content created by spammers or malicious members. You can create content rules that block, replace, flag, or allow you to review and approve member-generated content.

[Create Rate Limit Rules to Moderate Your Community](#)

Create and modify rate rules to monitor and limit how frequently member-generated content is created in your community. Rate rules protect your community against spammers and bots that attack your community by posting the same message multiple times in a row. You can create rate rules to notify your moderators of suspicious spammer-like behavior or freeze a member on the spot.

[How and when do community moderation rules execute?](#)

Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Create Content Rules to Moderate Your Community

Create and modify rules for your community to moderate member-generated content. Content rules protect your community from offensive language and inappropriate content created by spammers or malicious members. You can create content rules that block, replace, flag, or allow you to review and approve member-generated content.

If your community is using the Napili template, moderation rules apply to questions and group posts created by your community members.

You can also use the Metadata API or Tooling API to set up content rules.

Some things to keep in mind:

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
- Each content rule can have up to three keyword criteria and 10 member criteria.
- Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content. If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don't run when the content also applies to a review rule—we want community managers to review the original content.

 **Tip:** Before creating a rule, we recommend you create criteria to use in the rule.

1. [Open Community Management](#).

2. Click **Moderation > Rules**, then click **New** and select **Content Rule**.

3. Complete the following fields:

- **Name**—Enter a name for your rule.
- **Unique Name**—Enter a unique name for your rule. The unique name used by the API.
- **Description**—Optionally, enter a description.
- **Activate Rule**—If selected, the rule is activated.
- **Applies To**—Specify which types of member-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles. All feed types, such as polls and links, are supported.
- **Moderation Action**—Specify what you want to happen when the criteria is matched.
 - **Block** prevents the content from being published.
 - **Review** allows users with the “Can Approve Feed Post” permission to approve the content before it's published.

 **Note:** The Summer '16 release contains a beta version of the pre-moderation feature, which means it's a high-quality feature with [known limitations](#). This feature isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for this feature in the [Community Implementation](#) group in the Success Community.

- **Replace** publishes the content with the keywords replaced as asterisks. For example, *BadWord* becomes *******.
- **Flag** publishes the content and then automatically flags the content as inappropriate.
- **Message for Member**—Specify the message that your member sees when their content is blocked. If you don't specify a message, the member sees the standard message: “You can't use %*BLOCKED_KEYWORD*% or other inappropriate words in

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view, create, edit, and delete rules:

- “Manage Communities” OR “Create and Set Up Communities”

AND

Is a member of the community whose Community Management page they're trying to access.

this community. Review your content and try again." The `%BLOCKED_KEYWORD%` variable displays up to five blocked words. You can also use this variable in your own custom message.

Tip: For international communities, you can translate this message. From Setup, enter *Translate* in the Quick Find box, then select **Translate**. To provide a translation for the message, select the Moderation Rule setup component and expand the community the rule belongs to.

- **Member Criteria**—Specify member criteria to enforce this rule. Ask yourself, who should this rule apply to?
- **Content Criteria**—Specify the content criteria to enforce this rule. Ask yourself, what specific keywords should this rule apply to?

Important: Keep the following things in mind:

- If you activate a content rule without specifying member criteria, the rule applies to all members.
- If you activate a content rule without specifying content criteria, the rule either:
 - Prevents members from creating posts and comments entirely
 - Sends all posts for review
 - Flags all posts and commentsYikes! Be careful.
- If you select member criteria and content criteria, the rule applies only when both criteria are met.
- Specifying criteria is optional. However, we recommend that you include criteria in your rules to target specific members and content.

4. Click **Save** to apply your changes.

[Create Member Criteria to Moderate Your Community](#)

Create Rate Limit Rules to Moderate Your Community

Create and modify rate rules to monitor and limit how frequently member-generated content is created in your community. Rate rules protect your community against spammers and bots that attack your community by posting the same message multiple times in a row. You can create rate rules to notify your moderators of suspicious spammer-like behavior or freeze a member on the spot.

Each rate rule controls two actions: notification and freeze. You can set up your rate rule for both actions or just one. You can apply the rule to: posts, comments, files, and private messages. In Napili-based communities, this includes questions and answers.

Some things to keep in mind:

- Your org can have up to 30 rules. This limit is per org, not per community. This limit includes both content rules and rate rules.
- Each rate rule can have up to 10 member criteria.

 **Tip:** Before creating a rule, we recommend you create member criteria to use in the rule.

1. [Open Community Management](#).

2. Click **Moderation > Rules**, then click **New** and select **Rate Rule**.

3. Complete the following fields:

- **Name**—Enter a name for your rule.
- **Unique Name**—Enter a unique name for your rule. The unique name used by the API.
- **Description**—Optionally, enter a description.
- **Activate Rule**—If selected, the rule is activated.
- **Applies To**—Specify which types of member-generated content this rule applies to. Posts and comments only apply to content created in groups and user profiles.
- **Member Criteria**—Specify the member criteria to enforce this rule. Ask yourself, who do I want this rule to apply to?

Spammers are typically new members. We recommend creating member criteria that only includes customer users that were created in the last 7 days.

 **Note:**

- Rate rules don't apply to internal users. You can use member criteria that includes internal users, but the rules just don't apply to them.
- If you activate a rate rule without specifying member criteria, the rule applies to all external users.

- **Content Creation Time Frame**—Select the time frame you want to use.
- **Notify Moderators**—Enter a number. Moderators are sent an email when a member creates this much content in your set time frame.
- **Freeze Members**—Enter a number. Members are frozen when they create this much content in your set time frame.

 **Important:** When members are frozen, they're frozen in all communities that they're a member of.

Emails are sent to users with the "Moderate Community Users" permission. Make sure that you assign your moderators this permission. Emails are sent even if a user has turned off Chatter emails.

4. Click **Save** to apply your changes.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view, create, edit, and delete rules:

- "Manage Communities" OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

 **Example:** Let's use the following rate rule as an example.

Applies To: Posts and private messages

Member Criteria: Customer users created in the past 7 days

Content Creation Time Frame: 3 minutes

Notify Moderators: 6

Freeze Members: 10

With this rate rule, here's what happens when a member reaches your limits.

In the span of 3 minutes, a member creates...	Is the moderator notified?	Is the member frozen?
4 posts and 2 private messages	✓	✗
6 posts	✓	✗
6 comments	✗	✗
8 posts and 2 private messages	✓	✓
10 posts	✓	✓
10 comments	✗	✗

A rate rule like this protects the community from spammers and bots but also allows you to help your new members. Maybe a non-threatening member posted a question over and over hoping to get it answered faster. Rate rules do more than protect—they help you reach out to members in need.

Here's a rule set up just for private messages.

Applies To: Private messages

Member Criteria: Customer users created in the past 3 days

Content Creation Time Frame: 15 minutes

Notify Moderators: 1

Freeze Members: 3

This rate rule protects the community from spammers that attack via private messages.

My rate rule didn't do anything. What's going on?

Give it time. Rate limit rules might not seem exact, but they are. Trust us. For example, say you set up a rate rule to freeze members when they create content 10 times in 3 minutes. It's possible for a member to create 9 items towards the end of the first 3-minute time frame. In this case, the member isn't frozen until they post another 10 items in the second 3-minute time frame.

Check the member criteria you're using. For example, let's say you have a rate rule that uses member criteria to filter for members without community contributions. After a member's first post or comment, the rule doesn't apply to the member anymore, so the member doesn't reach the freeze limit you set.

SEE ALSO:

[Create Member Criteria to Moderate Your Community](#)

How and when do community moderation rules execute?

Rules that block content run first, followed by rules to review and approve content, then rules that replace content, and last by rules that flag content.

If two or more rules perform the same action, the oldest rule runs first, based on the date the rule was created. Rules to replace content don't run when the content also applies to a review rule—we want community managers to review the original content. On the server, Salesforce executes community rules within the standard order of execution.

Rules that block content execute during system validation. Rules that block content ignore changes made by `before` triggers. For example, if a `before` trigger changes a feed post, a moderation rule that blocks content isn't aware of the changed content and executes on the original content.

Rules to review and approve content execute before database saves. These rules execute before rules that replace content.

Rules that replace content execute before database saves.

Rules that flag content execute after workflow rules.

SEE ALSO:

[Apex Developer Guide: Triggers and Order of Execution](#)

Review and Approve Posts in Your Community (Beta)

Pre-moderation rules to review and approve content ensure that non-compliant and inappropriate content isn't immediately visible to everyone in your community. Posts pending review aren't displayed in the community feed; only the author and community moderators can see pending posts in the feed. After you set up the rules, moderators can approve content in two places: directly in the community feed or in Community Management.

To set up a moderation rule to review and approve posts, go to **Moderation > Rules** and create a content rule that uses the **Review** action. Here are some ways that you can use rules to review content:

Self-Service Community

Does your community allow members to self-register? You can set up a rule to review and approve questions from all your self-registering users. Use member criteria that includes only your guest user profile and filters for members who were created in the past seven days.

Have spammers ever attacked your community? Use member criteria that includes only your guest user profile and filters for members that have never contributed to the community.

Partner Community

Want to ensure that your partners aren't discussing a recent acquisition or other sensitive transactions? You can set up a rule to review posts that include keywords such as "acquisition" or "merger."

Employee Community

Does your community require HIPAA compliance? Set up your rules to review posts from all your employees.

 **Note:** The Summer '16 release contains a beta version of the pre-moderation feature, which means it's a high-quality feature with [known limitations](#). This feature isn't generally available unless or until Salesforce announces its general availability in documentation or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available products and features. You can provide feedback and suggestions for this feature in the [Community Implementation](#) group in the Success Community.

Pending Review is displayed in the header of the post until it's approved. Remember that while a post is pending approval, the author of the post can still edit or delete it, however they can't comment on it. To prevent the author from editing the post, you can disable feed post editing for certain users.

There are two ways to review and approve posts in your community:

- Use a preconfigured Insights report in Community Management.

Use the Pending Insights report provided in the Salesforce Communities Management package. This report lets you see all the posts that are pending review in your community. The Insights report displays the contents of posts so you can quickly assess whether a post is spam or harmless. You can then approve or delete a post directly from the report. You can also perform mass-action and approve multiple posts at once.

To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the Dashboards and Insights Package](#).
- Approve posts directly in the community feed.

In the community feed, users with the "Can Approve Feed Post" permission see an extra action in the drop-down menu of the post to **Approve** the content. If the post is inappropriate, they can delete it. If the post has a typo, they can edit it.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To approve, delete, or edit posts that are pending review in the community feed:

- "Can Approve Feed Post"

To approve, delete, or edit posts that are pending review in Community Management:

- "Can Approve Feed Post"

AND

"Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

After the post is approved, the author of the post receives an email that lets them know the post is approved and provides a link to the post in the community. Email notifications, such as @mentions notifications, are only sent after the post is approved.

SEE ALSO:

[Create Content Rules to Moderate Your Community](#)

[Feed Post and Comments Editing Overview](#)

Moderate Flagged Posts and Comments in Your Community

Community moderators can review a list of posts and comments that members of the community have flagged as inappropriate and take action. Group owners or group managers, can view flags and take action on items in their groups.

Flagged posts and comments have a small orange flag next to the post or comment date. The number next to the flag indicates how many people have flagged the item. The moderator can review each item and decide whether to take action.

A few things to keep in mind:

- Moderators can only view and act on items they have access to.
- Within a group in a community, group owners or managers can moderate items in their groups, including viewing or removing flags and deleting posts, comments, or files if necessary.
- If `Allow members to flag content` is disabled in a community, only moderators can flag items and view flagged items.

There are a few ways you can moderate flagged posts and comments:

- Use a preconfigured Insights report in Community Management.
Use the Flagged Posts and Flagged Comments reports provided in the Salesforce Communities Management package. These reports let you quickly manage your community's flagged posts and comments. You can see the content of the post or comment and then remove the flag or delete it. You can also select multiple items at once.
To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the Dashboards and Insights Package](#).
- Use the flagged feed in Chatter.
If you're using a Salesforce Tabs + Visualforce community, you can see a list of flagged posts and comments using the Chatter menu in your community. The `Allow members to flag content` preference must be enabled to see the Flagged feed.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view flagged items, remove flags, and delete posts or comments:

- "Moderate Communities Feeds"

To moderate posts and comments in Community Management:

- "Moderate Communities Feeds"

AND

"Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

- Moderate using a custom list. You can expose a list of flagged posts and comments using the Chatter REST API or ConnectApi in Apex.
- Moderate directly within context of the community by removing flags or deleting content in the feed.

 **Tip:** To receive an email each time an item in your community is flagged, select the **Flags an item as inappropriate** checkbox on your Email Settings page.

SEE ALSO:

[Chatter REST API Developer Guide](#)

[Apex Developer Guide](#)

Moderate Flagged Files in Your Community

Community moderators can review a list of files that members of the community have flagged as inappropriate and take action. Group owners or group managers can view flags and take action on files in their groups.

Members of your community may post files that aren't appropriate because they contain sensitive information or offensive content. Other members of the community can flag these files for review. Flagged files have a small orange flag. The number next to the flag indicates how many people have flagged the item.

A few things to keep in mind:

- Moderators can only view and act on items they have access to.
- Within a group in a community, group owners and managers can review and remove flags on files in the groups they own and manage if `Allow members to flag content` is enabled for their community.
- If `Allow members to flag content` is disabled in a community, only moderators can flag items and view flagged items.

There are a few ways you can moderate flagged files:

- Use a preconfigured Insights report in Community Management.
Use the Flagged Files report provided in the Salesforce Communities Management package. This report lets you see the name of the flagged file, who created it, who flagged it, and how many flags the file has. You can click a link to open the file and review the content. Then you can remove the flag or delete the file. You can also select multiple items at once.
To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the Dashboards and Insights Package](#).
- Moderate using a custom list. You can expose a list of flagged files using the Chatter REST API or ConnectApi in Apex.
- Moderate directly within context of the community by removing flags or deleting content on the file detail page.

 **Tip:** To receive an email each time an item in your community is flagged, select the **Flags an item as inappropriate** checkbox on your Email Settings page.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the file detail page, remove flags, and delete files:

- "Moderate Communities Files"

To moderate files in Community Management:

- "Moderate Communities Files"

AND

"Manage Communities"
OR "Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

To [limit the size and types of files allowed in your community](#), go to the **Administration > Preferences** page.

SEE ALSO:

[Chatter REST API Developer Guide](#)

[Apex Developer Guide](#)

Moderate Flagged Private Messages in Your Community

Community moderators can review and act on a list of Chatter messages that members of the community have flagged as inappropriate or as spam.

The “Moderate Communities Chatter Messages” permission allows users to see the contents of messages, remove flags, and delete messages only in communities they’re a member of. With this permission, only flagged messages can be deleted. The “Modify All Data” permission allows moderators to remove flags or delete a message in the SOAP API.

Ensure that your moderators are assigned the “Moderate Communities Chatter Messages” permission, *not* the “Manage Chatter Messages” permission. The “Manage Chatter Messages” permission allows users to see *all* the messages in your entire Salesforce org. Avoid security and privacy concerns; double-check that your moderators and managers have the right permission.

 **Important:** Keep these limitations in mind:

- Community members can’t flag messages sent from communities that they aren’t a member of or that haven’t turned on flagging for their users.
- Users can’t flag messages in your internal organization, in Salesforce1, or in partner and customer portals.

There are a few ways to monitor and manage flagged messages in your communities:

- Use a preconfigured Insights report in Community Management.
Use the Flagged Private Messages report provided in the Salesforce Communities Management package. This report lets you track trends and stay on top of message spamming attacks in your community. You can view who sent the message, the contents of the message, when it was sent, and who flagged the message. You can use this report to unflag messages and delete messages.
To get this report, install the Salesforce Communities Management package from the AppExchange. For more information, see [Report on Communities with the Dashboards and Insights Package](#).
- Create your own report.
First, create a custom report type using `Networks` as the primary object and `Network Audits` as the secondary object. Then create a report using your new custom report type and add a field filter for `Audited Object Type` set to equal `Chatter Message`. Use the API to delete flagged messages.
- Directly query the flagged messages from the API and then delete them.

 **Tip:** If you want to receive an email each time a message in your community is flagged, select the **Flags an item as inappropriate** option on the Email Settings page. To receive emails, you must have the “Moderate Communities Chatter Messages” and “Moderate

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To moderate messages in Community Management:

- “Moderate Communities Chatter Messages”

AND

“Manage Communities”
OR “Create and Set Up Communities”

AND

Is a member of the community whose Community Management page they’re trying to access.

To view the contents of a flagged message in reports:

- “Moderate Communities Chatter Messages”

To remove flags or delete messages in the SOAP API:

- “Modify All Data”

Communities Feeds” permissions. To set your email preferences, go to your profile page within a community, click the drop-down button () in the upper-right corner and select **My Settings**, then click **Email Settings**.

SEE ALSO:

[Guidelines for Deleting Your Users’ Chatter Messages](#)

[SOAP API Developer Guide: ChatterMessage](#)

[Apex Developer Guide: Moderate Chatter Private Messages with Triggers](#)

Set Up Apex Triggers for Flagging Items

Use triggers to create custom advanced moderation logic that automatically flags items in your community.

 **Tip:** Did you know you can do this in the UI? Most communities don’t need custom moderation triggers. You can create moderation rules and criteria directly in Community Management. For more information, see [Community Moderation Rules](#).

Using triggers to automatically flag items allows you to moderate your community behind the scenes. These flags are **only** visible to moderators. You can view flags in Community Management, query for them in the API, or use custom report types to create reports on flagged items, people whose items are flagged most, and more.

Consider the following when creating triggers:

- Create Apex after insert triggers on either FeedItem, FeedComment, ChatterMessage, or ContentDocument.
- Define criteria that when met creates a NetworkModeration (flag) record, with the FeedComment, FeedItem, ChatterMessage, or ContentDocument as the parent.

 **Example:** This trigger automatically flags posts in your community that contain *BadWord*.

```
trigger autoflagBadWord on FeedItem (after insert) {
    for (FeedItem rec : trigger.new) {
        if (!<CommunityId>.equals(rec.networkScope))
            continue;

        if (rec.body.indexOf('BadWord') >= 0) {
            NetworkModeration nm = new NetworkModeration(entityId=rec.id,
visibility='ModeratorsOnly');
            insert(nm);
        }
    }
}
```

A similar trigger on comments would look like this.

```
trigger autoflagBadWord on FeedComment (after insert) {

Organize Self-Service Communities with Topics

Topics are a fantastic way to organize content in any community. Community members can add topics to posts and discussions, and structure content organically. When you set up a self-service community with the Napili template, you can use the Community Management page to quickly guide members to key navigational and featured topics.

On the Community Management page, you choose navigational topics and subtopics to provide a consistent map of your community, and featured topics to highlight current, popular conversations. In the community itself, member-created topics let users organize information for each other, creating a personalized experience that boosts community engagement.

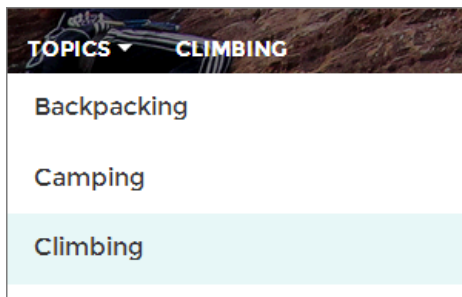

In a self-service community, the Napili template specifies the layout and design of navigational, featured, and member-created topics. Below are visual examples of each type in an active community.

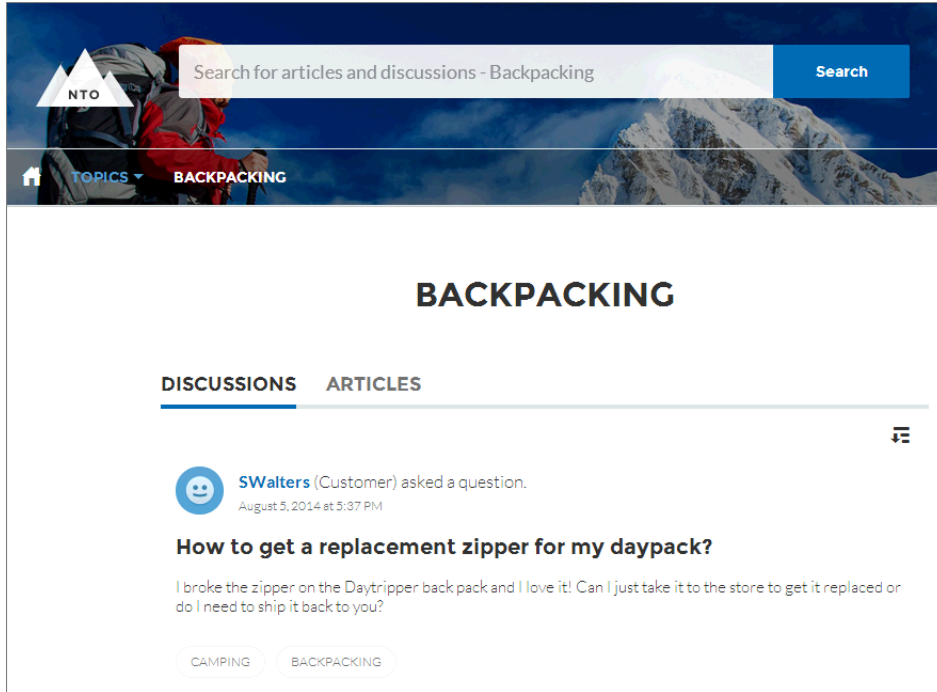

Tip: To add navigational and featured topics to other types of communities, Apex developers can use the [ConnectApi.ManagedTopics class](#) in a Visualforce page.

Navigational topics

On every page of a self-service community, navigational topics are available from the Topics menu at upper left. Community members can also see all the community's navigational topics and subtopics in one place in the topic catalog.

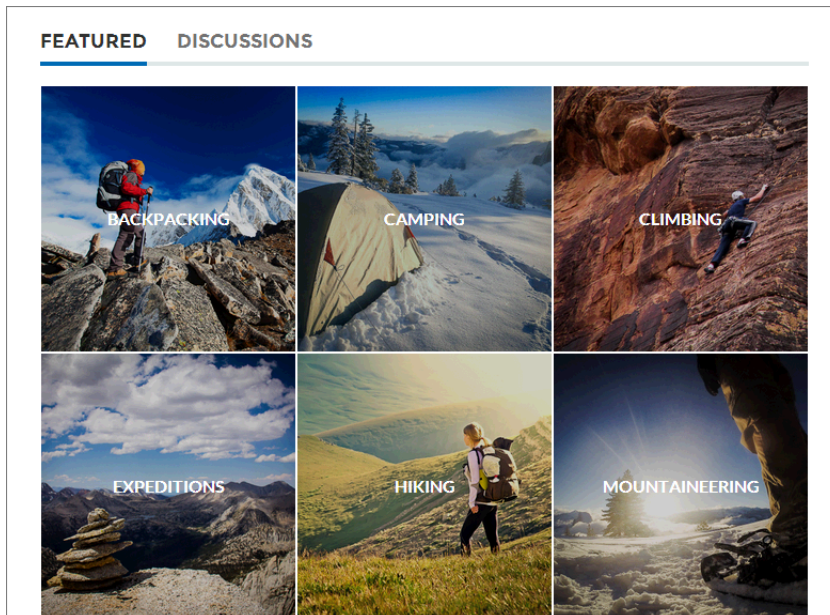

When visitors choose a navigational topic, the banner image you selected for it appears at the top of the page.

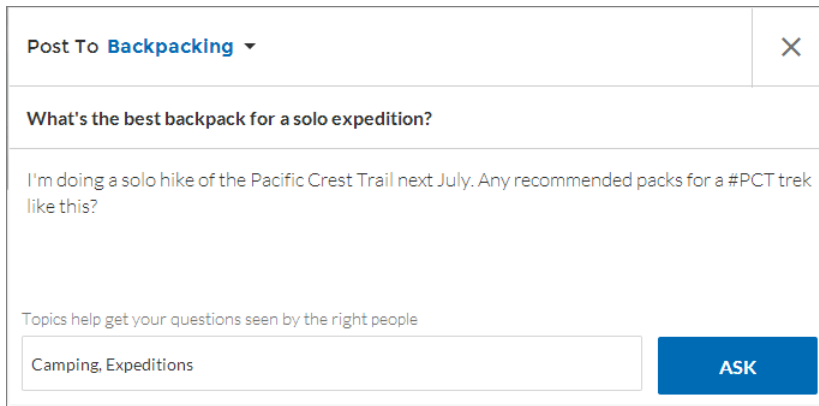

Featured topics

Featured topics are accessible from the body of your community home page. Thumbnail images you select for featured topics uniquely identify them. (These unique thumbnails appear only on the home page; at the top of all featured topic pages, the default banner image specified in Community Builder appears.)

Member-created topics

When posting questions, community members create topics by using hashtags in body text, or typing in the topic suggestions box below. (In Setup, the “Assign Topics” and “Create Topics” permissions must be enabled for community users.)

The screenshot shows a community post form. At the top, it says "Post To Backpacking" with a dropdown arrow and a close button (X). Below that is the question: "What's the best backpack for a solo expedition?". The main text of the post reads: "I'm doing a solo hike of the Pacific Crest Trail next July. Any recommended packs for a #PCT trek like this?". Below the text is a prompt: "Topics help get your questions seen by the right people". Underneath this prompt is a text input field containing "Camping, Expeditions" and a blue "ASK" button.

If any suggested topics are poor matches for the post, members can simply click to delete them.

Tip: Member-created topics can be accessed via search, or highlighted as featured topics on the Community Management page.

[Manage Topics in Communities](#)

As the number of topics in a community grows, curate them to improve usability. In Community Management, you can create, merge, rename, and delete topics in one convenient location.

[Set Up Featured Topics](#)

Featured topics highlight current, popular community conversations. Change them regularly to keep community members up-to-date and engaged.

[Set Up Navigational Topics](#)

Structure your community's content and help your users find what they need with navigational topics. If your organization uses data categories, community managers can link current Salesforce Knowledge articles associated with those categories to each navigational topic. (If data categories aren't enabled, administrators can add articles to each topic using the Chatter REST API.)

[See Your Community's Topics and Subtopics in One Place](#)

You've gone through the exhaustive task of adding topics and various levels of subtopics to your community's content. Now you want your community members to see all the organized topics in one place, so they can navigate to any subject their hearts desire. Fear not! They can see everything in your community's topic catalog.

[Add Topics to Articles or Remove Them](#)

Easily add multiple topics of any type to specific articles, or quickly remove them as community needs change.

[Translate Topics Names and Descriptions for International Communities](#)

Use the Translation Workbench to translate navigational and featured topics, and topic descriptions, in international communities.

Manage Topics in Communities

USER PERMISSIONS

To access the Community Management page:	“Manage Communities” OR “Create and Set Up Communities”
To create topics:	“Create Topics”
To merge topics:	“Merge Topics”
To delete topics:	“Delete Topics”
To rename topics:	“Edit Topics”

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

As the number of topics in a community grows, curate them to improve usability. In Community Management, you can create, merge, rename, and delete topics in one convenient location.

1. [Open Community Management](#).

2. Click **Topics > Topic Management**.

3. Do any of the following:

- To create a topic (often with a plan to merge existing ones into it), click **New**. Add a name and a topic description, which will boost SEO.
- To combine existing topics, click **Merge**.

Merging a topic automatically redirects existing hashtags in posts. If you merge a navigational or featured topic, the topic type, image, and any subtopic relationships are discarded.

- To rename or delete an existing topic, or add a description to it, click .

If you don't see a topic you want to rename or delete, either search for it or click **Show More** below the topic list.

Tip: For communities with a global audience, you can [translate names and descriptions](#) of navigational and featured topics. From Setup, search for and select *Translate*. Then select the *Managed Topic* setup component, and expand a community to see its master topic names.

SEE ALSO:

[Set Up Navigational Topics](#)

[Set Up Featured Topics](#)

Set Up Featured Topics

Featured topics highlight current, popular community conversations. Change them regularly to keep community members up-to-date and engaged.

1. [Open Community Management](#).
2. Click **Topics > Featured Topics**.
3. Select a navigational or member-created topic you want to feature from the dropdown menu. Up to 1000 topics load in the drop down menu when you are choosing a topic. Then click **Add**.

 **Tip:** Using the Chatter REST API, you can create unique featured topics, separate from navigational, or member-created ones.

4. Hover over a topic name, and click . Then click **Upload thumbnail image**, and select an image that represents the featured topic on the community home page.
(Thumbnail images are scaled to 250 x 250 pixels. To prevent distortion, create image files with those dimensions.)
5. Repeat steps 3 and 4 to create several featured topics for your community, up to a maximum of 25. Then click **Save**.

To quickly edit existing featured topics, simply hover over a topic name, and do any of following:

- To move topics up or down, click the arrows at left.
- To rename or delete topics, or change their thumbnail images, click .

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access the Community Management page:

- "Manage Communities"

OR

"Create and Set Up Communities"

AND

Is a member of the community whose Community Management page they're trying to access.

To set up featured topics:

- "Edit Topics"

Set Up Navigational Topics

Structure your community's content and help your users find what they need with navigational topics. If your organization uses data categories, community managers can link current Salesforce Knowledge articles associated with those categories to each navigational topic. (If data categories aren't enabled, administrators can add articles to each topic using the Chatter REST API.)

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**, and enable topics for all the article types you want to include.

 **Note:** Enabling topics disables public tags on articles. Personal tags aren't affected.

2. [Open Community Management](#).
3. Click **Topics > Navigational Topics**.
4. In the text box at right, enter a topic name, and click **Add**. Want to add subtopics? After you add a topic, choose your topic from the drop down menu (under Show the subtopics of). To add a subtopic, add another topic and click **Add**. You can add up to two levels of subtopics for each parent topic.
5. If your organization uses data categories, hover over the navigational topic name, and click . Select a Data Category Group, then select the categories you want to add to the topic, and click **Add Articles & Close Window**.

 **Important:** This process adds only current articles to a topic. To add new articles, return to Community Management and repeat the step above.

6. Hover over a topic name, and click . Then click **Upload banner image**, and select an image that appears across the top of the topic page.

(Banner images are scaled to 1400 x 180 pixels. To prevent distortion, create image files with those dimensions.)

7. Repeat steps 4-6 to create several navigational topics for your community. Then click **Save**.
8. Use subtopics to further categorize your content. Associate articles for each set of subtopics for a more granular organization.
The following is the maximum number of navigational topics and subtopics you can have in a Napili community template.

Level	Maximum Number of Entries
One (parent)	25
Two (subtopic)	10
Three (subtopic)	10

 **Tip:** To quickly edit existing navigational topics, simply hover over a topic name, and do any of following:

- To move a topic up or down, click the arrows at left.

See Your Community's Topics and Subtopics in One Place

You've gone through the exhaustive task of adding topics and various levels of subtopics to your community's content. Now you want your community members to see all the organized topics in one place, so they can navigate to any subject their hearts desire. Fear not! They can see everything in your community's topic catalog.

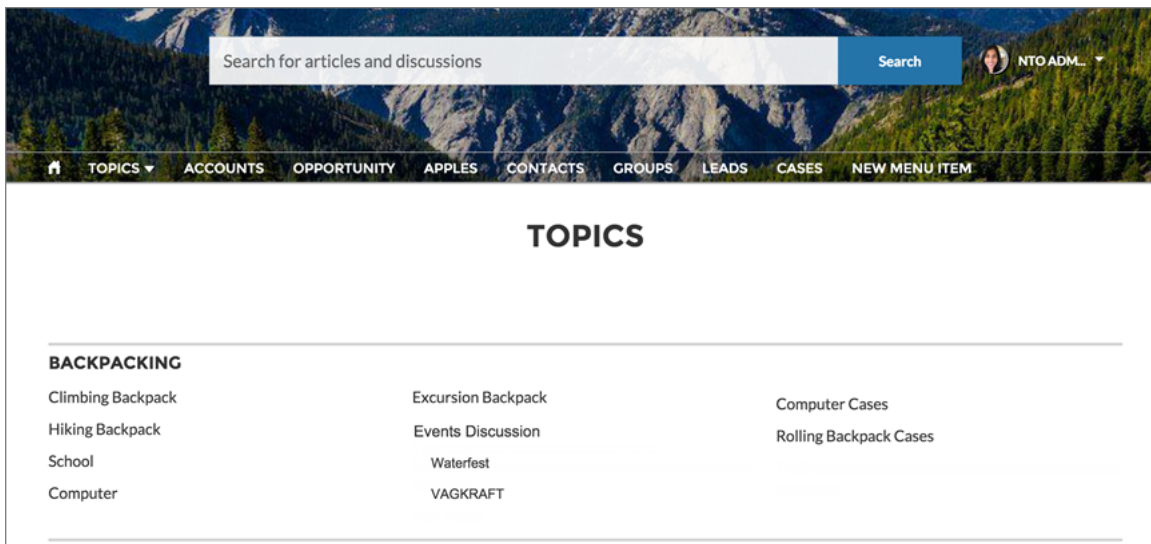

The topic catalog shows the community's hierarchy of navigational topics you have created. It is only visible once you have set up navigational topics, and it is accessed from the navigation menu.

How can the topic catalog be useful to your community members?

- New and returning users look at all the organized topics in one place, getting a lay of the land before diving deeper into a specific topic.
- Any community user can use the topic catalog as a jumping point to go from topic to topic.

To set up the topic catalog, select the **Add the "More Topics..." link** when editing the navigation menu on the home page.

 **Example:**

OR

"Create and Set Up Communities"

To add or remove topics:

- "Create Topics"

Translate Topics Names and Descriptions for International Communities

Use the Translation Workbench to translate navigational and featured topics, and topic descriptions, in international communities.

1. From Setup, enter *Translate* in the **Quick Find** box, then select **Translate**.
2. Select the *Language* you're translating into.
3. For *Setup Component*, select **Managed Topic**.
4. For *Aspect*, select **Field Label** to change the topic name, and **Description** to change the topic description.
5. In the *Community Name* column, expand a community to see its master topic names.
6. To enter language-specific names for navigational and featured topics, double-click in the *Topic Name Translation* column.

Consider the following when you're using the Translation Workbench:

- There is no Metadata API support for translated topic names or descriptions.
- While topic name uniqueness is guaranteed in English, the translator must ensure the uniqueness of topic names in the translated language.
- Modifying topic names from Community Management only changes the English community. All translated topic name and description changes must be made using the Translation Workbench.
- If a translated topic name is entered when the community is in English mode, the translated name can appear twice in the translated community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To translate topics:

- "View Setup and Configuration"

AND

Be designated as a translator

- When topics names are translated with the Translation Workbench, hashtags in the translated communities also change. For example, #help shows as #aiuto in Italian. If the community member then reverts to English from Italian, clicking the #aiuto hashtag gives an error message rather than showing the topic detail page of #help.

Customize Recommendations in Communities

Create recommendations to drive engagement for your community, encouraging users to watch videos, take trainings, and more. Edit these recommendations in Community Management, where you can target specific audiences and use channels to specify locations for the recommendations.

1. [Open Community Management](#).
2. Select **Recommendations** > **Recommendations**.
3. Select Default Channel or one of the custom channels.

A channel is a way to group recommendations together so you can determine where they show up in the community.

Default Channel

Recommendations in the default channel appear in predefined locations, such as directly in the feed in the Salesforce1 mobile browser app and on the Home and Question Detail pages in communities using the Summer '15 or later version of the Napili template.

Custom Channel

You choose the pages where you want these recommendations to appear. In Community Builder, add the Recommendations component to the page where you want the recommendation to appear. Use the Property Editor to specify the custom channel with the recommendation.

Using a custom channel, you could surface a recommendation to review specific knowledge articles on a product description page to guide customers to more information.

If you want to change the channel of a recommendation, delete the recommendation and recreate it in a different channel.

4. Click **New**.
5. Complete the following fields:
 - **Name**—Enter a name for the recommendation in Community Management. This name doesn't appear in the community.
 - **Image**—Click **Upload Image** to include an image with your recommendation.
 - **Title**—Optionally, enter header text that appears above the image.
 - **Description**—Enter detailed text that suggests what users can do.
 - **Button text**—Enter a label for the button in the recommendation.
 - **https://**—Enter the URL that the button opens.
 - **Audience**—Select an audience for the recommendation. If you don't select an audience, all members of the community see the recommendation.

 **Tip:** To create an audience that appears in this drop-down list, in Community Management select **Recommendations** > **Audiences** and click **New**.

 - **Enabled**—If checked, this recommendation is active and appears in communities.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To access the Community Management page:

- "Manage Communities"
- OR
- "Create and Set Up Communities"

When disabled, recommendations that exist in feeds in the Salesforce1 mobile browser app are not removed, but no new recommendations appear. In communities using the Summer '15 or later version of the Napili template, disabled recommendations no longer appear.

6. Click **Save**.

 **Tip:** To remove a recommendation, in Community Management, select **Recommendations > Recommendations**, and click the recommendation name. At the bottom of the recommendation details, click **Delete**.

[Target Community Member Audiences for Your Recommendations](#)

Create audiences of new community members, or use the API to manage customized lists of audience members.

SEE ALSO:

[Update Your Community's Template in Community Builder](#)

Target Community Member Audiences for Your Recommendations

Create audiences of new community members, or use the API to manage customized lists of audience members.

1. [Open Community Management](#).
2. Select **Recommendations > Audiences**.
3. Click **New**.
4. Complete the following fields.
 - **Name**—Enter a name for the audience in Community Management.
 - **Audience Type**
 - Select **New Members** to create an audience based on how long users have been community members.
Enter the number of days since registration for audience members.
 - Select **Custom List** to create an audience based on any criteria you want.

 **Note:** You can't manage audience membership for custom lists through the UI. Add and remove members through the API.

5. Click **Save**.

Audiences you create appear in the Audience drop-down list when you create a recommendation.

 **Tip:** To remove an audience, in Community Management, select **Recommendations > Audiences**, and click the audience name. At the bottom of the audience details, click **Delete**. If you remove an audience that is associated with a recommendation, the recommendation is disabled and the audience is set to the default (All community members).

Reputation Overview

Your reputation in the community directly corresponds to how active you are. The more you post, comment, and share, the higher your reputation level will be.

Your reputation level appears on your profile page and when any user hovers over your name. It's visible to other community members so that they know how influential you are. When you start out in the community, you are at the lowest level. As you become more active in the community, you gain points and your reputation level increases. Increases in reputation levels are posted to your feed. In other words, as people see you participating and sharing your knowledge, your credibility and influence grows.

Your administrator defines the activities that help you gain points. They also set the number of points for each action.

These are the default actions that increase your reputation level:

You increase your reputation by:

- Posting
- Commenting
- Liking a post or comment
- Sharing a post
- People sharing your posts
- People commenting on your posts
- People liking your posts or comments
- Mentioning someone
- Being mentioned
- Asking a question
- Answering a question
- Receiving an answer
- Marking an answer as best
- People marking your answer as best
- Endorsing someone for knowledge on a topic
- Being endorsed for knowledge on a topic

[Enable Reputation in Your Community](#)

Enable Reputation in Your Community

Enable reputation in your community so that members are recognized and rewarded for participating.

A powerful tool for a community manager is the ability to recognize individual members for their participation, because community managers know that recognition and a little friendly competition usually lead to more active members. Enabling reputation turns on a default point system and set of reputation levels in the community. A community manager can personalize labels and point values from the Community Management page.

Members start to accrue points by performing the actions that have assigned point values. Once the member exceeds the top of the level's point threshold, they move up a level. They, and other members of the community, see their reputation level on their profile and when hovering over their name. Total points also show on member's profiles.

 **Note:** When you enable Reputation, Chatter influence is removed from the Contribution section on the profile page.

1. [Open Community Management](#).
2. Click **Administration > Preferences**.
3. Select **Enable setup and display of reputation levels**, then click **Save**.

After you enabled reputation, a default point system and set of reputation levels is available on the Community Management page. The default reputation points are as follows:

Action	Points
Community Engagement	
Write a post	1
Write a comment	1
Receive a comment	5
Like something	1
Receive a like	5
Share a post	1
Someone shares your post	5
Mention someone	1
	If your post contains more than one @mention, you get a point for each @mention.
Receive a mention	5
Questions and Answers	
Ask a question	1
Answer a question	5
Receive an answer	5

EDITIONS

Endorsing someone for knowledge on a topic	5
Being endorsed for knowledge on a topic	20

If your selected community template doesn't have Chatter enabled, the Reputation node won't appear in Community Management. To show the Reputation node, go to **Administration > Preferences** and select **Show all settings in Community Management**.

SEE ALSO:

[Set Up Reputation Levels](#)

[Set Up Reputation Points](#)

[How is my community reputation calculated?](#)

Set Up Reputation Levels

Update the default reputation levels to meet your community's needs and help motivate your members.

When reputation is enabled for a community, 10 default levels are added. You can add or remove levels, give each level a name, and update the point range and image for each level.

 **Note:** A community must have at least three reputation levels and can have up to 50.

1. [Open Community Management](#).
2. Click **Reputation > Reputation Levels**.

From here you can:

- Upload your own image for each reputation level. Click the default image to browse to an image file and upload a new image.

 **Note:** You can't revert to the default reputation level images from the Salesforce user interface. Use the Salesforce Chatter REST API to do this.

- Give each level a name, such as "Beginner," "Intermediate," and "Expert." If you don't assign a name, the default is used. For example, "Level 1," "Level 2," "Level 3."
- Edit the point range for a level.

When you update the higher value of a level's point range, the lower value for the next level is automatically adjusted when you save.

- Add more levels by clicking **Add a level**, located underneath the list of levels.
- Remove a level by clicking  next to the level.

3. Click **Save** to apply your changes.

EDITIONS

Questions and answers in the community feed are not to be confused with the Chatter Answers functionality.

 **Note:** In organizations with reputation enabled prior to the Winter '15 release, actions associated with questions and answers will be available at the time of the release and their default point values will be set to 0. Existing user reputation points will not be affected by the release, and users won't accrue points from these actions until you configure point values for them.

1. [Open Community Management](#).
2. Click **Reputation** > **Reputation Points**.
3. Update the points for each action. If you don't want users to accrue points for a certain action, set the Points to 0.
4. Click **Save**.

Point totals show up on profile pages beneath the photo. Point totals are visible to anyone in the community.

 **Tip:** You can directly update reputation points for a community member via the Salesforce API. You can also use Apex triggers to send custom notifications based on changes to reputation points.

SEE ALSO:

[Set Up Reputation Levels](#)

How is my community reputation calculated?

The reputation level on your profile is calculated based on your total points.

Points are accrued when you perform activities that your community manager has assigned point values. You could also potentially gain points if your posts or comments draw reaction from other community members. For example, your community manager may have decided that writing a post earns you 5 points. If someone else shares your post, your community manager may decide that you should earn 10 points because your post is influencing others to contribute.

 **Note:** Only active users accrue points. For example, if an active user likes the post of an inactive user, the active user gets 1 point, but the inactive user does not get points.

Default point values are as follows. Keep in mind that your community manager may have customized these values. For more information, contact your community manager.

Report on Communities with the Dashboards and Insights Package

The Salesforce Communities Management package gives community managers an essential starter set of dashboards and reports to keep tabs on activity and engagement directly in Community Management.

Use the Salesforce Communities Management package to:

- View the latest metrics and rapidly spot trends
- Determine how fast your community is growing
- Find out who your most engaged members are
- Discover which discussions people and groups are most excited about
- Identify areas in your community that need attention
- Take immediate action on recent activity with Insights reports

 **Note:** To use the preconfigured Insights reports, your community must use Chatter.

Install one of the following versions from the AppExchange:

- [Salesforce Communities Management \(for Communities with Chatter\)](#)
- [Salesforce Communities Management \(for Communities without Chatter\)](#)

 **Tip:** For installation instructions, detailed information about the reports, and upgrade instructions, see [Get Started with the Communities Management AppExchange Package](#).

During installation, dashboard and report folders are automatically installed in your internal org. You'll also have the option to give your community managers access to the package contents so you don't have to share the dashboard and report folders with them later. If you have no previous Insights or dashboards mapped in Community Management, they are automatically mapped for you during installation.

After the package is installed, you can access your new dashboards and reports alongside all your other Salesforce dashboards and reports. When you view the dashboards in Community Management, community-specific data is displayed. After installation, here's what you see in Community Management.

Navigation Section	Page Name	Description	Requires Chatter
Dashboards	Home	Stay informed about recent activity or membership. This dashboard is mapped to your Community Management home page.	
	Overview	See the overall state of your communities at a glance. 90-day trending reports show total membership, newly joined members, and member logins. If you have Chatter enabled, 90-day snapshots show post and comment metrics.

	Engagement	Track posts and comments in groups and see which members are truly engaged in your community.	✓
	Files	Monitor file uploads and downloads, including files receiving a lot of comments.	✓
	Groups	Helps you identify groups with deactivated or inactive owners and also groups that have been or will be archived soon.	✓
	Moderation	Track flagged posts, files, messages, and content flagged by moderation rules in your community.	✓
	Self-Service	Track questions and answers in user profiles, including questions escalated to cases. This Insights page is great for communities using the Napili template.	✓
	Topics	Keep an eye on recent topic activity in your community.	✓

The dashboards and reports provided in the package are 100% customizable. Don't be afraid to customize and change what you get in the package. You won't hurt our feelings. As newer versions of the package become available, you can upgrade your package by reinstalling it. If you customized any of the reports and dashboards, fear not; your customizations are retained during upgrade.

Set Up Report Management for External Users—Create and Edit Reports

Community partner and customer users can create and edit reports in their own personal folder or in a privately shared folder if they have sufficient permissions. You can grant partner and customer users permissions to create and edit reports through their profiles or by using permission sets. After you grant the required permissions, they can use the drag-and-drop Report Builder tool.

Important: If your organization existed before the Summer '13 release, you must first turn on enhanced sharing for reports and dashboards before granting external users permissions. See [Analytics Folder Sharing](#).

To create, customize, and delete reports, external users must use the Report Builder tool.

Data visibility is based on two main things: the user role the partner or customer belongs to and your organization's sharing rules. Your organization's field-level security is respected, meaning that if a field is not visible for external users, a partner or customer user won't see it in Report Builder.

1. To allow external users to create and edit reports, turn on the "Create and Customize Reports," "Report Builder," and "Edit My Reports" permissions through custom profiles or permission sets. If you want external users to export report data, also assign them "Export Reports" permission.

In Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** or **Profiles**. Assign the following permissions:

External User Permissions Needed to Create and Edit Reports

To create, customize, and delete reports in a personal folder:	"Create and Customize Reports" AND "Report Builder"
To create, customize and delete their own reports in a privately shared folder with Viewer access:	"Edit My Reports" AND "Report Builder"
To export report data:	"Export Reports"

You can give permission to create and edit reports to all role-based external users with licenses such as Customer Community Plus and Partner Community. You can also give permission to all legacy role-based portal licenses such as Customer Portal and Gold Partner.

Note:

- These permissions aren't available to high-volume user licenses, such as Customer Community, High Volume Customer Portal, Service Cloud Portal, and Authenticated Website.
 - External users with legacy portal licenses can create and edit reports in communities, but not in portals.
2. If you want your external users to create or edit reports in a privately shared folder, grant them "Viewer" access on the folder.

On the **Reports** tab in the Folders view, click  next to the folder you want to share, then select **Share**.

 **Note:** Partner and customer users can't create, edit, or view reports in the Unfiled Public Reports folder.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create permission sets or enable custom permissions in profiles:

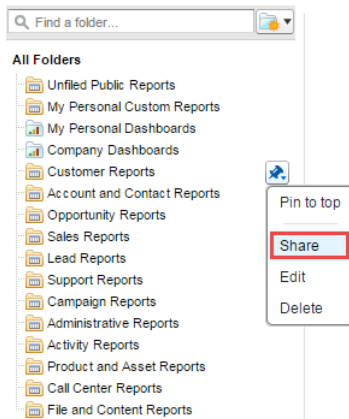

- "Manage Profiles and Permission Sets"

To assign a permission set to a user:

- "Assign Permission Sets"

To share a report folder with external users:

- "Manager" folder access or "Manage Reports in Public Folders"

Depending on what objects, fields, and categories your external users have access to, they might see custom report types in the UI when creating a report. Custom report types are visible if a user has read access on any fields or objects included in the custom report type.

[Communities Report and Dashboard Limitations](#)

Track Community Activity

Create custom reports to track usage, moderation, and other community activity.

 **Tip:** Keep in mind that you can get preconfigured dashboards in the [Salesforce Communities Management package](#) available for download on the AppExchange.

To monitor the health of your community, you can create custom report types and then create a report using that custom report type. If you want your community managers to see your report in Community Management, you can create or edit a dashboard to include your report and then map the updated dashboard in Community Management. To change the mapping of a dashboard, click **Dashboards > Settings**.

 **Note:** Only reports that are based on the Networks object show community-specific information on the Community Management page. Using reports based on the Networks object, means you can create one custom report and use it across all your communities.

Use the following table to get started with reporting for communities:

High-level usage	Primary Object > B (Child Object) > C (Child Object, If Applicable)	Description
Chatter Usage	Networks > Chatter Messages	Create reports on the private message activity in your community. ¹
Chatter Usage	Networks > Feed Revisions	Create reports on posts and comments that your members have edited.
Chatter Usage	Networks > Groups	Create reports on the groups in your community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

High-level usage	Primary Object > B (Child Object) > C (Child Object, If Applicable)	Description
Moderation	Networks > Network Audits	Create reports on all moderation activity and history in your community. To report on moderation activity in private Chatter messages, filter the report by <code>Audited Object Type</code> (on the Network Audits object) to equal <code>Chatter Message</code> .
Moderation	Networks > Network Members > Network Activity Audit — Moderators	Create reports on members in your community who either flagged items or moderated a flagged item.
Moderation	Networks > Network Members > Network Activity Audit — User	Create reports on the members in your community whose items were flagged, blocked, or replaced.
Moderation	Networks > Network Members > User Login	Create reports on frozen members in your community.
Moderation	Networks > Network Moderations > Content Documents Networks > Network Moderations > Feed Posts Networks > Network Moderations > Feed Comments Networks > Network Moderations > Private Messages	Create reports on content that is currently flagged in your community. These reports allow you to see the actual contents of the flagged item. For example, you can see the contents of a flagged private message to easily determine if the message is spam.
Moderation	Networks > Unpublished Feed Entities > Feed Posts	Create report on posts that are pending review and approval.
Public Activity	Networks > Network Public Usage Daily Metrics	Create reports on the daily public community page views and unique visitors.
Recommendations	Networks > Recommendation Metric	Create reports on custom recommendation usage in your community.
Topic Activity	Networks > Topics	Create reports on the topic activity in your community.
Topic Activity	Networks > Topic Assignments	Create reports on the topic assignments in your community.
User Activity	Networks > Network Activity Daily Metrics	Create reports on the daily number of posts and comments by member type.
User Activity	Networks > Network Members > Login History	Create reports on the login activity in your community. To report only on external user logins, filter the report by <code>Status</code> (on the Login History object) to equal <code>0</code> .
User Activity	Networks > Network Membership Daily Metrics	Create reports on the daily count of total active members, new members added, and external member logins by member type.

High-level usage	Primary Object > B (Child Object) > C (Child Object, If Applicable)	Description
User Activity	Networks > Network Unique Contributor Daily Metrics	Create reports on the unique daily contributors in your community. A member is counted as a contributor if they posted or commented on a group or a user profile.
User Profile Photos	Networks > Network Members	To report on user profiles with or without photos, filter the report by <code>Has Profile Photo</code> (on the Network Members object) to equal <code>True</code> or <code>False</code> .

¹To report on Chatter Messages, you must have the “Moderate Communities Chatter Messages” permission.

 **Note:** You can create reports based on other objects and expose them in Community Management. Just keep in mind that they show data from across your organization, not just for the community in which you’re viewing them.

Educate Your Users About Communities

Share Personal Contact Information Within Communities

Users can specify which information from their profile is visible to external users, such as customers and partners, and guests viewing publicly accessible pages that don’t require login.

When interacting with other community members, it’s important to balance being visible and accessible with protecting your personal contact information. You may not want to show your job title, phone numbers, and other contact details outside of your internal organization. Your customers and partners may not want other customers and partners viewing all their contact information.

Use either the user interface or API to control visibility. You can choose to expose fields to employees only, members of the community from outside your company, or guest users who aren’t required to log in. Some fields are always visible to everyone accessing the community. Some fields allow up to three levels of visibility, while others allow fewer.

- **Employees**—Only members from the internal organization can view.
- **External**—Members from the internal organization and external members, such as customers and partners, can view. External users are users with Community, Customer Portal, or partner portal licenses.
- **Public**—Anyone can view, including guest users viewing publicly accessible pages that don’t require login. Guest users can access public pages in communities via the Guest User license associated with each site or community.

In the API, setting a field to `true` on the User object makes it visible to the type of user indicated in the field name (external or guest users).

Consider these tips about the visibility of your contact information.

- Your chosen settings apply to every community you’re a member of.

- When a user is restricted from viewing a contact information field, there are differences in what's displayed in the user interface versus the API.
 - In the user interface, the restricted field is hidden from your profile everywhere that it usually displays in a community. If your organization displays your profile information on custom Visualforce pages, the field still displays, but with the value #N/A.
 - In the API, a field set to `false` returns the value `#N/A`.
- Information in hidden fields on a profile is not searchable by other partners and customers in the community, but is searchable by users in the company's internal organization.

Default Visibility Settings for Contact Information

This table summarizes the default visibility settings for contact information and your options for restricting visibility.

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object
First Name Last Name Nickname About Me	Public	Go to <i>Your Name</i> > Edit Contact Info , then click About	Everyone see these fields unless your administrator enables nickname display or creates a custom page that displays this information. If your administrator has enabled nickname display, your nickname displays in place of your first and last names in most locations.	N/A
Title	External	Go to <i>Your Name</i> > Edit Contact Info , then click About	Employees, external, or public	<code>UserPreferencesShowTitleToExternalUsers</code> <code>UserPreferencesShowTitleToGuestUsers</code>  Note: When the guest user preference is set to <code>true</code> , the job title field is visible to external members even if the external member preference is set to <code>false</code> .
Profile photo	External Users without access see the stock photo.	On your profile page, click Update under your photo (or Add Photo if you haven't added a photo yet), then select <code>Show in communities with publicly</code>	External or public	<code>UserPreferencesShowProfilePicToGuestUsers</code>

Contact Information	Default Visibility	Where to Set in User Interface	Options for Restricting Visibility	API Controls on User Object

				<code>UserPreferencesShowWorkPhoneToGuestUsers</code>

Navigate to Your Communities

You can easily switch between working in your internal organization and collaborating with customers or partners in communities. The global header is not available by default, the administrator for your organization must enable it for community members.

-  **Note:** Organizations who enabled Communities before Winter '14 see the new global header by default when they turn on Communities.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

The menu on the left side lets you switch between communities and your internal organization.

- To access communities from within your organization, click  next to *Organization Name* in the drop-down and select the community you want to switch to. The drop-down shows *Active* communities that you're a member of. If you have the "Create and Set Up Communities" permission, you also see *Preview* communities that you're a member of.
- To return to your internal organization, click  next to *Community Name* in the drop-down and select your organization name.

Internal users who aren't members of any community only see the company name. External users see the drop-down menu only if they belong to more than one active community.

-  **Note:** If an external user who is only a member of one *Active* community is given the URL for a *Preview* community, they don't see the drop-down menu in the *Preview* community.

You can work in more than one community at a time if you open each one in a different browser tab.

Switching between your internal organization and your communities doesn't have to disrupt your workflow. We automatically return you to the page where you were last working, so you can pick up right where you left off.

-  **Note:** If your organization is setting up My Domain but hasn't finished deployment of the new custom domain, switching from a community to your internal organization directs you to the Salesforce login page instead. This can happen when you've logged in using a My Domain URL that has been registered but not yet deployed. Once your domain is deployed, selecting your organization in the drop-down directs you to the internal organization as expected.

The *Your Name* menu on the right side contains links to edit contact information and log out. For internal users, it also contains a link to Help & Training and may also contain links to Setup and other tools depending on user permissions and enabled features. If your organization is using Lightning Experience, users with the appropriate permission can switch between Salesforce Classic and the new interface using the Switcher. Look for the *Switch to Lightning Experience* link in the *Your Name* menu. Communities aren't supported in Lightning Experience, so to create, manage, or access communities from the global header, you'll have to switch back to Salesforce Classic.

[Salesforce Communities Overview](#)

Search Behavior in Communities

Search capabilities in communities can make or break a member's experience. Search in communities is different depending on whether your community is using a Community Builder-based template or a Salesforce Tabs + Visualforce template. In general, searches within a community return results specific to that community.

For all communities:

Search behavior in communities is different from searches in the internal org:

- In general, searches within a community return matches from within the community. To find items from a different community, members must leave the current community and search from within the other community.
- In search results in a community, members can see what they have access to through their profiles or permission sets in addition to what is explicitly shared with them in the community. This can include internal company content and records not explicitly shared in the community. For example, if the user's profile allows access to account information, and the accounts tab isn't made visible in the community, the member is able to access account information from their search results.
- For user searches performed by external community members, global search and enhanced lookup search (with the **All Fields** option selected) query the following limited set of fields:
 - Name
 - Username
 - User ID
 - Body
 - Email
 - Phone
 - Custom fields

For example, if an external community member searches for a user, John Doe, by his alias *jdoe*, and that term isn't contained in any of the searchable fields, the user John Doe isn't included in search results.

- Search results for records and files are not limited to data made visible within the community. Record search results include all the records a user has access to across all community, including the internal org's records if they have access. In file searches, users can see:
 - Files they own
 - Files shared with them directly
 - Files they have access to in a library
 - Files that are posted to a record they have access to
 - Files that are posted to groups or shared with that community
- The admin must enable search result filters for an object in the internal org for it to be searchable in a community. To make custom objects searchable, the object must be associated to a tab in the internal org.

For communities using Community Builder-based templates Koa and Kokua:

- The Featured Search component lets community members search for articles within a specific data category.
- The Article List component shows the search results based on the search term entered in Featured Search.

For communities using the Community Builder-based template Napili:

- The Search Publisher component lets community members enter search terms in the community.
- The Search Results component shows a list of search results limited to articles and discussions.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

-  **Note:** Only articles that have a topic associated to them in Community Management populate in the Search Results component.
- The Global Search Results component lets members see search results in one tab (All), or in separate tabs for cases, accounts, contacts, and any other object exposed in the community (including custom objects) to which they have access.
-  **Note:** Admins must associate a tab to a custom object in order to make it searchable in global search.

For communities using Salesforce Tabs + Visualforce:

- If Chatter is enabled in your org, global search and contextual feed search are enabled by default in all communities.
 - With global search, members can search for records, files, people, groups, topics, and feed posts and comments.
 - Feed search () is helpful when members want to look for information in a specific feed context, such as in groups, on a user's profile, in a record feed, or in the community feed.
- If Chatter isn't enabled, sidebar search is enabled in all communities.
 - Sidebar search doesn't support searches for items specific to Chatter, such as feeds, groups, files, topics, and user profiles.

Manage Your Community Email Notifications

Use email notifications to keep up with important updates in communities.

You can choose to receive email notifications whenever someone posts on your profile, comments after you on a post you've commented on, posts to a group you belong to, and more. Email notification preferences are set by community.

To set your email preferences, go to your profile page within a community, click the drop-down button () in the upper-right corner and select **My Settings**, then click **Email Settings**. You can turn individual notifications on or off.

Your chosen settings apply to the current community. If you don't belong to any groups yet, you won't see the option to set groups on this page until after you join your first group. You can also set your group email preferences using the **Email Me...** drop-down on each group's page. You can choose to receive a daily or weekly digest email or an email every time someone posts. This option is visible if you're a group member.

Your email options are similar to the Chatter email settings in your internal organization under your personal settings (*Your Name* > **My Settings** > **Email Settings** for Chatter Free users). Within communities, however, note the following differences.

- The default notification frequency for new groups you join can't be set via the user interface. It can be set only via Salesforce APIs (SOAP API and REST API).
- Personal digests aren't currently available.
- If your community has Chatter messages enabled, you're notified of file shares in a message. If Chatter messages aren't enabled, you'll continue to be notified of file shares by email.
- If flagging is enabled in the community, the `Flags an item as inappropriate` option appears for all members of the community, but only sends notifications if:
 - You're a group owner or manager and a member flags a post, comment, or file in your group.
 - You're a moderator and a member flags a post, comment, or file you have access to. Depending on the type of notification you want to receive, you also need following permissions:

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Email Notifications About	Required Permission
Flagged posts and comments	"Moderate Communities Feeds"
Flagged files	"Moderate Communities Files"
Flagged Chatter messages	"Moderate Communities Feeds" and "Moderate Communities Chatter Messages"

If the **Flag as Inappropriate** link doesn't work in your email, try flagging the message from the UI.

Who Can See What in Communities

Communities contain various types of users who require varying levels of access. What users see depends on their user type and which tabs the administrator selects when creating the community. The behavior outlined below also doesn't take into account updates to your sharing model or user sharing.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

	Administrator or Salesforce user with "Create and Set Up Communities" permission	Salesforce Community Member (all Salesforce licenses including Chatter Free and Chatter Only)	External Community Member (Customer Portal, Partner Portal, Partner Community, or Customer Community license)

SET UP AND MAINTAIN COLLABORATION TOOLS

Welcome, Collaboration Tool Administrators

This documentation contains everything you need to help your users collaborate with each other, or even with people outside your organization. Learn how to set up and extend Chatter, or enable users to create, package and send files outside your organization using Salesforce CRM Content. For help with basic Salesforce administration, see *Set Up Your Organization*.

Salesforce Chatter

Chatter

Chatter is a Salesforce collaboration application that connects, engages, and motivates users to work efficiently across the organization regardless of role or location. Chatter lets users collaborate on sales opportunities, service cases, campaigns, and projects with embedded apps and custom actions.

Salesforce organizations created after June 22, 2010 have Chatter already enabled for all users by default. However, if you only want certain parts of your organization to use Chatter, you can do a profile-based rollout of Chatter instead. With a profile-based rollout, only the users that have been assigned the required user profile or permission sets have access to Chatter. Profile-based rollout of Chatter is useful for larger companies and companies or government agencies with regulatory constraints. It allows them to plan a controlled rollout and deploy Chatter on a department-by-department basis.

We recommend rolling out Chatter for all users in your organization, unless your company doesn't want all users to have full access to Chatter. Chatter is secure and works in accordance with all the security and permission settings in your Salesforce organization.

SEE ALSO:

[Profile-Based Chatter Rollout Overview](#)

Profile-Based Chatter Rollout Overview

Profile-based rollout of Chatter enables Chatter for a subset of users instead of all users in the organization.

Profile-based rollout of Chatter makes Chatter available for a part of your organization, but not for all users. Once profile-based rollout of Chatter is enabled for your organization, you can turn on Chatter for the users with the required user profile or permission sets. All other users in your organization don't have access to Chatter.

 **Example:** Let's say you assign a profile or permission set that excludes Chatter access to a subset of users. These users still have access to Salesforce objects, but they don't see the record feed and they can't make posts.

[Get Ready for Profile-Based Rollout of Chatter](#)

If you're rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

[Control Chatter Access Through User Profiles](#)

Modify existing custom user profiles to allow or deny access to Chatter.

[Control Chatter Access Through Permission Sets](#)

Handle Chatter access by modifying existing or creating new permission sets.

[Profile-Based Rollout Considerations](#)

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permissions sets, and the interaction between users with and users without Chatter access.

Get Ready for Profile-Based Rollout of Chatter

If you're rolling out Chatter to just a subset of your users, prepare your organization to control Chatter access with custom user profiles and permission sets.

From a high-level perspective, a profile-based rollout of Chatter consists of these steps:

 **Note:** Before you begin, disable Chatter for your entire organization (go to Chatter settings and deselect **Enable**).

1. Salesforce enables the profile-based rollout of Chatter feature for your organization.
2. You determine who gets access to Chatter.
3. You review and modify existing custom user profiles and permissions sets.
4. Verify that the Enable Chatter permission in a custom user profile or permission set has the desired setting.
5. To allow or restrict Chatter access, assign the associated profile or permission set to users.
6. You turn on Chatter for your organization.

 **Note:** Perform step 6 as a separate, final step. If step 6 is combined with another step or performed out of order, unpredictable and undesirable results can occur.

Control Chatter Access Through User Profiles

Modify existing custom user profiles to allow or deny access to Chatter.

When Salesforce turns on profile-based rollout of Chatter for your organization, the Enable Chatter permission is added to all of your existing user profiles and permissions sets. This permission is automatically enabled for all standard profiles. It is also automatically enabled for all custom profiles, if any of the following user-level permissions were already enabled, either manually or as part of a license:

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
- “Create and Share Content Deliveries for Chatter Files” (ChatterFileLink)
- “Invite Customers To Chatter” (ChatterInviteExternalUsers)
- “Manage Chatter Messages” (ManageChatterMessages)
- “Moderate Chatter” (ModerateChatter)
- “Moderate Chatter Feeds” (ModerateNetworkFeeds)
- “Use Case Feed” (ViewCaseInteraction)
- “View All Data” (ViewAllData)

Modify your existing custom profiles with the desired permissions to control access to Chatter and create new custom profiles, if required.

1. Log in as a Salesforce administrator.
2. From Setup, enter *Profiles* in the Quick Find box, then select **Profiles**.

3. For each of your existing custom user profiles:
 - a. Click **Edit**.
 - b. In the Administrative Permissions section, select or deselect **Enable Chatter**, depending on whether you want users with this profile to have Chatter access or not.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable Chatter:

- “Customize Application”

Administrative Permissions

The Enable Chatter permission is only available if profile-based rollout of Chatter is enabled for your organization.

- c. Save your changes.
4. If applicable, create new custom user profiles with the desired permissions and assign them to users.
 -  **Note:** Selecting the Enable Chatter permission in a person's user profile doesn't automatically turn on Chatter for that person. People can't use Chatter until actually you turn [on Chatter](#) for your organization.

SEE ALSO:

- [Get Ready for Profile-Based Rollout of Chatter](#)
- [Control Chatter Access Through Permission Sets](#)
- [Chatter Settings](#)
- [Profile-Based Rollout Considerations](#)

Control Chatter Access Through Permission Sets

Handle Chatter access by modifying existing or creating new permission sets.

When you enable or disable Chatter through permission sets, consider that:

- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn't enabled in their user profile.
- Permission sets don't persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both the person's user profile and permission set.

For your existing permission sets, verify that they include the correct and required Chatter permissions for the desired subset of users.

1. Navigate to Permission Sets.
2. For each existing user-level permission set:
 - a. In the System section, click **System Permissions**.
 - b. Click **Edit** and select **Enable Chatter**. This permission is available only after profile-based rollout of Chatter is enabled for your org.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To enable Chatter:

- "Customize Application"

System Permissions		Edit
▼ System		
Permission Name	Enabled	Description
Access Custom Mobile Apps	<input type="checkbox"/>	Allow user to run custom mobile apps.
API Enabled	<input type="checkbox"/>	Access any Salesforce.com API.
Api Only User	<input type="checkbox"/>	Access Salesforce.com only through a Salesforce.com API.
Assign Topics	<input type="checkbox"/>	Assign existing topics to feed items. Remove topics from feed items.

Manage Analytic Snapshots	<input type="checkbox"/>	Create, edit, and delete analytic snapshots.

- c. Save your changes.

3. If applicable, create new permission sets with the desired permissions and assign them to users. By default, all permissions in a new permission set are disabled. Enable the following Chatter permissions in the new permission set so users have these permissions.
 - “Create and Own New Chatter Groups” (ChatterOwnGroups)
 - “Create and Share Content Deliveries for Chatter Files” (ChatterFileLink)
 - “Invite Customers To Chatter” (ChatterInviteExternalUsers)
 - “Manage Chatter Messages” (ManageChatterMessages)
 - “Moderate Chatter” (ModerateChatter)
 - “Moderate Chatter Feeds” (ModerateNetworkFeeds)
 - “Use Case Feed” (ViewCaseInteraction)
 - “View All Data” (ViewAllData)

Note: Selecting the Enable Chatter permission in a person's permission set doesn't automatically turn on Chatter for that person. People can't use Chatter until you [turn on Chatter](#) for your organization.

SEE ALSO:

[Get Ready for Profile-Based Rollout of Chatter](#)

[Control Chatter Access Through User Profiles](#)

[Chatter Settings](#)

[Profile-Based Rollout Considerations](#)

Profile-Based Rollout Considerations

In organizations that use profile-based rollout of Chatter, certain limitations apply to user profiles, permissions sets, and the interaction between users with and users without Chatter access.

- The Enable Chatter option isn't available unless profile-based rollout of Chatter has been enabled for the organization.
- Permission sets persist over user profile settings when you enable Chatter. All users with a Chatter-enabled permission set have access to Chatter, even if Chatter isn't enabled in their user profile.
- Permission sets don't persist over user profile settings when you disable Chatter. All users with a Chatter-enabled user profile have access to Chatter, even if Chatter is disabled in their permission set. To prevent that person from accessing Chatter, disable Chatter in both the person's user profile and permission set.
- Selecting the Enable Chatter permission in a person's user profile or permission set doesn't automatically turn on Chatter for the organization. Turn on Chatter for your organization after you modified user profiles and permission sets.
- Standard Salesforce user profiles have Chatter enabled by default. You can't disable Chatter for these standard profiles.
- Don't deselect Enable Chatter permission on a cloned Chatter External user profile. The user sees an error message and can't log in.
- Don't deselect the Enable Chatter permission on a cloned Chatter Free or Chatter Moderator profile. You get an error message and can't save the profile.
- Enabling profile-based rollout of Chatter and Chatter for an organization also enables a set of dependent Chatter user permissions. If Chatter is disabled for the organization, these permissions are also disabled at the same time. However, if Chatter is then enabled again, these permissions aren't automatically re-enabled and the administrator must enable them explicitly.
- When profile-based rollout of Chatter is enabled for an organization, Chatter is automatically enabled for standard profiles. For all custom profiles and permission sets, Chatter is automatically enabled, if any of the following user-level permissions were already enabled, either manually or as part of a license:

- “Create and Own New Chatter Groups” (ChatterOwnGroups)
 - “Create and Share Links to Chatter Files” (ChatterFileLink)
 - “Invite Customers To Chatter” (ChatterInviteExternalUsers)
 - “Manage Chatter Messages” (ManageChatterMessages)
 - “Moderate Chatter” (ModerateChatter)
 - “Moderate Chatter Feeds” (ModerateNetworkFeeds)
 - “Use Case Feed” (ViewCaseInteraction)
 - “View All Data” (ViewAllData)
- In organizations that have Work.com enabled, users with access to Chatter can’t thank users who don’t have access to Chatter.
 - If your organization already has Chatter enabled and switches to profile-based rollout of Chatter, manually enable Chatter in all existing custom profiles and permission sets. Otherwise, users that are assigned these custom profiles and permission sets lose access to Chatter.

Chatter Settings

Chatter is enabled by default in Salesforce and the Salesforce1 app. Configure various Chatter features and customize the Chatter experience for your users on the Chatter Settings page in Setup.

- To access the Chatter Settings page, enter *Chatter* in the **Quick Find** box and select *Chatter Settings*.
- To disable Chatter for your entire organization, deselect **Enable** in the Chatter Settings section.

Chatter Group Settings

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates and ask questions.

Enable Emoticons in the Feed

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

Customer Invitations

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company's email domains. They have limited Chatter access and can only see groups they're invited to and interact with members of those groups.

Coworker Invitations

Allow Salesforce users to invite coworkers without Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

Enable Actions in the Publisher

To add global actions to the publisher, you must first enable the Actions in the Publisher feature in Chatter Settings. Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

Feed Post and Comments Editing Overview

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

SEE ALSO:

[Chatter](#)

Chatter Group Settings

Configure group features like group archiving, records in groups, and unlisted groups. Chatter groups are the main collaboration space in Chatter where people share information, post updates and ask questions.

Chatter Group Archiving

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

Enable Records in Chatter Groups

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

Enable Unlisted Chatter Groups

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter.

Unlisted Group Limitations

Consider the limitations of unlisted groups before you decide to enable them in your organization.

Chatter Group Archiving

Group archiving is enabled by default for your organization. If a group has no new feed posts or comments for 90 consecutive days, the group is archived automatically. When group archiving is enabled, feed activity in groups is reviewed on a weekly basis.

Mentioning a group doesn't count as feed activity and doesn't delay group archiving. Archived groups count toward your organization's group limits (30,000), but not toward a user's group membership limits (300).

There are more group archiving settings on the group settings page. That's where group owners and managers can archive, activate, or edit the automatic archiving settings. To change the archiving settings for multiple groups at once, use the Salesforce API.

If your organization doesn't want to use group archiving, disable this feature in Setup. Enter *Chatter* in the Quick Find box, select **Chatter Settings**, and deselect **Allow Group Archiving** in the Groups section.

 **Note:** To allow group owners and managers to archive, activate, or disable automatic archiving in the Salesforce1 apps and in the Lightning Experience, customize the group layout and add the necessary fields.

Enable Records in Chatter Groups

Records are allowed in groups by default. Customize the group publisher to include the Add Record action, so users can add records to groups.

The Add Record action on the group publisher lets users add account, contact, lead, opportunity, contract, campaign, case, and custom object records to groups. The Add Record action isn't available by default, so you must configure the group publisher to include this action.

Walk Through It: Allow Users to Add Records to Chatter Groups

We recommend that you also customize object layouts to include the Groups related list on record detail pages. Customize the layout of all the standard and custom objects in your organization that support group-record relationships. The Groups related list shows users the list of groups associated with the record.

Walk Through It: Add the Groups Related List to Records

If you don't want to users to add records to groups, enter *Chatter* in the *Quick Find* box in Setup, then select *Chatter Settings*, and deselect **Allow records in groups in the Groups** section. Disabling the feature hides the Group Records list on the group detail page and the **Add Record** action in the group publisher.

SEE ALSO:

[Customize the Chatter Group Layout and Publisher](#)

Enable Unlisted Chatter Groups

Enable unlisted groups for your organization to allow users to collaborate more privately in Chatter.

Unlisted groups offer more privacy for compared to private groups. Only group members and users with the "Manage Unlisted Groups" permission can access unlisted groups in list views, feeds, and search results. By default, unlisted groups aren't enabled for your organization. Review the limitations of unlisted groups, before you enable this feature in your organization.

1. From Setup, enter *Chatter* in the *Quick Find* box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Enable Unlisted Groups**.
A message displays with important information about enabling unlisted groups in your organization.
4. In the highlighted message, select the checkbox next to **I want to enable unlisted groups and understand that I may need to update Apex/Visualforce code in my organization**.
5. Click **Save**.

Any user can create an unlisted group. Unlike private groups, users with the "View All Data" or "Modify All Data permission" can't view or update unlisted groups unless they're members. To allow

non-members to view and modify unlisted groups, assign the “Manage Unlisted Groups” permission to them via their profile or a permission set.

SEE ALSO:

[Unlisted Group Limitations](#)

[Unlisted Groups Overview](#)

Unlisted Group Limitations

Consider the limitations of unlisted groups before you decide to enable them in your organization.

For Administrators

- Only users with the “Manage Unlisted Groups” permission can access or modify unlisted groups and its files and feed content without membership.
- Users with the “Modify All Data” permission can’t delete feed content from unlisted groups, unless they are group members.
- Users with the “Data Export” permission can export all Chatter data and view the exported posts and comments from any group, regardless of whether they have the “Manage Unlisted Groups” permission.
- You can’t grant the “Manage Unlisted Groups” permission to users with these profiles Chatter External, High Volume Portal, or High Volume Customer Portal.
- Unlisted groups count toward a user’s group limit, but they don’t appear in the Groups list on a user’s profile page unless the person who’s viewing the list is a member of those groups or has permission to manage unlisted groups. When unlisted groups are hidden, the count that’s shown next to the Groups list might not be accurate, depending on the permissions of the person viewing the list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager, and Developer** Editions

For Developers

Apex code runs in system mode, which means that the permissions of the current user aren’t taken into account. This limitation has implications for pages that are written in Apex.

- Visualforce pages that display groups might expose unlisted groups to users who aren’t members.
- Because system mode disregards the user’s permissions, all users who are accessing a Visualforce page that’s showing an unlisted group can act as an owner of that group.
- AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren’t members.

To limit and manage access to the unlisted groups in your organization:

- Explicitly filter out unlisted groups from SOQL queries in all Apex code.
- Use permission sets, profile-level permissions, and sharing checks in your code to further limit unlisted group access.
- Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of unlisted groups. In Setup, enter *Group Triggers* in the Quick Find box, then select **Group Triggers** to add triggers.

SEE ALSO:

[Enable Unlisted Chatter Groups](#)

[Unlisted Groups Overview](#)

Enable Emoticons in the Feed

Emoticons let your users add expressions like a smiley face to their posts and comments by typing a character combination.

Emoticons aren't supported in Salesforce1.

1. From Setup, enter *Chatter Settings* in the Quick Find box, then select **Chatter Settings**.
2. In the Emoticons in Feed section, select **Allow Emoticons**.

Salesforce supports these character combinations in posts and comments.

Character Combinations	Emoticon
<ul style="list-style-type: none"> • :) <ul style="list-style-type: none"> • :-) 	 (smile)
<ul style="list-style-type: none"> • :P <ul style="list-style-type: none"> • :-P • :p • :-p 	 (tongue)
<ul style="list-style-type: none"> • :(<ul style="list-style-type: none"> • :-(- 	 (frown)
<ul style="list-style-type: none"> • >:(<ul style="list-style-type: none"> • >:-(- 	 (angry)
<ul style="list-style-type: none"> • :((<ul style="list-style-type: none"> • :!(• :!-( (crying)

- "Customize Application"

Customer Invitations

Allow users to invite customers to private groups that they own or manage. Customers are users outside of your company's email domains. They have limited Chatter access and can only see groups they're invited to and interact with members of those groups.

Customer invitations don't support custom domains created using My Domain, single sign-on, and IP restrictions. To allow customer invitations with these features enabled, we recommend one of the following approaches:

- Customize the single sign-on page for your organization with an extra link redirecting users to `https://yourDomain.my.salesforce.com/`.
- Enable single sign-on for your customers.

Customer invitations are enabled by default. To disable customer invitations, enter *Chatter* in the **Quick Find** box in Setup, select *Chatter Settings*, and deselect **Allow Customer Invitations** in the Chatter Settings section. Disabling this feature doesn't delete existing customers or groups that allow customers.

SEE ALSO:

[Coworker Invitations](#)

[Can I connect multiple Salesforce organizations using Chatter?](#)

Coworker Invitations

Allow Salesforce users to invite coworkers without Salesforce licenses to Chatter. Invited users can access Chatter people, profiles, groups, and files but can't see record data unless they have a Salesforce license.

Coworker invitations are automatically enabled for new Salesforce organizations. The email domain of the first Salesforce user that is added to the organization is used as the company domain in the **Company Email Domains** field. Invitations aren't turned on if the user's domain is a free public email provider such as yahoo.com or gmail.com.

You can add up to 200 domains. Enter the domains that are used in email addresses for your company. We recommend that you don't enter public email domains such as hotmail.com, yahoo.com, or gmail.com. If invited, anyone with an email address in these domains can join and see user profiles, feeds, and Chatter groups.

To disable coworker invitations, enter *Chatter* in the **Quick Find** box in Setup, select *Chatter Settings*, and deselect **Allow Coworker Invitations** in the Coworker Invitations section. If you deselect this feature, users can't accept outstanding invitations. Similarly, if you remove an email domain, users can't accept outstanding invitations from that domain.

Enable Actions in the Publisher

To add global actions to the publisher, you must first enable the Actions in the Publisher feature in Chatter Settings. Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

1. From Setup, enter *Chatter Settings* in the **Quick Find** box, then select **Chatter Settings**.
2. Click **Edit**.
3. In the Actions in the Publisher section, select **Enable actions in the publisher**.
4. Save your changes.

USER PERMISSIONS

To enable actions:

- “Customize Application”

Feed Post and Comments Editing Overview

With feed post editing, users can edit their own feed posts. Record owners can also edit any post on records they own, no matter who created the post.

A Chatter Settings option and two user permissions control the feed post editing feature.

The *Allow users to edit posts and comments* option in Chatter Settings enables or disables the Edit Feed Post feature for your organization. This option is enabled by default in existing and new organizations. All users that are assigned a standard profile can edit their own posts and comments immediately, except for Chatter Free, Chatter External, and Customer Portal users. For users that are assigned custom profiles, administrators must specifically enable the permissions in the users' custom profiles or permission sets.

The “Edit My Own Posts” permission allows users to edit their own posts. This permission is available and automatically enabled on standard profiles, except Chatter External, Chatter Free, and Customer Portal User profiles. To allow Chatter External, Chatter Free, or Custom Portal users to edit their own posts, clone the profiles and enable the “Edit My Own Posts” permission in the cloned profiles. Assign the cloned profiles to the users.

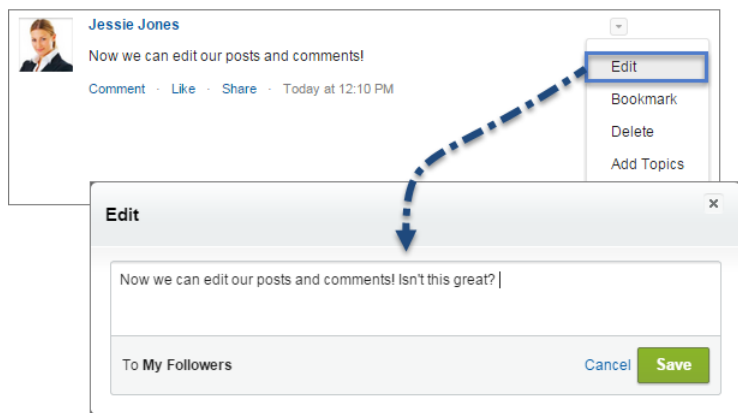

The “Edit Posts on Records I Own” permission allows users to edit posts and comments on records they own, including other people's posts and comments. For example, a group owner or manager can edit all posts on the group's feed. A manager for a particular record type can edit all posts on the record. This permission is available on standard and custom profiles, but it is disabled by default.

This table summarizes the permissions and their default settings.

User Permission	Description	Available in	Default Setting
Edit My Own Posts	Allows users to edit their own posts	Standard profiles, except <ul style="list-style-type: none"> • Chatter External User • Chatter Free User • High Volume Customer Portal User • Partner Community User Profile 	Enabled in all new and existing organizations
		Custom profiles	Disabled in all new and existing organizations
Edit Posts on Records I Own	Allows record owners to modify their own posts and	Custom profiles	Disabled in all new and existing organizations.

User Permission	Description	Available in	Default Setting
	posts other users made on groups and record detail pages.		However, Chatter moderators, community moderators, and users with “Modify All Data” permission can always edit all posts and comments.

The *Allow users to edit posts and comments* option in Chatter Settings is enabled by default. For users that have the required permissions, the Edit option is available from the drop-down menu on posts, comments, questions, and answers. It opens a separate Edit window, where users can modify the text.

After users saved their edited version of the post, it shows an Edited time stamp to indicate that the original post was modified.

If users edit a post or comment and mention new people or groups, those people and groups receive email notifications. People and groups who were mentioned in the original post or comment don't receive a new email notification. Email notifications for edited posts or comments show the Edited time stamp.

For community users, feed post editing is only available, if the community was created using Salesforce Tabs + Visualforce or the Napili template. The Edit option isn't available on system-generated posts like feed tracked record updates.

[Enable Feed Post Editing in User Profiles or Permission Sets](#)

By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

[Disable Feed Post Editing for All Users](#)

By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.

Enable Feed Post Editing in User Profiles or Permission Sets

By default, feed post editing is disabled on all custom profiles. To make the feature available to your users, you can either modify your user profiles or assign the permissions to users via a permission set.

Here's how you enable the permissions in a permission set.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click an existing permission set or create one.
3. In the System Permissions section, click **Edit**.
4. Select the edit feed post permissions you want to enable.
 - Select *Edit My Own Posts* to allow users that are assigned this custom profile to edit their own posts and comments.
 - Select *Edit Posts on Records I Own* to allow users that are assigned this custom profile to edit posts and comments on records they own, including posts and comments made by other users.
5. Click **Save**.
6. Assign the permission set to the users who need the permissions.

Example:  [Walk Through It: Assign a Permission Set](#)

USER PERMISSIONS

Disable Feed Post Editing for All Users

By default, all users who are assigned a profile that has the feed post editing permissions enabled can edit their posts and comments. If needed, you can disable feed post editing for all users in your organization, regardless of their assigned user profile.

1. From Setup, enter *Chatter Settings* in the **Quick Find** box, then select **Chatter Settings**.
2. Click **Edit**.
3. In the Post and Comment Modification section, deselect *Allow users to edit posts and comments*.

USER PERMISSIONS

To enable or disable features in Chatter Settings:

- “Customize Application”

Post and Comment Modification

The author of the post or comment, the record owner, a Chatter moderator, and a moderator in this community have permission to modify the text.

Allow users to edit posts and comments

4. Click **Save**.

The feed post editing feature is disabled for your entire organization. Users can no longer edit posts and comments.

Publisher Actions and Layouts

Actions add functionality to the Chatter publisher and let your users do more in Salesforce and in Salesforce1.

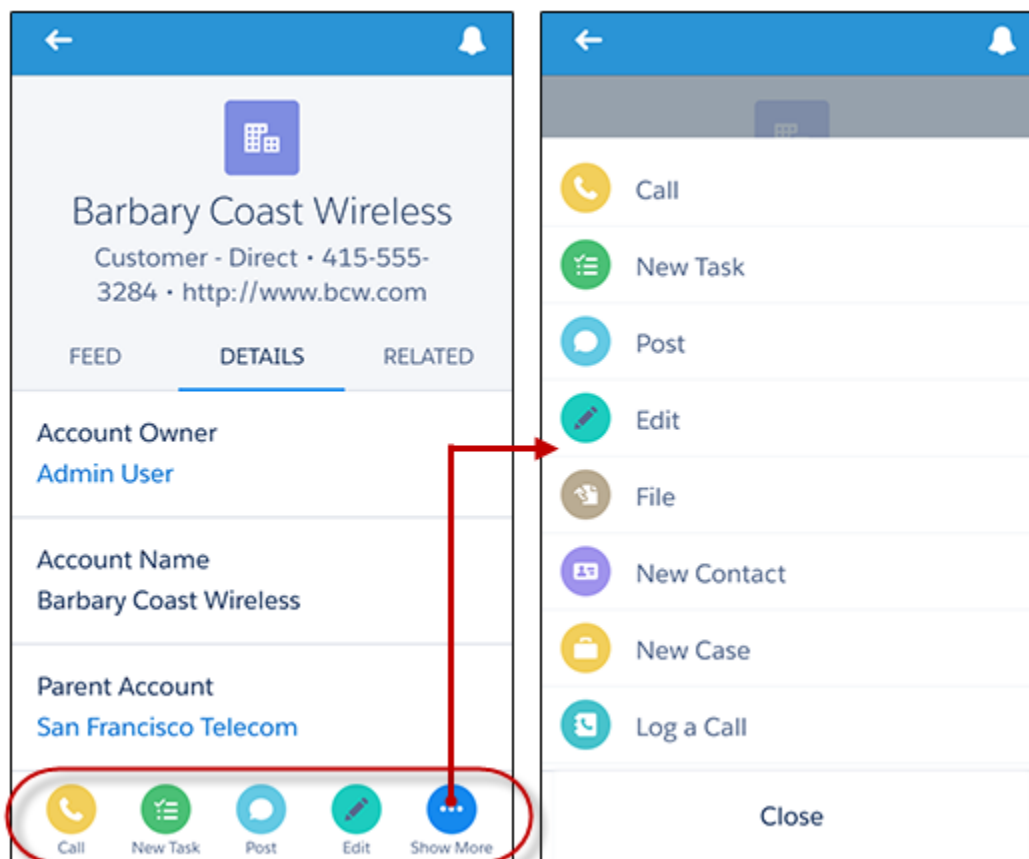

Actions are all about productivity. Actions let users accomplish things with fewer clicks, fewer fields, and ultimately less time spent. Actions are especially useful in Salesforce1, because it makes it easy to create and edit records with a simple, mobile-optimized interface. By default, the Chatter publisher includes the standard actions Post, File, Link, Poll, and Question.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer, and Database.com** Editions

In Salesforce1, actions appear in the action bar, its associated action menu, and as list-item actions.

There are several categories of actions, like standard actions, nonstandard actions, default actions, mobile smart actions, custom actions, and productivity actions.

- **Standard actions:** Standard actions are actions that are automatically added to the publisher when Chatter is enabled—such as Post, File, Link, and Poll. You can customize the order in which these actions appear in the publisher, but you can't edit their properties.
- **Nonstandard actions:** Nonstandard actions are actions that you create and customize yourself.
- **Default actions:** Default actions are predefined actions provided by Salesforce. Add them to the publisher layout to make them available to your users.
- **Mobile smart actions:** Mobile smart actions are a set of preconfigured actions, just like default actions. In Salesforce1, mobile smart actions let users create records directly in the feed.
- **Custom actions:** Custom actions are Visualforce pages or canvas apps with functionality that you define. For example, you can create a custom action so that users can write comments that are longer than 5000 characters.
- **Productivity actions:** Productivity actions are predefined by Salesforce and are attached to account, contact, event, lead, user, and user profile objects. You can't edit or delete productivity actions.

To customize the publisher with more actions or change the order of the actions, first enable actions in the publisher on the Chatter Settings page in Setup.

[Create Global Publisher Layouts](#)

Global publisher layouts determine the global actions that appear in the various Salesforce interfaces. In Salesforce Classic, these layouts customize the actions in Chatter publishers on global pages (like the Home page) and on the Chatter page. Lightning Experience uses these layouts to populate the Global Actions menu with Log A Call actions and Create a Record quick actions that point to the Events, Notes, and Tasks objects. And in Salesforce1, these layouts drive the actions that appear in the action bar on the Feed and People pages. Global publisher layouts can include global actions only.

[Add Actions to Global Publisher Layouts](#)

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Create Global Publisher Layouts

Global publisher layouts determine the global actions that appear in the various Salesforce interfaces. In Salesforce Classic, these layouts customize the actions in Chatter publishers on global pages (like the Home page) and on the Chatter page. Lightning Experience uses these layouts to populate the Global Actions menu with Log A Call actions and Create a Record quick actions that point to the Events, Notes, and Tasks objects. And in Salesforce1, these layouts drive the actions that appear in the action bar on the Feed and People pages. Global publisher layouts can include global actions only.

1. From Setup, enter *Publisher Layouts* in the Quick Find box, then select **Publisher Layouts**.
2. To create a new global publisher layout, click **New**.
3. To clone a publisher layout, select one from the Existing Global Publisher Layout drop-down list.
4. Enter a name for the new global publisher layout.
5. Click **Save**.

Add Actions to Global Publisher Layouts

Actions you add to the global publisher layouts appear on pages such as the Home and Chatter pages, and the action bar and action menu on the Feed and People pages in Salesforce1.

Arrange the actions so that the frequently used actions appear first in each list. All other actions appear in the publisher drop-down menu.

Walk Through It: Customizing Global Publisher Layouts

You can add actions to two sections on a page layout:

Quick Actions in the Salesforce Classic Publisher

This section can contain actions only from the Quick Actions category in the palette. Actions in this section appear in the Chatter publisher in Salesforce Classic.

Salesforce1 and Lightning Experience Actions

This section can contain actions only from the Salesforce1 Actions category in the palette. On object page layouts, the Salesforce1 Actions category contains all available types of actions for the object, including quick actions, productivity actions, and standard and custom buttons. Actions in this section appear in the action bar and action menu in Salesforce1 and in various areas of Lightning Experience.

1. From Setup, enter *Publisher Layouts* in the *Quick Find* box, then select **Publisher Layouts**.
2. To add or remove actions, drag them to and from the palette. To reorder actions, select an action and drag it to a new position.

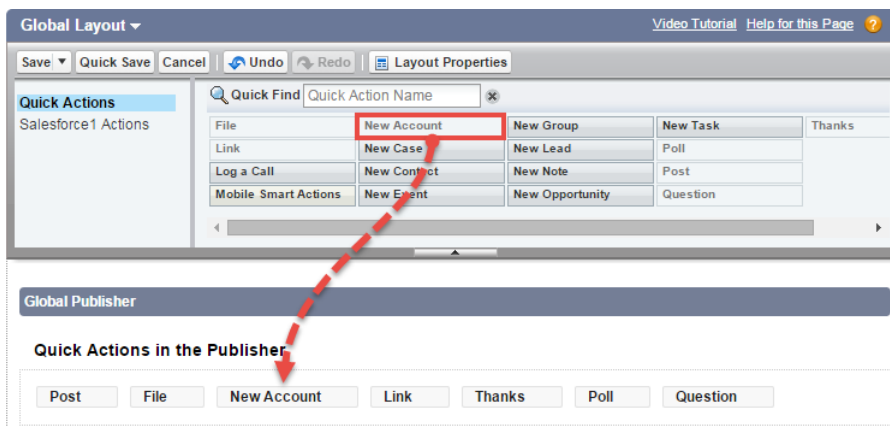

In the Quick Actions in the Salesforce Classic Publisher section, the first three actions on the left appear in the Chatter publisher. All other actions appear in the More drop-down menu.

3. Click **Save** when you're done, or click **Quick Save** to save your changes and continue working on the layout.

If you navigate away without saving, you lose your changes.

Example: Let's add the New Account action to the publisher, so users can create an account directly from the publisher. Just drag the New Account action to the Quick Actions in the Publisher section and save your changes.

Go to the Chatter tab. Now the New Account action shows up in the publisher.

EDITIONS

Feed Tracking

Feed tracking tracks changes to objects and fields and posts them as updates in Chatter. Users who follow a record, see the feed updates in their Chatter feed.

Feed tracking is available for objects and fields. You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

Sharing rules and field-level security determine visibility of record changes in Chatter feeds. To see changes to that record in their feeds, users must have access to the record.

These objects and fields are tracked by default:

- Account: Account Name, Account Owner
- Case: Case Owner, Priority, Status
- ChatterGroup: Allow Customers, Description, Group Access, Information Body, Information Title, Name, Owner Name
- Contact: Account Name, Contact Owner, Name
- Lead: Lead Owner, Lead Status, Name
- Opportunity: Amount, Close Date, Opportunity Name, Opportunity Owner, Stage
- Topic: Description
- User: About Me, Address, Email, Manager, Phone, Title

Tracked feed updates that are older than 45 days and have no likes or comments are deleted automatically. The tracked feed updates no longer appear in the feed. However, if auditing is enabled for a tracked field, the tracking field audit history is still available.

[Customize Chatter Feed Tracking](#)

Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer**, and **Database.com** Editions

The Account, Case, Contact, Lead, Opportunity and User objects are not available in **Database.com**.

Salesforce Connect external objects are available in: **Developer** Edition and for an extra cost in: **Enterprise, Performance**, and **Unlimited** Editions

USER PERMISSIONS

To customize fields tracked in feeds:

- “Customize Application”

To view the field tracking setup page:

- “View Setup and Configuration”

[Enable Feed Updates for Related Records](#)

Show feed updates on a record's detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

SEE ALSO:

Customize Chatter Feed Tracking

Enable feed tracking for objects and records, so users see updates for the objects and records they follow in their Chatter feed. Many objects and fields are tracked by default, but you can further customize feed tracking to include or exclude specific objects and fields.

You can configure feed tracking for users, Chatter groups, topics, custom objects, external objects, and the following standard objects: accounts, article types, assets, campaigns, cases, contacts, contracts, dashboards, events, leads, opportunities, products, reports, solutions, and tasks.

1. From Setup, enter *Feed Tracking* in the **Quick Find** box, then select **Feed Tracking**.
2. Select an object.
3. Select **Enable Feed Tracking**.

You must have the required user permissions to see this checkbox.

4. Select up to 20 fields to track.

You can't select fields for external objects or article types. The following standard field types can't be tracked:

- Auto-number, formula, and roll-up summary fields
- Encrypted and read-only system fields
- The **Expected Revenue** field on opportunities
- The **Solution Title** and **Solution Details** fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled

5. If you have actions in the publisher enabled, you see the **All Related Objects** option. Select this checkbox to show feed items when related objects are created.
6. Save your changes.

- "Customize Application"

To view the field tracking setup page:

- "View Setup and Configuration"

Enable Feed Updates for Related Records

Show feed updates on a record's detail page whenever someone creates related records. Feed updates for related records give users a complete view of the account activity.

1. From Setup, enter *Feed Tracking* in the **Quick Find** box, then select **Feed Tracking**.
2. Click the object for which you want to enable feed updates for related records.
3. Click **All Related Objects**.
If you don't see this option, make sure that actions in the publisher are enabled. The All Related Objects option is available only on these objects:
 - Account
 - Campaign
 - Case
 - Contact
 - Custom objects
 - Group
 - Lead
 - Opportunity
4. Save your changes.

Example: If you enable feed updates for related records on accounts, the account feed includes:

- Feed updates for all activity on the account
- Updates for related tasks, events, and contacts

Chatter Email Settings and Branding

Chatter email settings let you control whether users receive email notifications about new posts, comments, and other changes. You can also change the format of the emails, like add your company's logo and sender information.

If Chatter is enabled, email notifications are enabled by default. However, your users can configure their own email settings. They control whether they want to receive emails, for which changes, and how often. It is important that you teach your users how they can control the amount of email they receive. Too many email notifications are a pain point for many Chatter users and a common barrier to adoption.

Configure the general Chatter email settings and branding from Setup. Enter *Email Settings* in the **Quick Find** box, then select **Email Settings**. This table describes the settings.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Database.com,** and **Developer** Editions

USER PERMISSIONS

To change feed tracking settings

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Setting	Description
General Settings	
Allow Emails	Enables or disables email notifications for your entire company. If you deselect this option, all email notifications are disabled and your users don't receive any notifications.
Allow Email Replies	If selected, users can reply to email notifications about messages and comments via email instead of navigating to the comment or message in Chatter.
Allow Posts via Email	If selected, users can post to groups using email.
Allow Attachments via Email	If selected, users can include attachments in posts to groups using email.
Show Salesforce1 mobile app download badges	Show App Store and Google Play download badges for Salesforce1 in all Chatter email notifications from your internal org. Badges don't appear in email notifications from communities. A recipient's language setting affects whether badges appear: if a badge isn't translated in the set language, it doesn't appear in the email. The option to show badges is selected by default.
Allow API-only Chatter Digests	 Note: This setting appears only if API-only Chatter Digests are enabled for your company. To enable this feature, contact Salesforce. If selected, daily and weekly scheduled digests are disabled for your entire company. You must call the API to receive digests for your users.
Sender	
From Name	The name that appears as the sender's name in the email notification. For example, add your company's name.
Email Address	The email address of the sender. For example, add your company's email address.
Branding	
Logo	A logo that appears in the email notification. Upload a different logo to replace the default Chatter logo.
Footer Text	The text that appears in the footer of the notification email. We strongly recommend including your company's physical address to comply with applicable anti-spam laws.

[Customize Branding for Email Notifications](#)

Customize your company's Chatter email notifications to display sender information, footer text, and a footer logo that is personalized for your organization.

Customize Branding for Email Notifications

Customize your company's Chatter email notifications to display sender information, footer text, and a footer logo that is personalized for your organization.

1. From Setup, enter *Email Settings* in the **Quick Find** box, then select **Email Settings**.
2. Enter custom values for the email sender's name and address to replace the default values.

 **Note:** If you change the sender's email address, we send a verification email to the new address. The change is pending, and we continue to use the existing address while we await verification. The requested address doesn't take effect until you click the confirmation link in the email. If verification is already pending for a new email address and you specify a different new address, we retain the latest value and use that for verification.

If you enter a custom value for the sender's address and you have enabled mail relay, your Chatter emails will use the relay.

3. Customize what displays in the footer of Chatter emails.

 **Note:**

- All Chatter emails display the Chatter logo and Salesforce information unless you replace them with your organization's own logo and information.
- If you previously customized the logo or footer text and want to restore the default values, use the API to set these fields to `null`.

- a. Choose a logo to replace the default Chatter logo.

The logo must be an existing document in the Documents tab and must be marked **Externally Available Image**. Images with a maximum size of 150 x 50 pixels on a transparent background work best.

- b. Enter custom text to replace the default footer text, up to a maximum of 1,000 characters.

The default text includes Salesforce's name and physical address. We strongly recommend including your organization's physical address to comply with applicable anti-spam laws.

4. Click **Save**.

SEE ALSO:

[Chatter Email Settings and Branding](#)

Chatter Post Actions and Layouts

Actions on posts and comments appear in the drop-down menu on a post or comment. Users can edit, bookmark, mute, and delete posts, add topics, and create tasks from posts.

The standard Bookmark, Delete, Mute, and Add Topic actions on posts are available by default and you can't modify them. However, you can add more actions like the Edit and Create New Task actions.

[Enable Create New Tasks on Posts](#)

Enhance the feed with an action that lets users create tasks directly from a post.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To customize Chatter email settings:

- "Customize Application"

Enable Create New Tasks on Posts

Enhance the feed with an action that lets users create tasks directly from a post.

[Actions in the Publisher](#) and [feed tracking](#) for task objects must be enabled.

1. From Setup, enter *Feed Item* in the **Quick Find** box, then select **Feed Item Layouts**.
2. Click **Edit** next to Feed Item Layout.
3. In the Feed Item Layout, click **Quick Actions**.
4. Select the **Create New Task** action and drag it to the Actions in the Publisher section.

If you don't see the Create New Task action, verify that the [Actions in the Publisher](#) feature is enabled in the Chatter Settings in Setup.

5. Save your changes.

The Create New Task action displays on the drop-down menu on text and content posts. When a user creates a task from a post, the task shows up in the My Task list on the user's Home page. The Create New Task action on posts

- Is available on text and content posts, but not on system-generated posts like tracked feed updates
- Can be partly customized. You can't change the fields, but you can change the layout of the fields.
- Generates an update that displays in the user's feed

Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

[Add Actions to the Group Publisher](#)

Customize the group publisher with quick actions and Salesforce1 actions.

Customize the Chatter Group Layout and Publisher

Add and remove fields, buttons, lookups, and related lists to change the layout of groups.

1. From Setup, enter *Group Layouts* in the **Quick Find** box, then select **Group Layouts**.
2. Click **Edit** next to the group layout you want to customize, or click **New** to create a layout.
3. From the palette on the top of the page, drag and drop fields, buttons, and other user interface elements to the different sections to add them to the group layout. Drag and drop them back to the palette to remove them from the layout. To make sure this works in Salesforce1 and Lightning Experience, be sure the following are in your group layout:
 - Post
 - Announcement
 - File
 - Poll
 - Edit Group
 - New Group Member
 - Manage Notifications
 - Delete Group
 - Leave Group

All group layout changes affect Salesforce1 and Lightning Experience. Group publisher changes appear everywhere. For example, if you delete the Files related list or a field in the Group Details section, those changes show up only in Salesforce1 and Lightning Experience, but not in Salesforce Classic.

All group layout changes affect Salesforce1 and Lightning Experience. Group publisher changes appear everywhere. For example, if you delete the Files related list or a field in the Group Details section, those changes show up only in Salesforce1 and Lightning Experience, but not in Salesforce Classic.

4. Click **Save** to save the layout.

Example: To allow group owners and managers to archive and activate groups from Salesforce1 and Lightning Experience, drag the Archive field to the Group Detail section.

EDITIONS

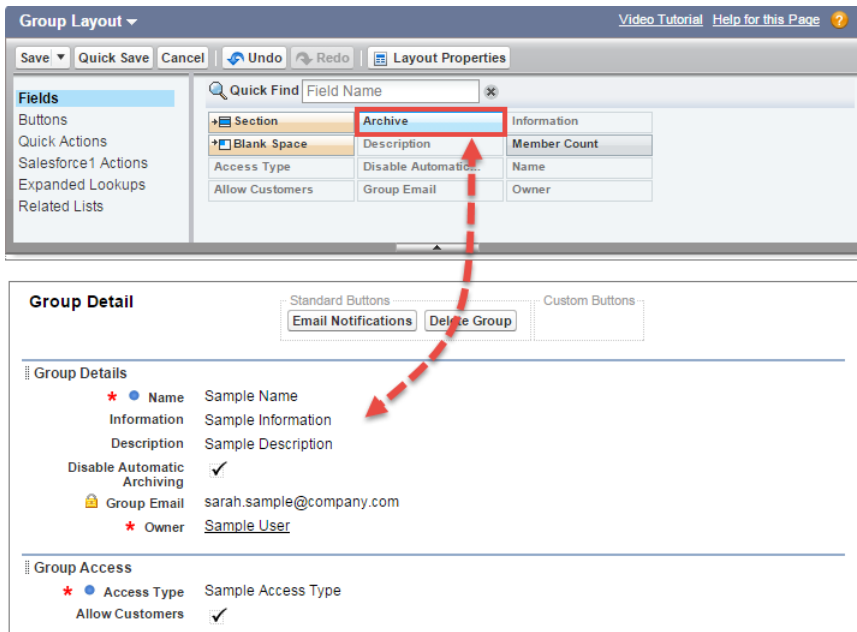

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To customize Chatter group layouts:

Add Actions to the Group Publisher

Customize the group publisher with quick actions and Salesforce1 actions.

By default, Chatter groups display standard actions that are part of the global publisher layout, like Post, File, Link, and Poll. Override the global publisher layout with a customized group publisher layout.

1. From Setup, enter *Groups* in the *Quick Find* box, then select *Group Layouts*.
2. Click **Edit** next to the group layout you want to customize, or click **New** to create a layout.
3. Click **override the global publisher layout** or  in the Quick Actions in the Publisher or Actions in the Salesforce1 Action Bar section. Drag and drop actions between the palette and the publisher layout to add, remove, and reorder actions.

Changes to the Quick Actions in the Publisher section appear in the full Salesforce site. Changes to the Actions in the Salesforce1 Action Bar section appear in Salesforce1. In groups that allow customers, the publisher only shows standard actions.

Example: Add the Announcement, Add Record, and Add Member actions to the group publisher.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

USER PERMISSIONS

To customize Chatter group layouts:

- “Customize Application”

Now users can select these actions directly from the publisher.

Topics on Objects

Topics on objects is one of the most powerful ways to crowdsource your company's key themes and issues.

Your employees can attach topics to object records based on what they're seeing in the field and from working with customers, giving your business insight into the voice of your customer. And because topics can cross objects, they can provide connections across people, conversations, and records.

Users can also add topics to posts. Topics on posts help users organize posts and increase their visibility. Topics are great for discussing a particular issue, theme, or subject, that isn't limited to a particular group of people. For example, if your company has created a year-long goal around volunteering with local schools, create a topic to allow your entire company to share posts, photos, and updates related to the company goal. Groups, on the other hand, are good for conversation with a specific gathering of people. Collaboration within a group can cover any number of subjects, but always involves the same key team members. For example, if your company is planning a holiday party, a private group for the party committee lets them plan the event without the rest of the company learning the details in advance.

EDITIONS

Available in: Salesforce Classic

Available in all editions

[Enable and Configure Topics for Objects](#)

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

[Delete Topics](#)

People with appropriate permissions can delete topics directly from topic detail pages.

[Topics Privacy](#)

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

Enable and Configure Topics for Objects

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

Administrators can enable topics for accounts, assets, campaigns, cases, contacts, contracts, files, leads, opportunities, orders, solutions, custom objects, and English articles. For each object type, administrators specify which fields to use for topic suggestions.

 **Note:** Topics are only supported on English Knowledge articles.

 **Warning:** When topics are enabled for an object, public tags are disabled for records of that object type.

1. From Setup, enter *Topics for Objects* in the **Quick Find** box, then select **Topics for Objects**.
2. Select an object.
3. At the right, select **Enable Topics**.
4. Select the text fields that you want to use for topic suggestions. (From a combination of the selected fields, up to 3 suggestions are made from the first 2,000 characters.)
5. Click **Save** to save changes for all objects.

Now, users with access to the enabled objects and appropriate topics permissions can:

- See topic assignments and suggestions on records of that object type
- Add and remove topics from records of that object type
- Use topics on records of that object type to filter their list views

Additionally, if your organization uses Chatter, users can click any topic assigned to a record to go directly to a topic page. There, they'll find other records on the topic, people who are knowledgeable about the topic, and other related information.

USER PERMISSIONS

To enable topics for objects:

- "Customize Application"

Delete Topics

People with appropriate permissions can delete topics directly from topic detail pages.

Because topic names and descriptions are not private, administrators might want to delete topics for compliance reasons or to remove inappropriate content. When deleting topics, consider these points.

- Topics are permanently deleted. They aren't sent to the Recycle Bin.
- Deleted topics are removed from search results, the topics list, all posts and records, Recently Talked About topics, Related Topics, and your users' favorites. Deleted topics are removed from Trending Topics after the next calculation.
- Users can reintroduce a topic after it's been deleted.

To delete a topic:

1. Navigate to the topic detail page.
2. In the upper-right, click , and choose **Delete**.

Topics Privacy

Topic names and descriptions are not private, even those that appear solely in private groups and on records. Posts and records with topics have the same security and privacy as those without topics.

This table explains where you can see all topics and where you can't see topics used solely in private groups or on records.

User interface element	Shows all topics	Doesn't show topics used solely in private groups and on records
Topics list	✓	
Topic search results	✓	
Topic reports	✓	
Knowledgeable User reports		✓
Related Topics on the topic detail page	✓

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

USER PERMISSIONS

To delete standard topics:

- "Modify All Data"
- OR
- "Delete Topics"

To delete topics also used as navigational or featured items in a community:

- "Create and Set Up Communities"
- OR
- "Manage Communities"

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

User interface element	Shows all topics	Doesn't show topics used solely in private groups and on records
Recently Talked About topics on group detail pages	✓	
Recently Talked About topics on profiles		✓
Trending Topics on the Chatter page		✓
Topic suggestions when adding topics to a post		✓
People talking number in the topics list and in topic suggestions when adding topics to a post		✓

 **Note:** You can't use topics in unlisted groups. You can add a hashtag topic when writing a post or comment in an unlisted group, and the topic will be formatted as a link after you post. However, a topic detail page isn't created, and the link won't work.

Customize Chatter Influence

Customize activity thresholds for posts, comments, and likes to improve the Chatter influence calculation.

Chatter activity statistics include how many posts and comments users made, how many comments they received, and how many people liked their posts and comments.

1. From Setup, enter *Influence* in the *Quick Find* box, then select **Influence**.
2. Change the minimum activity thresholds.
All minimum activity thresholds default to zero. If you set higher thresholds, users who don't meet all three minimums are considered observers who aren't counted when calculating influence rank. Users who do meet all three minimums but have relatively low activity are also considered observers, but they're counted when calculating influence.
3. Click **Save**.
Chatter influence is recalculated when you save these values.

 **Warning:** Use caution when setting new thresholds because users' influence levels can change immediately.

Guidelines for Deleting Your Users' Chatter Messages

Salesforce administrators with the "Manage Chatter Messages" permission can access all users' private messages via the SOAP API. You can view and delete any message (such as for compliance purposes).

When you delete private Chatter messages, consider these guidelines.

- Messages are hard deleted. They aren't sent to the recycle bin.
- Deleted messages aren't included in message search results.
- Deleting a message that resulted from sharing a file with someone does not delete the file itself.
- If all messages in a conversation are deleted, the conversation isn't shown in My Messages and can't be retrieved via the Chatter REST API.
- If replies via email are enabled and a user replies to a deleted message, Chatter returns an error notification and doesn't process the reply message.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions for users with a Salesforce license, and **Database.com** Edition for users with a Database.com Admin license

Report on Chatter with the Dashboards Package

The Salesforce Chatter Dashboards package packs a punch! You get multiple dashboards, over 100 reports, and even custom report types that you can use to monitor and manage Chatter adoption and engagement in your organization.

Use the Salesforce Chatter Dashboards package to:

- View overall Chatter adoption with detailed metrics and monthly trends
- Monitor group adoption with membership and engagement metrics, such as the number of posts, comments, likes, and the top contributors
- Monitor content creation and user engagement, such as the top files, trending content, and the top contributors
- View topic taxonomy and monitor topic assignments, including the most assigned topics and the top assigners
- Create customized reports using out-of-the-box groupings such as department, country, role, or profile

You can install the [Salesforce Chatter Dashboards](#) from AppExchange.

 **Tip:** For installation instructions, detailed information about the reports, and upgrade instructions, see [Get Started with Chatter Dashboards](#).

Once the package is installed, you can access your new dashboards, reports, and custom report types alongside all your other Salesforce dashboards and reports.

As newer versions of the package become available, you can upgrade your package by reinstalling the package. If you customized any of the reports and dashboards, fear not; your customizations are retained during upgrade.

Dashboard	Description
Overview	See the overall state of Chatter at a glance.
Adoption by Department	Get an overview of department metrics for groups, user profiles, and topic adoption.
Files	Track file uploads, downloads, engagement, and content creators.
Groups	Monitor feed and member activity in Chatter groups.
Management	Track unanswered questions and posts, group growth rates, and the overall health of your groups.

EDITIONS

Available in: **Professional, Enterprise, Unlimited, Developer, and Performance** Editions

Dashboard	Description
Q&A	Track recent activity for questions, answers, and best answers posted in groups.
Topics	Track your Chatter topics activity.
User	Track recent activity for questions, answers, and best answers in user profiles.

 **Note:** The reports in this package return data for all Chatter. If your organization is using a community, we recommend that you install the [Salesforce Communities Management \(for Communities with Chatter\)](#) package instead. This package allows you to report on Chatter usage in your internal organization and Chatter usage in your community.

Chatter Administration FAQs

Can I connect multiple Salesforce organizations using Chatter?

Chatter is only available on a per-organization basis. Only users within the same Salesforce organization can communicate with each other using Chatter. However, you can add people outside of your company's email domains to use Chatter in your organization as a customer in groups you own or manage.

Can portal users use Chatter?

Chatter is not available to portal users in partner portals or Customer Portals. Chatter is available to customer users and partner users in Communities.

Can I take control of the Chatter Expert user?

As an administrator, you can either deactivate or take over the Chatter Expert user and provide posts to your company. By default, the Chatter Expert posts when a new user chooses to start one of the groups suggested by Chatter on the Groups you can join page.

 **Note:** This only applies to organizations created after Summer '11.

To deactivate the Chatter Expert:

1. Click **People > Find People**.
2. Search for Chatter Expert.
3. Click **Manage User > Deactivate User**.

To take control of the Chatter Expert so that you can send and receive posts:

1. Click **People > Find People**.
2. Search for Chatter Expert.
3. Change the email address to your own.

Can I Stop a User From Creating Chatter Groups?

If there are users that shouldn't be able to create groups, you can prevent them from doing so.

The ability to create groups (public, private, or unlisted) is controlled by the permission "Create and Own New Chatter Groups." The permission is enabled by default and administrators can disable it on the appropriate users' profiles.

After an administrator disables this permission, a user can no longer create or be assigned as owner of new Chatter groups. If the user was already the owner of any groups, that ownership is not revoked.

SEE ALSO:

[Edit Profiles in the Original Profile Interface](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Enterprise, Professional, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Can I change the location of Chatter feeds using the page layout editor?

Currently, you can't change the location of Chatter feeds. However, users can click the  **Hide Chatter** link in a Chatter feed to hide the feed, and the  **Show Chatter** link to show the feed.

Can I prevent certain words from being used in Chatter posts?

No, not using the standard Chatter interface. However, there are third-party apps like [Chatter Blacklist](#). This app lets you create a "blacklist" of words, phrases, or custom expressions (for example, credit card numbers) that are prohibited in Chatter posts and comments. These words can prevent a post, be substituted with approved words or phrases, or be recorded for audit purposes.

Salesforce Support doesn't provide troubleshooting for third-party applications/packages unless specifically stated in the provider information of the application.

Do Chatter posts and files count toward my storage use?

Chatter feed posts, tracked changes, and comments don't count toward your data storage. However, any files and photos you upload are counted against file storage. Files uploaded on the Files tab are also counted against file storage.

Salesforce Files

Add the Files Related List to Page Layouts

Add the Files related list to your page layouts for accounts, opportunities, leads, cases, and other objects so users can attach files to records while leveraging the rich features and flexibility of Salesforce Files. Use files instead of attachments to make the files available outside of the context of the individual record. The file owner or admin still decides sharing settings for the file.

You can customize page layouts to include the Files related list. This allows users to add files to a record and see a list of files associated with the record such as a lead or a case.

1. From Setup, enter *Object Manager* in the **Quick Find** box, then select the name of the object you want to add the Files related list to (such as Opportunity).
2. Click **Page Layouts**.
3. Click the page layout you want to customize.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

4. In the list of available items in the left pane, click **Related Lists**.
5. Drag **Files** to the Related Lists section.
6. Click **Save**.

Prevent Users from Attaching Salesforce Files

You can disable the **Select Files from Salesforce** administrative permission in user profiles. Disabling this permission prevents users with that profile from selecting Salesforce files when attaching files to feed posts, records, or other objects. Another option is to apply the permission in a permission set. Users who have this permission disabled are still able to upload files from their local drive.

Disable or enable the user permission in Setup. Enter *User Profiles* in the **Quick Find** box, then select **Profiles**. Click **Edit** next to the user profile you want. In the Administrative Permissions section, enable or disable the Select Files from Salesforce checkbox. Click **Save**.

To apply the permission in a permission set, from Setup enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**. Edit the permission set and apply the Select Files from Salesforce permission.

EDITIONS

Available in: All Editions

Permission sets available in:
Contact Manager,
Professional, Group,
Enterprise, Performance,
Unlimited, Developer, and
Database.com Editions

Salesforce Files Sync

Enable Salesforce Files Sync

Enable Salesforce Files Sync to allow users to sync files between their devices and Salesforce.

1. From Setup, enter *Salesforce Files* in the **Quick Find** box.
2. Under **Settings**, select **General Settings**.
3. At the bottom of the Salesforce Files Sync Settings page, click **Edit**.
4. Select **Enable Files Sync**.
5. Click **Save**.

Salesforce Files Sync is now enabled for your organization.

Next, grant users access to Salesforce Files Sync.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise,**
Performance, Unlimited,
and **Developer** Editions

USER PERMISSIONS

To enable Salesforce Files Sync:

- “Customize Application”

Grant Users Access to Salesforce Files Sync

After enabling Salesforce Files Sync, grant your users access by either creating and assigning a permission set or by granting permission on profiles.

[Grant Access to Salesforce Files Sync Using a Permission Set](#)

Permission sets are an easy way to enable Salesforce Files Sync for users.

[Enable Salesforce Files Sync for Profiles](#)

Enable Salesforce Files Sync for all users with particular standard profiles, or for custom profiles specific to your Salesforce organization.

USER PERMISSIONS

To enable Salesforce Files Sync for users:

- “Customize Application”

Grant Access to Salesforce Files Sync Using a Permission Set

Permission sets are an easy way to enable Salesforce Files Sync for users.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click **New**.
3. Fill out the required fields.

Label

The unique label for the permission set. For example, you might call this permission set “Salesforce Files Sync Enabled”.

API Name

The unique name used by the Force.com API.

Description

A description of this permission set. For example, “Enables Salesforce Files Sync for assigned users. Salesforce Files Sync allows users to automatically sync files across devices.”

4. Select a user license option.

Note: If you plan to assign this permission set to users with both Salesforce and Chatter Only licenses, select — *None* —.

5. Click **Save**.
The overview page for your new permission set appears.
6. Under System, click **System Permissions**.
7. At the top of the System Permissions list, click **Edit**.
8. Select **Sync Files**.
9. Click **Save**.

Assign the permission set to users who should have access to Salesforce Files Sync.

USER PERMISSIONS

To enable Salesforce Files Sync for profiles:

- “Customize Application”

Install Salesforce Files Sync

To sync files between their computers and Salesforce, users must install the Salesforce Files Sync client, which is available for desktops and laptops. Users can also access synced files from Salesforce1.

To use Salesforce Files Sync, we recommend:

System Requirement	Windows	Mac
Supported operating systems	Microsoft® Windows® 7 and later	Apple® Mac OS X 10.8 Mountain Lion and later
Processors	2.33 GHz or faster x86-compatible processor, or Intel® Atom™ 1.6 GHz or faster processor for netbook devices	Intel® Core™ Duo 1.83 GHz or faster processor
Memory	512 MB of RAM (1 GB recommended)	512 MB of RAM (1 GB recommended)
Hard drive	4 GB of free space recommended for sync operations	4 GB of free space recommended for sync operations

Users can download Salesforce Files Sync from Chatter.

1. From your personal settings, enter *Files Sync* in the **Quick Find** box, then select **Salesforce Files Sync**. Multiple results? Select the one under Personal Setup.
2. Click the **Download** button.
3. Follow the installation instructions for your operating system.
4. Log in with your Salesforce credentials.

SEE ALSO:

[Personalize Your Salesforce Experience](#)

Configure File Upload and Download Security Settings

For security reasons, your organization may want to configure the way some file types are handled during upload and download.

To manage file upload and download settings:

1. From Setup, enter *File Upload and Download Security* in the **Quick Find** box, then select **File Upload and Download Security**.
2. Click **Edit**.
3. To prevent users from uploading files that may pose a security risk, select **Don't allow HTML uploads as attachments or document records**.
This setting blocks upload of these MIME file types: `.html`, `.htt`, `.mht`, `.svg`, `.swf`, `.thtml`, and `.xhtml`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To configure file upload and download settings:

- “Customize Application”

Warning: Keep the following in mind when selecting this option:

- If your organization uses the partner portal to give your partner users access to Salesforce, we don't recommend enabling this setting. Enabling this setting prevents your organization from customizing the appearance of your partner portal.
- HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.
- After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.

4. Set download behavior for each file type:

- Download** (recommended): The file, regardless of file type, is always downloaded.
- Execute in Browser:** The file, regardless of file type, is displayed and executed automatically when accessed in a browser or through an HTTP request.
- Hybrid:** Salesforce Files are downloaded. Attachments and documents execute in the browser.

5. Click **Save**.

Tips and Best Practices for Administering Salesforce Files Sync

After you've enabled Salesforce Files Sync for your users, you have access to administrator tools that help you monitor usage and access.

View When and How Salesforce Files Sync is Being Used

Once Salesforce Files Sync has been enabled for users, you may want to review how often the application is being accessed from the desktop, or how files are being shared.

- Logins to the Salesforce Files Sync desktop application are noted in the Login History page under the Application column as "Salesforce Files". To view these logins, you can either export your organization's login history to a CSV file, or create a custom list view with the Application column displayed prominently.
- An individual user's login history is available on their User detail page in the Login History related list.

Revoke Access to Salesforce Files Sync

Things happen—users have their laptops stolen, people leave the company. When these inconveniences arise, you have a few courses of action to revoke access to Salesforce Files Sync.

- On mobile devices, synced files are included in the Salesforce1 application, and therefore, if mobile security has been compromised, you should revoke that user's access to the Salesforce1 application.
- On desktop and laptop computers, Salesforce Files Sync is an installed application that syncs files in a folder called "Salesforce Files Sync" with Salesforce. When you disable the "Sync Files" permission for an individual user, the files in the user's Salesforce Files Sync folder will remain on their computer, but will no longer sync with Salesforce.

To make disabling Salesforce Files Sync for individual users easier, we recommend [enabling Salesforce Files Sync using a permission set](#) on the user record rather than [enabling the feature for profiles](#).

SEE ALSO:

[Monitor Login History](#)

Regenerate a Content or File Preview

If content or a file doesn't have a preview or the preview quality is poor, try to regenerate the preview.

The file is added to a queue while the regeneration is in progress. The existing preview is deleted immediately and users don't a preview while the file is in the queue.

You can't regenerate a preview for encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB.

1. From Setup, enter *Regenerate Previews* in the *Quick Find* box, then select **Regenerate Previews**.
2. Specify either the Content Document ID or the Content Version ID.
If you specify the Content Document ID but don't specify the Version Number, the latest version is used.

To see whether the preview regenerated successfully, navigate to the file's detail page.

Salesforce Files Connect

The Files Connect Setup Process

With Files Connect, Salesforce users can access, share, and search external data from systems like Google Drive, SharePoint, or Box. The setup process differs for cloud-based and on-premises external data sources.

 **Tip:** For detailed visuals, tips, and troubleshooting, see the Files Connect [Setup Guide](#) and [User Guide](#).

First, enable Files Connect, and let users access related external data sources

1. [Enable Salesforce Files Connect for Your Organization](#).
2. [Let Users and Administrators Access Files Connect Data Sources](#).

For cloud-based data sources, create an authentication provider, and then define the source

If you use Google Drive:

1. [Create an Authentication Provider for Google Drive](#).
2. [Define an External Data Source for Google Drive](#).

If you use Microsoft's cloud systems:

1. [Create an Authentication Provider for SharePoint Online or OneDrive for Business](#).
2. [Define an External Data Source for SharePoint Online or OneDrive for Business](#).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer**

USER PERMISSIONS

To regenerate a preview:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

If you use Box:

1. [Create an Authentication Provider for Box](#)
2. [Define an External Data Source for Box](#)

For on-premises data sources, set up a Secure Agent, and then define the source

 **Note:** This process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, [see Salesforce Help](#).

1. [Set Up a Secure Agent for SharePoint 2010 or 2013](#) on a Linux or Windows server to securely connect Salesforce to data stored behind your firewall.
2. [Define an External Data Source for SharePoint 2010 or 2013](#).

Include the external data in global search

To let users access external data in global Salesforce searches, you’ll need to [create an external object and give users access to its fields](#). This is an optional step, but highly recommended to best integrate external data with Salesforce.

For per-user data sources, have users authenticate in Salesforce

If you specified per-user authentication for a data source and exposed it through profiles or permission sets, ask authorized users to [provide their data source credentials](#).

Start accessing, sharing, and searching external files!

Now users can [access and share external files](#) via the Files tab and feed, and [search for them](#) right alongside their Salesforce content.

Enable Salesforce Files Connect for Your Organization

Let users search and share files from external systems like Google Drive and SharePoint. To complete the process, Chatter must be enabled for both the organization and the profile of the administrator who performs these steps.

1. From Setup, enter *Files Connect Settings* in the **Quick Find** box, then select **Files Connect Settings**.
 2. Click **Edit**, and then select **Enable Files Connect**.
 3. For File Sharing, select one of the following:
 - **Copy** stores a copy of external files in Salesforce. If files are shared with a Chatter group, all group members can access the files, even if they lack access to the external system.
 - **Reference** points to external files stored outside Salesforce. No previews are available in Chatter, and file downloads require user access to the external system. (Users must enter credentials for the system in the Authentication Settings for External Systems section of personal setup).
-  **Tip:** Choose the Copy mode if your organization shares files with external customers or partners. Choose the Reference mode to reflect access restrictions from the external system in Salesforce.

Regardless of sharing mode, Chatter doesn't reflect file revisions in external systems. However, Reference mode points to the latest versions in those systems.

[Let Users and Administrators Access Files Connect Data Sources](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in:

Professional, Enterprise, Performance, Unlimited, and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable Salesforce Files Connect:

- "Customize Application"

Let Users and Administrators Access Files Connect Data Sources

After you enable Files Connect, give users and administrators permission to access specific external data sources from Salesforce.

 **Tip:** Though you can provide access to data sources via permission sets or profiles, permission sets let you more quickly adjust access for several types of users. Regardless of which method you choose, be sure to give administrators access so they can configure data sources.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets** or enter *Profiles* in the **Quick Find** box, then select **Profiles**.

2. Create a new permission set or profile, or click an existing one.
If you use a permission set, User License must be set to the default option, "None."

3. For a permission set, click **System Permissions**, then click **Edit**.
For a profile, click **Edit**, and scroll down to the Administrative Permissions section.

4. Do either of the following, and then click **Save**.

- To access cloud-based data sources like SharePoint Online, select **Files Connect Cloud**.
- To access on-premises data sources like SharePoint 2010 or 2013, select **Files Connect On-premises**.

 **Note:** The on-premises permission is available with a paid permission set license, "Files Connect for on-premises external data sources." To enable the license for your organization, see [these brief instructions](#) in Salesforce Help.

5. For a permission set, click **Manage Assignments** in the toolbar at the top of the page. Then click **Add Assignments**, select users for the permission set, and click **Assign**.

 **Important:** Include any administrators who need to configure external data sources.

6. If you haven't already, define the external data sources for your organization:

- [Define an External Data Source for SharePoint Online or OneDrive for Business](#)
- [Define an External Data Source for SharePoint 2010 or 2013](#)
- [Define an External Data Source for Google Drive](#)
- [Define an External Data Source for Box](#)

 **Note:** If you select an identity type of Named Principal for the data source, skip the steps below. But if you select Per User, read on.

7. In Setup, return to the detail page for the permission set or profile. Then do either of the following:

- For a permission set, in the Apps section, click **External Data Source Access**.
- For a profile, go to the Enabled External Data Source Access related list.

8. Click **Edit**, add specific data sources to the Enabled External Data Sources list, and click **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To set permissions:

- "Customize Application"

To use Files Connect for on-premises external data sources:

- "API Enabled"

(Users enter their credentials when they first access external data sources, or from their personal settings on the Authentication Settings for External Systems page.)

Create an Authentication Provider for Box

To use Box as an external data source, you must create an authentication provider for it in Salesforce.

Create an Authentication Provider in Salesforce

1. In Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For *Provider Type*, select **Open ID Connect**, and then set the following options:
 - *Name*—Enter the name you want to appear in Salesforce.
 - *URL Suffix*—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the *Name* entry.
 - *Consumer Key*—Enter any placeholder value. You will fill this in after you create the Box application in Step 5.
 - *Consumer Secret*—Enter any placeholder value. You will fill this in after you create the Box application in Step 5.
 - *Authorize Endpoint URL*—Enter `https://app.box.com/api/oauth2/authorize`
 - *Token Endpoint URL*—Enter `https://app.box.com/api/oauth2/token`
 - *User Info Endpoint URL*—Leave empty.
 - *Default Scopes*—Leave empty.
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the *Callback URL* entry to a text file. (You'll use this when creating the Box application.)
5. [Create a Box application](#). Then return to step 6.
6. When you have created the Box application, edit the Salesforce Auth Provider and replace the following values with those from the Box app.
 - *Consumer . Key*: the Box `client_id`.
 - *Consumer . Secret*: the Box `client_secret`.
7. Click **Save**. Your Box authentication provider is now ready to be used.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To create authentication providers:

- "Customize Application"
- AND
- "Manage Auth. Providers"

Create a Box Application

1. Using the credentials of your Box admin account, log in to <https://app.box.com/developers/services>.
2. Click **Create a Box Application**.
3. Enter a project name, select Box content, and click **Create Application**.
4. Click **Configure your application**.
5. In the **redirect_uri** field, paste the Salesforce callback URL specified in the [OAuth2 specification](#).
6. Copy the **client_id** and **client_secret** values to a text file. Enter these values at step 6 of Create an Authentication Provider in Salesforce.

Define an External Data Source for Box

Let users access their Box content from Files home, feed posts, and search.

1. From Setup in Salesforce Classic, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Box
Identity Type	The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)
Authentication Protocol	The protocol used to access Google Drive. Select OAuth 2.0 .
Authentication Provider	Enter the Box Authentication Provider .
Scope	Leave blank.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Start Authentication Flow on Save	Select to immediately test the settings above.

Create an Authentication Provider for Google Drive

To use Google Drive as an external data source, you must create an authentication provider for it in Salesforce. The process begins with creating a related project in the Google Developers console.

Create a Project in the Google Developers Console

- Using the credentials of your Google App for Work admin account, log in to <https://console.developers.google.com/project>.
- Click **Create Project**.
- Enter a project name, and click **Create**.
- In the project dashboard, click **Enable and manage APIs** to access the API manager.
- In the API manager, go to the Google APIs tab and search for *Drive API*.
- Click **Drive API** in the search results, then click **Enable API**.
- Click **Credentials**, located in the left-hand menu.
- In the OAuth Consent Screen tab, enter a valid email address and product name. Then click **Save**.
- In the Credentials tab, click **Add credentials** and select `OAuth 2.0 client ID`.
- Select `Web application` and click **Create**.
- Copy the client ID and client secret values to a text file. You'll use these values when creating an authentication provider in Salesforce.

- "Customize Application"
AND
"Manage Auth. Providers"

Create an Authentication Provider in Salesforce

- In Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
- Click **New**.
- For `Provider Type`, select **Open ID Connect**, and then set the following options:
 - `Name`—Enter the name you want to appear in Salesforce.
 - `URL Suffix`—Enter the suffix at the end of the URL path. For example, in the path, `https://login.salesforce.com/services/authcallback/00Dx0000000001/MyGoogleProvider`, the suffix is "MyGoogleProvider"
 - `Consumer Key`—Enter the client ID you copied when creating the Google project.
 - `Consumer Secret`—Enter the client secret you copied when creating the Google project.
 - `Authorize Endpoint URL`—Enter `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`
 - `Token Endpoint URL`—Enter `https://accounts.google.com/o/oauth2/token`
 - `Default Scopes`—Enter `openid email profile https://www.googleapis.com/auth/drive`

4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the `Callback URL` entry to a text file. (You'll use this when editing the Google project.)

Edit the Project in the Google Developer Console

1. In the API Manager, click **Credentials**, located in the left-hand menu.
2. Click on the previously created Web application.
3. In the Authorized Redirect URIs section, add the Callback URL you copied when creating the authentication provider in Salesforce.
4. Click **Save**.

Define an External Data Source for Google Drive

Let Chatter users access their Google Drive content from the Files tab, feed posts, and search. Salesforce supports Google documents, spreadsheets, presentations, and drawings.

1. From Setup, enter *External Data Sources* in the `Quick Find` box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Google Drive
Identity Type	The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source..) Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.
Authentication Protocol	The protocol used to access Google Drive. Select OAuth 2.0 .

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
Authentication Provider	Enter the Google Drive authentication provider .
Scope	Leave blank.
Start Authentication Flow on Save	Select to immediately test the settings above.

Create an Authentication Provider for SharePoint Online or OneDrive for Business

To use one of Microsoft's cloud-based external data sources, you must create an authentication provider for it in Salesforce and register that provider in an Office 365 app.

To fully configure an authentication provider, complete these steps:

1. [Create an Authentication Provider Using Placeholder Values](#)
2. [Register an Office 365 app](#)
3. [Edit the Authentication Provider](#)

Create an Authentication Provider Using Placeholder Values

1. In Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.
2. Click **New**.
3. For *Provider Type*, select **Microsoft Access Control Service**, and then set the following options:
 - *Name*—Enter the name you want to appear in Salesforce.
 - *URL Suffix*—Enter a suffix you want to appear at the end of the URL path. By default, the suffix reflects the Name entry.
 - *Consumer Key*—Enter a placeholder value.
 - *Consumer Secret*—Enter a placeholder value.
 - *Authorize Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Token Endpoint URL*—Enter a placeholder that begins with *https*.
 - *Default Scopes*—Leave empty.
4. Click **Save**. Then, at the bottom of the Auth. Provider detail page, copy the *Callback URL* entry to a text file. (You'll use this when registering an Office 365 app.)

Register an Office 365 app

1. Log in to your Office365 account as an administrator, and go to one of the following URLs:

SharePoint Online

```
https://[your company name].sharepoint.com/[site collection path]/_layouts/15/appregnew.aspx
```

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To create authentication providers:

- "Customize Application"
AND
"Manage Auth. Providers"

OneDrive for Business

`https://[your company name]-my.sharepoint.com/_layouts/15/appregnew.aspx`

2. Set the following options:

- **App Type**—Select **An app running on a web server**.
- **Client Id**—Click **Generate**, and copy the generated value to a text file.
- **Client Secret**—Click **Generate**, and copy the generated value to a text file.
- **Title**—Enter a name for the app.
- **App Domain**—Enter the domain name of your Salesforce organization.
- **Redirect URL**—Enter the Callback URL you copied when creating the Authentication Provider in Salesforce.

3. Click **Create**.

Now you'll configure the newly created app to access SharePoint resources.

4. Go to one of the following URLs:

SharePoint Online

`https://[your company name].sharepoint.com/[site collection path]/_layouts/15/appinv.aspx`

OneDrive for Business

`https://[your company name]-my.sharepoint.com/_layouts/15/appinv.aspx`

5. Set the following options:

- **App Id**—Enter the Client Id you copied to a text file, then click **Lookup**.
- **Title**—Keep the default value.
- **App Domain**—Keep the default value.
- **Redirect URL**—Keep the default value..
- **Permission Request XML**—Enter a string with this format:

SharePoint Online

```
<AppPermissionRequests>
  <AppPermissionRequest Scope="[SCOPE]" Right="[PLACEHOLDER]"/>
</AppPermissionRequests>
```

OneDrive for Business

```
<AppPermissionRequests>
  <AppPermissionRequest Scope="http://sharepoint/content/tenant"
  Right="[PLACEHOLDER]"/>
  <AppPermissionRequest Scope="http://sharepoint/social/tenant" Right="Read"/>
</AppPermissionRequests>
```

6. For SharePoint Online, replace [SCOPE] with one of these values:

 **Important:** Office 365 recognizes only these scope URLs; copy them exactly, without changes.

- `http://sharepoint/content/sitecollection/web` to let users access a single site (but not its subsites).
- `http://sharepoint/content/sitecollection` to let users access a single site collection (including all subsites).
- `http://sharepoint/content/tenant` to let users access all site collections.

7. Replace [PLACEHOLDER] with one of these values:

- Read
- Write
- Manage
- Full Control

For details about the differences between permission levels above, [see the Microsoft website](#).

8. Click **Create**.

Edit the Authentication Provider

In Salesforce, you'll now replace the original placeholder values with the correct ones from the Office 365 app.

1. In Setup, enter *Auth. Providers* in the *Quick Find* box, then select **Auth. Providers**.

2. Click **Edit** next to the authentication provider you created previously.

3. Change the following values:

- *Consumer Key*—Enter the Client Id you copied to a text file.
- *Consumer Secret*—Enter the Client Secret you copied to a text file.
- *Authorize Endpoint URL*—Enter the URL of the OAuthAuthorize.aspx page in Office 365. The URL format is as follows:

SharePoint Online

```
https://[your company name].sharepoint.com/[site collection path]/_layouts/15/OauthAuthorize.aspx
```

OneDrive for Business

```
https://[your company name]-my.sharepoint.com/_layouts/15/OauthAuthorize.aspx
```

- *Token Endpoint URL*— Enter a URL in the following format:

SharePoint Online

```
https://accounts.accesscontrol.windows.net/[your company name].onmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/[your company name].sharepoint.com@[your company name].onmicrosoft.com
```

OneDrive for Business

```
https://accounts.accesscontrol.windows.net/[your company name].onmicrosoft.com/tokens/OAuth/2?resource=00000003-0000-0ff1-ce00-000000000000/[your company name]-my.sharepoint.com@[your company name].onmicrosoft.com
```

4. Click **Save**. Your authentication provider is now ready for use.

[The Files Connect Setup Process](#)

Define an External Data Source for SharePoint Online or OneDrive for Business

With Files Connect and Chatter, Salesforce can access content from Microsoft's cloud-based systems.

1. From Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Microsoft SharePoint Online or Files Connect: Microsoft OneDrive for Business .
Site URL	The URL of your SharePoint site, site collection, or web app.  Important: The URL must begin with <i>https</i> and end with the site name. (Don't copy the URL seen in the browser when accessing SharePoint.)
Exclude Other Site Collections	Accesses only the collection specified by the URL, ignoring any related collections.
Identity Type	The identity type used to authenticate to the external data source. Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.) Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.
Authentication Protocol	The protocol used to access SharePoint Online. Select OAuth 2.0 .

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To define an external data source:

- "Customize Application"

Field	Description
Authentication Provider	Enter the SharePoint Online authentication provider .
Scope	Leave blank.
Start Authentication Flow on Save	Select to immediately test your settings or to create an external object for this external data source.

SEE ALSO:

[The Files Connect Setup Process](#)

Set Up a Secure Agent for SharePoint 2010 or 2013

A Secure Agent provides secure communication between Salesforce and on-premises data in SharePoint 2010 or 2013.

 **Note:** The Secure Agent setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, [see Salesforce Help](#).

To fully configure a Secure Agent, complete these steps:

1. [Create a Connected App for the Secure Agent](#)
2. [Create a Profile and User Specific to the Secure Agent](#)
3. [Create the Agent in Salesforce, and Download the Installer to Your Server](#)
4. Install and Run the Agent on a [Windows Server](#) or a [Linux Server](#)
5. [Install Secure Agent Plug-ins for Your On-premises Data Source](#)
6. [Update Previously Installed Plug-ins](#)
7. [Import Any Required Certificates](#)
8. [Track and Troubleshoot Secure Agent Activity](#)

 **Tip:** For a visual walk-through, see this [video tutorial of Secure Agent setup](#).

Create a Connected App for the Secure Agent

1. In Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.
2. In the Connected Apps section, click **New**.
3. In the Basic Information section, enter the following settings:
 - `Connected App Name`—Enter a distinctive name like “Secure Agent App.”
 - `API Name`—Leave the default value.
 - `Contact Email`—Enter your administrator’s address.
4. In the API section, select **Enable OAuth Settings**, and enter the following settings:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an extra cost in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To set up a Secure Agent:

- “Customize Application”

- **Callback URL**—Enter `https://login.salesforce.com` for a production instance, or `https://test.salesforce.com` for a sandbox.
 - **Use Digital Signatures**—*Deselect* this option.
 - **Selected OAuth Scopes**—Add “Access and manage your data (api)” and “Perform requests on your behalf at any time (refresh_token, offline_access).”
5. Click **Save**.
 6. In Setup, enter *Connected Apps* in the **Quick Find** box, then select the option for managing connected apps.
 7. Next to the new app, click **Edit**, and then enter the following settings:
 - **Permitted Users**—Select “Admin approved users are pre-authorized.”
 - **IP Relaxation**—Select “Relax IP restrictions.”
 8. Click **Save**.

Create a Profile and User Specific to the Secure Agent

1. In Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Next to the Standard User profile, click **Clone**.
3. For **Profile Name**, enter a distinctive name like “Secure Agent profile.”
4. Click **Save**.
5. Next to the new profile, click **Edit**.
6. In the **Connected App Access** section, select the connected app you created for the agent.
7. In the **Administrative Permissions** section, select **Modify Secure Agents**.
8. Click **Save**.
9. In Setup, enter *Users* in the **Quick Find** box, then select **Users**.
10. Click **New User**.
11. For **Profile**, select the profile you created for the agent. Then complete the remaining required fields, and click **Save**.

 **Important:** Be sure to *deselect* “Generate new password and notify user immediately.”

Create the Agent in Salesforce, and Download the Installer to Your Server

1. In Setup, enter *Secure Agents* in the **Quick Find** box, then select **Secure Agents**.
2. Click **New Secure Agent**.
3. Enter a **Label** for the user interface and **Name** for the API.
 -  **Note:** Choose the label carefully, because you can't change it. Salesforce relies on a consistent label to remain connected to the agent.
4. For **Proxy User**, enter the user you created for the Secure Agent.
5. Click **Save**.
6. On the details page, click **Download Installer**, and then choose **Linux Agent** or **Windows Agent**.

7. In Setup, enter *Apps* in the *Quick Find* box, then select **Apps**, and click the name of the connected app you created. Then, in the API section, copy the Consumer Key value to a text file.
 8. To your server, copy the text file and the downloaded installer file (*sfdc-agent.zip* for Windows, or *sfdc-agent.run* for Linux).
-  **Important:** Make sure the server can access both Salesforce and your on-premises data source, and has Java 6.x or 7.x installed.

Install and Run the Agent on a Windows Server

1. Extract the files in *sfdc-agent.zip*. Then double-click *SecureAgentInstaller.exe*
2. Click **Next**, and enter an installation folder. Click **Next** again, and finish initial installation.
3. When the configuration window appears, enter proxy settings used to connect to Salesforce.
 -  **Tip:** To change proxy settings after installation (due to a new password for example), enter the `agent:proxyconfig` command in the agent interface.
4. For Login Server Type, choose **Production** or **Sandbox**.
 -  **Tip:** To later change this and following configuration settings, you must uninstall and reinstall the agent.
5. For OAuth Client Key, enter the Consumer Key value you copied to the text file.
6. For Encryption Settings, select one of the following:
 - **Generate** to randomly generate a 1,024-bit public/private key pair. See the [Re-use existing certificate](#) setting if you need another key size. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.
 - **Re-use existing keystore** to reuse a key pair from a previous agent installation. The keystore is in this location: `[agent installation folder]\etc\auth.jks`.
 -  **Note:** If you select an existing keystore, skip to step 10.
 - **Re-use existing certificate** to select your own certificate and private key. This option enables you to use a different key size. Contact Salesforce for more information.
7. In Salesforce, from Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
8. Click **Edit** next to the connect app, and select **Use Digital Signatures**.
9. Click **Choose File**, and select the *.509 certificate. Then click **Save**.
10. Return to the agent installer, and click **Next** to complete the installation.
11. Click **Install Agent as Service** to start the “Salesforce Secure Agent” service on your server.
 -  **Tip:** To access services in Windows, choose **Start > Administrative Tools > Services**.

Install and Run the Agent on a Linux Server

1. Run the installer using one of these commands:
 - Production instance:

```
./sfdc-agent.run
```

- Sandbox instance:

```
./sfdc-agent.run -l https://test.salesforce.com
```

- Production instance with your own public/private key pair:

```
./sfdc-agent.run -l https://login.salesforce.com -p [private key filename].PKCS8 -f [public key filename].X509
```

- Production instance with a keystore generated during a previous installation:

```
./sfdc-agent.run -l https://login.salesforce.com -j [path to *.jks file]
```

You'll find the *.jks file here: `[agent installation folder]/etc/auth.jks`

2. Follow the on-screen instructions to enter an installation folder and proxy settings.

 **Tip:** To change proxy settings after installation, enter the `agent:proxyconfig` command in the agent interface.

3. When the installer prompts you for an OAuth Client Key, enter the Consumer Key value you copied to the text file.

 **Note:** If you specified a keystore generated during a previous installation, skip to step 8.

4. If prompted, generate a random 1,024-bit public/private key pair. Then note the displayed path to the generated *.509 certificate file. You reference this path in the Salesforce connected app.

 **Note:** Contact Salesforce if you need to use a different key size.

5. In Salesforce, from Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.

6. Click **Edit** next to the connect app, and select **Use Digital Signatures**.

7. Click **Choose File**, and select the *.509 certificate. Then click **Save**.

8. Return to the agent installer, and press Enter to complete the installation.

9. Start the agent with this command: `[agent installation folder]/bin/start`

Install Secure Agent Plug-ins for Your On-premises Data Source

To connect a Secure Agent to an external data source in Salesforce, you need to install the necessary plug-ins.

1. In Setup, enter `Secure Agents` in the `Quick Find` box, then select **Secure Agents**.

2. Click an agent name to access its details page.

3. In the Secure Agent Plugins list, click **New**.

For SharePoint 2010 or 2013, you'll need to install the following plug-ins:

- Files Connect SharePoint
- Files Connect Remote Connector Service
- Secure Transport Client Service

4. To install a plug-in, select it from the Type menu, enter a distinctive name, and click **Save**. Repeat the process for each required plug-in.

Update Previously Installed Plug-ins

When plug-in updates are available, administrators receive weekly email notifications.

1. In Setup, enter *Secure Agents* in the **Quick Find** box, then select **Secure Agents**.
2. In the Secure Agent Plugins list, if the Update Available column states “Yes,” click **Edit** for that plug-in.
3. Select **Update to the recommended version on save**, and click **Save**.

Import Any Required Certificates

In the agent interface, you can press the TAB key to access a variety of commands. If your SharePoint server requires a self-signed certificate, or a certificated signed by an unofficial authority, you must use the `rcs:importcert` command. Then enter the path to import the self-signed certificate, or the root certificate of the authority, into the Secure Agent trust store.

The `rcs:listcert` command lists all certificates currently in the trust store, while `rcs:deletecert` deletes the specified certificate from the store.

Track and Troubleshoot Secure Agent Activity

Download log files to precisely monitor agent events.

1. In Setup, enter *Secure Agents* in the **Quick Find** box, then select **Secure Agents**.
2. Click the name of a previously created Secure Agent to open its detail page.
3. Click either of the following:
 - **Download Logs** to download a compressed .zip file containing text logs.
 - **Download Diagnostics** to see the current agent state, including the list of installed plug-ins and Java virtual machine status.

Ensure Access with Secure Agent Clusters

Secure Agent clusters provide failover protection, ensuring that Salesforce users can always access on-premises external data sources like SharePoint 2010 or 2013.

 **Note:** The Secure Agent setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, [see Salesforce Help](#).

Create the Secure Agent Cluster

1. Create multiple Secure Agents on different servers by repeating this process: [Set Up a Secure Agent](#).
2. From Setup, enter *Secure Agent Clusters* in the **Quick Find** box, then select **Secure Agent Clusters**.
3. Click **New Secure Agent Cluster**.
4. Enter a **Label** for the user interface and **Name** for the API.
5. To add available agents to the cluster, select them, and click **Add**.

Change the priority order in which agents are used by moving them up or down in the Selected Secure Agents list. The accessible agent with highest priority is used first.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an extra cost in: **Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To set up Secure Agent clusters:

- “Customize Application”

6. Click **Save**.

Check Cluster Status

1. From Setup, enter *Secure Agent Clusters* in the **Quick Find** box, then select **Secure Agents Clusters**.
2. Click a cluster name to access its details page.
3. Note the overall status for the cluster. Green indicates that all agents are accessible, yellow that some are, and red that none are.
4. Note the status of individual agents and these additional details:
 - The **Priority** column shows the order in which agents are used. To change priority, click **Edit**, and move agents up or down in the Selected Secure Agents list.
 - The **Active** column indicates which agent is currently in use.

Define an External Data Source for SharePoint 2010 or 2013

Let Salesforce access data in your on-premises system. Files Connect and Chatter make it possible.

 **Note:** This setup process requires a paid permission set license, “Files Connect for on-premises external data sources.” For information about permission set licenses, see [Salesforce Help](#).

1. From Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Files Connect: Microsoft SharePoint
Secure Agent	A service running on a Linux or Windows server on your intranet that lets you securely connect Salesforce to your on-premises SharePoint server. See Set Up a Secure Agent for SharePoint 2010 or 2013 .
Site URL	The URL of your SharePoint site, site collection, or web app.  Important: The URL must begin with <i>https</i> and end with the site name.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an extra cost in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To define an external data source:

- “Customize Application”

Field	Description
	(Don't copy the URL seen in the browser when accessing SharePoint.)
Identity Type	<p>The identity type used to authenticate to the external data source.</p> <p>Select Per User to require separate credentials for each user who accesses the data source. (Administrators must enable the data source for specific permission sets and profiles. Users then enter their credentials when first accessing the data source.)</p> <p>Select Named Principal to use the same set of credentials for every user who accesses the data source from Salesforce.</p>
Authentication Protocol	<p>The protocol required to access SharePoint.</p> <p>Select Password Authentication.</p> <p>(This option supports HTTP Basic and NTLM authentication.)</p>
Administration Username	<p>The username Salesforce uses to test the connection to SharePoint. You don't need to enter a SharePoint administrator's username. However, ensure that the credentials you use have adequate privileges to access the data source, perform searches, and return information.</p>
Administration Password	<p>The password Salesforce uses to test the connection to SharePoint.</p>

Note: Salesforce users can't access SharePoint 2010 if anonymous access is enabled for the web application.

[The Files Connect Setup Process](#)

Include a Files Connect Data Source in Global Search

Combine searches for Salesforce data with external data from Google Drive, SharePoint, or OneDrive for Business. Via the API, developers can automate the process with supported SOQL or SOSL queries.

To include external data in global searches or API queries, first create a related external object. External objects behave similarly to custom objects, but map to data stored outside Salesforce in an external system like SharePoint. Each external object maps to a data table, and the object fields map to accessible table columns.

 **Tip:** External objects support lookup relationships similar to custom objects, letting you integrate external data into related lists and other areas throughout Salesforce. For details, see [External Object Relationships](#).

To fully configure global search, complete these steps:

1. [Choose the Layout for Global Search Results](#)
2. [Create an External Object from an External Data Source](#)
3. [Give Users Access to the External Object Fields](#)

To automate search with SOQL or SOSL, review the supported queries for your data source:

- [SOQL and SOSL Support for SharePoint and OneDrive External Objects](#)
- [SOQL and SOSL Support for Google Drive External Objects](#)

Choose the Layout for Global Search Results

By default, Files Connect external objects use the standard search results layout for Chatter and the Files tab. If you want to display customized search layouts for these objects, complete these quick steps.

1. From Setup, enter *Files Connect Settings* in the **Quick Find** box, then select **Files Connect Settings**.
2. Select **Use External Object Search Layout**.

Create an External Object from an External Data Source

1. Define an external data source that supports search:
 - [SharePoint Online or OneDrive for Business](#)
 - [SharePoint 2010 or 2013](#)
 - [Google Drive](#)
 - [Box](#)
2. In Setup, enter *External Data Sources* in the **Quick Find** box, then select **External Data Sources**.
3. Click the data source name to access the details page.
4. Click **Validate and Sync**.

 **Note:** Note: If the **Validate and Sync** button is disabled, [edit the Authentication Settings for External Systems](#) on page 4859 to enable the **Start Authentication Flow on Save** checkbox.

5. Select the table named "items_[data source]." Then click **Sync** to create an external object that maps to the entire source.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create an external object and provide access to its fields:

- "Customize Application"

Now you deploy the object to make the data it contains available to users.

6. Choose **Build > Develop > External Objects**.
7. Click **Edit** next to the new external object.
8. At the bottom of the page, click **Deployed**, and then click **Save**.

Give Users Access to the External Object Fields

1. In Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.
2. Click [a permission set in which you enabled Files Connect](#).
3. In the Apps section, click **Object Settings**.
4. Click the name of the external object.
5. Click **Edit**, and enable the necessary Read permissions (for the object itself, and all fields you want to reveal in Salesforce).
6. Click **Save**.

SOQL and SOSL Support for SharePoint and OneDrive External Objects

SharePoint and OneDrive external objects support these standard fields and any custom fields you enable.

 **Note:** Queries on specific fields return only documents that the external data source indexed.

Field Name	Queryable	Sortable
Author	Yes	Yes
Comment	No	Yes
ContentLength	Yes	Yes
CreationDate	Yes	Yes
DisplayUrl	No	Yes
DownloadUrl	No	No
ExternalId	Yes	Yes
IsFolder	Yes	Yes
	 Note: Not supported for SharePoint 2010 or 2013.	
MimeType	Yes	Yes
Name	Yes	Yes
UpdateDate	Yes	Yes
UpdatedBy	Yes	Yes

 **Note:** You can also use `ParentId__c` as query criteria to retrieve the list of documents in a folder. However, that field isn't displayed in query results unless your query specifies a `ParentId__c` value.

SOQL and SOSL Support for Google Drive External Objects

Files Connect supports all standard Google Drive properties, but not custom properties. The following properties have different field names in Salesforce external objects:

Google Property	Salesforce Field
<code>alternateLink</code>	<code>DisplayUrl</code>
<code>createDate</code>	<code>CreationDate</code>
<code>description</code>	<code>Comment</code>
<code>downloadURL</code>	<code>contentStreamUri</code>
<code>editable</code>	<code>readOnly</code>
<code>fileSize</code>	<code>ContentLength</code>
<code>id</code>	<code>ExternalId</code>
<code>lastModifyingUserName</code>	<code>UpdatedBy</code>
<code>mimeType</code>	<code>MimeType</code>
<code>modifiedDate</code>	<code>UpdateDate</code>
<code>ownerNames</code>	<code>Author</code>
<code>originalFilename</code>	<code>contentStreamFileName</code>
<code>title</code>	<code>Name</code>

This subset of fields supports SOQL and SOSL queries. (None are sortable, reflecting limitations in the Google Drive API.)

- `CreationDate`
- `lastViewedByMeDate`
- `MimeType`
- `Name`

 **Note:** Google Drive queries on the `Name` field support only one wildcard, `%`. Searches using this wildcard match only name prefixes. For example, the title "HelloWorld" would be returned with the query `Name LIKE "Hello%"` but not `Name LIKE "%World"`.

- `sharedWithMe`

 **Note:** Queries on the `sharedWithMe` field with a value of "false" are not supported, protecting confidential data.

- `starred`

- UpdateDate

[Include SharePoint Custom Properties in Search, SOQL, and SOSL Queries](#)

Include SharePoint Custom Properties in Search, SOQL, and SOSL Queries

After you create an external object for a SharePoint data source, some special steps are needed to search or query any custom properties it contains.

Configuring Custom Properties in SharePoint

External objects in Salesforce let you select and filter on these custom properties from SharePoint:

- Custom columns defined in a Custom Content Type
- Metadata from Microsoft Word, Excel, and other Office documents

To search on these custom properties in Salesforce, a corresponding Managed Property must be created by a Sharepoint administrator.

- To display these properties in external object fields, or use them in SOQL or SOSL `SELECT` queries, set the corresponding Managed Property to `Retrievable`. (In Sharepoint 2010, this option is labeled, "Allow this property to be used in scopes.")
- To filter on these properties in external objects, or use them as query criteria in a SOQL or SOSL `WHERE` clause, set the corresponding Managed Property to `Queryable`.

Querying Resulting Fields in Salesforce

In the examples below, `CustomProperty` stands for the Custom column name defined in the Custom Content Type, or the Office document metadata name. `ManagedCustomProperty` stands for the corresponding Managed Property name.

SharePoint 2010

Use `CustomProperty` in the `SELECT` clause and `ManagedCustomProperty` in the `WHERE` clause. Two corresponding fields must exist for the external object in Salesforce: one for selecting, the other for filtering.

Here's a SOQL example:

```
SELECT CustomProperty FROM items_sp2010_x WHERE ManagedCustomProperty=...
```

SharePoint 2013 and Online

In most cases, `ManagedCustomProperty` can be used for both the `SELECT` and `WHERE` clause.

Here's a SOQL example:

```
SELECT ManagedCustomProperty FROM items_sp2013_x WHERE ManagedCustomProperty=...
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Files Connect for cloud-based external data sources is available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Files Connect for on-premises external data sources is available for an extra cost in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create an external object and provide access to its fields:

- "Customize Application"

However, for file types SharePoint doesn't index for search, such as .jpg, .png, and .pdf files, you must use `CustomProperty` in the `SELECT` clause and `ManagedCustomProperty` in the `WHERE` clause. As a workaround, you can define an alias on the Managed Property in SharePoint and format queries like this:

```
SELECT Alias FROM items_sp2013/Online WHERE Alias=...
```

 **Tip:** Normally, custom properties aren't displayed on external object detail pages—defining an alias also addresses this issue.

Boolean Custom Properties

When using boolean (Yes/No) custom properties with a corresponding Managed Property set to the Text type, the corresponding external object field must be set to the Text type as well. In filters, the values "0" and "1" equal false and true, respectively. For example:

```
WHERE customBooleanWithTextManagedProperty="1"
```

"0" and "1" are also displayed as results, however, so boolean custom properties should use a Managed Property type of YesNo. Set the corresponding external object field to Checkbox to query it with standard `true` or `false` values. For example:

```
WHERE customBooleanWithYesNoManagedProperty=true
```

Metadata in Microsoft Office Documents

The Sharepoint Search service returns all metadata from Office documents as strings, so corresponding external object fields must be set to the Text type.

Dates are returned in the format, MM/DD/YYYY hh:mm:ss AM/PM, (for example, "3/31/2015 9:59:00 PM"). To query on fields using the Date type, the external object must include a corresponding Date field for filtering, and a Text field for selecting.

Limitations for Specific SharePoint Property Types in Salesforce

All versions

- Number, Currency, and Choice multiple properties can't be selected for file types SharePoint doesn't index for search. By default, this includes image, video, and .pdf files, although .pdf files are natively indexed starting with SharePoint 2013.

SharePoint 2010

- Number, Choice multiple, and Currency properties can't be selected.
- Date properties can be selected but results are unlikely to be formatted in UTC (Coordinated Universal Time), so values may reflect a different time zone than expected.

SharePoint 2013

- Multiple Line of Text, URL, Date, and Choice Dropdown properties aren't queryable.
- Choice Dropdown, Choice multiple, URL, and Date properties can't be selected.

SharePoint Online

- Multiple Line of Text, URL, and Date properties aren't queryable.
- Choice multiple and URL properties can't be selected.

SEE ALSO:

[Include a Files Connect Data Source in Global Search](#)

Define a Simple URL External Data Source

If Chatter is enabled for your organization, Salesforce can access data hosted on another Web domain for use in the Files tab and feed.

1. From Setup, enter *External Data Sources* in the Quick Find box, then select **External Data Sources**.
2. Click **New External Data Source**. Then set the following options.

Field	Description
Label	A user-friendly name for the data source displayed in the Salesforce user interface.
Name	A unique identifier used to refer to this external data source definition through the API. The Name field can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
Type	Choose Simple URL .
URL	The URL of the server hosting data outside of Salesforce, which must begin with <i>http://</i> or <i>https://</i> .
Default External Repository	Used for SharePoint® Online®. If metadata is not accessible, use this field to create tables and default table fields.
Large Icon	Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources .
Small Icon	Specify an icon to easily identify the data source in the Salesforce user interface. First define the icon as a static resource in Salesforce. For more information, see Defining Static Resources .
Identity Type	The identity type used to authenticate to the external data source. Select Anonymous , which doesn't require users to provide credentials when accessing the data source.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To define an external data source:

- “Customize Application”

Field	Description
Authentication Protocol	The protocol required to access the data source. Select No Authentication .

 **Note:** Simple URL data sources can't be included in global search, so the "Validate and Sync" option isn't supported.

Chatter Desktop

Control Access to Chatter Desktop

Chatter Desktop is enabled for most organizations, but administrators can control access to Chatter Desktop.

1. From Setup, enter *Chatter Desktop Settings* in the Quick Find box, then select **Chatter Desktop Settings**.
2. Select `Enable Chatter Desktop` to allow users to access Chatter data from Chatter Desktop.
Deselect this option to block access to the Chatter Desktop self-installation page and prevent all instances of Chatter Desktop from accessing Chatter data.
3. Select `Allow Chatter Desktop Managed Installations Only` to prevent non-administrators from installing Chatter Desktop.
For example, select this option if your IT department plans to deploy Chatter Desktop to your organization.
4. Save your changes.

[Chatter](#)

[Install Chatter Desktop Managed Version](#)

[Configure Chatter Desktop Managed Version](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

Install Chatter Desktop Managed Version

Salesforce provides two Chatter Desktop installers: a standard version for individual installations and a managed version for enterprise deployments.

The following are the minimum requirements for using Chatter Desktop:

- Windows
 - 2.33GHz or faster x86-compatible processor, or Intel Atom™ 1.6GHz or faster processor for netbook devices
 - Microsoft® Windows® XP, Windows Server® 2003, Windows Server 2008, Windows Vista® Home Premium, Business, Ultimate, or Enterprise (including 64 bit editions) with Service Pack 2, or Windows 7
 - 512MB of RAM (1GB recommended)
- Mac
 - Intel® Core™ Duo 1.83GHz or faster processor
 - Mac OS X v 10.5, 10.6, or v10.7
 - 512MB of RAM (1GB recommended)

 **Important:** Chatter Desktop uses Adobe® Integrated Runtime (AIR®), Adobe's cross-platform runtime environment for desktop applications, and only runs on operating systems that Adobe AIR supports. Chatter Desktop does not run on operating systems that Adobe AIR does not support, such as 64-bit Linux. See the Adobe website for information on Adobe AIR.

The managed version of Chatter Desktop is ideal for enterprises deploying Chatter Desktop to users who don't have administrator privileges on their machines. The managed version:

- Doesn't automatically install AIR—your IT department must obtain a redistribution agreement from Adobe Systems Incorporated and deploy the required version of AIR before deploying Chatter Desktop
- Requires your IT department to accept the Chatter Desktop managed version end user license agreement on behalf of the users to which Chatter Desktop is deployed
- Doesn't automatically post to Chatter the first time Chatter Desktop launches
- Doesn't regularly check Salesforce for new versions

To install the managed version:

1. Deploy Adobe® Integrated Runtime (AIR®) version 2.6 or later (the latest version is recommended) to the machines on which you plan to deploy Chatter Desktop.

AIR is Adobe's cross-platform runtime environment for desktop applications, and is a prerequisite for Chatter Desktop.

 **Tip:** Visit these links before deploying AIR:

- AIR® overview:
http://www.adobe.com/devnet/air/articles/distributing_air_in_enterprise.html
- Information on obtaining an AIR® redistribution license from Adobe Systems Incorporated:
http://www.adobe.com/products/air/runtime_distribution1.html
- Installation information:
http://help.adobe.com/en_US/air/redist/WS485a42d56cd19641-70d979a8124ef20a34b-8000.html
- Administration information:
http://help.adobe.com/en_US/air/admin/WS485a42d56cd1964167ea49bd124ef17d52a-8000.html

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

- From Setup, enter *Chatter Desktop Settings* in the *Quick Find* box, then select **Chatter Desktop Settings**.
- Click the link to download the managed version.

Important: Chatter Desktop uses Adobe® Acrobat® Reader to preview PDF files. Before previewing files with Chatter Desktop, download Adobe Acrobat from [Adobe's website](#), install it, and open it at least once to complete the installation.

SEE ALSO:

[Control Access to Chatter Desktop](#)

[Configure Chatter Desktop Managed Version](#)

Configure Chatter Desktop Managed Version

Control Chatter Desktop settings by deploying an XML-based configuration file to each user's machine. The configuration in the file overrides the user's settings.

- Create a file named `.chatterdesktop`, add a `chatterdesktop` parent element with two child elements, `config` and `servers`.
- Inside the `config` element, create the child elements listed in this table and add an `default` and an `editable` attribute. Both attributes can have the value `true` or `false`.

To make a child element the default setting, set the element's `default` attribute to `true`. To allow users to change a default setting through the user interface, set the element's `editable` attribute to `true`.

Child Element	Description
<code>launchOnStartup</code>	Launches the application on startup.
<code>minimizeOnClose</code>	Minimizes the application on close.
<code>notifications</code>	Enables popup notifications.
<code>criticalAlerts</code>	Enables alerts for new feed posts and comments by highlighting the taskbar icon (Windows) or causing the dock icon to bounce (Mac OS).
<code>bringToFront</code>	Brings Chatter Desktop to the foreground for new feed posts and comments.
<code>alwaysOnTop</code>	Enables Chatter Desktop to always display in the foreground.
<code>chatWindowToFront</code>	Enables the chat window to display in the foreground when a new chat is received (Mac only).
<code>chatSoundEnabled</code>	Enables sounds for new chats received.
<code>playSoundForEveryMessage</code>	Enables sounds for all chats received.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, Developer,** and **Database.com** Editions

Salesforce CRM, Approvals, Chatter email notifications, Chatter Invitations, and customer invitations are not available in **Database.com**.

 **Note:** If the `default` attribute is set to `true` for `chatSoundEnabled` and `false` for `playSoundForEveryMessage`, a sound plays only for new chats received. If both are set to `true`, a sound plays for every chat received. If both are set to `false`, chat sounds are disabled.

3. If your organization uses instances of Salesforce other than Production and Sandbox, specify the servers that host those instances in separate `server` elements inside the `servers` element.

Inside each `server` element, include the following attributes:

- `label`—The name of the connection as you want it to appear in the user interface.
- `serverUrl`—The URL you use to log in to the instance. The URL must begin with `https://` and end with `salesforce.com` or `chatter.com`. For example, if your organization has a European division that you log into from `https://emea.salesforce.com`, enter that URL and name the connection `Europe`.
- `defaultServer`—Set to `TRUE` to make this server the default instance to which Chatter Desktop connects.

4. Test the `.chatterdesktop` configuration file.

a. Copy the `.chatterdesktop` configuration file to the user directory on your machine. The user directories are:

- Windows—`c:\Documents and Settings\` (Windows XP) or `C:\Users\` (Windows 7)
- Mac OS—`/Users/`
- Linux—`/home/`

b. Launch Chatter Desktop and verify that it functions correctly. See [Chatter Desktop Troubleshooting Tips](#) if there are problems.

5. Copy the `.chatterdesktop` file to the user directory on every machine running Chatter Desktop in your organization.

 **Example:** The following is a sample configuration file:

```
<chatterdesktop>
  <config>
    <launchOnStartup default="false"
      editable="false"/>
    <minimizeOnClose default="false"
      editable="true"/>
    <notifications default="true"
      editable="true"/>
    <criticalAlerts default="false"
      editable="true"/>
    <bringToForeground default="false"
      editable="true"/>
    <alwaysOnTop default="false"
      editable="false"/>
    <chatWindowToForeground default="false"
      editable="false"/>
    <chatSoundEnabled default="true"
      editable="true"/>
    <playSoundForEveryMessage default="true"
      editable="true"/>
  </config>
</chatterdesktop>
```

```

</config>

<servers>
  <server label="Europe"
    serverUrl="https://emea.salesforce.com"
    defaultServer="true"/>
  <server label="Production"
    serverUrl="https://login.salesforce.com"
    defaultServer="false"/>
</servers>
</chatterdesktop>

```

Chatter Licenses

Chatter User Licenses

All standard Salesforce licenses allow free Chatter access for everyone in your organization. Salesforce also offers Chatter-specific licenses: Chatter External, Chatter Free, and Chatter Only (also known as Chatter Plus).

Chatter External

This license is for users who are outside of your company's email domain. These external users, also called customers, can be invited to Chatter groups that allow customers. Customers can access information and interact with users only in the groups they're invited to. They have no access to Chatter objects or data.

Chatter Free

The Chatter Free license is for users who don't have Salesforce licenses but need access to Chatter. These users can access standard Chatter items such as people, profiles, groups, and files, but they can't access any Salesforce objects or data. Chatter Free users can also be Chatter moderators.

Chatter Free users don't see tabs like other Salesforce users. Chatter Free users access feeds, people, groups, and files using the links in the sidebar of the page.

Salesforce administrators can upgrade a Chatter Free license to a standard Salesforce or Chatter Only license at any time. You can't convert a standard Salesforce or Chatter Only license to a Chatter Free license.

EDITIONS

Available in: Salesforce Classic

Chatter External and Chatter Free licenses are available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Chatter Only (also known as Chatter Plus) licenses are available in: **Professional, Enterprise Unlimited, and Performance** Editions

Chatter Only (Chatter Plus)

The Chatter Only license is also known as the Chatter Plus license. It is for users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter. Chatter Plus users can be Chatter moderators and have access to standard Chatter people, profiles, groups, and files pages. They also can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects
- Add records to groups

By default, the tabs for standard Salesforce objects are hidden from Chatter Plus users. Expose these tabs, if you want to make them available to Chatter Plus users. For more information on Chatter Plus users, see [Chatter Plus Frequently Asked Questions](#)

Chatter License Overview

This table shows the list of features that are available for Chatter External, Chatter Free, and Chatter Only licenses.

Feature	Chatter External (Access limited to items and people in the groups customers are invited to)	Chatter Free	Chatter Only (a.k.a. Chatter Plus)
Chatter Desktop client	✓	✓	✓
Use the Salesforce1 mobile app (Downloadable apps require the "API Enabled" profile permission)	✓ Downloadable app users can't access Groups or People list views.	✓	✓
Feeds	✓	✓	✓
File sharing	✓	✓	✓
Files Connect			✓
Groups	✓	✓	✓
Invitations to join groups	✓ Only customers who are also group managers can invite Chatter users from groups they have access to or people outside Chatter.	✓	✓
Profiles	✓	✓	✓
Topics and hash tags	✓	✓	✓

Feature	Chatter External (Access limited to items and people in the groups customers are invited to)	Chatter Free	Chatter Only (a.k.a. Chatter Plus)
Private messages	✓	✓	✓
Global search	✓ Search results include only those items that customers have access to via groups.	✓	✓
Custom objects			✓ Up to 10 custom objects
Accounts and contacts			✓ Read only
Calendar and events			✓
Content library			✓
Ideas and answers			✓
Reports and dashboards			✓
Tasks and activities			✓
Using and approving workflows			✓

Salesforce CRM Content

Set Up Salesforce CRM Content

USER PERMISSIONS

To create, edit, or delete library permissions: "Manage Content Permissions"
OR
"Manage Salesforce CRM Content"

To create, edit, or delete page layouts and record types: "Manage record types and layouts for Files"
OR
"Manage Salesforce CRM Content"

To create content fields: "Manage Content Properties"
OR

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

	"Manage Salesforce CRM Content"
To create libraries:	"Create Libraries" OR "Manage Salesforce CRM Content"
To edit or delete libraries:	"Manage Salesforce CRM Content"

Set up Salesforce CRM Content to enable the use of content libraries in your org. Salesforce CRM Content is only available in Salesforce Classic, but files from content libraries are available in Lightning Experience if Salesforce CRM Content is enabled for your org.

 **Tip:** For more detailed information about setting up Salesforce CRM Content, refer to the [Salesforce CRM Content Implementation Guide](#).

You can also enable Salesforce CRM Content in the Salesforce Classic Mobile app by adding the Content tab to the desired mobile configuration data sets.

To set up Salesforce CRM Content for your organization:

1. Enable Salesforce CRM Content from Setup by entering *Salesforce CRM Content* in the Quick Find box, selecting **Salesforce CRM Content**, and then selecting *Enable Salesforce CRM Content*.
2. Give users access to Salesforce CRM Content by assigning feature licenses in one of the following ways:
 - To assign feature licenses to users automatically, from Setup, enter *Salesforce CRM Content* in the Quick Find box, select **Salesforce CRM Content**, and then select *Autoassign feature licenses to existing and new users*.
 - To assign feature licenses to users manually, from Setup, enter *Users* in the Quick Find box, then select **Users** and click **Edit** next to the user's name. Select the *Salesforce CRM Content User* checkbox and click **Save**.
3. Verify that the Salesforce CRM Content users have the Salesforce CRM Content user permissions enabled. The user permissions include "Manage Salesforce CRM Content," "Create Libraries," "Manage Content Permissions," "Manage Content Properties," "Manage record types and layouts for Files", and "Deliver Uploaded Files and Personal Content."

 **Note:** Users with the "Deliver Uploaded Files and Personal Content" user permission can create content deliveries from personal libraries. This user permission does not affect the ability to deliver content from shared libraries.

4. Optionally, create a public group with a set of Salesforce CRM Content users. You can save time later by assigning the group to a library rather than assigning several users to the same library individually.
5. Optionally, create one or more library permissions. Library permissions are the groups of privileges that determine user access within a library. Every user must be assigned a library permission before he or she can use a library. All new organizations contain three library permissions: library administrator, author, and viewer.
6. Use the New Library Wizard to create a library, add members to the library, and assign library permissions to the members.
7. Categorize and define your content:
 - a. Create content fields. These are custom fields that you assign to page layouts. The default fields are *Description*, *Tags*, and *Title*. If you want to create a field named, for example, *Reviewed By*, your custom content field would be a picklist with the names of possible reviewers.
 - b. Create a custom page layout or modify the default page layout. Page layouts are the containers for custom fields; they determine which fields are available during the publishing process and how the fields display on the content details page. You can create multiple page layouts and record types and assign a content field to any or all page layouts. For example, if sales and marketing

users need to record different information about their content, you can create Sales and Marketing page layouts and record types. If you create a `Related Campaign` lookup field and add it to the Marketing page layout and record type only, users who select the Sales record type during the upload process will not have the option to choose a campaign.

8. Optionally, enable the Add Google Doc to Salesforce service so library members can contribute Google docs to Salesforce CRM Content.

Implementation Tips

- Before creating libraries, review the files you plan to store in Salesforce CRM Content to determine how many libraries you need and what content belongs in each library. Users are given access to content based on library.
- If you have a large number of Salesforce CRM Content users, create a public group and add the group to a library rather than adding users to the library individually.
- To enable Salesforce CRM Content functionality for leads, accounts, contacts, opportunities, cases, products, or custom objects, add the Related Content related list to the appropriate page layout.
- To send web-formatted content to colleagues, leads, or contacts and associate it with Salesforce records, add the Content Deliveries related list to the page layout for leads, accounts, contacts, opportunities, cases, campaigns, or custom objects.
- To allow users to publish, edit, and search in any of the Salesforce-supported languages, from Setup, enter *Salesforce CRM Content* in the `Quick Find` box, select **Salesforce CRM Content**, and then click **Enable multilanguage search and contribute**.
- To associate Google docs with a library, the Add Google Doc to Salesforce service must be activated for your organization.
- Salesforce CRM Content is available via the Customer Portal and partner portal.
- All Salesforce CRM Content items display as primary tabs in the Salesforce Console.

Best Practices

- If you are using the Related Content related list on Salesforce objects, align your custom content fields with the standard and custom fields on the object to increase the accuracy of a “Find Content” search. Clicking the **Find Content** button on the related list matches content to the fields on the record and displays search results containing the related content.
- To ensure that content is classified consistently, define consistent tag names with your contributors. For example, by establishing tag names at the outset, you can avoid having tags such as “channel” and “channels” in the same library.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.
- To highlight valuable content and make it easier to find, mark it as “featured” on the content details page. Featured content receives a higher priority than similar content in search results, and appears on the Libraries tab for easy access. To feature content, users must have the `Feature Content` option checked in their library permission.

- If your organization uses Google Docs, encourage library members to add their Google docs to a library. Including Google docs in Salesforce CRM Content allows users to access all types of content from a single location and apply Salesforce CRM Content functionality, such as votes, comments, and subscriptions, to Google docs.

[Set Up Salesforce CRM Content](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, or delete content fields:

- "Manage Content Properties"

OR

"Manage Salesforce CRM Content"

To define or change field validation rules:

- "Customize Application"

To create, edit, or delete library permissions:

- "Manage Content Permissions"

OR

"Manage Salesforce CRM Content"

Modify content settings:

- "Manage Salesforce CRM Content"

Customizing Content Fields

To create, modify, and delete Salesforce CRM Content custom fields for categorizing and defining your content, go to the object management settings for content. If you're using Lightning Experience, go to the Object Manager, select **Content Version**, then scroll to the fields area. If you're using Salesforce Classic, enter *Salesforce Files* in the *Quick Find* box, then select **Fields**. The data assigned to these fields during upload is available on the content details page for the life of the file. After creating custom content fields, you must assign them to a page layout. The page layout determines which fields appear when a user uploads or revises files in Salesforce CRM Content.

To create a custom content field:

1. Click **New**.
2. Choose the type of field to create, and click **Next**.
3. For relationship fields, associate an object with the field and click **Next**.
4. Enter a field label. The field name is automatically populated based on the field label you enter. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Ensure the custom field name is not identical to any standard field name for that object.
5. Choose the page layout that should display the field as an editable field.

Click **Edit** or **Del** in the Content Custom Fields & Relationships related list to edit or delete a custom content field. You cannot edit or delete the standard content fields. Deleted custom fields and their data are stored until your org permanently deletes them or 15 days has elapsed, whichever happens first. Until that time, you can restore the field and its data.

SEE ALSO:

- [Customize Salesforce CRM Content](#)
- [Find Object Management Settings](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, or delete custom fields:

- "Manage Salesforce CRM Content"
- OR
- "Manage Content Properties"

Libraries

Create Libraries

Store, share, and manage your files in content libraries so you can decide who has access to files in each library and what permissions they have. Each org can have up to 2,000 libraries.

Step 1: Create a New Library

1. Click **New** in the My Libraries section of the Libraries tab home page.
2. Enter a unique library name.
3. If you want, add a description.
4. Click **Save and Add Members** or, if you want to add members later, click the **Save and Close** button.

Step 2: Add Library Members

1. On the **Libraries** tab, click the library name if the library isn't already open.
2. In the **Members** section, click **Add Members**.
3. If the member you want to add isn't listed, start to enter their first name in the search box and click **Find**.
4. Select members from the Available Members box. Members can include individual Salesforce CRM Content users or public groups containing Salesforce CRM Content users.
 -  **Tip:** If you have many Salesforce CRM Content users, create a public group and add it to a library rather than adding users to the library individually.
5. Click **Add** to add the members to the library.
6. Click **Next**.

Step 3: Assigning Library Permissions to Members

Select a library permission for each user or public group and click **Save**. For more information, see [Manage Library Permissions](#) on page 3282.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create libraries:

- "Manage Salesforce CRM Content"
- OR
- "Create Libraries"

To add members to a library:

- "Manage Salesforce CRM Content"
- OR

Manage Library checked in your library permission definition

To assign library permissions to members:

- "Manage Salesforce CRM Content"
- OR

Manage Library checked in your library permission definition

Manage Library Permissions

To manage library permissions, from Setup, enter *Content Permissions* in the **Quick Find** box, then select **Content Permissions**. A library permission is a group of privileges assigned to each Salesforce CRM Content library member. It determines which tasks a member can perform in a particular library. The same user can have a different library permission in each of his or her libraries.

 **Note:** If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has three library permissions: Library Administrator, Author, and Viewer.

To [create a custom library permission](#), click the **Add Library Permissions** button. To [edit a library permission](#), click **Edit** next to the library permission name. To [delete a library permission](#), click **Del** next to the library permission name.

 **Note:** Library permissions do not apply to personal libraries. All Salesforce CRM Content users can save files in their personal libraries.

SEE ALSO:

[Create Libraries](#)

Creating Library Permissions

To create a library permission in Salesforce CRM Content, from Setup, enter *Content Permissions* in the **Quick Find** box, then select **Content Permissions**. Next, click **Add Library Permissions**.

 **Tip:** If your Salesforce CRM Content organization was created after the Spring '09 release, your organization already has Viewer, Author, and Library Administrator library permissions. If not, consider creating them. These three library permissions provide the different levels of library access required for most organizations. For the "Viewer" library permission, select the **View Comments** and **Add Comments** library privileges. For the "Author" library permission, select the **Add Content**, **Add Content on Behalf of Others**, **Archive Content**, **Add Comment**, and **Tag Content** library privileges. For the "Library Administrator" permission, select the **Manage Library** privilege.

1. Assign a name to the library permission.
2. Optionally, enter a description of the library permission. If your organization has several library permissions, consider describing each by its function or with a summary of its privileges. For example, for a "Marketing Reviewer" permission you might include a description that reads, "Reviews all content used in outbound marketing campaigns" or "This user can view and comment on documents."
3. In the Permissions section, select the checkboxes that correspond to the privileges you want to grant to users with this library permission.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, or delete library permissions:

- "Manage Salesforce CRM Content"

OR

"Manage Content Permissions"

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create library permissions:

- "Manage Salesforce CRM Content"

OR

"Manage Content Permissions"

Library Privilege	Description
Manage Library	Perform any action in the library. This privilege is required to edit the libraries' name and description, add or remove library members, or delete a library. Creating a new library requires the "Manage Salesforce CRM Content" or "Create Libraries" user permissions.
Add Content	Publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.
Add Content on Behalf of Others	Choose an author when publishing content in the library.
Archive Content	Archive and restore any content in the library.
Delete Content	Delete any content in the library. Authors can undelete their own content from the Recycle Bin.
Feature Content	Identify any content in the library as "featured."
View Comments	Read comments posted to any content in the library.
Add Comments	Post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.
Modify Comments	Edit or delete comments made to any content in the library.
Tag Content	Add tags when publishing content or editing content details in the library.
Deliver Content	Create a content delivery using any files in the library.
Attach or Share Content within Chatter	Make content from this library accessible in Chatter. Within Chatter, select a file from the library and attach it to a post or share it.

4. Click **Save**.

Editing Library Permissions

To edit a Salesforce CRM Content library permission, from Setup, enter *Content Permissions* in the Quick Find box, then select **Content Permissions**. Then click **Edit** next to the appropriate permission.

1. Assign a name to the library permission.
2. Optionally, enter a description of the library permission. If your organization has several library permissions, consider describing each by its function or with a summary of its privileges. For example, for a "Marketing Reviewer" permission you might include a description that reads, "Reviews all content used in outbound marketing campaigns" or "This user can view and comment on documents."
3. In the Permissions section, select the checkboxes that correspond to the privileges you want to grant to users with this library permission.

Library Privilege	Description
Manage Library	Perform any action in the library. This privilege is required to edit the libraries' name and description, add or remove library members, or delete a library. Creating a new library requires the "Manage Salesforce CRM Content" or "Create Libraries" user permissions.
Add Content	Publish new content to the library, upload new content versions, or restore archived (deleted) content. Content authors can also change any tags associated with their content and archive or delete their own content.
Add Content on Behalf of Others	Choose an author when publishing content in the library.
Archive Content	Archive and restore any content in the library.
Delete Content	Delete any content in the library. Authors can undelete their own content from the Recycle Bin.
Feature Content	Identify any content in the library as "featured."
View Comments	Read comments posted to any content in the library.
Add Comments	Post comments to any content in the library and view all comments in the library. Users can edit or delete their own comments.
Modify Comments	Edit or delete comments made to any content in the library.

- "Manage Content Permissions"

Assigning Library Tagging Rules

In Salesforce CRM Content, tags are descriptive labels that help classify and organize content. Contributors can assign tags to their files, content packs, Google docs, or Web links, thus enabling all library members to browse for content by tag. The tagging rule in a library determines how contributors can tag content; for example, the restricted-tagging rule does not allow contributors to create new tags. Library tagging rules are optional. By default, library contributors can enter any tag.

To assign a tagging rule to a library:

1. On the Libraries tab, select a library from the **My Libraries** area.
2. Click **Tagging Rules** and choose one of the following options:

Library Tagging Rule	Description
Open Tagging	This rule places no restrictions on tagging. Contributors can enter any tag when publishing or editing content. While a tag is typed, Salesforce CRM Content autosuggests tags based on the contributor's recently used tags and the Popular Tags list.
Guided Tagging	This rule also enables contributors to enter any tag when publishing or editing content, but contributors are also offered a list of suggested tags. If you select Guided Tagging, the next step prompts you to enter the suggested tags that you want to recommend to library contributors.
Restricted Tagging	This rule requires contributors to choose from the list of suggested tags. If you select Restricted Tagging, the next step prompts you to enter the list of suggested tags.

3. If you chose **Guided Tagging** or **Restricted Tagging**, click the link for auto-populating the `Suggested Tags` field and then edit, add, or remove tags as needed. If you do not auto-populate the `Suggested Tags` field, any new tags you enter in the field are added to the existing list of suggested tags in the library.
4. Click **Save**.

Notes on Library Tagging Rules

- `Open Tagging` is the default tagging rule.
- If you publish, share, or move content to a library that uses restricted tags, you will receive an error if your content contains unsupported tags.
- When you share content from one library to another, the most restrictive tagging rule applies. For example:
 - When content is shared between a restricted-tagging library and a guided- or restricted-tagging library, you can only choose tags that are common to both libraries.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To assign a tagging rule to a library:

- "Manage Salesforce CRM Content"

OR

`Manage Libraries` checked in your library permission definition

- When content is shared between an open tagging library and a restricted-tagging library, you can only choose tags suggested in the restricted-tagging library.
- If a restricted tagging rule is applied after content has already been published in the library and the existing content contains tags that are no longer permitted by the rule, the tags remain assigned to the content until it is edited or revised. For example, if the `Q3Forecast` document has a `market indicators` tag and `market indicators` is not a suggested tag according to the new restricted-tagging rule, `market indicators` is removed from `Q3Forecast` only when a user publishes a new version of the file or edits the file's tags on the content details page.
- Avoid using too many tags. The search engine helps users find specific content, whereas tags enable users to browse and subscribe. Therefore, excessive tagging creates unnecessary clutter.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different upper and lowercase letters. The case of the original tag is always used.

SEE ALSO:

[Create Libraries](#)

Restrict Record Types in a Library

Library administrators can choose which record types are available in a library. They can also set the default record type for publishing content to the library.

To restrict the record types allowed in a library:

1. On the Libraries tab, select a library from the **My Libraries** area.
2. Click **Record Types**.
3. Optionally, change the default record type for the library.
4. Select the `Restrict the record types available in the library` checkbox.
5. Select one or both of the following options:
 - `Allow content with any record type to be linked to this library`—Select this option if you want to enable content published in other libraries to be shared to the library where you have restricted record types. The content in other libraries can be shared regardless of the record types used.
 - `Do not apply record type restrictions to existing content`—Select this option if you do not want to receive warnings regarding existing content in the library. You will not be alerted if existing content uses record types that you exclude from the library. This option refers to notifications only; existing content is not affected by restricted record types.
6. For each record type that you want to allow in the library, move it from the Available Record Types list to the Selected Record Types list.
7. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Record types available in: both Salesforce Classic and Lightning Experience

Record types available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To restrict record types:

- "Manage record types and layouts for Files"
- OR
- "Manage Salesforce CRM Content"

Notes on Restricting Record Types

- If the library already contains published content, selecting the `Restrict the record types available in the library` option automatically moves all the record types used by the published content to the Selected Record Types list.
- Deselecting the `Restrict the record types available in the library` option automatically moves any record types in the Selected Record Types list to the Available record Types list.
- When changing a file's managing library, the file's record type must be permitted in the new managing library.
- When sharing a file with a library, the file's record type must be permitted in the shared library unless the `Allow content with any record type to be linked to this library` option is selected for the shared library.
- When the default record type for a user's profile differs from the default record type for a library, the user profile default takes priority when a user with that profile shares a file with the library. `General` is used as the default record type when no default is set for the user profile.
- When there are no record types in common between a user profile and a library, the default record type for a library is available to users with that user profile who are sharing files with the library.

Content Settings

Customize Content Settings

From Setup, enter `Salesforce CRM Content` in the `Quick Find` box, then select **Salesforce CRM Content** to modify the defaults for your Salesforce CRM Content organization:

Enable Salesforce CRM Content

If this option is checked, Salesforce CRM Content is enabled for your organization.

Autoassign feature licenses to existing and new users

If this option is checked, Salesforce automatically attempts to assign Salesforce CRM Content feature licenses to all existing users. If there aren't enough licenses available, no licenses are assigned. Contact Salesforce to request additional feature licenses. When a new user is created, a Salesforce CRM Content feature license is automatically assigned as long as licenses are available. A feature license corresponds to the `Salesforce CRM Content User` checkbox on the user detail page.

Enable multilanguage search and contribute

If this option is checked, a `Language` drop-down list is available when users publish, edit, or search for content. The `Language` drop-down list contains all languages that Salesforce supports.

If a user does not choose a language when publishing content, that content is associated with the user's personal language by default. If the user's personal language setting is different from the organization's language, content published by that user is associated with the user's language, not the organization's language.

Enable content pack creation

If this option is checked, the **Create New > Content Pack** option displays on the Libraries tab and users can create content packs from any documents or files in their Salesforce CRM Content private or public libraries.

If this option is not checked after users in your organization have already created content packs, those packs are not deleted and users can continue to modify metadata such as description, title, and custom fields. However, once content pack creation is no longer enabled, users cannot customize or modify existing packs. Specifically, the **Clone & Customize** button and the **Edit > Edit Content Pack** option on the content details page are unavailable.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To modify Salesforce CRM Content settings:

- "Manage Salesforce CRM Content"

Enable enhanced document viewer

If this option is checked, an enhanced set of navigation and customization options are available for the document viewer. The document viewer allows users to preview a document without downloading, whether the document be a content delivery sent to a lead, prospect, or colleague, a document viewed internally in Salesforce CRM Content, or a file in Salesforce Files. The document viewer has three modes: the Preview tab on the content details page (preview mode), the content delivery URL (delivery mode), and full screen mode, which displays when you click the full-screen option on the content details page or in a content delivery. In Chatter, users can preview files in feeds, on file lists, and on the Files tab. The `Enhanced document viewer` setting provides the following capabilities to users who are viewing documents:

- In addition to using the next page () , previous page () , first page () , and last page () icons on the document toolbar, you can navigate page-by-page through a document by right-clicking and choosing **Next Page** and **Previous Page**. The right-click menu is not available in preview mode.
- You can jump directly to a page by entering the page number and clicking Enter. This option is not available in full-screen mode.
- From the right-click menu you can choose the **Fit Width** option to expand the width of the document or the **Fit Full Page** option to view the whole page of the document. The fit width icon () and fit full page icon () are also available on the toolbar.
- From the right-click menu you can choose the **Full Screen** option to view the document in full screen mode or the **Exit** option to exit full screen mode. The full screen icon () and exit icon () are also available on the toolbar.
- From the right-click menu you can **Zoom In** or **Zoom Out**. The zoom-in icon () and zoom-out icon () are also available on the toolbar.
- You can use the scroll bar to move continuously through a document without needing to click the **Next Page** and **Previous Page** icons. Continuous scrolling is not available in preview mode or for PowerPoint documents in any mode.
- You can use the keyboard arrow keys to navigate page-by-page through a document. Click on the document viewer and use the keys as follows:
 - Right-arrow key: moves a PowerPoint document forward one slide and moves a PDF, Word, or Excel document forward one page.
 - Left-arrow key: moves a PowerPoint document backward one slide and moves a PDF, Word, or Excel document backward one page.
 - Up-arrow key: moves a PowerPoint document forward one slide and scrolls a PDF, Word, or Excel document up the page.
 - Down-arrow key: moves a PowerPoint document backward one slide and scrolls a PDF, Word, or Excel document down the page.

Navigating with keyboard-arrow keys is not available in preview mode.

Enable Office 2007 previews in Content—Pilot

If this option is checked, Microsoft Office 2007 files, including PowerPoint, Word, and Excel can be previewed in their entirety in Salesforce CRM Content and Chatter. In Salesforce CRM Content you do not need to download a large document to determine if its content is relevant to you. The content details page provides document details at a glance, including document title, author, description, tags, libraries, comments, votes, versions, subscribers, and downloads. If the document is a Microsoft PowerPoint, Word, Excel, or Adobe® PDF file, you can preview the entire file in your browser without downloading it. Some aspects of files may not be displayed in previews. Copy-protected PDFs can't be previewed.

You can also preview files in Chatter feeds, from the Files tab, from a file detail page, and from group and profile file lists.

 **Note:** If this option is unchecked after Office 2007 previews have been generated, those previews will no longer be available.

Show Salesforce Files in Salesforce CRM Content

If this option is enabled, searches in Salesforce CRM Content include Salesforce Files. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Files, Shared with Company, My Groups, and My Libraries**.

If this option is not checked, searches in Salesforce CRM Content don't include Salesforce Files. The search drop-down list on the Content and Libraries tabs, and the filters on the Content tab include **All Libraries**, **Private Library**, and any shared libraries the user is a member of.

[Customize Salesforce CRM Content](#)

[Allow Content Previews in Link Posts](#)

Allow Content Previews in Link Posts

Salesforce provides rich media support for over 400 URL domains. When you attach a link to a post, supported links are converted into embedded videos, images, and rich article previews.

You must enable Chatter before you can enable link previews.

The rich media content is provided by Embed.ly, a third-party service. We don't share any content, user, organization, or account data with Embed.ly. We only share the URLs that are on the domain whitelist. Also all our URL requests pass through a Salesforce proxy. Embed.ly never receives calls directly from the client and therefore doesn't have information about who's making the URL request.

1. From Setup, enter *Chatter Settings* in the **Quick Find** box, then select **Chatter Settings**.
2. Click **Edit**.
3. Select **Allow Rich Link Previews**.
4. Click **Save**.

Post with links to rich media content are rendered as a preview, including thumbnails, descriptions, and video players for video URLs. If a post doesn't render a link as a rich preview in the feed, the URL domain for that link either isn't supported or Embed.ly was unable to return the preview content for the URL.

Rich media previews are enabled by default. If you disable rich media previews, users can only preview videos from the YouTube community.

 **Note:** For a look-up list of supported URL domains, see ["URL Domains for Rich Link Previews in Feeds."](#)

Content Deliveries

Set Up Content Deliveries

A *content delivery* allows you to easily convert documents such as Microsoft® PowerPoint and Word files into an optimized web-based version for easy online viewing. Once you create your delivery, you can send its encrypted URL to any recipient, such as leads, customers, partners, and colleagues, and then track how often the content is viewed or downloaded. Content deliveries are available in Salesforce Classic only. However, Lightning Email generates delivery-based links as email attachments for Lightning Experience users who have access to the Content Deliveries feature.

In addition to tracking, content deliveries provide several benefits over sending files as attachments, such as giving you control over how long the delivery is available to viewers and whether a viewer can download a file or see it online only. By default, a content delivery shows the most recent version of the file being delivered.

Create content deliveries from the Content Deliveries related list on most Salesforce objects. Salesforce CRM Content users can also create a content delivery from the content details page or the Related Content related list.

1. From Setup, enter *Content Deliveries* in the Quick Find box, then select **Content Deliveries** and enable `Enable Creation of Content Deliveries for Salesforce Files`. If you don't have access to the Content Deliveries feature, contact Salesforce Customer Support to activate it.
2. Choose a default option for content-delivery passwords. Because content-delivery URLs can be sent to leads, customers, or any unauthenticated user, Salesforce recommends requiring password protection if your users will send confidential documents via content delivery. The options below allow you to select an organization-wide default for content-delivery password protection.
 - **Password protection is optional and defaults to OFF**—If this option is selected, users can choose to require a password when they create a content delivery, but the `Require Password to Access Content` field on the create-delivery wizard is not checked by default.
 - **Password protection is optional and defaults to ON**—If this option is selected, the `Require Password to Access Content` field on the create delivery wizard is checked by default. Users can uncheck the option if they do not want to require a password.
 - **Password protection is required**—If this option is selected, a password is generated each time a content delivery is created. Users cannot opt out of the password requirement.

Note:

- If you choose to require a password, users who create a content delivery will receive a password when the delivery is generated; users must send the password and the delivery URL to delivery recipients. Delivery recipients are prompted for the password when they click the content delivery URL.
- Content delivery passwords display with the content-delivery URL when the delivery is created. You can also access the password on the delivery detail page for the life of the content delivery.

When content delivery is enabled, all users should add the Content Deliveries related list to their page layouts for leads, business accounts, contacts, opportunities, cases, campaigns, or custom objects. All Salesforce CRM Content users will see a **Deliver Content** option on each content details page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To enable or disable content deliveries:

- “Customize Application”

Implementation Tips

- To ensure quality of service, the total number of content-delivery views allowed within a 24-hour period is limited to 20,000. Also, the amount of bandwidth allocated to content deliveries is limited to 10 GB within a 24-hour period. If a recipient tries to view a delivery when a rate limit has been exceeded, a notification displays that asks the viewer to try again later. Salesforce may be able to increase rate limits on an exception basis. For more information, contact your sales representative.
- When you create a content delivery, Salesforce copies the original file and creates a new version of that file specifically for online viewing. Note the following information concerning supported file types:
 - Microsoft® Office 97 through Microsoft Office 2007 Word, Excel, and PowerPoint files are supported for online views.
 - Adobe® PDF files are supported for online views, but copy-protected PDFs are not.
 - JPG, BMP, GIF, and PNG are supported for online views.
 - Any document over 25 MB is not supported for online views.

You can create a content delivery with any file type, but if the file type is not supported for online viewing, your recipient can only download the document in its original file format.

- Always preview your content delivery before sending the URL to recipients. In some cases, formatting in the original file, such as colors and non-standard fonts, may not display properly in the online version. If you are not happy with the quality of the online version, the content delivery wizard gives you the option of making your content available for download in its original file format.
- Content deliveries require Adobe Flash version 9.0.115. If a recipient does not have Flash installed, a download option displays.
- Customer Portal and partner portal users cannot create content deliveries.
- Only the creator of a content delivery can delete the delivery record or edit details such as the expiration date.
- Each time a content delivery's URL is clicked, Salesforce records the click as one view and distinguishes between internal and external views. An internal view is a view by a Salesforce user, for example, clicking the delivery URL on the delivery detail page or the View option on the Content Deliveries related list is an internal view. The Content Deliveries related list provides a count of all views for each delivery. Open the delivery details page to see information about a specific view.

Note: For password-protected content deliveries, a view is recorded when the recipient clicks on the delivery URL regardless of whether he or she enters the password and views the delivery.

- Salesforce CRM Content users can deliver content from shared libraries or a personal library.

Best Practices

- After creating a content delivery, always preview it before sending the URL to your recipients to ensure that the formatting in the original file displays properly in the online version. For example, colors and non-standard fonts may not display properly in the preview player. If you are not happy with the quality of the online version, click **Previous** and choose to make your content available in its original file format or as a PDF file only. Your recipients will be able to download the file, and you can track whether the file was downloaded on the delivery detail page.
- Animation and timings in PowerPoint files are not supported in the content delivery's online version. Hyperlinks in all file types are also unsupported. See the [implementation tips](#) for a complete list of supported file types.
- If you are a Salesforce CRM Content user and want recipients of your content delivery to always see the latest version of a file rather than the version available on the delivery-creation date, open the delivery detail page and click **Edit**. Select the `Content Delivery Opens Latest Version` checkbox.
- If you select `Notify Me of First View` or `Download`, you will receive an email when the content delivery is viewed for the first time.

Storage Implications

In Salesforce CRM Content, file storage is consumed when content is published to shared libraries or saved to a private library. Creating content deliveries does not have an additional affect on storage limits, but users who frequently upload files to their personal libraries for the purpose of content delivery should consider their organization's file-storage limits. Administrators can use reporting to identify which users are consuming the most storage and which files are largest in size.

For non-Salesforce CRM Content users, file storage is consumed each time a content delivery is created. Once uploaded to Salesforce, a file cannot be reused for multiple content deliveries. Creating multiple content deliveries with the same file requires uploading the file each time. Deleting a content delivery deletes the source file in Salesforce, thus increasing file-storage space.

SEE ALSO:

[Set Up Salesforce CRM Content Content Delivery Fields](#)

Content Delivery Fields

The following table provides a description of the fields (in alphabetical order) that make up a content delivery. These fields are located on the create-delivery wizard, the Content Deliveries related list, or the delivery details page.

Field	Description
Allow Recipient to View in the Browser	If checked, the content delivery can be viewed online in a custom Web page. On the delivery details page, this field is labeled <code>Allow View in the Browser</code> .
Allow Recipient to Download as PDF	If checked, the content delivery converts Microsoft® Word, Excel, and PowerPoint files into PDF files and gives the recipient the option of downloading the PDF. If the file you uploaded was not a PDF, Word, Excel, or PowerPoint file, this option does not appear in the create-delivery wizard. On the delivery details page, this field is labeled <code>Allow Download as PDF</code> .
Allow Download in Original Format	If checked, the content delivery allows recipients to download the original file. In the create-delivery wizard, this field is called <code>Allow Recipient to Download as [file type]</code> where <code>[file type]</code> is the original file's file type, such as <code>.ppt</code> , <code>.pdf</code> , or <code>.doc</code> .
Author	For Salesforce CRM Content files, the user who published the file. (Read only)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Salesforce CRM Content available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Field	Description
Content Delivery Name	The name assigned to the content delivery. By default, the <code>Content Delivery Name</code> includes the file name and the creation date.
Content Delivery Opens Latest Version	For Salesforce CRM Content files, this flag indicates that the recipient of a content delivery sees the most current version of a file. For example, if a file is updated between the delivery-creation date and today's date, a recipient who views the delivery today sees the newest version.
Content Delivery Expires	A flag that indicates whether access to the content delivery will expire on the expiration date. In the create-delivery wizard, this flag corresponds to the checkbox next to the <code>Remove access to content on</code> field.
Created By	The user who created the content delivery, including creation date and time. (Read only)
Description	For Salesforce CRM Content files, the description provided when the file was published. (Read only)
Expiration Date	The date on which the content delivery can no longer be viewed. In the create-delivery wizard, this is the date entered in the <code>Remove Access to Content on</code> field.
File Downloaded	A flag that indicates whether a file in the content delivery was downloaded. For example, if a content delivery includes options to view the content in the browser, download the content in its original file format, and download the content as a PDF file, this flag is checked if the recipient downloads the original file or the PDF file. (Read only)
Internal View	A flag that indicates whether a Salesforce user viewed the content delivery. A view is considered internal if the user opens the delivery URL from within Salesforce, for example by clicking View on the Content Deliveries related list or clicking the delivery URL on the delivery detail page. If the user copies the URL and pastes it into his or her browser, the view is considered external. (Read only)
Last Modified By	The user who last modified the content delivery, including modification date and time. (Read only)
Last Viewed	The date and time on which the content delivery was last viewed. A view is one click of the content-delivery URL. (Read only)
Notify Me of First View or Download	If checked, the user who created the content delivery receives an email notification the first time the content delivery URL is clicked.
Owner Name	The user who owns the content delivery. (Read only)

Field	Description
Related To	The record that the content delivery is associated with, such as an account, opportunity, or custom object. Users with sharing access to the record can click it to view more details.
Require Password to Access Content	If checked, the recipient must enter the provided password before viewing the content delivery. The password appears when the content delivery is generated and for the life of the delivery on the delivery detail page.
Title	For Salesforce CRM Content files, the title of the file included in the content delivery. (Read only)
View Count	Total number of views for the content delivery, including internal and external. (Read only)

[Set Up Content Deliveries](#)

Setting Up Salesforce CRM Content for Salesforce Classic Mobile

Note the following about how Salesforce CRM Content is implemented in Salesforce Classic Mobile:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Classic Mobile is only supported on iPhone devices.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Classic Mobile is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Classic Mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Classic Mobile data sets:

- "Manage Mobile Configurations"

3. Click **Add...**
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

Because users can't search for content in the Salesforce Classic Mobile app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

- **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like `LAST 90 DAYS` or `LAST 180 DAYS` to ensure that recently updated content records are synchronized.
 - **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
 - **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
 - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals `Sales`.
6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.
 7. Click **Done**.

Google Apps

Getting Started with Salesforce and Google Apps

Google Apps is a suite of on-demand communication and collaboration services hosted by Google and designed for business users. If your organization has a Google Apps account, Salesforce administrators can enable Google Docs, Gmail, and a host of Google-related AppExchange apps—customized for use within Salesforce.

Step 1: Creating a Google Apps Account

Create a Google Apps account for your organization using one of the following methods:

- From Setup, enter *Google Apps* in the **Quick Find** box, select **Google Apps Settings**, and click **Sign Up** to launch the account-creation page on the Google website. You are prompted to register your organization's domain name or purchase a new domain name from Google. A domain is the portion of a website's URL that follows the "www." Follow Google's steps to configure your new or existing domain and set up your Google Apps account.
- If your organization purchased the Salesforce and Google Apps Supported feature, from Setup, enter *Premier Setup* in the **Quick Find** box, then select **Premier Setup** to create a new Google Apps Premier Edition account or upgrade your existing Standard Edition account to Premier Edition. For details, see [Getting Started With Salesforce and Google Apps Supported](#).

 **Note:** Google Apps in Salesforce supports Google Apps business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname@gmail.com* is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany.com* is a business rather than consumer account.

Step 2: Configuring Google Apps Domain Settings

1. On the Google Apps Settings page in Salesforce, click **Edit**.
2. Choose a user for the **Google Apps Administrative Contact** field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
3. Enter the **Google Apps Domain** that you registered with Google. For example, if your company's URL is `http://www.acme.com` and you created a Google Apps account for the `acme.com` domain, enter `acme.com` in the **Google Apps Domain** field.
4. Click **Save**.

Step 3: Activating Google Apps Services

1. In the **Activate Google Apps Services** section on the Google Apps Settings page, locate the Google Apps service(s) that you want to activate.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To view and modify Google Apps domain settings:

- "Customize Application"

To activate or deactivate Google Apps services:

- "Customize Application"

To install or uninstall Force.com AppExchange packages:

- "Download AppExchange packages"

To export a list of users to Google to create Google Apps accounts:

- "Customize Application"

2. Click **Edit** or **Install** to activate a service. In the Action column, **Edit** corresponds to Google Apps services that are already integrated in Salesforce, and **Install** corresponds to uninstalled Force.com AppExchange apps. Integrated Google Apps services include:

- [Add Google Docs to Salesforce](#)
- [Gmail to Salesforce](#)
- [Gmail Buttons and Links](#)
- [Google Talk Sidebar Component](#)

 **Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see [the Google Talk online help](#).

For descriptions of the Google-related AppExchange apps, visit <http://sites.force.com/appexchange>.

Step 4: Creating Google Apps Users

Activating Google Apps services in Salesforce makes the services visible to all users in your organization, but a user cannot access a service unless he or she has a Google Apps account on your organization's domain. The Google Apps administrator registered with Google can create these additional accounts. For more information, see [Creating Google Apps Accounts](#).

[Gmail™ in Salesforce](#)

Getting Started With Salesforce and Google Apps Supported

The Salesforce and Google Apps Supported feature includes a Google Apps Premier Edition account for your organization. In Salesforce, you can create that account or upgrade from an existing Google Apps Standard Edition account to Google Apps Premier Edition.

After you create a new Google Apps Premier Edition account or upgrade your existing Google Apps Standard Edition account in Salesforce, the Premier Setup page displays your organization's domain name, the number of Google Apps Premier Edition licenses available to your organization, and, if applicable, the status of your upgrade.

Creating a New Google Apps Premier Edition Account

If your organization does not have a Google Apps account, complete the following steps to register a Google Apps Premier Edition account and enable Salesforce and Google Apps:

1. From Setup, enter *Premier Setup* in the **Quick Find** box, then select **Premier Setup**.
2. Complete the fields in Column A:

Field	Description
Domain Name	Enter the domain that you want to register as your organization's Google Apps account. For example, if your company's URL is <code>http://www.acme.com</code> , enter <code>acme.com</code> as your Domain Name.
User Name	This value is used to create the Google Apps administrator for your organization's account. For example, if your Google Apps administrator will be <code>jsmith@acme.com</code> , enter <code>jsmith</code> . After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
First Name	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
Last Name	This value is used to create the Google Apps administrator for your organization's account. After your Google Apps account is created, you can log in with the User Name and Password and change this value if necessary.
Email Address	This email address receives a confirmation notice when your Google Apps Premier

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To create a new Google Apps Premier Edition account in Salesforce:

- "Customize Application"

OR

Google Apps
Administrative Contact

To upgrade Google Apps Standard Edition to Google Apps Premier Edition in Salesforce:

- "Customize Application"

OR

Google Apps
Administrative Contact

Field	Description
	Edition account is created. Google does not store this value for any other purpose.
Password	The Google Apps administrator can log in to Google Apps with this password.
Confirm Password	The Google Apps administrator can log in to Google Apps with this password.

3. Click **Create New Premier Account**.

4. To enable Salesforce and Google Apps, from Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings**.

5. Choose a user for the *Google Apps Administrative Contact* field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.

6. Verify that the *Google Apps Domain* field contains the domain name you registered with Google.

7. Activate Google Apps services in Salesforce. For more information, see [Activating Google Apps Services](#).

8. Create users for your organization's Google Apps account. For more information, see [Creating Google Apps Accounts](#).

Note: The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

Upgrading to a Google Apps Premier Edition Account

Complete the following steps to upgrade your organization's existing Google Apps Standard Edition account to a Google Apps Premier Edition account.

1. From Setup, enter *Premier Setup* in the **Quick Find** box, then select **Premier Setup**.

2. Complete the fields in Column B:

Field	Description
Domain Name	The domain that you want to register as your organization's Google Apps Premier Edition account. If you already enabled Salesforce and Google Apps, this field is prepopulated with your organization's domain name.
Google Apps Token	The 16-digit token required to upgrade from Google Apps Standard Edition to Google Apps Premier Edition. Your organization's Google Apps administrator can access this information on the Google website. For more information, click Retrieve Google Apps Token in Column B.

3. Click **Upgrade Existing Account to Premier**.
 4. To enable Salesforce and Google Apps, from Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings**.
 5. As needed, edit the *Google Apps Administrative Contact* field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
 6. Verify that the *Google Apps Domain* field contains the domain name you registered with Google.
 7. As necessary, activate Google Apps services in Salesforce. For more information, see [Activating Google Apps Services](#).
 8. As necessary, create users for your organization's Google Apps account. For more information, see [Creating Google Apps Accounts](#).
-  **Note:** The number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased with the Salesforce and Google Apps Supported feature.

[Getting Started with Salesforce and Google Apps](#)

Set Up Google Apps in Salesforce

From Setup, enter *Google Apps Settings* in the **Quick Find** box, then select **Google Apps Settings** to edit your Google Apps domain settings, activate or deactivate Google Apps services in Salesforce, or install or uninstall Google-related Force.com AppExchange packages..

 **Important:** You cannot use Salesforce and Google Apps until a Google Apps account has been created for your organization and your Google Apps domain settings are configured in Salesforce. For instructions on creating an account and configuring your domain settings, see [Getting Started with Salesforce and Google Apps](#) on page 3297.

Editing Google Apps Domain Settings

Domain settings consist of two values: the user chosen to administer your organization's Google Apps account and the domain your organization registered with Google. Both fields are required to enable Google Apps in Salesforce. To edit your domain settings:

1. In the Configure Google Apps Domain section, click **Edit**.
2. Optionally, choose a new user for the *Google Apps Administrative Contact* field. This person is the point of contact for Google Apps users in your organization; specifically, if a user cannot access a Google Apps service, he or she is directed to contact the Google Apps Administrative Contact. The Google Apps Administrative Contact does not need to be the same person who is registered as your organization's Google Apps administrator with Google, but only the Google Apps administrator can create new Google Apps users on your domain.
3. Optionally, modify the *Google Apps Domain* that is registered with Google for your organization's Google Apps account. Your *Google Apps Domain* is typically your company's domain; for example, acme.com.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To edit Google Apps domain settings and activate or deactivate services:

- "Customize Application"

To install or uninstall AppExchange packages:

- "Download AppExchange packages"

Modifying Google Apps Services

This section lists Google Apps services that are integrated with Salesforce and also provides links to several Google-related Force.com AppExchange apps that can be easily installed from AppExchange.

To activate or deactivate an integrated service, click **Edit** next to the service name. These services include:

- [Add Google Docs to Salesforce](#)
- [Gmail to Salesforce](#)
- [Gmail Buttons and Links](#)
- [Google Talk Sidebar Component](#)

 **Important:** Google Talk within Salesforce is no longer available. For alternative ways to use Google Talk, see [the Google Talk online help](#).

To install or uninstall an AppExchange app, click **Install** or **Uninstall** next to the appropriate name. To view all Google-related AppExchange offerings, visit <http://sites.force.com/appexchange>.

Implementation Tips

- For detailed information about Google Apps, refer to [Google's online help](#).
- Google Apps in Salesforce is available for Google business accounts but not consumer accounts. You can identify a consumer account by the "gmail.com" domain in an email address; for example, *myname@gmail.com* is a consumer account. The Google Apps domain you set up in Salesforce must be the domain you registered with Google for your organization; for example, *mycompany.com* is a business rather than consumer account.
- After creating a Google Apps account for your organization, create Google Apps accounts for your Salesforce users. From Setup, enter *Users* in the **Quick Find** box, select **Users**, and then click **Export to Google Apps**.
- Notify users of their Google Apps usernames and passwords.
- Notify users about the changes they will see in Salesforce when Google Apps services are activated.
- To view all the Google apps available on Force.com AppExchange, visit <http://sites.force.com/appexchange>.
- By default, Google Apps users on your organization's domain can share Google docs with Google Apps accounts outside your domain. The control panel for your Google Apps account contains sharing settings that enable you to restrict document sharing to within your domain.
- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google Docs to Salesforce service is reactivated within 30 days, Google docs that were associated with Salesforce records before the deactivation are restored to their previous location. Deactivating the Add Google Docs to Salesforce service does not affect Google docs in Salesforce CRM Content libraries; deactivation does not remove Google docs associations in libraries and does not permanently delete Google docs in Recycle Bins.
- Customer Portal and partner portal users with access to the **Contribute** tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.
- Customer Portal and partner portal users cannot access Gmail Buttons and Links.
- If your organization purchased the Salesforce for Google Apps Supported feature, see [Getting Started With Salesforce and Google Apps Supported](#) on page 3299.

Best Practices

- Test your Google Apps integration using a sandbox or Developer Edition organization.
- Manage Google Apps users as you would Salesforce users. For example, if you deactivate a Salesforce user, also deactivate his or her Google Apps account in the control panel for your organization's Google Apps account. For information about administering your organization's Google Apps account, refer to [Google's online help](#).
- To locate a Google doc quickly in Salesforce, search for the doc using search.

SEE ALSO:

[Getting Started with Salesforce and Google Apps](#)

Creating Google Apps Accounts

After [creating a Google Apps account for your organization](#) and [enabling Google Apps in Salesforce](#), you can create Google Apps accounts for individual users. To access the Google Apps services that are enabled in Salesforce, each user needs a Google Apps account on the domain your organization registered with Google. An account includes a username and password that allow the user to log into all Google Apps services.

 **Note:** If your organization purchased Salesforce and Google Apps Supported, the number of Google Apps Premier Edition accounts you can create is limited to the number of licenses your organization purchased.

To export a list of users to Google and create Google Apps accounts for each user:

1. From Setup, enter `users` in the `Quick Find` box, then select **Users**.
2. In the View drop-down list, choose a list of users.
3. Click **Export to Google Apps** to export all the users in the list. To export certain users only, select those users in the Action column.

 **Note:** If Google Apps is not enabled for your organization, the **Export to Google Apps** button does not display. To enable Google Apps in Salesforce, see [Getting Started with Salesforce and Google Apps](#) on page 3297.

4. On the Export Users to Google Apps page, click the export file link that is labeled as Step 1. The name of the link depends on the list view you chose to export; for example, if you were viewing the All Users list, the link on the Export Users to Google Apps page is **All Users Export File**.
5. In the CSV spreadsheet that displays when click you the export link, provide a temporary password for each user. You can modify the `username`, `last name`, and `first name` fields for any user as needed. Google creates account names by adding your domain to the usernames in the spreadsheet; for example, if your domain is `acme.com` and the spreadsheet contains `john.doe` and `jane.doe` usernames, the Google Apps usernames are `john.doe@acme.com` and `jane.doe@acme.com`.
6. Save the spreadsheet to your computer.
7. Click the **Google Apps Bulk User Import Tool** link to launch the Bulk Account Update page for your organization's Google Apps account. If prompted, log in with your Google Apps administrator username. Only the user who is registered with Google as the administrator of your organization's account can create additional Google Apps accounts on your organization's domain.
8. Follow Google's instructions to import the data in the spreadsheet. The Google Apps administrator receives a confirmation report, and the user for each successfully created account receives a notification email at his or her new Gmail account..

EDITIONS

Activate Google Docs in Salesforce

! **Important:** After you activate a Google Apps service in Salesforce, it's visible to all your Salesforce users. To use these services, your users need Google Apps accounts on your domain. For more information, see [Getting Started with Salesforce and Google Apps](#).

Google Docs™ allows you to create on-demand documents, spreadsheets, and presentations, edit them in your browser, and work together in real time with other collaborators.

To activate or deactivate the Add Google Docs to Salesforce service:

1. From Setup, enter *Google Apps Settings* in the Quick Find box, then select **Google Apps Settings**.
2. Click **Edit** next to the Add Google Docs to Salesforce option in the Activate Google Apps Services list.
3. Select **Activate**.
4. Read and indicate whether you agree to the Terms of Use.
5. Click **Save**.

When the Add Google Docs to Salesforce service is enabled, the following changes allow users to create, edit, or view Google docs and associate them with Salesforce records:

- The Notes & Attachments related list on accounts, assets, contacts, contracts, leads, opportunities, products, and custom objects is renamed to Google Docs, Notes, & Attachments.
- The Attachments related list on cases, solutions, and campaigns is renamed to Google Docs & Attachments.
- If Salesforce CRM Content is enabled, the Libraries tab has an **Add Google Doc** drop-down list.

Users can also install the **Add Google Doc to Salesforce** browser button, which allows them to associate a Google doc to several Salesforce records or a Salesforce CRM Content library without being logged into Salesforce.

Implementation Tips

- For information about Google Docs, refer to [Google's online help](#).
- By default, Google Docs users on your domain can share their Google docs with Google Apps accounts outside your domain. The control panel in your Google Apps account contains sharing settings that enable you to restrict document sharing to users within your organization's domain.
- Customer Portal and partner portal users with access to the Contribute tab in Salesforce CRM Content can create new Google docs and associate existing Google docs to a Salesforce library. Portal users without access to Salesforce CRM Content can associate an existing Google doc to a record, but they cannot create new Google docs from within a record because they do not have access to the Google Docs, Notes, and Attachments related list in the portal. Portal users cannot use the **Add Google Doc to Salesforce** browser button.
- When the Add Google Docs to Salesforce service is deactivated, Google docs cannot be accessed from Salesforce records, and any Google docs in users' Recycle Bins that were deleted from a record are permanently removed from Salesforce. If the Add Google

Gmail™ in Salesforce

Integrate Gmail with Salesforce.

Gmail to Salesforce available in: both Salesforce Classic and Lightning Experience

Gmail Buttons and Links available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

Activating Gmail in Salesforce:

- “Customize Application”

 **Important:** After you activate a Google Apps service in Salesforce, it's visible to all your Salesforce users. To use these services, your users need Google Apps accounts on your domain. For more information, see [Getting Started with Salesforce and Google Apps](#).

Integrate Gmail with Salesforce in two ways

- Gmail to Salesforce
- Gmail Buttons and Links

Gmail to Salesforce

Gmail to Salesforce lets you log emails automatically. It also lets you log chats you send from your Gmail account as activities on leads, contacts, opportunities, and other records that support activity history. It's important to know that after you activate Gmail to Salesforce, you can't deactivate it.

To activate Gmail to Salesforce:

1. From Setup, enter *Email to Salesforce* in the Quick Find box, then select **Email to Salesforce**. Confirm that it's activated.
2. From Setup, enter *Google Apps Settings* in the Quick Find box, then select **Google Apps Settings**.
3. Set a Google Apps Administrative Contact and Google Apps Domain, then save your changes.

Gmail Buttons and Links

Gmail Buttons and Links adds **Gmail** links next to email fields on all records and adds **Compose Gmail** buttons in Activity History on leads and contacts. When you select a Gmail link or **Compose Gmail**, Salesforce automatically logs you in to your Gmail account and automatically populates the **To** field. If Gmail to Salesforce is activated, Salesforce also populates the **BCC** field with your Email to Salesforce address.

To activate Gmail Buttons and Links:

1. From Setup, enter *Google Apps* in the **Quick Find** box, then select **Google Apps Settings**.
2. In the Activate Google Apps Services list, click **Edit** next to Gmail Buttons and Links.
3. To activate Gmail Buttons and Links, select **Active**.
4. To add **Gmail** links next to all email fields (except email fields on pages under Setup), select **Gmail Links**.
5. To add **Compose Gmail** buttons in Activity History on leads and contacts, select **Gmail Buttons**.
6. Read and indicate whether you agree to the Terms of Use.
7. Click **Save**.

Implementation Notes

If enable Gmail Buttons and Links without Gmail to Salesforce, you can still use the Gmail links on contacts and leads. But keep in mind that Salesforce doesn't log emails you send from your Gmail account. Salesforce also doesn't automatically populate the **BCC** field on the **Compose Mail** window with an Email to Salesforce address.

[Wave Analytics Limits](#)

Wave Analytics Glossary

Familiarize yourself with common Wave Analytics terminology.

App

An *app* contains dashboards, lenses, and datasets in any combination that makes sense for sharing your data analyses with colleagues. Apps are like folders. They allow users to organize their data projects—private and shared—and to control sharing.

Dashboard

A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.

Dashboard JSON file

A *dashboard JSON file* defines the components that a dashboard contains and describes how they're connected.

Data monitor

The *data monitor* tool allows you to monitor dataflow and system jobs. You can also use it to start, stop, reschedule, download, and upload dataflows.

Dataflow

A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying.

Dataflow definition file

A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic.

Dataflow job

A *dataflow job* processes the logic in a dataflow.

Dataset

A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.

Dataset builder

The *dataset builder* is a point-and-click user interface that allows you to easily select and extract data from related Salesforce objects to create a single dataset.

Date

A *date* can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

Designer

Designer is the interface where you create dashboards.

Dimension

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions.

Explorer

Explorer is the interface where you explore datasets and lenses.

Extended metadata (XMD)

Extended metadata (XMD) allows you to customize the formatting of many dashboard elements in Wave Analytics.

External data

External data is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.

External Data API

Use *External Data API* to upload external data files to Wave Analytics to create datasets.

Lens

A *lens* is a particular view into a dataset's data. It's where you do exploratory analysis and visualization.

Measure

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

Metadata file

A *metadata file* is a JSON file that describes the structure of an external data file.

Predicate

A *predicate* is a filter condition that defines row-level access to records in a dataset.

Salesforce Analytics Query Language (SAQL)

Use *SAQL* to access and analyze data in Wave Analytics datasets.

Transformation

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

Visualization

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

Wave Platform Setup

To set up your organization to use the Salesforce Wave Analytics platform, learn about Wave Analytics platform licenses and permissions. Then follow the same basic process you use to set up other Salesforce products.

 **Important:** If you purchased a Wave Analytics Platform license before October 20, 2015 with Analytics Cloud Builder or Analytics Cloud Explorer permission set licenses, read [Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015](#). If you're migrating users from Builder or Explorer licenses to the new Analytics Cloud - Wave Analytics Platform license, see [Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#) before you start the setup process for those users.

 **Note:** Sales Wave app users should see [The Sales Wave Analytics App](#) to get started with the app.

Each Analytics Cloud - Wave Analytics Platform license is a single-user license that provides access to the Salesforce Wave Analytics cloud. It includes a single Analytics Cloud - Sales Wave Analytics App single-user license. The table shows data storage limits for each license. If you require more data, you can purchase Analytics Cloud - Additional Data Rows, which entitles you to an additional 100 million rows.

License	Limit
Analytics Cloud - Wave Analytics Platform	100 million rows
Analytics Cloud - Sales Wave Analytics App	25 million rows when used without Analytics Cloud - Wave Analytics Platform license. Use of Sales Wave app license does not increase data limit for platform license
Analytics Cloud - Additional Data Rows	100 million rows

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

 **Important:** Wave Analytics license data storage limits are contractual, not technical. Licensee agrees to strictly monitor its total number of data rows.

Wave Platform Setup Process

Enable Wave and assign permission set licenses to users. The first step when you set up Wave is simply to enable it. Then, you assign an Analytics Cloud - Wave Analytics Platform permission set license to each user. Each permission set license can be assigned to only one user. Also, the user license that's associated with the user profile must support the Analytics Cloud - Wave Analytics Platform permission set license. Not all user licenses support the Wave platform permission set license.

Define user types and create and assign permission sets. Next, define the main user types in your organization and create permission sets to group related user permissions according to each user type's needs. After you create permission sets, assign them to users. Although you can assign a permission set to an individual user, for efficiency, you can also assign it to groups of users. You can assign multiple permission sets to a user.

[Walk Through It: create, edit, and assign a permission set](#)

You can assign a Wave permission set license along with any of the following Salesforce user licenses:

- Force.com (app subscription)
- Force.com (one app)
- Full CRM
- Salesforce Platform
- Salesforce Platform One

 **Note:** If you disable Wave Analytics, user permissions are removed from each defined permission set. If you re-enable Wave Analytics later, you must define the permission sets again.

 **Tip:** For best results, follow the steps for setting up the Wave Analytics platform in the order shown here.

1. [Learn About Analytics Cloud Permission Set Licenses and User Permissions](#)
Wave Analytics permission set licenses enable the user permissions to explore data with and manage the Salesforce Wave Analytics platform and let Salesforce Community users view Wave dashboards.
2. [Identify Wave Analytics Platform User Types](#)
Identifying types of Wave users and the tasks they need to perform helps assure that the setup process meets the majority of your team members' analytics needs.
3. [Enable Wave Analytics and Select Analytics Cloud - Wave Analytics Platform Permission Set License](#)
After Salesforce provisions you with the Wave Analytics platform license, you need to enable Wave and select the Wave Analytics permission set license and assign it to users.
4. [Create Wave Analytics Permission Sets](#)
To give users in your organization access to Wave features, create and assign one or more permission sets based on the level of analytics capabilities they need.
5. [Assign Wave Analytics Permission Sets to Users](#)
Assign permission sets to one or more users—either one at a time, or in bulk—to give them access to the Wave functionality.

6. Complete Setting up the Wave Analytics Platform

Enhance the Wave platform user experience and fine-tune Wave access to Salesforce data with optional setup procedures.

[Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#)

Learn About Analytics Cloud Permission Set Licenses and User Permissions

Wave Analytics permission set licenses enable the user permissions to explore data with and manage the Salesforce Wave Analytics platform and let Salesforce Community users view Wave dashboards.

- Each Wave platform user needs an Analytics Cloud - Wave Analytics Platform permission set license to use Wave.
- Community users need an Analytics Cloud - Wave Community Users permission set license to view Wave apps shared via dashboards embedded in Visualforce pages.

The Analytics Cloud - Wave Analytics Platform permission set license enables the following permissions.

User Permission	What It Enables
"Use Wave Analytics"	Accessing Wave Analytics. Viewing and exploring datasets. Viewing and sharing lenses and dashboards.
"Create and Edit Wave Analytics Dashboards"	Creating, editing, and deleting Wave Analytics dashboards.
"Create Wave Analytics Apps"	Creating, editing, deleting, and sharing Wave Analytics applications.
"Upload External Data to Wave Analytics"	Uploading external data to Wave Analytics to create a dataset. Monitoring dataflow and system jobs in the data monitor.
"Edit Wave Analytics Dataflows"	Editing, starting, stopping, and rescheduling the dataflow. Monitoring dataflow and system jobs in the data monitor. Use discretion when assigning this user permission because it enables the user to access all Salesforce object data to which the Integration User has access. For more information see Salesforce Data Access in Wave Analytics .
"Manage Wave Analytics"	Accessing all Wave Analytics features. Provides Wave administrator-level capabilities.
"Download Wave Analytics Data"	Downloading screenshots and data in tabular format through the Wave Analytics user interface.

 **Note:** When you create permission sets for Wave users, selecting any Wave Analytics permission automatically enables the "Use Wave Analytics" permission as well. Also, the type of access granted on an app controls the actions a user can perform on its datasets, lenses, and dashboards. For example, if a user has the "Use Wave Analytics" permission, the user must also have Viewer access on an app to view its datasets, lenses, and dashboards.

The Analytics Cloud - Wave Community Users permission set license enables the "View Wave Analytics on Communities Pages" permission. That permission enables external users to view Wave dashboards embedded in VisualForce pages in their communities.

Identify Wave Analytics Platform User Types

Identifying types of Wave users and the tasks they need to perform helps assure that the setup process meets the majority of your team members' analytics needs.

The Wave Analytics Platform license includes the permissions users in your organization need to administer Wave as well as to import, work with, and explore data. To set up Wave in the most useful way, think through the different ways people need to access Wave features and categorize them into user types. Here are a few examples:

In most cases, you'll need to set up Wave to meet the needs of two basic types of people on your team:

- Users, who need to be able to view Wave dashboards, lenses, and datasets and occasionally import data to Wave.
- Administrators or managers, who need access to all of Wave functionality to create apps, dashboards, lenses, and datasets, edit data, and otherwise customize the Wave experience.

Accordingly, when you set up the Wave platform, creating two basic permission sets can probably meet the needs of most users in your organization:

- A "view" permission set that contains the permissions needed by most basic-level users when they access Wave.
- A "manage" permission set that's reserved for a select few administrators and managers and contains permissions to use all Wave features

You can set up Wave Analytics however you want, defining other user types and permissions sets based on the needs of users in your organization. For example, you may need to create a "superuser" permission set who need capabilities to create and share apps and dashboards or a "data wizard" permission set for users who want to work closely with datasets.

We focus on two main types of people on your team -- users and administrators -- in the example permission sets we show you how to create and assign in our detailed setup instructions.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

Enable Wave Analytics and Select Analytics Cloud - Wave Analytics Platform Permission Set License

After Salesforce provisions you with the Wave Analytics platform license, you need to enable Wave and select the Wave Analytics permission set license and assign it to users.

1. In the Salesforce Setup menu, under administer, click **Analytics Cloud | Getting Started**.
2. Click **Enable Analytics**.
3. In the Setup menu, click **Manage Users | Users**.
4. Click the name of a user you want to access Wave. You might want to start with **User, Admin**, or whatever name has been given to the system administrator.
5. Position the cursor over **Permission Set License Assignments** and click **Edit Assignments**.
6. Select the Analytics Cloud - Wave Analytics Platform permission set license and click **Save**.
7. Repeat the above steps for all users in your organization who require access to Wave.

 **Note:** No data is available for queries until you load data into Wave Analytics.

Create Wave Analytics Permission Sets

To give users in your organization access to Wave features, create and assign one or more permission sets based on the level of analytics capabilities they need.

After assigning permission set licenses to users, the next step in the setup process is to create permission sets made up of Wave user permissions and assign them to users. You can create any permission sets you need to meet the needs of your users. We show you how to create two permission sets:

- *Manage Wave Analytics* permission set, for users who administer and manage Wave Analytics and need access to all Wave Analytics features.
- *View Wave Analytics* permission set, for users who explore data and occasionally upload new data to Wave Analytics and need access to a limited set of Wave Analytics features.

 **Note:** Customers who purchased Wave before October 20, 2015: See [Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015](#) before following the instructions here.

Walk Through It: create, edit, and assign a permission set

1.  **Note:** The Manage Wave Analytics permission set enables the equivalent functionality provided by the previous Wave Analytics Builder license (purchased before October 20, 2015). If you have a Builder license or you're migrating to the new Wave Analytics platform license, follow these steps to create a permission set with the same functionality.

Create Manage Wave Analytics permission set, which gives users access to all Wave features.

- a. In the Setup menu, under administer, click **Manage Users | Permission Sets** and then click **New**.
- b. Enter `Manage Wave Analytics` in the Label field. This automatically creates the API name, as well, which you can change if you'd like. Note that the API name can't include spaces, end with an underscore, or have two consecutive underscores.
- c.  **Warning:** Follow this step precisely or some users in your organization may not be able to access Wave.
In the User License field, keep the default value `--None--`. Do *not* select a user license.
- d. Click **Save**. The permission set details page shows the new permission set. Now add user permissions to the set.
- e. Scroll to the bottom of the permission set details page, and click **System Permissions**. Then click **Edit**.
- f. Select "Manage Wave Analytics" user permissions and click **Save**. You've successfully created a permission set that enables a user to access all Wave features. You can now assign it to users, which is covered in Assign Permission Sets to Users. You should assign this permission set sparingly because it provides access to all Wave features, many of which are inappropriate for most analytics users.

2.  **Note:** The View Wave Analytics permission set enables the equivalent functionality provided by the previous Wave Analytics Explorer license (purchased before October 20, 2015). If you have an Explorer license or you're migrating to the new Wave Analytics platform license, follow these steps to create a permission set with the same functionality.

Create View Wave Analytics permission set, which enables users to view Wave lenses, dashboards, and datasets and import data to Wave.

- a. In the Setup menu, under administer, click **Manage Users | Permission Sets** and then click **New**.
- b. Enter `View Wave Analytics` in the Label field. This automatically creates the API name, as well, which you can change if you'd like. Note that the API name can't include spaces, end with an underscore, or have two consecutive underscores.
- c.  **Warning:** Follow this step precisely or some users in your organization may not be able to access Wave.

USER PERMISSIONS

To create permission sets:

- "Manage Profiles and Permission Sets"

In the User License field, keep the default value --None--. Do *not* select a user license.

- d. Click **Save**. The permission set details page shows the new permission set. Now add user permissions to the set.
- e. Scroll to the bottom of the permission set details page, and click **System Permissions**. Then click **Edit**.
- f. Select “Use Wave Analytics Cloud” and “Upload External Data to Wave Analytics” user permissions and click **Save**. You’ve successfully created a permission set that enables a user to view the Wave datasets, lenses, and dashboards that they have permission to view upload data files from outside Salesforce. You can now assign it to users, which is covered in Assign Permission Sets to Users.

Assign Wave Analytics Permission Sets to Users

Assign permission sets to one or more users—either one at a time, or in bulk—to give them access to the Wave functionality.

1.  [Walk Through It: assign a permission set](#)
2. In the Setup menu, under administer, click **Manage Users | Permission Sets**.
3.  **Warning:** Assign the Manage Wave Analytics permission set sparingly, since it provides access to all Wave features. It should only be assigned to users who administer or manage the Wave platform.

Click the permission set you want to assign to users. If you’ve followed the instructions in [Create Wave Analytics Permission Sets](#) on page 3315, select either the Manage Wave Analytics or View Wave Analytics permission sets.

4. Click **Manage Assignments** and click **Add Assignments**.
5. Select the users who need access to Wave, and click **Done**.

USER PERMISSIONS

To assign a permission set to users:

- “Assign Permission Sets”

Complete Setting up the Wave Analytics Platform

Enhance the Wave platform user experience and fine-tune Wave access to Salesforce data with optional setup procedures.

[Enable Preview Thumbnails for All Lenses and Dashboards](#)

Make it easier for users to find their lenses and dashboards on the home page and on app pages. Replace the generic icons with preview thumbnails of the contents of all lenses and dashboards, including those assets that have row-level security restrictions.

[Enable Wave Analytics for Communities](#)

Securely share Wave Analytics apps with community partner and customer users.

[Enable Downloading from Wave Analytics](#)

Enable users to download the results from lens explorations and dashboard widgets as images (.png), Microsoft® Excel® (.xls), or comma-separated values (.csv) files.

[Grant Users Access to the Flex Dashboard Designer](#)

To grant users access to the flex dashboard designer, enable the feature and assign the “Create and Edit Wave Analytics Dashboards” user permission to the users. If you assign the permission but don’t enable the feature, the users can’t access the new designer, but they can access the old one.

[Enable Annotations on Dashboard Widgets](#)

Annotate dashboard widgets with comments posted in the dashboard and in Chatter.

[Enable the Wave REST API](#)

You can access Wave Analytics datasets and lenses programmatically using the Wave REST API. Selecting this option overrides the "APIEnabled" permission for individual users and gives all Wave users (including Community users) access to the Wave API.

[Connected App for Wave Analytics for iOS](#)

Install the Analytics for iOS Connected App to allow your mobile clients to easily connect to your org. The Connected App gives you control over who's logging in and how your mobile clients share images and links.

[Wave Analytics Security Implementation Guide](#)

Wave Analytics has different levels of security that your organization can implement to ensure that the right user has access to the right data.

[Salesforce Data Access in Wave Analytics](#)

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Wave Analytics gains access to Salesforce data based on permissions of two internal Wave Analytics users: Integration User and Security User.

Enable Preview Thumbnails for All Lenses and Dashboards

Make it easier for users to find their lenses and dashboards on the home page and on app pages. Replace the generic icons with preview thumbnails of the contents of all lenses and dashboards, including those assets that have row-level security restrictions.

If no security predicate is defined for a dataset, then preview thumbnails always appear. If a security predicate is defined, then preview thumbnails don't show unless this setting is enabled. With the setting enabled, preview thumbnails appear for all assets.

 **Important:** Even if row-level security applies to the dataset used by a lens or dashboard, the preview thumbnail could expose data from restricted rows. Row-level security restrictions take effect only after you've clicked through to the lens or dashboard.

1. From Setup, enter *Wave Analytics* in the Quick Find box, then select **Settings**.
2. Select **Show preview thumbnails for lenses and dashboards with row level-security enabled**.
3. Click **Save**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

Enable Wave Analytics for Communities

Securely share Wave Analytics apps with community partner and customer users.

 **Note:** Only users with a Customer Community Plus or Partner Community license can use this feature. This feature is supported in communities but not in portals.

To set up Wave Analytics for sharing with Communities, complete the following steps.

1. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**. Select **Enable Wave Analytics for Communities**.
2. Assign your community members the Analytics Cloud - Wave Community Users permission set license.
3. Create a permission set that includes the "View Wave Analytics on Communities Pages" permission and assign it to your community members.

Enable Downloading from Wave Analytics

Enable users to download the results from lens explorations and dashboard widgets as images (.png), Microsoft® Excel® (.xls), or comma-separated values (.csv) files.

 **Note:** This feature isn't supported for flex dashboards (beta).

To set up users to download data from Wave, complete the following steps.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, and then select **Permission Sets** under Manage Users.
2. Select the Analytics Cloud Permission Set where you want to add the permission, and then select **System Permissions**.
3. Select **Download Wave Analytics Data**.
4. Click **Save**.

To view Wave dashboards and lenses:

- "View Wave Analytics on Communities Pages"

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

Grant Users Access to the Flex Dashboard Designer

To grant users access to the flex dashboard designer, enable the feature and assign the “Create and Edit Wave Analytics Dashboards” user permission to the users. If you assign the permission but don’t enable the feature, the users can’t access the new designer, but they can access the old one.

1. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**.
2. Select **Enable Flex Dashboard Designer (Beta)**, and then click **Save**.
3. For each user that builds dashboards, assign the “Create and Edit Wave Analytics Dashboards” user permission to them.
Each user has a choice whether to use the old or new designer for each dashboard.

SEE ALSO:

[Quickly Build Responsive Grid-Based Dashboards with Flex Dashboard Designer \(Beta\)](#)

Enable Annotations on Dashboard Widgets

Annotate dashboard widgets with comments posted in the dashboard and in Chatter.

 **Note:** Annotations are supported only in flex dashboards (beta).

To enable annotations, complete the following steps.

1. From Setup, enter *Feed Tracking* in the **Quick Find** box, and then select **Feed Tracking** under Chatter.
2. Scroll down and select **Wave Asset**.
3. Select **Enable Feed Tracking**.
4. Click **Save**.

SEE ALSO:

[Collaborate with Dashboard Annotations](#)

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To access the old or new designer:

- “Create and Edit Wave Analytics Dashboards”

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- “Manage Wave Analytics”

Enable the Wave REST API

You can access Wave Analytics datasets and lenses programmatically using the Wave REST API. Selecting this option overrides the "APIEnabled" permission for individual users and gives all Wave users (including Community users) access to the Wave API.

1. From Setup, enter *Wave Analytics* in the **Quick Find** box, then select **Settings**.
2. Select **Enable the Wave API for all Wave users**.
3. Click **Save**.

Connected App for Wave Analytics for iOS

Install the Analytics for iOS Connected App to allow your mobile clients to easily connect to your org. The Connected App gives you control over who's logging in and how your mobile clients share images and links.

1. While logged in as an admin, navigate to <https://login.salesforce.com/packaging/installPackage.apexp?p0=04tB0000000DKTA>.
2. Select **Install for All Users**.
If you install the Connected App only for certain roles, then only those clients are subject to your policies.
3. After clicking **Done**, open the Salesforce Insights for iOS package.
4. To configure policies and other settings, click **Edit**. When you are finished, save your changes.
For more information about Connected App settings, see [Edit a Connected App](#).
5. If you want to disable sharing options for mobile users, click **New** in the Custom Attributes section.
All sharing options are enabled by default. To disable an option, add its attribute key and enter "false" for the attribute value. See the table for the supported attribute keys.

Attribute Key	Mobile clients can share
SHARE_IMAGE_AIRDROP	Images via AirDrop
SHARE_IMAGE_CAMERAROLL	Images from Camera Roll
SHARE_IMAGE_OPEN	The image that's currently open on the mobile device
SHARE_IMAGE_S1	Images in Salesforce1

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To modify settings:

- "Manage Wave Analytics"

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To install and configure Connected App:

- "Manage Wave Analytics"

Attribute Key	Mobile clients can share
SHARE_IMAGE_EMAIL	Images via email
SHARE_LINK_AIRDROP	Links via AirDrop
SHARE_LINK_CLIPBOARD	The link that's currently in the clipboard of the mobile device
SHARE_LINK_S1	Links in Salesforce1
SHARE_LINK_EMAIL	Links via email
SPOTLIGHT_SEARCH	Mobile clients can see Wave Analytics assets in Spotlight search results

 **Note:** To apply custom attributes to connected users, you can revoke them and ask them to reconnect.

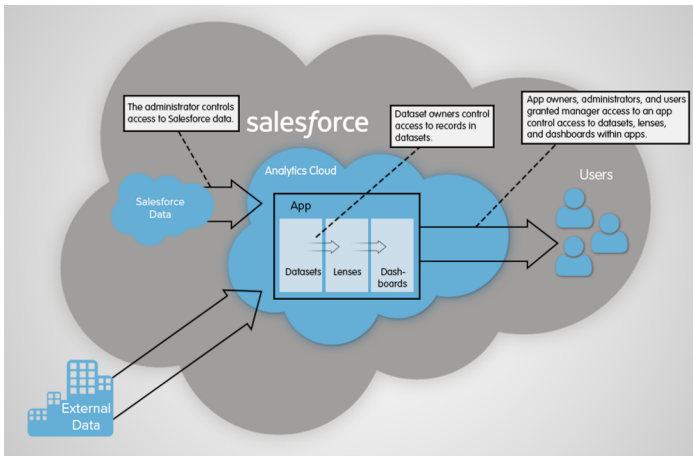

- To view and control how mobile clients connect to your Wave-enabled org, from Setup, enter *Connected Apps* in the *Quick Find* box, then select **Connect Apps OAuth Usage**.

You can block user sessions, revoke individual users, and drill in to user details. For more information, see [Monitoring Usage for a Connected App](#).

 **Note:** For certificate-based authentication, users must set their desktop browsers to allow cookies.

Wave Analytics Security Implementation Guide

Wave Analytics has different levels of security that your organization can implement to ensure that the right user has access to the right data.

- The administrator can implement object-level and field-level security to control access to Salesforce data. For example, the administrator can restrict access to prevent the dataflow from loading sensitive Salesforce data into datasets. This document describes how Wave Analytics uses object-level and field-level security on Salesforce data and how to configure permissions on Salesforce objects and fields.
- Dataset owners can implement row-level security on each dataset that they create to restrict access to its records. If a dataset does not have row-level security, users who have access to the dataset can view all records. This document describes how to configure row-level security on datasets and provides some sample implementations based on datasets created from Salesforce data and external data.

- App owners, administrators, and users granted manager access to an app control access to datasets, lenses, and dashboards within apps. This document describes the different levels of access for apps and how to share datasets, lenses, dashboards in an app with other users.

Note: Wave Analytics doesn't synchronize with sharing that's configured in Salesforce. Instead, you configure security separately in Wave Analytics. Wave Analytics provides a robust row-level security feature that enables you to model many different types of access controls on datasets.

For complete information about implementing Wave Analytics security, see [Wave Analytics Security Implementation Guide](#).

Salesforce Data Access in Wave Analytics

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Wave Analytics gains access to Salesforce data based on permissions of two internal Wave Analytics users: Integration User and Security User.

Wave Analytics uses the permissions of the Integration User to extract data from Salesforce objects and fields when a dataflow job runs. Because the Integration User has View All Data access, consider restricting access to particular objects and fields that contain sensitive data. If the dataflow is configured to extract data from an object or field on which the Integration User does not have permission, the dataflow job fails.

When you query a dataset that has row-level security based on the User object, Wave Analytics uses the permissions of the Security User to access the User object and its fields. The Security User must have at least read permission on each User object field included in a predicate. A predicate is a filter condition that defines row-level security for a dataset. By default, the Security User has read permission on all standard fields of the User object. If the predicate is based on a custom field, then grant the Security User read access on the field. If the Security User does not have read access on all User object fields included in a predicate expression, an error appears when you try to query the dataset using that predicate.

[Control Access to Salesforce Objects and Fields](#)

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Configure the permissions of the Integration User on Salesforce objects and fields to control the dataflow's access to Salesforce data. Configure the permissions of the Security User to enable row-level security based on custom fields of the User object.

SEE ALSO:

[Control Access to Salesforce Objects and Fields](#)

Control Access to Salesforce Objects and Fields

Wave Analytics requires access to Salesforce data when extracting the data and also when the data is used as part of row-level security. Configure the permissions of the Integration User on Salesforce objects and fields to control the dataflow's access to Salesforce data. Configure the permissions of the Security User to enable row-level security based on custom fields of the User object.

When configuring permissions for the Integration User or Security User, make changes to a cloned version of the user profile.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**, and then select the user profile.

For the Integration User, select the Analytics Cloud Integration User profile. For the Security User, select the Analytics Cloud Security User profile.

2. Click **Clone** to clone the user profile.

USER PERMISSIONS

To clone a user profile:

- "Manage Profiles and Permission Sets"

To edit object permissions:

- "Manage Profiles and Permission Sets"

AND

"Customize Application"

3. Name and save the cloned user profile.
4. Click **Object Settings**.
5. Click the name of the Salesforce object.
6. Click **Edit**.
 - a. To enable permission on the object, select **Read** in the Object Permissions section.
 - b. To enable permission on a field of the object, select **Read** for the field in the Field Permissions section.
 -  **Note:** You can't change the permissions on standard fields of the User object.
7. Save the object settings.
8. Assign the cloned user profile to the Integration User or Security User.
 - a. From Setup, enter `users` in the `Quick Find` box, then select **Users**.
 - b. Select the user to which you want to assign the user profile.
 - c. Click **Edit**.
 - d. In the Profile field, select the user profile.
 - e. Click **Save**.
9. Verify that the Integration User or Security User has the right permissions on fields of the objects.

Set up the Wave Analytics Platform With Licenses Purchased Before October 20, 2015

If you purchased Wave Analytics Builder or Explorer licenses before October 20, 2015, you can continue to use your licenses to set up the Wave platform for users in your organization or you can migrate to the new single-user Wave Analytics platform license.

 **Note:** This information applies only to customers who purchased Wave Analytics licenses before October 20, 2015, and continue to use the Analytics Cloud Builder or Analytics Cloud Explorer permission set licenses after that without migrating to the new Analytics Cloud Wave Platform license. If you purchased Wave on or after October 20, 2015, go to [Wave Platform Setup](#).

 **Important:** If you're migrating from the previous Analytics Cloud Builder or Analytics Cloud Explorer platform licenses to the single-user Wave Analytics platform license, read [Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#).

The Analytics Cloud Wave Platform License

Analytics Cloud Wave Platform license purchased before October 20, 2015, enable you to turn on Wave Analytics for your organization. Each previous Wave Platform license is contractually limited to a maximum of 400 users. If you need more than 400 users, you can purchase additional Wave Platform licenses.

Each previous Wave Platform license enables you to:

- Store up to 250,000,000 rows in your final registered datasets.
- Run up to 50 concurrent queries in Wave Analytics.

The Analytics Cloud Permission Set Licenses

Each user needs an Analytics Cloud permission set license to use the product. The permission set license defines what user permissions can be assigned to the user. The administrator assigns permission set licenses to users.

As part of Wave Analytics platform licenses sold before October 20, 2015, Salesforce provides the following permission set licenses:

- Analytics Cloud Builder permission set license enables users to access all Wave Analytics features.
- Analytics Cloud Explorer permission set license enables users to upload external data to Wave Analytics and explore data.

Here are Wave Analytics user permissions included with each permission set license.

User Permission	Included in Explorer or Builder Permission Set License?	What It Enables
"Create and Edit Wave Analytics Dashboards"	Builder only	Creating and editing Wave Analytics dashboards.
"Create Wave Analytics Apps"	Builder only	Creating and sharing Wave Analytics applications.
"Edit Wave Analytics Dataflows"	Builder only	Downloading, uploading, starting, stopping, and rescheduling the dataflow. Viewing dataflow and system jobs in the data monitor.
"Manage Wave Analytics"	Builder only	Accessing all Wave Analytics features. Provides Wave administrator-level capabilities.
"Upload External Data to Wave Analytics"	Builder and Explorer	Uploading external data to Wave Analytics to create a dataset. Viewing dataflow and system jobs in the data monitor.
"Use Wave Analytics"	Builder and Explorer	Using Wave Analytics, and viewing the datasets, lenses, and dashboards that the user has permission to view. Automatically enabled when you select any other Wave permission.

 **Note:** When you create permission sets for Wave users, selecting any of the other Wave Analytics permissions automatically enables the "Wave Analytics" permission.

You can assign previous Wave Analytics permission set licenses along with any of the following Salesforce user licenses:

- Force.com (app subscription)
- Force.com (one app)
- Full CRM
- Salesforce Platform

- Salesforce Platform One

SEE ALSO:

[Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses](#)

Migrating From Wave Licenses Purchased Before 10/20/2015 to New Wave Platform Licenses

To complete migration from previous Analytics Cloud Builder and Analytics Cloud Explorer licenses purchased before October 20, 2015, to the new Analytics Cloud - Wave Analytics Platform license, you may need to set up Wave users in your organization with new permission sets.

When Salesforce provisions your organization with the new Analytics Cloud - Wave Analytics Platform license, you may have to set up some users with the new license.

- **Builder license users.** Users who access Wave with the Analytics Cloud Builder permission set license should be able to continue to use the Wave Analytics platform without any additional setup. The Builder license is simply renamed *Analytics Cloud - Wave Analytics Platform*, and you'll see that permission set license in Salesforce Setup.
- **Explorer license users.** During the new license provisioning process, Salesforce may remove the Analytics Cloud Explorer license from your org. If that's the case, you'll see the new Analytics Cloud - Wave Platform license instead of the Explorer license and you have to set up users with that license. If the Explorer permission set license is still visible, you do not have to repeat the setup process for Explorer users.

If users in your organization require you to set them up with the new Analytics Cloud - Wave Platform license—even if they used Wave with a previous license—follow the steps in [Wave Platform Setup](#) on page 3311. You need to assign them the new permission set license, create one or more new permission sets, and assign the permission sets to users.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

Update the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota (Target) Dataset

If you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level, you need to update the Sales Wave Quota dataset so the app includes quotas data for your team.

When you create the Sales Wave app, a Quota (Target) dataset is created along with the app. To explore how team members are tracking to their monthly, quarterly, or annual quotas in Sales Wave, you need to update the Quota dataset by completing the following steps. You can also watch the video [Create the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App, Part 2: Upload the Quota CSV File and Schedule a Dataflow](#), which covers the steps described here.

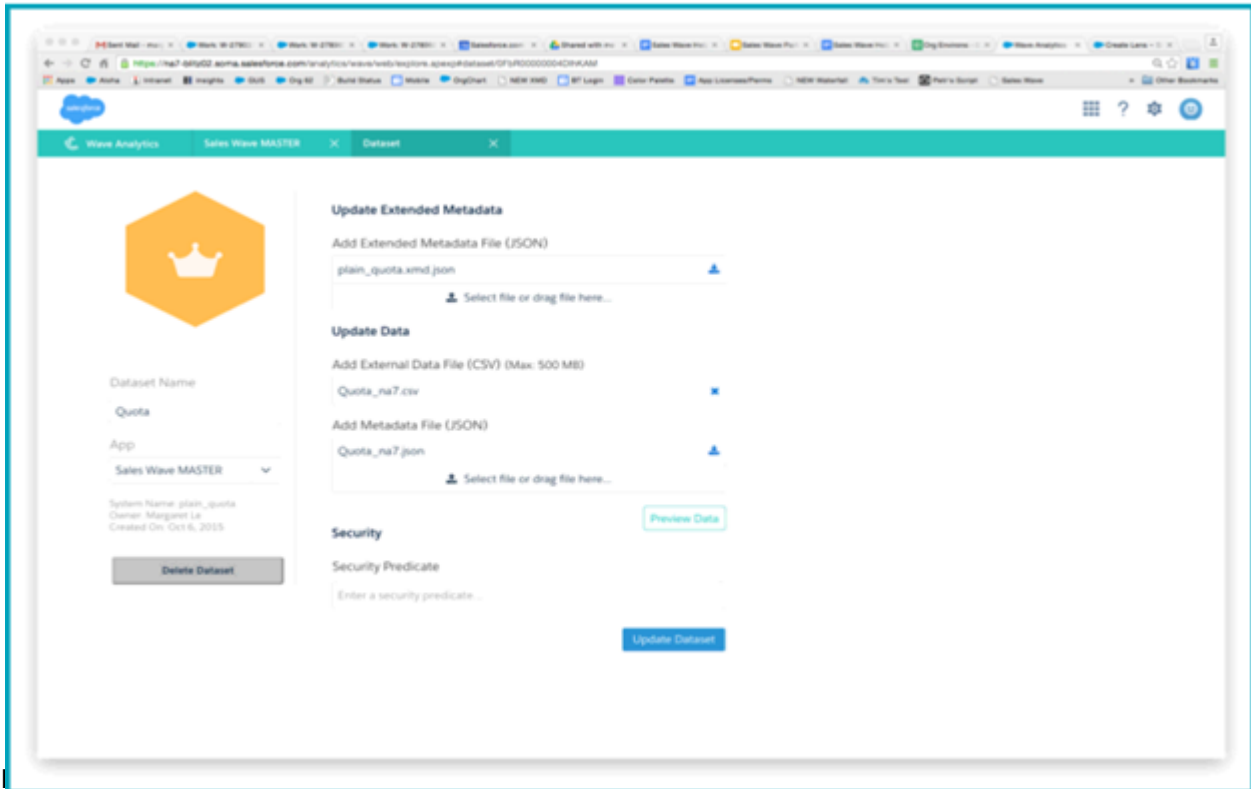

- 📌 **Note:** When you work with .CSV files you want to import to Sales Wave, create and open them using only a UTF-8-compliant text editor. Opening them in Microsoft Excel or other spreadsheet software reformats .CSV files and makes them unusable in Sales Wave
- 📌 **Note:** If your business doesn't track quotas at the user level, you can skip this step. You only need to complete this if you answer “yes” to the configuration wizard question about whether your business tracks quotas at the user level.

USER PERMISSIONS

To create and manage Wave apps:

- “Manage Wave Analytics Templated Apps”
- “Edit Wave Analytics Dataflows”

1. Create a .CSV file to include the following fields, in this order: QuotaAmount, StartDate (in yyyy-mm-dd format), OwnerName, and Username. Field names are case sensitive and must appear in your file exactly as shown here. For an example, see [Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Example .CSV File](#).
2. Save the file to a location that you can easily remember.
3. In Salesforce, go to the Wave Analytics home page and find the Quota (Target) dataset.
4. Hover over the dataset, then click **Edit**.
5. Salesforce displays the dataset editing screen for the Quota dataset. From the Update Data section, select **Select file or drag file**

6. In the dialog box that opens, navigate to the .CSV file you created in Step 1, and double-click it.
7. Click **Update Dataset**.
8. If your fiscal period is different than calendar period, that is if it starts another date besides January 1, you also need to update the Quota Metadata file.
 - a. Copy the JSON from [Sales Wave Quota Dataset JSON File](#) and paste it into a text editor of your choice.
 - b. Change the value of "fiscalMonthOffset" from 4 to a number that represents the month your fiscal period starts. In Sales Wave metadata, the numeral "0" stands for January, "1" stands for February, and so on up to "11," which stands for December.
 - c. Save the file to your desktop and upload it to Sales Wave by dragging it to **Select file or drag file here...** in the Add Metadata File (JSON) section of the dataset editing screen.
 - d. Click **Update Dataset**.
9. After uploading your quota data, re-run the dataflow to update the dashboards.
 - a. Click the Gear menu at the upper right of the Sales Wave screen and select Data Monitor.

b. Select Dataflow view from the menu at the top left of the Data Monitor screen.

c. Find your app; you may have to scroll down the page. Open the menu located on the far right of the screen next to the app icon and name, and click

it. The dataflow assures that Sales Wave has your company's latest sales data. You can learn more about dataflows from [Schedule the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Daily Dataflow.](#)

Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Example .CSV File

Here's an example of the .CSV file you create to update the Sales Wave app Quota (Target) dataset.

 **Note:** This file is for example purposes only. Create a unique .CSV file with quota data for members of your team including the following fields:

- QuotaAmount
- StartDate
- OwnerName
- Username

Create the file using a UTF-8 compliant text editor, and do not open the file with Microsoft Excel or another spreadsheet application. Field names are case sensitive and must appear in your file exactly as shown here.

See [Update the Sales Wave AppService Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota \(Target\) Dataset](#) on page 3526.

 **Example:**

```
QuotaAmount,StartDate,OwnerName,Username
5000000,2014-01-01,Priya Anand,user9.kthjbnrxifyo@yourDomain.com

Sales Wave Quota Dataset JSON File

Use this file to update the Sales Wave Quota dataset with your fiscal year start date if it's *not* January 1.

Copy the contents of this file into an editor of your choice and change the "fiscalMonthOffset" value (shown in **bold**) to the month your fiscal period begins. In Sales Wave metadata, the numeral "0" stands for January, "1" stands for February, and so on up to

"11," which stands for December. In the code below, the number is set to "4", which stands for May. Use the number that represents the month your fiscal period begins. Then save the file and upload it to Sales Wave following the instructions in [Update the Sales Wave App Service Wave Analytics app Service Wave Analytics App Service Wave app Service Wave Service Wave App Quota \(Target\) Dataset](#).

```

```

Data Integration

You can integrate Salesforce data and external data into Wave Analytics to enable users to explore and visualize the data with explorer and designer. *External data* is data that resides outside of Salesforce, such as data from outside applications and spreadsheets.

When you load data into Wave Analytics, you load it into datasets. A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form.

You can use the following methods to create datasets in Wave Analytics.

	Dataflow JSON	Dataset Builder	Upload User Interface	External Data API	Wave Connector
Data source	Salesforce objects; existing datasets	Salesforce objects	External data	External data	Microsoft Excel
Can join external and Salesforce data?	Yes	No	No	No	No
Graphical user interface?	No (JSON)	Yes	Yes	No (programmatic access)	Yes
Can create multiple datasets at once?	Yes	No	No	No	No
Supports incremental extraction?	Yes	No	No	Yes	No
Data refresh method	Automatic	Automatic	Manual	Manual	Manual
Can filter records?	Yes	No	No	No	No
Can generate new columns when creating datasets?	Yes (delta and dimension columns)	No	No	No	No
Can override metadata?	Yes	No	Yes	Yes	No

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

[Create Datasets with a Dataflow](#)

You can use a dataflow to create one or more datasets based on data from Salesforce objects or existing datasets.

[Transformations for Wave Dataflows](#)

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

[Create a Dataset with the Dataset Builder](#)

You can use the dataset builder to create a single dataset based on data from one or more Salesforce objects. The dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs. You can also edit the dataflow definition file to add transformations that manipulate the dataset.

[Wave Connector for Excel Data](#)

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

[Create a Dataset with External Data](#)

You can either upload external data through the user interface or through the External Data API to create a dataset. When you upload an external data file (in .csv, .gz, or .zip format), you can also provide a metadata file. A metadata file contains metadata attributes that describe the structure of the data in the external data file. If you upload a .csv from the user interface, Wave Analytics automatically generates the metadata file, which you can preview and change. If you do not provide a metadata file, Wave Analytics imports all external data file columns as dimensions.

[Edit a Dataset](#)

You can edit a dataset to change the dataset name, app, security predicate, or extended metadata (XMD) file associated with the dataset. For datasets created from an external data file, you can also upload a new external data file or metadata file to update the data or metadata.

[Delete a Dataset](#)

Delete unnecessary datasets from your My Private App or in shared apps on which you have at least Editor access. Removing datasets reduces clutter and helps you avoid reaching your org's limit for rows across registered datasets.

[Row-Level Security for Datasets](#)

If a Wave Analytics user has access to a dataset, they have access to all records in the dataset, by default. However, you can implement row-level security on a dataset to restrict access to records. Some records might contain sensitive data that shouldn't be accessible by everyone.

[Predicate Expression Syntax for Datasets](#)

You must use valid syntax when defining the predicate expression.

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. For each platform license, your organization can have a maximum of 250 million rows of data stored for all registered datasets combined.

Wave Analytics applies one of the following types to each dataset field:

Date

A *date* can be represented as a day, month, year, and, optionally, time. You can group, filter, and perform math on dates.

Dimension

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions. To increase query performance, Wave Analytics indexes all dimension fields in datasets.

Measure

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate.

For each dataset that you create, you can apply row-level security to restrict access to records in the dataset.

Attention: Before you create a dataset, verify that the source data contains at least one value in each column. Columns with all null values won't be created in datasets and can't be referenced in dataflows, lenses, or dashboards. Consider providing a default value for null values, like "n/a" or "empty."

[Numeric-Value Handling in Datasets](#)

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number "3,200.99" with a scale of "2" as "320099". The user interface converts the stored value back to decimal notation to display the number as "3200.99."

[Date Handling in Datasets](#)

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

[Dataflow JSON](#)

You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

[Dataset Builder](#)

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

[Wave Connector for Excel Data](#)

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

[Upload External Data from the User Interface](#)

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.

[External Data API](#)

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

Numeric-Value Handling in Datasets

Wave Analytics internally stores numeric values in datasets as long values. For example, it stores the number “3,200.99” with a scale of “2” as “320099”. The user interface converts the stored value back to decimal notation to display the number as “3200.99.”

The maximum numeric value that can be stored in a dataset is 36,028,797,018,963,967 and the minimum numeric value is -36,028,797,018,963,968.

Warning: If a numeric value is not within this range, you might receive unexpected results. For example, if you try to load the value 3.7E-16 with a scale of 16 into a dataset, Wave Analytics tries to store the value as 3700000000000000. However, because this value exceeds the maximum, Wave Analytics fails to load the entire record. In addition, if you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum, the value overflows and Wave Analytics returns an incorrect result.

Date Handling in Datasets

When Wave Analytics loads dates into a dataset, it breaks up each date into multiple fields, such as day, week, month, quarter, and year, based on the calendar year. For example, if you extract dates from a `CreateDate` field, Wave Analytics generates date fields such as `CreateDate_Day` and `CreateDate_Week`. If your fiscal year differs from the calendar year, you can enable Wave Analytics to generate fiscal date fields as well.

Wave Analytics generates the following date fields.

Field Name	Field Type	Description
<date field name>_Second	Text	Number of seconds. If the date contains no seconds, value is '0.'
<date field name>_Minute	Text	Number of minutes. If the date contains no minutes, value is '0.'
<date field name>_Hour	Text	Number of hours. If the date contains no hours, value is '0.'
<date field name>_Day	Text	Day of the month.
<date field name>_Week	Text	Week number in calendar year.
<date field name>_Month	Text	Month number in calendar year.
<date field name>_Quarter	Text	Quarter number in calendar year.
<date field name>_Year	Text	Calendar year.
<date field name>_Week_Fiscal	Text	Week number in fiscal year.
<date field name>_Month_Fiscal	Text	Month number in fiscal year.
<date field name>_Quarter_Fiscal	Text	Quarter number in fiscal year.
<date field name>_Year_Fiscal	Text	Fiscal year.
<date field name>_sec_epoch	Numeric	Number of seconds that have elapsed since January 1, 1970 (midnight UTC).
<date field name>_day_epoch	Numeric	Number of days that have elapsed since January 1, 1970 (midnight UTC).

You can set metadata attributes to control how dates are loaded into datasets and to enable Wave Analytics to generate fiscal date fields. You set the metadata attributes in the [sfdcDigest transformation parameters](#) for Salesforce data or in the [metadata file](#) for external data.

⚠ Important: Before loading dates from an external data file, ensure that you review the date format requirements [here](#). Also, ensure that the column names in the external data file do not conflict with the generated date field names. For example, if you load a CSV with column `Create_Date`, Wave Analytics generates the `Create_Date_Year` field in the dataset. If the CSV also had a field named `Create_Date_Year`, Wave Analytics would throw an error because the names conflict.

Fiscal Periods in Wave Analytics

If the calendar and fiscal year differ, you can enable Wave Analytics to generate the fiscal date fields in the dataset in addition to calendar date fields. To enable Wave Analytics to generate fiscal date fields, set the `fiscalMonthOffset` attribute to a value other than '0'. You set this attribute for each date column for which you want to generate fiscal date fields. If you set the offset to '0' or you do not specify a value, Wave Analytics does not generate any fiscal date fields.

Additionally, to configure the fiscal periods, set the following metadata attributes for each date column:

fiscalMonthOffset

In addition to enabling the generation of fiscal date fields, this attribute also determines the first month of the fiscal year. You specify the difference between the first month of the fiscal year and first month of the calendar year (January) in `fiscalMonthOffset`. For example, if your fiscal year begins in April, set `fiscalMonthOffset` to '3'.

isYearEndFiscalYear

Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year. The `isYearEndFiscalYear` attribute indicates whether the fiscal year is the year in which the fiscal year ends or begins.

To see how this works, let's look at a couple of examples. If `isYearEndFiscalYear = true` (or you do not specify this attribute), then the fiscal year is the year in which the fiscal year ends. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2016 because the fiscal year ends in 2016.

If `isYearEndFiscalYear = false`, then the fiscal year is the year in which the fiscal year begins. As shown in the following diagram, any dates between 4/1/2015 and 3/31/2016 are part of the fiscal year 2015 because the fiscal year begins in 2015.

**Week Numbering in Wave Analytics**

For each date loaded into a dataset, Wave Analytics generates the corresponding week number for the calendar year and, if applicable, fiscal year. Similar to the SOQL function `WEEK_IN_YEAR`, week 1 in Wave Analytics is January 1 - January 7. (This is different from the UTC `week()` calculation.)

If needed, you can configure the week to start on a particular day of the week by setting the `firstDayOfWeek` attribute. For example, if January 1 is a Saturday and you configure the week to start on a Monday, then week 1 is January 1 - 2. Week 2 starts on Monday, January 3. Week 3 starts January 10, the following Monday. Notice that week 1 can be a short week to ensure that the subsequent weeks start on the specified day of the week.

Dataflow JSON

You can use the dataflow to create one or more datasets based on data from Salesforce objects or existing datasets. A *dataflow* is a set of instructions that specifies what data to extract from Salesforce objects or datasets, how to transform the datasets, and which datasets to make available for querying. With a dataflow, you can manipulate the extracted data and override the metadata before you load it into a dataset. The dataflow runs on a daily schedule to continually refresh the data.

Wave Analytics provides a default dataflow that contains some sample transformation logic. This dataflow is just a sample that you must configure before running it.

To configure the dataflow, you add transformations to the dataflow definition file. A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic. You can add transformations to determine what data to extract, how to transform datasets, and which datasets to register to make available for queries.

After you configure the dataflow, you upload the new dataflow definition file to Wave Analytics.

By default, the dataflow doesn't run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule. The dataflow runs on a daily schedule to capture the latest changes to Salesforce data and changes in the dataflow logic.

You can also stop, reschedule, and monitor dataflow jobs.

SEE ALSO:

[Create Datasets with a Dataflow](#)

Dataset Builder

Use the dataset builder to create a single dataset based on data from one or more related Salesforce objects. With the dataset builder you simply point and click to identify and select related Salesforce objects.

After you select the data to include in the dataset, the dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs.

SEE ALSO:

[Create a Dataset with the Dataset Builder](#)

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization's private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

[Install the Wave Connector Excel App](#)

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics..

Upload External Data from the User Interface

You can use the upload user interface to create a single dataset based on external data. You can upload an external data file in a .csv, .gz, or .zip format. To refresh the data, you can overwrite the data in the dataset by uploading a new external data file.

When Wave Analytics loads any data into a dataset, it also adds metadata about each column of data. For example, metadata can include the field type, precision, scale, and default value.

For external data, Wave Analytics infers metadata about each column of data in the external data file unless you specify different metadata attributes in a metadata file. A *metadata file* is a JSON file that describes the structure of an external data file. For example, you can use a metadata file to explicitly set the field type and default value for a specific column of external data. If no metadata file is provided when you upload external data, Wave Analytics treats every column as a dimension and sets the field type to 'Text.' This impacts the type of queries that can be placed on the dataset because you can't perform mathematical calculations on dataset columns with a Text field type. You can only perform mathematical calculations on dataset columns with a Numeric field type.

After you create a dataset based on an external data file, you can edit the dataset to apply a new metadata file. This enables you to change the metadata attributes of each column.

 **Note:** Wave temporarily stores the uploaded CSV and metadata files for processing only. After a dataset is created, Wave purges the files.

SEE ALSO:

[Create a Dataset with External Data](#)

External Data API

You can use the External Data API to create a single dataset based on external data in the .csv format. You can also use the API to edit the dataset by uploading a new .csv file. When you edit the dataset, you can choose to overwrite all records, append records, update records, or delete records.

For more information about the External Data API, see the [Wave Analytics External Data API Developer Guide](#).

Create Datasets with a Dataflow

You can use a dataflow to create one or more datasets based on data from Salesforce objects or existing datasets.

1. [Design the Dataflow](#)

Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

2. [Configure the Dataflow](#)

Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

3. [Start and Stop a Dataflow](#)

You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it's running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

4. [Monitor a Dataflow Job](#)

Use the data monitor to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

5. [Reschedule and Unschedule a Dataflow](#)

After you run a dataflow job for the first time, it runs on a daily schedule, by default. You can change the time of the daily schedule or schedule it to run on an hourly interval. You might change the schedule to ensure that the data is available by a particular time or to run the job during non-business hours. You can also unschedule a dataflow.

Design the Dataflow

Before you start creating the dataflow definition file in the .json format, think about the dataflow design. Consider what data to make available for queries, where to extract the data from, and whether you need to transform the extracted data to get the data you want.

To illustrate some key design decisions, let's consider an example. In this example, the goal is to create a dataset called "Won Opportunities." The dataset will contain opportunity details, including the account name for each opportunity.

To create this dataset, you design the following dataflow:

The dataflow extracts opportunity data from the Opportunity object and extracts the account name from the Account object. For each extracted object, the dataflow creates a new dataset.

The dataflow then transforms the datasets created from the extracted data. First, the dataflow joins the opportunity and account data into a new dataset. Next, the dataflow filters the records based on the opportunity stage so that the dataset contains only won opportunities. Each time the dataflow transforms a dataset, it creates a new dataset.

Finally, because you want users to be able to query won opportunities only, you configure the dataflow to register the final dataset only. However, if you wanted, you could register any dataset created by the dataflow and register as many datasets as you like.

Carefully choose which datasets to register because:

- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.

Configure the Dataflow

Configure the dataflow based on your dataflow design. You can configure the dataflow to extract data, transform datasets based on your business requirements, and register datasets that you want to make available for queries. To configure the dataflow, add transformations to the dataflow definition file.

A *dataflow definition file* is a JSON file that contains transformations that represent the dataflow logic. The dataflow definition file must be saved with UTF-8 encoding.

Before you can configure a dataflow to process external data, you must [upload the external data to Wave Analytics](#).

1. In Wave Analytics, click the gear icon () and then click **Data Monitor** to open the data monitor.
The Jobs view of the data monitor appears by default.
2. Select **Dataflow View**.
3. To download the dataflow definition file, click **Download** in the actions list (1).

EDITIONS

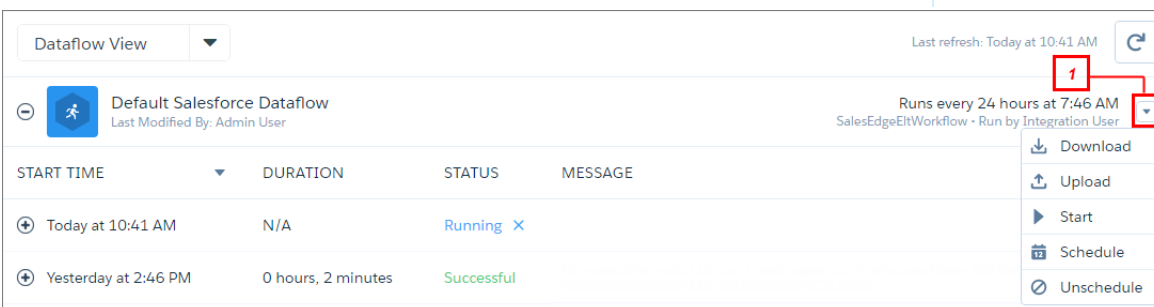

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To edit the dataflow definition file:

- "Edit Wave Analytics Dataflows"

The screenshot shows the 'Dataflow View' interface. At the top, there is a 'Dataflow View' dropdown and a refresh button. Below this, the details for a 'Default Salesforce Dataflow' are shown, including 'Last Modified By: Admin User' and 'Runs every 24 hours at 7:46 AM'. A table lists the job history:

START TIME	DURATION	STATUS	MESSAGE
Today at 10:41 AM	N/A	Running	×
Yesterday at 2:46 PM	0 hours, 2 minutes	Successful	

To the right of the table is an actions menu with buttons for Download, Upload, Start, Schedule, and Unschedule. A red box labeled '1' highlights the 'Download' button.

4. Make a backup copy of the dataflow definition file before you modify it.
Wave Analytics doesn't retain previous versions of the file. If you make a mistake, you can upload the previous version to roll back your changes.
5. Add transformations to the dataflow definition file.
For example, based on the design in the [previous step](#), you can add the following transformations:

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  }
}
```

```

    ]
  }
},
"Extract_AccountDetails": {
  "action": "sfdcDigest",
  "parameters": {
    "object": "Account",
    "fields": [
      { "name": "Id" },
      { "name": "Name" }
    ]
  }
},
"Transform_Augment_OpportunitiesWithAccountDetails": {
  "action": "augment",
  "parameters": {
    "left": "Extract_Opportunities",
    "left_key": [ "AccountId" ],
    "relationship": "OpptyAcct",
    "right": "Extract_AccountDetails",
    "right_key": [ "Id" ],
    "right_select": [
      "Name"
    ]
  }
},
"Transform_Filter_Opportunities": {
  "action": "filter",
  "parameters": {
    "filter": "StageName:EQ:Closed Won",
    "source": "Transform_Augment_OpportunitiesWithAccountDetails"
  }
},
"Register_Dataset_WonOpportunities": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "WonOpportunities",
    "name": "WonOpportunities",
    "source": "Transform_Filter_Opportunities"
  }
}
}

```

 **Note:** The JSON keys and values are case-sensitive. Each bolded key in the previous example JSON contains one action, which identifies the transformation type. The order in which you add the transformations to the dataflow definition file doesn't matter. Wave Analytics determines the order in which to process the transformations by traversing the dataflow to determine the dependencies among them.

6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid. An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save the dataflow definition file with UTF-8 encoding, and then close the file.
8. In the Dataflow view of the data monitor, click **Upload** from the action list (1) to upload the updated dataflow definition file.

 **Note:** Uploading the dataflow definition file does not affect any running dataflow jobs and does not automatically start the dataflow job.

You can now start the dataflow on demand or wait for it to run on the schedule. Users cannot query the registered datasets until the dataflow runs.

Start and Stop a Dataflow

You can manually start a dataflow job to load the data into datasets immediately. You can also stop the job while it's running. You can run a maximum of 24 dataflow jobs during a rolling 24-hour period.

 **Note:** By default, the dataflow doesn't run automatically. To start running the dataflow on the schedule, you must manually start the dataflow first. After the first job runs, the dataflow job runs on the daily schedule.

1. In Wave Analytics, click the gear icon () and then click **Data Monitor** to open the data monitor.
The Jobs view of the data monitor appears by default.
2. Select **Dataflow View**.

EDITIONS

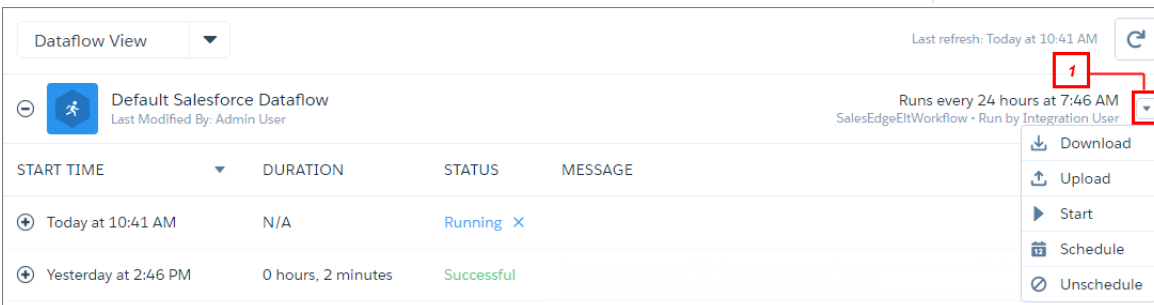

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To start a dataflow job:

- "Edit Wave Analytics Dataflows"

The screenshot shows the 'Dataflow View' interface. At the top, there is a 'Dataflow View' dropdown and a refresh button. Below this, the details for a 'Default Salesforce Dataflow' are shown, including its last modified user and a schedule of 'Runs every 24 hours at 7:46 AM'. A table lists the job history with columns for Start Time, Duration, Status, and Message. The most recent job is 'Running' and started 'Today at 10:41 AM'. To the right of the table is an actions menu with buttons for Download, Upload, Start, Schedule, and Unschedule. A red box labeled '1' highlights the 'Start' button.

START TIME	DURATION	STATUS	MESSAGE
Today at 10:41 AM	N/A	Running 	
Yesterday at 2:46 PM	0 hours, 2 minutes	Successful	

3. Click **Start** in the actions list (1) to start the dataflow job.
The dataflow job is added to the job queue. The **Start** button is greyed out while the dataflow job runs.
4. After the job completes, Wave Analytics sends an email notification to the user who last modified the dataflow definition file.
The email notification indicates whether the job completed successfully. It also shows job details like start time, end time, duration, and number of processed rows. If the job failed, the notification shows the reason for the failure.
5. To stop a dataflow job that is currently running, click  next to the job status.
If you click **Start** to restart a stopped dataflow, the job starts over—the dataflow job does not resume from the point at which it was stopped.

You can monitor the dataflow job in the data monitor to determine when dataflow completes. After the dataflow completes successfully, refresh the Home page to view the registered datasets.

Monitor a Dataflow Job

Use the data monitor to monitor dataflow jobs to ensure that they complete successfully or to troubleshoot them if they fail.

The Dataflow view of the data monitor shows the status, start time, and duration of the last 10 dataflow jobs and retains the last 7 days of history. To help you troubleshoot a failed job, you can view error messages about the job and view the run-time details about every transformation that is processed.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To access the data monitor:

- “Edit Wave Analytics Dataflows,” “Upload External Data to Wave Analytics,” or “Manage Wave Analytics”

The screenshot shows the Dataflow Monitor interface. At the top, there is a 'Dataflow View' dropdown menu (1) and a refresh button (2). Below this, the job name 'SalesEdge ELT Workflow' is displayed, along with 'Last Modified By: cc' and 'Runs every 24 hours at 6:59 PM GMT'. A table lists recent jobs with columns for Start Time, Duration, Status, and Message. One job is highlighted with a red box (3) and shows a 'Failed' status with the message 'Killed by: cc@na2.insights'. Below the main table, a detailed view of a node is shown with columns for Node Name, Start Time, Duration, Node Type, Status, and Input Rows Processed. A dropdown menu on the right side of the interface contains options: Download, Upload, Start, Schedule, and Unschedule.

1. In Wave Analytics, click the gear button (), and then click **Data Monitor** to open the data monitor. The Jobs view shows by default.
2. Select **Dataflow View** (1).
3. Click the Refresh Jobs button () to see the latest status of a job. Each job can have one of the following statuses:

Status	Description
Running	The job is running.

Status	Description
Failed	The job failed.
Successful	The job completed successfully.

- If the dataflow job fails, expand the job node (3) and review the run-time details for every transformation that was processed.
- If there's a problem with the dataflow logic, edit the dataflow definition file, upload it, and then run the dataflow again.

Reschedule and Unschedule a Dataflow

After you run a dataflow job for the first time, it runs on a daily schedule, by default. You can change the time of the daily schedule or schedule it to run on an hourly interval. You might change the schedule to ensure that the data is available by a particular time or to run the job during non-business hours. You can also unschedule a dataflow.

- In Wave Analytics, click the gear icon () and then click **Data Monitor** to open the data monitor.
The Jobs view shows by default.
- Select **Dataflow View**.

EDITIONS

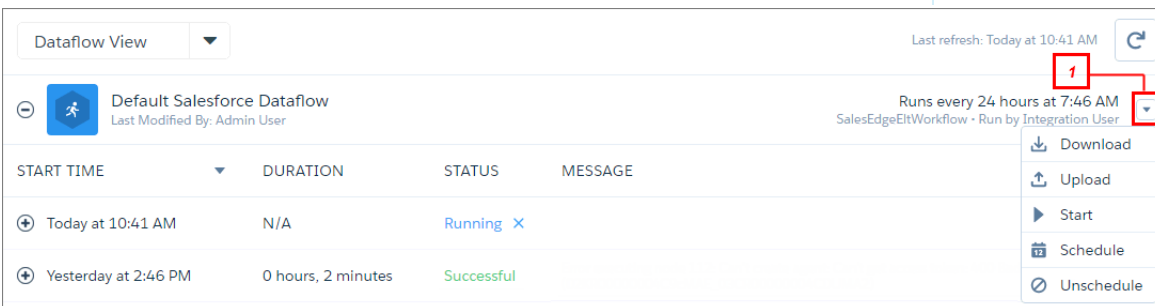

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To schedule or unschedule a dataflow job:

- “Edit Wave Analytics Dataflows”

The screenshot shows the 'Dataflow View' interface. At the top, there is a 'Dataflow View' dropdown and a 'Last refresh: Today at 10:41 AM' indicator with a refresh icon. Below this, a card for 'Default Salesforce Dataflow' is shown, indicating it 'Runs every 24 hours at 7:46 AM' and is 'Run by Integration User'. A table lists the following runs:

START TIME	DURATION	STATUS	MESSAGE
Today at 10:41 AM	N/A	Running	
Yesterday at 2:46 PM	0 hours, 2 minutes	Successful	

To the right of the table is an actions menu with the following options: Download, Upload, Start, Schedule, and Unschedule. A red box labeled '1' highlights the 'Schedule' option.

- Click **Schedule** in the actions list (1) to reschedule the dataflow job.
The default daily schedule and start time appears.
- To continue running it once per day, select the time that you'd like to start the dataflow job.
- To run it on an hourly basis, select **Hour(s)** and then specify the interval details. Minute offset is the number of minutes past the hour to run the dataflow.

Dataflow Schedule ✕

Run every

Minute offset

Save

Hourly scheduled dataflows run relative to a fixed base time (00:00 UTC). For example, if you schedule a dataflow to run every 6 hours with a 15-minute offset, the dataflow is scheduled to run at 00:15 UTC, 06:15 UTC, 12:15 UTC, and 18:15 UTC, each day. The first dataflow run occurs at the next scheduled time. So, if you change the schedule at 04:00 UTC, the dataflow runs at the next scheduled time (06:15 UTC), and then every 6 hours thereafter. To keep things simple, the scheduler specifies the time of the first dataflow run (in your time zone), after you save the schedule.

6. Click **Save**.
The Dataflow Schedule pop-up box specifies the next time, in your local time zone, that the dataflow runs.
7. Click **Done**.
8. To stop a dataflow from running on a schedule, select **Unschedule** in the action list (1).

Transformations for Wave Dataflows

A *transformation* refers to the manipulation of data. You can add transformations to a dataflow to extract data from Salesforce objects or datasets, transform datasets that contain Salesforce or external data, and register datasets.

For example, you can use transformations to join data from two related datasets and then register the resulting dataset to make it available for queries.

[append Transformation](#)

The append transformation combines records from multiple datasets into a single dataset.

[augment Transformation](#)

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

[computeExpression Transformation](#)

The computeExpression transformation enables you to add derived fields to a dataset. The values for derived fields aren't extracted from the input data source. Instead, Wave generates the values using a SAQL expression, which can be based on one or more fields from the input data or other derived fields. For example, you can use an expression to assign a value to a field, concatenate text fields, or perform mathematical calculations on numeric fields.

[computeRelative Transformation](#)

You can use the computeRelative transformation to analyze trends in your data by adding derived fields to a dataset based on values in other rows. For example, to analyze sales pipeline trends, create derived fields that calculate the number of days an opportunity remains in each stage. You can also calculate the changes to the opportunity amount throughout the stages of the opportunity.

[delta Transformation](#)

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

[dim2mea Transformation](#)

The dim2mea transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don't break if they use the dimension.

[edgemart Transformation](#)

The edgemart transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that its data can be used in subsequent transformations in the dataflow. You can use this transformation and the Augment transformation together to join an existing dataset with a new dataset.

[filter Transformation](#)

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

[flatten Transformation](#)

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

[sfdcDigest Transformation](#)

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren't relevant for analysis.

[sfdcRegister Transformation](#)

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

[update Transformation](#)

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we'll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

[Overriding Metadata Generated by a Transformation](#)

Optionally, you can override the metadata that is generated by a transformation. You can override object and field attributes. For example, you can change a field name that is extracted from a Salesforce object so that it appears differently in the dataset. To override the metadata, add the overrides to the Schema section of the transformation in the dataflow definition file.

SEE ALSO:

[Create Datasets with a Dataflow](#)

append Transformation

The append transformation combines records from multiple datasets into a single dataset.

Consider the following rules when using this transformation.

- This transformation does not remove duplicate records.
- All input datasets must have the same structure—the corresponding columns must be in the same order and have the same name and field type.

 **Example:** Let's look at an example. Each month, you create a dataset that contains the month's sales targets. Now, you want a holistic view of sales targets for all months. To do that, you create the following dataflow definition file to merge the existing datasets into a single dataset.

```
{
  "Extract_SalesTargets_2014Jan": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Jan" }
  },
  "Extract_SalesTargets_2014Feb": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Feb" }
  },
  "Extract_SalesTargets_2014Mar": {
    "action": "edgemart",
    "parameters": { "alias": "SalesTargets_2014Mar" }
  },
  "Append_SalesTargets_2014Quarter1": {
    "action": "append",
    "parameters": {
      "sources": [
        "Extract_SalesTargets_2014Jan",
        "Extract_SalesTargets_2014Feb",
        "Extract_SalesTargets_2014Mar"
      ]
    }
  },
  "Register_AllSalesTargets": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "AllSalesTargets",
      "name": "AllSalesTargets",
      "source": "Append_SalesTargets_2014Quarter1"
    }
  }
}
```

After you create the single dataset, you can use date filters to analyze the sales targets by month, quarter, or year.

[append Parameters](#)

When you define an append transformation, you set the action attribute to `append` and specify the parameters.

append Parameters

When you define an append transformation, you set the action attribute to `append` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
sources	Yes	Nodes in the dataflow definition file that identify the datasets that you want to merge.

SEE ALSO:

[append Transformation](#)

augment Transformation

The augment transformation augments an input dataset by combining columns from another related dataset. The resulting, augmented dataset enables queries across both related input datasets. For example, you can augment the Account dataset with the User dataset to enable a query to return account records and the full names of the account owners.

When you create the transformation, you identify each input dataset as the left or right dataset and specify the relationship between them. Wave Analytics combines all the columns of the left dataset with only the specified columns from the right dataset. (Keep in mind that each dataset can't have more than 5,000 columns.) Wave Analytics adds the relationship to column names from the right dataset, which is useful when the left and right datasets have columns with the same names.

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. To match related records, the augment transformation uses a match condition. You specify the match condition based on a key from each dataset. For example:

```
"left_key": [ "Id" ], "right_key": [ "Prod_ID" ]
```

A key can be a single-column key or a composite key. For a match condition based on a composite key, the keys for both datasets must have the same number of columns, specified in the same order.

-  **Tip:** To augment more than two datasets, augment two datasets at a time. For example, to augment three datasets, augment the first two datasets, and then augment the resulting dataset with the third dataset.
-  **Example:** Let's look at an example of the augment transformation. In this example, you want to extract data from the Opportunity and Accounts objects, and then match the data based on the account ID field.

You create the following dataflow definition file.

```

{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_AccountDetails": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" }
      ]
    }
  },
  "Augment_OpportunitiesWithAccountDetails": {
    "action": "augment",
    "parameters": {
      "operation": "LookupSingleValue",
      "left": "Extract_Opportunity",
      "left_key": [
        "AccountId"
      ],
      "relationship": "OpptyAcct",
      "right": "Extract_AccountDetails",
      "right_key": [
        "Id"
      ],
      "right_select": [ "Name" ]
    }
  }
}

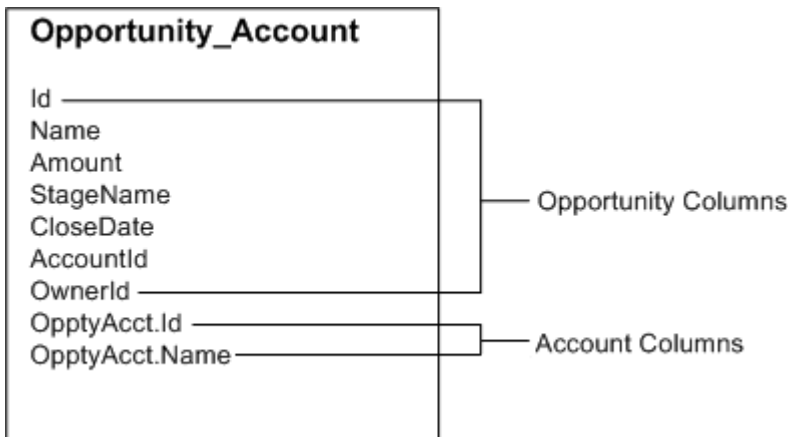

```

```

    },
    "Register_OpportunityDetails": {
      "action": "sfdcRegister",
      "parameters": {
        "alias": "Opportunity_Account",
        "name": "Opportunity_Account",
        "source": "Augment_OpportunitiesWithAccountDetails" }
    }
  }
}

```

After you run the dataflow, Wave Analytics creates and registers the `Opportunity_Account` dataset. It also adds the relationship as a prefix to all columns from the right dataset.

[Special Cases for Matching Records with the augment Transformation](#)

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. However, it's critical that you understand how the augment transformation handles special cases when matching records.

[augment Parameters](#)

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

Special Cases for Matching Records with the augment Transformation

For each record in the left dataset, the augment transformation performs a lookup to find a matching record in the right dataset. However, it's critical that you understand how the augment transformation handles special cases when matching records.

Let's look at some examples that illustrate some special cases.

Handling Null Keys

When a record in the left dataset contains a null key, Wave Analytics doesn't perform a lookup to match the record. Instead, Wave Analytics appends the right columns and inserts null for dimensions (including dates) and '0' for measures.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product	
Id	Name
Prod1	Table
Prod2	Chair
<i>null</i>	Bench

Price		
ProdId	Pricebook	UnitPrice
Prod1	Standard	1000
Prod2	Standard	450
<i>null</i>	Custom	800
Prod3	Standard	700

Wave Analytics doesn't match the last record because the product ID is null. Instead, Wave Analytics inserts a null for the `Price.Pricebook` dimension and '0' for the `Price.UnitPrice` measure. Here's the resulting dataset after the augment.

```
[ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 ],
[ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 ],
[ "id":null, "Name":"Bench", "Price.Pricebook":null, "Price.UnitPrice":0 ]
```

Handling Empty Keys

Wave Analytics matches empty-value left keys and empty-value right keys.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product	
Id	Name
Prod1	Table
Prod2	Chair
''	Bench

Price		
ProdId	Pricebook	UnitPrice
Prod1	Standard	1000
Prod2	Standard	450
''	Custom	800
<i>null</i>	Standard	700

Wave Analytics matches the last record in the Product dataset with the third record in the Price dataset because they both have empty values (''). Here's the resulting dataset after the augment.

```
[ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 ],
[ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 ],
[ "id":'', "Name":"Bench", "Price.Pricebook":"Custom", "Price.UnitPrice":800 ]
```

Handling Non-Unique Keys

Although it's recommended, the left key doesn't have to be unique. If multiple records have the same left key, Wave Analytics creates the same values for the appended columns.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod2	Chair	Prod3	Standard	700

Wave Analytics matches the records in the Product dataset with records in the Price dataset. Here's the resulting dataset after the augment.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 }
```

Handling No Match

If left key doesn't have a match in the right dataset, Wave Analytics appends the right columns and inserts null for dimensions (including dates) and '0' for measures.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod4	Standard	1000
Prod2	Chair	Prod5	Standard	450
Prod3	Bench			

Because no keys match, Wave Analytics doesn't match any records in the Product dataset with records in the Price dataset. Here's the resulting dataset after the augment.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook": null, "Price.UnitPrice":0 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook": null, "Price.UnitPrice":0 },
{ "id":"Prod3", "Name":"Bench", "Price.Pricebook": null, "Price.UnitPrice":0 }
```

Handling Multiple Matches

If the left dataset has a one-to-many relationship with the right dataset, Wave Analytics might find multiple matches for a left record. What Wave Analytics does with multiple matches depends on the specified augment operation. You can specify one of the following operations to handle the multiple-match case:

LookupSingleValue

The augment transformation returns results from a single row. Wave Analytics randomly selects one row from the list of matched rows.

Note: Each time you run the dataflow, Wave Analytics can return different results depending on the returned row.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to `LookupSingleValue`, and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod3	Bench	Prod3	Custom	800
		Prod3	Standard	700

Although there are multiple rows for Prod3 in the Price dataset, Wave Analytics randomly chooses one matching row and returns values based on that row. Here's the resulting dataset after the augment if Wave Analytics chooses the first Prod3 row.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
{ "id":"Prod3", "Name":"Bench", "Price.Pricebook":"Custom", "Price.UnitPrice":800 }
```

LookupMultiValue

Wave Analytics returns results from all matched rows.

Let's look at an example. You apply the augment transformation on the following datasets, set the relationship to "Price," set the operation to `LookupMultiValue`, and match the records based on the `Id` and `ProdId` fields.

Product		Price		
Id	Name	ProdId	Pricebook	UnitPrice
Prod1	Table	Prod1	Standard	1000
Prod2	Chair	Prod2	Standard	450
Prod3	Bench	Prod3	Custom	800
		Prod3	Standard	700

Because the lookup returns multiple rows for Prod3, the dimension `Price.Pricebook` field in the resulting dataset becomes a multi-value field, showing all dimension values. The measure field `Price.UnitPrice` contains 1500, which is the sum of 800 and 700. Here's the resulting dataset after the augment.

```
{ "id":"Prod1", "Name":"Table", "Price.Pricebook":"Standard", "Price.UnitPrice":1000 },
{ "id":"Prod2", "Name":"Chair", "Price.Pricebook":"Standard", "Price.UnitPrice":450 },
{ "id":"Prod3", "Name":"Bench", "Price.Pricebook":["Custom", "Standard"], "Price.UnitPrice":1500 }
```

SEE ALSO:

[augment Transformation](#)

augment Parameters

When you define an augment transformation, you set the action attribute to `augment` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
operation	No	<p>Indicates what the transformation does if it matches multiple rows in the right dataset with a row in the left. Valid values:</p> <ul style="list-style-type: none"> • <code>LookupSingleValue</code>. Returns values from one of the matched rows. If you don't specify the <code>operation</code> parameter, the transformation uses this operation. • <code>LookupMultiValue</code>. Returns values from all matched rows. <p>For more information about each operation, see Special Cases for Matching Records with the augment Transformation.</p>
left	Yes	Node in the dataflow definition file that identifies the left dataset. This is one of two input sources for this transformation.
left_key	Yes	<p>Key column in the left dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order. For a composite key, use the following syntax:</p> <pre>["Key Column1", "Key Column2", ..., "Key ColumnN"]</pre> <p> Note: The left or right key can't be a multi-value field.</p>
right	Yes	Node in the dataflow definition file that identifies the right dataset. This is one of two input sources for this transformation.
relationship	Yes	Relationship between the left and right datasets. The dataflow adds the relationship to the beginning of the right column names in the output dataset to make the column names unique and descriptive.
right_select	Yes	An array of column names from the right dataset that you want to include in the output dataset. The dataflow adds the relationship as a prefix to the column name to determine the name of the right column in the output dataset.

Parameter	Required?	Value
right_key	Yes	Key column in the right dataset used to augment the datasets. If you use a composite key, the left and right keys must have the same number of columns in the same order.

[augment Transformation](#)

computeExpression Transformation

The computeExpression transformation enables you to add derived fields to a dataset. The values for derived fields aren't extracted from the input data source. Instead, Wave generates the values using a SAQL expression, which can be based on one or more fields from the input data or other derived fields. For example, you can use an expression to assign a value to a field, concatenate text fields, or perform mathematical calculations on numeric fields.

 **Note:** The computeExpression and computeRelative transformations are similar, but they have a key difference. The computeExpression transformation performs calculations based on other fields within the same row. The computeRelative transformation performs calculations based on the previous and next values of the same field in other rows.

Consider the following guidelines when creating a computeExpression transformation:

- You can include only the following SAQL operators and functions in the expression:
 - [Arithmetic operators](#)
 - [Case operator](#)
 - [String operator](#)
 - [Date functions](#)
- The values of the derived field must match its specified type. For example, set the type of the derived field to `text` if the values are strings.
- Wave calculates the values of derived fields in the order in which they are listed in the JSON. Thus, if you create a derived field based on other derived fields in the same computeExpression transformation, the input derived fields must be listed first. For example, `Derived_A` must be listed before `Derived_B` in the following computeExpression transformation JSON snippet:

```
"CreateDerivedFields": {
  "action": "computeExpression",
  "parameters": {
    "source": "sourceNode",
    "mergeWithSource": false,
    "computedFields": [
      {
        "name": "Derived_A",
        "type": "Text",
        "label": "Derived Field A",
        "saqlExpression": "\"hello \""},
      {
        "name": "Derived_B",
        "type": "Text",
        "label": "Derived Field B Dependent on Field A",
```

```

    "sqlExpression": "Derived_A + \"world\""
  ]
}
}

```

- You can choose whether the resulting dataset includes only the derived fields, or includes the input and derived fields.

Example: Let's look at an example. You want to create a dataset based on Salesforce opportunity data. You create a dataflow that extracts the Id and Amount fields from the Opportunity object. In addition, you also want to add the following derived fields to the dataset: ModifiedId, SalesTax, FinalPrice, and ValueCategory. For the derived fields, you will:

- Append "SFDC" to each opportunity Id to get a new modified Id.
- Calculate the sales tax based on an 8% tax rate.
- Calculate the final price by adding the amount and sales tax.
- Categorize opportunities into low-, medium-, and high-value buckets based on the calculated final price.

You create the following dataflow definition.

```

{
  "salesData": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        {"name": "Amount"},
        {"name": "Id"}]
    }
  },
  "Derived_Fields": {
    "action": "computeExpression",
    "parameters": {
      "source": "salesData",
      "mergeWithSource": true,
      "computedFields": [
        {
          "name": "ModifiedId",
          "type": "Text",
          "sqlExpression": "\"SFDC\" + Id",
        },
        {
          "name": "SalesTax",
          "type": "Numeric",
          "precision": 18,
          "defaultValue": "0",
          "scale": 5,
          "sqlExpression": "Amount * 0.08",
        },
        {
          "name": "FinalPrice",
          "type": "Numeric",
          "precision": 18,
          "defaultValue": "0",
          "scale": 5,
          "sqlExpression": "Amount + SalesTax",
        },
        {
          "name": "ValueCategory",
          "type": "Text",
          "sqlExpression": "

```

```

        case
          when FinalPrice < 1000 then \"Low\"
          when FinalPrice >= 1000 and FinalPrice < 2000 then \"Medium\"
          else \"High\"
        end"}
      ]
    }
  },
  "Register_CategorizedSales": {
    "action": "sfcdRegister",
    "parameters": {
      "alias": "Categorized_Sales",
      "name": "Categorized_Sales",
      "source": "Derived_Fields" }
    }
  }
}

```

[computeExpression Parameters](#)

When you define a `computeExpression` transformation, you set the `action` attribute to `computeExpression`. You also specify the parameters for the input source and the expression used to generate the values.

computeExpression Parameters

When you define a `computeExpression` transformation, you set the `action` attribute to `computeExpression`. You also specify the parameters for the input source and the expression used to generate the values.

You can specify parameters in the following sections of the `computeExpression` node: `parameters` and `computedFields`.

Parameters

The following table describes the parameters in the `parameters` section.

Parameter	Required?	Value
<code>source</code>	Yes	Node in the dataflow definition file that identifies the input source for this transformation.
<code>mergeWithSource</code>	No	Indicates whether the input fields are included with the derived fields in the resulting dataset. When true, the resulting dataset contains all input fields from the source and the newly generated derived fields. When false, the resulting dataset contains the derived fields only. Default is true.
<code>computedFields</code>	Yes	Attributes and expression used to generate derived fields in the dataset. See computedFields .

computedFields

The following table describes the attributes in the `computedFields` section. It also describes optional attributes that you can provide to override the field metadata to make the data appear differently in a dataset. For example, Wave can replace null values in a field with a default value.

Parameter	Required?	Value
name	Yes	API name of the generated field.  Note: The API names must be unique. Otherwise, the dataflow fails to run.
type	Yes	Wave Analytics field type associated with the field. Valid types are Text, Numeric, or Date. Example: <pre>"type": "Text"</pre>
label	No	The display name of the generated field that appears in the Wave user interface. Can be up to 255 characters. Defaults to input field name if not specified.
sqlExpression	Yes	SAQL expression used to calculate the value for the derived field. The expression can be based on input fields or other derived fields in the transformation. Example: <pre>"sqlExpression": "toDate (birth_day, \ "yyyy-M-d\ ") "</pre>
format	Yes (for Date fields only)	Format of the derived date field. For information about formats, see the External Data Format Reference .
precision	Yes (for Numeric fields only)	The maximum number of digits in a numeric value, or the length of a text value. For numeric values: Includes all numbers to the left and to the right of the decimal point (but excludes the decimal point character). Value must be between 1 and 18, inclusive. For text values: Value defaults to 255 characters, and must be between 1 and 32,000 characters, inclusive.

Parameter	Required?	Value
		Example: <pre>"precision": 10</pre>
scale	Yes (for Numeric fields only)	The number of digits to the right of the decimal point in a numeric value. Must be less than the precision value. Value must be between 0 and 17 characters, inclusive. Example: <pre>"scale": 2</pre>
defaultValue	No	For text and numeric fields that can be null. Default value that replaces a null value for the specified field.

SEE ALSO:

[computeExpression Transformation](#)

computeRelative Transformation

You can use the `computeRelative` transformation to analyze trends in your data by adding derived fields to a dataset based on values in other rows. For example, to analyze sales pipeline trends, create derived fields that calculate the number of days an opportunity remains in each stage. You can also calculate the changes to the opportunity amount throughout the stages of the opportunity.

 **Note:** The `computeExpression` and `computeRelative` transformations are similar, but the `computeExpression` transformation performs calculations based on fields within the same row. The `computeRelative` transformation performs calculations based on the same field in other rows—particularly the current, first, previous, or next rows.

When you define a `computeRelative` transformation, you specify an `sfdcDigest` transformation as the input, partition the records, and sort the records within each partition. For example, you can use `sfdcDigest` to extract opportunity history records, and then use `computeRelative` to calculate changes in each opportunity over time. You can partition opportunity records by opportunity ID, and then chronologically sort records within each partition to correctly identify the previous and next values.

Wave processes the `computeRelative` transformation differently than other transformations. Wave merges the logic from this transformation into the associated `sfdcDigest` transformation. As a result, you don't have to register the `computeRelative` transformation to add the derived fields to the final dataset. Instead, register only `sfdcDigest`—the registered dataset has fields from both transformations. For example, the `sfdcDigest` transformation extracts data from three fields (Id, CloseDate, and Amount). The `computeRelative` transformation generates two derived fields (`PreviousCloseDate` and `PreviousAmount`). The resulting dataset contains all five columns.

Consider the following guidelines when creating a `computeRelative` transformation.

- This transformation supports only the `sfdcDigest` node as input—you can't use any other transformation node as input.
- Specify this transformation directly after the associated input `sfdcDigest` transformation in the dataflow JSON.
- You can use this transformation to analyze trends in Salesforce data, not external data.
- You can use this transformation in a replication dataflow. For more information about replication, see [Getting Started with Wave Replication Tipsheet](#).

 **Example:** Let's look at an example. To perform trending analysis on the sales pipeline, create a dataflow that contains the following transformations.

sfdcDigest transformation

Extracts the following data from the OpportunityHistory object.

OpportunityHistory Object				
OpportunityId	CreatedDate	StageName	Amount	CloseDate
00630000003JrH6AAK	2005-11-23T20:24:09.000Z	Closed Won	36938	11/15/2005

computeRelative transformation

Performs the following tasks:

- Partitions the extracted records by opportunity ID.
- Within each partition, sorts the extracted records by CreatedDate in ascending order. Sorting by CreatedDate ensures that the changes that occur for each opportunity are listed in chronological order.
- Adds the following derived fields to the final dataset.

OpportunityCreatedDate

Determines the date that the opportunity was first created. You can use this date with the actual close date to determine the number of days required to close the sale. The goal is to shorten the sales cycle to recognize revenue.

ValidToDate

Determines the date to which the state of the opportunity is valid. You can use this field to determine the time period for which the opportunity details are valid in each record.

AmountPrev

Determines the previous amount of the opportunity. You can use this field to determine if the values of opportunities are increasing or decreasing, which can affect whether you hit your sales targets.

CloseDatePrev

Determines the previous expected close date for the opportunity. You can use this field to analyze how the expected close date changes over the sales cycle of the opportunity. If the expected close date keeps getting pushed out, identify the issues that are causing the longer sales cycle.

sfdcRegister transformation

Registers the final dataset that contains the extracted fields from the sfdcDigest transformation and the derived fields from computeRelative transformation. You apply sfdcRegister on sfdcDigest to get the fields from both transformations.

You create the following dataflow definition.

```
{
  "extractOppHistory": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityHistory",
      "fields": [
```

```

        {"name": "OpportunityId"},
        {"name": "CreatedDate"},
        {"name": "StageName"},
        {"name": "Amount"},
        {"name": "CloseDate"}
    ]
}
},
"computeTrending": {
    "action": "computeRelative",
    "parameters": {
        "partitionBy": ["OpportunityId"],
        "orderBy": [
            {
                "name": "CreatedDate",
                "direction": "asc"
            }
        ],
        "computedFields": [
            {
                "name": "OpportunityCreatedDate",
                "expression": {
                    "sourceField": "CreatedDate",
                    "offset": "first()",
                    "default": "current()"
                }
            },
            {
                "name": "ValidToDate",
                "expression": {
                    "sourceField": "CreatedDate",
                    "offset": "next()",
                    "default": "3000-01-01T00:00:00.000Z"
                }
            },
            {
                "name": "AmountPrev",
                "expression": {
                    "sourceField": "Amount",
                    "offset": "previous()",
                    "default": "0"
                }
            },
            {
                "name": "CloseDatePrev",
                "expression": {
                    "sourceField": "CloseDate",
                    "offset": "previous()",
                    "default": "01/01/1970"
                }
            }
        ],
        "source": "extractOppHistory"
    }
}

```

```

    },
    "Register_OppportunityHistory_Dataset": {
      "action": "sfcdRegister",
      "parameters": {
        "alias": "SalesPipelineTrending",
        "name": "Sales Pipeline Trending",
        "source": "extractOppHistory"
      }
    }
  }
}

```

The dataflow runs and creates the following dataset.

Sales Pipeline Trending Dataset								
OpportunityId	CreatedDate	StageName	Amount	CloseDate	OpportunityCreatedDate	ValidToDate	AmountPrev	CloseDatePrev
00630000003JrH6AAK	2005-10-17T22:28:33.000Z	Present/Demo/Quote	429000	11/15/2005	2005-10-17T22:28:33.000Z	2005-11-03T21:53:36.000Z	0	1/1/1970

00630000003Yx9BAAS	2005-11-25T18:03:46.000Z	Closed Won	58320	11/23/2005	2005-11-23T01:06:57.000Z	3000-01-01T00:00:00.000Z	71280	11/30/2005

Notice that Wave partitions the records by opportunity ID and then sorts the records in ascending order based on the CreatedDate field within each partition. Wave can now use the previous and next rows within each partition to determine changes in field values in the dataset.

[computeRelative Parameters](#)

When you define a computeRelative transformation, you set the action attribute to `computeRelative`. You also specify the parameters for the input source, partition-by field, sort field, and derived field definitions.

computeRelative Parameters

When you define a computeRelative transformation, you set the action attribute to `computeRelative`. You also specify the parameters for the input source, partition-by field, sort field, and derived field definitions.

You can specify parameters in the following sections of the computeRelative node.

Parameters

The following table describes the parameters in the `parameters` section.

Parameter	Required?	Value
source	Yes	sfcdDigest node in the dataflow definition file that identifies the input source for this transformation.
partitionBy	Yes	API name of the field used to partition the records in the dataset. Specify one and only one partition-by field.

Parameter	Required?	Value
orderBy	Yes	<p>Field used to sort the records within each partition and the sort order: ascending (asc) or descending (desc). Specify one and only one sort field.</p> <p>Example:</p> <pre>"orderBy": [{ "name": "CreatedDate", "direction": "asc" }]</pre>
computedFields	Yes	<p>A list of definitions for derived fields.</p> <p>Example:</p> <pre>"computedFields": [{ "name": "OpportunityCreatedDate", "expression": { "sourceField": "CreatedDate", "offset": "first()", "default": "current()" } }, { "name": "AmountPrev", "expression": { "sourceField": "Amount", "offset": "previous()", "default": "0" } }]</pre> <p>See computedFields.</p>

computedFields

The following table describes the attributes in the `computedFields` section.

Parameter	Required?	Value
name	Yes	<p>API name of the derived field to add to the dataset. The name must be unique in the dataset.</p> <p> Note: If the name is not unique, the dataflow fails to run.</p>

Parameter	Required?	Value
expression	Yes	<p>Expression attributes used to calculate the value for the derived field. The expression can be based on input fields or other derived fields in the transformation.</p> <p>Example:</p> <pre>"expression": { "sourceField": "CloseDate", "offset": "previous()", "default": "01/01/1970" }</pre> <p>See expression.</p>

expression

The following table describes the attributes in the `expression` section.

Parameter	Required?	Value
sourceField	Yes	API name of the input field from the <code>sfdcDigest</code> transformation that's used in the expression.
offset	Yes	<p>The function used in the expression. You can use the following functions:</p> <p>current () Gets the value from the current record. Example: <pre>"offset": "current ()"</pre></p> <p>first () Gets the value from the first record in the partition, like the first <code>CreateDate</code> for an opportunity. Example: <pre>"offset": "first ()"</pre></p> <p>next () Gets the value from the next record. Example: <pre>"offset": "next ()"</pre></p> <p>previous () Gets the value from the previous record. Example: <pre>"offset": "previous ()"</pre></p>

Parameter	Required?	Value
		<p> Note: Derived fields are computed in the order that they're defined. The calculation of a derived field can be based on the value from another derived field as long as it has already been defined. For example, <code>next ()</code> can't access the value of a derived field in the next row.</p> <p> Tip: To get the correct results when using the <code>previous ()</code> and <code>next ()</code> functions, the <code>computeRelative</code> transformation requires you to sort the records.</p>
default	Yes (for numeric fields only)	<p>The default value if one can't be calculated. For example, you can specify a default value when no previous or next value exists. You can insert a constant value or <code>current ()</code> as a default value.</p> <p>Examples:</p> <pre>"default": "3000-01-01T00:00:00.000Z"</pre> <pre>"default": "current ()"</pre>

delta Transformation

The delta transformation calculates changes in the value of a measure column in a dataset over a period of time. The delta transformation generates an output column in the dataset to store the delta for each record. Create deltas to make it easier for business analysts to include them in queries.

The delta transformation calculates each delta value by comparing the value in each record with the value in the previous record. Because records might not be sorted, the delta transformation orders the records before computing the delta values. To do this, the transformation sorts the data by the specified dimension, and then by the specified epoch date column.

 **Note:** When Wave Analytics processes dates, it creates the following epoch date columns for each date processed:

Epoch Time Column	Description
<date_column_name>_sec_epoch	For example, if the date column is <code>CloseDate</code> , the generated epoch second column is <code>CloseDate_sec_epoch</code> . This column provides the number of seconds that have elapsed since January 1, 1970 (midnight UTC/GMT).
<date_column_name>_day_epoch	For example, if the date column is <code>CloseDate</code> , the generated epoch day column is <code>CloseDate_day_epoch</code> . This column provides the number of days that have elapsed since January 1, 1970 (midnight UTC/GMT).

 **Example:** Let's look at an example. You want to create an `OppHistoryDelta` dataset that contains opportunity history from the `OpportunityHistory` object and also calculates the deltas for opportunity amounts.

The `OpportunityHistory` object contains the following data.

OpportunityId	CloseDate	StageName	Amount
1	1/1/2014	New	100
2	1/1/2014	New	100
2	2/1/2014	ClosedWon	200
1	3/1/2014	ClosedWon	100

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfcdigest",
    "parameters": {
      "object": "OpportunityHistory",
      "fields": [
        { "name": "OpportunityId" },
        { "name": "CloseDate" },
        { "name": "StageName" },
        { "name": "Amount" }
      ]
    }
  },
  "Calculate_Delta": {
    "action": "delta",
    "parameters": {
      "dimension": "OpportunityId",
      "epoch": "CloseDate_day_epoch",
      "inputMeasure": "Amount",
      "outputMeasure": "DeltaAmount",
      "source": "Extract_Opportunities"
    }
  },
  "Register_Dataset": {
    "action": "sfcdregister",
    "parameters": {
      "alias": "OppHistoryDelta",
      "name": "OppHistoryDelta",
      "source": "Calculate_Delta"
    }
  }
}
```

To calculate the delta values for each opportunity amount, the delta transformation sorts the records by the dimension (OpportunityId) first, and then by time (CloseDate_day_epoch) as shown here.

OpportunityID	CloseDate	StageName	Amount
1	1/1/2014	New	100
1	3/1/2014	ClosedWon	100

OpportunityID	CloseDate	StageName	Amount
2	1/1/2014	New	100
2	2/1/2014	ClosedWon	200

After the records are sorted, for each dimension (OpportunityId), the transformation compares the previous value to the next value to determine the delta for each record. The transformation creates the following dataset.

OpportunityId	CloseDate	StageName	Amount	DeltaAmount
1	1/1/2014	New	100	0
1	3/1/2014	ClosedWon	100	0
2	1/1/2014	New	100	0
2	2/1/2014	ClosedWon	200	100

For the first record of each dimension, the transformation inserts '0' for the delta value.

 **Note:** If an opportunity contains multiple changes on the same day, you must sort the records on a shorter time interval. In this case, sort on CloseDate_sec_epoch column. Otherwise, records might not be sorted correctly, which means delta values will be incorrect.

delta Parameters

When you define a delta transformation, you set the action attribute to `delta` and specify the parameters.

delta Parameters

When you define a delta transformation, you set the action attribute to `delta` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
dimension	Yes	Dimension column in the dataset used to sort records when calculating the delta values.
epoch	Yes	Epoch date column in the dataset used to sort records within each dimension when calculating delta values.
inputMeasure	Yes	Measure column on which you want to calculate the delta.
outputMeasure	Yes	Name of the output column that contains the delta value.

Parameter	Required?	Value
source	Yes	Node in the dataflow definition file that contains the dataset to which you want to add the delta column.

SEE ALSO:

[delta Transformation](#)

dim2mea Transformation

The dim2mea transformation creates a new measure based on a dimension. The transformation adds the new measure column to the dataset. The transformation also preserves the dimension to ensure that existing lenses and dashboards don't break if they use the dimension.

If the transformation cannot create a measure from a dimension, the transformation populates the measure with the specified default value. If no default value is provided, the transformation inserts '0.'

Example: Let's look at an example. Your Opportunity object contains a custom text field called StageVal__c, which contains the opportunity amount at a particular stage. Because this is a text field, Wave Analytics loads this data as a dimension. However, you'd like to create a measure from this dimension to enable users to perform calculations on stage amount.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "StageVal__c" }
      ]
    }
  },
  "Create_Measure_From_Dimension": {
    "action": "dim2mea",
    "parameters": {
      "dimension": "StageVal__c",
      "measure": "StageValue",
      "measureDefault": "0",
      "measureType": "long",
      "source": "Extract_Opportunities"
    }
  },
  "Register_The_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
```

```

    "alias": "OpportunitiesWithConvertedMeasure",
    "name": "OpportunitiesWithConvertedMeasure",
    "source": "Create_Measure_From_Dimension"
  }
}
}

```

[dim2mea Parameters](#)

When you define a `dim2mea` transformation, you set the action attribute to `dim2mea` and specify the parameters.

dim2mea Parameters

When you define a `dim2mea` transformation, you set the action attribute to `dim2mea` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
dimension	Yes	Dimension column in the dataset from which you want to create the measure.
measure	Yes	Name of the output measure. This column name must be unique within the dataset. Do not use the same name as the dimension because the transformation preserves the dimension in the dataset.
measureDefault	Yes	Default value for the measure if the transformation is unable to create a measure from a dimension.
measureType	Yes	Type of measure. Valid value: "long"
source	Yes	Node in the dataflow definition file that contains the dataset to which you want to add the measure.

[dim2mea Transformation](#)

edgemart Transformation

The `edgemart` transformation gives the dataflow access to an existing, registered dataset, which can contain Salesforce data, external data, or a combination of the two. Use this transformation to reference a dataset so that its data can be used in subsequent transformations in the dataflow. You can use this transformation and the `Augment` transformation together to join an existing dataset with a new dataset.

Example: Let's look at an example. You would like to compare the final sales amount against the opportunity amount to determine if heavy discounts were offered to close deals. You previously created and registered the FinalSales dataset. The FinalSales dataset contains the final sale amount of each opportunity that was closed and won.

Table 49: FinalSales Dataset

OppID	UpdateDate	StageName	SaleAmount
1	1/1/2014	ClosedWon	100,000
2	11/1/2013	ClosedWon	150,000
3	2/1/2014	ClosedWon	200,000

You would now like to create a dataset that contains opportunity information from the Opportunity object. Then, you would like to join the data from the existing FinalSales dataset with the Opportunity dataset.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" }
      ]
    }
  },
  "Extract_Final_Sales_Data": {
    "action": "edgemart",
    "parameters": { "alias": "FinalSales" }
  },
  "Combine_Opportunities_FinalSales": {
    "action": "augment",
    "parameters": {
      "left": "Extract_Opportunities",
      "left_key": [ "Id" ],
      "relationship": "Opportunity",
      "right": "Extract_Final_Sales_Data",
      "right_key": [ "OppID" ],
      "right_select": [ "SaleAmount" ]
    }
  },
  "Register_Opportunity_FinalSales_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OpportunityVersusFinalSales",
      "name": "OpportunityVersusFinalSales",
      "source": "Combine_Opportunities_FinalSales"
    }
  }
}
```

[edgemart Parameters](#)

When you define an edgemart transformation, you set the action attribute to `edgemart` and specify the parameters.

edgemart Parameters

When you define an edgemart transformation, you set the action attribute to `edgemart` and specify the parameters.

The following table describes the input parameter:

Parameter	Required?	Value
alias	Yes	API name of the dataset from which you want to extract data. To determine the API name of a dataset, edit the dataset and view the system name.

SEE ALSO:

[edgemart Transformation](#)

filter Transformation

The filter transformation removes records from an existing dataset. You define a filter condition that specifies which records to retain in the dataset.

 **Example:** Let's look at an example. You would like to create a dataset that contains only opportunities that were Closed Won. First, you extract all opportunities from the Opportunity object. Next, you filter the records so that you only include opportunities with a Closed Won stage name.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Filter_Opportunities": {
    "action": "filter",
    "parameters": {
      "filter": "StageName:EQ:Closed Won",
      "source": "Extract_Opportunities"
    }
  }
},
```

```

"Register_My_Won_Oppportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "MyWonOppportunities",
    "name": "MyWonOppportunities",
    "source": "Filter_Oppportunities"
  }
}

```

filter Parameters

When you define a filter transformation, you set the action attribute to `filter` and specify the parameters.

filter Expression Syntax

You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

filter Parameters

When you define a filter transformation, you set the action attribute to `filter` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
filter	Yes	Filter expression that specifies which records to include in the new dataset. See filter Expression Syntax .
source	Yes	Node in the dataflow definition file that contains the dataset that you want to filter.

SEE ALSO:

[filter Transformation](#)

filter Expression Syntax

You create a filter expression in the filter transformation based on one or more dimensions in a dataset.

 **Note:** String comparisons in a filter expression are case-sensitive.

You can use the following types of filter expressions:

Filter Expression Syntax	Description
dim:EQ:value	True if the dimension and value are equal. Example: <code>"filter": "StageName:EQ:Closed Won"</code>
dim:R:val0:val1	True if the left dimension falls within the specified range between val0 and val1.

Filter Expression Syntax	Description
	Example: <code>"filter": "EmployeeId:R:100:1000"</code>
<code>dim:R:val</code>	True if the dimension is greater than or equal to the value based on binary sort order. For example, this is true when the dimension is 'City' and the value is 'Anderson' because 'City' > 'Anderson'). Example: <code>"filter": "LastName:R:Li"</code>
<code>dim:R::val</code>	True if the dimension is less than or equal to the value based on binary sort order. Example: <code>"filter": "LastName:R::Levy"</code>
<code>dim:N:val</code>	True if the dimension and value are not equal. Example: <code>"filter": "RoleName:N:Manager"</code>
<code>dim:EQ:val1 val2</code>	True if the dimension equals values val1 or val2. This filter expression uses the logical OR operator (). You can compare the dimension value against more than two values. For example, to compare against three values, use the following syntax: <code>dim1:EQ:val1 val2 val3.</code> Example: <code>"filter": "Lead Status:EQ:Open Contacted"</code>
<code>dim1:EQ:val1,dim2:EQ:val2</code>	True if dimension dim1 equals value val1 and dimension dim2 equals value val2. This filter expression uses the logical AND operator (,). You can compare more than two dimensions. For example, to compare three dimensions, use the following syntax: <code>dim1:EQ:val1,dim2:EQ:val2,dim3:EQ:val3.</code> Example: <code>"filter": "Lead Status:EQ:Qualified,Rating:EQ:Hot"</code>

SEE ALSO:

[filter Transformation](#)

flatten Transformation

The flatten transformation flattens hierarchical data. For example, you can flatten the Salesforce role hierarchy to implement row-level security on a dataset based on the role hierarchy.

When you configure the flatten transformation to flatten a hierarchy, you specify the field that contains every node in the hierarchy and the field that contains their corresponding parent based on the hierarchy. The flatten transformation generates one record for each hierarchy node, which we refer to as the "self ID." Each record contains two generated columns that store the hierarchy for each self ID node. One column contains a comma-separated list of all ancestors for each node in the hierarchy. The other column contains the hierarchy path.

See the Roles and RolePath columns in the following flattened dataset to see how ancestors are stored.

Role ID (Self ID)	Role Name	Parent Role ID	Roles	RolePath
1	Salesperson 1	10	10, 20, 30	\10\20\30
2	Salesperson 2	10	10, 20, 30	\10\20\30
3	Salesperson 3	11	11, 20, 30	\11\20\30
10	Regional Manager 1	20	20, 30	\20\30
11	Regional Manager 2	20	20, 30	\20\30
20	Vice President 1	30	30	\30
21	Vice President 2	30	30	\30
30	CEO	Not applicable	Not applicable	Not applicable

You can also configure the flatten transformation to include the self ID node in the generated hierarchy columns. The following dataset shows the self ID in bold.

Role ID (Self ID)	Role Name	Parent Role ID	Roles	RolePath
1	Salesperson 1	10	1 , 10, 20, 30	\ 1 \10\20\30
2	Salesperson 2	10	2 ,10, 20, 30	\ 2 \10\20\30
3	Salesperson 3	11	3 ,11, 20, 30	\ 3 \11\20\30
10	Regional Manager 1	20	10 ,20, 30	\ 10 \20\30
11	Regional Manager 2	20	11 ,20, 30	\ 11 \20\30
20	Vice President 1	30	20 ,30	\ 20 \30
21	Vice President 2	30	21 ,30	\ 21 \30
30	CEO	Not applicable	30	30

 **Example:** Let's look at an example. You want to create a dataset that contains all opportunities. For each opportunity, you want to include user and role information about the opportunity owner. Also, to implement row-level security based on the role hierarchy, each opportunity record must also contain a list of all ancestors above each opportunity owner based on the role hierarchy. To generate the list of ancestors, use the flatten transformation to flatten the role hierarchy.

You create the following dataflow definition file:

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
```

```

        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_User": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "User",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Department" },
        { "name": "UserRoleId" }
      ]
    }
  },
  "Extract_UserRole": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "UserRole",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "ParentRoleId" }
      ]
    }
  },
  "Flatten_UserRole": {
    "action": "flatten",
    "parameters": {
      "source": "Extract_UserRole",
      "self_field": "Id",
      "parent_field": "ParentRoleId",
      "multi_field": "Roles",
      "path_field": "RolePath",
      "include_self_field": false
    }
  },
  "Augment_User_FlattenUserRole": {
    "action": "augment",
    "parameters": {
      "left": "Extract_User",
      "left_key": [ "UserRoleId" ],
      "relationship": "Role",
      "right": "Flatten_UserRole",
      "right_key": [ "Id" ],
      "right_select": [
        "Id",
        "Name",

```

```

        "Roles",
        "RolePath"
    ]
}
},
"Augment_Opportunity_UserWithRoles": {
    "action": "augment",
    "parameters": {
        "left": "Extract_Opportunity",
        "left_key": [ "OwnerId" ],
        "right": "Augment_User_FlattenUserRole",
        "relationship": "Owner",
        "right_select": [
            "Name",
            "Department",
            "Role.Id",
            "Role.Name",
            "Role.Roles",
            "Role.RolePath"
        ],
        "right_key": [ "Id" ]
    }
},
"Register_OpportunityWithRoles_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
        "alias": "OppRoles",
        "name": "OppRoles",
        "source": "Augment_Opportunity_UserWithRoles",
        "rowLevelSecurityFilter": "'Owner.Role.Roles' == \"\$User.UserRoleId\" || 'OwnerId'
== \"\$User.Id\""
    }
}
}
}

```

To flatten the Salesforce role hierarchy, the flatten transformation uses the following input fields from the UserRole object.

Id

Id identifies each node in the Salesforce role hierarchy.

ParentRoleId

ParentRoleId identifies the parent as defined in the role hierarchy.

After traversing through each parent-child relationship in the UserRole object, the flatten transformation generates one record for each role ID. Each record contains all ancestor roles for each role in the hierarchy. The flatten transformation generates two output columns—Roles and RolePath—to store all ancestor roles for each role.

[flatten Parameters](#)

When you define a flatten transformation, you set the action attribute to `flatten` and specify the parameters.

flatten Parameters

When you define a flatten transformation, you set the action attribute to `flatten` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
include_self_id	No	Indicates whether to include the self ID node in the generated multi_field and path_field columns. Valid values are <code>false</code> (default) and <code>true</code> .
self_field	Yes	Name of the input field that identifies each node in the hierarchy.
parent_field	Yes	Name of the input field that identifies the direct parent of each node in the hierarchy. For example, the Regional Manager 1 role is the parent of the Salesperson 1 role in a role hierarchy.
multi_field	Yes	Name of the multi-value output field that contains a list of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the list of ancestors for each node in the hierarchy. For example, for Salesperson 1 role, the hierarchy of ancestors is: <code>Sales Manager 1, Regional Manager 1, Vice President 1, CEO</code> .
path_field	Yes	A string representation of the multi-field field, separated by backslashes. This output field contains the hierarchical path of all ancestors in the hierarchy, in order from the lowest to the highest level. The flatten transformation creates this field and generates the ancestry path for each node in the hierarchy. For example, for a salesperson role in a role hierarchy, the value is: <code>Sales Manager 1\Regional Manager 1\Vice President 1\CEO</code> .
source	Yes	Node in the dataflow definition file that contains the hierarchical data that you want to flatten. This node is the input source for this transformation and it must contain the input fields mapped to self_field and parent_field.

Note: By default, the multi_field and path_field fields are created as system fields, which aren't visible in the user interface. To make the fields appear in the user interface, set the `ISSystemField` metadata attribute to `false` for each field in the flatten transformation. For more information about metadata attributes, see [Overriding Metadata Generated by a Transformation](#).

SEE ALSO:

[flatten Transformation](#)

sfdcDigest Transformation

The sfdcDigest transformation generates a dataset based on data that it extracts from a Salesforce object. You specify the Salesforce object and fields from which to extract data. You might choose to exclude particular fields that contain sensitive information or that aren't relevant for analysis.

When you upload the dataflow definition file, Wave Analytics validates access to Salesforce objects and fields based on the user profile of the user who uploads the file. If the user profile does not have read access to a field or object, the upload fails.

At run time, Wave Analytics runs the dataflow as the Integration User. Wave Analytics validates access to Salesforce objects and fields based on the user profile of the Integration User. For example, if the dataflow tries to extract data from a custom field on which the Integration User does not have read access, the dataflow job fails.

 **Note:** The Integration User is a preconfigured user that is created when Wave Analytics is enabled in your organization. If you or the Integration User need permission on a Salesforce object or field, ask the administrator to grant access.

For more information about preconfigured users in Wave Analytics, see the *Wave Analytics Security Implementation Guide*.

 **Example:** Let's look at an example. You would like to create a dataset that contains all opportunities from the Opportunity object.

You create the following dataflow definition.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" },
        { "name": "OpportunitySupportTeamMembers__c" }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}
```

Tips for Using the sfdcDigest Transformation

- Be selective when choosing fields because a dataset can contain a maximum of 5,000 fields.
- To extract data from a Salesforce object, the sfdcDigest transformation runs a SOQL query. The length of the SOQL query cannot exceed 20,000 characters. No results are returned if the SOQL query exceeds the maximum. To reduce the SOQL query length, break up the extract into two or more sfdcDigest transformations and then use theaugment transformation to combine the results. For example, you might create one sfdcDigest transformation to extract the half of the fields and create another sfdcDigest transformation to extract the remaining fields.

Extracting Incremental Changes to Data (Pilot)

You can configure the `sfdcDigest` transformation to extract only records that changed in a Salesforce object since the last dataflow run. Use incremental extraction to decrease the time required to extract the data.

Filtering Records Extracted from a Salesforce Object

Add a filter to the `sfdcDigest` transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.

Overriding Salesforce Field Metadata

You can override the field metadata that the `sfdcDigest` transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

Unsupported Salesforce Objects and Fields in Wave

The `sfdcDigest` transformation can't extract data from all Salesforce objects and fields. Consider these limitations before configuring the extraction of Salesforce objects.

`sfdcDigest` Parameters

When you define an `sfdcDigest` transformation, you set the action attribute to `sfdcDigest` and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

Extracting Incremental Changes to Data (Pilot)

You can configure the `sfdcDigest` transformation to extract only records that changed in a Salesforce object since the last dataflow run. Use incremental extraction to decrease the time required to extract the data.

 **Note:** Incremental extraction with the `sfdcDigest` transformation is currently available through a pilot program. Any unreleased services or features referenced in this or other press releases or public statements are not currently available and may not be delivered on time or at all. Customers who purchase our services should make their purchase decisions based upon features that are currently available.

There are two types of extractions: full and incremental. With a full extraction, the `sfdcDigest` transformation extracts all records from the Salesforce object. With incremental extraction, the transformation extracts only records that have changed since the last dataflow run. Unless configured otherwise, the `sfdcDigest` transformation runs full extractions.

When you enable incremental extraction, the `sfdcDigest` transformation performs different actions on the dataset based the types of record changes in the Salesforce object since the last dataflow run:

Record Change in Salesforce Object	Change to Dataset
Deleted record	Deletes corresponding record in the dataset.
New record	Inserts the new record into the dataset.
Updated record	Updates the corresponding record in the dataset.

Consider the following guidelines when enabling incremental extraction for an `sfdcDigest` transformation:

- Use incremental extraction for as many instances of the `sfdcDigest` transformation in the dataflow as possible.
- If necessary, when the `sfdcDigest` transformation is configured to run an incremental extraction, you can use the `fullRefreshToken` parameter to run a one-time, full extraction. You might use this option if the data in the Salesforce object and dataset become out of sync.

- The sfcdigest transformation extracts all records from the object if you enable incremental extraction and it's the first time running the dataflow.
- You must use a full extraction in the following cases because incremental extraction is not supported:
 - The Salesforce object contains a formula field that references an external data object.
 - The Salesforce object fields or field types changed since the last dataflow run.
 - The filter in the sfcdigest transformation changed since the last dataflow run.
 - The Salesforce object is one of the following objects:
 - CallCenter
 - CaseTeamMember
 - CategoryNode
 - CollaborationGroup
 - CollaborationGroupMember
 - CollaborationGroupMemberRequest
 - Division
 - Domain
 - DomainSite
 - Group
 - GroupMember
 - Profile
 - Site
 - Territory
 - Topic
 - User
 - UserRole
 - UserTerritory

Example: Let's consider an example. You'd like to incrementally extract data from the Opportunity object. As a result, you configure the following dataflow definition:

```
{
  "Extract_Opportunities": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Opportunity",
      "incremental": true,
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  }
},
```

```

"Register_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "Opportunities",
    "name": "Opportunities",
    "source": "Extract_Opportunities"
  }
}

```

Later, you realize that one of the opportunity records is missing. You decide to run a one-time full extraction by adding the `fullRefreshToken` parameter as shown in the following dataflow definition.

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "incremental": true,
      "fullRefreshToken": "bb",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}

```

After the full extraction, the dataflow performs an incremental extraction each time thereafter even though the `fullRefreshToken` parameter is included in the dataflow definition. To run a full extraction again, change the value of the `fullRefreshToken` parameter to a different value.

[sfdcDigest Transformation](#)

Filtering Records Extracted from a Salesforce Object

Add a filter to the `sfdcDigest` transformation to extract a subset of all records from a Salesforce object. You can filter records to reduce the number of extracted and processed records, exclude records that contain irrelevant or sensitive data, and increase dataflow performance.

A filter consists of one or more filter conditions, where each filter condition compares a field value to a value. For example, `Amount >= 1000000`. You can also apply SOQL functions on the field value in a filter condition, like `CALENDAR_YEAR (CreatedDate) = 2011`. You can add multiple filter conditions using logical operators AND, OR, and NOT. You can also use a backslash (\) to escape double quotes included in strings.

The `sfdcDigest` transformation extracts all records for which the filter is true. If you configured the `sfdcDigest` transformation for incremental extraction, the filter applies to data extracted during the incremental run only—Wave Analytics doesn't apply the filter to records that were previously loaded into the dataset. If you add an invalid filter, the dataflow fails at run time.

For each instance of `sfdcDigest`, you can use one of the following types of filters:

- Structured filter
- Advanced filter

 **Tip:** Are you trying to decide whether to use a filter in the `sfdcDigest` transformation or use a filter transformation? Use a filter transformation to filter records at any point in the dataflow. For example, you can add it after the dataflow joins two datasets. However, to reduce the number of rows processed in the dataflow and optimize dataflow performance, add the filter closest to the point at which records are extracted—when possible, add the filter in the `sfdcDigest` transformation.

[Structured Filter in sfdcDigest Transformation](#)

You define a structured filter using JSON syntax.

[Advanced Filter in sfdcDigest Transformation](#)

You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.

SEE ALSO:

[sfdcDigest Transformation](#)

Structured Filter in sfdcDigest Transformation

You define a structured filter using JSON syntax.

A structured filter uses the following JSON syntax for each filter condition.

```
{
  "field": "<field name>",
  "operator": "<operator>",
  "value": "<value>"|["<value 1>", "<value 2>"],
  "isQuoted": true|false}
```

The value can be a number, date, string, list of strings, or [date literal](#). Wave Analytics automatically quotes strings unless you set `isQuoted` to true, which indicates that the string is already quoted.

You can use one of the following operators in a filter condition.

Operator	Comment
=	Filter condition is true if the value in the field equals the specified value. String comparisons using the equals operator are case-insensitive.

Operator	Comment
	<p>Example:</p> <pre data-bbox="824 306 1432 533">"filterConditions": [{ "field": "OwnerId", "operator": "=", "value": "a07B00000012HYu" }]</pre>
<p>!=</p>	<p>Filter condition is true if the value in the field does not equal the specified value.</p> <p>Example (using backslashes to escape double quotes in a string value):</p> <pre data-bbox="824 747 1432 974">"filterConditions": [{ "field": "Nickname__c", "operator": "!=", "value": "\"Sammy\"" }]</pre>
<p>></p>	<p>Filter condition is true if the value in the field is greater than the specified value.</p> <p>Example:</p> <pre data-bbox="824 1157 1432 1383">"filterConditions": [{ "field": "Amount", "operator": ">", "value": "100000" }]</pre>
<p><</p>	<p>Filter condition is true if the value in the field is less than the specified value.</p> <p>Example (using a date literal):</p> <pre data-bbox="824 1564 1432 1812">"filterConditions": [{ "field": "CloseDate", "operator": "<", "value": "THIS_MONTH", "isQuoted": false }]</pre>

Operator	Comment
>=	<p>Filter condition is true if the value in the field is greater than or equal to the specified value.</p> <p>Example:</p> <pre data-bbox="821 394 1443 625">"filterConditions": [{ "field": "Amount", "operator": ">=", "value": "100000" }]</pre>
<=	<p>Filter condition is true if the value in the field is less than or equal to the specified value.</p> <p>Example (using a SOQL function):</p> <pre data-bbox="821 802 1443 1062">"filterConditions": [{ "field": "CALENDAR_YEAR (CreatedDate)", "operator": "<=", "value": "2015", "isQuoted": true }]</pre>
LIKE	<p>Filter condition is true if the value in the field matches the specified value. The LIKE operator is similar to the LIKE operator in SQL; it provides a mechanism for matching partial text strings and supports wildcards.</p> <ul data-bbox="821 1262 1443 1535" style="list-style-type: none">• The % and _ wildcards are supported for the LIKE operator.• The % wildcard matches zero or more characters.• The _ wildcard matches exactly one character.• The LIKE operator is supported for string fields only.• The LIKE operator performs a case-insensitive match.• The LIKE operator supports escaping of special characters % or _. Use a backslash (\) to escape special characters. <p>Example:</p> <pre data-bbox="821 1604 1443 1822">"filterConditions": [{ "field": "FirstName", "operator": "LIKE", "value": "Chris%" }]</pre>

Operator	Comment
IN	<p>Filter condition is true if the value in the field equals any one of the values in the specified list. You can specify a quoted or non-quoted list of values. If the list is quoted, set <code>isQuoted</code> to true.</p> <p>Example:</p> <pre data-bbox="824 432 1448 663">"filterConditions": [{ "field": "StageName", "operator": "IN", "value": ["Closed Won", "Closed Lost"] }]</pre>
NOT IN	<p>Filter condition is true if the value in the field does not equal any of the values in the specified list.</p> <p>Example:</p> <pre data-bbox="824 840 1448 1066">"filterConditions": [{ "field": "BillingState", "operator": "NOT IN", "value": ["California", "New York"] }]</pre>
INCLUDES	<p>For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field includes the specified value.</p> <p>Example:</p> <pre data-bbox="824 1243 1448 1470">"filterConditions": [{ "field": "BillingState", "operator": "INCLUDES", "value": ["California"] }]</pre>
EXCLUDES	<p>For picklist or multi-select picklist fields only. Filter condition is true if the value in the picklist field excludes the specified value.</p> <p>Example:</p> <pre data-bbox="824 1646 1448 1873">"filterConditions": [{ "field": "BillingState", "operator": "EXCLUDES", "value": ["California", "New York"] }]</pre>

Let's look at a few examples of structured filters.

 **Example:** Let's look at an example with a basic structured filter. To perform pipeline analysis on opportunities in fiscal quarter 2 of fiscal year 2015, you create this dataflow definition file to create the relevant dataset.

```
{
  "Extract_Filtered_Opportunities": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" },
        { "name": "SystemModstamp" }
      ],
      "filterConditions": [
        {
          "field": "FiscalYear",
          "operator": "=",
          "value": "2015"
        },
        {
          "field": "FiscalQuarter",
          "operator": "=",
          "value": "2"
        }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfcdregister",
    "parameters": {
      "alias": "Opportunities_2015Q2",
      "name": "Opportunities_2015Q2",
      "source": "Extract_Filtered_Opportunities"
    }
  }
}
```

 **Note:** If you do not specify a logical operator for multiple filter conditions—as is the case in this example—Wave Analytics applies AND between the conditions.

 **Example:** Let's look at an example of a structured filter with a logical operator. To help forecast expected revenue, you create this dataflow to view all opportunities that have either closed or have greater than 90% probability of closing.

```
{
  "Extract_Opportunities": {
    "action": "sfcdigest",
```

```

"parameters": {
  "object": "Opportunity",
  "fields": [
    { "name": "Id" },
    { "name": "Name" },
    { "name": "AccountId" },
    { "name": "Amount" },
    { "name": "StageName" },
    { "name": "CloseDate" },
    { "name": "OwnerId" },
    { "name": "Probability" },
    { "name": "FiscalYear" },
    { "name": "FiscalQuarter" }
  ],
  "filterConditions": [
    {
      "operator": "OR",
      "conditions": [
        {
          "field": "StageName",
          "operator": "=",
          "value": "Closed Won"
        },
        {
          "field": "Probability",
          "operator": ">=",
          "value": "90"
        }
      ]
    }
  ]
},
"Register_Opportunities_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OpportunitiesExpectedToWin",
    "name": "OpportunitiesExpectedToWin",
    "source": "Extract_Opportunities"
  }
}
}

```

Example: Finally, let's look at an example of a structured filter with nested logical operators. You create this dataflow to view all opportunities that closed in the current fiscal quarter and are owned by either one of your two direct reports.

```

{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },

```

```

        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "OwnerId" },
        { "name": "FiscalYear" },
        { "name": "FiscalQuarter" }
    ],
    "filterConditions": [
        {
            "operator": "AND",
            "conditions": [
                {
                    "field": "CloseDate",
                    "operator": "=",
                    "value": "THIS_FISCAL_QUARTER",
                    "isQuoted": false
                },
                {
                    "operator": "OR",
                    "conditions": [
                        {
                            "field": "OwnerId",
                            "operator": "=",
                            "value": "00540000000HfUz"
                        },
                        {
                            "field": "OwnerId",
                            "operator": "=",
                            "value": "00540000000HfV4"
                        }
                    ]
                }
            ]
        }
    ]
},
"Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
        "alias": "DirectReport_Opportunities",
        "name": "DirectReport_Opportunities",
        "source": "Extract_Opportunities"
    }
}
}

```

Advanced Filter in sfdcDigest Transformation

You define an advanced filter using a Salesforce Object Query Language (SOQL) WHERE clause expression. Use an advanced filter only if you are familiar with SOQL.

 **Example:** Let's look at an example of an advanced filter. You want to extract only opportunity records that are owned by a specific user and that have either high value or a high probability of closing. You create this dataflow.

```
{
  "Extract_Filtered_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AccountId" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "Probability" },
        { "name": "OwnerId" }
      ],
      "complexFilterConditions": "OwnerId = '00540000000HfUz' AND (Amount > 100000
OR Probability > 75)"
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "FilteredOpportunities",
      "name": "FilteredOpportunities",
      "source": "Extract_Filtered_Opportunities"
    }
  }
}
```

Overriding Salesforce Field Metadata

You can override the field metadata that the sfdcDigest transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field.

You can add the following field parameters to the sfdcDigest transformation to override the field metadata:

- defaultValue
- type
- fiscalMonthOffset
- isYearEndFiscalYear
- firstDayOfWeek
- isMultiValue
- multiValueSeparator
- precision
- scale

For a description of each of these field parameters, see [Field Parameters](#). For information about using metadata attributes to configure dates, see [Date Handling in Datasets](#).

 **Example:** Let's look at an example. You would like to override metadata extracted from the Opportunity object. You add the bold text in the following dataflow definition to override field metadata from the Opportunity object.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        {
          "name": "Amount",
          "defaultValue": 0
          "precision": 18
          "scale": 2
        },
        { "name": "StageName" },
        {
          "name": "CloseDate",
          "fiscalMonthOffset": 9,
          "firstDayOfWeek": "2",
          "isYearEndFiscalYear": true
        },
        { "name": "AccountId" },
        { "name": "OwnerId" },
        {
          "name": "OpportunitySupportTeamMembers__c",
          "type": "Text",
          "isMultiValue": true,
          "multiValueSeparator": ",",
          "precision": 255
        }
      ]
    }
  },
  "Register_Opportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  }
}
```

The sfcdcDigest transformation cannot extract data from external objects created in Salesforce. External objects are similar to custom objects, except that they map to data located outside Salesforce.

If you include an unsupported or inaccessible object in the sfcdcDigest transformation, the dataflow fails at run time with an error message.

Unsupported Fields

The sfdcDigest transformation cannot extract data from these fields:

Object	Unsupported Fields
Account	CleanStatus
ActionPlanItem	ItemId
AuthSession	<ul style="list-style-type: none"> LoginGeoid LoginHistoryId
CaseArticle	KnowledgeArticleId

If you include a field with an unsupported field in the `sfdcDigest` transformation, the dataflow ignores the field.

In addition, Salesforce recommends that you do not extract data from the `MayEdit` field of the `Account` object. Extracting data from this field significantly decreases performance and can cause the dataflow to fail.

Unsupported Field Types

The `sfdcDigest` transformation can't extract data from fields with these field types.

- base64
- composite (like address and location)
- data category group reference
- encrypted string

If you include a field with an unsupported field type in the `sfdcDigest` transformation, the dataflow ignores the field.

SEE ALSO:

[sfdcDigest Transformation](#)

sfdcDigest Parameters

When you define an `sfdcDigest` transformation, you set the action attribute to `sfdcDigest` and specify the parameters for the object and fields that you want to extract. Optionally, you can also specify parameters to filter the records extracted from the Salesforce object.

You can specify parameters in the following sections of the `sfdcDigest` node: `parameters`, `fields`, and `filterConditions`.

Parameters

The following table describes the parameters in the `parameters` section.

Parameter	Required?	Value
<code>object</code>	Yes	API name of the Salesforce object from which you want to extract data. This object is the input source for this transformation. The <code>sfdcDigest</code> transformation doesn't support extraction from all Salesforce objects.
<code>incremental</code>	No	Performs an incremental extraction, which extracts only changes to the Salesforce object since the last dataflow run. Valid values: true or false.
<code>fullRefreshToken</code>	No	Performs a one-time full extraction to synchronize the data in the dataset with data in the Salesforce object. Specify any value for this parameter. After the full extraction, the dataflow performs an incremental extraction each time thereafter even though the <code>fullRefreshToken</code> parameter is included in the dataflow definition. To run a full extraction again, change the value of the <code>fullRefreshToken</code> parameter to a different value.
<code>fields</code>	Yes	An array of names of all fields from which you want to extract data from the specified Salesforce object. The <code>sfdcDigest</code> transformation doesn't support extraction from all field types. See Field Attributes.
<code>filterConditions</code>	No	A filter that restricts the records extracted from the specified Salesforce object. The <code>sfdcDigest</code> transformation extracts all records from the Salesforce object for which

Parameter	Required?	Value
		the filter is true. You can specify a structured or advanced filter. See Filter Conditions Parameters.
complexFilterConditions	No	For advanced filters only. A SOQL WHERE clause used to filter records extracted from the specified Salesforce object.

Field Attributes

The following table describes the attributes in the `fields` section. It also describes optional attributes that you can provide to override the field metadata. You can override the metadata that the `sfdcDigest` transformation extracts from a Salesforce object to make the data appear differently in a dataset. For example, Wave Analytics can add a default value to records that have missing values for a field. If you don't override the values, Wave Analytics gets the values from Salesforce.

Attribute	Required?	Value
name	Yes	API name of the field in the Salesforce object that you want to include in the dataset. You can specify multiple fields.
defaultValue	No	For text and numeric fields that can be null. Default value that replaces a null value for the specified field.
type	No	Wave Analytics field type associated with the specified field. Valid types are Text, Numeric, or Date. Any value, including numeric values, can be Text. For example, by default, fiscal quarter from Salesforce objects is Number. However, you can change it to Text. Specify a type to override the type determined by Wave Analytics. Example: <pre>"type": "Text"</pre>
fiscalMonthOffset	No	For date fields only. The difference, in months, between the first month of the fiscal year and the first month of the calendar year (January). For example, if the fiscal year starts in January, the offset is 0. If the fiscal year starts in October, the offset is 9. Example: <pre>"fiscalMonthOffset": 9</pre>

Attribute	Required?	Value
		<p> Note: This attribute also controls whether Wave Analytics generates fiscal date fields. To generate fiscal date fields, set <code>fiscalMonthOffset</code> to a value other than '0'.</p> <p>For more information, see Date Handling in Datasets.</p>
isYearEndFiscalYear	No	<p>For date fields only. Indicates whether the fiscal year is the year in which the fiscal year ends or begins. Because the fiscal year can start in one calendar year and end in another, you must specify which year to use for the fiscal year.</p> <ul style="list-style-type: none"> • If true, then the fiscal year is the year in which the fiscal year ends. The default is true. • If false, then the fiscal year is the year in which the fiscal year begins. <p>Example:</p> <pre>"isYearEndFiscalYear": true</pre> <p>This field is relevant only when <code>fiscalMonthOffset</code> is greater than 0.</p> <p>For more information, see Date Handling in Datasets.</p>
firstDayOfWeek	No	<p>For date fields only. The first day of the week for the calendar year and, if applicable, fiscal year. Use 0 to set the first day to be Sunday, 1 to set the first day to be Monday, and so on. Use -1 to set the first day to be on January 1. The default is -1.</p> <p>Example:</p> <pre>"firstDayOfWeek": "0"</pre> <p>For more information, see Date Handling in Datasets.</p>
isMultiValue	No	<p>For text fields only. Indicates whether the specified field has multiple values.</p>

Attribute	Required?	Value
		Example: <pre>"isMultiValue": false</pre>
multiValueSeparator	No	For text fields only. Character used to separate multiple values in the specified field when isMultiValue equals true. This value defaults to a semicolon (;) if you do not specify a value and isMultiValue equals true. Set to null when isMultiValue equals false. Example: <pre>"multiValueSeparator": ";"</pre>
precision	No	The maximum number of digits in a numeric value, or the length of a text value. For numeric values: Includes all numbers to the left and to the right of the decimal point (but excludes the decimal point character). Value must be between 1 and 18, inclusive. For text values: Value defaults to 255 characters, and must be between 1 and 32,000 characters, inclusive. Example: <pre>"precision": 10</pre>
scale	No	The number of digits to the right of the decimal point in a numeric value. Must be less than the precision value. Value must be between 0 and 17 characters, inclusive. Example: <pre>"scale": 2</pre>

Filter Conditions Parameters

The following table describes the structured filter parameters in the `filterConditions` section. These parameters do not apply to advanced filters.

Parameter	Required?	Value
field	No	The field in the Salesforce object on which you want to apply a filter condition. Each

Parameter	Required?	Value
		<p>filter condition in a structured filter uses the following syntax:</p> <pre data-bbox="1036 338 1448 510"> { "field": "<field name>", "operator": "<operator>", "value": "<value>", "isQuoted": true false} </pre>
operator	No	<p>The purpose depends on the context.</p> <ul data-bbox="1036 604 1448 846" style="list-style-type: none"> • <code>operator</code> can be used as a comparison operator—like <code>=</code>, <code><</code>, and <code>IN</code>—that compares the field value against a constant value. • <code>operator</code> can also be used as a logical operator (AND, OR, or NOT) that links multiple filter conditions together. <p>In the example below, the bold <code>operator</code> is the logical operator. The other instances of <code>operator</code> are comparison operators.</p> <pre data-bbox="1036 1020 1448 1703"> "filterConditions": [{ "operator": "OR", "conditions": [{ "field": "StageName", "operator": "=", "value": "Closed Won" }, { "field": "Probability", "operator": ">=", "value": "90" }] }] </pre>
value	No	The value used in a filter condition.
isQuoted	No	Indicates whether you quoted the string value in a filter condition.

Parameter	Required?	Value
		<p>Example with quoted values:</p> <pre>"filterConditions": [{ "field": "StageName", "operator": "IN", "value": "('Closed Won', 'Closed Lost')", "isQuoted": true }]</pre> <p>Example with non-quoted values:</p> <pre>"filterConditions": [{ "field": "StageName", "operator": "IN", "value": ["Closed Won", "Closed Lost"], "isQuoted": false }]</pre> <p>If you don't include isQuoted for a filter on a string value, Wave Analytics assumes that the string value is not quoted and adds the quotes for you.</p>
conditions	No	Use to specify a logical operator to link multiple filter conditions together.

- [Extracting Incremental Changes to Data \(Pilot\)](#)

sfdcRegister Transformation

The sfdcRegister transformation registers a dataset to make it available for queries. Users cannot view or run queries against unregistered datasets.

You don't need to register all datasets. For example, you don't need to register an intermediate dataset that is used to build another dataset and does not need to be queried. In addition, you don't need to register datasets that are created when you upload external data because Wave Analytics automatically registers these datasets for you.

Carefully choose which datasets to register because:

- The total number of rows in all registered datasets cannot exceed 250 million per platform license.
- Users that have access to registered datasets can query their data. Although, you can apply row-level security on a dataset to restrict access to records.

 **Example:** Let's look at an example. You create a dataflow that extracts opportunities from the Opportunity object. To register the dataset, name it "Opportunities," and apply row-level security on it, you add the `sfdcRegister` transformation as shown in the following dataflow definition file.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Register_Oppportunities_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities",
      "rowLevelSecurityFilter": "'OwnerId' == \"\$User.Id\""
    }
  }
}
```

[sfdcRegister Parameters](#)

When you define an `sfdcRegister` transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

sfdcRegister Parameters

When you define an `sfdcRegister` transformation, you set the action attribute to `sfdcRegister` and specify the parameters.

The following table describes the input parameters:

Parameter	Required?	Value
alias	Yes	API name of the registered dataset. This name can contain only underscores and alphanumeric characters, and must be unique among other dataset aliases in your organization. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. It also cannot exceed 80 characters.

Parameter	Required?	Value
name	Yes	<p>Display name of the registered dataset. The name cannot exceed 80 characters.</p> <p> Note: To change the name after you create the dataset, you must edit the dataset.</p>
source	Yes	<p>Node in the dataflow definition file that identifies the dataset that you want to register. This is the input source for this transformation.</p>
rowLevelSecurityFilter	No	<p>The predicate used to apply row-level security on the dataset when the dataset is first created.</p> <p>Example: "rowLevelSecurityFilter": "OwnerId" == "\$User.Id"</p> <p> Note: To change the predicate after you create the dataset, you must edit the dataset.</p> <p>When entering the predicate in the Register transformation of the dataflow JSON, you must escape the double quotes around string values.</p> <p>After the dataset is created, Wave Analytics ignores its security predicate setting in the dataflow. To change the security predicate for an existing dataset, edit the dataset in the user interface.</p>

[sfdcRegister Transformation](#)

update Transformation

The update transformation updates the specified field values in an existing dataset based on data from another dataset, which we'll call the lookup dataset. The transformation looks up the new values from corresponding fields in the lookup dataset. The transformation stores the results in a new dataset.

When you create the transformation, you specify the keys that are used to match records between the two datasets. To dictate which field in the lookup dataset updates the field in the source dataset, you also map the corresponding fields from both datasets.

 **Example:** Let's look at an example. You have an existing Accounts dataset that contains account information—Id, Name, and AnnualRevenue. Unfortunately, some of the account names in the dataset are now incorrect because of a series of mergers and acquisitions. To quickly update the account names in the dataset, you perform the following tasks.

1. Create a .csv file that contains the new account names and associated account IDs for accounts that have name changes.
2. Upload the .csv file to create a dataset called UpdatedAccountNames.
3. Create a dataflow definition file to update account names in the Accounts dataset by looking up the new account names in the UpdatedAccountNames dataset.

You create the following dataflow definition file.

```
{
  "Extract_AccountDetails": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": [ "Id" ],
      "right_key": [ "AccountID" ],
      "update_columns": { "Name": "NewAccountName" }
    }
  },
  "Register_UpdatedAccountRecords": {
    "action": "sfdcregister",
    "parameters": {
      "alias": "Accounts",
      "name": "Accounts",
      "source": "Update_AccountRecords"
    }
  }
}
```

```

    }
  }
}

```

 **Example:** Let's look at another example, where a composite key is used to match records between both datasets. In this case, you match records using the account ID and account name fields.

You create the following dataflow definition file.

```

{
  "Extract_AccountDetails": {
    "action": "sfcdigest",
    "parameters": {
      "object": "Account",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "AnnualRevenue" }
      ]
    }
  },
  "Extract_UpdatedAccountNames": {
    "action": "edgemart",
    "parameters": { "alias": "UpdatedAccountNames" }
  },
  "Update_AccountRecords": {
    "action": "update",
    "parameters": {
      "left": "Extract_AccountDetails",
      "right": "Extract_UpdatedAccountNames",
      "left_key": ["Id", "Name"],
      "right_key": ["AccountId", "NewAccountName"],
      "update_columns": {
        "Name": "NewAccountName",
        "CreatedDate": "NewCreatedDate",
        "AnnualRevenue": "NewAnnualRevenue"
      }
    }
  },
  "Register_UpdatedAccountRecords": {
    "action": "sfcdRegister",
    "parameters": {
      "alias": "Accounts",
      "name": "Accounts",
      "source": "Update_AccountRecords"
    }
  }
}

```

[update Parameters](#)

When you define an update transformation, you set the action attribute to `update` and specify the parameters.

update Parameters

When you define an update transformation, you set the action attribute to `update` and specify the parameters.

The following table describes the input parameters.

Parameter	Required?	Value
left	Yes	Node in the dataflow definition file that identifies the dataset that contains the records that you want to update.
right	Yes	Node in the dataflow definition file that identifies the lookup dataset that contains the new values.
left_key	Yes	Key column in the left dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order. For an example, see update Transformation on page 3400.
right_key	Yes	Key column in the right dataset used to match records in the other dataset. If you use a composite key, the left and right keys must have the same number of columns in the same order.
update_columns	No	<p>An array of corresponding columns between the left and right datasets. Use the following syntax: <code>"update_columns": { "LeftColumn1": "RightColumn1", "LeftColumn2": "RightColumn2", ... "LeftColumnN": "RightColumnN" }</code>. The value from right column replaces the value from the corresponding left column. The field types of the left and right column must match.</p> <p> Note: If you specify a column name that does not exist, the dataflow fails.</p> <p>If you do not specify this parameter, the transformation updates the left dataset by matching all columns in the right dataset with those in the left. In this case, the right column names must match exactly with the</p>

Parameter	Required?	Value
		left column names. Otherwise, an error might occur.

SEE ALSO:

[update Transformation](#)

Overriding Metadata Generated by a Transformation

Optionally, you can override the metadata that is generated by a transformation. You can override object and field attributes. For example, you can change a field name that is extracted from a Salesforce object so that it appears differently in the dataset. To override the metadata, add the overrides to the Schema section of the transformation in the dataflow definition file.

In the Schema section, you can override the metadata attributes for one object only.

The Schema section in this sample `sfdcDigest` transformation contains metadata overrides:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions

```
"Extract_Opportunities": {
  "action": "sfdcDigest",
  "parameters": {
    "object": "Opportunity",
    "fields": [
      { "name": "Name" },
      { "name": "Amount" }
    ]
  },
  "schema": {
    "objects": [
      {
        "label": "Sales Opportunities",
        "fields": [
          {
            "name": "Amount",
            "label": "Opportunity Amount"
          }
        ]
      }
    ]
  }
}
```

Object Attributes

You can override the following object attributes.

Object Attribute	Type	Description
label	String	The display name for the object. Can be up to 40 characters. Example: <code>"label": "Sales Data"</code>
description	String	The description of the object. Must be less than 1,000 characters. Add a description to annotate an object in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface. Example: <code>"description": "The SalesData object tracks basic sales data."</code>
fields	Array	The array of fields for this object.

Field Attributes

You can override attributes of each specified dataset field.

Field Attribute	Type	Description
name	String	Name of the field in the dataset. Identifies the field that you want to override. Examples: <code>"name": "Amount"</code> <code>"name": "Role.Name"</code>
label	String	The display name for the field. Can be up to 255 characters. Example: <code>"label": "Opportunity Amount"</code>
description	String	The description of the field. Must be less than 1,000 characters. Add a description to annotate a field in the dataflow definition file. This description is not visible to users in the Wave Analytics user interface. Example: <code>"description": "The Amount field contains the opportunity amount."</code>
isSystemField	Boolean	Indicates whether this field is a system field to be excluded from query results. Example: <code>"isSystemField": "false"</code>
format	String	The display format of the numeric value. Examples:

Field Attribute	Type	Description
		"format": "\$#,##0.00" (Numeric) For more information about valid formats, see Numeric Formats .

Numeric Formats

An example of a typical numeric value is \$1,000,000.99, which is represented as \$#,##0.00. You are required to specify the precision and scale of the number. The format is specified by using the following symbols:

Symbol	Meaning
0	One digit
#	Zero or 1 digit
.	This symbol is the default decimal separator. Use the <code>decimalSeparator</code> field to set the decimal separator to a different symbol.
-	Minus sign
,	Grouping separator
\$	Currency sign

 **Note:** The format for numeric values isn't used in data ingestion. It is used only to specify how numeric values are formatted when displayed in the UI. Also, you can't override date formats.

 **Example:** Let's consider an example where you want to override the following object and field attributes that the `sfdcDigest` transformation extracts from the Opportunity object.

Object/Field	Attribute Changes
Opportunity object	<ul style="list-style-type: none"> Change the object label to "Sales Opportunities" Add an object description
Id field	<ul style="list-style-type: none"> Change the field label to "Opportunity Id" Hide the field from queries
Amount field	<ul style="list-style-type: none"> Change the field label to "Opportunity Amount" Change the format to \$#,##0.00
CloseDate field	<ul style="list-style-type: none"> Change the field label to "Closing Date"

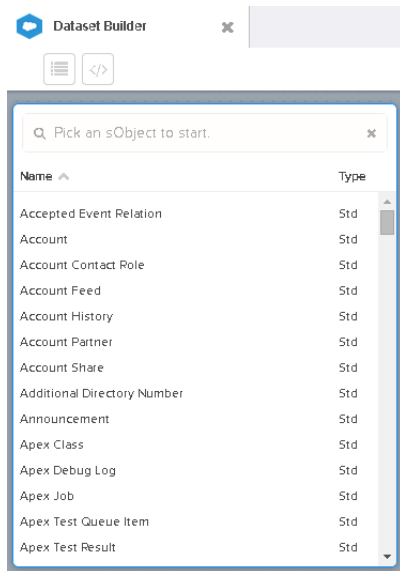

To override the attributes, you add the Schema section with the override values to `sfdcDigest` in the dataflow definition file.

```
{
  "Extract_Opportunities": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "CloseDate" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    },
    "schema": {
      "objects": [
        {
          "label": "Sales Opportunities",
          "description": "These are all sales opportunities.",
          "fields": [
            {
              "name": "Id",
              "label": "Opportunity Id",
              "isSystemField": true
            },
            {
              "name": "Amount",
              "label": "Opportunity Amount",
              "format": "$#,##0.00"
            },
            {
              "name": "CloseDate",
              "label": "Closing Date"
            }
          ]
        }
      ]
    }
  },
  "Register_Dataset_Opportunities": {
    "action": "sfdcRegister",
    "parameters": {
      "source": "Extract_Opportunities",
      "alias": "Opportunities",
      "name": "Opportunities"
    }
  }
}
```

Create a Dataset with the Dataset Builder

You can use the dataset builder to create a single dataset based on data from one or more Salesforce objects. The dataset builder generates and appends the associated JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. The data in the dataset refreshes each time the dataflow runs. You can also edit the dataflow definition file to add transformations that manipulate the dataset.

1. On the home page or on an app page, click **Create > Dataset**.
2. Click **Salesforce**.
The dataset builder opens on the Dataset Builder tab.

3. Select the root object.
The root object is the lowest level child object that you can add to the canvas. After you select the root object, you can add only parent objects of the root object—you can't add its children objects. To change the root object, refresh the page and start over.
4. Hover over the root object, and then click .
The Select Fields dialog box appears. By default, the Fields tab appears and shows all available object fields from which you can extract data.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

To access the dataset builder:

- "Edit Wave Analytics Dataflows"

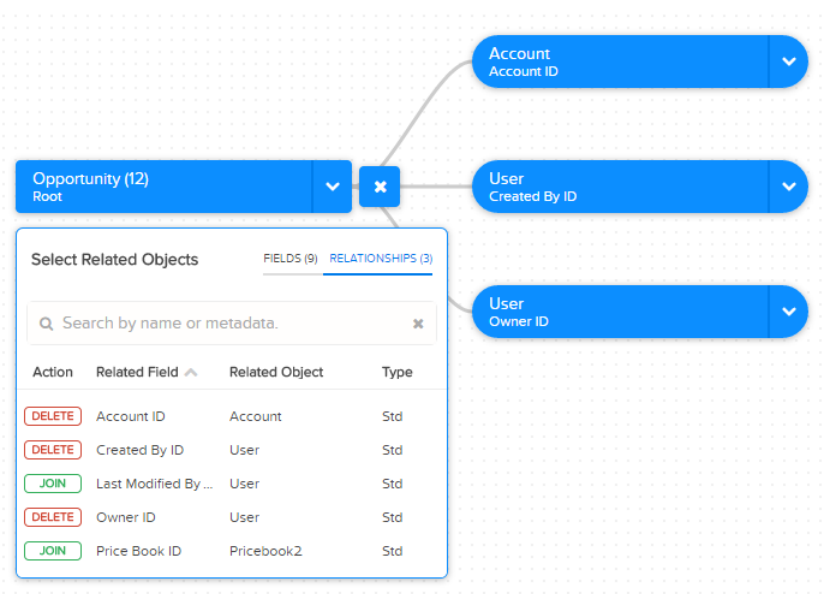

Note: You can view this dialog box for any object included in the canvas.

- In the Fields tab, select the fields from which you want to extract data.
To locate fields more quickly, you can search for them or sort them by name or type.

Important: You must select at least one field for each object that you add to the canvas. If you add an object and don't add any of its fields, the dataflow fails at run time.

- In the Relationships tab, click **Join** to add the related objects to the canvas.
When you add a related object, the related object appears in the canvas.

- To remove a related object, click **Delete**.

 **Warning:** When you delete a related object, you also delete all objects that descend from the related object in the diagram. For example, if you delete Account shown below, you delete the branch that contains Account and User.

- For each related object, select the fields from which you want to extract data.
- To move the entire diagram, select a white space in the canvas and drag it. You might need to move the diagram to view a different section of the diagram.

- To view all objects included in the canvas, click . The Selected Objects dialog box shows a tree structure of all objects included in the canvas. The root object appears at the top of the tree.

If you select one of the objects, the dataset builder focuses on the object by placing the object in the center of the canvas.

- To view the associated JSON, click .

When you create the dataset, the dataset builder appends the JSON to the dataflow definition file.

12. Click **Create Dataset**.

13. Enter the name of the dataset, and select the app that will contain the dataset if it's not already selected.

 **Note:** If you enter a dataset name that is already used, when you create the dataset, the dataset builder appends a number to the dataset name. For example, if you entered MyOpportunities, the dataset builder creates MyOpportunities1. The dataset name cannot exceed 80 characters.

14. Click **Create**.

The dataset builder appends the underlying JSON to the dataflow definition file. The dataset is created the next time the dataflow runs. You can manually run the dataflow to immediately create the dataset.

Wave Connector for Excel Data

The Salesforce Wave Connector makes it easy to import data from Microsoft Excel 2013 to Wave Analytics.

The Wave Connector is available as an app for Excel 2013 on the desktop and Excel Online in Office 365. The Connector is available as an app from the Microsoft Apps for Office store or your organization's private app catalog. After you install the Connector just point and click to import data from Excel to Salesforce.

[Install the Wave Connector Excel App](#)

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics..

Install the Wave Connector Excel App

The Wave Connector app gives users a fast, easy way to import data from Excel 2013 into Salesforce Wave Analytics..

USER PERMISSIONS

To import data from Excel 2013 to Wave Analytics :

- Upload External Data to Wave Analytics

If you use Excel 2013 on the desktop or Office 365, the Office Online version of Excel, the Wave Connector gives you a great way to get your data into Salesforce Wave Analytics. After installing the Connector, you just select data from Excel, click Submit, and the Connector does the work for you, importing the data to Wave Analytics and creating a dataset.

Here's how to install the Connector:

1. Open Excel, either on your desktop or in Office Online.
2. Open the Insert tab.
3. Click Apps for Office.
4. Search for the Wave Connector, and click to install it.
5. Enter your Salesforce credentials to open the Connector.

Once you've installed the Connector, follow the instructions in the Connector window to create datasets based on Excel data. Opening the Connector automatically logs you in to Salesforce Wave Analytics. Click the Connector Help icon for complete information about using the app.

Create a Dataset with External Data

You can either upload external data through the user interface or through the External Data API to create a dataset. When you upload an external data file (in .csv, .gz, or .zip format), you can also provide a metadata file. A metadata file contains metadata attributes that describe the structure of the data in the external data file. If you upload a .csv from the user interface, Wave Analytics automatically generates the metadata file, which you can preview and change. If you do not provide a metadata file, Wave Analytics imports all external data file columns as dimensions.

 **Tip:** Wave temporarily stores the uploaded CSV and metadata files for processing only. After the datasets are created, Wave purges the files. If you want to use the files again later, keep a copy.

Before uploading external data files, review the format requirements and examples of the .csv and metadata files in the [External Data Format Reference](#).

 **Note:** You can also use the the External Data API to upload external data files. Use the API to take advantage of additional features, like performing incremental extracts and performing append, delete, and upsert operations. For more information about the External Data API, see the [External Data API Developer's Guide](#).

1. On the home or app page, click **Create > Dataset**.

2. Type the name of your dataset in the Dataset Name field.
The name cannot exceed 80 characters.
3. If you want to create the dataset in a different app, change the app in the App drop-down list.
4. Click **CSV**.
5. Add the .csv file.
After you add the .csv file, Wave Analytics automatically generates and adds the corresponding metadata file.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To upload external data:

- "Upload External Data to Wave Analytics"

 **Note:** Instead of using the generated metadata file, if you want, you can upload a different metadata file that you created from scratch. If you upload your own metadata file, the **Preview Data** button is disabled.

6. Perform the following tasks to change the metadata attributes in the generated metadata file.
 - a. Click **Preview Data** to view and change the required metadata attributes.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

- b. Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.

- c. Click the column header to change other attributes for the column.

You can change the attributes for measure and date columns only.

- d. To apply the changes to all other columns of the same data type, click **Apply to All <data type> Columns**.
- e. Click **Submit** to save the metadata changes to the metadata file.
-  **Note:** If there are errors, the **Submit** button is grayed out.
- f. Click **OK** to close the confirmation message.
- g. To change optional metadata attributes, click  to download the metadata file, edit the file, and then upload it.

7. Click Create Dataset.

Your data files are scheduled for upload. It might take some time to process the data upload job; you can monitor its status in the data monitor. If upload is successful, the new dataset is available from the home or app page.

- 8. Click Continue** to dismiss the confirmation message.

[Rules for Automatic Generation of a Metadata File](#)

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

[Monitor an External Data Upload](#)

When you upload an external data file, Wave Analytics kicks off a job that uploads the data into the specified dataset. You can use the data monitor to monitor and troubleshoot the upload job.

Rules for Automatic Generation of a Metadata File

When you upload a CSV file from the user interface, Wave Analytics automatically generates the metadata file as long as the CSV file meets certain requirements.

To enable Wave Analytics to generate the metadata file, a CSV file must meet the following requirements.

- The file type must be .csv, not .gz or .zip.
- The file must contain one row for the column header and at least one record.
- The CSV file must meet all Wave Analytics requirements as mentioned in the [External Data Format Reference](#).

Wave Analytics generates the metadata attributes for each CSV column based on the first 100 rows in the CSV file. Wave Analytics uses the following rules to convert the CSV column names to field labels.

- Replaces special characters and spaces with underscores. For example, "Stage Name" becomes "Stage_Name."
- Replaces consecutive underscores with one underscore, except when column name ends with "__c." For example, "stage*&name" becomes "stage_name."
- Prefixes the field label with "X" when the first character of the column name is numeric. For example, "30Day" becomes "X30Day."
- Replaces the field name with "Column" + column number when all characters in the column name are not alphanumeric. For example, the fourth column name "&^*(&*%" becomes "Column4."
- Deletes underscores at the beginning and end of the field label to ensure that it doesn't start or end with an underscore.
- Increments the derived field label if the label is the same as an existing label. For example, if "X2" already exists, uses "X21," "X22," "X23."

Tip: You can download the generated metadata file to change the metadata settings, and then upload it to apply the changes. You can download the metadata file when you create or edit a dataset.

Monitor an External Data Upload

When you upload an external data file, Wave Analytics kicks off a job that uploads the data into the specified dataset. You can use the data monitor to monitor and troubleshoot the upload job.

The Jobs view (1) of the data monitor shows the status, start time, and duration of each dataflow job and external data upload job. It shows jobs for the last 7 days and keeps the logs for 30 days.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To access the data monitor:

- “Edit Wave Analytics Dataflows,” “Upload External Data to Wave Analytics,” or “Manage Wave Analytics”

Dataflow	Start Time	Duration	Status	Message
Default Salesf...	Today at 7:39 AM	24 seconds	Successful	
Default Salesf...	Yesterday at 7:39 AM	0 hours, 10...	Failed	Queue wait time exceeded limi
Sales_Targets...	2 Days Ago at 9:34 AM	0 hours, 1 ...	Failed	Error executing node load [roo

Node Name	Start Time	Duration	Node Type	Status
load	2 Days Ago at 9:34 AM	0 hours, 1 minute	sfdcFetch	error
digest	N/A	N/A	csvDigest	pending
optimize-register	N/A	N/A	optimizer	pending
register	N/A	N/A	sfdcRegister	pending

1. In Wave Analytics, click the gear button () and then click **Data Monitor** to open the data monitor. The Jobs view appears by default. The Jobs view displays dataflow and upload jobs. The Jobs view displays each upload job name as `<dataset_name upload_flow>`. You can hover a job to view the entire name.

 **Note:** To view external data upload jobs in the Jobs view, **Show** in the File Uploads field (2) must be selected. It's selected by default.

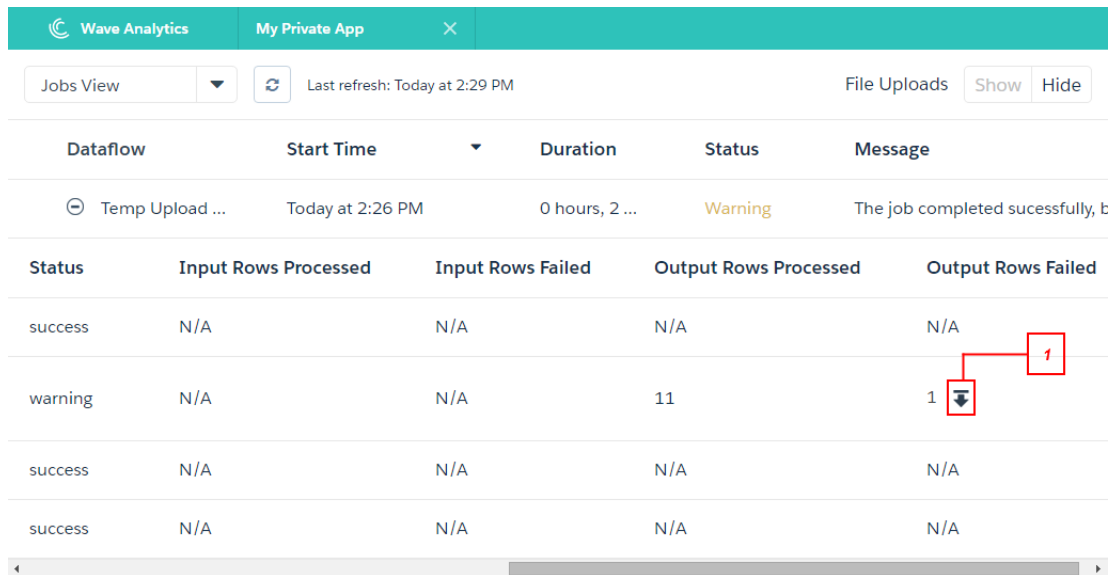

- To see the latest status of a job, click the Refresh Jobs button ().

Each job can have one of the following statuses.

Status	Description
Queued	The job is in queue to start.
Running	The job is running.
Failed	The job failed.
Successful	The job completed successfully.
Warning	The job completed successfully, but some rows failed.

- To view the run-time details for a job, expand the job node (3).
- The run-time details display under the job. In the run-time details section, scroll to the right to view information about the rows that were processed.
- To troubleshoot a job that has failed rows, view the error message. Also, click the download button (1) in the run-time details section to download the error log.

 **Note:** Only the user who uploaded the external data file can see the download button.

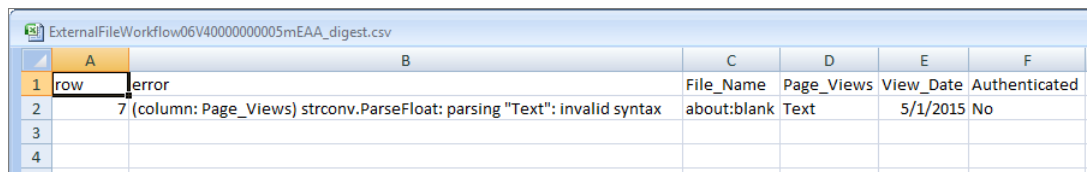

The screenshot shows the Wave Analytics interface. At the top, there's a teal header with 'Wave Analytics' and 'My Private App'. Below that, a 'Jobs View' dropdown and a refresh button are visible. A job named 'Temp Upload ...' is shown with a 'Warning' status. Below the job summary, a table displays row processing details:

Status	Input Rows Processed	Input Rows Failed	Output Rows Processed	Output Rows Failed
success	N/A	N/A	N/A	N/A
warning	N/A	N/A	11	1
success	N/A	N/A	N/A	N/A
success	N/A	N/A	N/A	N/A

A red box highlights a download button (a downward arrow) in the 'Output Rows Failed' column for the 'warning' row. A red line connects this button to another red box containing the number '1'.

The error log contains a list of failed rows.

The screenshot shows an external CSV file named 'ExternalFileWorkflow06V4000000005mEAA_digest.csv'. The file has columns A through F. The first row contains an error message:

	A	B	C	D	E	F
1	row	error	File_Name	Page_Views	View_Date	Authenticated
2		7 (column: Page_Views) strconv.ParseFloat: parsing "Text": invalid syntax	about:blank	Text	5/1/2015	No
3						
4						

5. To troubleshoot a failed job, view the error message and the run-time details.

Edit a Dataset

You can edit a dataset to change the dataset name, app, security predicate, or extended metadata (XMD) file associated with the dataset. For datasets created from an external data file, you can also upload a new external data file or metadata file to update the data or metadata.

If you add an external data file, Wave Analytics generates and adds the corresponding metadata file. To make further changes to the metadata, you can click **Preview Data** or download and edit the generated metadata file. You can also upload your own metadata file to overwrite the generated file.

1. On the home or app page, click the **Datasets** tab.
2. Hover over the dataset that you want to edit, and then click **Edit**.
3. Configure the following options if applicable.

Option	Description
Dataset Name	Enter a new name if you'd like to change the name of the dataset. The name cannot exceed 80 characters.
App	Select a new app if you'd like to move the dataset to a different app.
Add Extended Metadata File (JSON)	Specify an extended metadata file if you'd like to customize the formatting of dashboards associated with the dataset. Refer to <i>Extended Metadata (XMD) Reference</i> for information about extended metadata files.
Add External Data File (CSV)	Specify an external data file if you'd like to replace the existing data in the dataset with data from the external data file. Maximum file size is 500 MB. You can upload a .CSV, .GZ, or .ZIP file. Refer to <i>External Data Format Reference</i> for information about external data files and metadata files.
Add Metadata File (JSON)	Specify a metadata file if you'd like to redefine the structure of the external data file. If you upload a new metadata file, you must also upload the corresponding external data file. Refer to <i>External Data Format Reference</i> for information about metadata files.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To edit a dataset:

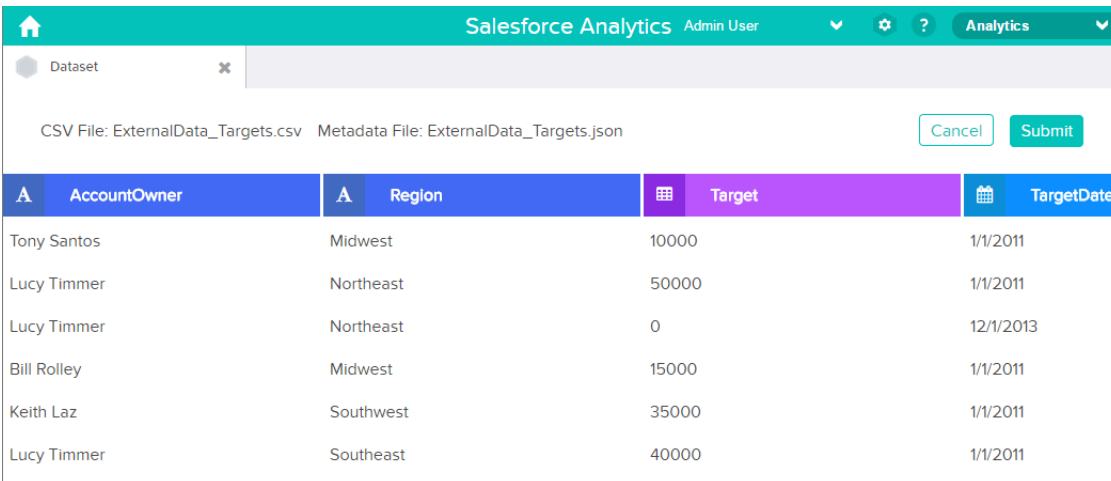

- "Edit Wave Analytics Dataflows"

Option	Description
Security Predicate	<p>Add a security predicate if you'd like to apply row-level security on the dataset.</p> <p>For information about predicates, see Row-Level Security for Datasets.</p>

- If you uploaded a new .csv file, click **Preview Data** to view and change the required metadata attributes. You can change the optional metadata later.

 **Note:** The **Preview Data** button is disabled if you uploaded your own metadata file.

After you click **Preview Data**, the preview page appears.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

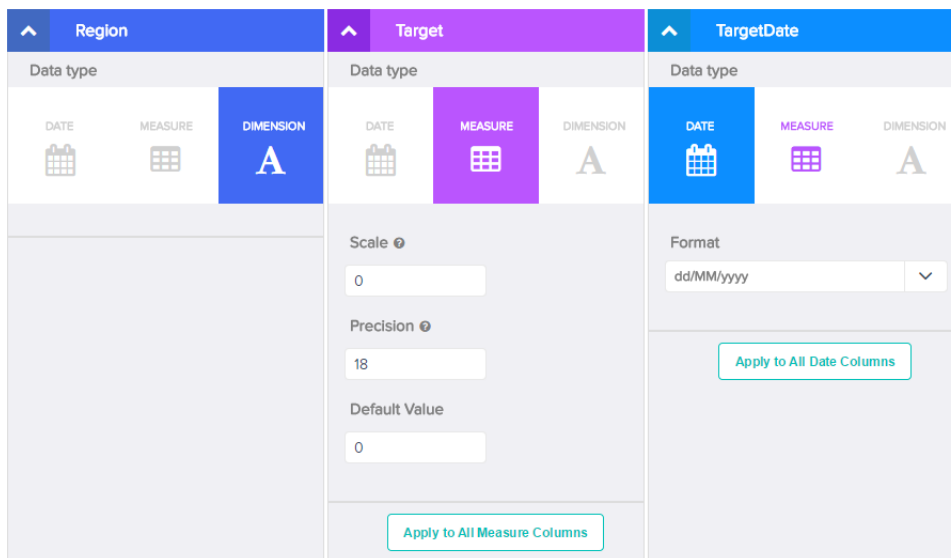

- For each column:
 - Click a column name to change it. The column name is the display name in the dataset. The column name cannot exceed 40 characters.

- Click the column header to change other required attributes for the column.

You can change the attributes for measure and date columns only.

- c. To apply the changes to all other columns of the same data type, click **Apply to All <data type> Columns**.
6. Click **Submit** to save the metadata changes in the preview page to the metadata file.
 -  **Note:** The **Submit** button is grayed out if there are errors.
7. Click **OK** to close the confirmation message.
8. To change optional metadata attributes—which are not visible in the preview page—click  to download the metadata file, edit the file, and then upload it.
9. Click **Update Dataset**.
10. Click **Continue** to dismiss the confirmation message.

Delete a Dataset

Delete unnecessary datasets from your My Private App or in shared apps on which you have at least Editor access. Removing datasets reduces clutter and helps you avoid reaching your org's limit for rows across registered datasets.

When you delete a dataset, Wave Analytics permanently deletes the dataset and doesn't delete the corresponding lenses or dashboards that reference the dataset. Lenses and dashboards that reference a deleted dataset will no longer be available. As a result, Salesforce.com recommends that you remove the associated lenses and dashboards before you delete a dataset.

If a dataflow transformation —like `edgemart` or `sfdcRegister`— references the dataset, you must remove the reference before you can delete the dataset. For example, to delete the "Opportunities" dataset, you must remove the `sfdcRegister` transformation from the dataflow snippet shown below.

```
{
  ...
  "Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "Opportunities",
      "name": "Opportunities",
      "source": "Extract_Opportunities"
    }
  },
  ...}
```

 **Warning:** You can't recover a deleted dataset.

1. On the home or app page, click the **Datasets** tab.
2. Hover over the dataset that you want to delete, and then click **Edit**.
3. Click **Delete Dataset**.
If applicable, Wave Analytics shows a list of all lenses and dashboards that reference the dataset and that you have access to view. After you delete the dataset, any lens or dashboard that reference the dataset will become unusable.
4. Click **Delete Permanently** and confirm.

Row-Level Security for Datasets

If a Wave Analytics user has access to a dataset, they have access to all records in the dataset, by default. However, you can implement row-level security on a dataset to restrict access to records. Some records might contain sensitive data that shouldn't be accessible by everyone.

To implement row-level security, define a predicate for each dataset on which you want to restrict access to records. A *predicate* is a filter condition that defines row-level access to records in a dataset.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To delete a dataset:

- "Edit Wave Analytics Dataflows"

When a user submits a query against a dataset that has a predicate, Wave Analytics checks the predicate to determine which records the user has access to. If the user doesn't have access to a record, Wave Analytics does not return that record.

The predicate is flexible and can model different types of security policies. For example, you can create predicates based on:

- Record ownership. Enables each user to view only records that they own.
- Management visibility. Enables each user to view records owned or shared by their subordinates based on a role hierarchy.
- Team or account collaboration. Enables all members of a team, like an opportunity team, to view records shared with the team.
- Combination of different security requirements. For example, you might need to define a predicate based on the Salesforce role hierarchy, teams, and record ownership.

The type of security policy you implement depends on how you want to restrict access to records in the dataset.

 **Warning:** If row-level security isn't applied to a dataset, any user that has access to the dataset can view all records in the dataset.

Considerations when Defining a Predicate for a Dataset

Applying a predicate to a dataset is more than just defining the predicate expression. You also need to consider how the predicate is dependent on the information in the dataset and where to define the predicate expression.

Row-Level Security Example based on Record Ownership

Let's look at an example where you create a dataset based on a CSV file and then implement row-level security based on record ownership. In this example, you will create a dataset that contains sales targets for account owners. To restrict access on each record in the dataset, you will create a security policy where each user can view only sales targets for accounts that they own. This process requires multiple steps that are described in the sections that follow.

Row-Level Security Example based on Opportunity Teams

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on an opportunity team. In this example, you will create a dataset that contains only opportunities associated with an opportunity team. To restrict access on each record in the dataset, you will create a security policy where only opportunity members can view their opportunity. This process requires multiple steps that are described in the sections that follow.

Row-Level Security Example based on Role Hierarchy and Record Ownership

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on the Salesforce role hierarchy and record ownership. In this example, you will create a dataset that contains all opportunities. To restrict access on each record in the dataset, you will create a security policy where each user can view only opportunities that they own or that are owned by their subordinates based on the Salesforce role hierarchy. This process requires multiple steps that are described in the sections that follow.

[sfdcRegister Parameters](#)

Considerations when Defining a Predicate for a Dataset

Applying a predicate to a dataset is more than just defining the predicate expression. You also need to consider how the predicate is dependent on the information in the dataset and where to define the predicate expression.

You can create a predicate expression based on information in the dataset. For example, to enable each user to view only dataset records that they own, you can create a predicate based on a dataset column that contains the owner for each record. If needed, you can load additional data into a dataset required by the predicate.

The location where you define the predicate varies.

- To apply a predicate on a dataset created from a dataflow, add the predicate in the **rowLevelSecurityFilter** field of the Register transformation. The next time the dataflow runs, Wave Analytics will apply the predicate.
- To apply a predicate on a dataset created from an external data file, define the predicate in the **rowLevelSecurityFilter** field in the metadata file associated with the external data file. Wave Analytics applies the predicate when you upload the metadata file and external data file. If you already created the dataset from a external data file, you can edit the dataset to apply or change the predicate.

Row-Level Security Example based on Record Ownership

Let's look at an example where you create a dataset based on a CSV file and then implement row-level security based on record ownership. In this example, you will create a dataset that contains sales targets for account owners. To restrict access on each record in the dataset, you will create a security policy where each user can view only sales targets for accounts that they own. This process requires multiple steps that are described in the sections that follow.

 **Note:** Although this example is about applying a predicate to a dataset created from a CSV file, this procedure can also be applied to a dataset that is created from Salesforce data.

1. Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

2. Determine Row-Level Security for Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

3. Add the Predicate to the Metadata File

For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

4. Create the Dataset

Now that you updated the metadata file with the predicate, you can create the dataset.

5. Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see their own sales targets.

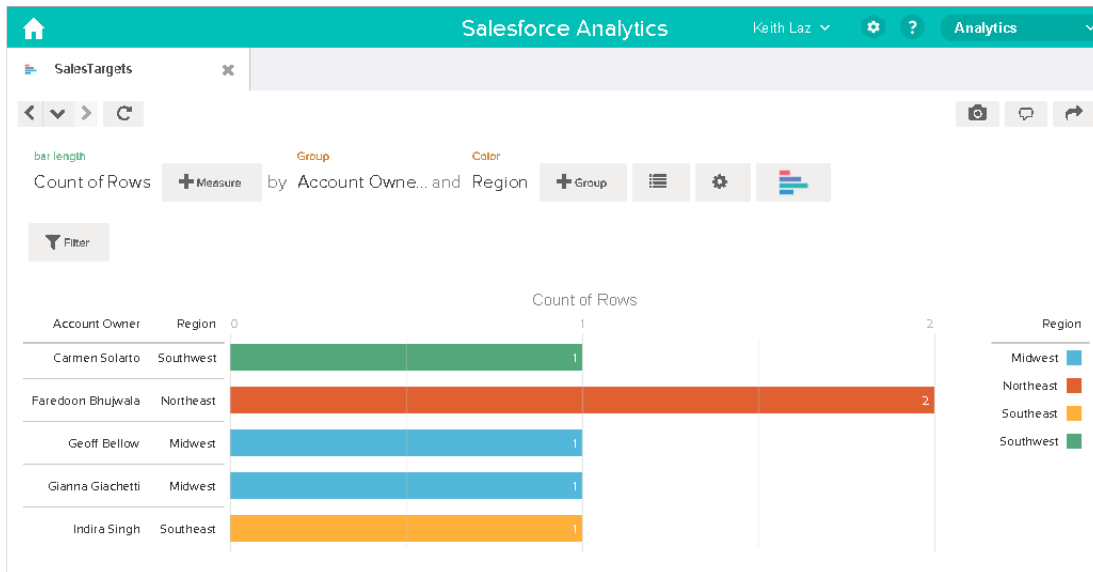

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create a Targets dataset that contains all sales targets.

You will obtain sales targets from the CSV file shown below.

AccountOwner	Region	Target	TargetDate
Tony Santos	Midwest	10000	1/1/2011
Lucy Timmer	Northeast	50000	1/1/2011
Lucy Timmer	Northeast	0	12/1/2013
Bill Rolley	Midwest	15000	1/1/2011
Keith Laz	Southwest	35000	1/1/2011
Lucy Timmer	Southeast	40000	1/1/2011

If you were to create the dataset without implementing row-level security, any user that had access to the dataset would be able to see the sales targets for all account owners. For example, as shown below, Keith would be able to view the sales targets for all account owners.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'AccountOwner' == "$User.Name"
```

Note: All predicate examples in this document escape the double quotes because it's required when you enter the predicate in the Register transformation or metadata file. This predicate implements row-level security based on record ownership. Based on the predicate, Wave Analytics returns a sales target record when the user who submits the query on the dataset is the account owner.

Let's take a deeper look into the predicate expression:

- AccountOwner refers to the dataset column that stores the full name of the account owner for each sales target.
- \$User.Name refers to the Name column of the User object that stores the full name of each user. Wave Analytics performs a lookup to get the full name of the user who submits each query.

Note: The lookup returns a match when the names in AccountOwner and \$User.Name match exactly—they must have the same case.

Add the Predicate to the Metadata File

For a dataset created from a CSV file, you can specify the predicate in the metadata file associated with the CSV file or when you edit the dataset.

You must escape the double quotes around string values when entering a predicate in the metadata file.

In this example, you add the predicate to the metadata file shown below.

```
{
  "fileFormat": {
    "charsetName": "UTF-8",
    "fieldsDelimitedBy": ",",
    "fieldsEnclosedBy": "\"\"",
    "numberOfLinesToIgnore": 1 },
  "objects": [
    {
      "name": "Targets",
      "fullyQualifiedName": "Targets",
      "label": "Targets",
      "rowLevelSecurityFilter": "'AccountOwner' == \"\$User.Name\"",
      "fields": [
        {
          "name": "AccountOwner",
          "fullyQualifiedName": "Targets.AccountOwner",
          "label": "Account Owner",
          "type": "Text"
        },
        {
          "name": "Region",
          "fullyQualifiedName": "Targets.Region",
          "label": "Region",
          "type": "Text"
        },
        {
          "name": "Target",
          "fullyQualifiedName": "Targets.Target",
          "label": "Target",
          "type": "Numeric",
          "precision": 16,
          "scale": 0,
          "defaultValue": "0",
          "format": null
        },
        {
          "name": "TargetDate",
          "fullyQualifiedName": "Targets.TargetDate",
          "label": "TargetDate",
          "description": "",
          "type": "Date",
          "format": "dd/MM/yy HH:mm:ss",
          "isSystemField": false,
          "fiscalMonthOffset": 0
        }
      ]
    }
  ]
}
```

Create the Dataset

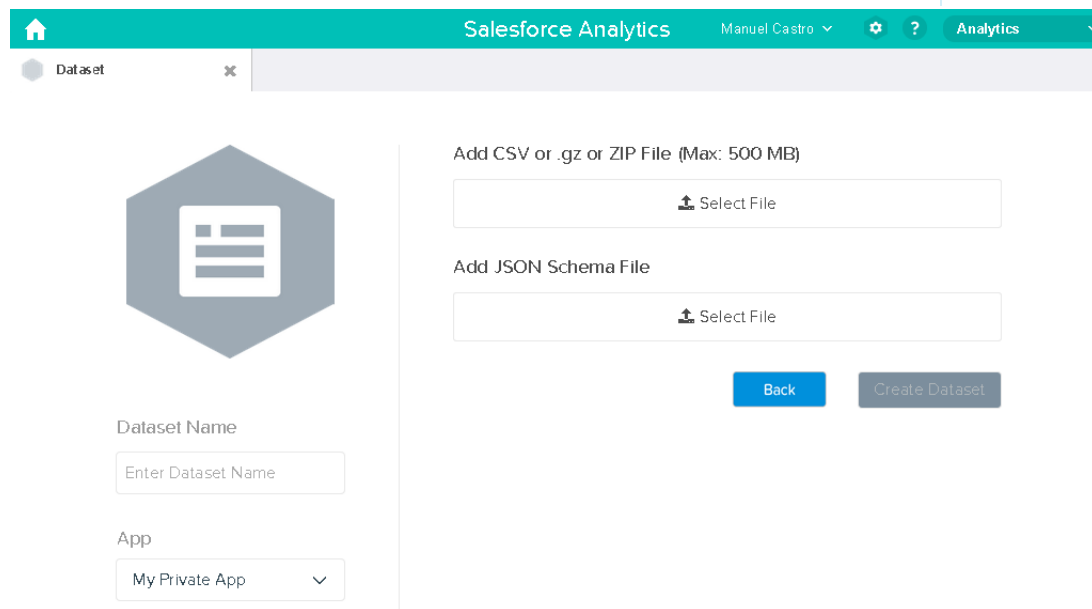

Now that you updated the metadata file with the predicate, you can create the dataset.

 **Warning:** If you wish to perform the steps in this sample implementation, perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created.

To create the dataset, perform the following steps.

1. In Wave Analytics, go to the home page.
2. Click **Create > Dataset**
3. Click **CSV**.

The following screen appears.

4. Select the CSV file and metadata (schema) file.
5. In the **Dataset Name** field, enter “SalesTarget” as the name of the dataset.
6. Optionally, choose a different app where you want to store the dataset.
7. Click **Create Dataset**.

Wave Analytics confirms that the upload is successful and then creates a job to create the dataset. You can view the SalesTarget dataset after the job completes successfully.

8. To verify that the job completes successfully, perform the following steps:

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To upload a CSV and metadata file:

- “Upload External Data to Wave Analytics”

- a. Click the gear icon () and then select **Data Monitor** to open the data monitor.
By default, the Jobs View of the data monitor appears. It shows the statuses of dataflow and external data upload jobs.
- b. Click the Refresh Jobs button () to view the latest statuses of the jobs.

Test Row-Level Security for the Dataset

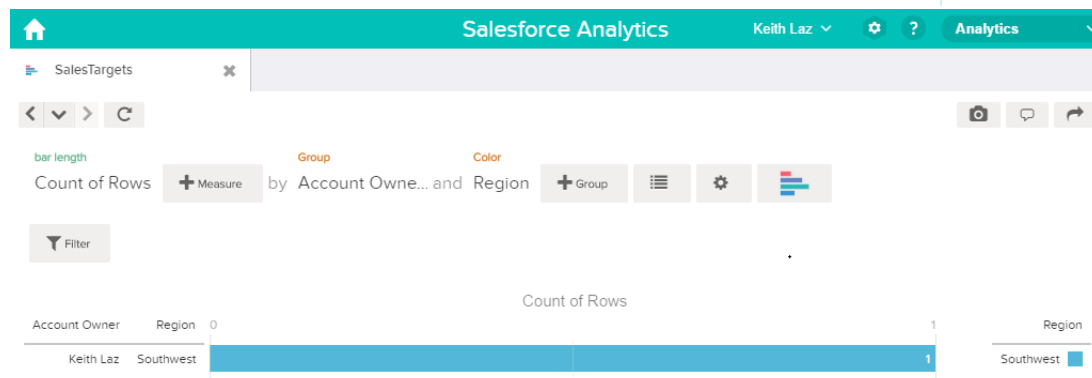

You must verify that the predicate is applied properly and that each user can see their own sales targets.

1. Log in to Wave Analytics as Keith.
2. Open the SalesTargets dataset.
As shown in the following lens, notice that Keith can see only his sales target.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

Row-Level Security Example based on Opportunity Teams

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on an opportunity team. In this example, you will create a dataset that contains only opportunities associated with an opportunity team. To restrict access on each record in the dataset, you will create a security policy where only opportunity members can view their opportunity. This process requires multiple steps that are described in the sections that follow.

1. [Determine Which Data to Include in the Dataset](#)
First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.
2. [Design the Dataflow to Load the Data](#)
Now it's time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.

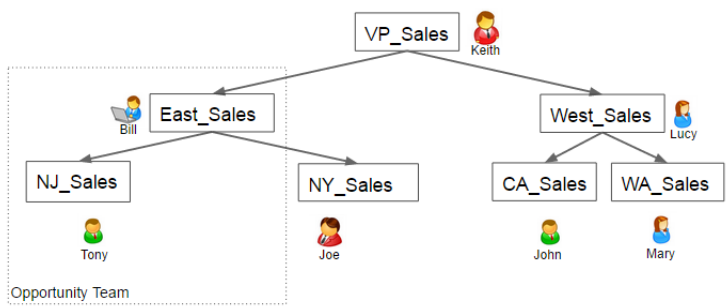

3. [Determine Row-Level Security for the Dataset](#)
Now it's time to think about row-level security. How will you restrict access to each record in this dataset?
4. [Modify the Dataflow Based on Row-Level Security](#)
It's now time to add the predicate in the dataflow definition file.
5. [Create the Dataset](#)
Now that you have the final dataflow definition file, you can create the dataset.
6. [Test Row-Level Security for the Dataset](#)
You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create an OppTeamMember dataset that contains only opportunities associated with an opportunity team.

You will obtain opportunities from the Opportunity object and the opportunity teams from the OpportunityTeamMember object. Both are Salesforce objects.

In this example, your Salesforce organization has the following opportunity team and users.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

Your organization also contains the following opportunities, most of which are owned by Keith.

Action	Opportunity Name	Account Name	Amount	Close Date	Stage	Opportunity Owner Alias
<input type="checkbox"/> Edit Del +	Acc - 1000 Widgets	Acc salesrep		9/4/2014	Prospecting	Tony
<input type="checkbox"/> Edit Del +	Acme - 1,200 Widgets	Acme	\$140,000.00	6/14/2012	Value Proposition	Keith
<input type="checkbox"/> Edit Del +	Acme - 200 Widgets	Acme	\$20,000.00	10/13/2012	Prospecting	Keith
<input type="checkbox"/> Edit Del +	Acme - 600 Widgets	Acme	\$70,000.00	8/10/2012	Needs Analysis	Keith
<input type="checkbox"/> Edit Del +	ESales_01	East Sales_acc_01		9/4/2014	Prospecting	Bill
<input type="checkbox"/> Edit Del +	Global Media - 400...	Global Media	\$40,000.00	7/13/2012	Id. Decision Makers	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 1...	salesforce.com	\$100,000.00	6/14/2012	Negotiation/Review	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 2...	salesforce.com	\$20,000.00	8/12/2012	Value Proposition	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 50...	Global Media	\$50,000.00	5/12/2012	Closed Won	Keith
<input type="checkbox"/> Edit Del +	salesforce.com - 50...	Global Media	\$500,000.00	5/12/2012	Closed Won	Keith
<input type="checkbox"/> Edit Del +	West_Sales_01	West_Sales_Acc_01		9/4/2014	Prospecting	Lucy

Acc - 1000 Widgets is the only opportunity shared by an opportunity team. Bill is the Sales Manager for this opportunity. Tony is the opportunity owner.

Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the Salesforce data and load it into a dataset. You start by creating this high-level design for the dataflow.

The dataflow will extract data from the Opportunity and OpportunityTeamMember objects, join the data, and then load it into the OppTeamMember dataset.

Now let's implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```
{
  "Extract_OpportunityTeamMember": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OpportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OpportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
      "left": "Extract_OpportunityTeamMember",
      "left_key": [
        "OpportunityId"
      ],
      "relationship": "TeamMember",
    }
  }
}
```

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

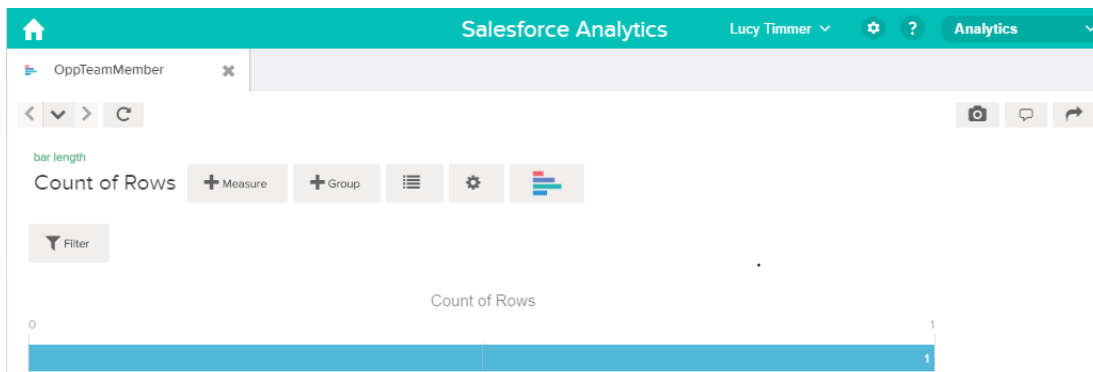

```

    "right": "Extract_Opportunity",
    "right_key": [
      "Id"
    ],
    "right_select": [
      "Name", "Amount"
    ]
  }
},
"Register_Dataset": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppTeamMember",
    "name": "OppTeamMember",
    "source": "Augment_OpportunityTeamMember_Opportunity",
    "rowLevelSecurityFilter": ""
  }
}
}

```

If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to see the opportunity shared by the opportunity team.

For example, as shown below, Lucy would be able to view the opportunity that belongs to an opportunity team of which she is not a member.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for the Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

```
'UserId' == "$User.Id"
```

This predicate compares the UserId column in the dataset against the ID of the user running a query against the dataset. The UserId column in the dataset contains the user ID of the team member associated with each opportunity. To determine the ID of the user running the query, Wave Analytics looks up the ID of the user making the query in the User object.

For each match, Wave Analytics returns the record to the user.

Modify the Dataflow Based on Row-Level Security

It's now time to add the predicate in the dataflow definition file.

You add the predicate to the Register transformation that registers the OppTeamMember dataset as shown below.

```
{
  "Extract_OppportunityTeamMember": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "OppportunityTeamMember",
      "fields": [
        { "name": "Name" },
        { "name": "OppportunityId" },
        { "name": "UserId" }
      ]
    }
  },
  "Extract_Oppportunity": {
    "action": "sfdcDigest",
    "parameters": {
```

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

```

    "object": "Opportunity",
    "fields": [
      { "name": "Id" },
      { "name": "Name" },
      { "name": "Amount" },
      { "name": "StageName" },
      { "name": "AccountId" },
      { "name": "OwnerId" }
    ]
  },
  "Augment_OpportunityTeamMember_Opportunity": {
    "action": "augment",
    "parameters": {
      "left": "Extract_OpportunityTeamMember",
      "left_key": [
        "OpportunityId"
      ],
      "relationship": "TeamMember",
      "right": "Extract_Opportunity",
      "right_key": [
        "Id"
      ],
      "right_select": [
        "Name", "Amount"
      ]
    }
  },
  "Register_Dataset": {
    "action": "sfdcRegister",
    "parameters": {
      "alias": "OppTeamMember",
      "name": "OppTeamMember",
      "source": "105_Augment_OpportunityTeamMember_Opportunity",
      "rowLevelSecurityFilter": "'UserId' == \"\$User.Id\""
    }
  }
}

```

Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

-  **Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon () and then select **Data Monitor** to open the data monitor.
The Jobs view of the data monitor appears by default.
2. Select **Dataflow View**.
3. Click the actions list (1) for the dataflow and then select **Download** to download the existing dataflow definition file.

EDITIONS

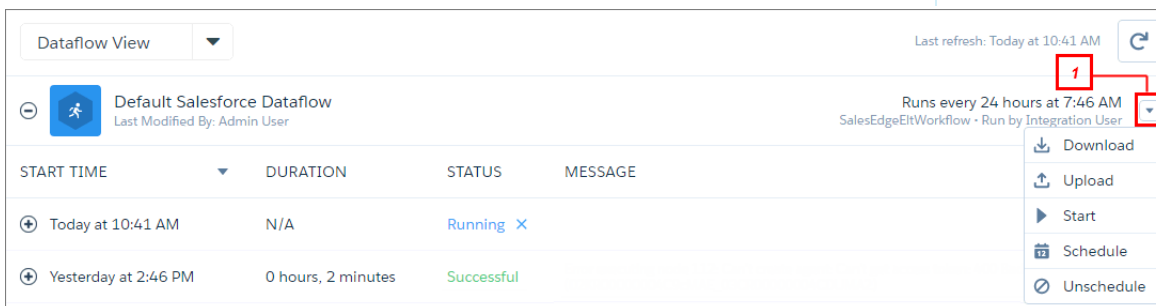

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To download, upload, run, and monitor a dataflow:

- “Edit Wave Analytics Dataflows”

The screenshot shows the 'Dataflow View' interface. At the top, there is a 'Dataflow View' dropdown and a 'Last refresh: Today at 10:41 AM' indicator with a refresh icon. Below this, the dataflow details are shown: 'Default Salesforce Dataflow' (Last Modified By: Admin User) and 'Runs every 24 hours at 7:46 AM' (SalesEdgeEitWorkflow - Run by Integration User). A table lists the jobs:

START TIME	DURATION	STATUS	MESSAGE
Today at 10:41 AM	N/A	Running	X
Yesterday at 2:46 PM	0 hours, 2 minutes	Successful	

On the right side, there is an actions list with buttons: Download, Upload, Start, Schedule, and Unschedule. The 'Download' button is highlighted with a red box and a '1' label. The 'Refresh Jobs' button is also visible in the top right corner.

4. Open the dataflow definition file in a JSON or text editor.
5. Add the JSON determined in the [previous step](#).
6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid.
An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save and close the dataflow definition file.
8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Upload**.
9. Select the updated dataflow definition file and click **Upload**.
10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Run** to run the dataflow job.
11. Click the **Refresh Jobs** button () to view the latest status of the dataflow job.
You can view the OppTeamMember dataset after the dataflow job completes successfully.

-  **Note:** If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.

Test Row-Level Security for the Dataset

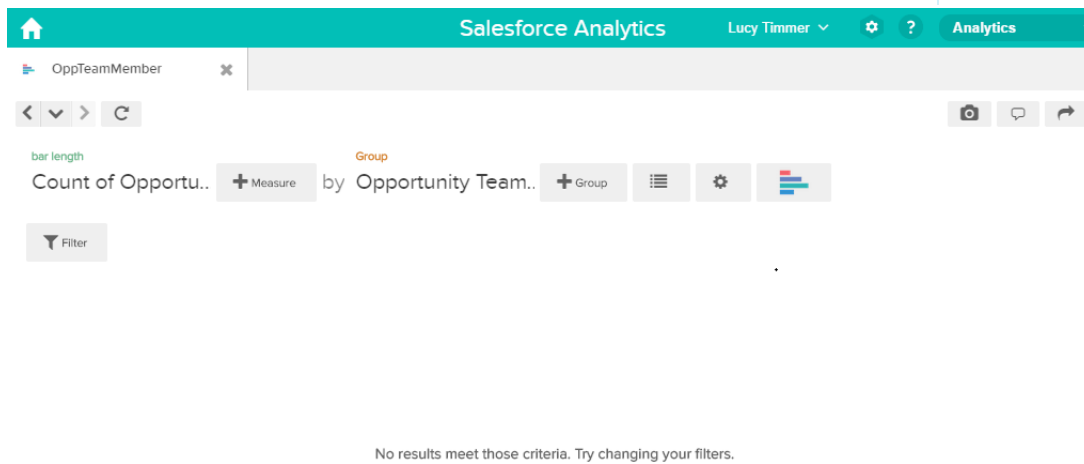

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

1. Log in to Wave Analytics as Lucy.
2. Open the OppTeamMember opportunity.
Notice that Lucy can't view the opportunity associated with the opportunity team anymore because she is not a member of the team.

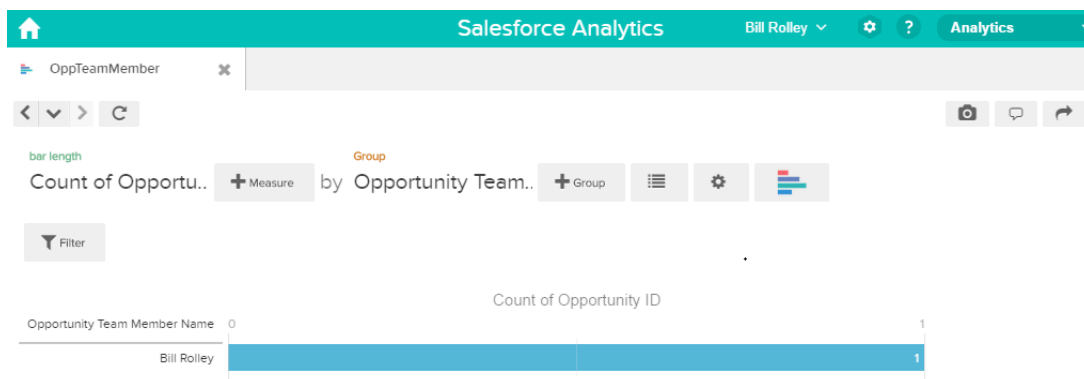

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

3. Log out and now log in as Bill.
Bill can view the opportunity that is shared by the opportunity team of which he is a member.

Row-Level Security Example based on Role Hierarchy and Record Ownership

Let's look at an example where you create a dataset based on Salesforce data and then implement row-level security based on the Salesforce role hierarchy and record ownership. In this example, you will create a dataset that contains all opportunities. To restrict access on each record in the dataset, you will create a security policy where each user can view only opportunities that they own or that are owned by their subordinates based on the Salesforce role hierarchy. This process requires multiple steps that are described in the sections that follow.

1. [Determine Which Data to Include in the Dataset](#)

First, determine what data you want to include in the dataset. For this example, you will create the OppRoles dataset that contains all opportunities as well as user details about each opportunity owner, such as their full name, division, and title.

2. [Design the Dataflow to Load the Data](#)

Now it's time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

3. [Determine Row-Level Security for the Dataset](#)

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

4. [Modify the Dataflow Based on Row-Level Security](#)

Now it's time to modify the dataflow definition file to account for the predicate.

5. [Create the Dataset](#)

Now that you have the final dataflow definition file, you can create the dataset.

6. [Test Row-Level Security for the Dataset](#)

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

SEE ALSO:

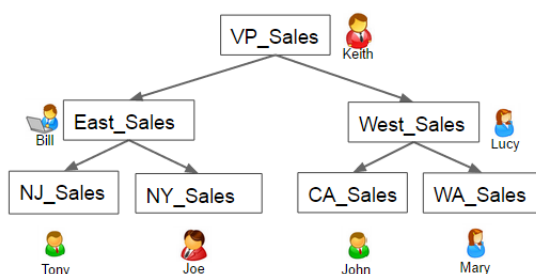

[flatten Parameters](#)

Determine Which Data to Include in the Dataset

First, determine what data you want to include in the dataset. For this example, you will create the OppRoles dataset that contains all opportunities as well as user details about each opportunity owner, such as their full name, division, and title.

You will obtain opportunities from the Opportunity object and user details from the User object. Both are objects in Salesforce.

In this example, your Salesforce organization has the following role hierarchy and users.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

Also, your organization contains the following opportunities, most of which are owned by Keith.

All Opportunities Edit | Delete | Create New View List Feed

Action	Opportunity Name ↑	Account Name	Amount	Close Date	Stage	Opportunity Owner Alias
Edit Del +	Acc - 1000 Widgets	Acc_salesrep		9/4/2014	Prospecting	Tony
Edit Del +	Acme - 1,200 Widgets	Acme	\$140,000.00	6/14/2012	Value Proposition	Keith
Edit Del +	Acme - 200 Widgets	Acme	\$20,000.00	10/13/2012	Prospecting	Keith
Edit Del +	Acme - 600 Widgets	Acme	\$70,000.00	8/10/2012	Needs Analysis	Keith

Edit Del +	West_Sales_01	West_Sales_Acc_01		9/4/2014	Prospecting	Lucy

Design the Dataflow to Load the Data

Now it's time to figure out how the dataflow will extract the data and load it into a dataset. You start by creating this high-level design for the dataflow.

The dataflow will extract data from the Opportunity and User objects, join the data, and then load it into the OppRoles dataset.

Now let's implement that design in JSON, which is the format of the dataflow definition file. A dataflow definition file contains transformations that extract, transform, and load data into a dataset.

Based on the design, you create the JSON shown below.

```

{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  }
},

```

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

```

"Extract_User": {
  "action": "sfdcDigest",
  "parameters": {
    "object": "User",
    "fields": [
      { "name": "Id" },
      { "name": "Username" },
      { "name": "LastName" },
      { "name": "FirstName" },
      { "name": "Name" },
      { "name": "CompanyName" },
      { "name": "Division" },
      { "name": "Department" },
      { "name": "Title" },
      { "name": "Alias" },
      { "name": "CommunityNickname" },
      { "name": "UserType" },
      { "name": "UserRoleId" }
    ]
  }
},
"Augment_Opportunity_User": {
  "action": "augment",
  "parameters": {
    "left": "Extract_Opportunity",
    "left_key": [
      "OwnerId"
    ],
    "right": "Extract_User",
    "relationship": "Owner",
    "right_select": [
      "Name"
    ],
    "right_key": [
      "Id"
    ]
  }
},
"Register": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppRoles",
    "name": "OppRoles",
    "source": "Augment_Opportunity_User",
    "rowLevelSecurityFilter": ""
  }
}
}

```

If you were to run this dataflow, Wave Analytics would generate a dataset with no row-level security. As a result, any user that has access to the dataset would be able to view all opportunities. For example, as shown below, Bill would be able to view all opportunities, including those owned by his manager Keith.

You need to apply row-level security to restrict access to records in this dataset.

Determine Row-Level Security for the Dataset

Now it's time to think about row-level security. How will you restrict access to each record in this dataset?

You decide to implement the following predicate on the dataset.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

```
'ParentRoleIDs' == "$User.UserRoleId" || 'OwnerId' == "$User.Id"
```

Note: The current dataflow doesn't contain logic to create a dataset column named "ParentRoleIDs." ParentRoleIDs is a placeholder for the name of a column that will contain this information. In the [next step](#), you will modify the dataflow to add this column to the dataset. This column name will change based on how you configure the dataflow.

Based on the predicate, Wave Analytics returns an opportunity record if:

- The user who submits the query is a parent of the opportunity owner based on the Salesforce role hierarchy. Wave Analytics determines this based on their role IDs and the role hierarchy.
- Or, the user who submits the query on the dataset is the opportunity owner.

Let's examine both parts of this predicate.

Predicate Part	Description
'ParentRoleIDs' == "\$User.UserRoleId"	<ul style="list-style-type: none"> ParentRoleIDs refers to a dataset column that contains a comma-separated list of role IDs of all users above the opportunity owner based on the role hierarchy. You will create this dataset column in the next section. \$User.UserRoleId refers to the UserRoleId column of the User object. Wave Analytics looks up the user role ID of the user who submits the query from the User object.
'OwnerId' == "\$User.Id"	<ul style="list-style-type: none"> OwnerId refers to the dataset column that contains the user ID of the owner of each opportunity. \$User.Id refers to the Id column of the User object. Wave Analytics looks up the user ID of the user who submits the query from the User object.

Modify the Dataflow Based on Row-Level Security

Now it's time to modify the dataflow definition file to account for the predicate.

In this scenario, you have to make changes to the dataflow based on the predicate.

- Add a column in the dataset that stores a comma-separated list of the role IDs of all parents for each opportunity owner. When you defined the predicate in the previous step, you temporarily referred to this column as "ParentRoleIDs." To add the column, you redesign the dataflow as shown in the following diagram:

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

The new dataflow design contains the following changes:

- Extracts the role IDs from the UserRole object.
- Uses the Flatten transformation to generate a column that stores a comma-separated list of the role IDs of all parents of each user. When you determined the predicate in the previous step, you temporarily referred to this column as "ParentRoleIDs."
- Link the new column to the OppRoles dataset.

- Add the predicate to the Register transformation that registers the OppRoles dataset.

You modify the dataflow as shown below.

```
{
  "Extract_Opportunity": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "Opportunity",
      "fields": [
        { "name": "Id" },
        { "name": "Name" },
        { "name": "Amount" },
        { "name": "StageName" },
        { "name": "AccountId" },
        { "name": "OwnerId" }
      ]
    }
  },
  "Extract_User": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "User",
      "fields": [
        { "name": "Id" },
        { "name": "Username" },
        { "name": "LastName" },
        { "name": "FirstName" },
        { "name": "Name" },
        { "name": "CompanyName" },
        { "name": "Division" },
        { "name": "Department" },
        { "name": "Title" },
        { "name": "Alias" },
        { "name": "CommunityNickname" },
        { "name": "UserType" },
        { "name": "UserRoleId" }
      ]
    }
  },
  "Extract_UserRole": {
    "action": "sfdcDigest",
    "parameters": {
      "object": "UserRole",
      "fields": [
        { "name": "Id" },
        { "name": "ParentRoleId" },
        { "name": "RollupDescription" },
        { "name": "OpportunityAccessForAccountOwner" },
        { "name": "CaseAccessForAccountOwner" },
        { "name": "ContactAccessForAccountOwner" },
        { "name": "ForecastUserId" },
        { "name": "MayForecastManagerShare" },
        { "name": "LastModifiedDate" },
        { "name": "LastModifiedById" },
      ]
    }
  }
}
```

```

        { "name": "SystemModstamp" },
        { "name": "DeveloperName" },
        { "name": "PortalAccountId" },
        { "name": "PortalType" },
        { "name": "PortalAccountOwnerId" }
    ]
}
},
"Flatten_UserRole": {
    "action": "flatten",
    "parameters": {
        "multi_field": "Roles",
        "parent_field": "ParentRoleId",
        "path_field": "RolePath",
        "self_field": "Id",
        "source": "Extract_UserRole"
    }
},
"Augment_User_FlattenUserRole": {
    "action": "augment",
    "parameters": {
        "left": "Extract_User",
        "left_key": [
            "UserRoleId"
        ],
        "relationship": "Role",
        "right": "Flatten_UserRole",
        "right_key": [
            "Id"
        ],
        "right_select": [
            "Roles",
            "RolePath"
        ]
    }
},
"Augment_Opportunity_UserWithRoles": {
    "action": "augment",
    "parameters": {
        "left": "Extract_Opportunity",
        "left_key": [
            "OwnerId"
        ],
        "right": "Augment_User_FlattenUserRole",
        "relationship": "Owner",
        "right_select": [
            "Name",
            "Role.Roles",
            "Role.RolePath"
        ],
        "right_key": [
            "Id"
        ]
    }
}

```

```

},
"Register": {
  "action": "sfdcRegister",
  "parameters": {
    "alias": "OppRoles",
    "name": "OppRoles",
    "source": "Augment_Opportunity_UserWithRoles",
    "rowLevelSecurityFilter": "'Owner.Role.Roles' == \"\$User.UserRoleId\" || 'OwnerId'
== \"\$User.Id\""
  }
}
}
}

```

 **Note:** In this example, the dataset has columns Owner.Role.Roles and OwnerId. A user can view the values of these columns for each record to which they have access.

Create the Dataset

Now that you have the final dataflow definition file, you can create the dataset.

 **Warning:** If you wish to perform the steps in this sample implementation, verify that you have all required Salesforce objects and fields, and perform the steps in a non-production environment. Ensure that these changes do not impact other datasets that you already created. Also, always make a backup of the existing dataflow definition file before you make changes because you cannot retrieve old versions of the file.

To create the dataset, perform the following steps.

1. In Wave Analytics, click the gear icon () and then select **Data Monitor** to open the data monitor. The Jobs View of the data monitor appears by default.
2. Select **Dataflow View**.
3. Click the actions list (1) for the dataflow and then select **Download** to download the existing dataflow definition file.

EDITIONS

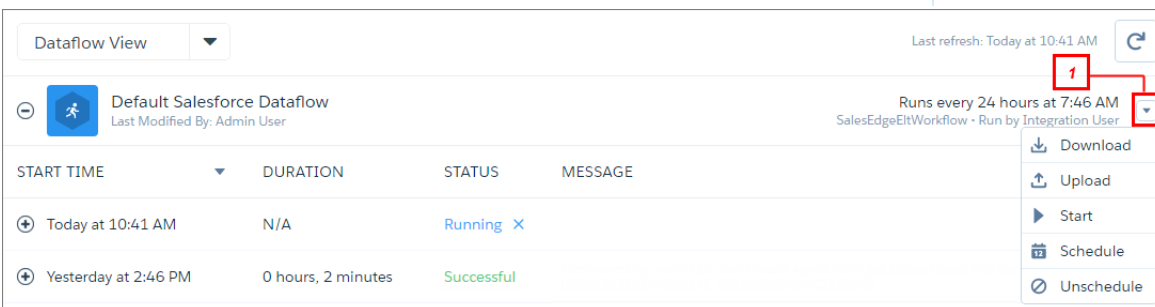

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To download, upload, run, and monitor a dataflow:

- “Edit Wave Analytics Dataflows”

4. Open the dataflow definition file in a JSON or text editor.
5. Add the JSON determined in the [previous step](#).

6. Before you save the dataflow definition file, use a JSON validation tool to verify that the JSON is valid.
An error occurs if you try to upload the dataflow definition file with invalid JSON. You can find JSON validation tool on the internet.
7. Save and close the dataflow definition file.
8. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Upload**.
9. Select the updated dataflow definition file and click **Upload**.
10. In the Dataflow View of the data monitor, click the actions list for the dataflow and then select **Run** to run the dataflow job.
11. Click the **Refresh Jobs** button () to view the latest status of the dataflow job.
You can view the OppRoles dataset after the dataflow job completes successfully.

 **Note:** If you are adding a predicate to a dataset that was previously created, each user must log out and log back in for the predicate to take effect.

Test Row-Level Security for the Dataset

You must verify that the predicate is applied properly and that each user can see the appropriate opportunities.

1. Log in to Wave Analytics as Bill.
2. Open the OppRoles opportunity.
Notice that Bill can't see his manager Keith's opportunities anymore. Now, he can see only his opportunity and his subordinate Tony's opportunity.

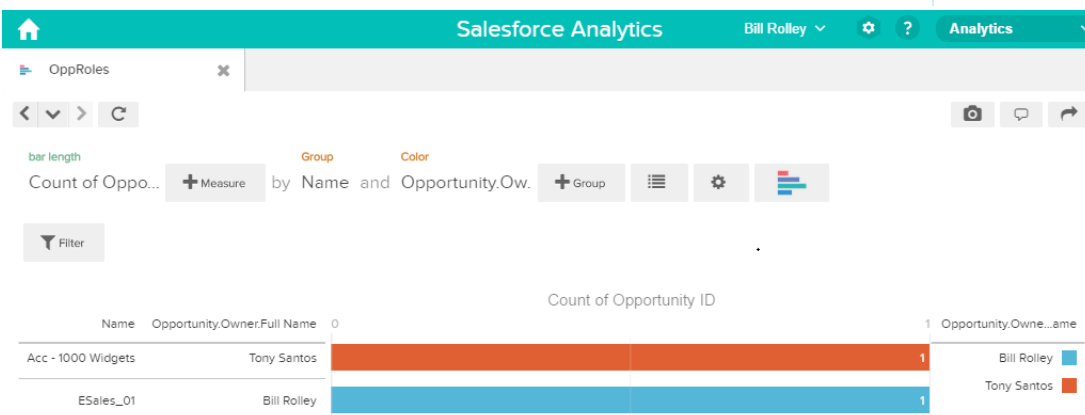

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

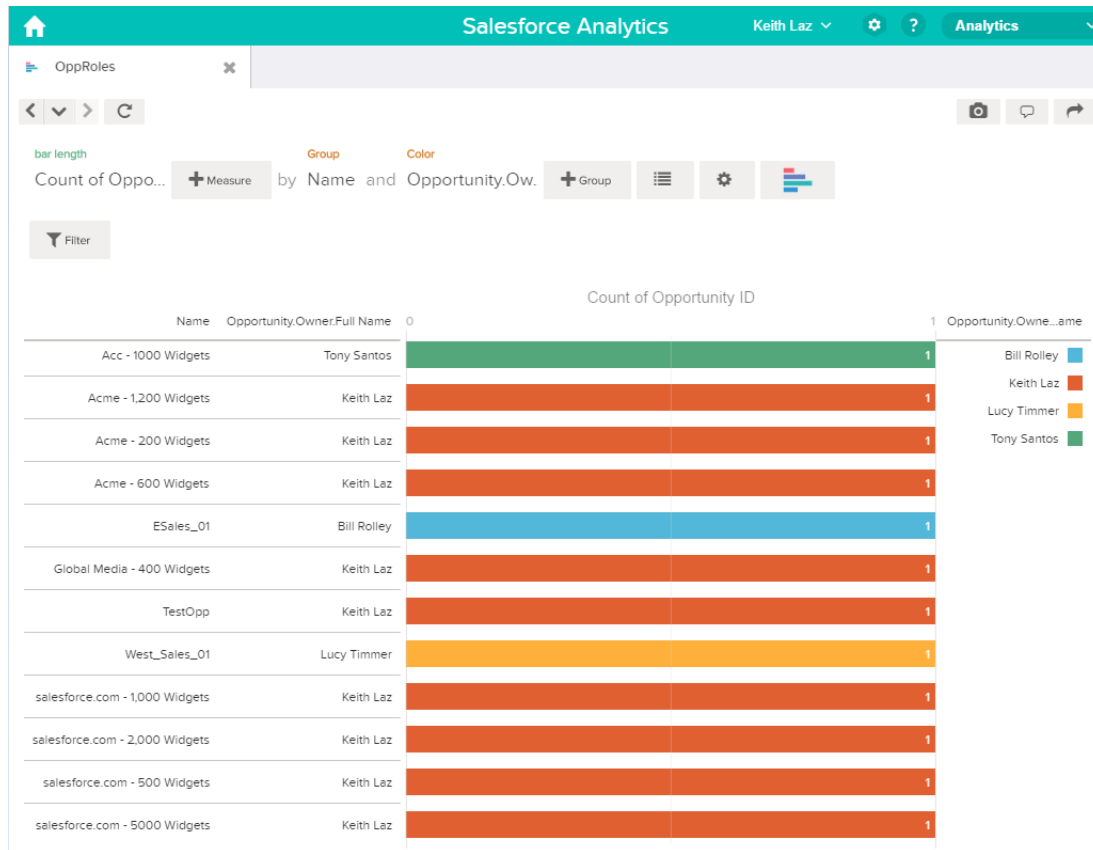

USER PERMISSIONS

-  ""
-  ""

3. Log out and now log in as Keith.

As expected, Keith can still see all opportunities.

Predicate Expression Syntax for Datasets

You must use valid syntax when defining the predicate expression.

The predicate expression must have the following syntax:

```
<dataset column> <operator> <value>
```

For example, you can define the following predicate expression for a dataset:

```
'UserId' == "$User.Id"
```

You can create more complex predicate expressions such as:

```
('Expected_Revenue' > 4000 || 'Stage Name' == "Closed Won") && 'isDeleted' != "False"
```

Consider the following requirements for the predicate expression:

- The expression is case-sensitive.
- The expression cannot exceed 1,000 characters.
- There must be at least one space between the dataset column and the operator, between the operator and the value, and before and after logical operators. This expression is not valid: 'Revenue' >100. It must have spaces like this: 'Revenue' > 100.

If you try to apply a predicate to a dataset and the predicate is not valid, an error appears when any user tries to query the dataset.

Dataset Columns in a Predicate Expression

You include at least one dataset column as part of the predicate expression.

Values in a Predicate Expression

The value in the predicate expression can be a string literal or number literal. It can also be a field value from the User object in Salesforce.

Escape Sequences

You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

Character Set Support

Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (🔍). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

Special Characters

Certain characters have a special meaning in Wave Analytics.

Operators

You can use comparison operators and logical operators in predicate expressions.

Sample Predicate Expressions for Datasets

Review the samples to see how to structure a predicate expression.

Dataset Columns in a Predicate Expression

You include at least one dataset column as part of the predicate expression.

Consider the following requirements for dataset columns in a predicate expression:

- Column names are case-sensitive.
- Column names must be enclosed in single quotes ('). For example, 'Region' == "South"
-  **Note:** A set of characters in double quotes is treated as a string rather than a column name.
- Single quotes in column names must be escaped. For example, 'Team\'s Name' == "West Region Accounts"

Values in a Predicate Expression

The value in the predicate expression can be a string literal or number literal. It can also be a field value from the User object in Salesforce.

Consider the following requirements for each value type.

Value Type	Requirements	Predicate Expression Examples
string literal	Enclose in double quotes and escape the double quotes.	<ul style="list-style-type: none"> • 'Owner' == "Amber" • 'Stage Name' == "Closed Won"
number literal	Can be a float or long datatype. Do not enclose in quotes.	<ul style="list-style-type: none"> • 'Expected_Revenue' >= 2000.00 • 'NetLoss' < -10000

Value Type	Requirements	Predicate Expression Examples
field value	<p>When referencing a field from the User object, use the \$User.[field] syntax. Use the API name for the field.</p> <p>You can specify standard or custom fields.</p> <p>When you define a predicate for a dataset, you must have read access on all User object fields used to create the predicate expression.</p> <p>However, when a user queries a dataset that has a predicate based on the User object, Wave Analytics uses the access permissions of the Insights Security User to evaluate the predicate expression based on the User object.</p> <p> Note: By default, the Security User does not have access permission on custom fields of the User object.</p> <p>To grant the Security User read access on a field, set field-level security on the field in the user profile of the Security User.</p>	<ul style="list-style-type: none"> • 'Owner.Role' == "\$User.UserRoleId" • 'GroupID' == "\$User.UserGroupId__c"

Escape Sequences

You can use the backslash character (\) to escape characters in column names and string values in a predicate expression.

You can use the \' escape sequence to escape a single quote in a column name. For example:

```
'Team\'s Name' == "West Region Accounts"
```

You can use the following escape sequences for special characters in string values.

Sequence	Meaning
\b	One backspace character
\n	New line
\r	Carriage return
\t	Tab
\Z	CTRL+Z (ASCII 26)
\"	One double-quote character
\\	One backslash character
\0	One ASCII null character

Character Set Support

Wave Analytics supports UTF-8 characters in dataset column names and values in a predicate expression. Wave Analytics replaces non-UTF-8 characters with the UTF-8 symbol (). If Wave Analytics has to replace a non-UTF-8 character in a predicate expression, users may experience unexpected query results.

Special Characters

Certain characters have a special meaning in Wave Analytics.

Character	Name	Description
'	Single quote	Encloses a dataset column name in a predicate expression. Example predicate expression: <code>'Expected_Revenue' >= 2000.00</code>
"	Double quote	Encloses a string value or field value in a predicate expression. Example predicate expression: <code>'OpportunityOwner' == "Michael Vesti"</code>
()	Parentheses	Enforces the order in which to evaluate a predicate expression. Example predicate expression: <code>('Expected_Revenue' > 4000 'Stage Name' == "Closed Won") && 'isDeleted' != "False"</code>
\$	Dollar sign	Identifies the Salesforce object in a predicate expression.  Note: You can only use the User object in a predicate expression. Example predicate expression: <code>'Owner.Role' == "\$User.UserRoleId"</code>
.	Period	Separates the object name and field name in a predicate expression. Example predicate expression: <code>'Owner' == "\$User.UserId"</code>

Operators

You can use comparison operators and logical operators in predicate expressions.

[Comparison Operators](#)

Comparison operators return true or false.

[Logical Operators](#)

Logical operators return true or false.

Comparison Operators

Comparison operators return true or false.

Wave Analytics supports the following comparison operators.

Operator	Name	Description
==	Equals	True if the operands are equal. String comparisons that use the equals operator are case-sensitive. Example predicate expressions: <code>'Stage Name' == "Closed Won"</code>
!=	Not equals	True if the operands are not equal. String comparisons that use the not equals operator are case-sensitive. Example predicate expression: <code>'isDeleted' != "False"</code>
<	Less than	True if the left operand is less than the right operand. Example predicate expression: <code>'Revenue' < 100</code>
<=	Less or equal	True if the left operand is less than or equal to the right operand.
>	Greater than	True if the left operand is greater than the right operand.
>=	Greater or equal	True if the left operand is greater than or equal to the right operand.
in	Multi-value list filter	True if the left operand exists in the list of strings substituted for a multi-value picklist (field value). Example predicate expression: <code>'Demog' in ["\$User.Demographic__c"]</code> In this example, <code>Demographic__c</code> is of type <code>multiPicklistField</code> . During evaluation, the multi-value picklist field is substituted by a list of strings, with 1 string per user-selected item.  Note: Comma-separated lists are not supported within the square-bracket construct.

You can use the `<`, `<=`, `>`, and `>=` operators with measure columns only.

Logical Operators

Logical operators return true or false.

Wave Analytics supports the following logical operators.

Operator	Name	Description
&&	Logical AND	True if both operands are true. Example predicate expression: 'Stage Name' == "Closed Won" && 'isDeleted' != "False"
	Logical OR	True if either operand is true. Example predicate expression: 'Expected_Revenue' > 4000 'Stage Name' == "Closed Won"

Sample Predicate Expressions for Datasets

Review the samples to see how to structure a predicate expression.

The samples are based on the following Opportunity dataset.

Opportunity	Expected_Rev	Owner	OwnerRoleID	Stage_Name	IsDeleted
OppA	2000.00	Bill	20	Prospecting	True
OppB	3000.00	Joe	22	Closed Won	False
OppC	1000.00	可爱的花	36	Closed Won	False
OppD	5000.00	O'Fallon	18	Prospecting	True
OppE		Joe	22	Closed Won	True

Let's take a look at some examples to understand how to construct a predicate expression.

Predicate Expression	Details
'OwnerRoleID' == "\$User.UserRoleId"	Checks column values in the User object.
'Expected_Rev' > 1000 && 'Expected_Rev' <= 3000	
'Owner' = "Joe" 'Owner' = "Bill"	
('Expected_Rev' > 4000 'Stage Name' == "Closed Won") && 'isDeleted' != "False"	Parentheses specify the order of operations.

Predicate Expression	Details
'Stage Name' == "Closed Won" && 'Expected_Rev' > 70000	
'Owner' == "可爱的花"	String contains Unicode characters.
'Owner' == "O\Fallon"	Single quote in a string requires the escape character.
'Stage Name' == ""	Checks for an empty string.

Datasets

A dataset is a collection of related data that is stored in a denormalized, yet highly compressed form. There are multiple ways to create datasets. You can also edit datasets after they've been created.

Tip: To ensure that you do not reach the limit (250 million) for the maximum number of rows in all registered datasets, deleted unused datasets.

[Monitor an External Data Upload](#)

External Data

You can integrate external data into Wave Analytics to make the data available for queries from explorer and designer.

The External Data API enables you to upload external data files to Wave Analytics. The External Data API can upload .csv files, and you can optionally specify the structure of your data by defining metadata in JSON format.

The External Data API is available in API version 31 and later.

The high-level steps for uploading external data by using the API are:

1. Prepare your data in CSV format, and then create a metadata file to specify the structure of the data.
2. Connect programmatically to your Salesforce organization.
3. Configure the upload by inserting a row into the `InsightsExternalData` object, and then set input values such as the name of the dataset, the format of the data, and the operation to perform on the data.
4. Split your data into 10-MB chunks, and then upload the chunks to `InsightsExternalDataPart` objects.
5. Start the upload by updating the `Action` field in the `InsightsExternalData` object.
6. Monitor the `InsightsExternalData` object for status updates, and then verify that the file upload was successful.

Explore and Visualize Your Data

When sifting through an overwhelming amount of business data, sometimes you know exactly what you're looking for. Other times you don't, but you recognize it when you see it. Salesforce Wave Analytics gives you a fast, fluid way to discover the compelling stories within your data and to create the right visuals to tell your story.

After your data is uploaded, explore freely. Drill through the data by using interactive visualizations. Surface unexpected insights that can transform your business. Then let Wave Analytics do the work of producing dynamic charts that look sharp and communicate volumes.

[Exploring and Visualizing Your Data Interactively](#)

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

[Get Oriented in Wave Analytics](#)

Go to Wave Analytics by opening the Force.com app menu in the Salesforce header and then clicking **Wave Analytics**.

[Collections of Data in Wave Analytics](#)

Several kinds of data collections are available from the home page. Datasets, lenses, dashboards, and apps represent levels of data refinement—everything from raw data that's uploaded from your source systems to highly curated, packaged views of your data.

[Data Exploration Concepts](#)

As you learn how to explore and visualize your data, it's helpful to review key concepts such as visualization, measure, and dimension.

[Explore Your Data](#)

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

[Clone a Visualization](#)

Build upon a visualization by cloning it to a new tab where you can continue exploring while saving the original in its own tab.

[Save a Visualization](#)

Save your visualization as a lens.

[Share a Visualization](#)

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, downloading a screenshot of it, or downloading its filtered data. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that's presented. To share without giving access to the asset, use the download options.

[Export a Visualization as an Image](#)

Export your current visualization so that you can save it as an image file.

Exploring and Visualizing Your Data Interactively

Data exploration is an iterative process. It typically involves these steps: view, explore, refine, save, and share.

- View—View the data set.
- Explore—Get to know the boundaries and shape of your data. Play with different views, zoom in and zoom out, and see what you get with different charting options.
- Refine—Narrow your view to the most important data. Decide the level of detail and categorization that's easiest for your colleagues to understand. Choose the most appropriate chart visualization.
- Save—Save your work.
- Share—Share your view with others. For a more packaged presentation, use your visualization to build a dashboard.

Get Oriented in Wave Analytics

Go to Wave Analytics by opening the Force.com app menu in the Salesforce header and then clicking **Wave Analytics**.

1. Open Wave Analytics.

The home page is your home base for exploring all the data that you have access to.

Collections of Data in Wave Analytics

Several kinds of data collections are available from the home page. Datasets, lenses, dashboards, and apps represent levels of data refinement—everything from raw data that's uploaded from your source systems to highly curated, packaged views of your data.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To access Wave Analytics:

- "Use Wave Analytics"

- A *dataset* contains a set of source data, specially formatted and optimized for interactive exploration.
- A *lens* is a particular view into a dataset's data. It's where you do exploratory analysis and visualization.
- A *dashboard* is a curated set of charts, metrics, and tables based on the data in one or more lenses.
- An *app* contains dashboards, lenses, and datasets in any combination that makes sense for sharing your data analyses with colleagues. Apps are like folders: They allow users to organize their data projects—private and shared—and to control sharing.

Data Exploration Concepts

As you learn how to explore and visualize your data, it's helpful to review key concepts such as visualization, measure, and dimension.

A *visualization* is commonly a chart or graph, such as a bar chart, donut chart, timeline, or heat map. It can also be data in tabular form, such as a comparison table or pivot table. Every visualization has an underlying query, which is how Wave Analytics retrieves information from the source data.

A *measure* is a quantitative value, like revenue and exchange rate. You can do math on measures, such as calculating the total revenue and minimum exchange rate. Measures have names (revenue) and values (\$1,000,000). When you're viewing a chart visualization in Wave Analytics, it's important to remember:

- The chart either shows a slice of your data based on the number of or amount of something, or it shows tabular data.
- A measure is typically *aggregated* in some way, which means that it's displayed with some math already applied to it. For example, when you first view a dataset, you often see a simple aggregation such as the count of the number of rows. You typically aggregate by a different method—sum, average, maximum, and so on—as you explore and change or add measures, but you always specify how you want to aggregate at the time when you select the measure.
- You can identify measures by their position (the far left items in the top left corner of a lens) and by the text that indicates the aggregation method (such as Sum of Revenue).

 **Warning:** If you perform a query that aggregates measures—like sum or group by—and the resulting value exceeds the maximum for a numeric field (36,028,797,018,963,967), the value overflows and Wave Analytics returns an incorrect result.

A *dimension* is a qualitative value, like region, product name, and model number. Dimensions are handy for grouping and filtering your data. Unlike measures, you can't perform math on dimensions. Like measures, dimensions also have names (region) and values (northeast). Time is usually considered a dimension rather than a measure.

Explore Your Data

See what unexpected insights you can surface by interactively exploring and visualizing your data, using explorer tools.

[View Your Data in a Lens](#)

When you look at data in an exploratory mode, you do so in a *lens*. A lens has several aspects: it's how you view data in a dataset, it's the place where you explore the data graphically, and it's the basis for building any dashboard.

[Group Your Data into Categories](#)

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

[Filter Your Data](#)

Apply filters in a lens to unclutter your chart and focus on the subset of data that's most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

Change the Sort Order

Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

Change the Chart Type

Switch between chart types to see which visualization options tell the most compelling story for your data.

Change Measures

Your choice of measure defines your entire visualization and determines the scope of your exploration. For example, change the measure and the aggregation method from “Count of Opportunities” to “Sum of Amount.” Then add a second measure to see two visualizations side by side.

Change the Chart Scale

Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

Create Calculated Columns Using the Compare Table

Use the Compare Table to define custom formulas with columns of data. View measures side by side, and perform math across the table’s columns and rows.

Return to a Previous View by Using History

Exploring your data can lead you down many paths. Not all of them will be fruitful, and that’s OK. Explorer keeps a full history of your activity in a lens. If you’ve changed your lens in undesired ways, or just want to see those nifty animations again, use history to backtrack quickly to a previous state in your visualization.

Apply Groups and Filters by Copying and Pasting Using Your Browser’s Clipboard

Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer’s copy and paste tools to replicate specific groupings and filters from one tab to another.

View the Query Behind Your Lens

Wave Analytics uses Salesforce Analytics Query Language (SAQL) behind the scenes in lenses and dashboards to gather data for visualizations. Open the SAQL viewer to watch the underlying SAQL query being written as you explore or to copy it for use elsewhere.

View Your Data in a Lens

When you look at data in an exploratory mode, you do so in a *lens*. A lens has several aspects: it’s how you view data in a dataset, it’s the place where you explore the data graphically, and it’s the basis for building any dashboard.

1. From the home page, click a dataset or a lens.
A lens opens in a new tab. For example, this lens opens as a bar chart that shows the number of rows in an opportunity dataset.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- “Use Wave Analytics”

Group Your Data into Categories

Group data to organize it so that the data is displayed in useful categories. For example, to look for seasonal patterns in your sales cycle, group opportunity data by the month when deals close.

1. Click the **Group** button.

2. Using the search box, type the first few letters of the dimension that you want to group by, such as Close Date.

The dimensions in your data determine which categories you can group by.

3. Hover over the Close Date line. Click the **Scale** button that appears at the right.

4. In the Calendar Date Scale list, click Month.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

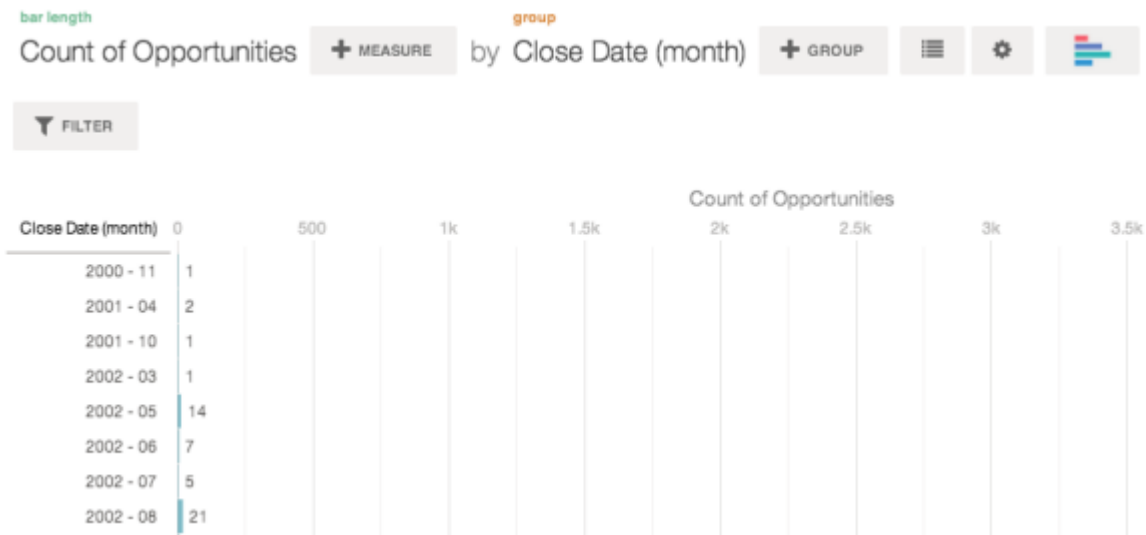

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

The bar chart changes from a single bar to multiple bars that show the data grouped separately by the closed year and month.

- To add a secondary grouping, also called a *stacked grouping*, click the **Group** button. Using the search box, find the StageName dimension, and then select it.

At this point, we're just adding a group. If you had clicked the **Filter** button, a group and a filter would have been added.

The visualization changes to show the data grouped by both dimensions. The entries in the last subgroup are assigned a color for each category, and the color legend is displayed on the right. You can have a maximum of four groupings in a lens.

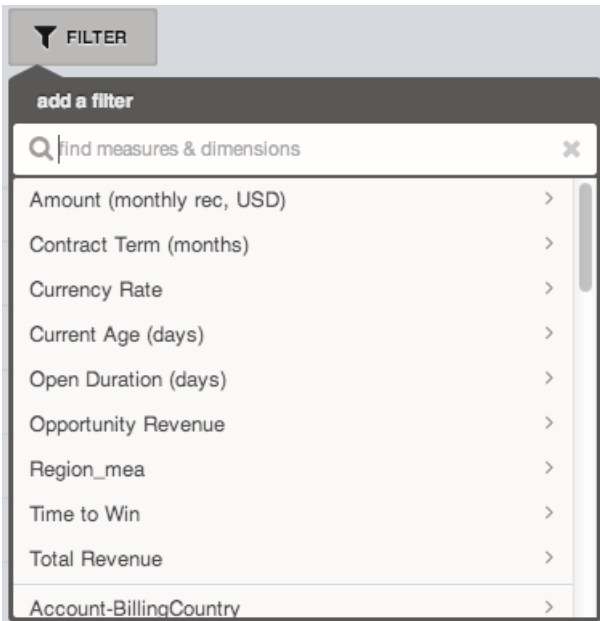

Filter Your Data

Apply filters in a lens to unclutter your chart and focus on the subset of data that’s most relevant for your business unit, project, or management team. For example, limit your visualization to certain fiscal years.

1. Click **Filter**.

In the Add a Filter dialog box, measures are listed at the top, followed by dimensions.

2. Select the FiscalYear dimension. The values for FiscalYear appear.

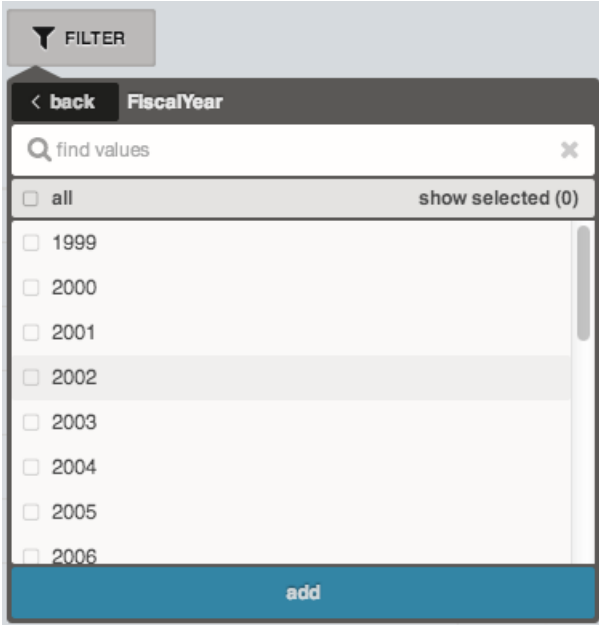

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

- To view visualizations:
- “Use Wave Analytics”

3. Select 2012 and 2013, and then click **Add**. If you use the search box to find values to filter by, be aware that this search is case-sensitive. The filter that you've applied is displayed next to the **Filter** button.

The chart visualization changes to show data for fiscal years 2012 and 2013.

Change the Sort Order

Choose whether data in your chart visualization is sorted ascending, sorted descending, or unsorted.

1. Click the **Options** button.

2. In the dialog box, choose **Asc** (sorted ascending), **Dsc** (sorted descending), or **Off** (unsorted).

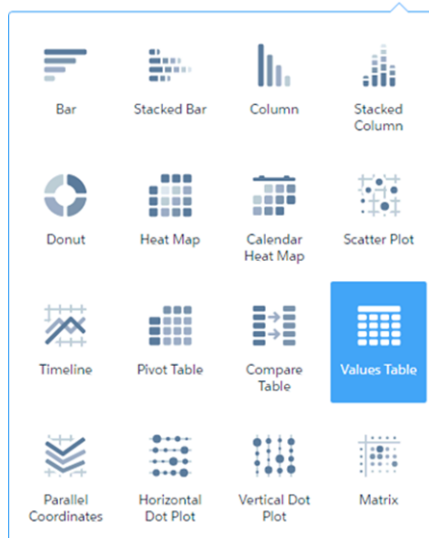

Change the Chart Type

Switch between chart types to see which visualization options tell the most compelling story for your data.

1. Click the **Change Chart Type** button.

A gallery of chart types that are available for this lens is displayed.

2. Hover over a chart type to see how many measures and dimensions that type of visualization requires.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise**, **Performance**, and **Unlimited** Editions. Also available in **Developer Edition**.

For example, a donut chart can have one measure and one or two dimensions.

3. Click a chart type, such as Stacked Bar. The chart visualization changes.

Change Measures

Your choice of measure defines your entire visualization and determines the scope of your exploration. For example, change the measure and the aggregation method from “Count of Opportunities” to “Sum of Amount.” Then add a second measure to see two visualizations side by side.

1. Click the aggregation **Sum**, and then click the Amount (monthly rec, USD) measure. The visualization changes to show the Sum of Amount.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

- To view visualizations:
- “Use Wave Analytics”

- To add a second measure, click the **Measure** button.

- Click the aggregation **Average**, and then click the Open Duration (days) measure.

The new measure is displayed on the right.

- To move the new measure to the left, click Avg of Open Duration (days), and then click **< Move Left**.

The two visualizations swap positions.

- To add additional measures, click the **Measure** button again. You can have a maximum of four measures in a lens.

Change the Chart Scale

Change the scale of a chart, such as applying a logarithmic scale. The options that are available depend on the chart type.

1. Click the **Options** button.

2. In the dialog box, choose a scale.

Create Calculated Columns Using the Compare Table

Use the Compare Table to define custom formulas with columns of data. View measures side by side, and perform math across the table's columns and rows.

1. Select **Compare Table** from the chart type gallery.

2. Add dimensions by clicking **Group**.
3. Change the first measure by clicking the **cells** selection ("Count of Rows"). Add more measures by clicking the arrow in the measure column header and then selecting **add a column**.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.

USER PERMISSIONS

With the new column selected, click the **cells** selection to change the measure. You can also apply a filter by clicking the header of a measure column to select it and then clicking **Filter**.

Opportunity Owner	Opportunity Amount ^A	Expected Revenue ^B	Expected Revenue ^C
Ely East	134,381,275		
Bill West	89,291,860		
James Barry	78,821,529		
Cindy Central	77,106,000		
Kasey Central	76,590,000		
Ricky East	74,472,500		
Wendy West	69,786,500		
Tom Reseller	43,385,600		
Jamie Preston	9,355,000		
Sean Silver	4,060,000		
Barry Bronze	4,060,000		
Ted Data	3,039,560		

Notice that dimension columns are on the left and measure columns are on the right. The measure columns are identified in formulas as A, B, C, and so on, with A being the far left measure column.

4. Add a measure column to hold a custom formula, and then select **edit formula and format** from the drop-down menu.

Edit Column Details

Enter a custom column name, define a formula for the column, or set the data format for the column...

column name

formula

data format

In the **formula** field, create formulas using operators from this table.

 **Note:** Measure columns are identified by uppercase letters from left to right.

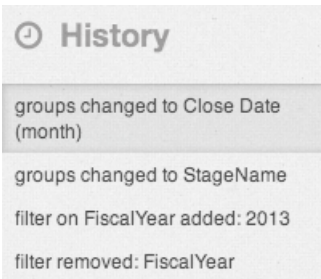

Symbol	Examples	Calculation
+	A+B, A+100	Addition, applied per row.
-	A-B, A-100	Subtraction, applied per row.
/	A/B, A/100	Division, applied per row.
*	A*B, A*100	Multiplication, applied per row.
()	(B-A)/(A*100)	Parentheses for grouping operations.

 **Tip:** Use Compare Tables for simple, ad hoc calculations. If a particular calculated value is needed frequently or is more complex, consider performing the calculation at the source data level.

Return to a Previous View by Using History

Exploring your data can lead you down many paths. Not all of them will be fruitful, and that's OK. Explorer keeps a full history of your activity in a lens. If you've changed your lens in undesired ways, or just want to see those nifty animations again, use history to backtrack quickly to a previous state in your visualization.

1. Click the **View History** button  in the header. A sidebar lists a history of all the actions that you've taken in the lens.

2. Select any item in the list to go to that point. Or use the buttons to **Step Backward**  and **Step Forward**  through the list.

Apply Groups and Filters by Copying and Pasting Using Your Browser's Clipboard

Sometimes you want to go multiple directions when exploring a dataset, such as trying different groupings or focusing on different angles. Instead of exploring linearly in a lens and using the history tool to backtrack and then branch off in a new direction, you can explore multiple directions at the same time by opening the same dataset in multiple Wave Analytics tabs. Then use explorer's copy and paste tools to replicate specific groupings and filters from one tab to another.

From the home page, each time you click a dataset, it opens in a new tab. The copy and paste tools in explorer are designed to be used when you have the same dataset in multiple tabs.

1. If the chart type that you're viewing allows you to select a subset of data, make your selection by clicking or by clicking and dragging within the chart. Everything except your selected data is unavailable.
2. Click the **Actions** button.

3. Copy the selection to your browser's clipboard. Click **Copy** to capture the selected items in the clipboard. You can decide later whether to paste your selection as a group or as a filter. Click **Focus** to both capture the selected items in the clipboard and apply them as a filter to the current chart.
4. Switch to a different Wave Analytics tab that has the same dataset.
5. Click the **Actions** button.

EDITIONS

6. Apply the selection from the clipboard to the current chart. Click **Paste as Group** to make the data display grouped by the selected dimensions. Click **Paste as Filter** to make the data display with your selection applied as a filter.

To restore a chart to the full dataset, remove your selection by clicking  and then **Clear**.

View the Query Behind Your Lens

Wave Analytics uses Salesforce Analytics Query Language (SAQL) behind the scenes in lenses and dashboards to gather data for visualizations. Open the SAQL viewer to watch the underlying SAQL query being written as you explore or to copy it for use elsewhere.

1. Open the Options menu () to access the **Show SAQL** control.

2. Select **On**.

The SAQL Query pane opens. Continue exploring and see your work expressed in SAQL.

EDITIONS

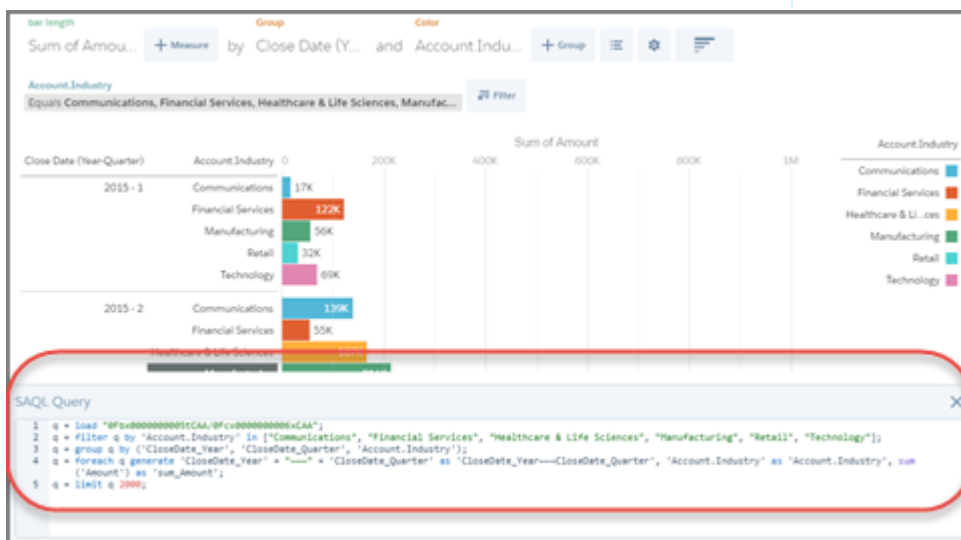

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance, and Unlimited Editions**. Also available in **Developer Edition**.

USER PERMISSIONS

To view visualizations:

- "Use Wave Analytics"

For more information about SAQL, see the [Wave Analytics SAQL Reference](#).

Clone a Visualization

Build upon a visualization by cloning it to a new tab where you can continue exploring while saving the original in its own tab.

1. Click the **Clone in New Tab** icon.

2. Continue exploring in the new tab, building upon the visualization. When you reach the next view that you want to keep, click **Save** and then **Clone in New Tab** again.

Save a Visualization

Save your visualization as a lens.

1. Click the **Save** icon.

2. Enter a title and a description for your lens, and select the app to save it in.
3. Click **Save**.

Share a Visualization

Share a visualization with your colleagues by posting to Chatter, getting its unique URL, downloading a screenshot of it, or downloading its filtered data. A Chatter post provides an image and a link to the asset—lens, dashboard, or app—in Wave Analytics. Colleagues with the link and access to the asset can drill down and explore the information that’s presented. To share without giving access to the asset, use the download options.

1. Click **Share**.

2. Click the tab for the sharing method that you want:
 - a. **Post to Feed** posts to Chatter an image and the link to the lens, dashboard, or app. Select **User** or **Group** feed, enter the name, and then type your comment. You can also remove the image from your post by hovering over it and clicking the **x**. Note that posted images are public.
 - b. **Get URL** provides a unique URL to the asset. Copy the link and then paste it wherever you want to share it.
 - c. **Download** gives you options to share a visualization without giving access to it. You can download it as an image (.png) or as filtered data in Microsoft® Excel® (.xlsx) or comma-separated values (.csv) format.

3. If applicable, click **Give Access** to set the level of sharing access.

4. Click **Done**.

Note: To share a visualization, you must give access to the app that contains it. Lenses, datasets, and dashboards within the default Shared App are accessible to all Wave Analytics users, unless administrators have restricted access. All other apps are private unless someone with Manager access to the app has shared it with a specific user, group, or role.

Export a Visualization as an Image

Export your current visualization so that you can save it as an image file.

1. Click the **Actions** button.

2. Click **Export as Image**.

A new browser window opens with the visualization in a .png image file.

3. Right-click the image, and then choose **Save Image As...**

4. Type a file name, and then click **Save**.

Key Elements of a Wave Dashboard

A dashboard isn't just for reading. It's for carrying on a conversation based on one or more datasets that matter to your company. Don't just look at the pictures—use the tools on the dashboard to dive deeper into the data that you care about. Go ahead, click around and explore!

You read a Salesforce Wave dashboard interactively by clicking its displayed elements. Every element is a picture of a live, filtered database query.

Selectors

A selector lets you filter down to a particular value that matters to you. For example, you can set the maximum and minimum sliders in a range selector to make the dashboard show only the amounts that fall within a specific range. Watch the charts and numbers on the page change when you set the sliders. Selectors are often tied to each other in sequence so that you can progressively drill deeper. For example, you can use one selector to look at sales of a product, then use the next selector to filter sales by region, and then use the next selector to filter sales regions by account. There are different types of selectors, such as list, selectors, toggle, date, and range selectors.

Key Performance Indicators

Some information is best represented by a single number. Some number elements can be affected by filtering actions that you take on charts or selectors. For example, in a bar chart that shows individual salespeople's pipelines, clicking a specific bar can cause a number element to change to reflect the specific bar's value instead of the total value.

Charts

A rich variety of charts shows you data from multiple angles. Many parts of a chart are interactive. For example, click a bar in a bar chart and watch what happens. Clicking a bar filters the query that the bar chart represents. Your revision changes other values in this chart, values in other charts, and number displays.

Build Wave Dashboards

You've explored your data, picking out the useful themes and patterns. You've created one or more lenses. Now you can design a dashboard to help your audience turn data into decisions.

EDITIONS

Available in Salesforce Classic and Lightning Experience.

Available for an extra cost in **Enterprise, Performance,** and **Unlimited** Editions. Also available in **Developer Edition**.
