SALESFORCE BASICS

Welcome to Salesforce, the award-winning cloud computing service designed to help you manage your customer relationships, integrate with other systems, and build your own applications! Here are some key concepts to help you understand the Salesforce products and editions and guide you through setting yourself up as a user. You'll also find information about common tasks you'll perform in Salesforce—like using basic Chatter features, running reports, or searching Salesforce for the information or records you need.

EDITIONS

Available in: Salesforce Classic

Available in all editions

[What is Salesforce?](#)

Salesforce helps you manage your customer relationships, integrate with other systems, and build your own applications.

[Get Started as a New User](#)

New to Salesforce? Set yourself up as a new user so you can start using the application right away.

[Get Set Up For the Way You Work](#)

Use your setup options to personalize your Salesforce experience. Set your display the way you like it, protect your information, and let others know you're here.

[Work on Mobile Devices](#)

Salesforce provides several mobile apps to keep you connected and productive, no matter where you are.

[Manage Relationships and Data With Records](#)

Much of your Salesforce data is stored in individual *records*, and organized within objects. For example, the Account object presents all of your account records. If the Acme company is one of your accounts, you'll have an account record for Acme.

[Find Information with Search](#)

Salesforce search gives you the power to find information faster. Search is available via the Salesforce site, a Salesforce1 mobile app, or a custom search implementation built on the Salesforce platform.

[Run a Report](#)

To run a report, find it on the Reports tab and click the report name. Most reports run automatically when you click the name. If you're already viewing a report, click **Run Report** to run it immediately or schedule a future run. In Lightning Experience, the **Run Report** button only appears after you save a report.

[Your Access to UI Elements, Records, and Fields](#)

Your Salesforce admin can customize many different areas to secure your company's data. Users in Professional, Enterprise, Performance, Unlimited, and Developer Edition orgs can control other users' access to their data by sharing records individually with colleagues.

What is Salesforce?

Salesforce helps you manage your customer relationships, integrate with other systems, and build your own applications.

Salesforce includes the following products and services.

Salesforce Applications

Salesforce includes prebuilt applications (or “apps”) for customer relationship management (CRM) ranging from sales force automation to partner relationship management, marketing, and customer service.

Force.com Platform

The Force.com platform is the first platform as a service (PaaS), enabling developers to create and deliver any kind of business application entirely on demand and without software. The platform also includes easy to use point-and-click customization tools to help you create solutions for your unique business requirements, without any programming experience.

AppExchange

AppExchange is a marketplace featuring hundreds of cloud applications created by Salesforce customers, developers, and partners. Many of the applications are free and all of them are pre-integrated with Salesforce, enabling you to easily and efficiently add functionality.

Salesforce.com Community

Salesforce provides training, support, consulting, events, best practices, and discussion boards to help you be successful. Visit [Salesforce.com Community](#).

Key Concepts and Terms

As you’re getting up to speed with Salesforce, it’s helpful to learn some key concepts and terms. They’ll come up frequently as you interact with the product, our documentation, and our service professionals. The concepts here will help you understand how Salesforce works. And the terms will help you understand some of its main components.

Salesforce Editions

Salesforce offers several bundles of its products and services, each geared toward a different set of business needs.

Other Salesforce Editions

Some Salesforce editions are no longer sold. You can continue to use your Contact Manager, Group, Personal, Performance, or Database.com Edition org or purchase one of the editions that are currently sold: Professional, Enterprise, Unlimited, and Developer Editions.

Database.com Feature List

The list of Salesforce features also available in Database.com. Use this list in combination with the feature Edition tables to find topics in the Salesforce help that also apply to Database.com.

Supported Browsers

Supported browsers for Salesforce vary depending on whether you use Salesforce Classic or Lightning Experience.

Read-Only Mode

At Salesforce, we recognize that you may want to access your data at a moment’s notice—even during our planned maintenance windows. To minimize interruption to your business, Salesforce gives users read-only access during splits, instance migrations, instance switches, pre-scripts, and certain other maintenance events.

What’s New in Salesforce?

Tip Sheets and Implementation Guides

EDITIONS

Available in: Salesforce Classic

Your Salesforce edition determines which features and functionality you can access.

Key Concepts and Terms

As you're getting up to speed with Salesforce, it's helpful to learn some key concepts and terms. They'll come up frequently as you interact with the product, our documentation, and our service professionals. The concepts here will help you understand how Salesforce works. And the terms will help you understand some of its main components.

Available in: **All Editions**

Concepts

Concept	Definition
Cloud	A Salesforce name for a loose federation of features that help you accomplish certain types activities, such as selling products, supporting your customers, or collaborating with your coworkers. Two common examples you'll come across are <i>Service Cloud</i> and <i>Sales Cloud</i> .
Cloud Computing	Technology that enables Internet-based services that let you sign up and log in through a browser. Salesforce delivers its service in the cloud. Other familiar cloud computing services include Google Apps and Amazon.com.
Software as a Service (SaaS)	Software delivered not by traditional means (such as on disk) but in the cloud, as a service. There's nothing to download or install, and updates are automatic.
Trust	<p>A Salesforce term for its company-wide commitment to building and delivering the most secure, fast, and reliable cloud-based service available.</p> <p>Created to enhance customer success, <code>trust.salesforce.com</code> is a systems status website giving Salesforce customers and the community access to real-time and historical system performance information and updates, incident reports and maintenance schedules across all its key system components.</p> <p><code>trust.salesforce.com</code> is free to all members of the Salesforce community.</p>

Terms

Term	Definition
App	Short for <i>application</i> . A collection of components such as tabs, reports, dashboards, and Visualforce pages that address specific business needs. Salesforce provides standard apps, which you can customize, such as Sales and Call Center. You can customize the standard apps to match the way you work.
Edition	One of several bundles of Salesforce products and services, each geared toward a different set of business needs. All Salesforce editions share the same look and feel, but they vary by feature, functionality, and pricing.
Object	<p>A definition of a specific type of information you can store in Salesforce. For example, the Case object lets you store information about customer inquiries. For each object, your organization will have multiple, specific records.</p> <p>Salesforce comes with lots of standard objects, but you can create custom objects, as well.</p>
Organization	A deployment of Salesforce that has a defined set of licensed users. Your organization includes all of your data and applications.

Term	Definition
Record	A collection of fields that store information about a specific item of a specific type (represented by an object), such as a contact, an account, or an opportunity. For example, you might have a contact record to store information about Joe Smith, and a case record store information about his training inquiry.
Release	Salesforce releases new products and features three times per year, and releases are identified by season—Winter, Spring, and Summer—along with the calendar year. <i>Example:</i> Winter '15. For every Salesforce release, the Salesforce release notes include new features and products that are generally available or in beta release, plus all changes to existing features and products. You can find the release notes when you search for “Release Notes” in the Salesforce Help.
Salesforce	The name of the Salesforce cloud computing CRM service.
Salesforce	The company name.

Salesforce Editions

Salesforce offers several bundles of its products and services, each geared toward a different set of business needs.

These bundles, called *editions*, share a look and feel but vary by feature, functionality, and pricing. For example, Enterprise Territory Management is available in Enterprise and Unlimited Edition orgs with the Sales Cloud, but not in Professional Edition orgs. Some customers start with a basic edition and upgrade as they grow their businesses.

The Salesforce Help describes all generally available features, including those that aren't available in all editions. To find out whether a feature is available in your edition, search for the feature in the Salesforce Help, and then read the “Available in:” table at the top of any topic about the feature.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Unlimited,** and **Developer** Editions

Professional Edition

This edition is designed for businesses who need full-featured CRM functionality. Professional Edition includes straightforward and easy-to-use customization, integration, and administration tools to facilitate any small to midsize deployment.

Enterprise Edition

This edition is designed to meet the needs of large and complex businesses. Enterprise Edition orgs get advanced customization and administration tools, in addition to all the functionality available in Professional Edition, that can support large-scale deployments. Enterprise Edition also includes access to the web services API, so you can easily integrate with back-office systems.

Unlimited Edition

This edition is Salesforce's solution for maximizing your success and extending that success across the entire enterprise through the Force.com platform. Unlimited Edition customers benefit from new levels of platform flexibility for managing and sharing all their information on demand. Unlimited Edition includes all Enterprise Edition functionality plus Premier Support, full mobile access, unlimited custom apps, increased storage limits, and more.

Developer Edition

This edition provides access to the Force.com platform and API. A Developer Edition org allows developers to extend the Salesforce system, integrate with other applications, and develop new tools and applications. Developer Edition provides access to many of the features available in Enterprise Edition orgs.

 **Note:** Salesforce doesn't provide technical support for Developer Edition orgs. You can solicit help from the developer community message boards available to registered users via the Force.com developer website: developer.salesforce.com. Documentation for Developer Edition is available from the [Technical Library](#).

For a comparison chart of editions and their features, see the [Salesforce Pricing and Editions page](#).

SEE ALSO:

[Salesforce Mobile Product Comparison](#)

Other Salesforce Editions

Some Salesforce editions are no longer sold. You can continue to use your Contact Manager, Group, Personal, Performance, or Database.com Edition org or purchase one of the editions that are currently sold: Professional, Enterprise, Unlimited, and Developer Editions.

 **Note:** Lightning Experience isn't available in Contact Manager, Personal, or Database.com Edition orgs.

Contact Manager Edition

This edition is designed for small businesses and provides access to key contact management features including accounts, contacts, activities, calendars, notes and attachments, and reports. Contact Manager provides straightforward, easy-to-use customization options.

Group Edition

This edition is designed for small businesses and work groups with a limited number of users. Group Edition users can manage their customers from the start of the sales cycle through closing the deal and providing customer support and service. Group Edition offers access to accounts, contacts, opportunities, leads, cases, dashboards (read only), and reports.

Personal Edition

This edition is a CRM solution designed for an individual sales representative or other single user. Personal Edition provides access to key contact management features such as accounts, contacts, and synchronization with Microsoft Outlook®. It also provides sales representatives with sales tools such as opportunities.

 **Note:** Personal Edition orgs purchased after June 2009 don't have access to opportunities.

Performance Edition

This edition is designed for customers who need to drive amazing growth, achieve new levels of customer satisfaction, and maximize sales and service success in the social and mobile world. Performance Edition orgs include all Unlimited Edition functionality plus clean, targeted lead and customer data from Data.com, coaching and feedback tools from Work.com, trusted identity services from Identity, and more. For customers in Japan, Singapore, and South Korea, we offer Performance Edition Limited, which includes all Performance Edition functionality except Data.com.

Database.com

Database.com is a multitenant cloud database service that's designed to store data for mobile, social enterprise applications. You can use Database.com as the back-end database for applications that are written in any language and run on any platform or mobile device. Database.com's built-in social computing infrastructure and native support for building sophisticated REST-based APIs enable you to create employee-facing, native mobile and social apps.

As a Salesforce user, you already use Database.com when you perform tasks such as creating custom objects, managing security, or importing data with the Force.com platform and API. A stand-alone version of Database.com is available for developers who want to create applications that leverage other languages, platforms, and devices.

Database.com-specific documentation isn't provided. Use the Salesforce documentation and the [list of features](#) that Database.com supports. This list identifies the Salesforce documentation subjects that apply to Database.com. Also, every feature's Edition Table

EDITIONS

Available in: **Contact Manager, Group, Personal, Performance, and Database.com** Editions

includes Database.com if the feature is available in Database.com. Use the Salesforce Help, release notes, workbooks, and developer guides for APIs, Apex, SOQL, and SOSL.

SEE ALSO:

[Salesforce Editions](#)

Database.com Feature List

The list of Salesforce features also available in Database.com. Use this list in combination with the feature Edition tables to find topics in the Salesforce help that also apply to Database.com.

The Salesforce features listed here are those that are also available in Database.com. The features are organized by general product area. Some features are only available through the API. These are noted where they appear.

Administration

- Audit Trail
- Company Information
- Delegated Administrator and Login As
- Enhanced Profile Management
- Field-Level Security
- Login History
- Mass Transfers
- New Profile UI
- Permission Sets
- Profiles

Apex (Libraries are available only for features supported in Database.com.)

API

- API Clients
- Bulk API
- Data Loader
- Metadata API
- Chatter REST API
- Web Services API Data Replication
- Web Services API Reads
- Web Services API Writes

Application Lifecycle Management

- Change Sets

Chatter

- Ability to stop following records that you own in Chatter
- At Mentions (API only)
- Chatter Activity and Influence

EDITIONS

Available in: **Salesforce Classic**

Available in: **Database.com Edition**

- Customize Chatter settings
- Feed Tracking

Users

- Expiring Passwords
- Manage Users
- Managing Roles
- Monitoring User Events (logins and training)
- Resetting Passwords
- Role Fields
- Role List page
- Set Up Password Expiration
- Setting Login Restrictions

Viewing the Public Group Related List

Weekly Export

Workflow

- Outbound messages (as both immediate and time-dependent actions)
- Time-Based Workflow (Workflow Queue)
- Workflow Field Updates and Outbound Messages
- Workflow rules

Supported Browsers

Supported browsers for Salesforce vary depending on whether you use Salesforce Classic or Lightning Experience.

[Supported Browsers for Salesforce Classic](#)

Salesforce Classic is supported with Microsoft® Internet Explorer® versions 9, 10, and 11, Apple® Safari® version 8.x on Mac OS X, and Microsoft® Edge for Windows® 10. The most recent stable versions of Mozilla® Firefox® and Google Chrome™ are also supported.

There are some limitations.

[Supported Browsers for Lightning Experience](#)

Lightning Experience is supported with Apple® Safari® version 8.x and 9.x on Mac OS X and Microsoft® Edge for Windows® 10. The most recent stable versions of Mozilla® Firefox® and Google Chrome™ are also supported. If you're using Microsoft® Internet Explorer® versions 9–11, you're redirected to Salesforce Classic. There are some limitations.

[Getting Plug-ins for Viewing Documentation and Online Training Courses](#)

Download the plug-ins you need to view Salesforce PDF documentation and online training courses.

[Learning Keyboard Shortcuts](#)

Use keyboard shortcuts to work efficiently in Salesforce.

[Keyboard Shortcuts for Lightning Experience Composer Windows](#)

Use keyboard shortcuts to work efficiently in Lightning Experience composer windows. Open a composer window to create tasks, jot down notes, log a call, and more. Keyboard shortcuts make it easy to cycle through the fields inside a composer and work your way through multiple composer windows that are open at the same time.

[Configuring Internet Explorer](#)

If you use Internet Explorer, we recommend using the latest version that Salesforce supports. Apply all Microsoft software updates.

[Configuring Firefox](#)

To ensure Salesforce works optimally with Firefox, you'll need to do a few configurations to the browser.

Supported Browsers for Salesforce Classic

Salesforce Classic is supported with Microsoft® Internet Explorer® versions 9, 10, and 11, Apple® Safari® version 8.x on Mac OS X, and Microsoft® Edge for Windows® 10. The most recent stable versions of Mozilla® Firefox® and Google Chrome™ are also supported. There are some limitations.

Note: Using Salesforce Classic in a mobile browser isn't supported. Instead, we recommend using the Salesforce1 app when you're working on a mobile device. To see the mobile browsers that are supported for Salesforce1, check out [Requirements for the Salesforce1 Mobile App](#) on page 94.

Microsoft Edge

Salesforce supports Microsoft Edge on Windows 10 for Salesforce Classic. Note these restrictions.

- The HTML solution editor in Microsoft Edge isn't supported in Salesforce Knowledge.
- Microsoft Edge isn't supported for the Developer Console.
- Microsoft Edge isn't supported for Salesforce CRM Call Center built with CTI Toolkit version 4.0 or higher.

Microsoft Internet Explorer versions 9, 10, and 11

If you use Internet Explorer, we recommend using the latest version that Salesforce supports. Apply all Microsoft software updates. Note these restrictions.

- The full Salesforce site is supported in Internet Explorer 9, 10, and 11 on Windows 8 and 8.1 for touch-enabled laptops with standard keyboard and mouse inputs only. There is no support for mobile devices or tablets where touch is the primary means of interaction. Use the Salesforce1 mobile browser app instead.
- The HTML solution editor in Internet Explorer 11 is not supported in Salesforce Knowledge.
- Both Compatibility Mode and the Compatibility View in Internet Explorer aren't supported.
- The Metro version of Internet Explorer 10 isn't supported.
- Internet Explorer 11 isn't supported for the Developer Console.
- Internet Explorer 11 isn't supported for Salesforce CRM Call Center built with CTI Toolkit version 4.0 or higher.

EDITIONS

Salesforce Classic available in: **All Editions**

- Community Templates for Self-Service supports Internet Explorer 9 and above for desktop users and Internet Explorer 11 and above for mobile users.
- Internet Explorer 9 isn't supported for Salesforce Wave Analytics.
- Internet Explorer 9 and 10 aren't supported for the Lightning App Builder.
- Internet Explorer 9 users don't have browser-based spell check.

For configuration recommendations, see [Configuring Internet Explorer](#) on page 15.

 **Note:** Salesforce Classic support for Microsoft® Internet Explorer® versions 7 and 8 is discontinued as of Summer '15.

Mozilla Firefox, most recent stable version

Salesforce makes every effort to test and support the most recent version of Firefox.

- Mozilla Firefox is supported for desktop users only for Community Templates for Self-Service.

For configuration recommendations, see [Configuring Firefox](#) on page 16.

Google Chrome, most recent stable version

Chrome applies updates automatically. Salesforce makes every effort to test and support the most recent version. There are no configuration recommendations for Chrome.

Chrome isn't supported for:

- The Console tab (The Salesforce console is supported.)

Apple Safari versions 8.x on Mac OS X

There are no configuration recommendations for Safari. Apple Safari on iOS isn't supported for the full Salesforce site.

Safari isn't supported for:

- The Salesforce console
- Salesforce CRM Call Center built with CTI Toolkit versions below 4.0
- Salesforce Wave Analytics

Wave Analytics Supported Browsers

Browser support is available for Microsoft Internet Explorer versions 10 and 11 and the most recent stable versions of Mozilla Firefox and Google Chrome.

Recommendations and Requirements for All Browsers

- For all browsers, enable JavaScript, cookies, and TLS 1.2. If TLS 1.2 isn't available, enable TLS 1.1. Browsers that don't support TLS 1.1 or TLS 1.2 won't be able to access Salesforce after we deactivate TLS 1.0. Deactivation is scheduled, but not guaranteed, for June 2016 for sandbox orgs and early 2017 for production orgs.
- The minimum screen resolution required to support all Salesforce features is 1024 x 768. Lower screen resolutions don't always properly display Salesforce features such as Report Builder and Page Layout Editor.
- For Mac OS users on Apple Safari or Chrome, make sure the system setting `Show scroll bars` is set to **Always**.
- Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Some features in Salesforce—and some desktop clients, toolkits, and adapters—have their own browser requirements. For example:

- Internet Explorer is the only supported browser for:
 - Standard mail merge

- Installing Salesforce Classic Mobile on a Windows Mobile device
- Connect Offline
- For the best experience with the enhanced page layout editor, use Firefox.
- For the best experience on machines with 8 GB of RAM in the Salesforce console, use Chrome.
- Browser requirements also apply for uploading multiple files on Chatter.

Supported Browsers for Lightning Experience

Lightning Experience is supported with Apple® Safari® version 8.x and 9.x on Mac OS X and Microsoft® Edge for Windows® 10. The most recent stable versions of Mozilla® Firefox® and Google Chrome™ are also supported. If you're using Microsoft® Internet Explorer® versions 9–11, you're redirected to Salesforce Classic. There are some limitations.

-  **Note:** You can't access Lightning Experience in a mobile browser. Instead, we recommend using the Salesforce1 app when you're working on a mobile device. For a list of supported mobile browsers on Salesforce1, see [Requirements for the Salesforce1 Mobile App](#) on page 94.

EDITIONS

Lightning Experience available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Microsoft Edge

Salesforce supports Microsoft Edge on Windows 10 for Lightning Experience. Note these restrictions.

- The HTML solution editor in Microsoft Edge isn't supported in Salesforce Knowledge.
- Microsoft Edge isn't supported for the Developer Console.
- Microsoft Edge isn't supported for Salesforce CRM Call Center built with CTI Toolkit version 4.0 or higher.

Microsoft Internet Explorer version 11

-  **Important:** Support for Internet Explorer 11 to access Lightning Experience is retiring beginning in Summer '16.
- Users of existing orgs can continue to use IE11 to access Lightning Experience until December 16, 2017.
 - Users of new orgs created after Summer '16 can't use IE11 to access Lightning Experience. Instead, IE11 users are automatically redirected to Salesforce Classic.

For more details about this change, see [Retirement of Support for Accessing Lightning Experience and Salesforce1 Using Internet Explorer 11](#).

If you use Internet Explorer, we recommend using the latest version that Salesforce supports. Apply all Microsoft software updates. Note these restrictions.

- The full Salesforce site is supported in Internet Explorer 11 on Windows 8 and 8.1 for touch-enabled laptops with standard keyboard and mouse inputs only. There is no support for mobile devices or tablets where touch is the primary means of interaction. Use the Salesforce1 mobile browser app instead.
- The HTML solution editor in Internet Explorer 11 is not supported in Salesforce Knowledge.
- The Compatibility View feature in Internet Explorer isn't supported.
- Changing the compatibility parsing mode of the browser, for example, by using the `X-UA-Compatibility` header, isn't supported.
- Internet Explorer 11 isn't supported for the Developer Console.
- Internet Explorer 11 isn't supported for Salesforce CRM Call Center built with CTI Toolkit version 4.0 or higher.
- Drag and drop of files into feed comments isn't supported in Internet Explorer.

For configuration recommendations, see [Configuring Internet Explorer](#) on page 15.

Mozilla® Firefox®, most recent stable version

Salesforce makes every effort to test and support the most recent version of Firefox. For configuration recommendations, see [Configuring Firefox](#) on page 16.

Google Chrome™, most recent stable version

Chrome applies updates automatically. Salesforce makes every effort to test and support the most recent version. There are no configuration recommendations for Chrome.

 **Note:** The latest stable version of Google Chromium™ is supported.

Apple® Safari® version 8.x and 9.x on Mac OS X

There are no configuration recommendations for Safari.

Safari isn't supported for:

- Salesforce CRM Call Center built with CTI Toolkit versions earlier than 4.0
- Salesforce Wave Analytics

Wave Analytics Supported Browsers

Browser support is available for Microsoft Internet Explorer version 11 and the most recent stable versions of Mozilla Firefox and Google Chrome.

Recommendations and Requirements for All Browsers

- For all browsers, enable JavaScript, cookies, and TLS 1.2. If TLS 1.2 isn't available, enable TLS 1.1. Browsers that don't support TLS 1.1 or TLS 1.2 won't be able to access Salesforce after we deactivate TLS 1.0. Deactivation is scheduled, but not guaranteed, for June 2016 for sandbox orgs and early 2017 for production orgs.
- The minimum screen resolution required to support all Salesforce features is 1024 x 768. Lower screen resolutions don't always properly display Salesforce features such as Report Builder and Page Layout Editor.
- For Mac OS users on Apple Safari or Google Chrome, make sure that the system setting `Show scroll bars` is set to **Always**.
- Some third-party Web browser plug-ins and extensions can interfere with the functionality of Chatter. If you experience malfunctions or inconsistent behavior with Chatter, disable the Web browser's plug-ins and extensions and try again.

Getting Plug-ins for Viewing Documentation and Online Training Courses

Download the plug-ins you need to view Salesforce PDF documentation and online training courses.

- **Adobe Reader**—For viewing PDF documentation. Go to the [Adobe Reader download page](#) to download a free copy.
- **Macromedia Flash Player**—For taking online training courses. Go to the [Adobe Flash Player download page](#) to download a free copy.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Learning Keyboard Shortcuts

Use keyboard shortcuts to work efficiently in Salesforce.

In addition to the standard keyboard shortcuts available with your Web browser, Salesforce supports these keyboard shortcuts.

- Press ALT plus any number between 0 and 9 to highlight an item in the Recent Items list in the sidebar. For example, press ALT+1 to highlight the first item in the list, ALT+2 to highlight the second item, and so on. Pressing ALT+0 highlights the tenth item in the list.
 - 📌 **Note:** If you're using Mozilla® Firefox®, press SHIFT+ALT plus a number to automatically display the item you highlighted. If you're using Mozilla Firefox on a Mac, press CTRL plus a number. If you're using Microsoft® Internet Explorer®, press ALT plus a number and then press Enter to display the highlighted item.
- If your organization has enabled the collapsible sidebar, press ALT+S to open or close the sidebar. Opening the sidebar using ALT+S automatically places your cursor in the Search box.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Keyboard Shortcuts for Lightning Experience Composer Windows

Use keyboard shortcuts to work efficiently in Lightning Experience composer windows. Open a composer window to create tasks, jot down notes, log a call, and more. Keyboard shortcuts make it easy to cycle through the fields inside a composer and work your way through multiple composer windows that are open at the same time.

In addition to the standard keyboard shortcuts available with your Web browser, Lightning Experience supports these handy shortcuts when using the composer windows.

- Alt+1: opens the overflow menu from anywhere on the page
- Up and Down Arrow keys: moves through the list of open composer windows in the overflow menu
- Left and Right Arrow keys: moves between open composer windows
- Enter (from a composer window's header): moves focus to inside the composer window
- Tab key: cycles through the fields inside the composer window
- Esc key: moves focus from a composer window to the window's header

EDITIONS

Available in Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Configuring Internet Explorer

If you use Internet Explorer, we recommend using the latest version that Salesforce supports. Apply all Microsoft software updates.

To maximize the performance of Internet Explorer, set the following in the Internet Options dialog box via your browser's settings:

General Tab

1. From the General tab, click **Settings** under Browsing History.
2. For the *Check for newer versions of stored pages* option, select **Automatically**.
3. For the *Disk space to use* option, enter at least 50 MB.

Security Tab

1. From the Security tab, click **Custom Level** under Internet and scroll to the Scripting section.

EDITIONS

Available in: Salesforce Classic

Available in all editions

2. Make sure the `Active Scripting` option is enabled. JavaScript depends on this setting being enabled.

Privacy Tab

1. From the Privacy tab, click **Advanced**.
2. Select the **Override automatic cookie handling** option.
3. Select the **Always allow session cookies** option.
4. For the **Third-party Cookies** option, select **Accept**.

Advanced Tab

From the Advanced tab, scroll to the Security section and do the following:

- Do not select the `Do not save encrypted pages to disk` option.
- Select `Use TLS 1.0`, `Use TLS 1.1`, and `Use TLS 1.2`. Make sure to *deselect* `Use SSL 2.0` and `Use SSL 3.0`. SSL is no longer supported by Salesforce. TLS 1.0 won't be supported after we deactivate it, currently scheduled for June 2016 for sandbox orgs and early 2017 for production orgs.

Tip: The `Empty Temporary Internet Files folder when browser is closed` option causes the cache to clear when Internet Explorer is shut down. This increases privacy, but sometimes decrease performance.

SEE ALSO:

[Supported Browsers](#)

Configuring Firefox

To ensure Salesforce works optimally with Firefox, you'll need to do a few configurations to the browser.

Salesforce makes every effort to test and support the most recent version of Firefox.

Required Settings

Make sure Firefox can accept cookies.

1. Click **Tools > Options** (or on a Mac, click **Firefox > Preferences**).
2. Go to the Privacy panel.
3. For the `Firefox will` option, select **Use custom settings for history**
4. Select the **Accept cookies from sites** option.
5. Select the **Accept third-party cookies** option.
6. For the `Keep until` option, select **they expire**.
7. Click **OK**.

Advanced Settings

Optionally, configure advanced caching preferences to maximize performance.

1. Type `about:config` in the browser's location bar, and then press Enter.
2. If a warning displays, click **I'll be careful, I promise!**
3. Search for the following preferences and set them to the recommended value by double-clicking the preference name. Changes take effect immediately.

EDITIONS

Available in: Salesforce Classic

Available in all editions

4. Change how the browser retains common resources across requests by setting the following caching preferences.

Preference	Recommended Value	Default Value
browser.cache.check_doc_frequency	3	3
browser.cache.disk.capacity	50,000 or more; increase to use more hard disk space	50,000
browser.cache.disk.enable	True	True
browser.cache.disk_cache_ssl	True	False
browser.cache.memory.enable	True	True
network.http.use-cache	True	True

 **Note:** You can set some of these preferences by clicking **Tools > Options** in the Firefox browser. Refer to [Firefox Help](#) for details.

 **Tip:** Setting `privacy.sanitize.sanitizeOnShutdown` to “True” causes the cache to clear when Firefox shuts down. This increases privacy, but may decrease performance.

To view the contents of your cache, type `about:cache` in the Firefox location bar and press Enter.

Refer to [MozillaZine Knowledge Base](#) and [Firefox Support Home Page](#) for more information on these and other preferences.

Read-Only Mode

At Salesforce, we recognize that you may want to access your data at a moment’s notice—even during our planned maintenance windows. To minimize interruption to your business, Salesforce gives users read-only access during splits, instance migrations, instance switches, pre-scripts, and certain other maintenance events.

EDITIONS

Available in: **All Editions**

What to Expect in Read-Only Mode

When Salesforce is in read-only mode, you can navigate within the application and view and report on your business data.

During read-only mode, you **can’t**:

- Add, edit, or delete data
- Perform any actions in Salesforce that modify your Salesforce data. For example:
 - Post on Chatter
 - Use LiveAgent
 - Refresh dashboards
 - Perform API write or edit actions
 - Perform bulk API read actions
 - Save new or edited reports

 **Note:** You can still run existing reports.

Activity reminders don't occur, and Recent Items lists don't update. Login history is still recorded for compliance purposes, but it isn't reflected in your organization until a few minutes after the organization exits read-only mode.

When your organization is in read-only mode, desktop and mobile browser users see a banner at the top of their browser window:

When to Expect Read-Only Mode

The maintenance schedule posted on trust.salesforce.com indicates whether each upcoming maintenance window includes read-only access. Planned maintenance windows vary in length depending on the level of maintenance needed. In addition, when users are notified two weeks before a planned maintenance window, the notification specifies whether the maintenance includes read-only access.

If you'd like to see how your organization works in read-only mode, contact Salesforce to have the testing option enabled in your sandbox organization.

Get More Done Faster with Walkthroughs

Interactive walkthroughs guide you step-by-step through a task or feature. Salesforce creates walkthroughs to help you be successful with Salesforce.

Before you click a walkthrough link, make sure you have the correct user permissions and license associated with the feature so you can access the proper pages in Salesforce. Then, click the link to open the walkthrough. If you're not already logged in, you'll be prompted to log into your account.

The walkthrough guides you through a series of steps to help you complete a task or review a feature directly within your own Salesforce account.

-  **Note:** Keep in mind that walkthroughs guide you through your own Salesforce account rather than a demo environment. So you're actually making changes to the data in your org as you follow along through the steps. If you're concerned about making these changes, follow the walkthrough in a sandbox account or other test environment first.

Because Salesforce is highly customizable, you might not have access to all of the product features.

7. [Tips for New Users](#)

Learn the tips you need to be a fast, productive Salesforce user on day one.

Log In for the First Time

When your administrator sets you up as a new user, you receive an email that includes your username and a link to your organization’s Salesforce site.

Here’s how to log in for the first time.

1. Check your email for your login information.
2. Click the link provided in the email.
The link logs you in to the site automatically.
3. The site prompts you to set a password and choose a security question and answer to verify your identity in case you forget your password.

If you haven’t received your login information, contact the Salesforce administrator at your organization.

[Understanding How Salesforce Organizes Your Information](#)

Salesforce groups your data into logical categories called objects. An object is a collection of fields named for the kind of information those fields capture. Commonly-used Salesforce objects include Contacts, Accounts, Cases, and Reports. For example, the Contacts object contains fields with information describing the people you do business with, such as their first names, last names, phone numbers, business titles, and the companies they work for.

[Navigating Object Home Pages](#)

[Open a Different App](#)

Not finding the feature you need to use? Maybe it's in another app. Check out the drop-down menu to see all the apps available to you, and select the one you need.

[Find Setup](#)

How you find Setup depends on which Salesforce experience you're using and on your organization's user interface settings.

Understanding How Salesforce Organizes Your Information

Salesforce groups your data into logical categories called objects. An object is a collection of fields named for the kind of information those fields capture. Commonly-used Salesforce objects include Contacts, Accounts, Cases, and Reports. For example, the Contacts object contains fields with information describing the people you do business with, such as their first names, last names, phone numbers, business titles, and the companies they work for.

There are two types of Salesforce objects.

- *Standard* objects are included with the Salesforce license your company purchases. These are the most commonly-used objects.
- *Custom* objects are created to meet your company's business needs.

Your organization's administrator can customize standard objects or create custom objects to support the type of work your company does or the industry you're in. For example, your organization may choose to create a custom object called "Bugs" to track their known product issues, or rename the standard object "Accounts" to "Clients" because this is how your organization refers to your customers.

In the Salesforce interface, you generally work with objects from their tabs. For example, the Opportunity object has an Opportunities tab. If you learn about an object from the Salesforce documentation but can't find it in the user interface, contact your administrator to find out whether the object is available to you. If your edition features objects and related tabs that you can't find documentation for, it may be because the object is custom. Contact your administrator to learn how to use it.

SEE ALSO:

[Navigating Object Home Pages](#)

Navigating Object Home Pages

In the desktop application, commonly-used objects are found by clicking on their tabs, which appear at the top of your screen. Other Salesforce features, such as Home and Chatter, also have tabs.

To work with your data, click an object's tab. For instance, to access account information for the customers you work with, click the Accounts tab. Here you find:

1. The name of the object and type of data you are viewing. In this case, Accounts.

2. *List View* options. A list view narrows your accounts to a specific set (for example, you can choose to view All Accounts or just Recently Viewed Accounts).
3. A list of recently-accessed records. Here, Recent Accounts. This list is visible for every standard and custom object and can't be customized.
4. Links to other features you may want to use next.

Open a Different App

Not finding the feature you need to use? Maybe it's in another app. Check out the drop-down menu to see all the apps available to you, and select the one you need.

To use features available in a different Salesforce app than the one you have open, you need to open the other app. Other apps include the Salesforce Marketing app, the Call Center app, and any custom apps for your organization.

Your organization may also use connected apps. Connected apps include productivity apps such as Gmail™ and Microsoft Office 365™, or other apps to help you get your work done. If your administrator has added these apps to your organization, they appear in the App Launcher.

[Open a Different Salesforce App in Salesforce Classic](#)

It's easy to navigate between Salesforce apps, such as the Sales app and the Marketing app.

[Open an App from the App Launcher in Salesforce Classic](#)

Navigate between your Salesforce apps and connected apps from a single menu.

[Open a Different App in Lightning Experience](#)

Use Search or the App Launcher to navigate between all of your apps.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **All** editions except **Database.com**

Open a Different Salesforce App in Salesforce Classic

It's easy to navigate between Salesforce apps, such as the Sales app and the Marketing app.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

To use features available in a different Salesforce app than the one you have open, you need to open the other app. You can have one app open at a time, and the app you have open will open the next time you log in to Salesforce.

To open an app: In the upper-right corner of any Salesforce page, select the app you want from drop-down app menu.

Open an App from the App Launcher in Salesforce Classic

Navigate between your Salesforce apps and connected apps from a single menu.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

You must have access to a Salesforce app or connected app to see and open it from the App Launcher.

To open the App Launcher: select the App Launcher on any Salesforce page from the Force.com App Menu.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To use an app:

- Access to that app as specified in your user profile or permission set.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To see the App Launcher:

- "Use Identity Features"

In the App Launcher, click an installed app icon to launch the app.

SEE ALSO:

- [App Launcher](#)
- [User Permissions and Access](#)
- [Connected Apps](#)

Open a Different App in Lightning Experience

Use Search or the App Launcher to navigate between all of your apps.

-  **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

To open an app, you have 2 options.

- Use the `Search Salesforce` box at the top of any Salesforce page. Start typing the name of the app, such as "Marketing," and click the result as it appears. This search works for custom apps and connected apps, too. The search doesn't allow wildcard character searches for apps. However, partial words do generate app search results as you type (such as "Mark").

EDITIONS

Available in: Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To use an app:

- Access to that app as specified in your user profile or permission set.

- In the upper-right corner of any Salesforce page, click the App Launcher icon.

The App Launcher displays all of your available Salesforce apps, and any connected apps your administrator has installed.

You can have one Salesforce app open at a time, and the app you have open will open the next time you log on to Salesforce.

You can open multiple connected apps simultaneously. Connected apps are apps your administrator installs to help you get your work done, such as Gmail™ and Microsoft Office 365™. Each connected app opens in a new window, so set your pop-up blocker to allow pop-ups from here, or the connected app doesn't open.

Drag an app icon from one position to another, and sort them by the apps you use most.

Don't see what you want? Click **Other Items** to see more apps, objects, and items. Or, ask your administrator if more apps are available.

[App Launcher](#)

[User Permissions and Access](#)

[Connected Apps](#)

Find Setup

How you find Setup depends on which Salesforce experience you're using and on your organization's user interface settings.

Salesforce includes many options for setting up, maintaining, and customizing your organization. Some organizations also have options for building, packaging, and distributing their own apps. These options are all available from the Setup menu. If you're a Salesforce administrator or developer, you use the Setup menu frequently. Your organization's user interface settings determine how everyone in your organization accesses this menu.

1. Look at the top of any Salesforce page.
 - If you're using Lightning Experience, click , then select **Setup Home**.
 - If you're using Salesforce Classic and you see **Setup** in the user interface header, click it.
 - If you're using Salesforce Classic and you don't see **Setup** in the header, click your name, then select **Setup**.
2. Enter the name of the page that you want in the **Quick Find** box, then select the appropriate page from the menu.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**.

 **Tip:** Type the first few characters of a page's name in the `Quick Find` box. As you type, pages that match your search terms appear in the menu. For example, to find the Language Settings page, type `Lang` in the `Quick Find` box, then select **Language Settings**.

SEE ALSO:

[Find Your Personal Settings in Salesforce Classic](#)

Set Up Your Chatter Profile

Your Chatter profile communicates who you are to your coworkers and any customers you communicate with. It features your photo and basic information like your professional title and contact details.

Set up your Chatter profile soon after you begin using Salesforce, and update it often.

 **Note:** If your organization doesn't use Chatter, you can still [add and edit personal information](#).

1. Click the **Chatter** tab and find the placeholder profile image on the left side of the page. Click *Your Name* next to the placeholder image.
2. To update your profile photo, hover over the placeholder image and click **Add Photo**.

 **Tip:** Use a photo of you and not a group of people or a pet. Chatter is a business tool, so choose a photo you don't mind showing to your boss and CEO.

3. To update your contact information, click  under your profile photo. In the **Edit Profile** box, complete the fields on the Contact tab and the About tab.

 **Tip:** Complete your profile with details about the department you work in, your past experience, or projects you are currently working on.

4. Click **Save All**.

SEE ALSO:

[Edit Your Personal Information](#)

Personalize Your Salesforce Experience

Salesforce includes personal settings options to help you personalize your experience. Depending on which experience of Salesforce you have enabled, these settings are located in different parts of the application.

[Find Your Personal Settings in Lightning Experience](#)

If you use Lightning Experience, your personal settings are located either in Personal Setup or My Settings.

[Find Your Personal Settings in Salesforce Classic](#)

If you use Salesforce Classic, your personal settings are located either in Personal Setup or My Settings.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager,** and **Developer** Editions

Find Your Personal Settings in Lightning Experience

If you use Lightning Experience, your personal settings are located either in Personal Setup or My Settings.

1. At the top of any Salesforce page, click your image.
2. Click **Settings**.
3. On the left side of the page, click a menu item to display its sub-menu, then click the item you want.

 **Tip:** To quickly find a page, type the first few characters of its name in the **Quick Find** box. As you type, pages that match your search terms appear in the menu. For example, to find the Personal Information page, type *pers* in the **Quick Find** box.

EDITIONS

Available in: Lightning Experience

Available in: **All** editions except **Database.com**.

Find Your Personal Settings in Salesforce Classic

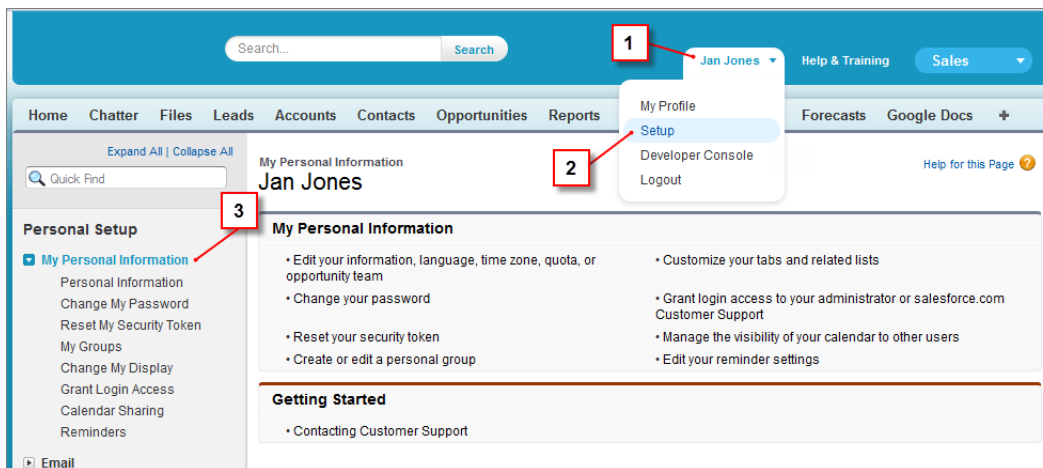

If you use Salesforce Classic, your personal settings are located either in Personal Setup or My Settings.

1. At the top of any Salesforce page, click the down arrow next to your name.
Depending on your organization's user interface settings, you should see either **Setup** or **My Settings** in the menu.
2. From the menu under your name, click **Setup** or **My Settings**.
3. Do one of the following:
 - If you clicked **Setup**, look on the left side of the page and click a menu item to display its sub-menu, then click the item you want.

EDITIONS

Available in: Salesforce Classic

Available in: **All** editions except **Database.com**.

- If you clicked **My Settings**, look on the left side of the page and click a menu item under My Settings to display its sub-menu, then click the item you want.

Tip: To quickly find a page, type the first few characters of its name in the **Quick Find** box. As you type, pages that match your search terms appear in the menu. For example, to find the Personal Information page, type *pers* in the **Quick Find** box.

Get to Know Your Salesforce Admin

Your Salesforce administrator—or “admin” as you may choose to call them—is a Salesforce user with system administration duties and other super powers. Admins are responsible for setting up Salesforce for their organizations and making sure it runs smoothly. Admins have a special profile, which lets them add users and specify what they can see and do in Salesforce. Admins can make everyone more productive by creating custom Salesforce objects, workflows, validation rules, reports, and more. Admins are planners, problem-solvers, and heroes.

All Salesforce organizations have at least one administrator, but larger ones may have more. Your administrator’s role can be as simple or as complex as your company’s size and structure. In smaller organizations, the admin might be someone who also uses Salesforce the way other users do: to sell products or provide customer service, for example. Many hats, one big brain.

Salesforce offers lots of features and items (such as those detailed in the *Learn Salesforce Basics* guide) that you can set up and configure yourself. It’s quite satisfying! For some things, though, you should partner with your trusty admin. They’ll help you get the best of what Salesforce has to offer and make sure you have a successful and productive experience.

Here are a few examples of the kinds of things your admin can help you with or do for you.

- Find or use an object, field, or feature you heard about during training.
- Create a custom workflow to find out when a case is closed.
- Create a custom approval process to sign off on employee expenses.
- Create a custom report for your sales region.
- Give you a user permission that’s not granted as part of your user profile.
- Answer questions about your own or others’ access to records.
- Address those cursed error messages that ask you to contact your administrator for help or more information.

How you contact your administrator, and when and why, depends on your company's internal business policies and practices. Need to find out exactly what those are? Ask your administrator!

[Grant Login Access](#)

Why Can't I See Some Features?

Because Salesforce is highly customizable, you might not have access to all of the product features.

You might learn about new Salesforce features in our help documentation and training videos. However, sometimes you'll find you can't access these through your interface. This might happen for several reasons.

- You may need to adjust your custom page views or install external apps to enable the feature.
- Your permissions and access settings for some features are limited.
- Your company customized Salesforce so that some standard objects and fields have different names, or created their own custom objects and fields.
- The feature you're looking for isn't offered in the Salesforce edition or the Salesforce experience that your company uses.

Tips for New Users

Learn the tips you need to be a fast, productive Salesforce user on day one.

New users should keep these tips in mind:

- When you click on an object to find your data, you won't see a full list of your existing records—Salesforce keeps those tucked out of view until you manually recall them, in case you want to choose a subset of the full list. Choose an option within *View*, and click **Go!**

- *Related lists* are links featured at the bottom of object pages. Related lists provide quick access to other related objects that you might want to visit next. This feature adds a lot of value, because it gives you fast access to information you likely need next. It means less navigation and can speed up your workflow. In the Accounts object, your related lists might look like this:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All editions

EDITIONS

Available in: Salesforce Classic

Available in: All Editions

Account Detail			
Account Owner	Matt Wilson [Change]	Phone	1-408-555-2091
Account Name	ABC Labs [View Hierarchy]	Fax	1-408-555-2092
Parent Account		Website	http://www.ABCLabs.net
Prospect Rating Warm			
▼ Sales Region			
Region		Zone	
▼ Additional Information			
Type	Customer	Employees	120

▼ Support Plan Information			
Has Support Plan	Support Plan Expiration Date		7/2/2014
Description			
▼ Address Information			
Billing Address	54 Park Drive San Jose, CA 95035 USA	Shipping Address	54 Park Drive San Jose, CA 95035 USA

Salesforce delivers the application with some standard related lists, but administrators can also customize some related list items.

- If you read or hear about a feature that you don't see in your own interface, don't worry. Your administrator can customize it to meet your organization's needs. If your administrator hasn't enabled help for the customization, contact them.
- Our help and training materials might mention a feature that your company hasn't enabled, or that your permissions profile doesn't allow you to see. If you believe this feature should be in your interface, or might help you in your job, contact the Salesforce administrator at your company. Not sure who that is? Reach out to the person at your company who introduced you to Salesforce.
- Save your work! It's easy to spend a lot of time updating the fields in a record and then to navigate away from that screen without saving. Make a habit of seeking out the save button before clicking away through another page element.

Available in: All Editions.

[Edit Your Language and Locale Settings](#)[Edit Your Email Settings](#)

Edit outgoing email settings to specify the name that appears as well as an optional signature. You can also specify a return address, and opt to automatically send BCC emails to yourself at the return address.

[Set Record Type Preferences](#)

Set an option to automatically insert your default record type when creating new records. Using this setting, you can bypass the page prompting you to select a record type. If you have several different record types available to you, you may prefer to be prompted to select a record type every time you create a new record.

[Update Your Contact Information](#)

Update your contact information at any time on your profile page. Your contact information is visible to everybody in your company.

[Add Tabs for Frequently Used Items](#)

The Salesforce Classic user interface is composed of tabs that serve as starting points for viewing, adding, and editing information for an object. Different apps can have different sets of tabs. Add tabs for items you use frequently in any app.

[Customize Your Display](#)

You can customize your Salesforce display through your personal settings.

[Available Salesforce Tabs](#)[Accessibility Standards](#)

Learn about the standards Salesforce follows to design applications with accessibility in mind.

[View and Display FAQ](#)[Salesforce Pages](#)

Salesforce apps are made up of tabs and pages. Standard objects such as Accounts, Contacts, and Leads, and other features such as Chatter typically have tabs, and from a tab, you navigate through pages to interact with the features you're using. For example, if you want to create an account record, you'll click the Accounts Tab, and land on the Accounts Home page.

[The Home Tab](#)

From the Home tab, you can create a Chatter post, view dashboard snapshots, view your tasks and calendar, and search the feed ().

[Troubleshoot Login Issues](#)

Can't log in? Forgot your username or password, or you're locked out from too many login attempts? To resolve login problems, try these solutions.

Verify Your Identity

Easily verify your identity when logging in from outside a trusted IP range. Verifying your identity helps prevent unauthorized access to your Salesforce account.

[Activating Your Computer](#) (1:29 minutes)

When you log in to Salesforce from a browser or application that we don't recognize, and your IP address is outside a trusted IP range, you're prompted to verify your identity.

Salesforce asks you to verify your identity using one of the following verification methods.

Salesforce Authenticator Mobile App

If you connected the Salesforce Authenticator app (version 2 or later) to your account, use the app to verify your Salesforce account activity. Salesforce sends a push notification to your mobile device. When you get the notification, open the app, verify the activity details, and tap **Approve** on your mobile device.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

One-Time Password Generator App

If you connected an authenticator app (like Salesforce Authenticator or Google Authenticator) to your account, use the mobile app to generate a verification code. This type of code is sometimes called a “time-based one-time password.” The code value changes periodically.

SMS Text Message

If you have a verified mobile number associated with your account, you receive a verification code in a text message sent to your phone. If you don't have a verified mobile number, you're prompted to register one when you log in to Salesforce. Registering your mobile phone number verifies it and enables this method when you're challenged in the future. If your mobile number changes, contact your Salesforce admin.

Email

Salesforce sends a verification code in an email to the address associated with your account. The code expires after 24 hours.

The identity verification page includes a “Don't ask again” option, which is selected by default. If you leave the option selected and click **Verify**, Salesforce doesn't ask you to verify your identity again when you log in from the same browser or application. Exceptions are if you manually clear browser cookies, set your browser to delete cookies, or browse in private or incognito mode. In these cases, you're prompted to verify your identity every time you log in to Salesforce from an IP address that's not defined as trusted for your org.

 **Note:** When you log in from a public or shared device, deselect **Don't ask again**. Deselecting this option ensures that subsequent users have to verify their identity when they log in from that device.

[Connect Salesforce Authenticator \(Version 2 or Later\) to Your Account for Identity Verification](#)

You can connect version 2 or later of the Salesforce Authenticator mobile app to your account. Use the app whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in or access reports or dashboards, use the app to verify your account activity. If you're required to use two-factor authentication before you have the app connected, you're prompted to connect it the next time you log in to Salesforce. If you don't yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

[Connect a One-Time Password Generator App or Device for Identity Verification](#)

You can connect a one-time password generator app, such as Salesforce Authenticator or Google Authenticator, to your account. Use a verification code generated by the app, sometimes called a “time-based one-time password,” whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in, access connected apps, or access reports or dashboards, use a code from the app. If you're required to use two-factor authentication before you have an app connected, you're prompted to connect one the next time you log in to Salesforce. If you don't yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

[Verify Your Identity with a Temporary Code](#)

When you can't access the device you usually use for two-factor authentication, ask your Salesforce admin to give you a temporary identity verification code. The code is valid for 1 to 24 hours. Your admin sets the expiration time, but you can expire the code early if you no longer need it.

Connect Salesforce Authenticator (Version 2 or Later) to Your Account for Identity Verification

You can connect version 2 or later of the Salesforce Authenticator mobile app to your account. Use the app whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in or access reports or dashboards, use the app to verify your account activity. If you're required to use two-factor authentication before you have the app connected, you're prompted to connect it the next time you log in to Salesforce. If you don't yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

The Salesforce Authenticator (version 2 or later) app on your mobile device is the second "factor" of authentication. Using the app adds an extra level of security to your account. Once you connect the app, you get a notification on your mobile device whenever you do something that requires identity verification. When you get the notification, open the app on your mobile device, check the activity details, and respond on your mobile device to verify. If you get a notification about activity you don't recognize, use the app to block the activity. You can flag the blocked activity for your Salesforce admin. The app also provides a verification code you can use as an alternate method of identity verification.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

1. Download and install version 2 or later of the Salesforce Authenticator app for the type of mobile device you use. For iPhone, get the app from the [App Store](#). For Android devices, get the app from [Google Play](#).
If you previously installed version 1 of Salesforce Authenticator on your mobile device, you can update the app to version 2 through the App Store or Google Play. The update preserves any connected accounts you already have in the app. These accounts are code-only accounts that generate verification codes but don't receive push notifications or allow location-based automated verifications. Code-only accounts appear on your Connected Accounts list without a > at the far right of the account name row, and there's no account detail page. If you have a code-only account for the username you used for your current login to Salesforce, swipe left in the app to remove that username before proceeding. In the following steps, you connect the account for that username again. The new connected account gives you full Salesforce Authenticator version 2 functionality: push notifications, location-based automated verifications, and verification codes.
2. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
3. Find **App Registration: Salesforce Authenticator** and click **Connect**.
4. For security purposes, you're prompted to log in to your account.
5. Open the Salesforce Authenticator app on your mobile device.
If you're opening the app for the first time, you see a tour of the app's features. Take the tour, or go straight to adding your Salesforce account to the app.
6. In the app, tap **+** to add your account.
The app generates a unique two-word phrase.
7. Back in your browser, enter the phrase in the **Two-Word Phrase** field.
8. Click **Connect**.
If you previously connected an authenticator app that generates verification codes to your account, you sometimes see an alert. Connecting version 2 or later of the Salesforce Authenticator mobile app invalidates the codes from your old app. When you need a verification code, get it from Salesforce Authenticator from now on.
9. In the Salesforce Authenticator app on your mobile device, you see details about the account you're connecting. To complete the account connection, tap **Connect** in the app.

To help keep your account secure, we send you an email notification whenever a new identity verification method is added to your Salesforce account. You get the email whether you add the method or your Salesforce admin adds it on your behalf.

Connect a One-Time Password Generator App or Device for Identity Verification

You can connect a one-time password generator app, such as Salesforce Authenticator or Google Authenticator, to your account. Use a verification code generated by the app, sometimes called a “time-based one-time password,” whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in, access connected apps, or access reports or dashboards, use a code from the app. If you’re required to use two-factor authentication before you have an app connected, you’re prompted to connect one the next time you log in to Salesforce. If you don’t yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in all editions

1. Download the supported authenticator app for your device type. You can use any authenticator app that supports the time-based one-time password (TOTP) algorithm ([IETF RFC 6238](#)), such as [Salesforce Authenticator for iOS](#), [Salesforce Authenticator for Android](#), or Google Authenticator.
2. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
3. Find **App Registration: One-Time Password Generator** and click **Connect**.
4. For security purposes, you’re prompted to log in to your account.
5. Using the authenticator app on your mobile device, scan the QR code.
Alternatively, you can click **I Can’t Scan the QR Code** in your browser. The browser displays a security key. In the authenticator app, enter your username and the key displayed.
6. In Salesforce, enter the code generated by the authenticator app in the **Verification Code** field.
The authenticator app generates a new verification code periodically. Enter the current code.
7. Click **Connect**.

To help keep your account secure, we send you an email notification whenever a new identity verification method is added to your Salesforce account. You get the email whether you add the method or your Salesforce admin adds it on your behalf.

[Personalize Your Salesforce Experience](#)

Verify Your Identity with a Temporary Code

When you can't access the device you usually use for two-factor authentication, ask your Salesforce admin to give you a temporary identity verification code. The code is valid for 1 to 24 hours. Your admin sets the expiration time, but you can expire the code early if you no longer need it.

If your Salesforce admin has given other users permission to help you with two-factor authentication, they can give you a temporary code. Your company's Help Desk or support staff, for example, sometimes has this permission.

1. Ask your Salesforce admin (or someone designated by your admin) for a temporary identity verification code.
Your admin sets how long the code is valid. You can use the code multiple times until it expires. You get an email notification whenever your admin generates a temporary code for you.
2. Enter the temporary code where prompted in the identity verification screen.
3. If you don't need the code any more and it's still valid, expire the code.
 - a. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
 - b. Find **Temporary Verification Code** and click **Expire Now**.

Add Tabs for Frequently Used Items

The Salesforce Classic user interface is composed of tabs that serve as starting points for viewing, adding, and editing information for an object. Different apps can have different sets of tabs. Add tabs for items you use frequently in any app.

1. Click the Plus icon () to the right of your current tabs.
The All Tabs page appears. By default, it shows all the tabs you have available to view or add.
2. If you want to see a list of just the tabs for a specific app, select that app from the View drop-down list.
3. Click **Customize My Tabs**.
4. In the Custom App drop-down list, select the app where you want the tab to appear.
For example, if you want the Ideas tab to appear in your Marketing app, select *Marketing* and the Ideas tab will appear in that app only.
5. Use the Add, Remove, Up, and Down arrows to customize which tabs appear in the app, and their order.
6. Click **Save**.
7. If you added a tab to an app you're not actively using, open that app to see your new tab.

Customize Your Display

You can customize your Salesforce display through your personal settings.

- [Customize which tabs display in your app and in what order](#)
- [Customize what displays on your pages](#)

Customize Your Tabs

Specify which tabs display when you log in, or if you have multiple apps, which tabs display in each app.

Customize Your Pages

Specify the related lists that appear in detail pages.

Customize Your Tabs

Specify which tabs display when you log in, or if you have multiple apps, which tabs display in each app.

1. From your personal settings, enter *Customize My* in the **Quick Find** box, then select **Customize My Tabs**. No results? Enter *Display* in the **Quick Find** box, then select **Change My Display**.
2. If you have access to multiple apps, select the app whose tabs you want to customize from the **Custom Apps** drop-down list.
By default, you'll see the tabs for the selected custom app that are set for your profile.

Note: The first tab that displays when you select an app may change if your administrator changes the app's default landing tab.

3. If desired, add each tab you want to display and change the display order of the tabs you've selected.
4. Save your changes.

Customize Your Pages

Specify the related lists that appear in detail pages.

1. From your personal settings, enter *Customize My* in the **Quick Find** box, then select **Customize My Pages**. No results? Enter *Display* in the **Quick Find** box, then select **Change My Display**.

For your Home tab, select the dashboard snapshot to display on the Home tab. The link to customize your Home tab is available only if your administrator has customized your home page layout to include a dashboard.

For all other tabs, specify which related lists display on your detail pages.

- To add or remove related lists, select a related list and click the **Add** or **Remove** arrow.

Accessibility Standards

Learn about the standards Salesforce follows to design applications with accessibility in mind.

Salesforce is committed to providing on-demand enterprise applications accessible to all individuals, including users working with assistive devices, such as speech recognition software and screen readers. To help meet our goal of universal design, Salesforce follows the internationally recognized best practices in Section 508 of the Rehabilitation Act and the Web Content Accessibility Guidelines (WCAG) 2.0 Level AA to the extent possible.

Our [Voluntary Product Accessibility Template \(VPAT\)](#) is a tool used to document a product's conformance with the accessibility standards under Section 508 of the Rehabilitation Act and includes an accessibility assessment of our products.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

General Accessibility Requirements

Consider these requirements when using Salesforce.

- JavaScript support must be available and turned on.
- After a specified period of inactivity, a session timeout popup window automatically displays, prompting you to log out or continue working. Your administrator can set this time interval or disable it altogether. Your browser must allow pop-ups in Salesforce; otherwise you won't receive a warning about the upcoming timeout.

- Pilot and Beta features may not be accessible.

Recommended Browsers

For general accessibility testing, Salesforce uses the most current version of Mozilla® Firefox® and Microsoft® Internet Explorer® on Windows®, and Apple® Safari® on OS X®.

Contacting Salesforce with Accessibility Concerns

To access documentation and knowledge base articles or to contact customer support, click the **Help & Training** link at the top of any page.

To report any accessibility concerns or to request an alternate format of any document, send an email to accessibility@salesforce.com.

- 📧 **Note:** Customer support is not available for Personal and Developer Edition users. In addition, knowledge base access is not available for Developer Edition users. All users are welcome to contact accessibility@salesforce.com in English with any accessibility-related queries.

[Recommendations for Salesforce Accessibility](#)

Learn about Salesforce accessibility features designed for users working with assistive devices, such as speech recognition software and screen readers.

Accessibility Mode

Learn how accessibility mode changes your experience using Salesforce.

Salesforce includes an alternate user interface mode that lets users with assistive devices, such as speech recognition software and screen readers, work with Salesforce more effectively. Most new features are designed with accessibility in mind and are inherently accessible in the standard mode. However, you may find that accessibility mode better suits your needs, particularly when using speech recognition or screen reading software to create reports and dashboards or interact with list views.

Accessibility mode includes the full functionality of Salesforce with the modifications detailed here to create a better experience for users with assistive devices.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All Editions except Database.com**

Accessibility Mode Features that Enhance Usability

- Access setup pages from a Setup link at the top of the page.
- Drop-down menus include a **Go** button that you select to navigate to the option you choose in the drop-down list.
- Menu buttons are rendered as a drop-down list with a **Go** button.
- Overlay pages are rendered as separate pop-up windows.
- The HTML editor is replaced with a text box. This text box only accepts HTML and does not recognize plain text entries like carriage returns. To separate content, you must use paragraph or line break HTML tags.

- When viewing a dashboard, the `View Dashboard` auto-complete filter is replaced with a standard drop-down menu.
- The **Edit Columns** link on the Manage Members page, accessible via the Manage Members drop-down on a campaign detail page, becomes a drop-down button. The Edit Columns overlay is replaced by a standard setup page.
- Clicking a requested meeting in the Open Activities related list and in some list views doesn't open the meeting detail page. Instead, a dialog opens that instructs you to contact the meeting organizer for details about the requested meeting.
- The **Turn My Email On** drop-down list on a Chatter group displays as a **Chatter Email Settings** link that opens your settings for receiving Chatter email.

Disabled Calendar Features

- Event detail overlays in the calendar view
- Drag-and-drop editing
- Drag-and-drop scheduling
- Click-and-create events
- The **New Meeting Request** button on the Open Activities related list

Note: As a result, you can't request a meeting in accessibility mode, and the Requested Meetings subtab in the Calendar section of the Home tab doesn't display any meetings.

Disabled Report and Dashboard Features

- Drag-and-drop editing in the dashboard builder
- Creating and editing reports in report builder

Note: Report builder is required to create or edit joined reports and reports containing cross filters or buckets. Users with accessibility mode enabled can run those reports, but can't create or edit them. To create reports in accessibility mode, you must use the report wizard.

- Drag-and-drop to move reports and dashboards between folders

Disabled List View Features

- Related list hover links
- These enhanced list features:
 - Inline editing
 - Rearranging and adjusting the width of columns
 - Editing, deleting, or refreshing the current list view
 - Changing the number of records displayed per page
 - Jumping to a specific page of results

Other Disabled Features

- The **Check Spelling** button for solutions
- The latest Manage Members page
- The **Recent Tags** drop-down menu when you add the tag component to the sidebar
- When finding similar opportunities, the Match Criteria sidebar on the search results page

- The list of similar questions as you type a question in an answers community

Tip: Users with accessibility mode enabled should use the search box on the Answers tab to see if their question has already been asked before they post their question.

Enable Accessibility Mode

Optimize your experience using Salesforce with assistive devices, such as speech recognition software and screen readers, by enabling accessibility mode.

1. From your personal settings, enter *Accessibility* in the **Quick Find** box, then select **Accessibility**. No matching results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Select **Accessibility Mode**.
3. Click **Save**.

Here are some recommendations to help you work with Salesforce.

- [Sighted Keyboard Users](#)
- [Screen Reader Users](#)
- [Deaf or Hearing Impaired Users](#)
- [Specific Color Users](#)
- [Low-Vision Users Who Need Magnification](#)

SEE ALSO:

- [Enable Accessibility Mode](#)

Sighted Keyboard Users

These Salesforce features help ensure an accessible experience.

- Accessibility Mode helps you work more effectively with Salesforce, particularly reports, dashboards, and list views. See [Accessibility Mode](#) on page 64 for more information.
- Selected areas on the screen include highlights to give you an on-screen visual indication of focus.
- These elements are identified in our page markup to help you interact with them.
 - Headings are marked up as headings rather than field set and legend elements for grouping form controls.
 - The main heading for the page (typically at the start of the main content area) is a level 1 heading. You can shift to this heading with a shortcut key.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

- Data tables have data table markup (except enhanced listviews in Standard Mode only) to aid identification of headers for each cell.
- Lists provided in the main content area are marked up as lists.
- A skip link (the first keyboard-focusable link on each page) allows you to shift the focus to the start of the main content area. This generally bypasses the navigational menus before the main content area, greatly reducing the number of tab presses that would otherwise be required to reach the main content area of the page.
- Keyboard focus is placed inside of dialog boxes when they open and will remain locked there until the dialog is closed.
- On edit pages, the keyboard focus defaults to the first editable field on the page. When creating or editing a task or event, the keyboard focus defaults to the Subject field, regardless of its location on the page.
- Buttons, links, and fields that aren't currently active are labeled with a “disabled” attribute. For example, when using a wizard with multiple steps, some buttons may be disabled until you select a specific option.

Screen Reader Users

Salesforce on-demand applications are designed to take advantage of the latest features of the most widely used screen reading software. Although you might find that many browser and screen reader combinations work well, we recommend you use the most current versions of Mozilla® Firefox® and JAWS® or NVDA with Salesforce.

These Salesforce features help ensure an accessible experience:

- Accessibility Mode helps you work more effectively with Salesforce, particularly reports, dashboards, and list views. See [Accessibility Mode](#) on page 64 for more information.
- Important images have text alternatives equivalent to the purpose of the image; non-important images have empty text equivalents or are implemented through CSS. Images showing detailed information are also links to source data. For example, Dashboards contain charts and graphs that are visual in nature. To access the report data used to generate the chart or graph, simply select the dashboard component.
-  **Note:** The underlying report may contain additional data than what is represented in the dashboard component. In addition, the underlying report may contain some data that you don't have access to view due to sharing settings.
- These elements are identified in our page markup to help you interact with them.
 - Headings are marked up as headings rather than field set and legend elements for grouping form controls.
 - The main heading for the page (typically at the start of the main content area) is a level 1 heading. You can shift to this heading with a shortcut key.
 - Data tables have data table markup (except enhanced listviews in Standard Mode only) to aid identification of headers for each cell.
 - Lists provided in the main content area are marked up as lists.
- A skip link (the first keyboard-focusable link on each page) allows you to shift the focus to the start of the main content area. This generally bypasses the navigational menus before the main content area, greatly reducing the number of tab presses that would otherwise be required to reach the main content area of the page.
- Keyboard focus is placed inside of dialog boxes when they open and will remain locked there until the dialog is closed.
- On edit pages, the keyboard focus defaults to the first editable field on the page. When creating or editing a task or event, the keyboard focus defaults to the Subject field, regardless of its location on the page.
- Buttons, links, and fields that aren't currently active are labeled with a “disabled” attribute. For example, when using a wizard with multiple steps, some buttons may be disabled until you select a specific option.

In addition, we recommend you enable these personalized web settings in your screen reader:

- Set pages to refresh automatically.

- Turn on live region update announcements.
- Set text links to show titles. This setting ensures the screen reader announces information provided through a link's title attribute, such as a warning that a new window will open.
- Set headings to announce Headings and Levels. Heading markup is used to provide context as well as navigation.
- Add common signs, such the @ (at) sign for mentioning people in Chatter posts and comments, to your screen reader dictionary to customize how they're announced by default.

Deaf or Hearing Impaired Users

Salesforce provides video demos hosted on YouTube. To view synchronized captions for videos, click `Watch on YouTube.com` in the bottom-right corner of embedded videos.

Specific Color Users

Browser and operating system settings don't change the colors displayed within images, and Salesforce implements many images as background images (which aren't displayed when browser and operating system settings for color display are in effect). If you rely on browser settings and your operating system to change your display to a particular color combination, you may need to:

- Display image text alternatives to access information provided by important images.
- Override our CSS for these classes: `assistiveText`, `zen-assistiveText`. Then set your browser settings according to your preferences.

In addition:

- Some charts (for example, in reports and dashboards) rely on color to display information. If you have trouble interpreting the information in charts, select `Color-Blind Palette on Charts` from your personal detail page. This option sets an alternate color palette for charts that has been optimized for use by color-blind users. Dashboard emails don't use the alternate palette. You can also click a chart to view its source report.
- Dashboards contain charts and graphs that are visual in nature. To access the report data used to generate the chart or graph, simply select the dashboard component.

Note: The underlying report may contain additional data than what is represented in the dashboard component. In addition, the underlying report may contain some data that you don't have access to view due to sharing settings.

Low-Vision Users Who Need Magnification

Salesforce supports standard OS-level, browser, and third-party magnification tools. Adjust the zoom setting to suit your needs.

These elements are identified in our page markup. You can alter the styles for these elements to help you identify them.

- Headings are marked up as headings rather than field set and legend elements for grouping form controls.
- The main heading for the page (typically at the start of the main content area) is a level 1 heading. You can shift to this heading with a shortcut key.
- Data tables have data table markup (except enhanced listviews in Standard Mode only) to aid identification of headers for each cell.
- Lists provided in the main content area are marked up as lists.

View and Display FAQ

[Which Languages Does Salesforce Support?](#)

[Why can't I see some buttons and links?](#)

[Why can't I view Salesforce popup windows such as lookup dialogs and the Help & Training window?](#)

[Why did my data disappear when I pressed the Backspace key while editing a record?](#)

[Can I change or delete the drop-down list of entries that appears when I edit a text field?](#)

Which Languages Does Salesforce Support?

Salesforce offers three levels of language support: [fully supported languages](#), [end-user languages](#), and [platform-only languages](#). Each language is identified by a two-character language code, such as `en`, or a five-character locale code, such as `en_AU`.

 **Note:** Setting a default locale is different from setting a default language.

In addition to the Salesforce language support, you can localize your organizations in two ways. The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

The second option is to rename tabs and fields in Salesforce. If your custom application uses only a few standard Salesforce tabs and fields, you can translate them.

Fully Supported Languages

You can change the language for all features, including Help, to one of the following fully supported languages from Setup by entering *Company Information* in the Quick Find box, selecting **Company Information**, then selecting **Edit**.

- Chinese (Simplified): `zh_CN`
- Chinese (Traditional): `zh_TW`
- Danish: `da`
- Dutch: `n1_NL`
- English: `en_US`
- Finnish: `fi`
- French: `fr`
- German: `de`
- Italian: `it`
- Japanese: `ja`
- Korean: `ko`
- Norwegian: `no`
- Portuguese (Brazil): `pt_BR`
- Russian: `ru`
- Spanish: `es`
- Spanish (Mexico): `es_MX`
- Swedish: `sv`
- Thai: `th`

-  **Note:**
- Spanish (Mexico) falls back to Spanish for customer-defined translations.
 - Even though the Salesforce user interface is fully translated to Thai, Help remains in English.

End-User Languages

End-user languages are useful if you have a multilingual organization or partners who speak languages other than your company's default language. For end-user languages, Salesforce provides translated labels for all standard objects and pages, *except* administrative pages, Setup, and Help. When you specify an end-user language, labels and Help that aren't translated appear in English. End-user languages are intended only for personal use by end users. Don't use end-user languages as corporate languages. Salesforce doesn't provide customer support in end-user languages.

End-user languages include:

- Arabic: `ar`
- Bulgarian: `bg`
- Croatian: `hr`
- Czech: `cs`
- English (UK): `en_GB`
- Greek: `el`
- Hebrew: `iw`
- Hungarian: `hu`
- Indonesian: `in`
- Polish: `pl`
- Portuguese (Portugal): `pt_PT`
- Romanian: `ro`
- Slovak: `sk`
- Slovenian: `sl`
- Turkish: `tr`
- Ukrainian: `uk`
- Vietnamese: `vi`

 **Note:** Salesforce provides limited support for right-to-left languages—Arabic and Hebrew—for the following features.

- Live Agent
- Cases
- Accounts

These features are not supported in Lightning Experience, the Salesforce1 mobile app, any other mobile app or mobile browser, or any user interface except Salesforce Classic. There is no guarantee that right-to-left languages function correctly with any other Salesforce features. There are no plans to expand the list of supported features.

Features that aren't supported for right-to-left languages include, but are not limited to, the following.

- Report Builder
- Generating quote PDFs
- Customizable forecasting
- Emails
- Salesforce Knowledge
- Feeds
- Communities

The absence of a feature from this list does not imply support. Only Live Agent, Cases, and Accounts are supported with right-to-left languages.

Platform-Only Languages

In situations where Salesforce doesn't provide default translations, use platform-only languages to localize apps and custom functionality that you've built on the Salesforce App Cloud. You can translate items such as custom labels, custom objects, and field names. You can also rename most standard objects, labels, and fields. Informative text and non-field label text aren't translatable.

Platform-only languages are available in all places where you can select a language in the application. However, when you select a platform-only language, all standard Salesforce labels default to English or, in select cases, to an end-user or fully supported language.

When you specify a platform-only language, labels for standard objects and fields fall back to English, except:

- English (Australia), English (India), English (Malaysia), and English (Philippines) fall back to English (UK).
- German (Austria) and German (Switzerland) fall back to German.
- French (Canada) falls back to French.
- Romanian (Moldova) falls back to Romanian.
- Montenegrin falls back to Serbian (Latin).
- Portuguese (Portugal) falls back to Portuguese (Brazil).

The following platform-only languages are currently supported.

- Albanian: `sq`
- Arabic (Algeria): `ar_DZ`
- Arabic (Bahrain): `ar_BH`
- Arabic (Egypt): `ar_EG`
- Arabic (Iraq): `ar_IQ`
- Arabic (Jordan): `ar_JO`
- Arabic (Kuwait): `ar_KW`
- Arabic (Lebanon): `ar_LB`
- Arabic (Libya): `ar_LY`
- Arabic (Morocco): `ar_MA`
- Arabic (Oman): `ar_OM`
- Arabic (Qatar): `ar_QA`
- Arabic (Saudi Arabia): `ar_SA`
- Arabic (Sudan): `ar_SD`
- Arabic (Syria): `ar_SY`
- Arabic (Tunisia): `ar_TN`
- Arabic (United Arab Emirates): `ar_AE`
- Arabic (Yemen): `ar_YE`
- Armenian: `hy`
- Basque: `eu`
- Bosnian: `bs`
- Bengali: `bn`

- Chinese (Simplified—Singapore): zh_SG
- Chinese (Traditional—Hong Kong): zh_HK
- English (Australia): en_AU
- English (Canada): en_CA
- English (Hong Kong): en_HK
- English (India): en_IN
- English (Ireland): en_IE
- English (Malaysia): en_MY
- English (Philippines): en_PH
- English (Singapore): en_SG
- English (South Africa): en_ZA
- Estonian: et
- French (Belgium): fr_BE
- French (Canada): fr_CA
- French (Luxembourg): fr_LU
- French (Switzerland): fr_CH

[Enable and Disable the Translation Workbench](#)

Why can't I see some buttons and links?

Buttons and links only display for users who have the appropriate permissions to use them. For example, users who do not have the “Delete” permission on opportunities do not see the **Delete** button on an opportunity detail page nor do they see the **Del** link on an opportunity related list.

Why can't I view Salesforce popup windows such as lookup dialogs and the Help & Training window?

If your browser's popup blocker settings are configured for maximum security, you won't be able to view any popup windows within Salesforce—even those that provide necessary functionality such as the calendar popup for choosing a date on an activity, lookup dialogs for selecting a record, the Help & Training window, and more.

To test your popup settings:

1. From your personal settings, enter *Reminders* in the **Quick Find** box, then select **Reminders & Alerts**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Click **Preview Reminder Alert**.

To allow popup windows for Salesforce, add Salesforce as a trusted site within your browser's popup blocker settings. Consult the online help for your browser for specific instructions.

Some browser add-ons, like the Google toolbar, also have popup blocking. Consult your software documentation on those products for details on how to configure them to allow popup windows from Salesforce.

SEE ALSO:

[Personalize Your Salesforce Experience](#)

Why did my data disappear when I pressed the Backspace key while editing a record?

Some versions of Internet Explorer use the Backspace key as a keyboard shortcut for the browser's Back button. When you press the Backspace key and your cursor is not within a text field, the browser goes back to the previous page, making it appear that your data has been lost. To retrieve your data and return to the page you were working on, click your browser's Forward button.

Can I change or delete the drop-down list of entries that appears when I edit a text field?

No. These auto-complete entries that appear when you are editing certain text fields are a feature of Internet Explorer. The browser remembers text you have entered previously and provides a list of those entries for you to automatically complete the field. If you would like to turn this feature off, click **Tools** on your browser's menu bar, select **Internet Options**, click the **Content** tab, and then choose the **AutoComplete** button to change your browser's settings.

Salesforce Pages

Salesforce apps are made up of tabs and pages. Standard objects such as Accounts, Contacts, and Leads, and other features such as Chatter typically have tabs, and from a tab, you navigate through pages to interact with the features you're using. For example, if you want to create an account record, you'll click the Accounts Tab, and land on the Accounts Home page.

Click **New** to open the Account Edit page where you'll enter information for the account. Click **Save**, and you'll see the Account's Detail page. Return to the Accounts Home page and the new account is listed.

Salesforce tabs can have multiple types of pages, including Home, Edit, and Detail pages, and you can create list views for some objects. Chatter has one primary page type: a feed. And Data.com has a search interface. Dashboards and reports have their own page styles, as well.

Your system administrator typically sets up page layouts for standard objects and enables the navigation features your organization can use, but interacting with Salesforce is easier if you understand the most common page elements for the most frequently used objects. They include:

1. A *tag* bar, where you can view and add tags for a record.
2. A *feed*, where you can add and view comments about a record.
3. A *sidebar*, where you can do things like search and quickly create new records.
4. *Sections* for the record, with key fields and links.
5. *Related lists*, which group and display links to other records associated with the one you're viewing. You can change the order of related lists on your page.
6. Various *links* that help you move around the page or go to different pages or external sites.

Let's look at these elements on an account detail page.

Understanding the Salesforce Sidebar

Showing and Hiding the Collapsible Sidebar

Working with Related Items Directly from the Record You're Viewing

On Salesforce records, links and details for associated records are grouped within related lists. Some related lists let you perform common tasks for the related object, like creating new records or attaching files.

If your administrator has enabled the Collapsible Sidebar, you can show or hide the sidebar as needed.

 **Note:** Call center users won't see incoming calls if they collapse the sidebar.

Click the edge of the sidebar to open or close the sidebar as needed.

EDITIONS

Available in: Salesforce Classic

Available in: **All editions** except **Database.com**

Working with Related Items Directly from the Record You're Viewing

On Salesforce records, links and details for associated records are grouped within related lists. Some related lists let you perform common tasks for the related object, like creating new records or attaching files.

For example, the Lead record offers a number of related lists, including Open Activities, which lists open activities and key activity fields. On this related list, you can create a new task, a new activity, or a new meeting request. When a task related to the lead is closed, a link to that task appears in the Lead record's Activity History related list, which displays the same key fields as Open Activities, and offers other common tasks.

The related lists you can view and use are determined by:

- Your user permissions
- User interface and page layout customizations made by your Salesforce administrator
- Personal customizations you can make

It's easy to arrange and access related lists. Here's how.

EDITIONS

Available in: Salesforce Classic

Available in: All editions

The screenshot shows the Salesforce interface for a Lead record. At the top, there's a navigation bar with tabs for Groups, Files, Leads, Accounts, Contacts, Opportunities, Reports, Dashboards, and Products. Below this is the user profile for Denise Arlen, including her name, photo, and social media links. A 'Show Feed' button is visible. A 'Back to List: Leads' link is present. A 'Lead Detail' section contains fields for Lead Owner (Norah Logan), Name (Denise Arlen), Company (GrowthCo, Inc.), and Title (Buyer). Below this are three related lists: 'Approval History', 'Open Activities', and 'Activity History'. The 'Approval History' list is currently empty. The 'Open Activities' list is also empty. The 'Activity History' list shows two activities: 'Meet and Greet - Demo' and 'Send quote'. A 'Customize Page' button is located in the top right corner of the record page.

1. Scroll the page to find the related list you need.
2. If related list hover links are enabled in your organization, click a link to view the list in a pop-up.
3. Click **Customize Page** to select and arrange the available related lists you want to see.

Working with Enhanced Lists

Enhanced lists give you the ability to quickly view, customize, and edit list data to speed up your daily productivity. They must first be enabled by your administrator for you to take advantage of them.

Enhanced lists allow you to:

- Navigate through the list results by clicking the first page icon (<<), **Previous**, **Next**, or the last page icon (>>) at the bottom of the list.
- Jump to a specific page of results by entering a number in the text box in the lower right corner, and then pressing ENTER.
- Create a new view by clicking **Create New View**. Edit, delete or refresh the current view by clicking **Edit**, **Delete**, or , respectively.
- Change the number of records displayed per page. Click  in the lower left corner of the list and select the desired setting. You can view 10, 25, 50, 100, or 200 records at a time. When you change this setting, you return to the first page of list results.

Changing your preference for the number of records displayed per page applies to all lists in all Salesforce apps, not just the one currently displayed. In addition, if you change your preference to 200, a message warns you of possible performance degradation.

- Change the width of a column by dragging the right side of the column heading with your mouse. Any changes you make to column widths are specific to that list only, and are preserved when you next view the list.

If you add or remove columns from a list, any column width customizations for that list are discarded automatically.

- Change the order in which a column is displayed by dragging the entire column heading with your mouse to the desired position. If you have permission to edit the list definition, your changes are automatically saved for all users who see the list. If you do not have permission to edit the list definition, your changes are discarded when you navigate away from the page.
- Change the number and order of columns displayed by clicking **Edit** next to the list drop-down in the upper left corner.
- If your administrator has enabled inline editing for your organization, edit single records directly from the list by double-clicking on individual field values. If your administrator has granted you the “Mass Edit from Lists” permission, you can also edit up to 200 records at a time.
- On account, contact, and lead list views, click the  **Open Calendar** link at the bottom of the page to display a weekly view of a calendar underneath the list. Then, you can drag a record from the list to a time slot on the calendar to quickly create an event associated with the record. Note that your administrator controls the availability of the Drag-and-Drop Scheduling feature.

Navigating Long Lists

Many list pages in Salesforce include the following tools for managing a large amount of data:

- To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views.

To edit or delete any view you created, select it from the **View** drop-down list and click **Edit**.

- At the top of a list, click a letter to show items that correspond to that letter, or click **Other** to show items whose names begin with numbers or symbols. Click **All** to display all items that match the criteria of the current view.
- To sort list view items by the data in a particular column, click that column’s heading. This sorts text data alphabetically and numerical data in ascending order. Dates are sorted with the most recent date first. To reverse the sort order, click the column heading a second time.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To use inline editing in an enhanced list:

- “Mass Edit from Lists”

EDITIONS

Available in: Salesforce Classic

Available in all editions

 **Note:** You can sort by any custom field except multi-select picklists. User list views are not sorted for organizations with more than two million users. Organizations with more than 2 million users can contact Salesforce to re-enable sorting.

- Click the **Previous Page** or **Next Page** link to go to the previous or next set of items in the current view.
- At the bottom of a list, click the **fewer** or **more** link to decrease or increase the number of items per page.

In some related lists with many items, the following links are available:

- Click **Show [number] more** to increase the number of items in the list.
- Click **Go to list** to display a secondary page of the entire related list.

Changing Your Working Division

You can change which records you are viewing by selecting the division you are currently working in.

You can change the division you are working in at any time and override the default division you were originally assigned for some searches and reports.

- From the Divisions field in the sidebar, select the division you want to work in.

 **Note:** Records you create are assigned to your default division, not to your working division. You can explicitly set a division other than your default division when you create the record.

Using Your Tasks and Calendar on the Home Page

 **Note:** The My Tasks and Calendar sections display on the Home page if they are included as components on your Home page layout.

From the Home page, you can view, create, and edit tasks and events. If you have Salesforce for Outlook installed, you may be able to sync your Outlook items with Salesforce so they appear in the My Tasks and Calendar sections.

In the My Tasks section, you can:

- Click **New** to create a task.
- View a list of tasks assigned to you. Up to fifteen tasks can be displayed; to view all your tasks, click **View More**.
 identifies tasks that are part of a recurring series.
- Choose a time frame from the drop-down list to change which tasks display.
- Assign unresolved emails to related records; to view all your unassigned emails, click **My Unresolved Items**.
- If your organization has enabled hover links for the My Tasks list, hover your mouse over the subject of a task to see the details of the task in an overlay. Alternatively, click the subject of a task to open the detail page of that task.
- Click **X** to close a task.

In the Calendar section, you can:

- Click **New Event** to create a new event.
- Click the Scheduled Meetings subtab to view a list of the events you have scheduled for the next seven days. This tab displays a maximum of 50 events per day.
 -  identifies events that are part of a recurring series.
 -  identifies events with invitees. Events owned by multiple people aren't available in Personal Edition.
 - If your organization has enabled home page hover links for events, hover your mouse over the subject of an event to display the details of the event in an interactive overlay. Alternatively, click the subject of an event to open the detail page of that event.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

- Click the Requested Meetings subtab to view meetings you have requested but not confirmed. This tab displays a maximum of 100 requested meetings.
 - Click the subject of the meeting to open its detail page where you can cancel and reschedule the meeting.
 - The Responses column shows the number of invitees that have responded to your meeting request.
 - Once you confirm a meeting, it appears on the Scheduled Meetings subtab.

If the Requested Meetings subtab doesn't appear, ask your Salesforce administrator to add it to the Calendar section.

- View a small calendar of the current month. To change which month appears, click  and .
- Navigate to different views of your calendar and click the icons underneath the small monthly calendar as appropriate.

Viewing Custom Links on the Home Tab

This section appears on the Home tab depending on your customized home page layout.

The Custom Links section of the Home tab contains links to websites or Salesforce pages that are useful for everyone in your organization. Your administrator sets which links appear in this section.

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Performance Chart

Use the performance chart on the Home page in Lightning Experience to track your sales performance or the performance of your sales team against a customizable sales goal.

The performance chart displays data based on your sales team's opportunities if you have an associated team. Otherwise, the chart displays opportunities you own. Only opportunities for the current sales quarter that are closed or open with a probability over 70% are displayed.

- Closed—The sum of your closed opportunities.
- Open (>70%)—The sum of your open opportunities with a probability over 70%. The blue line in the chart is the combined total of the closed opportunities and open opportunities with a probability over 70%.
- Goal—Your customizable sales goal for the quarter. This field is specific to the performance chart and has no impact on forecast quotas or any other type of goal. Click  to set the goal.

EDITIONS

Available in: Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Hover over the chart to see the closed and committed opportunity amounts for different dates. If you hover over a date when an opportunity was closed or set to a probability over 70%, a blue dot appears. Click the dot to see a window with more opportunity details.

Troubleshoot Login Issues

Can't log in? Forgot your username or password, or you're locked out from too many login attempts? To resolve login problems, try these solutions.

Your Salesforce admin sets password policies for your org. These policies determine how many times you can attempt to log in, how long you're locked out, and what your password requirements are.

To protect the privacy of your data, change your password periodically. If your Salesforce administrator expires user passwords on a periodic basis, you're prompted to change your password at the end of each period.

- Forgot your password? [Retrieve it](#).
- Locked out? Wait until the lockout period expires and try again, or contact your Salesforce admin.
- Password expired? We prompt you to change your password.
- Accessing Salesforce from outside a trusted IP range, using a new browser or app? We prompt you to [verify your identity](#).
- What does Use Custom Domain on the login page mean? If your Salesforce admin created a custom domain for your org, click **Use Custom Domain** to provide the domain name and log in.

A custom domain is in the form `https://universalcontainers.my.salesforce.com`, where `universalcontainers` is a name provided by your admin.

[Reset Your Security Token](#)

When you access Salesforce from an IP address that's outside your company's trusted IP range using a desktop client or the API, you need a security token to log in. A security token is a case-sensitive alphanumeric code that you append to your password or enter in a separate field in a client application.

[Grant Login Access](#)

To assist you, your administrator or a customer support representative can log in to the application using your login. By default, your company's administrators can access your account without any action from you. If your organization requires users to grant login access to administrators, you can grant access for a specified duration. You can also grant access to representatives of support organizations.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

[Reset Your Forgotten Password](#)

If you forgot your password, you can easily reset it using the forgot password link on the login page. All you need is your username.

Reset Your Security Token

When you access Salesforce from an IP address that's outside your company's trusted IP range using a desktop client or the API, you need a security token to log in. A security token is a case-sensitive alphanumeric code that you append to your password or enter in a separate field in a client application.

Your security token isn't displayed in your settings or profile.

Some client applications provide a separate field for entering the security token. If the application doesn't have a separate field, add the security token to the end of your password. For example, if your password is *mypassword* and your security token is *XXXXXXXXXX*, enter *mypasswordXXXXXXXXXX* in the Password field. Don't use the security token or add it to your password when you log in to Salesforce via a browser.

If your admin assigned you the "Two-Factor Authentication for API Logins" permission, use the code generated by an authenticator app, such as Salesforce Authenticator, for the security token value.

Get or Reset Your Token

A new security token is emailed to you when you reset your password. Or you can reset your token separately.

1. From your personal settings, enter *Reset* in the **Quick Find** box, then select **Reset My Security Token**.
2. Click **Reset Security Token**. The new security token is sent to the email address in your Salesforce personal settings.

 **Tip:** Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using **Reset My Security Token**.

Update Your Token in Salesforce Outlook Edition

1. In Outlook, go to **Tools > Salesforce Options**.
2. In the password window, enter your password and security token, with the security token added to the end of your password. For example, *mypasswordXXXXXXXXXX*.
3. To test that you correctly entered your password and token, click **Verify**.
4. Click **OK**.

Update Your Token in Connect Offline, Connect for Office, and Data Loader

When you log in, add the security token value to the end of your password, such as *mypasswordXXXXXXXXXX*.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

Connect for Office not available in **Database.com**

Connect Offline available in: Salesforce Classic

Connect Offline available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

-  **Note:** If you get an invalid password error when you log in, try logging in only with your password. You can get this error if you use your security token to log in from an IP address that's within a trusted IP range set by your admin.

SEE ALSO:

Grant Login Access

To assist you, your administrator or a customer support representative can log in to the application using your login. By default, your company's administrators can access your account without any action from you. If your organization requires users to grant login access to administrators, you can grant access for a specified duration. You can also grant access to representatives of support organizations.

Watch a Demo:  [Letting Your Salesforce Administrator Access Your Account](#)

For security reasons, the maximum period for granting access is one year. During the time you granted access, administrators or support representatives can use your login and access your data to help you resolve problems.

1. From your personal settings, enter *Login Access* in the **Quick Find** box, then select the option to grant login access.
2. Set the access expiration date by choosing a value from the picklist.
3. Click **Save**.

If an administrator, support representative, or publisher makes setup changes using your login, the setup audit trail lists the changes and the username. In some organizations, records of clicks made by an administrator logged in as you are also kept for auditing purposes.

-  **Note:** You can't grant access to certain support organizations if your administrator set up restrictions, or if a packaged application's license prevents it.

Work on Mobile Devices

Salesforce provides several mobile apps to keep you connected and productive, no matter where you are.

[Salesforce Mobile Product Comparison](#)

Salesforce1, SalesforceA, Salesforce Classic Mobile, and Salesforce Authenticator are available on different mobile devices and in different editions, with different support options.

[Salesforce1 Mobile App](#)

The Salesforce1 mobile app is Salesforce on the go! This enterprise-class mobile experience gives you real-time access to the same information you see in the office, but organized for getting work done faster between customer meetings, waiting for a flight, even when you're in line for coffee. The intuitive interface makes it easy to navigate and interact with data on a touchscreen, so you can review and update information with just a few taps. And Salesforce1 includes many of your organization's customizations, so the app is tailored to your business needs.

[Salesforce Classic Mobile](#)

The Salesforce Classic Mobile app provides mobile access to your Salesforce data from Android™ and iPhone® devices. You can view, create, edit, and delete records, keep track of your activities, view your dashboards, run simple reports, and log calls and emails. Your Salesforce admin must assign you a mobile license before you can use Salesforce Classic Mobile.

[Salesforce Authenticator](#)

Welcome to the all-new Salesforce Authenticator mobile app! Version 2 is a powerful and innovative two-factor authentication app for your mobile device. The app adds an extra layer of security to protect your Salesforce account and data. And we've designed it to be super easy to use. You get increased security and increased convenience—all in one beautiful app.

Salesforce Mobile Product Comparison

Salesforce1, SalesforceA, Salesforce Classic Mobile, and Salesforce Authenticator are available on different mobile devices and in different editions, with different support options.

Salesforce1 Mobile App

The Salesforce1 mobile app is Salesforce on the go! This enterprise-class mobile experience gives you real-time access to the same information you see in the office, but organized for getting work done faster between customer meetings, waiting for a flight, even when you're in line for coffee. The intuitive interface makes it easy to navigate and interact with data on a touchscreen, so you can review and update information with just a few taps. And Salesforce1 includes many of your organization's customizations, so the app is tailored to your business needs.

 **Note:** This release of Salesforce1 doesn't have all of the functionality of the full Salesforce site. To see data or do actions that aren't supported in Salesforce1, use the full site instead.

[Get the Salesforce1 Mobile App](#)

The way you access Salesforce1 depends on how you want to work: using an app installed on your device or using a mobile browser. It's possible that some of the Salesforce1 versions are disabled for your organization—ask your Salesforce administrator about your options.

[Salesforce1 Mobile App Features: What's Available in Each Version](#)

Salesforce1 is available as a downloadable app on iOS and Android devices and as a mobile browser app in supported mobile browsers. In most cases, all of the Salesforce1 "flavors" include the same features. But there are some differences between the experiences, often related to differences in the mobile platforms on which Salesforce1 is supported.

[Requirements for the Salesforce1 Mobile App](#)

Salesforce1 is available for most Salesforce editions and many user license types. The app is supported on a variety of mobile platforms, with some device, operating system, and mobile browser requirements. An Internet connection is necessary to communicate with Salesforce.

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

[What Data Is Available in the Salesforce1 Mobile App?](#)

Salesforce1 uses your organization's Salesforce edition, your user license type, and your assigned user profile and permission sets to determine the data that's available to you. Usually you see the same objects, record types, fields, and page layouts that you do when working in the full Salesforce site. Not all Salesforce data or functionality is supported in Salesforce1, however.

[Why Can't I Log in to the Salesforce1 Mobile App?](#)

You're certain that you're using your correct Salesforce credentials but you can't log in to Salesforce1? There are several common reasons why you might be having trouble.

[Find Help in the Salesforce1 Mobile App](#)

Salesforce1 includes a **Help** link that you can use to learn about the mobile app.

[Help Resources for the Salesforce1 Mobile App](#)

These resources provide information about using the Salesforce1 mobile app, setting up your organization to use the app, and developing for the app.

[Locale and Language Support for the Salesforce1 App](#)

Salesforce1 works with almost all Salesforce-supported locales and the fully supported and end-user languages. (The Salesforce Help includes a complete list of supported locales and languages.) Languages that are read right to left, including Arabic and Hebrew, aren't supported in this release.

[Salesforce1 Mobile App Accessibility Considerations](#)

Salesforce1 is designed with accessibility in mind and delivers a fully-accessible mobile experience for all individuals, including users working with screen readers.

[Turn the Salesforce1 Mobile Browser App Off or On](#)

When the Salesforce1 mobile browser app is enabled for your organization, you automatically redirect to this experience when you log in to Salesforce from a supported mobile browser. Using the full Salesforce site in a mobile browser isn't supported. But it is possible to turn off the mobile browser app if you need to access Salesforce Classic from your mobile device for awhile.

SEE ALSO:

[Help Resources for the Salesforce1 Mobile App](#)

Get the Salesforce1 Mobile App

The way you access Salesforce1 depends on how you want to work: using an app installed on your device or using a mobile browser. It's possible that some of the Salesforce1 versions are disabled for your organization—ask your Salesforce administrator about your options.

Install a Downloadable App

The Salesforce1 downloadable apps are available for supported Android and iOS devices. You can download and install Salesforce1 from Google Play or the App Store.

Once the app is installed, launch it from your home screen and log in to your Salesforce account. You may be prompted to create a security PIN. By default, you're connected to your production environment.

 **Note:** If you're not able to log in, verify with your administrator that you're enabled to use the downloadable app.

Access the Mobile Browser App

The Salesforce1 mobile browser app runs in a mobile browser. The mobile browser app is a great option if your organization prevents installing apps on your corporate-issued device.

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

If the mobile browser app is enabled for your organization, you're automatically redirected to Salesforce1 when you log in to Salesforce from a supported mobile browser. If Salesforce1 doesn't automatically start for you, make sure you didn't turn off the redirection to the mobile browser app and that you're using a supported browser.

(From most unsupported mobile browsers, you're redirected to Salesforce Classic instead. If you're using an iOS device, you can access the mobile browser from Google Chrome for iOS or when tapping a Salesforce link in Gmail for iOS, but working in either of these environments isn't supported by Salesforce.)

[Help Resources for the Salesforce1 Mobile App](#)

Requirements for the Salesforce1 Mobile App

Salesforce1 is available for most Salesforce editions and many user license types. The app is supported on a variety of mobile platforms, with some device, operating system, and mobile browser requirements. An Internet connection is necessary to communicate with Salesforce.

Supported Devices and Browsers

Salesforce1 is supported on these device–OS–mobile browser combinations only. If you run Salesforce1 in an environment other than what's listed here, you may encounter problems that Salesforce won't address.

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

Salesforce1 App	Supported Devices	Supported Mobile OS	Supported Mobile Browser
Downloadable app for iOS	iPhone 5c/5s or later models iPad 4 or later models (including iPad Air 2 and iPad Pro)	iOS 9.2 or later	Not applicable

Salesforce1 App	Supported Devices	Supported Mobile OS	Supported Mobile Browser
	iPad mini 2 or later models Apple Watch (<i>push notifications only</i>)		
Downloadable app for Android	Android phones	Android 4.4 or later	Not applicable
	Samsung Galaxy Note 10.1 tablets	Android 5.1.1 or later	Not applicable
Mobile browser app	iPhone 5c/5s or later models iPad 4 or later models (including iPad Air 2 and iPad Pro) iPad mini 2 or later models	iOS 9.2 or later	Apple Safari Good Access
	Android phones Android tablets	Android 4.4 or later	Google Chrome Good Access
	Nokia Lumia 950	Windows 10	Microsoft Edge
	Nokia Lumia 1020 and HTC 8X phones (Support ends December 17, 2017)	Windows 8.1 Update	Microsoft Internet Explorer 11
	BlackBerry Z10 phones (Support ends Winter '17)	BlackBerry OS 10.2 or later	BlackBerry Browser
	BlackBerry Z30 phones (Support ends Winter '17)	BlackBerry OS 10.2.1.3175 or later	BlackBerry Browser

 **Note:** Salesforce supports touch-enabled laptops, such as Microsoft Surface and Surface Pro devices, as laptops instead of tablets. It's not possible to access the Salesforce1 mobile browser app on these devices. Users are always redirected to the full site experience that's enabled for them—Lightning Experience or Salesforce Classic. Only standard keyboard and mouse inputs are supported on these types of devices.

For optimal Salesforce1 performance, we recommend keeping your mobile devices' operating systems updated and upgrading to late model devices as allowed by your mobile plan. Future Salesforce1 versions may require removing support for older operating systems and sometimes newer operating system releases don't perform well on older devices.

When using the mobile browser app, we recommend turning off Incognito Mode in Chrome, InPrivate Browsing in Internet Explorer, or Private Browsing in Safari or BlackBerry Browser.

Salesforce Editions and Licenses

These Salesforce editions and user license types allow the use of Salesforce1.

Salesforce Editions

These Salesforce editions allow the use of Salesforce1.

- Personal Edition

Database.com Edition isn't supported.

- Group Edition
- Professional Edition
- Enterprise Edition
- Performance Edition
- Unlimited Edition
- Developer Edition
- Contact Manager Edition

User License Types

These user license types can access Salesforce1. A special Salesforce1 or mobile license isn't required.

- Salesforce users
- Salesforce Platform and Force.com users
- Chatter Plus users (also known as Chatter Only), Chatter Free users, and Chatter External users*
- Customer Community, Customer Community Plus, and Partner Community external users
- Portal users who are a member of a Salesforce community

These user license types aren't supported: portal users (unless a member of a Salesforce community), Database.com users, Sites and Site.com users, Data.com users, and Work.com users.

Note: You can access the same data and functionality that's available to you in the full site, as determined by your organization's Salesforce edition, your user license type, and your assigned user profile and permission sets.

* Chatter Plus, Chatter Free, and Chatter External users must have the "API Enabled" profile permission turned on to use any of the Salesforce1 downloadable apps. Chatter External users who have API access can't access Groups or People list views when using a downloadable app.

Wireless Connection

A Wi-Fi® or cellular network connection is needed to communicate with Salesforce. For cellular connections, a 3G network or faster is required. For the best performance, we recommend using Wi-Fi or LTE.

If you're using one of the Salesforce1 downloadable apps, you can view your most recently accessed records, and create and edit records, when your device is offline.

[Locale and Language Support for the Salesforce1 App](#)

[Salesforce1 Mobile App Accessibility Considerations](#)

[What Data Is Available in the Salesforce1 Mobile App?](#)

What Data Is Available in the Salesforce1 Mobile App?

Salesforce1 uses your organization's Salesforce edition, your user license type, and your assigned user profile and permission sets to determine the data that's available to you. Usually you see the same objects, record types, fields, and page layouts that you do when working in the full Salesforce site. Not all Salesforce data or functionality is supported in Salesforce1, however.

These objects are available in Salesforce1. Unless noted otherwise, you can view, edit, or create records for these objects.

- Accounts and Person Accounts
- Assets
- Campaigns
- Cases
- Contacts
- Contracts
- D&B Company (*view only, for Data.com Premium Prospector and Data.com Premium Clean customers*)
- Dashboards (*view only*)
- Events
- Leads
- Linked Articles (*view only*)
- Live Chat Transcripts
- Opportunities
- Orders (*view or edit only*)
- Reports (*view only*)
- Salesforce Knowledge Articles (*view only*)
- Tasks
- Work.com Coaching, Goals, Thanks, Rewards, and Skills (*Skills not available in the iOS downloadable app*)
- Work Orders
- Work Order Milestones (*view only*)
- Custom objects that have a tab you can access
- Salesforce Connect external objects that are searchable and have a tab you can access

You can access all these objects from the Salesforce1 navigation menu. The navigation menu helps you focus on the objects you work with most frequently. Tap **More** at the bottom of the Recent section to see the full list of all objects available to you in Salesforce1.

With some exceptions, all the standard and custom fields are available on these records. And you can work with most of the related lists for supported objects.

 **Tip:** If you're new to Salesforce and don't yet have a history of recent items, you initially see these objects in the Recent section of the Salesforce1 navigation menu: Accounts, Cases, Contacts, Files, Groups (unless added directly to the navigation menu), Leads, Opportunities, and People (unless added directly to the navigation menu).

As you spend time working in Salesforce1 and the full Salesforce site, the objects that you use the most eventually replace the default ones in the Recent section and become the objects that are available for global searches in Salesforce1.

It can take up to 15 days for the objects that you work with regularly to appear in the Recent section. To make objects appear under Recent immediately, pin them from your search results in the full site.

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

When doing a global search in Salesforce1, you can find records for the objects that appear in the Recent section only. To find records for the other objects that are in the full object list when the Recent section is expanded, search from the object's home page.

If Chatter is enabled, you can access feeds, user profiles, groups, and files. You can access user profiles even if Chatter is disabled.

If you're using a Salesforce1 downloadable app, you can use Salesforce Today to prepare for meetings, stay in touch with customers, quickly join conference calls, and generally manage your day.

Why Can't I Log in to the Salesforce1 Mobile App?

You're certain that you're using your correct Salesforce credentials but you can't log in to Salesforce1? There are several common reasons why you might be having trouble.

- Make sure that you actually have permission to use Salesforce1. Salesforce administrators can control who's able to use the Salesforce1 downloadable apps and can also disable access to the mobile browser app, for you or your entire company. If you're not sure that you have access, check with your administrator.
- If you're using a downloadable app, make sure you're logging in to the correct instance—production, sandbox, or a custom domain. By default, Salesforce1 connects to your production environment. If your organization uses single sign-on, configure the app to point to a different page during login. The same is true to connect Salesforce1 to a sandbox environment for testing purposes or to log in using a Community URL.

A custom domain is in the form of `https://universalcontainers.my.salesforce.com`, where `universalcontainers` is a name selected by your administrator. Your administrator can provide you with the domain name to use.

- To connect the downloadable app for iOS to a different instance, use [these steps](#).
- To connect the downloadable app for Android to a different instance, use [these steps](#).

If you're still unable to log in, ask your administrator for help.

Locale and Language Support for the Salesforce1 App

Salesforce1 works with almost all Salesforce-supported locales and the fully supported and end-user languages. (The Salesforce Help includes a complete list of supported locales and languages.) Languages that are read right to left, including Arabic and Hebrew, aren't supported in this release.

 **Note:** The Salesforce1 downloadable apps use the language and locale settings from both your Salesforce user profile and the locale settings on your mobile device. If your device uses different locale settings than are specified for your user profile, you may see different languages displayed throughout the app. For example, the navigation menu might display in English while records display in French.

Salesforce1 includes multi-currency support, but advanced currency management isn't available.

[Requirements for the Salesforce1 Mobile App](#)

Salesforce1 Mobile App Accessibility Considerations

Salesforce1 is designed with accessibility in mind and delivers a fully-accessible mobile experience for all individuals, including users working with screen readers.

Unlike the full Salesforce site, Salesforce1 doesn't require accessibility mode to give users working with assistive devices a fully accessible experience.

Check your mobile device's documentation for more information about using a screen reader.

Turn the Salesforce1 Mobile Browser App Off or On

When the Salesforce1 mobile browser app is enabled for your organization, you automatically redirect to this experience when you log in to Salesforce from a supported mobile browser. Using the full Salesforce site in a mobile browser isn't supported. But it is possible to turn off the mobile browser app if you need to access Salesforce Classic from your mobile device for awhile.

 **Note:** If you disable automatic redirection to the Salesforce1 mobile browser app, you're turning off automatic access for any supported browser, on any of your mobile devices. For example, if you turn off the mobile browser app from your tablet, you won't be able to use the mobile browser app on your smartphone either.

These steps don't affect the Salesforce1 downloadable apps which always display the Salesforce1 interface.

To turn off the mobile browser app from within the app:

1. Tap .
2. Tap **Full Site**.

You switch immediately to the Salesforce Classic full site. It's not possible to access Lightning Experience from any mobile browser.

The full site is now your default environment whenever you log in from a mobile browser. You can switch back to the Salesforce1 mobile browser app using the **Go to Salesforce1** link in the full site footer, after which Salesforce1 returns to being your default environment.

To turn off the mobile browser app from the full site:

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Deselect **Salesforce1 User**.
3. Save your changes.

To turn the Salesforce1 mobile browser app back on from the full site, repeat the previous steps and select the **Salesforce1 User** checkbox.

[Personalize Your Salesforce Experience](#)

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

Salesforce Classic Mobile

The Salesforce Classic Mobile app provides mobile access to your Salesforce data from Android™ and iPhone® devices. You can view, create, edit, and delete records, keep track of your activities, view your dashboards, run simple reports, and log calls and emails. Your Salesforce admin must assign you a mobile license before you can use Salesforce Classic Mobile.

 **Note:** Supported features may vary depending on your mobile operating system and device model.

Salesforce Classic Mobile stores your Salesforce records in a local database on your mobile device, which means you can use the Salesforce Classic Mobile app even when a data connection is unavailable. Salesforce Classic Mobile periodically polls Salesforce for new and updated records, saving you from the hassle of manually synchronizing your data.

Check the [list of supported mobile devices](#) to see if you can use the Salesforce Classic Mobile app on your smartphone.

Requirements for Using Salesforce Classic Mobile

The Salesforce Classic Mobile app can run on Android and iOS operating systems. It's also supported by wireless carriers—if the device can establish a data connection to the Internet, it can typically run the mobile app. [Verify that your device is supported](#) before installing the mobile app. Recently released mobile devices aren't immediately supported because every device goes through the official certification and quality assurance process.

Notes About iOS Devices

Use of the Salesforce Classic Mobile app for Apple products is subject to certain limitations:

- Third parties (including, but not limited to, Apple Inc. and your network connectivity provider) may at any time restrict, interrupt or prevent use of Salesforce Classic Mobile for the iPhone and iPod touch devices, or delete the Salesforce Classic Mobile app from iPhone or iPod touch devices, or require Salesforce to do any of the foregoing, without entitling the customer to any refund, credit or other compensation from such third-party or Salesforce.

Installing the Salesforce Classic Mobile App

You can install the Salesforce Classic Mobile app on any [supported](#) Android or iPhone device.

The easiest way to install Salesforce Classic Mobile is to visit

<http://mobile.salesforce.com> from your mobile device and follow the on-screen instructions.

Or, you can use the installation steps for your type of device.

Android Installation

Salesforce Classic Mobile is available for download from Google Play. To access Google Play, your Android device must be connected to the network. You also need a Google account to download applications. If you don't already have a Google account, go to <https://accounts.google.com> and select **Sign up** to set one up.

To install Salesforce Classic Mobile from Google Play:

1. From the Apps screen of your Android device, select the Google Play Store.
2. Select the **Search** field, and type *salesforce*.
3. Select Salesforce Classic Mobile from the search results.
4. Select **Download**.
5. Tap **Accept and Download** if you agree to the terms.
6. Select **Open** to launch the application.
7. The first time you launch the Salesforce Classic Mobile app on your device, you must activate the app for your device by logging in and downloading data. Verify that your phone is connected to a network.
 - a. Select **I Accept**.
 - b. On the activation screen, enter your Salesforce username and password.
 - c. Select **Activate**.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

iPhone Installation

Salesforce Classic Mobile is available for download from Apple's App Store. To use the App Store, your iPhone or iPod touch must be connected to the network. You also need an iTunes™ Store account to download applications. If you don't already have an iTunes Store account, open iTunes on your computer and select **Store > Account** to set one up.

To install Salesforce Classic Mobile from [the App Store](#):

1. From the Home screen of your iPhone or iPod touch, select the App Store icon.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in:

Performance, Unlimited, and Developer Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

2. Tap **Search**.
3. Tap within the `Search` field to open the keyboard. Type `salesforce`.
4. Select Salesforce Classic Mobile in the list of search results to view information about the application.
5. Tap **Free**, and then tap **Install**.
 -  **Note:** There's no charge to download the app from the App Store. But only users in Enterprise, Professional, Unlimited, Performance, or Developer Editions who've been assigned a mobile license can run Salesforce Classic Mobile.
6. Enter your iTunes Store account and password and tap **OK**.
7. The first time you launch Salesforce Classic Mobile, you must activate the app for your device by logging in and downloading data. Verify that your device is connected to a network.
 - a. Tap the Salesforce icon on the Home screen.
 - b. Tap **I Accept**.
 - c. On the activation screen, enter your Salesforce username and password.
 - d. Tap **Activate**.
 -  **Warning:** If the application closes or the device locks during the activation process, the iPhone operating system pauses the download process but it will resume the next time you open the app.

Depending on your organization's setup, you might need to set up a passcode before accessing the app.

Using Salesforce Classic Mobile FAQ

- [Do I need a license to use Salesforce Classic Mobile?](#)
- [Is my phone compatible with the Salesforce Classic Mobile app?](#)
- [What Salesforce data is stored on my device when I use the Salesforce Classic Mobile app?](#)
- [Can I see records in the Salesforce Classic Mobile app that I can't access in Salesforce?](#)
- [How frequently does the Salesforce Classic Mobile app update my data?](#)
- [How do I use the Salesforce Classic Mobile app to access records that aren't on my mobile device?](#)
- [When I receive a call on my mobile device, will the Salesforce Classic Mobile app open the associated contact record?](#)

Do I need a license to use Salesforce Classic Mobile?

You need a mobile license for each users who needs to access Salesforce Classic Mobile. .

If you've been assigned a mobile license but your administrator hasn't set up your mobile configuration yet, you can activate Salesforce Classic Mobile with the default mobile configuration. The default configuration automatically synchronizes the records you most recently accessed in Salesforce to your mobile device. You can also search for and download any records from Salesforce that aren't available locally on your device.

To find out if your user account has been assigned a mobile license to access Salesforce Classic Mobile, review your personal setup.

- If the **Mobile User** checkbox is selected, you can install and run Salesforce Classic Mobile. If the **Mobile User** checkbox is selected but the `Mobile Configuration` field is blank, you can activate Salesforce Classic Mobile using the default mobile configuration.

 **Note:** The `Mobile User` checkbox is disabled by default for new Unlimited and Performance Edition users.

Is my phone compatible with the Salesforce Classic Mobile app?

The Salesforce Classic Mobile app can run on iPhones, iPod touch devices, and most Android devices. To find out if your phone can run the app, see the [list of supported mobile devices](#).

 **Note:** Supported features may vary depending on your mobile operating system and device model.

What Salesforce data is stored on my device when I use the Salesforce Classic Mobile app?

Using the Salesforce Classic Mobile app to access Salesforce on a mobile device is much different from using the full Salesforce application on your computer. Mobile devices have a minimal amount of memory and a small screen, and don't always maintain a constant network connection. To work with these limitations, a subset of your Salesforce data is stored in a local database on your phone.

The following types of tabs are available in the Salesforce Classic Mobile app:

- All custom object tabs and these standard object tabs:
 - Accounts
 - Assets
 - Attachments
 - Cases
 - Contacts
 - Content
 - Events
 - Groups
 - Group Members
 - Leads
 - Notes
 - Opportunities
 - Price Books
 - Products
 - Solutions
 - Tasks
 - Users
 - Dashboards
 - Reports

- Web and Visualforce tabs

 **Note:** The tabs and objects that you see in the app are determined by your mobile configuration and might not include all the tabs and objects listed here.

Additionally, the iPhone and Android apps don't support reports.

When you open the tab for an object, you probably won't see all of your Salesforce records. For each mobilized object, your administrator can create filter criteria to limit the number of records on your device. For example, in a large organization, sending all open and closed opportunities to your mobile device could consume too much memory or potentially crash it. Instead of sending all opportunities, your administrator might send a subset of them, such as open opportunities that you own that are scheduled to close this month.

Can I see records in the Salesforce Classic Mobile app that I can't access in Salesforce?

No. User permissions, sharing rules, and field-level security are inherited from Salesforce—the mobile application enforces all the restrictions set up in Salesforce.

How frequently does the Salesforce Classic Mobile app update my data?

The Salesforce Classic Mobile app checks for data changes every 20 minutes. During this incremental update, the server retrieves any newly created Salesforce records that you own, and then sends that data to your device. It also sends modifications to any records already stored on the device.

 **Note:** Note the following about data synchronization:

- The Android client app adjusts data polling time based on app usage. If the app isn't in use, the polling time interval increases in an exponential fashion, until it reaches eight hours. From that point forward, the device polls for data every eight hours. This prevents the Salesforce Classic Mobile app from draining the device battery when the app is rarely used.
- Because only one app can run on the iPhone at a time, the Salesforce Classic Mobile app can't request a data update unless the app is open. When you launch the app on the iPhone, it performs an incremental update unless a data synchronization has occurred in the past 20 minutes.

How do I use the Salesforce Classic Mobile app to access records that aren't on my mobile device?

The Salesforce data available on your device is defined by your mobile configuration. You can easily search for records that aren't automatically downloaded to your device. A search box is available on each object tab in the Salesforce Classic Mobile app, as well as on the app's home page.

When I receive a call on my mobile device, will the Salesforce Classic Mobile app open the associated contact record?

The Salesforce Classic Mobile app can't open a Salesforce contact when you receive incoming calls. However, if you place a call from Salesforce Classic Mobile, you're automatically prompted to log the call.

Salesforce Authenticator

Welcome to the all-new Salesforce Authenticator mobile app! Version 2 is a powerful and innovative two-factor authentication app for your mobile device. The app adds an extra layer of security to protect your Salesforce account and data. And we've designed it to be super easy to use. You get increased security and increased convenience—all in one beautiful app.

[What Is Two-Factor Authentication?](#)

We all want to keep our online accounts and data secure. Two-factor authentication is a great way to do just that. Two-factor authentication means that you have to have two things, or two *factors*, to access your account. The first factor is something you know, like your username and password combination. The second is something you have, like a mobile device with a security app installed. That second factor—the mobile device with a security app—adds an extra layer of protection to your account. Even if hackers steal your password, they can't log in, because they don't have your mobile device with Salesforce Authenticator installed on it.

[Get the Salesforce Authenticator Mobile App \(Version 2 or Later\)](#)

Salesforce Authenticator is an app that you download and install on your mobile device.

[Requirements for Salesforce Authenticator \(Version 2 or Later\)](#)

The Salesforce Authenticator mobile app is supported on various mobile platforms, with some device, operating system, and mobile browser requirements. An Internet connection is necessary to communicate with Salesforce for user verifications of account activity and location-based automated verifications. Verification codes (time-based one-time passwords, or TOTPs) can be generated without an Internet connection on the mobile device.

[Salesforce Authenticator \(Version 2 or Later\) Accessibility Considerations](#)

Salesforce Authenticator is designed with accessibility in mind and delivers a fully accessible mobile experience for all individuals, including users working with screen readers. Unlike the full Salesforce site, Salesforce Authenticator doesn't require accessibility mode to give users working with assistive devices a fully accessible experience.

[Locale and Language Support for Salesforce Authenticator \(Version 2 or Later\)](#)

Salesforce Authenticator works with almost all Salesforce supported locales and the fully supported end-user languages. Salesforce Help includes a list of supported locales and languages. Languages that are read right to left, including Arabic and Hebrew, aren't supported in this release.

[Salesforce Authenticator \(Version 2 or Later\) Account Types](#)

The Salesforce Authenticator mobile app (version 2 or later) supports two types of connected accounts. Standard accounts feature push notifications, location-based automated verifications, and verification codes for two-factor authentication. Code-only accounts provide only verification codes.

[Connect an Account to Salesforce Authenticator \(Version 2 or Later\)](#)

Connect your Salesforce account to the Salesforce Authenticator mobile app to use the app for two-factor authentication. In some orgs, you're prompted to connect your account as you log in. In other orgs, you connect the account through your personal settings.

[Remove an Account from Salesforce Authenticator \(Version 2 or Later\)](#)

When you no longer want to use the app for two-factor authentication, remove your Salesforce account from the Salesforce Authenticator mobile app. Before you remove an account from the Salesforce Authenticator app on your mobile device, make sure that you don't lose access to your Salesforce account. Either ask your Salesforce admin to disable the two-factor authentication requirement from your account, or make sure that you have another two-factor authentication method available.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Two-factor authentication with Salesforce Authenticator available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

[Verify Account Activity with Salesforce Authenticator \(Version 2 or Later\) for Two-Factor Authentication](#)

If your org settings require you to complete two-factor authentication when you log in or access restricted resources in Salesforce, use the Salesforce Authenticator mobile app. You use the app to verify identifying details for your logins and other account activity. Using the app to verify account activity satisfies the two-factor authentication requirement.

[Block Unrecognized Account Activity with Salesforce Authenticator \(Version 2 or Later\)](#)

If you get a notification from the Salesforce Authenticator mobile app about account activity you don't recognize, use the app to block the activity. You can also flag the blocked activity for your Salesforce admin.

[Automate Two-Factor Authentication from a Trusted Location with Salesforce Authenticator \(Version 2 or Later\)](#)

Enable location services in the Salesforce Authenticator mobile app, and then use the app to automate two-factor authentication from a trusted location. Examples of trusted locations can include your home or office.

[Stop Location-Based Automated Verifications in Salesforce Authenticator \(Version 2 or Later\)](#)

You can remove a location from your list of trusted locations to turn off automated verification from there.

What Is Two-Factor Authentication?

We all want to keep our online accounts and data secure. Two-factor authentication is a great way to do just that. Two-factor authentication means that you have to have two things, or two *factors*, to access your account. The first factor is something you know, like your username and password combination. The second is something you have, like a mobile device with a security app installed. That second factor—the mobile device with a security app—adds an extra layer of protection to your account. Even if hackers steal your password, they can't log in, because they don't have your mobile device with Salesforce Authenticator installed on it.

Many mobile authenticator apps generate verification codes that expire after a certain amount of time. When you log in to an online account that requires two-factor authentication, you enter the code along with your username and password. Salesforce Authenticator also generates codes for whenever you need them, but version 2 of the app introduces new features for added convenience, without sacrificing security.

When someone tries to log in or access restricted online data in your account, Salesforce sends a notification to your mobile device. You open the Salesforce Authenticator app to see details of the online activity. After you check the details, you can tap **Approve** to verify that the activity belongs to you. If you don't recognize the activity, you tap **Deny** to block it. You can also flag the blocked activity for your Salesforce admin.

When you enable location services for Salesforce Authenticator, you unleash even more powerful features. If you're in your home or office, for example, you can tell Authenticator to verify your activities automatically from that trusted location. Automation gives you the extra security of two-factor authentication, and you don't even have to take your phone out of your pocket.

Before you can use Salesforce Authenticator for two-factor authentication, you connect the app to your online account. In Salesforce, you can connect the app to your account in your personal settings. Connecting the app doesn't mean that you're required to use two-factor authentication every time you log in. Your admin sets up a two-factor authentication requirement for you in keeping with your company's security policies. If your admin requires two-factor authentication before you connect Salesforce Authenticator to your account, you're prompted to connect the app the next time you log in.

Get the Salesforce Authenticator Mobile App (Version 2 or Later)

Salesforce Authenticator is an app that you download and install on your mobile device.

New Installations

You can download and install the Salesforce Authenticator mobile app from Google Play or the App Store to supported Android and iOS devices.

After you install the app, launch it from your home screen and connect it to your Salesforce account. In some orgs, you're prompted to connect the app during login. Otherwise you connect the app through your personal settings in Salesforce.

Updating from Salesforce Authenticator Version 1

If you already have version 1 installed on your mobile device, download the update from the App Store or Google Play. The update preserves the connected accounts you already have in the app. These accounts are code-only accounts that generate verification codes but don't receive push notifications or allow location-based automated verifications. Code-only accounts appear on your Connected Accounts list without a > at the far right of the account name row, and there's no account detail page. The verification codes in these code-only accounts are valid until you connect the new version 2 functionality to your Salesforce account via your personal settings. After you connect the new version, your account gives you full Salesforce Authenticator version 2 functionality: push notifications, location-based automated verifications, and verification codes.

SEE ALSO:

[Requirements for Salesforce Authenticator \(Version 2 or Later\)](#)

Requirements for Salesforce Authenticator (Version 2 or Later)

The Salesforce Authenticator mobile app is supported on various mobile platforms, with some device, operating system, and mobile browser requirements. An Internet connection is necessary to communicate with Salesforce for user verifications of account activity and location-based automated verifications. Verification codes (time-based one-time passwords, or TOTPs) can be generated without an Internet connection on the mobile device.

Supported Devices and Browsers

Salesforce Authenticator is supported in portrait orientation in these environments.

Salesforce Authenticator App	Supported Devices	Supported Mobile OS
iOS, v2 or later	iPhone 5 or later models	iOS 8 or later
Android, v2 or later	Android phones	Android 4.2 or later

For optimal Salesforce Authenticator performance, we recommend keeping your mobile device's operating system updated and upgrading to a late model device as allowed by your mobile plan. Future Salesforce versions might require removing support for older operating systems, and sometimes newer operating system releases don't perform well on older devices.

Salesforce Editions and Licenses

These Salesforce editions and user license types allow the use of Salesforce Authenticator for identity verification and two-factor authentication.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Two-factor authentication with Salesforce Authenticator available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Two-factor authentication with Salesforce Authenticator available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

Salesforce Editions

- Group Edition
- Professional Edition
- Enterprise Edition
- Performance Edition
- Unlimited Edition
- Developer Edition
- Contact Manager Edition

Database.com Edition isn't supported.

User License Types

- Salesforce users
- Salesforce Platform and Salesforce users
- Customer Community, Customer Community Plus, and Partner Community external users
- Portal users who are a member of a Salesforce community

These user license types aren't supported: portal users (unless a member of a Salesforce community), Database.com users, Sites and Site.com users, Data.com users, and Work.com users.

Wireless Connection

A Wi-Fi or cellular network connection is needed to communicate with Salesforce. For cellular connections, a 3G network or faster is required. For the best performance, we recommend using Wi-Fi or LTE. Salesforce Authenticator generates valid verification codes when your device is offline. You can also view your activity history and list of trusted locations when the device is offline.

SEE ALSO:

[Locale and Language Support for Salesforce Authenticator \(Version 2 or Later\)](#)

[Salesforce Authenticator \(Version 2 or Later\) Accessibility Considerations](#)

Salesforce Authenticator (Version 2 or Later) Accessibility Considerations

Salesforce Authenticator is designed with accessibility in mind and delivers a fully accessible mobile experience for all individuals, including users working with screen readers. Unlike the full Salesforce site, Salesforce Authenticator doesn't require accessibility mode to give users working with assistive devices a fully accessible experience.

Check your mobile device's documentation for more information about using a screen reader.

SEE ALSO:

[Requirements for Salesforce Authenticator \(Version 2 or Later\)](#)

Locale and Language Support for Salesforce Authenticator (Version 2 or Later)

Salesforce Authenticator works with almost all Salesforce supported locales and the fully supported end-user languages. Salesforce Help includes a list of supported locales and languages. Languages that are read right to left, including Arabic and Hebrew, aren't supported in this release.

SEE ALSO:

[Requirements for Salesforce Authenticator \(Version 2 or Later\)](#)

Salesforce Authenticator (Version 2 or Later) Account Types

The Salesforce Authenticator mobile app (version 2 or later) supports two types of connected accounts. Standard accounts feature push notifications, location-based automated verifications, and verification codes for two-factor authentication. Code-only accounts provide only verification codes.

Standard Accounts

In your Connected Accounts list, standard accounts display a > at the far right of the row. Tap anywhere on the account row to go to the account detail page. The detail page shows information about the account, including recent account activity.

Code-Only Accounts

In your Connected Accounts list, code-only accounts don't display a > at the far right of the row, and there's no account detail page.

SEE ALSO:

[Connect an Account to Salesforce Authenticator \(Version 2 or Later\)](#)

[Remove an Account from Salesforce Authenticator \(Version 2 or Later\)](#)

Connect an Account to Salesforce Authenticator (Version 2 or Later)

Connect your Salesforce account to the Salesforce Authenticator mobile app to use the app for two-factor authentication. In some orgs, you're prompted to connect your account as you log in. In other orgs, you connect the account through your personal settings.

If you're prompted to connect Salesforce Authenticator to your Salesforce account as you log in, follow the onscreen instructions. To connect the app from your personal settings in Salesforce, log in to your account, then follow these steps.

1. Download and install version 2 or later of the Salesforce Authenticator app for the type of mobile device you use. For iPhone, get the app from the [App Store](#). For Android devices, get the app from [Google Play](#).

If you previously installed version 1 of Salesforce Authenticator on your mobile device, you can update the app to version 2 through the App Store or Google Play. The update preserves any connected accounts you already have in the app. These accounts are code-only accounts that generate verification codes but don't receive push notifications or allow location-based automated verifications. Code-only accounts appear on your Connected Accounts list without

a > at the far right of the account name row, and there's no account detail page. If you have a code-only account for the username you used for your current login to Salesforce, swipe left in the app to remove that username before proceeding. In the following

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Two-factor authentication with Salesforce Authenticator available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Two-factor authentication with Salesforce Authenticator available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

steps, you connect the account for that username again. The new connected account gives you full Salesforce Authenticator version 2 functionality: push notifications, location-based automated verifications, and verification codes.

- From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
- Find **App Registration: Salesforce Authenticator** and click **Connect**.
- For security purposes, you're prompted to log in to your account.
- Open the Salesforce Authenticator app on your mobile device.
If you're opening the app for the first time, you see a tour of the app's features. Take the tour, or go straight to adding your Salesforce account to the app.
- In the app, tap **+** to add your account.
The app generates a unique two-word phrase.
- Back in your browser, enter the phrase in the **Two-Word Phrase** field.
- Click **Connect**.
If you previously connected an authenticator app that generates verification codes to your account, you sometimes see an alert. Connecting version 2 or later of the Salesforce Authenticator mobile app invalidates the codes from your old app. When you need a verification code, get it from Salesforce Authenticator from now on.
- In the Salesforce Authenticator app on your mobile device, you see details about the account you're connecting. To complete the account connection, tap **Connect** in the app.

To help keep your account secure, we send you an email notification whenever a new identity verification method is added to your Salesforce account. You get the email whether you add the method or your Salesforce admin adds it on your behalf.

SEE ALSO:

[Salesforce Authenticator \(Version 2 or Later\) Account Types](#)

[Remove an Account from Salesforce Authenticator \(Version 2 or Later\)](#)

Remove an Account from Salesforce Authenticator (Version 2 or Later)

When you no longer want to use the app for two-factor authentication, remove your Salesforce account from the Salesforce Authenticator mobile app. Before you remove an account from the Salesforce Authenticator app on your mobile device, make sure that you don't lose access to your Salesforce account. Either ask your Salesforce admin to disable the two-factor authentication requirement from your account, or make sure that you have another two-factor authentication method available.

- Begin in a web browser, in your Salesforce account. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
- Find **App Registration: Salesforce Authenticator**, and click **Disconnect**.
- Find **App Registration: One-Time Password Generator**, and click **Disconnect**.
- Open the Salesforce Authenticator app on your mobile device.
- In the app list of connected accounts, find the account you want to remove.

EDITIONS

Verify Account Activity with Salesforce Authenticator (Version 2 or Later) for Two-Factor Authentication

If your org settings require you to complete two-factor authentication when you log in or access restricted resources in Salesforce, use the Salesforce Authenticator mobile app. You use the app to verify identifying details for your logins and other account activity. Using the app to verify account activity satisfies the two-factor authentication requirement.

Before you can use the app for two-factor authentication, connect the app to your account. When you do something that requires verification in Salesforce, you receive a notification from the Salesforce Authenticator app on your mobile device.

1. Respond to the notification by opening the Salesforce Authenticator app on your mobile device. The app displays details of your account activity, including your username, the service you're trying to access (such as Salesforce), and information about the device used for the activity. If location services are enabled and available, the app shows your current location. Owing to the nature of geolocation technology, the accuracy of geolocation fields (for example, street address, country, city) can vary.
2. Check the details.
3. If you recognize the details, tap **Approve** on your mobile device.
In Salesforce, you're logged in or granted access to the desired resource.

SEE ALSO:

[Verify Account Activity with Salesforce Authenticator \(Version 2 or Later\) for Two-Factor Authentication](#)

Automate Two-Factor Authentication from a Trusted Location with Salesforce Authenticator (Version 2 or Later)

Enable location services in the Salesforce Authenticator mobile app, and then use the app to automate two-factor authentication from a trusted location. Examples of trusted locations can include your home or office.

Before you can use the app for two-factor authentication, connect the app to your account. The first time you use Salesforce Authenticator to verify your account activity, the app asks for access to your location. Either respond to allow access, or go later to your mobile device's settings to allow Salesforce Authenticator to access your location. Your mobile device's location data does not leave the app. Allowing access to your location lets you automate two-factor authentication when you're working at your office, home, or other trusted location.

1. Respond to a notification from Salesforce Authenticator by opening the app on your mobile device. The app displays details of your account activity, including your username, the service you're trying to access (such as Salesforce), and information about the device used for the activity. If location services are enabled and available, the app shows your current location. Owing to the nature of geolocation technology, the accuracy of geolocation fields (for example, street address, country, city) can vary.
2. Check the details.
3. If you recognize the details, and you're in a location you trust, like your office or home, switch on **Always verify from here**.
4. Tap **Approve**.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Two-factor authentication with Salesforce Authenticator available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

In Salesforce, you're logged in or granted access to the desired resource. The next time you take the same action from the same location, the Salesforce Authenticator app automatically verifies the activity for you. You need your mobile device with you, but you don't have to respond to an app notification.

Manage Relationships and Data With Records

Much of your Salesforce data is stored in individual *records*, and organized within objects. For example, the Account object presents all of your account records. If the Acme company is one of your accounts, you'll have an account record for Acme.

[Find and View Records and Data](#)

Use tabs, search, or lists to look at your data.

[Create Records](#)

Creating records is standard procedure for most Salesforce users. Some objects (such as Account) have special *guidelines and considerations* you need to be aware of, but the *process* of creating a record is similar for all.

[Edit Records](#)[Delete Records](#)[Attach Files to Records](#)

You can attach files—such as Microsoft® Office documents, Adobe® PDFs, and images and videos—to most kinds of Salesforce records. The size limit for an attached file is 25 MB when attached directly to the related list, including a file attached to a solution. The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file.

[Topics on Records](#)

Topics are words or phrases that you can associate with Salesforce records to organize them around common themes. Use topics to group records by a common theme, and then use those topics to filter list views.

[Tags on Records](#)

Tags are words or short phrases that you can associate with most Salesforce records to describe and organize their data in a personalized way. Use tags to group records from various objects by a common theme or use, and then use those tags in search to make finding information fast and intuitive.

[Guidelines for Entering Currency, Dates, Times, and Phone Numbers](#)[Select Picklist Values](#)

You may encounter a few different types of picklist fields in Salesforce.

[Notes](#)

Notes is an enhanced version of the Salesforce note-taking tool that lets your users take better notes faster. Use Notes to streamline your workflow, increase productivity, and get the most out of Salesforce.

[Considerations for Managing Files and Notes Attached to Records](#)

When working with attachments, Google docs, or notes created with the old note-taking tool, there are a number of things to keep in mind.

[Note and Attachment Fields](#)

Notes is an enhanced version of the Salesforce note-taking tool. This table lists the fields available when you create a note using Notes. There's also a toolbar with icons for adding bulleted and numbered lists to notes.

[Delete Notes and Attachments from Records](#)

To delete a note or attachment, click **Del** next to the note or attachment in the Notes and Attachments related list or Attachments related list of a record.

[Why is the record I'm trying to save being flagged as a duplicate? What can I do?](#)

Your organization uses duplicate rules, which prevent users from creating duplicate records. Read the message to decide how to proceed.

Find and View Records and Data

Use tabs, search, or lists to look at your data.

When you're working with records, it's important to remember that the types of records you can create, view, edit, and delete are determined by administrator settings, such as a user profile or permission set. Your access to individual records may be determined by other configurations, such as sharing settings. And your access to fields on types of records may be controlled by field-level security. Work with your administrator to make sure you have access to the records and data you need.

There are a few easy ways to find and view your records.

- From a tab, such as Accounts or Contacts, start from the default view and click **Go!** or select a different view.

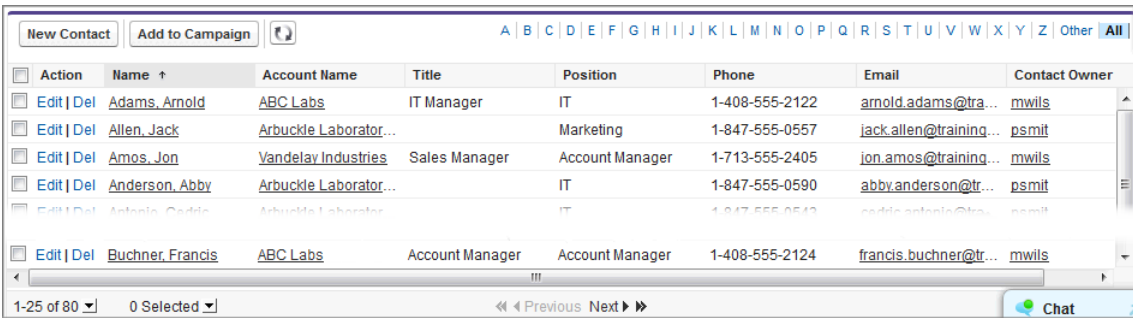

The resulting page you see is called a *list view*.

EDITIONS

- Search for a record using keywords, such as a name or address stored in the record. Use the search bar in the banner displayed on most pages.
- On many records, below the main page sections, look for related lists, which identify records that are associated with the record you're currently viewing. For example, an account record probably has a related list of contacts at that account.

Granting Access to Records

You can use manual sharing to give specific other users access to certain types of records, including accounts, contacts, and leads. In some cases, granting access to one record includes access to all its associated records.

Editing or Deleting Record Access

Edit or remove access to a record.

Viewing Which Users Have Access to Your Records

After you have granted access to a record you own, you can view a list of users who have access to the record and its related information and records, including their access level and an explanation. The list shows every user who has access that's greater than the org-wide default settings.

Record Access Levels

List Views

List views give you quick access to your important records. You can find preconfigured views, such as a list of recently viewed records, for every standard and custom object. Create customized list views to display records that meet your own criteria. Scroll through preconfigured views and list views that you created, and use list view charts to see a graphical display of your list view data.

How does the sharing model work?

Which kinds of records can I print list views for?

Open Items You've Recently Viewed

In the Recent Items section of the Salesforce sidebar, you'll find a list of up to 10 items (records, documents, custom objects, and the like) you've most recently added, edited, or viewed.

[Sharing Settings](#)

Granting Access to Records

You can use manual sharing to give specific other users access to certain types of records, including accounts, contacts, and leads. In some cases, granting access to one record includes access to all its associated records.

For example, if you grant another user access to an account, the user will automatically have access to all the opportunities and cases associated with that account.

To grant access to a record, you must be one of the following users.

- The record owner
- A user in a role above the owner in the hierarchy (if your organization's sharing settings control access through hierarchies)
- Any user granted "Full Access" to the record
- An administrator

[Walk Through It: grant users access to your account](#)

To grant access to a record using a manual share:

1. Click **Sharing** on the record you want to share.
2. Click **Add**.
3. From the **Search** drop-down list, select the type of group, user, role, or territory to add.

Depending on the data in your organization, your options can include:

Type	Description
Managers Groups	All direct and indirect managers of a user.
Manager Subordinates Groups	A manager and all direct and indirect reports who he or she manages.
Public Groups	All public groups defined by your administrator.
Personal Groups	All personal groups defined by the record owner. Only the record owner can share with his or her personal groups.
Users	All users in your organization. Does not include portal users.
Roles	All roles defined for your organization. This includes all of the users in each role.
Roles and Subordinates	All of the users in the role plus all of the users in roles below that role in the hierarchy. Only available when no portals are enabled for your organization.
Roles and Internal Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role,

EDITIONS

Available in: Salesforce Classic

Sharing for accounts and contacts is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Sharing for campaigns, cases, custom object records, leads, and opportunities is available in **Enterprise, Performance, Unlimited, and Developer** Editions

Territory management available in: **Developer** and **Performance** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

Type	Description
	excluding partner portal and Customer Portal roles.
Roles and Internal and Portal Subordinates	Adds a role and its subordinate roles. Includes all of the users in that role plus all of the users in roles below that role. Only available when a partner or Customer Portal is enabled for your organization. Includes portal roles and users.
Territories	For organizations that use territory management, all territories defined for your organization, including all users in each territory.
Territories and Subordinates	For organizations that use territory management, all users in the territory plus the users below that territory.

 **Note:** In organizations with more than 2,000 users, roles, and groups, if your query doesn't match any items in a particular category that category won't show up in the Search drop-down menu. For example, if none of your group names contain the string "CEO," after searching for "CEO" you'll notice the Groups option no longer appears in the drop-down. If you enter a new search term, all of the categories will still be searched even if they don't appear in the list. You can repopulate the drop-down by clearing your search terms and pressing **Find**.

- Choose the specific groups, users, roles, or territories who should have access by adding their names to the Share With list. Use the **Add** and **Remove** arrows to move the items from the Available list to the Share With list.
- Choose the [access level](#) for the record you are sharing and any associated records that you own.

 **Note:**

- If you're sharing an opportunity or case, those you share it with must also have at least "Read" access to the associated account (unless you are sharing a case via a case team). If you also have privileges to share the account itself, those you share it with are automatically given "Read" access to the account. If you do not have privileges to share the account, you must ask the account owner to give others "Read" access to it.
 - `Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent.
 - For sharing rules that specify access for associated object records, the given access level applies to that sharing rule only. For example, if an account sharing rule specifies Private as the access level for associated contacts, a user can still have access to associated contacts via other means, such as org-wide defaults, the "Modify All Data" or "View All Data" permission, or the "Modify All" or "View All" permission for contacts.
- When sharing a forecast, select `Submit Allowed` to enable the user, group, or role to submit the forecast.
 - Select the reason you're sharing the record so users and administrators can understand.
 - Click **Save**.

SEE ALSO:

- [Editing or Deleting Record Access](#)
- [Your Access to UI Elements, Records, and Fields](#)
- [Viewing Which Users Have Access to Your Records](#)
- [Record Access Levels](#)
- [Why can't I see the Sharing button on a record?](#)

Editing or Deleting Record Access

Edit or remove access to a record.

Manual shares are deleted automatically if the record owner is changed or if they are no longer needed, such as when the organization-wide defaults or sharing rules grant a similar or wider access than the manual share.

To edit or delete access to a record:

1. Open the record for which you want to edit or delete.
2. Click **Sharing** on the record.
3. Click **Edit** or **Del** next to the group, user, role, or territory whose access you want to modify or remove.

SEE ALSO:

[Granting Access to Records](#)

[Why can't I see the Sharing button on a record?](#)

[Record Access Levels](#)

Viewing Which Users Have Access to Your Records

After you have granted access to a record you own, you can view a list of users who have access to the record and its related information and records, including their access level and an explanation. The list shows every user who has access that's greater than the org-wide default settings.

For forecast sharing, the list shows whether the user can submit a forecast (in forecasting versions where sharing is available). High-volume portal users and Customer Portal super users are excluded from this list.

 **Note:** For sharing rules that specify access for associated object records, the given access level applies to that sharing rule only. For example, if an account sharing rule specifies Private as the access level for associated contacts, a user can still have access to associated contacts via other means, such as org-wide defaults, the "Modify All Data" or "View All Data" permission, or the "Modify All" or "View All" permission for contacts.

1. Click **Sharing** on the desired record.
2. Click **Expand List**.
3. Click **Why?** next to a user's name to see the reason the user has access to the record.

If there are multiple reasons with different access levels, the user is always granted the most permissive access level.

The possible reasons are:

Reason	Description
Account Sharing Rule	The user has access via an account sharing rule created by the administrator.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Reason	Description
Account Sharing	The user was granted access via the Sharing button on the associated account.
Account Team	The user is a member of the account team.
Account Territory	The account has been assigned to a territory to which the user has access.
Account Territory Rule	The user has access via an account territory sharing rule created by the administrator.
Administrator	The user has the "Modify All Data" or "View All Data" administrative permission, or the "Modify All" or "View All" object permission.
Associated Portal User or Role	The portal user or any role above the portal user's role has access to the account for which the portal user is a contact.
Associated Record Owner or Sharing	The user owns or has sharing access to a contact or contract associated with the account. Click the link to view which associated records the user owns or has been given sharing access to.
Associated Record Sharing	The user is a member of a share group that has access to a contact or contract that's associated with the account owned by high-volume portal users.
Campaign Sharing Rule	The user has access via a campaign sharing rule created by the administrator.
Case Sharing Rule	The user has access via a case sharing rule created by the administrator.
Contact Sharing Rule	The user has access via a contact sharing rule created by the administrator.
Delegated Forecast Manager	A user has access to forecast data that was granted via the Sharing button on the forecast (in forecasting versions where sharing is available).
Forecast Manager	A user has access due to being a forecast manager in the forecast hierarchy.
Group Member	The user has access via a group, such as a Managers Group or Manager Subordinates Group.
Lead Sharing Rule	The user has access via a lead sharing rule created by the administrator.
Manager of Territory Member	The user has a subordinate in the role hierarchy who is assigned to the territory with which the account is associated.
Manual Sharing	The user has access that was granted via the Sharing button on the record.

Reason	Description
Manual Territory Sharing	The account has been manually assigned to a territory to which the user has access.
Opportunity Sharing Rule	The user has access via an opportunity sharing rule created by the administrator.
Owner	The user owns the record, or the user is a member of the queue that owns the record or above the queue member in the role hierarchy.
Portal Share Group	The user is a member of a share group that has access to records owned by high-volume portal users.
Related Portal User	The portal user is a contact on the case.
Role Above Owner or Shared User (Portal Only)	The user's role is above the role of a portal user who has access to the record via ownership or sharing.
Sales Team	The user is a member of the opportunity sales team.
View All Forecasts Permission	The user has the "View All Forecasts" permission.

If a user has access to a record as a result of multiple sharing reasons, you might see some reasons compressed into a single record that contains the highest level of permission. The reasons that are compressed are: Associated Portal User or Role, Associated Record Owner or Sharing, Manual Sharing, and Owner. For example, if a user owns opportunities associated with an account and was also manually given access to that account, the user is listed only once on sharing pages.

SEE ALSO:

[Your Access to UI Elements, Records, and Fields](#)

[Granting Access to Records](#)

[Record Access Levels](#)

Record Access Levels

When you share records with other users, you can assign them different levels of access to the records.

The available access levels are:

Access Level	Description
Full Access	User can view, edit, delete, and transfer the record. User can also extend sharing access to other users; however, the user cannot grant Full Access to other users.
Read/Write	User can view and edit the record, and add associated records, notes, and attachments to it.
Read Only	User can view the record, and add associated records to it. They cannot edit the record or add notes or attachments.
Private	User cannot access the record in any way.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Sharing for accounts and contacts is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Sharing for campaigns, cases, custom object records, leads, and opportunities is available in **Enterprise, Performance, Unlimited, and Developer** Editions

Note: If you encounter an error when selecting the Full Access option, you no longer have the permission to set full access on records. Contact your administrator to determine if this access is necessary.

[Your Access to UI Elements, Records, and Fields](#)

[Viewing Which Users Have Access to Your Records](#)

List Views

List views give you quick access to your important records. You can find preconfigured views, such as a list of recently viewed records, for every standard and custom object. Create customized list views to display records that meet your own criteria. Scroll through preconfigured views and list views that you created, and use list view charts to see a graphical display of your list view data.

[Create a List View](#)

Create a list view to see a specific set of records. You can create and save views for opportunities, contacts, leads, and other standard and custom objects. You determine which records display by setting filters. All records that meet your filter criteria appear in your list view.

[Edit List View Filters](#)

Refine or update your list views to make sure that you're seeing the most relevant records. To change which records display in a list view, edit the list view filters.

[Sort List Views](#)

Lots of objects let you view records in lists, also called "list views." If your list is long, you can sort the records by one of the field columns. For example, you can sort the All Accounts list view by the `Account Name` field column, `Billing State/Province` field column, and others. You can also sort custom list views. Sorting is alphanumeric.

[Print a List View in Salesforce Classic](#)[Delete a List View](#)

Delete a list view when you no longer need it to keep your workspace up to date.

[Relative Date Values for Filter Criteria](#)

When you create a list view that includes a filter for a range of dates, such as `Create Date` or `Last Update Date`, use one or more of the relative date values provided to specify the range.

[Visualize List View Data with Charts in Lightning Experience](#)

See a graphic display of list view data with list view charts. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view, select from available standard and custom list view charts. You can change the data display to another type, if desired.

[Create a List View Chart in Lightning Experience](#)

Create a chart to visualize list view data. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view chart, you can change the data display to another type, if desired. When you create a list view chart for an object, such as Opportunities or Leads, the chart is associated with the object. The chart is available for any list view that you have permission to see for that object, except the Recently Viewed list.

[Edit a List View Chart in Lightning Experience](#)

Refine or update your custom list view charts to make sure that you're seeing the most meaningful data visualizations. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view chart, you can change the data display to another type, if desired.

Create a List View

Create a list view to see a specific set of records. You can create and save views for opportunities, contacts, leads, and other standard and custom objects. You determine which records display by setting filters. All records that meet your filter criteria appear in your list view.

[Create a List View in Lightning Experience](#)

Create a view to see an infinitely scrollable list of records that meet your filter criteria.

[Create a List View in Salesforce Classic](#)

Create a list view to see a specific set of contacts, documents, or other object records. For example, create a list view of accounts in your state, leads with a specific lead source, or opportunities above a particular amount. You can also create views of contacts, leads, users, or cases to use for mass email recipient lists.

Create a List View in Lightning Experience

Create a view to see an infinitely scrollable list of records that meet your filter criteria.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

Actions you can take for list views are available in the List View Controls menu, accessed by clicking

next to the list view name.

1. From List View Controls, select **New**. A dialog box appears.
2. Enter a name for your list.
3. Choose who can see this list view: just you, or all users, including Partner and Customer Portal users.
4. Click **Save**. The Filters panel appears.
5. Click **Show me**, then select **All objects** or **My objects**.
6. Click **Done**.
7. Add and set filters to view only the records that meet your criteria. You have different options depending on the field you want to filter and the operator you choose.

Filters support values only between the minimum and maximum for a signed 23-bit integer, or between 1 and 2,147,483,648. A value outside of this range disables that filter.

- a. Click **Add Filter**.
 - b. From the New Filter drop-down menu, select the field to filter.
 - c. From the Filter by... drop-down menu, select an operator. For example, choose **equals**, **starts with**, or **does not contain**.
 - d. For Value, make a selection or enter a value.
 - e. Click **Done**.
 - f. To set another filter, click **Add Filter**.
 - g. To remove a filter, click  near the filter name.
8. To add logic that further refines which records appear in your list view, click **Filter Logic**. Use the number assigned to each filter to reference filters in your logic statement.

 **Important:** Include every filter number in your logic statement. You can't have filters that aren't referenced in the logic statement.

Operand	Definition
AND	Finds records that match both values. 1 AND 2
OR	Finds records that match either value. 1 OR 2

EDITIONS

Available in: **Lightning Experience**

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create list views:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

To create, edit, or delete public list views:

- "Manage Public List Views"

Operand	Definition
NOT	Finds records that exclude values. For example, Filter 1 is Industry equals Biotechnology . You set filter logic as NOT 1 . Your report returns records that don't have Biotechnology as the Industry value.

Let's say a rep wants to see all opportunities created in July 2015 or later, that are either in late stages of negotiation or have high probability to close, or both. Here are the filters:

- Last Modified Date greater or equal 7/1/2015
- Stage contains Proposal/Price Quote, Negotiation/Review
- Probability greater or equal 50

Then the rep adds the logic statement: **1 AND (2 OR 3)**.

The screenshot shows the Salesforce 'Recent Promising Opportunities' list view. The table displays 8 items, sorted by Opportunity Name, filtered by Last Modified Date, Stage, and Probability (%). The filters panel on the right shows three active filters:

- 1. Last Modified Date greater or equal 7/1/2015
- 2. Stage contains Proposal/Price Quote, Negotiation/Review
- 3. Probability (%) greater or equal 50

The Filter Logic is set to **1 AND (2 OR 3)**.

OPPORTUNITY NAME	ACCOUNT NAME	STAGE	CLOSE DATE	AMOUNT
August Order	Emerson Electric Co	Perception Analysis	8/29/2015	\$250,000.00
Avocados	Rosa Mexicano	Id. Decision Makers	7/31/2015	\$5,700.00
Cell Towers	AT&T Corp	Negotiation/Review	7/31/2015	\$250,000.00
Cilantro	Rosa Mexicano	Id. Decision Makers	7/14/2015	\$1,200.00
Microprocessors	Advanced Micro D...	Closed Won	9/21/2015	\$150,000.00
Tomatoes	Chipotle2	Value Proposition	1/5/2016	\$68,000.00
Tomatoes	Rosa Mexicano	Value Proposition	7/31/2015	\$4,050.00
Tomatoes	H.J. Heinz Company	Value Proposition	11/12/2015	\$60,000.00

Note: NOT doesn't work with parenthetical expressions. For example, the expression **1 AND NOT (2 AND 3)** evaluates as **1 AND (NOT 2 AND 3)**. In the filter results, no records are returned when you'd expect to see some records.

- Click **Save**. The view appears in the list view drop-down list so you can access it later.

10. Optionally, choose and order the columns in your list view.

- a. From the List View Controls menu, select **Select Fields to Display**.
- b. To add columns, select one or more fields from Available Fields and use the arrow to move them to Visible Fields.
- c. To remove columns, select one or more fields from Visible Fields and use the arrow to move them to Available Fields.
- d. Order columns by selecting one or more fields from Visible Fields and using the arrows to move them up or down.
- e. Click **Save**.

 **Note:** In list views you see only the data that you have access to. You see records that you own or have read or write access to, and records shared with you. List views also include records owned by or shared with users in roles below you in the role hierarchy. You can see only the fields that are visible according to your page layout and field-level security settings.

[Filter Operators Reference](#)

[Visualize List View Data with Charts in Lightning Experience](#)

Create a List View in Salesforce Classic

Create a list view to see a specific set of contacts, documents, or other object records. For example, create a list view of accounts in your state, leads with a specific lead source, or opportunities above a particular amount. You can also create views of contacts, leads, users, or cases to use for mass email recipient lists.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

To create a view, click **Create New View** at the top of any list page or in the Views section of any tab home page.

 **Note:** If you don't see **Create New View**, you don't have the "Create and Customize List Views" permission. Contact your Salesforce admin to request it.

1. For **Enter View Name**, enter the name to display in the views drop-down list.
2. If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.
3. Specify your filter criteria.

Filter by Owner

These options vary depending on the kind of record. In general, select **All . . .** or **My . . .** to specify the set of records to search. Possible options include:

- Viewing leads and cases by queue.
- Grouping by price book.
- Viewing activity list views in any of several ways.
- If your org has territory management, restricting account and opportunity list views by **My Territories** or **My Territory Teams**. **My Territories** means records associated with territories to which you belong. **My**

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To create custom list views:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

To create, edit, or delete public list views:

- "Manage Public List Views"

`Territory Teams` means records associated with either territories to which you belong or territories below you in the territory hierarchy.

- If your org has case teams, restricting case list views by `My Case Teams`.
- If your org has account teams, restricting account list views by `My Account Teams`.
- If your org has opportunity teams, restricting opportunity list views by `My Opportunity Teams`.

Filter by Campaign

This option is available on these list views:

- Contacts home
- Leads home
- Mass email contacts
- Mass email leads
- Mass add campaign members wizard
- Mass update campaign members wizard

If you're editing a list view that's filtered by campaign and don't have at least read access to the campaign, you get an error when attempting to save the list view.

Filter by Division

If your org uses divisions to segment data and you have the "Affected by Divisions" permission, select the division for the records you want to view. This option is disabled if you're not searching all records.

Select **Current** to show records in your current working division.

Filter by Additional Fields

Optionally, enter filter criteria to specify conditions that the selected items must match—for example, *Lead Source equals web*. You can also use date values in your filter criteria.

-  **Note:** When you select the `Created Date` field in a list view filter, the value you specify can only be a date and not a time. This restriction does not apply to other filters.

4. Select which fields to display.

The default fields are automatically selected. From the fields that are in your page layout, you can display up to 15 different fields in your view.

- To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.
- Use the arrows to arrange the fields in the proper sequence.

Considerations for adding fields

When you select a long text area field, up to 255 characters are displayed in the list view.

You can use only custom long text area fields in custom list views; standard long text area fields aren't available.

If you add or remove a field and save the change, the list view's columns adjust to the default width to accommodate the change. This change ignores any previously set custom widths.

5. Optionally restrict the view's visibility.

If you're an admin or a user with the "Manage Public List Views" permission, specify whether everyone or just you can see the custom view. This option is not available in Personal Edition. To see a list view, users also require "Read" permission for the type of records within the list view.

Enterprise, Unlimited, Performance, and Developer Edition users can give access to a public group or role, including all users below that role. To share the list view:

- a. Select `Visible to certain groups of users`.
- b. Choose the type of group or role from the drop-down list, and then select the group or role from the list.
- c. Click **Add**.

 **Note:** List views are visible to your Salesforce Customer Portal users if the `Visible to all users` setting is enabled for views of objects in Customer Portal users' profiles. To make list views visible only to your Salesforce users, select `Visible to certain groups of users`. Then share the view with the All Internal Users group or a selected set of internal groups and roles.

When implementing a Customer Portal, create custom views that contain only relevant information for Customer Portal users. Then make those views visible to Customer Portal users by sharing them with the All Customer Portal Users group, or a set of portal groups and roles.

6. Click **Save**. The view appears in the View drop-down list so you can access it later.

You can rename an existing list view and click **Save As** to save the criteria of the list view without altering the original view.

To navigate back to the last list page you viewed, click **Back to list** at the top of any detail page.

 **Note:** In list views you see only the data that you have access to. You see records that you own or have read or write access to, and records shared with you. List views also include records owned by or shared with users in roles below you in the role hierarchy. You can see only the fields that are visible according to your page layout and field-level security settings.

Archived activities are not included in activity list views. You can use the Activity History related list to view these activities.

Edit List View Filters

Refine or update your list views to make sure that you're seeing the most relevant records. To change which records display in a list view, edit the list view filters.

[Edit List View Filters in Lightning Experience](#)

Edit filters on a list view from List View Controls, or click  to access the Filters panel.

[Edit List View Filters in Salesforce Classic](#)

To change a list view's filters, edit the list.

SEE ALSO:

[Filter Operators Reference](#)

[Create a List View in Lightning Experience](#)

Edit List View Filters in Lightning Experience

Edit filters on a list view from List View Controls, or click  to access the Filters panel.

Important: These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

Actions you can take for list views are available in the List View Controls menu, accessed by clicking

 next to the list view name.

Note: Some list views have predefined filter scopes and can't be filtered. For example, the SOQL query for a generic Team list view or the Recently Viewed list view doesn't allow further filtering of the query results.

1. From List View Controls, select **Edit List Filters**. Alternatively, click . The Filters panel appears.
2. Edit, remove, or add filters to view only the records that meet your criteria. You have different options depending on the field you want to filter and the operator you choose.

- a. Click the filter you want to change.
- b. From the Filter by... drop-down menu, select an operator. For example, choose **equals**, **starts with**, or **excludes**.
- c. In Value, make a selection or enter a value.

Note: Filters support values only between the minimum and maximum for a signed 23-bit integer, or between 1 and 2,147,483,648. A value outside of this range disables that filter.

- d. Click **Done**.
 - e. To set another filter, click **Add Filter**.
 - f. To remove a filter, click  near the filter name.
3. Adjust your filter logic if needed. The filter logic statement can't reference a filter number that doesn't exist.

Note: NOT doesn't work with parenthetical expressions. For example, the expression `1 AND NOT (2 AND 3)` evaluates as `1 AND (NOT 2 AND 3)`. In the filter results, no records are returned when you'd expect to see some records.

4. To apply the edited filters and update the list, click **Save**.

Everyone with access to the list sees the results of your saved changes.

Example: You want to display a set of opportunities on a board rather than in a grid, but the list view includes records with different record types. The Opportunities board can only display list views with records of a single record type. To make the view displayable on a board, edit the filters on your list view. On the Filters panel, select **Add Filter**. Choose **Opportunity Record Type** and the **equals** operator, then input the value of the record type you want. Your edited list view can now be displayed on the board.

Edit List View Filters in Salesforce Classic

To change a list view's filters, edit the list.

-  **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.
- 1. Click **Edit** next to the list view name. Users without the "Manage Public List Views" permission see **Clone** instead of **Edit** so they can clone a public or standard view.
- 2. In Specify Filter Criteria, change your **Filter By Owner** selection, if desired. Add or change the **Field**, **Operator**, or **Value** selections in Filter By Additional Fields.
If you add or remove a field and save the change, the list view's columns adjust to the default width to accommodate the change. This change ignores any previously set custom widths.
- 3. Click **Save** to apply your edited filters to the list view.

All users with access to the list view see the results of your saved changes.

-  **Note:** In list views you see only the data that you have access to. You see records that you own or have read or write access to, and records shared with you. List views also include records owned by or shared with users in roles below you in the role hierarchy. You can see only the fields that are visible according to your page layout and field-level security settings.

Sort List Views

Lots of objects let you view records in lists, also called "list views." If your list is long, you can sort the records by one of the field columns. For example, you can sort the All Accounts list view by the **Account Name** field column, **Billing State/Province** field column, and others. You can also sort custom list views. Sorting is alphanumeric.

1. Open the list view.
2. Click the header for the field column you want to sort by.
An arrow appears indicating how the list is sorted: from the column's first record (↑) (alphanumerically) or its last (↓).

-  **Note:** Starting in Spring '13, you can't sort list views for the Users object in Salesforce orgs that have more than two million users.

[Create a List View in Salesforce Classic](#)

Relative Date Values for Filter Criteria

When you create a list view that includes a filter for a range of dates, such as `Create Date` or `Last Update Date`, use one or more of the relative date values provided to specify the range.

 **Important:** Creation and filtering of list views in Lightning Experience is currently available only in Trial orgs. We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

For example, to create a custom view or report of accounts created the previous week, enter `Create Date equals LAST WEEK`. For relative date values with variables, such as "NEXT *N* DAYS", substitute *N* with any number greater than zero.

Relative date values are not case-sensitive. You can use "LAST WEEK" or "last week."

You can use multiple range values in a single field, separated by commas.

 **Note:** For Enterprise, Unlimited, Performance, Professional, and Developer Editions, the week is defined by the Locale drop-down list on your personal information page. For Contact Manager, Group, and Personal Editions, the week is defined by the Locale setting in the company profile. For example, when the locale is US English, a week runs Sunday to Saturday, whereas with UK English, a week spans Monday to Sunday.

 **Note:** In the table, the relative date values marked with an asterisk (*) aren't available in Lightning Experience.

Relative Date Value	Range
YESTERDAY	Starts at 12:00:00 AM on the day before the current day and continues for 24 hours.
TODAY	Starts at 12:00:00 AM on the current day and continues for 24 hours.
TOMORROW	Starts at 12:00:00 AM. on the day after the current day and continues for 24 hours.
LAST WEEK	Starts at 12:00:00 AM on the first day of the week before the current week and continues for seven days.

<i>n</i> FISCAL YEARS AGO*	Starts at 12:00:00 AM on the first day of the fiscal year <i>n</i> fiscal years ago and continues through the end of the last day of that fiscal year.

Visualize List View Data with Charts in Lightning Experience

See a graphic display of list view data with list view charts. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view, select from available standard and custom list view charts. You can change the data display to another type, if desired.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. On an object home page, select a list view with data you want to visualize.
2. Click .
The Charts panel appears.
3. To select a different chart, click  next to the chart name.
4. To change the graphical display of data, click  in the Charts panel and choose a new chart type.
Your data changes to the new display.

SEE ALSO:

Create a List View Chart in Lightning Experience

Create a chart to visualize list view data. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view chart, you can change the data display to another type, if desired. When you create a list view chart for an object, such as Opportunities or Leads, the chart is associated with the object. The chart is available for any list view that you have permission to see for that object, except the Recently Viewed list.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. On an object home page, select a list view with data you want to visualize.
2. Click .
3. In the Charts panel that appears, click .
4. Select **New Chart**.
A dialog box appears.
5. Enter a chart name.
6. Select a chart type: vertical bar, horizontal bar, or donut.
7. Select the aggregate type, aggregate field, and grouping field.
The aggregate type specifies how the field data is calculated: by sum, count, or average. The aggregate field specifies the type of data to calculate. The grouping field labels the chart segments.
8. To view your chart, click **Save**.

EDITIONS

Available in: Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To see list view charts:

- "Read" on the type of record included in the list

EDITIONS

Available in: Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create list view charts:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

 **Example:** Your sales team wants to compare accounts by number of employees to focus prospecting efforts on large corporations. One of the reps creates a horizontal bar chart by selecting **Sum** as the aggregate type, **Employees** as the aggregate field, and **Account Name** as the grouping field. The chart shows the number of employees at each account by account name.

[Edit a List View Chart in Lightning Experience](#)

Edit a List View Chart in Lightning Experience

Refine or update your custom list view charts to make sure that you're seeing the most meaningful data visualizations. There are three types of charts: vertical bar, horizontal bar, and donut. For any list view chart, you can change the data display to another type, if desired.

 **Note:** These steps work in Lightning Experience. If you see a navigation bar on the left side of your screen, you're in Lightning Experience. If you see a row of tabs across the top of the screen, you're in Salesforce Classic.

1. On an object home page, click .
2. In the Charts panel that appears, select the name of one of your custom charts.
3. Click .
4. Select **Edit Chart**.
A dialog box appears.
5. Make your changes to the chart name, chart type, aggregate type, aggregate field, or grouping field.

The aggregate type specifies how the field data is calculated: by sum, count, or average. The aggregate field specifies the type of data to calculate. The grouping field labels the chart segments.
6. To view your edited chart, click **Save**.

 **Note:** You can't edit standard or preconfigured charts. You can only edit charts that you create. You can't delete list view charts.

How does the sharing model work?

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, the administrator can define the default sharing model for your organization by setting organization-wide defaults. Organization-wide defaults specify the default level of access to records. For most objects, organization-wide defaults can be set to Private, Public Read Only, or Public Read/Write.

In environments where the sharing model for an object has been set to Private or Public Read Only, an administrator can grant users additional access to records by setting up a role hierarchy and defining sharing rules. Role hierarchies and sharing rules can only be used to grant additional access—they cannot be used to restrict access to records beyond what was originally specified with the sharing model through organization-wide defaults.

EDITIONS

Available in: Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To edit list view charts:

- "Read" on the type of record included in the list AND "Create and Customize List Views"

After restricting access using organization-wide defaults, users typically get access through one or more of these methods:

- Role hierarchy
- Sharing rules
- Manual sharing
- Implicit access (Accounts and associated child records)
- Teams (Account, Case, and Opportunity)

Which kinds of records can I print list views for?

If printable list views are enabled for your organization, you can print standard and custom list views for these kinds of records.

- Accounts
- Activities
- Campaigns
- Cases
- Contacts
- Contracts
- Custom objects
- Documents
- Leads
- Opportunities
- Permission sets
- Price books
- Profiles
- Products
- Reports
- Solutions

Open Items You've Recently Viewed

In the Recent Items section of the Salesforce sidebar, you'll find a list of up to 10 items (records, documents, custom objects, and the like) you've most recently added, edited, or viewed.

To open any item's detail or edit page, just click its link.

 **Tip:** If your organization has enabled hover details, you can hover your mouse over any item in the Recent Items list to view key information about the record before clicking into that record's detail or edit page.

 **Note:** Your Recent Items may show fewer than 10 items if you have recently deleted any of your recently viewed items. Likewise, the Recent lists on the tab home pages (for example, the Recent Leads list) may show fewer than 10 or 25 items if you have recently deleted items.

[Creating Records Using the Create New Drop-Down List](#)

[Creating Records with Quick Create](#)

Creating Records from Object Tabs

Before you create a record, make sure you're aware of any guidelines for the kind of record you're creating.

1. Click the tab for the kind of record you want to create. You'll start from that object's Home page. For example, click the Accounts tab if you want to create an account record.
2. Click **New**.
3. Select a record type if you're prompted to.
4. Enter values in the fields. Required fields are identified with a red bar ().
 -  **Tip:** Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `INDUSTRY` drop-down list, look up "Account Fields" in the help.
5. When you finish entering values for your new record, click **Save**, or click **Save & New** to save the current record and create another. If you navigate away from the page before clicking **Save**, you may lose your changes.

[Creating Records in Feeds](#)

[Creating Records with Quick Create](#)

[Create Records](#)

Creating Records in Feeds

Depending on how your administrator has set up Salesforce, you may be able to create records in the feed on the home page, the Chatter tab, and record detail pages. Publishers on different feeds may have different actions available; check with your administrator for information on what you can do in each feed. Before you create a record, make sure you're aware of any guidelines for the kind of record you're creating.

1. In the feed in which you want to create a record, click the quick action that corresponds to the kind of record you want to create.
2. Enter values in the fields. Required fields are identified with a red bar ().

Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `INDUSTRY` drop-down list, look up "Account Fields" in the help.
3. When you finish entering values for your new record, click **Create**.

A feed item for the record you've created appears:

- In the feed in which you created the record.

Creating Records Using the Create New Drop-Down List

The Create New drop-down list, available in the sidebar, provides options to create new records. To create a new record using the drop-down list:

1. Select the type of record you want to create. The new record page immediately displays in the appropriate tab or the Upload a File dialog box displays if you selected **File**.
2. Fill in the fields.
3. Click **Save** or **Upload to My Files** if you selected **File**.

Creating Records with Quick Create

If your administrator has enabled Quick Create, you can create records from the home pages for leads, accounts, contacts, and opportunities. You can also create accounts from the Account lookup field results list on the Quick Create form on contacts, leads, and opportunities. Validation rules don't apply when you create new records with Quick Create.

1. Click the tab for the kind of record you want to create. To create an account while you create a contact, lead or opportunity, click the  icon next to the Account field in the Quick Create form you're using.
2. Enter values in the fields. Required fields are identified with a red bar (|). Most objects have field definitions in the Salesforce help. Just search the help for the object name + "fields". For example, if you're creating or editing an account record and want to know more about your options in the `INDUSTRY` drop-down list, look up "Account Fields" in the help.

EDITIONS

Available in: Salesforce Classic

The available options in the Create New drop-down list vary according to which permissions you have, which Salesforce Edition you are using, and which app you are using.

ACTIVITY	COLLABORATE	DETAILS	
Opportunity Name Acme - 1,200 Widgets (Sample)		Opportunity Owner Admin User	Change O...
Account Name Acme (Sample)		Close Date 8/9/2015	
Type Existing Business		Stage Needs Analysis	
Primary Campaign Source		Probability (%) 35%	
Budget Confirmed <input type="checkbox"/>		Amount \$140,000.00	
Discovery Completed <input type="checkbox"/>			
ROI Analysis Completed <input type="checkbox"/>			

Use keyboard shortcuts to edit a record quickly.

- To move to the next field in the record, press the Tab key.
- To return to the revert icon of the previous field, press Shift + Tab.
- To revert the change in a field, press Enter on the revert icon.
- To revert all changes made to the record, press Esc to move to Cancel and press Enter.
- To save, press Enter and press Enter again.

Here are a few more advantages to inline editing in Lightning Experience.

- Reps can navigate within the page while editing a record. They can switch to the record's chatter feed and back without losing changes.
- Reps are warned if they try to navigate to another page or browser tab without saving changes.
- Error messages appear in a window at the bottom of the page. Reps can click  to hide the window when scrolling through a long record.

The screenshot shows the Salesforce interface for editing an Account record. The account name 'Global Media' is partially visible. The 'Account Name' field is highlighted in yellow, and a red error message box is overlaid on it, stating: 'Review the following errors. These required fields must be completed: Account Name'. The error message box has a red background and a white border, with a red triangle icon. Below the error message are 'Cancel' and 'Save' buttons. The 'Save' button has a red warning icon next to it. The background shows the account details form with fields for 'Account Owner', 'Phone', 'Fax', 'Website', and 'Parent Account'. The 'Type' dropdown is set to 'Prospect'.

 **Note:** Inline editing works only when editing record details. It'll soon be available in the Highlights panel and list views.

Guidelines for Editing Records with the Inline Editor

Tips for Saving Inline Edits

- Press **Enter** while your cursor is in a field's edit box to confirm the change for that field.
- Press **Enter** when no fields are in edit mode to save all edits to the record.

Limitations

- Inline editing isn't available in:
 - Accessibility mode
 - Setup pages
 - Dashboards
 - Customer Portal
 - Descriptions for HTML solutions
- The following standard checkboxes on case and lead edit pages are not inline editable:
 - Case Assignment (Assign using active assignment rules)
 - Case Email Notification (Send notification email to contact)

EDITIONS

Available in: Salesforce Classic

Inline editing settings available in: **All** Editions except **Database.com**

USER PERMISSIONS

To use inline editing:

- "Edit" on the object

- Lead Assignment (Assign using active assignment rule)
- The fields in the following standard objects are not inline editable.
 - All fields in Documents and Price Books
 - All fields in Tasks except for Subject and Comment
 - All fields in Events except for Subject, Description, and Location
 - Full name fields of Person Accounts, Contacts, and Leads. However, their component fields are, for example, First Name and Last Name.
- You can use inline editing to change the values of fields on records for which you have read-only access, either via field-level security or your organization's sharing model; however, Salesforce doesn't let you save your changes, and displays an insufficient privileges error message when you try to save the record.

Special Cases

- Inline editing is available on detail pages for all editable fields on edit pages, except for some fields on tasks, events, price books, and documents. To edit any of these, navigate to the edit page of a record, change the value of the field desired, and then click **Save**. The following table lists the objects that have inline editing restrictions on some of their fields. You may need special permissions to view some of these fields:

Object	Fields
All Objects	All fields are editable except long text area fields.
Opportunities	All fields are editable, except the following fields are only editable on detail pages (not on list views): <ul style="list-style-type: none"> - Amount - Stage - Forecast Category - Quantity
Leads	All fields are editable, except Lead Status is only editable on detail pages (not on list views).
Cases	All fields are editable, except Case Status is only editable on detail pages (not on list views).
Contracts	All fields are editable, except Contract Status is only editable on detail pages (not on list views).
Events	Only the following fields are editable: <ul style="list-style-type: none"> - Description - Location - Subject - Type - Custom fields
Tasks	Only the following fields are editable: <ul style="list-style-type: none"> - Call Type - Description

Object	Fields
	<ul style="list-style-type: none"> - Subject - Type - Custom fields
Documents	No fields are editable.
Price Books	No fields are editable.

Editing Records Directly From Enhanced Lists

If both inline editing and enhanced lists are enabled for your organization, you can edit records directly in a list. Editable cells display a pencil icon (✎) when you hover over the cell, while non-editable cells display a lock icon (🔒).

 **Warning:** In enhanced list views, when different users make inline edits to the same fields on a record simultaneously, records are updated with the most recent edit, but we don't identify the conflict with a message.

If you have the "Mass Edit from Lists" permission, you can change the value for a common field in up to 200 records at a time for most kinds of records. Products must be edited one at a time.

To edit a single record from a list:

1. From the list, double-click the editable cell.
2. Enter the value you want.
3. Click **OK**.

To mass edit records from a list:

1. Select the checkbox next to each record you want to edit. You can select records on multiple pages.
2. Double-click one of the cells you want to edit. Apply your edit to just one record or to every record you selected.

If you encounter any errors when trying to update records, a console window appears, showing the name of each record in error (if known), as well as an explanation. Click a record in the console window to open its detail page in a new window.

 **Note:** To view the error console, you must have pop-up blockers disabled for the Salesforce domain.

Tips for Using Inline Editing with Lists

- Some standard fields don't support inline editing. For example, `Case Status`, `Opportunity Stage`, `Opportunity Amount`, `Opportunity Quantity` and `Lead Status`, and most Task and Event fields can only be edited from a record's edit page. For more information, see [Guidelines for Editing Records with the Inline Editor](#) on page 146.
- If your organization uses record types, inline editing with lists is only available when all of the records in the list are of the same record type. Therefore, you must specify a filter of `Record Type equals X`, where `X` is the name of a single record type (or blank for the master record type).
- You can't use inline editing on an enhanced list if your list view filter criteria contain an OR clause.
- For lists of activities, you must specify an additional filter of either `Task equals True` (for tasks) or `Task equals False` (for events) for inline editing to be available.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To use inline editing in an enhanced list:

- "Mass Edit from Lists"

- If your organization is using Person Accounts:
 - You can't use inline editing to change Person Accounts from a Contact list. You can only inline edit them from an Account list.
 - You can only use inline editing on contacts associated to business accounts by specifying an additional filter of *Is Person Account EQUALS False* in your list criteria.

Delete Records

Deleting records is standard procedure for most Salesforce users. For some kinds of objects, deleting one record affects other, related records. For example, if you delete an account or contact, all associated assets are also deleted.

1. Make sure you're aware of the effects (if any) of deleting the kind of record you want to delete. The Salesforce help will tell you.
2. Find and open the record you want to delete.
3. Click **Delete**.

SEE ALSO:

[Using the Recycle Bin](#)

[Delete Notes and Attachments from Records](#)

Attach Files to Records

You can attach files—such as Microsoft® Office documents, Adobe® PDFs, and images and videos—to most kinds of Salesforce records. The size limit for an attached file is 25 MB when attached directly to the related list, including a file attached to a solution. The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file.

1. Open the record
2. Click **Attach File**.
3. Click **Browse** and find the file you want to attach
4. Click **Attach File** to upload the file.
5. Click **Done** when the upload is finished

Note:

- When a file is attached to a record's Chatter feed it's added to the Notes and Attachments related list as a feed attachment. The file size limit for Chatter feed attachments is 2 GB.
- If the `Don't allow HTML uploads as attachments or document records` security setting is enabled for your organization, you cannot upload files with the following file extensions: `.htm`, `.html`, `.htt`, `.htx`, `.mhtm`, `.mhtml`, `.shtm`, `.shtml`, `.acgi`, `.svg`.

USER PERMISSIONS

To attach files to records:

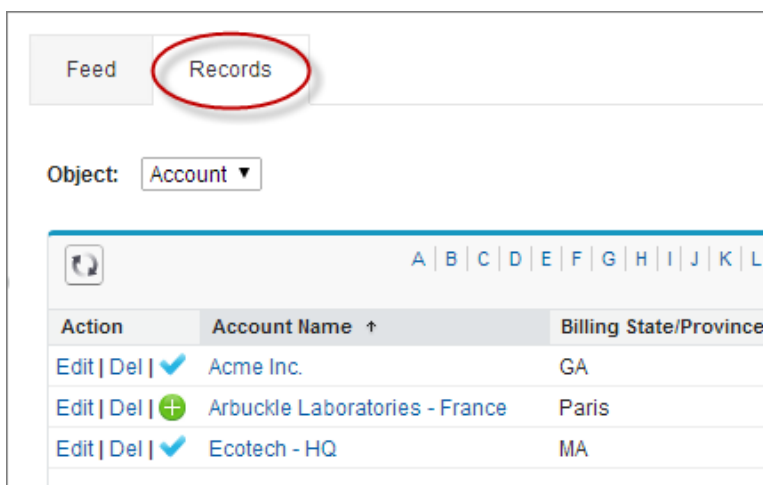

- "Edit" on the object

Topics on Records

Topics are words or phrases that you can associate with Salesforce records to organize them around common themes. Use topics to group records by a common theme, and then use those topics to filter list views.

If Chatter is enabled, you can also see records on a topic in one central place—the Records tab of the topic detail page. For example, if a number of accounts are participating in a conference, you might add the topic *User Conference 2014* to their records. You could then use that topic to filter an accounts list view, or (with Chatter) view the accounts together on the Records tab of the *User Conference 2014* topic page.

Here's an example topic detail page, with the Records tab showing accounts on the topic. (If you don't see a Records tab like this for a particular topic, the topic hasn't been added to any records.)

Admins can enable or disable topics for accounts, assets, campaigns, cases, contacts, contracts, files, leads, opportunities, orders, solutions, custom objects, and English articles. Topics can also be enabled for tasks and events, they aren't accessible via list views or the Records tab. Topics on files are added to files automatically when topics are added to the feed posts they're attached to.

 **Note:** Only English Knowledge articles support topics.

[Add Topics to Records](#)

Add topics to quickly organize records around common themes, retrieve them in list views, and (with Chatter) view them on topic detail pages.

[Remove Topics from Records](#)

Remove a topic from a record if it no longer applies.

SEE ALSO:

[Add Topics to Files](#)

EDITIONS

Available in: Salesforce Classic

Available in all editions

Add Topics to Records

Add topics to quickly organize records around common themes, retrieve them in list views, and (with Chatter) view them on topic detail pages.

Topics for objects must be enabled before you can add topics to records of that object type.

 **Note:** All topic names are public and appear in search results, but this doesn't affect the visibility of records that have topics.

1. On the top of the record detail page under the record name, click **Click to add topics**. If the record already has topics, click **Topics**.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To add topics to a record:

- "Read" and "Edit" on the record

AND

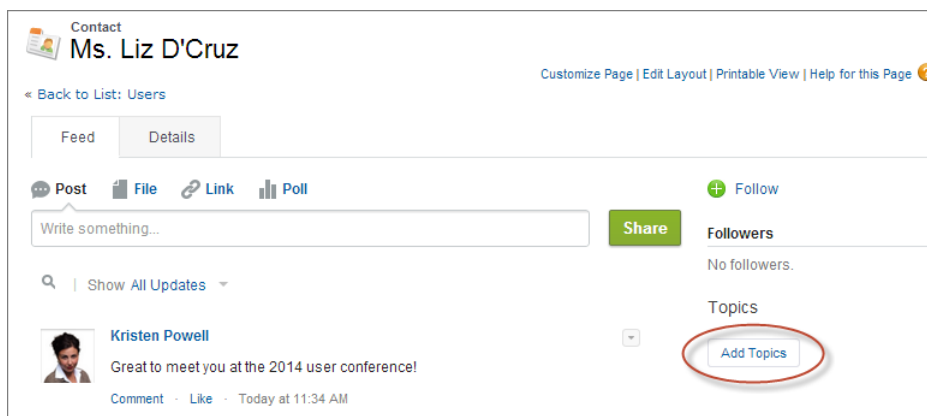

"Assign Topics" to add existing topics

OR

"Create Topics" to add new topics

If your administrator enabled feed-based layouts, click **Add Topics** in the sidebar of the feed view.

2. In the topic editor, start typing your text. As you type, you can pick a topic from the list of suggestions, or keep typing to create your own unique topic. To add more than one topic, type a comma after each topic.

Commas (,) and closing square brackets (]) automatically end a topic. Other punctuation, symbols, and separators are supported in topic names.

Records can have up to 100 topics.

3. When you're done adding topics, click **Done** or press **Enter**.

You can now use topics you add to records to filter your list views. And if your administrator enabled Chatter, topics added to records become links to topic detail pages, where associated records appear on the Records tab for easy access. (Note that Chatter posts on a record aren't automatically added to a record's topics; you must add the topics to the posts.)

SEE ALSO:

[Create a List View in Salesforce Classic](#)

[Remove Topics from Records](#)

[Add Topics to Files](#)

Remove Topics from Records

Remove a topic from a record if it no longer applies.

Removing topics doesn't delete them. Before you remove a topic from a record, consider whether someone else added it; they may be using the topic to track the record.

1. On the top of the record detail page, click **Topics**.
2. Click  next to the topic you want removed from the record.
3. Click **Done** or press ENTER.

Removing a topic from a record removes the record from any list views using that topic as a filter. If Chatter is enabled, the record is also removed from the Records tab of the topic detail page.

Tags on Records

Tags are words or short phrases that you can associate with most Salesforce records to describe and organize their data in a personalized way. Use tags to group records from various objects by a common theme or use, and then use those tags in search to make finding information fast and intuitive.

For example, if you met a number of contacts and leads at a conference, you might tag them all with the phrase *User Conference 2011*. You could then search for the *User Conference 2011* tag and click that tag in search results to retrieve those records.

Salesforce supports two types of tags.

- *Personal tags* are private. Only you can view any personal tags that you add to a record.
- *Public tags* are shared among all users in an organization. Any user with access to the record can view the public tags that you add.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To remove topics from a record:

- "Read" and "Edit" on the record

AND

"Assign Topics"

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Administrators can enable personal and public tags for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members), allowing you to:

- [Tag records](#)
- [Remove tags from a record](#)
- [Browse, search, and manage tags](#)

 **Note:** If your administrator enables [topics](#) for an object, public tags are disabled for that object. Personal tags aren't affected.

[Tagging Records](#)

[Removing Tags from Records](#)

[Browsing, Searching, and Managing Tags](#)

[Viewing Recently Used Tags](#)

Tagging Records

1. On the top right corner of the record detail page, click **Add Tags**. If the record already has associated tags, click **Edit Tags**.
2. In the `Personal Tags` or `Public Tags` text boxes, enter comma-separated lists of the [tags](#) that you want to associate with the record. Tags can only contain letters, numbers, spaces, dashes, and underscores, and must contain at least one letter or number.

As you enter new tags, up to 10 tags that have already been defined are displayed as auto-complete suggestions. As you type, the list of suggestions changes to show only those tags that match the prefix you have entered. To choose a suggestion, click it or use your keyboard arrow keys to select it and press the TAB or ENTER key.

3. Click **Save**.

 **Tip:** When you create or edit tags, you can press the ENTER key to save your changes or the ESC key to discard them.

 **Note:** There are limits on the number of personal and public tags you can create and apply to records. For all editions, if you attempt to tag a record with a new tag that exceeds one or more of these limits, the tag isn't saved. If you reach a limit, you can go to the Tags page and delete infrequently used tags.

SEE ALSO:

[Tags on Records](#)

[Removing Tags from Records](#)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To edit tags on a record:

- "Read" on the record

To rename or delete public tags:

- "Tag Manager"

Removing Tags from Records

1. On the top right corner of the record detail page, click **Edit Tags**.
2. Next to the `Personal Tags` or `Public Tags` text boxes, click **[X]** next to the tag that you want to remove.
3. Click **Save**.

 **Tip:** When you create or edit tags, you can press the ENTER key to save your changes or the ESC key to discard them.

If the tag that you removed is the last instance of the tag, the tag is deleted from your organization completely. If other records use the tag, the tag still appears in search results and the Tags page.

Browsing, Searching, and Managing Tags

To access the [Tags](#) page, click the name of any tag on a detail page, or if your administrator added tags to the sidebar, click **Tags** in the sidebar.

From this page, you can:

- [View and browse tags](#)
- [Find records with tags](#)
- [Search tags](#)
- [Rename and delete tags](#)
- [Review personal tag statistics](#)

Viewing and Browsing Tags

Use the `Personal Tags` and `Public Tags` checkboxes to limit or expand your view. Because personal tags are private, you can only see the personal tags that you have defined. You can see all public tags that are defined in your organization.

Click a letter at the top of the tag browsing area to view only tags that begin with that letter or click **Next Page** or **Previous Page**.

By default, tags are listed in alphabetical order. From the `Sort` picklist, choose **By Number of Uses** to sort tags by the number of records that are tagged by them, or choose **By Most Recently Used** to sort tags by how recently they were added to a record.

Finding Records with Tags

Click a tag to see the list of records organized by object. The number of records associated with the tag is displayed next to the tag. You can narrow your results further by clicking additional tags. When more than one tag is selected, only records that match all selected tags are displayed in the list of results. Click **[X]** next to a tag to deselect it and remove it from the filter. Click **Clear Selected Tag(s)** to deselect all tags and start over.

 **Note:**

- The number of records associated with a tag can sometimes be greater than the number of records displayed when you click that tag in the Tags page. This situation occurs if you tagged a record and then lost permission to view it because of a change in sharing, or if a record that you don't have access to has one or more public tags.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To edit tags on a record:

- "Read" on the record

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To rename or delete public tags:

- "Tag Manager"

- Search results and the Tags page don't display custom objects without an associated tab, even if tags are enabled for the custom object.

You can customize columns and filter the search results.

Searching Tags

Enter terms in the Search Tags text box and click **Search**. Only tags that meet your search criteria are listed in the tag browsing area. You can then click any tag to view records associated with that tag.

Search strings must include at least two characters and can include wildcards and operators.

The most recent search result is saved in the tag browsing area next to the alphabet at the top of the page. Click the search string to return to your results.

Renaming and Deleting Tags

- To rename a tag, hover over the tag and select **Rename** from the drop-down list that appears around the tag. Enter a new name for the tag in the text box that appears and click **Save**.
- To delete a tag, hover over the tag and select **Delete** from the drop-down list that appears around the tag. The tag is removed from every record in your organization and is placed in the Recycle Bin.

If you restore a tag from the Recycle Bin, it is automatically reassociated with the records from which it was removed. For more information, see [Using the Recycle Bin](#) on page 189.

You can rename or delete any personal tag, but you must have the "Tag Manager" permission to rename or delete a public tag.

Reviewing Personal Tag Statistics

Click **Personal Tag Usage** on the right side. This page displays your current number of unique personal tags and personal tag applications. You can have a maximum of:

- 500 unique personal tags
- 5,000 instances of personal tags applied to records

If you are approaching your personal tag limits, consider merging similar tags into a single tag by renaming. For example, if you have tags for Bicycling, Cycling, and Biking, you can rename Cycling and Biking to Bicycling to reduce your number of unique personal tags.

To reduce the number of instances of tags applied to records, delete personal tags that you no longer use.

Viewing Recently Used Tags

The **Tags** link and Recent Tags drop-down list, available in the sidebar, allow you to browse tags and access your most recently used tags, respectively.

- Click **Tags** to browse, search, and manage your entire tag collection.
- Select a tag in the Recent Tags drop-down list to view all records that have been marked with that tag. The tags that appear in this list are those you have most recently used to tag records.

Guidelines for Entering Currency, Dates, Times, and Phone Numbers

Creating and editing records is easier if you understand a few guidelines and tips for the currency, date, time, and phone number fields you'll find in various records.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **All Editions** except **Database.com**

Currency

In most Salesforce editions, the format and currency type you can use for currency fields, such as `Quota` or `Annual Revenue`, are determined by the `Currency Locale` setting for your company. In Group, Professional, Enterprise, Unlimited, and Performance Edition organizations that use multiple currencies, the format and currency type are determined by the `Currency` field in the record you're creating or editing.

 **Tip:** When you enter a monetary amount (or any other type of number), you can use the shortcuts **k**, **m**, or **b** to indicate thousands, millions, or billions. For example, when you enter `50k` it appears as `50,000`. However, these shortcuts do not work for filter criteria.

Dates and Times

Many fields allow you to enter a date or a time in the format specified by your personal `Locale` setting.

When entering dates, you can choose a date from the calendar, or manually enter a date.

Only dates within a certain range are valid. The earliest valid date is `1700-01-01T00:00:00Z GMT`, or just after midnight on January 1, 1700. The latest valid date is `4000-12-31T00:00:00Z GMT`, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is `1699-12-31T16:00:00`, or 4:00 PM on December 31, 1699.

 **Tip:**

- Years appear and are saved as four digits, but you can enter the final two digits and Salesforce will determine the first two. Entries `60` through `99` are assumed to be in the 20th century (for example: `1964`), and entries `00` to `59` are assumed to be in the 21st century (for example: `2012`).
- If you enter numbers for month and day only (example: `01/15`), Salesforce supplies the *current* year.
- If your locale and language are English, you can enter words like *Yesterday*, *Today*, and *Tomorrow*, or any day of the week, and Salesforce figures it out. Weekday names (such as *Monday*) are always considered to be in the following week.

Phone Numbers

When you enter phone numbers in various phone fields, Salesforce preserves whatever phone number format you enter. However, if your `Locale` is set to English (United States) or English (Canada), ten-digit phone numbers and eleven-digit numbers that start with "1" are automatically formatted as `(800) 555-1212` when you save the record.

 **Tip:**

- If you do not want the parentheses-space-hyphen formatting (`(800) 555-1212`) for a ten- or eleven-digit number, enter a "+" before the number. For example: `+49 8178 94 07-0`.
- If your ten- and eleven-digit phone numbers have Salesforce's automatic format, you may need to enter the parentheses when specifying filter conditions. For example: *Phone starts with (415)*.

Select Picklist Values

You may encounter a few different types of picklist fields in Salesforce.

- Standard picklists - Click the down arrow to select a single value.
- Multi-select picklists - Double click on any available value in one scrolling box to add that value to the selected scrolling box on the right. You can choose a single value or multiple values. To select values within a range, select the first value and click the last value in the range while holding down the SHIFT key; then, click the arrow to add selections to the chosen box.
- Dependent and controlling picklists work in conjunction with each other. The value chosen in the controlling picklist affects the values available in its dependent picklist. Both controlling and dependent picklists are indicated on edit pages by an  icon. Hover your mouse over the icon to display the name of the controlling or dependent picklist.

Notes

Notes is an enhanced version of the Salesforce note-taking tool that lets your users take better notes faster. Use Notes to streamline your workflow, increase productivity, and get the most out of Salesforce.

Notes is built on top of Salesforce Files, so you can do many of the same things with notes that you can do with files, such as report on notes and use Chatter to share notes.

For more information on what you can do with Notes, check out the video:  [How to Use Notes](#).

Learn some tips, tricks, and best practices for using Notes in Salesforce1.

Watch a video: [How to Use Notes](#)

Your administrator will need to set up Notes for your organization. Then, you can start using Notes in Salesforce1. Here are some guidelines to help you out.

- Create notes by tapping  in the action bar.
- Add bulleted and numbered lists to notes using the icons in the Notes toolbar.
- Relate notes to multiple records by tapping **Relate Records**. To change the related records, tap the names of the related records (3).
- Create a task by swiping a line in a note. Alternatively, tap on a line or highlight some text, and then tap  in the toolbar.
- Work with related tasks directly from a note.
- View and search all their notes by selecting **Notes** in the Salesforce1 navigation menu.
- If you or your administrator has added the Notes related list to object page layouts, you can:
 - Quickly access related notes directly from records instead of having to switch away to the navigation menu to open the Notes item.
 - Create notes from the related list.

Considerations for Managing Files and Notes Attached to Records

When working with attachments, Google docs, or notes created with the old note-taking tool, there are a number of things to keep in mind.

- If Chatter is enabled for your organization, files posted to a feed on a record are added to the record's Notes & Attachments related list as feed attachments. You can preview (if available), download, and delete feed attachments from the Notes & Attachments related list, but you can't edit them.
- You can't edit a note or attachment unless you also have access to edit the record associated with it.
- To delete a note or attachment, you must be the owner of the note or attachment or an administrator with the "Modify all Data" permission. Note ownership is determined by the owner field. Attachment ownership is determined by the created by field.
- Record owners can delete attachments on records even if they did not add the attachment.
- Community users can download attachments, but can only preview, edit, or delete attachments that they've created..

EDITIONS

Available in: Salesforce Classic

Notes and attachments are available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Google Docs available in all editions

- Notes and attachments marked as private via the `Private` checkbox are accessible only to the person who attached them and administrators. For administrators to view private notes and attachments, they need the “View All Data” permission; to edit or delete them, they need the “Modify All Data” permission.
- If the Add Google Docs to Salesforce service is enabled in your organization, the Notes & Attachments related list is entitled Google Docs, Notes & Attachments. The Attachments related list is entitled Google Docs & Attachments.
- To access a Google doc from a record detail page, the doc must be shared with your Google Apps account.
- The Notes and Attachments related list includes files from Salesforce CRM Content when they are posted to a Chatter feed on a record. However, the Notes and Attachments related list does not include Salesforce CRM Content files that only exist in Salesforce CRM Content. If your organization has Salesforce CRM Content enabled, you can add the Related Content related list to the detail pages for accounts, contacts, leads, opportunities, cases, products, or custom objects.
- If you publish notes to external contacts via Salesforce to Salesforce, all public notes are automatically shared with a connection when you share the parent object. Attachments are automatically shared if the `Share With Connections` checkbox on the attachment is selected. To stop sharing a note or attachment, select `Private`.
- Not all files can be previewed, such as encrypted files, password-protected files, copy-protected PDFs, unknown file types, and any file larger than 25 MB. For files that can't be previewed, the **Preview** option isn't available on feeds or list views, and files appear as generic file type icons in the feed. Some Microsoft Office 2007 features don't display correctly in previews. If a file can be previewed, but a preview doesn't exist, contact your Salesforce administrator who may be able to regenerate the preview.
- All notes and attachments added to contacts and opportunities roll up under the associated account as well.

Note and Attachment Fields

Notes is an enhanced version of the Salesforce note-taking tool. This table lists the fields available when you create a note using Notes. There's also a toolbar with icons for adding bulleted and numbered lists to notes.

Fields for Notes

-  **Note:** In Salesforce1 and Lightning Experience, there are additional fields for relating multiple records to the note.

Field	Description
Body	Text of the note. Can hold up to 50 MB of data.
Title	Subject of note. Maximum of 200 characters.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Fields for the Old Note-Taking Tool

Field	Description
Body	Text of the note. Can hold up to 32 KB of data.
Private	Checkbox to indicate that note is only accessible to the owner and administrators. For administrators to view private notes, they need the "View All Data" permission; to edit them, they need the "Modify All Data" permission.
Title	Short description of note. Maximum of 80 characters.

Fields for Attachments

Attachment Fields	
Field	Description
Description	Description of the uploaded file. Maximum of 500 characters.
File Name	Name of the uploaded file.
Private	Checkbox to indicate that the attachment is only accessible to the owner and administrators. For administrators to view private attachments, they need the "View All Data" permission; to edit them, they need the "Modify All Data" permission.
Share With Connections	Checkbox to indicate that the attachment is shared with connections when the parent record is shared. This checkbox is only available if Salesforce to Salesforce is enabled, the parent record is shared, and the attachment is public.
Size	Size of the uploaded file.

Delete Notes and Attachments from Records

To delete a note or attachment, click **Del** next to the note or attachment in the Notes and Attachments related list or Attachments related list of a record.

Deleted notes and attachments can be restored from the Recycle Bin.

To delete a file that was attached from a Chatter feed, click **Del** next to the feed attachment. This removes the file from all Chatter feeds where it's been shared and deletes the file from the Notes and Attachments related list. Restore the file by clicking on the Recycle Bin, selecting the file, and clicking **Undelete**. If the file was attached from your computer, a Chatter feed, group, or a Salesforce CRM Content library, deleting it from the Notes and Attachments related list also removes it from the post, but doesn't delete it from its original location.

1. A system-generated message tells you how many possible duplicates were found. The number includes only the records you have access to. If you don't have access to any of the records that are identified as possible duplicates, then this message won't include a number but will include a list of record owners so you can request access to the existing duplicates.
2. A custom alert written by whoever created the duplicate rule. Ideally, the alert should explain why you can't save the record and what you should do.
3. If the duplicate rule allows you to save a record despite it being a possible duplicate, the **Save (Ignore Alert)** button is present. If the duplicate rule blocks you from saving a record that is a possible duplicate, the **Save** button is present but the record cannot be saved successfully until you make the necessary changes to the record so it's no longer flagged as a possible duplicate.
4. The list of possible duplicates includes only records you have access to. The fields shown in the list include only fields you have access to (up to the first 7 fields that were compared and determined to match). A maximum of 5 records are displayed in this list, but if more than 5 duplicates were found, click **Show All >>** to see full list of records, up to 100. Records are listed in the order they were last modified. Go directly to one of the records in the list by clicking on its link.
5. The highlighted fields are the fields that were compared and determined to match.

What formats should I use for dates, times, and names in Salesforce?

How do I allow only certain users to share data?

Can an individual user control the sharing of records they own?

Can I transfer records to other users?

How do I print Salesforce records?

What formats should I use for dates, times, and names in Salesforce?

The format used for dates, times, and names of people in Salesforce is determined by your `Locale` setting.

To find out what date/time format your `Locale` setting uses:

1. From your personal settings, enter *Advanced User Details* in the `Quick Find` box, then select **Advanced User Details**. No results? Enter *Personal Information* in the `Quick Find` box, then select **Personal Information**.
2. View the date/time format used in the read-only `Created By` field. This is the format you should use for entering dates and times in Salesforce fields.

SEE ALSO:

[Personalize Your Salesforce Experience](#)

How do I allow only certain users to share data?

If your Professional, Enterprise, Unlimited, Performance, or Developer Edition organization has a Private or Public Read Only sharing model, your administrator can still allow certain users to share information. Your administrator can create public groups and then set up sharing rules to specify that users in certain roles or groups will always share their data with users in another role or public group. Individual users can also create personal groups to give access to their own accounts, contacts, and opportunities.

Can an individual user control the sharing of records they own?

Yes. In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, all account owners are empowered to further extend the sharing on an account-by-account basis. For example, if the organization has a Private model, the Acme account owner can share this account and its related data to selected groups, or to individual users.

In Enterprise, Unlimited, Performance, and Developer Editions, opportunity owners can also extend the sharing for individual opportunities separately from account sharing.

You can use account, lead, case, and opportunity sharing to increase access to your data; you cannot restrict access beyond your organization's default access levels.

This type of sharing is called manual sharing, and is done by the **Sharing** button on the record detail page.

Can I transfer records to other users?

In most editions, you can transfer ownership of records using one of these methods. When you change a record's owner, Salesforce also transfers ownership of certain related records.

Transferring ownership of a single record you own

Click **Change Owner** on the record's detail page. For more information, see [Changing Ownership](#) and [Transfer of Associated Items](#).

Transferring ownership of multiple cases, leads, or custom object records that you own

Click the object's tab and view a list view. Select the records to be transferred, and click **Change Owner**.

Transferring ownership of multiple records owned by other users

Use the Mass Transfer feature. For more information about using Mass Transfer and which related records are transferred, see [Mass Transferring Records](#).

Transferring record ownership using workflow rules

When a record owner is changed by a workflow rule, Salesforce does not change the ownership of any related records.

How do I print Salesforce records?

To print the details of a Salesforce record:

1. Click the **Printable View** link located in the upper right corner of most detail pages. A new browser window opens with the record displayed in a simple, print-ready format.
2. Optionally, collapse and expand individual sections in the printable view by clicking the triangles next to the section headings.
3. Optionally, click **Expand All** or **Collapse All** to show or hide all of the collapsible sections on the page. Related lists, such as the list of opportunities related to an account, are not collapsible.
4. Click **Print This Page** or use your browser's print function to send the page to a printer.

 **Note:** On the Console tab, you can click the print icon () to open a record's printable view.

Find Information with Search

Salesforce search gives you the power to find information faster. Search is available via the Salesforce site, a Salesforce1 mobile app, or a custom search implementation built on the Salesforce platform.

EDITIONS

Available in: **All Editions except Database.com**

[How Does Search Work?](#)

Search efficiently finds what you're looking for by breaking apart your search terms and finding matches for them from the index.

[How Does Search Break Up Information?](#)

Each time you create a record, the search engine breaks up the searchable information into pieces. Knowing how these pieces are broken up helps you choose which search terms to use.

[How Is Search Different Between Lightning Experience, Salesforce Classic, and Salesforce1?](#)

Global search in the full Salesforce site (whether Lightning Experience or Salesforce Classic) and the Salesforce1 mobile app uses the same search index, so you're always searching the same data. You see the same set of recently accessed records in instant results. The search scope (the list of objects you use the most) influences search results. But remember that some standard objects aren't available in Salesforce1 and Lightning Experience, so you might not always see the exact same search results. And the global search interface is different between all these experiences, so there are visual and navigational differences to consider.

[How Do I Search in Lookup Fields?](#)

Use lookup search to associate two records together.

[Search Results](#)

In many cases, you'll quickly find the record you searched for by just reviewing the top results because results are sorted by relevance for each user. Understand why certain records are returned and how to best refine your results.

[Limitations for Search in Salesforce Classic](#)

When using global search, sidebar search, advanced search, structured queries, list views, and filters, certain restrictions apply.

How Does Search Work?

Search efficiently finds what you're looking for by breaking apart your search terms and finding matches for them from the index.

Check out the video:

 [How Does Search Work?](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions except Database.com**

When you enter a search term in the search field (1), the search engine breaks up your search term into smaller pieces, called *tokens* (2). It matches those smaller terms to the record information stored in the index (3), ranks the associated records by relevance (4), and returns the results you have access to (5).

-  **Note:** After a searchable object's record is created or updated, it could take about 15 minutes or more for the updated text to become searchable. An object's records are only searchable after they're stored in the search index. The search engine only returns results you have permission to view.

For more information on what you can do with search, check out these videos.

-  [Search in Salesforce Lightning Experience](#)

How Does Search Break Up Information?

Each time you create a record, the search engine breaks up the searchable information into pieces. Knowing how these pieces are broken up helps you choose which search terms to use.

When you create or update a record (1), the search engine breaks up the record's searchable text into smaller terms, called *tokens* (2). It then stores the tokens in the search index (3). Similarly, when you search, the search engine breaks down your search terms into tokens so that it can return records with matching tokens from the index.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions except Database.com**

Here are some examples of the tokens created from record information. The search engine creates alphanumeric tokens when search terms contain punctuation. You could find the record with a search using any indexed token listed.

[How Does Search Handle Terms in Chinese, Japanese, Korean, and Thai?](#)

Search finds relevant results for searches in East Asian languages such as Chinese, Japanese, Korean, and Thai by breaking up information to store in the search index.

SEE ALSO:

[How Does Search Work?](#)

How Does Search Handle Terms in Chinese, Japanese, Korean, and Thai?

Search finds relevant results for searches in East Asian languages such as Chinese, Japanese, Korean, and Thai by breaking up information to store in the search index.

The search engine returns accurate search results from searches in East Asian languages that don't include spaces between words using morphological tokenization.

Consider the problem of indexing the term *Tokyo Prefecture* and a subsequent search for Kyoto in Japanese.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions except Database.com**

Indexed Term	Search Term
東京都	京都
Tokyo Prefecture	Kyoto

Morphological tokenization segments the term 東京都 (Tokyo Prefecture) into two tokens.

Indexed Term	Search Term
東京	都
Tokyo	Prefecture

This form of tokenization ensures that a search for 京都 (Kyoto) returns only results that include 京都 (Kyoto) and not 東京都 (Tokyo Prefecture).

In Chinese, Japanese, Korean, and Thai (CJKT) you can find a person by entering the last name before the first name. Searching for 佐々木律子 returns any person who has both the last name 佐々木 and first name 律子.

How Is Search Different Between Lightning Experience, Salesforce Classic, and Salesforce1?

Global search in the full Salesforce site (whether Lightning Experience or Salesforce Classic) and the Salesforce1 mobile app uses the same search index, so you're always searching the same data. You see the same set of recently accessed records in instant results. The search scope (the list of objects you use the most) influences search results. But remember that some standard objects aren't available in Salesforce1 and Lightning Experience, so you might not always see the exact same search results. And the global search interface is different between all these experiences, so there are visual and navigational differences to consider.

 **Note:** Although small differences in the order of search results can occur, you're still searching the same set of data.

[Lookup Search in Salesforce Classic](#)

Lookup fields allow you to associate two records together in a relationship. For example, a contact record includes an account lookup field that associates the contact with its account.

[Lookup Search in Lightning Experience](#)

Lookup fields allow you to associate two records together in a relationship. For example, a contact record includes an account lookup field that associates the contact with its account. In the lookup search for searchable objects, terms are matched against all searchable fields within a record, not just the name of the record. If you don't see a record in the auto-suggested instant results, perform a full search. If you don't see a new record in search results, wait 15 minutes and try again. Check out some more answers to frequently asked questions about lookups.

Lookup Search in Salesforce Classic

Lookup fields allow you to associate two records together in a relationship. For example, a contact record includes an account lookup field that associates the contact with its account.

[Standard and Enhanced Lookups in Salesforce Classic](#)

Salesforce objects often include *lookup fields* that allow you to associate two records together in a relationship. For example, a contact record includes an `Account` lookup field that associates the contact with its account. Lookup fields appear with the  button on record edit pages. Clicking the icon opens a lookup search dialog that allows you to search for the record that you want to associate with the record you're editing. There are two main types of lookups: standard and enhanced.

[Tips for Using Standard and Enhanced Lookups](#)

Consider these tips when using standard and enhanced lookups.

[Lookup Search Auto-Completion](#)

If enabled by your administrator, lookups support auto-complete.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

Standard and Enhanced Lookups in Salesforce Classic

Salesforce objects often include *lookup fields* that allow you to associate two records together in a relationship. For example, a contact record includes an `Account` lookup field that associates the contact with its account. Lookup fields appear with the  button on record edit pages. Clicking the icon opens a lookup search dialog that allows you to search for the record that you want to associate with the record you're editing. There are two main types of lookups: standard and enhanced.

[Standard Lookups in Salesforce Classic](#)

Standard lookups search through a limited set of searchable fields per object and users can't refine search results.

[Enhanced Lookups in Salesforce Classic](#)

Enhanced lookups offer more search capabilities than standard lookups. In addition, enhanced lookups allow search result sorting and filtering.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

Standard Lookups in Salesforce Classic

Standard lookups search through a limited set of searchable fields per object and users can't refine search results.

Availability

Standard lookups are available for most standard objects. All lookup fields use standard lookups by default.

Search Behavior

When you perform a blank lookup, a list of recently viewed records displays in the lookup search dialog.

Standard lookups query selected *Name* fields for objects.

A wildcard is automatically appended to each of your search terms. For example, a search for `bob jo` is really a search for `bob*jo*` and returns items with *bob jones*, *bobby jones*, or *bob johnson*.

Standard lookup queries match your search term against the org's database (not the search index) without breaking up the term into separate tokens.

Search Results

Most standard lookups return up to 200 of the most relevant records and allow you to page through 50 records at a time. Lookup searches for campaigns only return the top 100 results. If you've gone through all the results and still don't see the desired record, enter a more specific search term.

Results are ordered in alphabetical order by the primary record name field.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

Lookup

AW

You can use "*" as a wildcard next to other characters to improve your search results.

[< Clear Search Results](#)

Search Results

Campaign Name
AW 5000 Series Printer Campaign - Email
AW 5000 Series Printer Campaign - Telemarketing
AW Expo Campaign - International 2010
AW Expo Campaign - US 2010

You can't sort, filter, or customize the columns in the search results.

Salesforce only returns matches for a custom object if your admin has associated a custom tab with it. You don't have to add the tab for display.

 **Note:** Consider converting standard lookups into enhanced lookups for better search results. Admins enable enhanced lookups.

Enhanced Lookups in Salesforce Classic

Enhanced lookups offer more search capabilities than standard lookups. In addition, enhanced lookups allow search result sorting and filtering.

Availability

Enhanced lookups are available for the Business Account, Contact, Custom Object, Opportunity, Person Account, User, Work Order, and Work Order Line Item objects. Admins enable enhanced lookups for each object.

Search Behavior

When you perform a blank lookup, a list of recently viewed records displays in the lookup search dialog. If available, you can sort and filter recently viewed records. If you don't see a record, perform a full lookup search.

By default, enhanced lookups query a limited set of fields, primarily *Name* fields for each object. If available in the enhanced lookup search dialog, select **All Fields** and enter other search terms unique to the record, to search through all searchable fields.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

Lookup

Acme

Search Name **All Fields**

Enhanced lookup search queries breaks down your search terms into tokens so that it can return records with matching tokens from the index.

Search Results

Enhanced lookups return up to 2,000 of the most relevant records and allow you to page through large sets of search results. If you've gone through all the results and still don't see the desired record, enter a more specific search term.

Results are initially presented in ascending alphabetical order by the primary record name field. Custom objects are listed in descending order by the date when you most recently accessed them.

Sort results by clicking on the column heading. Use **Show Filters** to filter results. Use **My Columns** to change which columns display in the search results.

Lookup

Acme

Search Name All Fields

[< Clear Search Results](#)

Search Results

Accounts [4]

Account Name	Phone	Account Owner Alias
Acme Corporation	(415) 555-1234	JSmit
Acme Food Company	(650) 213-1234	JSmit
Acme Toy Company	(510) 451-1234	JSmit
Acme	(212) 555-5555	JSmit

Note: Admins must setup a search layout for the Lookup Filter Field before users can sort or filter results. Admins determine the available fields that appear as columns in the search layout. Although you can hide and organize the columns that appear in the layout with **My Columns**, you can't add columns that aren't included in the layout. So, contact your admin to request additional columns added to the layout.

Salesforce only returns matches for a custom object if your admin has associated a custom tab with it. You don't have to add the tab for display.

Tips for Using Standard and Enhanced Lookups

Consider these tips when using standard and enhanced lookups.

- If you can't find a record in lookup search results, verify the search term is correct or try entering a more specific search term. If enhanced lookups are enabled by the admin, you can filter or sort results. Admins also define which fields appear as columns in the search layout for refining results.
- If you enter a value in the lookup text box and save the record without clicking the lookup icon, Salesforce automatically performs a standard lookup search. If it finds an exact match, it saves that value to the lookup field, even if it finds other partial matches. If it doesn't find an exact match and finds one or more partial matches, Salesforce requires you to select a value from a drop-down list of matches. If no results match the text you entered, an error displays instead.
- To search for contacts, leads, users, or other individuals that include spaces in the `First Name` or `Last Name` fields, enter quotes around the terms. For example, to search for someone with the last name *von hausen*, enter `"von hausen"`.
- In organizations where the Salesforce Customer Portal or partner portal is enabled, you can filter the results that appear on the user lookup dialog by selecting either a queue or group of users from the `Owner` or `Assigned To` drop-down list.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All Editions except Database.com**

- If your organization uses divisions and you have the “Affected by Divisions” permission, your lookup dialog search results include records in the division you select in the lookup dialog window.
- When you perform a *blank lookup*, a list of recently used records displays. For standard lookups, records are ordered in alphabetical order by the primary record name field. For enhanced lookups, records are ordered by when you last viewed them. The number of records vary for some object types. Here are some examples of common blank lookup scenarios.
 - For standard lookups of products, the dialog displays 50 records.
 - For standard lookups of campaigns, the dialog displays 100 active campaigns.
 - For standard lookups of assets, the dialog displays all assets tied to the contact on the case.

If you don't see the desired record in the list of recently used records, perform a full lookup search. You'll get the best results with more specific search terms.

Lookup Search Auto-Completion

If enabled by your administrator, lookups support auto-complete.

Both standard lookups and enhanced lookups can display a dynamic list of matching recently used records when a lookup field is edited. This list is restricted to objects of the appropriate type and, with the exception of lookups of users, is populated from recently used items. For example, while editing an Account lookup, you can see recently used accounts with names that match the prefix you have entered. Recently used contacts don't appear in this list.

Lookup auto-completion is subject to the following restrictions:

- You must have recently visited records of the appropriate type for the lookup's auto-completion list to be populated.
- You must be editing the lookup field on a record's edit page.

Hover details are displayed only for lookup fields on object types that are included in lists of recently used records. For example, products aren't included in lists of recently used records, so hover details aren't displayed for a lookup field on products.

Lookup Search in Lightning Experience

Lookup fields allow you to associate two records together in a relationship. For example, a contact record includes an account lookup field that associates the contact with its account. In the lookup search for searchable objects, terms are matched against all searchable fields within a record, not just the name of the record. If you don't see a record in the auto-suggested instant results, perform a full search. If you don't see a new record in search results, wait 15 minutes and try again. Check out some more answers to frequently asked questions about lookups.

[Why Can't I See Any Results in the Picklist?](#)

If an object hasn't been made searchable in your org or if you haven't previously viewed the record, the drop-down is empty.

[Can I Use a Partially Matching Search?](#)

To find the correct record, enter the full search term. The lookup search does not use automatic partially matching searches with trailing wildcards. This behavior is to avoid returning unwanted results to you.

[What Determines the Secondary Field Under the Record Name?](#)

When available, there's a secondary field displayed under the primary record name in lookups that provide more contextual information. For example, the location *San Francisco* appears under the company *Acme, Inc.* to help you distinguish similar record names and pick the right record. Your admin customizes secondary fields when setting which record fields display and in which order.

Which Fields are Searched in Lookup Dialog Search?

When you start typing in the lookup field, you see a list of auto-suggested results. These instant results are matches for the search term to the name type field of the record. However, if you perform a full search, the returned results match the search term to all searchable fields for the object. This behavior is similar to global search results.

Search Results

In many cases, you'll quickly find the record you searched for by just reviewing the top results because results are sorted by relevance for each user. Understand why certain records are returned and how to best refine your results.

[How Are Search Results Ordered?](#)

The search engine sorts results most relevant to the user based on search term frequency, order, and uniqueness, record and user activity, and access permissions. Search result relevancy can vary for each user.

[How Do I Refine Search Results?](#)

Use these guidelines to quickly find records on the search result page.

[What Search Term Variations Will I See in the Search Results?](#)

Search results include expanded results for relevant or similar terms through lemmatization (returns matches for root form of word), synonym groups, spell correction, and nicknames.

[What Are the Results I See As I Type in the Search Bar?](#)

As you type in the global search box, a list of auto-suggested records appears. These instant results let you quickly access a record before performing a full search.

How Are Search Results Ordered?

The search engine sorts results most relevant to the user based on search term frequency, order, and uniqueness, record and user activity, and access permissions. Search result relevancy can vary for each user.

Priority Boosts and Filters

The search engine uses many factors to prioritize records. These factors aren't listed in the order they are applied or by importance.

Frequency

Prioritizes records that include more occurrences of the search term. In addition, records that contain all or more of the multiple search terms entered are prioritized higher.

Uniqueness

Prioritizes records that contain unique terms, under the assumption that uniqueness increases the likelihood of a relevant match.

Location

Prioritizes records with the search term in the name, title, or subject type fields.

Proximity

Prioritizes records with the search terms closer together with few or no intervening words. Records that contain the same sequence of terms are prioritized higher. Similarly, if a single alphanumeric string is indexed with multiple tokens, exact matches are prioritized over matches with intervening words.

Ownership

Prioritizes records that you own.

Length

Normalizes the number of instances of a term in a record so that longer documents aren't given undue priority over shorter ones. This boost applies to Salesforce Knowledge records only.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions except Database.com**

Record Attachment

Normalizes the number of instances of a term in an attachment. Attachments with many instances of a search term aren't given undue priority over more relevant records with fewer instances. Applies only to Salesforce Knowledge records.

Record Activity

Prioritizes records frequently viewed or edited and records having more associated records, such as related lists. The creation date of the data doesn't affect result priority.

User Activity

Prioritizes records that you recently edited or viewed.

Access

Returns only the records that you have access to view.

Why do different users see different results?

Search results are adjusted for the user who performs the search.

- Access permissions are based on the users' profiles. If you don't have access to a record, but someone else does, it appears for them but not you.
- Record ownership boosts records in results. If you own the record, it appears higher in the search results.
- View or edit record history boosts records in results. If you recently viewed or edited a record, the record is prioritized higher in the search than someone else viewing it for the first time.
- Object history boosts records in results. Records from object types that you use more frequently have higher priority in your search results.

How Do I Refine Search Results?

Use these guidelines to quickly find records on the search result page.

[How Do I Refine Search Results in Salesforce Classic?](#)

Use our guidelines for sorting and filtering your results to quickly find records.

[How Do I Refine Search Results in Lightning Experience?](#)

Use our guidelines for navigating the search results page to quickly find records.

Available in: **All Editions except Database.com**

How Do I Refine Search Results in Salesforce Classic?

Use our guidelines for sorting and filtering your results to quickly find records.

When you use the global search bar, you search through all objects and multiple fields types, including custom and long text fields, within a record. If you enter multiple terms, results containing all the search terms are returned, which can be a lot of records! Here are some strategies to find the record that you're looking for after performing a full search.

Search All

Search defaults to return results for the objects that you use most frequently. To expand the search to other objects, use **Search All**. If you don't have a **Search All** option, global search doesn't have enough information about which objects you use. Your results include all objects until it has more information.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

Pin

Hover over and pin important objects to the top of the search results object list. You can always unpin or reorder objects later. Pinning is helpful for objects that you don't use frequently.

Filter

- Use **Options...** to restrict your search to items you own, if available, to exact phrase searches, and to divisions, if your organization uses them.
- Use **Show Filters**, if available, to filter your search results.
- Use **My Columns**, if available, to customize which columns display by customizing **Selected Fields** from the **Available Fields**.

 **Note:** Your admin determines the availability of filter fields and customizable columns in a search layout. If your admin didn't create a search layout or if search layouts aren't available for an object, you can't filter search results or customize the columns in search results. Filters aren't available in Customer Portals or partner portals.

More Guidelines

- Make sure that you are on the right object scope. You can change the scope in the left navigation.
- Check your spelling and that you entered the full search term. Or, try entering a more specific search term.
- If you recently created the record or the record was changed multiple times, the record won't appear in the search results right away. The process for making a record searchable, called indexing, can take 15 minutes.

 [Search in Salesforce Classic](#)

SEE ALSO:

[Why Can't I See Some Features?](#)

How Do I Refine Search Results in Lightning Experience?

Use our guidelines for navigating the search results page to quickly find records.

Sort your results

You can order the results using the sort drop-down. The menu lists all the columns in the search layout in addition to **Relevance**. Sort by choosing one of the items in the drop-down. Or, click the column headers.

Sorting results helps if there are too many records on the search results page.

If the search layout includes all non-sortable fields, the sort button is disabled.

See the most relevant results on one page with Top Results

The Top Results search results page lists the most relevant record results for each of your most frequently used objects.

This page is a good choice when you want to review results for a search term but you aren't looking for a specific object type. For example, you search for *Acme Inc.* and look at the Top Results page for accounts, leads, and opportunities. Each person's Top Results page is different depending on which objects they use the most. Use the **View More** link in case you want to see more results for an object.

EDITIONS

Available in: Lightning Experience

Available in: **All Editions except Database.com**

See All Company posts under Feeds

If enabled by your administrator, the Feeds search results page lists posts from the All Company feed that include matches on the search term entered.

Using Feeds is helpful when searching for a post that you want to review again. For example, you saw a post about a new training video, but you don't remember who posted the information.

Filter results by object with the search scope bar

Quickly click through filtered results by object using the search scope bar beneath the global search box. Searchable objects are shown in the same order they appear in the navigation menu. To see results for the object, click the name.

Let's say that you search for a contact from the Accounts home page and landed on the Accounts search results page. Click the Contacts object to see results for contacts.

See all available objects under More

If you don't see an object in the search scope bar, select **More** to see a list of all objects that are available to you. Searchable objects listed in the navigation menu that don't fit in the search scope bar appear at the top of the **More** object list.

More Guidelines

- Check your spelling and that you entered the full search term. Or, try entering a more specific search term.
- If you recently created the record or the record was changed multiple times, the record won't appear in the search results right away. The process for making a record searchable, called indexing, can take 15 minutes.

 [Search in Salesforce Lightning Experience](#)

SEE ALSO:

[Why Can't I See Some Features?](#)

What Search Term Variations Will I See in the Search Results?

Search results include expanded results for relevant or similar terms through lemmatization (returns matches for root form of word), synonym groups, spell correction, and nicknames.

Lemmatization

Lemmatization reduces different inflected forms of a word to a single form depending on the context. Search then returns matches for the expanded forms. This behavior applies to the type of word for which you're searching. A search for a noun could return matches for variants of the noun form. A search for a verb could return matches for variants of the verb form. For example, a search for *feature* returns results for *features*, and a search for *add* matches items that contain *adds*, *adding*, and *added*.

Matches on forms of a search term rank lower than matches on the exact term in search results.

Synonym Groups

Synonym groups have words or phrases that are treated equally in searches. A search for one term in a synonym group returns results for all terms in the group. For example, a search for *USB* returns results for all terms in the synonym group which contains *USB*, *thumb drive*, *flash stick*, and *memory stick*.

What Are the Results I See As I Type in the Search Bar?

As you type in the global search box, a list of auto-suggested records appears. These instant results let you quickly access a record before performing a full search.

Instant results only appear for records within searchable objects.

The suggested records displayed are ones that you recently viewed or that include the search term you entered. If you don't see the record you're looking for in the instant results, perform a full search for more results.

Stopwords, such as *how* and *to*, are included in the instant results for these objects.

Limitations for Search in Salesforce Classic

When using global search, sidebar search, advanced search, structured queries, list views, and filters, certain restrictions apply.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

Chatter and Global Search

When Chatter is enabled, global search and feed search are enabled, but sidebar search and advanced search are disabled. Your organization's administrator must have Chatter enabled to use global search. Search options aren't available to Chatter Free users.

Search scope doesn't affect Chatter feed searches; which include matches for posts across all objects.

Sidebar and Advanced Search

The table outlines the main differences between the sidebar and advanced search.

Feature	Sidebar	Advanced
Location	If made available, located to the left of the page. The sidebar panel can be customized to be collapsible.	Link to advanced search within the sidebar search.
Record Fields and Attachments	Searches all custom field types except for type text area, long text area, and rich text area. The standard fields searched vary by object. Attachments aren't searched.	Searches all custom field types. The standard fields searched vary by object.
Multiple Object Searches	Choose 1 object by which to limit your search. Select Search All to search across all objects searchable by sidebar.	Choose one or more objects by which to limit your search. Select Search All to search across all objects searchable by advanced.

Feature	Sidebar	Advanced
Search Terms	Uses a phrase search and matches terms in the exact sequence that they appear. For example, searching for <i>bob jones</i> returns items with <i>Bob Jones</i> , but not <i>Bobby Jones</i> or <i>Bob T Jones</i> . In addition, a trailing wildcard is added at the end of the search terms. For example, <i>Bob T Jones*</i> .	Uses separate word search for searchable fields within a record. For example, searching for <i>bob jones</i> returns items with <i>Bob Jones</i> , and a contact named Bob Smith because his email address is <i>bsmith@jones.com</i> .
Nickname Search	Doesn't include results for nicknames.	Includes results for nicknames.
Spell Correction	Not available.	Available. When you enter a search term that doesn't yield results because of incorrect spelling, you see results that match a corrected spelling of the search term. Spell check availability varies by object.

Structured Queries Based on Multiple Criteria

To look for records based on a structured query, such as accounts in a certain area or open opportunities within a company, use a list view, report, or dashboard.

Limit to Items I Own

When **Limit to items I own** is selected, the search results don't return asset, idea, invoice, order, question, quote, reply, and user records because these records don't have owners.

Filters

Your administrator determines the available filter fields in a search layout. Search filters aren't available in Customer Portals or partner portals.

When filtering search results, the operator is selected automatically based on the field type. Except as noted, all fields use the contains operator. Auto number and phone fields use the contains operator because they can contain non-numeric characters. The = (equals) operator is used with these types of fields.

- Dates
- Numbers, except auto number or phone fields
- Record IDs

Explicitly using the OR operator is only supported in number fields. Except for number fields, commas are used as OR operators in search results filters. For example, if you enter *acme, california* in the Account Name filter field, your results include account names with either *acme* or *california*. For number fields (where a comma can be part of a number) commas aren't treated as OR operators, so explicitly enter the OR operator.

If you specify more than one criterion, the result includes only records that match all the criteria. For example, if you enter *acme california* in the Account Name filter field, your results include account names with both *acme* and *california*.

Don't include *http://* or *https://* in URL filter criteria to avoid receiving unexpected results. When you enter values in URL fields and save records, Salesforce adds *http://* to any URL that doesn't start with *http://* or *https://*. The added *http://* isn't stored in the database. For example, if you enter *salesforce.com* in the Website field and save the record, the Website field displays *http://salesforce.com*, but the

value stored is salesforce.com. Therefore, if you enter `http://salesforce.com` in the Website filter field, your results don't include your record.

Using the Recycle Bin

Using the Recycle Bin

The **Recycle Bin** link in the sidebar lets you view and restore recently deleted records for 15 days before they are permanently deleted. Your Recycle Bin record limit is 25 times the Megabytes (MBs) in your storage. For example, if your organization has 1 GB of storage then your limit is 25 times 1000 MB or 25,000 records. If your organization reaches its Recycle Bin limit, Salesforce automatically removes the oldest records if they have been in the Recycle Bin for at least two hours.

Viewing Items in the Recycle Bin

Choose **My Recycle Bin** from the drop-down list to view just the items you deleted. Administrators, and users with the "Modify All Data" permission, can choose **All Recycle Bin** to view all data that has been deleted for the entire organization. In Personal Edition, the **All Recycle Bin** option shows all of your deleted items.

Searching for Items in the Recycle Bin

1. Choose **My Recycle Bin** or **All Recycle Bin** from the drop-down list. Choosing **My Recycle Bin** searches for matches only in the items you deleted.
2. Enter your search terms. Search terms are treated as separate words with an implied AND between them. For example, searching for *bob jones* returns items with *bob* and *jones* together but not *bob smith* whose email address is *bsmith@jones.com*. An implied wildcard is appended to your search terms so searching for *bob* returns any *bob* or *bobby*. Searches look for matches in the field displayed in the Name column of the Recycle Bin such as `lead Name`, `Case Number`, `Contract Number`, or `Product Name`.

 **Note:** Some search features, including stemming and synonyms, are not available in the Recycle Bin search.

3. Click **Search**.

Restoring Items in the Recycle Bin

You can restore items by checking the box next to those items and clicking **Undelete**. To restore all deleted items, check the box in the column header and then click **Undelete**.

When you undelete a record, Salesforce restores the record associations for the following types of relationships:

- Parent accounts (as specified in the `Parent Account` field on an account)
- Parent cases (as specified in the `Parent Case` field on a case)
- Master solutions for translated solutions (as specified in the `Master Solution` field on a solution)
- Managers of contacts (as specified in the `Reports To` field on a contact)
- Products related to assets (as specified in the `Product` field on an asset)
- Opportunities related to quotes (as specified in the `Opportunity` field on a quote)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except for **Database.com**

USER PERMISSIONS

To view and recover your deleted records:

- "Read" on the records in the Recycle Bin

To view and recover records deleted by other users:

- "Modify All Data"

To recover deleted public tags:

- "Tag Manager"

To purge the Recycle Bin:

- "Modify All Data"

- All custom lookup relationships
- Relationship group members on accounts and relationship groups, with some exceptions
- Tags
- An article's categories, publication state, and assignments

 **Note:** Salesforce only restores lookup relationships that have not been replaced. For example, if an asset is related to a different product prior to the original product record being undeleted, that asset-product relationship is not restored.

Purging the Recycle Bin

To permanently remove your deleted items prior to the 15 day period, administrators, and users with the “Modify All Data” permission, can click **Empty your Recycle Bin** or **Empty your organization’s Recycle Bin** .

SEE ALSO:

[Delete Records](#)

Run a Report

To run a report, find it on the Reports tab and click the report name. Most reports run automatically when you click the name. If you’re already viewing a report, click **Run Report** to run it immediately or schedule a future run. In Lightning Experience, the **Run Report** button only appears after you save a report.

If you don’t see any results, check the report for one of these conditions:

- The report didn’t return any data. Check your filter criteria to make sure some data is returned.
- Due to field-level security, you don’t have access to one of the groupings you selected.
- Your custom summary formula’s context didn’t match the chart settings. For example, if the formula is calculated for Industry, but the chart doesn’t include Industry, no results are returned.
- Your values are out of the range of acceptable values. The maximum value allowed is 9999999999999999. The minimum value allowed is -9999999999999999.

If your report returns more than 2,000 records, only the first 2,000 records are displayed. To see a complete view of your report results, click **Export Details**.

If your report takes longer than 10 minutes to complete, Salesforce cancels the report. Try the following techniques to reduce the amount of data in your report:

- Filter for your own records, rather than all records.
- Limit the scope of the data to a specific date range.
- Exclude unnecessary columns from your report.
- Hide the report details.

[Add Filter Logic](#)

Filter logic governs how and when filters apply to your report.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To run reports:

- “Run Reports”

To schedule reports:

- “Schedule Reports”

To create, edit, and delete reports:

- “Create and Customize Reports”

AND

“Report Builder”

[Sort Report Results](#)

Sort a report by the data in a particular column by clicking that column's heading. Clicking a column header sorts data according to that column's ascending order: text is sorted from A to Z, numerical data is sorted from lowest to highest, and time/date data is sorted from earliest to latest.

[Visualizing Data with Dashboards](#)

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

SEE ALSO:

[The Report Run Page](#)[The Report Run Page](#)[Report Run Page Options](#)[Report Run Page Options](#)[Print a Report](#)[Sort Report Results](#)

Add Filter Logic

Filter logic governs how and when filters apply to your report.

After adding a filter to your report, the filter is numbered. Your first filter becomes Filter 1 and your second filter becomes Filter 2. You apply filter logic based on these numbered filters.

For example, let's say you have a report of Accounts with fields like `State`, `Annual Revenue`, and `Industry`. Your report has these filters:

1. State includes California, Arizona, Nevada
2. Industry equals Banking
3. Annual Revenue greater than 1000000

These three filters cause your report to return Accounts located in California, Arizona, or Nevada in the Banking industry with annual revenue greater than \$1,000,000. But what if you only want Accounts located in California, Arizona, or Nevada AND in the Banking industry, OR with annual revenue greater than \$1,000,000.00? Add filter logic to your report.

1. Click **Add > Filter Logic**.
2. Enter each filter line number, separated by a filter logic operator.

For example, **(1 AND 2) OR 3** finds records that match both Filter 1 and Filter 2, or Filter 3.

Here's a complete table of filter logic operators:

Operator	Definition
AND	Finds records that match both values. 1 AND 2
OR	Finds records that match either value. 1 OR 2

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

To create custom list views:

- "Read" on the type of record included in the list

To create, edit, or delete public list views:

- "Manage Public List Views"

Operator	Definition
NOT	<p>Finds records that exclude values.</p> <p>For example, Filter 1 is Industry equals "Biotechnology". You set filter logic as Not 1. Your report returns records which aren't equal to Biotechnology.</p>

3. Click **Save**.

Now your report shows Banking industry Accounts in California, Arizona, and Nevada with any amount of revenue, and any Account with annual revenue above \$1,000,000.00.

Note:

- Filter logic isn't available for all filters. For example, you can't use them for roll-up summary fields.
- On reports where object A may or may not have object B, you can't use the OR condition to filter across multiple objects. For example, if you enter filter criteria *Account Name starts with M OR Contact First Name starts with M*, an error message displays informing you that your filter criteria is incorrect.
- Except filter logic on lookup fields, you can't use filter logic if your field filters use any of the following fields:
 - Topics
 - Description
 - any Address Line 1, Address Line 2, Address Line 3 fields
 - Forecast Category
 - Campaign: Member Type
 - User: Profile Name
 - Login Status
 - custom long-text area fields

[Filter Operators Reference](#)

The operator in a filter is like the verb in a sentence. Operators specify how filter criteria relate to one another. Refer to this list of filter operators while setting filters on list views, reports, dashboards, and some custom fields.

[Filtering on Special Picklist Values](#)

SEE ALSO:

[Filter Operators Reference](#)

[Filtering on Special Picklist Values](#)

[Notes about Filtering on Types of Fields and Values](#)

Filter Operators Reference

The operator in a filter is like the verb in a sentence. Operators specify how filter criteria relate to one another. Refer to this list of filter operators while setting filters on list views, reports, dashboards, and some custom fields.

Operator	Uses
equals	Use for an exact match. For example, "Created equals today."
less than	Use for results that are less than the value you enter. For example, "Quota less than 20000" returns records where the quota field ranges from 0 to 19,999.99.
greater than	Use when you want results that exceed the value you enter; for example, "Quota greater than 20000" returns records where the quota amount begins at 20,000.01.
less or equal	Use for results that match or are less than the value you enter.
greater or equal	Use for results that match or exceed the value you enter.
not equal to	Shows results that don't have the value you enter. This operator is especially useful for eliminating empty fields. For example, "Email not equal to <blank>."
contains	Use for fields that include your search string, but sometimes also include other information. For example, "Account contains California" would find California Travel, California Pro Shop, and Surf California. Keep in mind that if you enter a short search string, it can match a longer word. For example, "Account contains pro" would find California Pro Shop and Promotions Corporation. This operator is not case-sensitive.
does not contain	<p>Eliminates records that don't contain the value you enter. For example, "Mailing Address Line 2 does not contain P. O. Box."</p> <p> Note: When specifying filter criteria on roll-up summary fields, <code>does not contain</code> uses "or" logic on comma-separated values. On list views, reports, and dashboards, <code>does not contain</code> uses "and" logic.</p> <p>This operator is not case-sensitive.</p>
starts with	Use when you know what your value starts with, but not the exact text. This operator is a narrower search term than "contains." For example, if you enter "Account starts with California," you find California Travel and California Pro Shop, but not Surf California.
includes	<p>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that include one or more of the values you enter.</p> <p>For example, if you enter "Interests includes hockey, football, baseball," you find records that have only hockey selected, and records that have two or three of the values entered. Results do not include partial matches of values.</p>
excludes	<p>Available when you choose a multi-select picklist as the selected field. Use this operator to find records that do not contain any values that match the ones entered.</p> <p>For example, if you enter "Interests exclude wine, golf," your report lists records that contain any other values from that picklist, including values that are blank. Results do not include partial matches of values.</p>
between	<p>Available for dashboard filters only. Use to filter on ranges of values. For each range, the filter returns results that are greater than or equal to the minimum value and less than the maximum value.</p> <p>For example, if you enter "Number of Employees from 100 through 500," your results include accounts with 100 employees up to those with 499 employees. Accounts with 500 employees aren't included in the results.</p>
within	Available when you create list views based on a Geolocation custom field. Shows results that are within the specified radius from a fixed latitude and longitude. For example, if you enter "Warehouse location within 50

Operator**Uses**

miles 37.775° –122.418°, your list view includes all warehouses within a 50-mile radius of San Francisco, California.

Filtering on Special Picklist Values

When creating filter criteria, you can use special picklist values for your search criteria. These special picklists have values of either `True` or `False`.

For example, to show all opportunities you have won, enter `Won equals True` as your search criteria. To show all closed/lost opportunities, enter `Closed equals True` and `Won equals False`.

 **Note:** If you are creating filter criteria for a report or list view, the lookup icon automatically displays when you choose to filter on one of the special picklists. Click the lookup icon to choose the value `True` or `False`. Alternatively, you can manually enter `True` or `False` in the filter criteria.

These are the available fields and their values:

Special Picklist Field	Value	Description
Accounts and contacts: Is Person Account	True	The account is a person account. Your administrator could have customized the name of this field. This field displays as the person account icon ().
	False	The account is a business account.
Accounts, leads, and opportunities: Partner Account	True	The account is a partner account, or the lead or opportunity owner is a partner user.
	False	The account is not a partner account or the lead or opportunity owner is not a partner user.
Activities: All-day	True	Applies only to events, not tasks. The event is marked as an all day event.
	False	The event has a specific time.
Activities: Closed	True	Applies only to tasks, not events. The task has been closed, that is, the task <code>Status</code> field has a "Closed" value.
	False	Task is still open.
Activities: Event Invitation (Only for reports)	True	Applies only to events, not tasks. The event is the meeting invite sent to another user for a multi-person event.
	False	The event is the original multi-person event assigned to the event host.
	False	Activity does not have a green sheet.
Activities: Task	True	Activity is a task, not an event.
	False	Activity is an event.

EDITIONS

Available in: Salesforce Classic

The available fields vary according to which Salesforce Edition you have.

Special Picklist Field	Value	Description
Campaigns: Active	True	Campaign is active and can be chosen from various campaign picklists.
	False	Campaign is inactive.
Cases: Closed	True	The case is closed, that is, the case <code>Status</code> field has a "Closed" value.
	False	Case is still open.
Cases: Escalated	True	Case has been automatically escalated via your org's escalation rule.
	False	Case has not been escalated.
Cases: New Self-Service Comment	True	Case has a new comment added by a Self-Service user.
	False	Case does not have a new Self-Service comment.
Cases: Open (Only for reports)	True	The case is open, that is, the case <code>Status</code> has a value that is not equivalent to "Closed."
	False	Case has been closed.
Cases: Self-Service Commented	True	Case has a comment added by a Self-Service user.
	False	Case does not have a Self-Service comment.
Contacts: Email Opt Out	True	The contact cannot be included in a mass email recipient list.
	False	The contact can receive mass email.
Contacts: Self-Service Active (Only for reports)	True	The contact is enabled to log in to your Self-Service portal.
	False	The contact is not enabled for Self-Service.
Leads: Converted (Only for reports)	True	The lead has been converted.
	False	The lead has not been converted.
Leads: Email Opt Out	True	The lead cannot be included in a mass email recipient list.
	False	The lead can receive mass email.
Leads: Unread	True	The lead has not yet been viewed or edited by the owner since it was assigned to that user.
	False	The lead has been viewed or edited at least once by the owner since it was assigned.
Opportunities: Closed	True	The opportunity is closed, that is, the <code>Stage</code> field has a value of the type Closed/Won or Closed/Lost.
	False	The opportunity is still open.
Opportunities: Primary (Only for Partner Opportunities report)	True	The partner for the opportunity has been marked as the primary partner.

Special Picklist Field	Value	Description
	False	The partner for the opportunity has not been marked as the primary partner.
Opportunities: Private	True	The opportunity owner has checked the <code>Private</code> box on the opportunity edit page.
	False	The <code>Private</code> box on the opportunity is not checked.
Opportunities: Won	True	The opportunity is closed and won, that is, the <code>Stage</code> field has a value of the type Closed/Won.
	False	The opportunity has not been won. The <code>Stage</code> field may have a value of the type Open or Closed/Lost.
Products: Active	True	Product is active and can be added to opportunities in Enterprise, Unlimited, and Performance Edition orgs.
	False	Product is inactive and cannot be added to opportunities.
Product: Has Quantity Schedule	True	Product has a default quantity schedule.
	False	Product does not have a default quantity schedule.
Product: Has Revenue Schedule	True	Product has a default revenue schedule.
	False	Product does not have a default revenue schedule.
Solutions: Visible in Self-Service Portal	True	The solution has been marked <code>Visible in Self-Service Portal</code> and is visible to Self-Service portal users.
	False	Solution is not marked <code>Visible in Self-Service Portal</code> and is not visible to Self-Service portal users.
Solutions: Reviewed	True	The solution has been reviewed, that is, the solution <code>Status</code> field has a "Reviewed" value.
	False	Solution is not reviewed.
Solutions Out of Date	True	The translated solution has not been updated to match the master solution with which it is associated.
	False	The translated solution has been updated to match the master solution with which it is associated.
Users: Active	True	User is active and can log in.
	False	User is inactive and cannot log in.
Users: Offline User	True	User has access to use Connect Offline.
	False	User is not enabled for Connect Offline use.
Users: Marketing User	True	User can manage campaigns.
	False	User is not enabled to manage campaigns.

Special Picklist Field	Value	Description
User: Is Partner	True	User is a partner user.
	False	User is not a partner user.

 **Note:** The special picklists you can view are only those that are visible in your page layout and field-level security settings.

Sort Report Results

Sort a report by the data in a particular column by clicking that column's heading. Clicking a column header sorts data according to that column's ascending order: text is sorted from A to Z, numerical data is sorted from lowest to highest, and time/date data is sorted from earliest to latest.

- To reverse the sort order, click the column heading a second time.
- If the floating report header is enabled for your organization, sort behavior is slightly different. When users sort data by clicking a floating report heading, the report refreshes and redirects users to the beginning of report results.
- In a report with multiple grouping levels, you can sort by the summary value that defines each grouping. For example, take an Opportunities report that's grouped by type of business. Each `Type` grouping is in turn grouped by `Stage`, and each `Stage` grouping is grouped by `Lead Source`. Now you can sort the `Type` groupings by amount, the `Stage` grouping by stage, and the `Lead Source` grouping by record count.

EDITIONS

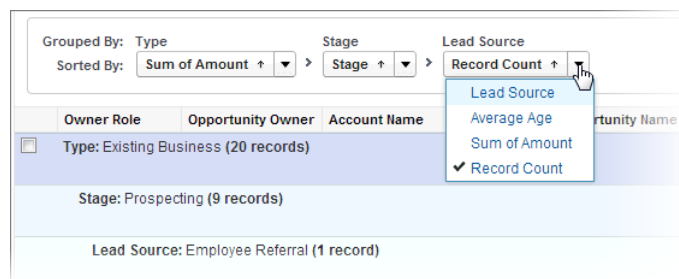

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To sort report results:

- "Run Reports"

Visualizing Data with Dashboards

A *dashboard* shows data from source reports as visual components, which can be charts, gauges, tables, metrics, or Visualforce pages. The components provide a snapshot of key metrics and performance indicators for your organization. Each dashboard can have up to 20 components.

Clicking the Dashboards tab displays the dashboard you viewed most recently. The top of the page shows the time the dashboard was refreshed last and the user whose permissions determine what data is visible on the dashboard.

Each component in a dashboard shows data from an underlying report. If you have access to the folder for the underlying source report, you can see the related dashboard component. Click a dashboard component or its elements to drill down to the source report, filtered report, record detail page, or other URL. If you drill down on a filtered component, the dashboard filters are applied to the source report.

Click **Go to Dashboard List** to view your dashboards. Find a dashboard using dashboard finder. Type a name in the `View Dashboard` field and choose a dashboard from the list of results. You can only see dashboards in folders you can access.

Follow a dashboard to get updates about the dashboard posted to your Chatter feed.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view and refresh dashboards:

- “Run Reports” AND access to dashboard folder

To create dashboards:

- “Run Reports” AND “Manage Dashboards”

To edit and delete dashboards you created:

- “Run Reports” AND “Manage Dashboards”

To edit and delete dashboards you didn't create:

- “Run Reports,” “Manage Dashboards,” AND “View All Data”

Your Access to UI Elements, Records, and Fields

Your Salesforce admin can customize many different areas to secure your company's data. Users in Professional, Enterprise, Performance, Unlimited, and Developer Edition orgs can control other users' access to their data by sharing records individually with colleagues.

Action	Access Needed
To view a tab:	<ul style="list-style-type: none"> • You must have the “Read” permission on the records within that tab. • Make sure you have customized your personal display to show the tab.

EDITIONS

Available in: Salesforce Classic

Available in: **All** Editions except **Database.com**

Action**Access Needed**

To view a record:

- Make sure you have the “Read” permission on the type of record you want to view.
- Professional, Enterprise, Performance, Unlimited, and Developer Edition orgs can set a sharing model that determines the access users have to records they do not own. Depending on your sharing model, the owner may need to share the record with you if you are not the owner of the record or above the owner in the role hierarchy.
- Developer and Performance Edition orgs, and Enterprise and Unlimited Edition orgs with the Sales Cloud, can use territory management to grant access to accounts, opportunities, and cases.

To view a field:

- Make sure you have the “Read” permission on the type of record for the field.
- For Professional, Enterprise, Performance, and Unlimited Edition orgs, check the field-level security; your field-level security settings may prevent you from seeing the field.
- Check your page layout; depending on your page layout settings, you may see some fields and not others.

To edit a field:

- Make sure you have the “Edit” permission on the type of record for the field.
- For Professional, Enterprise, Performance, and Unlimited Edition orgs, check the field-level security; your field-level security settings may set a field to “Read-Only.”
- Check your page layout; page layouts can set fields to read only.

To view a related list:

- Make sure you have the “Read” permission on the type of records displayed in the related list.
- Check your page layout; depending on your page layout settings, you may see some fields and not others.

To view a button or link:

- Make sure you have the necessary permission to perform the action. Buttons and links only display for users who have the appropriate user permissions to use them.
-

EVALUATE AND ROLL OUT LIGHTNING EXPERIENCE FOR YOUR ORG

It's here ... the new Salesforce user experience! Lightning Experience is a completely reimagined interface. Even better, it's built on our UI platform, so the experience can grow and evolve with your needs.

As an admin, you are your company's trusted advisor for all things Salesforce and you'll help decide when to roll out Lightning Experience to your org. This guide contains the details you need to evaluate the new interface and decide if it meets the needs of some or all of your users. When you're ready, you'll be prepared to act on your rollout plan and make the switch to Lightning Experience.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

[What Makes Lightning Experience So Special?](#)

Welcome to Lightning Experience, the new, fast, beautiful user experience from Salesforce. With a sales-centric mindset, we focused on reinventing the desktop environment to better support your sales process. The result is an intuitive, intelligent interface that helps sales reps work more naturally and close more deals faster. Let's take a peek at some of the key features of the new interface so that you can decide if Lightning Experience is right for some or all of your users.

[Is Lightning Experience Right for Your Salesforce Org?](#)

So you're intrigued and excited about Lightning Experience! The new interface clearly offers numerous benefits for sales teams. But Salesforce is a deep well, and we can't rebuild everything at once. This release doesn't have complete parity with Salesforce Classic, the full-featured Salesforce predecessor. Let's look at some use cases, see how Lightning Experience compares to Salesforce Classic to help you decide if now is the right time to switch, and even see a preview of your org in the new interface.

[Transition to Lightning Experience: Let's Do This!](#)

Great! You've decided you're ready to switch to Lightning Experience. First, we recommend that you develop a strategy to guide your rollout. Then, when the time is right, here's how to enable the new user interface.

[Find Your Way Around Lightning Experience](#)

Feeling a little discombobulated by all the Lightning Experience newness? Perfectly understandable. Diving in to a redesigned app can be disorienting—especially when you're able to work in the original interface with your eyes closed. To hone your Lightning Experience chops, let's look at where some of the most common Salesforce features landed in the new interface.

[Lightning Experience Considerations](#)

This release of Lightning Experience doesn't include everything that's available in Salesforce Classic. Review these topics to see if any functionality that's critical to your business is limited or unavailable in this release. This information can also help you train users about what to expect when you do switch to Lightning Experience.

[Lightning Experience Info Center](#)

Check out these resources to learn about using Lightning Experience, setting it up for your organization, or developing for the new user interface.

What Makes Lightning Experience So Special?

Welcome to Lightning Experience, the new, fast, beautiful user experience from Salesforce. With a sales-centric mindset, we focused on reinventing the desktop environment to better support your sales process. The result is an intuitive, intelligent interface that helps sales reps work more naturally and close more deals faster. Let's take a peek at some of the key features of the new interface so that you can decide if Lightning Experience is right for some or all of your users.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Feature	Why It's Cool
Home	Start the day on the new, intelligent home page. Monitor performance to goal, and get insights on key accounts. And stay on track by seeing exactly what needs doing in the Assistant.
Opportunity Workspace	Drive the right behaviors at every stage of your sales process from this action-optimized workspace. You can customize coaching scripts for each step. And reps can work their deals more efficiently using the handy composer to quickly log calls, create tasks, send emails, and more.
Opportunity Kanban	Visually review the status of deals, organized by each stage in the pipeline. Users can drag deals from one stage to another, and get alerts when an action is needed on a key deal.
Composer Windows	Breeze through those minor but important activities that inevitably crop up during the day without switching context. Get a call from a customer while reviewing a report? It's no problem to quickly log the call—without needing to search for the related deal or switch to a different record. Composer

Feature	Why It's Cool
	windows open on the current page and let users log calls and create events, tasks, and notes that can be related to any record.
Activity Timeline and Task List	<p>See open tasks, planned meetings, and accomplishments in the activity timeline on each opportunity, lead, account, and contact.</p> <p>Or use the task list to see the details of specific tasks alongside the full list of open tasks, tasks due today, and closed tasks. Managers can use the Delegated view to see tasks assigned to people below them in the role hierarchy.</p>
Accounts and Contacts	Find information and gather insights at a glance from the new layout. Get the latest news about customers with integrated Twitter and Account Insights for customers, review upcoming and completed activities, and keep data clean with field-level duplicate matching.
Enhanced Notes	Take better notes with auto-save, rich text capabilities, inline images, and versioning. You can even relate a note to multiple records and share notes with teammates or Chatter groups.
Lightning Voice	Use phone features without ever leaving Salesforce. You can make and receive calls, add call notes, and log call information with ease.
Integrated Email	Send email through Gmail or Office 365 accounts with your Salesforce email. See the emails you've sent in your Gmail or Office 365 Sent Items folder for seamless integration. With Enhanced Email, you can relate emails to multiple contacts, leads, and users, and to a single opportunity, campaign, case, account, or person account.
File Preview Player	Enjoy a richer file preview experience that doesn't require Adobe Flash Player. Vector-based preview images render in higher quality and don't degrade on high-resolution screens, plus they load faster. New controls allow scrolling through multi-page documents, previewing animated GIFs, giving full-screen presentations, and accessing file actions.
Reports and Dashboards	Get more from your data. The new report run page is easier to read and filter. Animated, interactive charts bring your organization's data to life. And a new dashboard editor supports flexible layouts and components that span columns and rows.
List Views	Seamlessly create and edit custom list views to rapidly find relevant data. See data faster with more intuitive list views, and search on-the-fly for a specific list view. Visualize data with handy list view charts, or apply filters to slice the data as needed.
Search	Find records faster with improved search, which includes recent records and top results.
Setup Tree and Object Manager	Navigate setup pages with a simplified organization and a cleaner look and feel. Use the new Object Manager, which combines all standard and custom objects into a single list that is more easily searchable.

Is Lightning Experience Right for Your Salesforce Org?

So you're intrigued and excited about Lightning Experience! The new interface clearly offers numerous benefits for sales teams. But Salesforce is a deep well, and we can't rebuild everything at once. This release doesn't have complete parity with Salesforce Classic, the full-featured Salesforce predecessor. Let's look at some use cases, see how Lightning Experience compares to Salesforce Classic to help you decide if now is the right time to switch, and even see a preview of your org in the new interface.

Currently, Lightning Experience is geared toward sales teams, so most features from other Clouds aren't available yet. And some Sales features aren't available either. Although Lightning Experience will expand to include more features in upcoming releases, evaluate how important these upcoming features are to your business needs right now.

Keep in mind that you can enable Lightning Experience for a subset of your users. This flexibility means you can move your Sales team to the new interface now, but have your Service org continue using Salesforce Classic. Or you can opt to run a Lightning Experience pilot with a small group of users without disrupting everyone else until you know that the new experience provides what you need.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

[Saying Hello to Lightning Experience Doesn't Mean Saying Goodbye to Salesforce Classic](#)

Salesforce Classic is still here, and we've made it easy for Lightning Experience users to move between the old and the new. So even if Lightning Experience isn't a perfect fit yet, you and your users can try it on for size without losing out.

[Supported Editions and User Licenses for Lightning Experience](#)

Let's take a look at the supported editions and user licenses to see if your organization can enable and use Lightning Experience.

[Best Use Cases for Lightning Experience](#)

Let's look at the types of organizations that are a good fit for this release of Lightning Experience. And also some uses cases that might not be suitable just yet.

[Compare Lightning Experience and Salesforce Classic](#)

Understanding what you get—and don't get—in the new interface is a big part of the decision to switch to Lightning Experience. Here are some highlights of how Lightning Experience compares to what you're used to in Salesforce Classic.

[What's the Fate of Existing Salesforce Customizations?](#)

We've worked hard to respect your existing configurations and customizations in Lightning Experience. Many of your point-and-click and programmatic implementations also work seamlessly in the new interface. However, some customizations don't apply in the new interface or require updating to take advantage of all that Lightning Experience has to offer. Here are some issues to consider.

[Preview Your Org in Lightning Experience](#)

This is probably the point where you're thinking: "Yeah, yeah, yeah, but I want to see this thing." But you're not ready to switch your users over yet, so quandary, right? Nope! Lightning Experience Migration Assistant to the rescue. The Migration Assistant's Preview feature lets you explore your production org in Lightning Experience, so you can see exactly how your real data and your current customizations work in the new interface. Without disrupting anyone.

[Lightning Experience Considerations](#)

Saying Hello to Lightning Experience Doesn't Mean Saying Goodbye to Salesforce Classic

Salesforce Classic is still here, and we've made it easy for Lightning Experience users to move between the old and the new. So even if Lightning Experience isn't a perfect fit yet, you and your users can try it on for size without losing out.

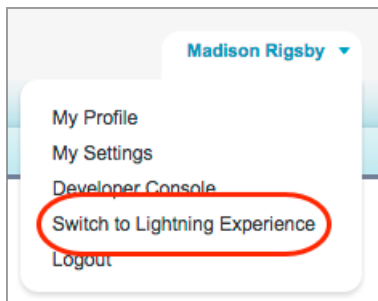

When you enable users for Lightning Experience, you can set it up so some or all of them immediately get the new interface as their default, *preferred* experience. Ideally, your Lightning Experience users find that the new interface meets all their needs. But if there's an important feature or tool back in the classic interface, users can switch to Salesforce Classic at any time, without assistance from you.

To head back to Salesforce Classic, use the Switcher. In the Lightning Experience header, click the profile picture and select **Switch to Salesforce Classic**.

The Switcher changes the default preference to Salesforce Classic. The user remains in the classic interface until using the Switcher to return to Lightning Experience. And then the new interface becomes the default preference. You get the idea.

To find the Switcher in Salesforce Classic, click the name in the upper-right corner, then select **Switch to Lightning Experience**.

Knowing that your users can switch between interfaces makes it easier for you to decide when to start using Lightning Experience. If Lightning Experience is missing only a few features that your team uses occasionally, your users can switch back to Salesforce Classic to use them. It's probably an acceptable trade-off given the benefits of the new experience. But, if users need daily access to unsupported sales features or service features, it's best to keep users in Salesforce Classic—at least for now.

[Gotchas If Users Switch Between Lightning Experience and Salesforce Classic](#)

Supported Editions and User Licenses for Lightning Experience

Let's take a look at the supported editions and user licenses to see if your organization can enable and use Lightning Experience.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Editions

Supported Editions

- Group Edition
- Professional Edition
- Enterprise Edition
- Performance Edition
- Unlimited Edition
- Developer Edition

Unsupported Editions

- Personal Edition
- Contact Manager Edition
- Database.com Edition
- Chatter.com Edition

User Licenses

Supported Licenses

- Salesforce
- All Salesforce Platform and Force.com (excluding Force.com Free)
- Identity User
- Company (Employee) Community

Unsupported Licenses

- Customer Community, Customer Community Plus, Partner Community
- All Portal licenses
- Force.com Free
- Data.com
- Work.com
- Database.com
- Content Only
- Ideas Only
- Knowledge Only
- Site.com Only

Best Use Cases for Lightning Experience

Let's look at the types of organizations that are a good fit for this release of Lightning Experience. And also some uses cases that might not be suitable just yet.

Consider using Lightning Experience for some or all of your organization if:

- Your sales team does business-to-business sales using accounts, contacts, leads, opportunities, custom objects, and the other sales features supported in the new user interface.
- You want to pilot the new user interface with a group of sales reps.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- You're looking to reboot your Salesforce implementation. This is a great opportunity to introduce new features because you're doing change management anyway.

Consider sticking with Salesforce Classic if:

- Your sales team makes regular use of features that aren't yet available in Lightning Experience, such as quotes, forecasting, or territory management.
- You primarily use customer service tools or other non-sales features.
- You want a single experience for your sales and service teams.

Compare Lightning Experience and Salesforce Classic

Understanding what you get—and don't get—in the new interface is a big part of the decision to switch to Lightning Experience. Here are some highlights of how Lightning Experience compares to what you're used to in Salesforce Classic.

 **Note:** These lists aren't a complete view of what's not available in Lightning Experience. Also read [Lightning Experience Considerations](#) to help make your decision.

What's the Fate of Existing Salesforce Customizations?

We've worked hard to respect your existing configurations and customizations in Lightning Experience. Many of your point-and-click and programmatic implementations also work seamlessly in the new interface. However, some customizations don't apply in the new interface or require updating to take advantage of all that Lightning Experience has to offer. Here are some issues to consider.

Lightning Experience Navigation Menu

Lightning Experience replaces the Salesforce Classic tab bar with a collapsible navigation menu along the left side of the page. Customizations made to the tab bar in the classic interface aren't reflected in the navigation menu. Instead, you can create multiple custom navigation menus and assign them to user profiles. Which means you can empower different types of users, like sales reps, sales managers, and execs, with a navigation experience that's unique to their business needs.

You can add a wide variety of items to a custom navigation menu, including many standard Salesforce objects, your custom objects, Lightning component and Visualforce tabs, Lightning Page tabs, and other items like Home, the main feed, people, groups, files, dashboards, reports, and the user's task list and calendar.

In fact, most of the items that appear in the App Launcher can go in a custom navigation menu. The few exceptions include connected apps and some Salesforce objects that aren't supported in Lightning Experience. Items that can't go in a custom navigation menu are always available from the App Launcher by clicking  in the header.

To learn more, see [Customize Lightning Experience Navigation Menus](#) and [Navigation and Actions: What's Not in Lightning Experience](#) in the Salesforce Help.

Page Layouts and Compact Layouts

Record page customizations made in Salesforce Classic—for custom and standard objects—also affect record pages in Lightning Experience. However, some page elements display differently in Lightning Experience, and some aren't supported.

 **Tip:** You can create a custom Lightning Experience record page with the Lightning App Builder.

Compact layouts play the same role in Lightning Experience that they do for the Salesforce1 mobile app: displaying a record's key fields in the highlights panel on a record page. In Lightning Experience, the highlights panel shows the first five fields from your current compact layouts.

Actions and Buttons

If you've already created and used actions in Salesforce Classic, you know that they appear in the Chatter publisher, while standard and custom buttons appear above the details on a record page. And if you use Salesforce1, you know that all action types and buttons are co-mingled on the Salesforce1 action bar. In Lightning Experience, we continue to blur the line between actions and buttons. But instead of displaying in a single place, actions and buttons are grouped by type in several different areas on the record page.

By default, Lightning Experience includes the actions and buttons defined in the Salesforce1 and Lightning Experience Actions section on the global publisher layout. Or you can customize what's available using the same section on object page layouts. Here's the logic that determines where on the record page an action or button appears.

- Global actions with the Log a Call action type or the Create a Record action type for events, notes, and tasks display in the Global Actions menu in the header.
- Most quick actions, productivity actions, standard buttons, and supported custom buttons are added to the page-level action menu.
- Object-specific activities-related actions, such as Log a Call, New Event, New Task, and Email, display in the composer on the Activity tab.
- Standard Chatter actions appear in the composer on the Collaborate tab.

The order of actions in each area is based on the order in which they've been added to the global publisher or object page layout.

To learn more, see [Actions in Lightning Experience](#) in the Salesforce Help.

Custom Buttons

Custom buttons that use a JavaScript content source aren't supported in Lightning Experience. You can replace some of the functions covered by these buttons by using point-and-click tools, like Process Builder, Visual Workflow, or code-driven approaches.

Custom buttons that define the content source as a URL or Visualforce page work as you'd expect.

Visualforce and Lightning Components

Yes, Lightning Experience is a major change from Salesforce Classic, but that doesn't mean your Visualforce pages stop working. This release includes support for Visualforce in Lightning Experience. Your existing Visualforce pages work in Lightning Experience, many without needing any revisions. Because things have moved around in the new interface, you'll want to complete some chores to make sure your Visualforce pages work the way you expect. And at this point, a few Visualforce features don't work in Lightning Experience.

Here are a few basic details to consider.

- If your Visualforce pages use JavaScript, there are things you need to check. Visualforce doesn't "own" the whole page when shown in Lightning Experience, and because of that, your JavaScript code needs to play by some new rules.
- If your Visualforce pages use the built-in standard components, their look-and-feel matches Salesforce Classic, whether users access them in the new or old interface. Some work is needed if you want your pages to match the Lightning Experience styling.

To help with this effort, we're publishing the Salesforce Lightning Design System (SLDS), a collection of design patterns, components, and guidelines for creating interfaces that fit in with Lightning Experience. The SLDS is available at www.lightningdesignsystem.com.

For the complete skinny on what works and doesn't work, see the "Visualforce & Lightning Experience" module in the [Developer Trail - Lightning Experience](#) Trailhead trail.

What about new UI customization? The Lightning Component framework is our new UI framework for developing dynamic web apps for both desktop and mobile devices. You can use it or Visualforce in your new projects. To learn more about UI development, see “[User Interface Development Considerations](#)” in the [Lightning Experience Development](#) Trailhead module. To learn more about Lightning Components, see the “[Lightning Components](#)” module in the [Developer Trail - Lightning Experience](#) Trailhead trail.

Force.com Canvas

Force.com Canvas allows you to easily integrate third-party applications in Salesforce. Canvas functionality in Lightning Experience is the same as in Salesforce Classic. You can still embed Canvas apps in Visualforce pages and everywhere else they're supported, with the added bonus that you can expose Canvas apps in Lightning Components.

Salesforce APIs and Apex

Most of the programmatic tools and processes you're used to are largely unaffected by Lightning Experience. We've kept our promise that our new releases won't break your dependencies on Salesforce APIs. Tools like Workbench haven't changed. Your development environment is the same as ever.

While your Apex classes and API calls work fine, some features aren't yet supported in Lightning Experience. If a user is in the new interface and executes some Apex code that interacts with an unsupported feature, the user can't complete the task. To address this scenario, we've added capabilities to determine a user's interface preference from both the API and Apex. You can use this functionality to add logic to your existing code so that your users don't encounter errors. See “[Understanding Changes to Other Development Tools](#)” in the [Lightning Experience Development](#) Trailhead module for full details.

AppExchange Apps

Many apps from the AppExchange feature customizations, including custom objects, custom buttons, Visualforce pages, and more. Salesforce partners are testing their apps in Lightning Experience and applying for *Lightning Ready* certification. Apps that are Lightning Ready work in Lightning Experience and offer a more consistent experience with other Lightning Pages. If an app is supported in Lightning Experience, a Lightning Ready sash appears on its AppExchange listing. If an app isn't supported in Lightning Experience, use it in Salesforce Classic instead.

 **Note:** Your org can use apps without Lightning Ready certification in Lightning Experience, but some features might not be available or work as expected. These apps can also appear visually inconsistent with Lightning Experience because they use Salesforce Classic styling. For the best experience, use Salesforce Classic for apps that aren't certified as Lightning Ready.

Preview Your Org in Lightning Experience

This is probably the point where you're thinking: "Yeah, yeah, yeah, but I want to see this thing." But you're not ready to switch your users over yet, so quandary, right? Nope! Lightning Experience Migration Assistant to the rescue. The Migration Assistant's Preview feature lets you explore your production org in Lightning Experience, so you can see exactly how your real data and your current customizations work in the new interface. Without disrupting anyone.

The Preview feature isn't a locked-down, read-only tour. You can change data, settings, permissions—you name it. But remember that you're working with your live org. If you do make changes, they're for real and visible to your users back in Salesforce Classic.

To get started, from Setup, enter *Lightning* in the **Quick Find** box, then select **Lightning Experience**. Click **Preview** to dive in.

Transition to Lightning Experience: Let's Do This!

Great! You've decided you're ready to switch to Lightning Experience. First, we recommend that you develop a strategy to guide your rollout. Then, when the time is right, here's how to enable the new user interface.

[Develop Your Lightning Experience Rollout Strategy](#)

One of the best investments you can make in your Lightning Experience rollout is to have a clear plan. A plan helps you do things in the right order, identify key resources, communicate with everyone, and have a clear end date in mind.

[Enable Lightning Experience](#)

Turning on Lightning Experience is a very simple task—just flip the switch! But we recommend that you set up a few other features first so your users get the full power of the new interface when you enable Lightning Experience. Then you set up the appropriate users to access Lightning Experience. You can choose to start slow and roll out the new interface to a small pilot group, or jump in and turn it on for everyone in your organization.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Develop Your Lightning Experience Rollout Strategy

One of the best investments you can make in your Lightning Experience rollout is to have a clear plan. A plan helps you do things in the right order, identify key resources, communicate with everyone, and have a clear end date in mind.

Depending on the size of your organization, you could be working with a Change Management department or have a project manager assigned to the rollout. Or perhaps you're the one charged with organizing and executing the rollout from start to finish. However the work gets divvied up, use the [Lightning Experience Rollout](#) module in *Admin Trail - Migrating to Lightning Experience* from Trailhead to help with this process.

Your rollout will likely fall into these phases.

Learn

- Learn about Lightning Experience
- Identify stakeholders and an executive sponsor
- Educate your company with presentations and demos
- Review [Compare Lightning Experience and Salesforce Classic](#) and [Lightning Experience Considerations](#)
- Conduct a gap analysis to confirm you're getting what you need

Launch

- Identify users for a pilot of Lightning Experience
- Identify and activate super users
- Create the project schedule
- Define measures for success
- Create and execute your marketing and training strategies
- Customize and test, ideally in a sandbox environment
- Go live!

Iterate

- Evaluate how things are working to see if you're hitting your success metrics
- Survey your users for satisfaction and pain points
- Use reports and dashboards to track metrics and feedback
- Deliver an executive summary

To jump-start your planning, download the [Lightning Experience Customer Enablement Pack](#) that's part of the [Lightning Experience Rollout](#) module. The Enablement Pack is chock-full of valuable resources, like a presentation deck, a risk severity matrix, a project schedule template, a sample email drip campaign, and a rollout checklist to keep you focused and on track.

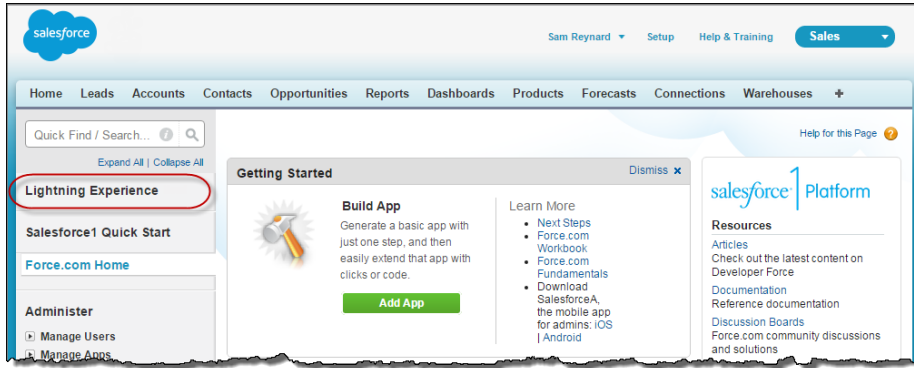

Enable Lightning Experience

Turning on Lightning Experience is a very simple task—just flip the switch! But we recommend that you set up a few other features first so your users get the full power of the new interface when you enable Lightning Experience. Then you set up the appropriate users to access Lightning Experience. You can choose to start slow and roll out the new interface to a small pilot group, or jump in and turn it on for everyone in your organization.

Use the Lightning Experience Migration Assistant as your control center for tackling these steps. From Setup in Salesforce Classic, click **Lightning Experience**.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Recommended Features for Lightning Experience

If you haven't already, consider enabling and setting up several supporting features before turning on Lightning Experience. These features ensure that the new user interface is fully optimized to help your sales reps sell faster and smarter.

Set Up Users for Lightning Experience

Next up, make sure that the desired users get access to Lightning Experience. By default, the "Lightning Experience User" permission is automatically enabled for all users with a standard Salesforce profile. But you can fine-tune access to Lightning Experience with custom profiles or permission sets. Meaning you can do a limited rollout to a pilot group or enable a specific team of users who can benefit from the new interface. Or go for it and set your entire organization loose. The power is yours.

Turn on Lightning Experience for Your Org

You've knocked off the "Learn" and "Launch" items in your rollout plan. You've set up the Salesforce features that optimize the new user interface. You've enabled the right users and designated who gets the new interface right away and who stays in the classic interface. You're ready to go live! Fortunately, it's easy to turn on Lightning Experience using the Migration Assistant.

SEE ALSO:

[Supported Editions and User Licenses for Lightning Experience](#)

Recommended Features for Lightning Experience

If you haven't already, consider enabling and setting up several supporting features before turning on Lightning Experience. These features ensure that the new user interface is fully optimized to help your sales reps sell faster and smarter.

Related Files

Leverage the rich features and flexibility of Salesforce Files from standard Salesforce objects and your custom objects. Add the new Files related list to page layouts so that users can upload files to records, see files associated with records, and quickly page through files in the modern, visually rich preview player.

Enhanced Notes

Help your users stay organized with our enhanced note-taking tool. It's a breeze to create rich-text notes and quickly relate them to specific records. When you turn on Notes, remember to add the new Notes related list to page layouts so that your users can create and read notes directly from their records.

EDITIONS

Available in: **Group**,
Professional, **Enterprise**,
Performance, **Unlimited**,
and **Developer** Editions

Sales Path

Help your sales reps adopt your company's sales processes and close more deals. Customize your lead statuses and opportunity stages, and even the order you want them to appear in the sales paths on lead and opportunity workspaces. Then with help from sales management, add guidance for success in each status and stage.

Duplicate Management

Create duplicate rules to alert users if they're about to create a duplicate record. Craft your duplicate rules to control whether and when users can create duplicate records in Salesforce.

Lead Conversion

Keep the sales process moving by letting your sales reps convert qualified leads to contacts. At the time of conversion, sales reps select an account for the newly created contact, or create an account if it's not yet in Salesforce. Reps can also create an opportunity on the spot. Add the Convert button to the Lead page layout.

Account Insights

Give your reps instant access to relevant, timely news about their accounts and opportunities. This feature is available only in English, so if your org uses a different primary language, you might not want this option. (For information about privacy issues with this feature, see [Account Insights](#) in the Salesforce Help.)

Social Accounts, Contacts, and Leads

Keep the team up to date by letting reps link their accounts, contacts, and leads to matching Twitter profiles. Users can see Twitter user profiles and people in common in Salesforce and quickly access tweets.

Shared Activities

Represent activity relationships more accurately by letting your sales reps relate multiple contacts to individual events and tasks. Shared Activities is forever. After the feature's enabled, it can't be disabled.

My Domain

Create a custom domain with the Salesforce My Domain feature. A custom domain helps you manage login and authentication. You must set up a custom domain to use Lightning components in Lightning component tabs, Lightning Pages, the Lightning App Builder, and standalone apps. To set up a custom domain, see [My Domain](#) in the Salesforce Help.

Set Up Users for Lightning Experience

Next up, make sure that the desired users get access to Lightning Experience. By default, the "Lightning Experience User" permission is automatically enabled for all users with a standard Salesforce profile. But you can fine-tune access to Lightning Experience with custom profiles or permission sets. Meaning you can do a limited rollout to a pilot group or enable a specific team of users who can benefit from the new interface. Or go for it and set your entire organization loose. The power is yours.

 **Note:** Okay, if you use Group Edition, that's overstating things. You can't remove the "Lightning Experience User" permission from your org's standard profiles, and custom profiles aren't available. So it's "all or nothing" if you want to turn on Lightning Experience in Group Edition—all your users will be enabled to use the new interface. But you can control who is immediately switched into the new interface and who remains in the classic interface until they're ready to switch themselves.

EDITIONS

Profiles and Permission Sets available in: both Salesforce Classic and Lightning Experience

Profiles and Permission Sets available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Decide Who Can Use Lightning Experience

First things first, do you have users with standard profiles who shouldn't get access to Lightning Experience yet? Move these users to custom profiles that don't include the "Lightning Experience User" permission.

For users with custom profiles, decide who gets Lightning Experience. Custom profiles don't automatically include the "Lightning Experience User" permission so it's up to you. Consider these options.

- Want to test Lightning Experience with a small group of custom profile users but you don't want to turn it on for everyone assigned to these profiles? Create a permission set that includes the "Lightning Experience User" permission. Then apply the permission set to each pilot user. When you turn on Lightning Experience, only pilot users see the new interface.

Are you new to permission sets? Check out this walkthrough!  [Walk Through It: Create, Edit, and Assign a Permission Set](#)

- Interested in rolling out Lightning Experience to specific custom profiles? Or ready to enable all your custom profile users? Adding the "Lightning Experience User" permission to profiles is the fastest way to mass-enable the new user interface.

If you're dealing with many profiles, you can tackle them at the same time with the Data Loader. But remember, with great power comes great responsibility. Take care you don't inadvertently enable or disable other features.

If you're going to limit Lightning Experience to a subset of your users, we recommend that you keep all members of a functional team on the same experience. If you have team members who often share links and work closely together, include them all in your pilot. See [Gotchas If Users Switch Between Lightning Experience and Salesforce Classic](#) for more details.

Decide Who Immediately Switches to Lightning Experience

The last step is to decide which of your users should immediately switch to the new interface when you enable Lightning Experience and who should stay in Salesforce Classic. You can choose what's right for each user. If your team isn't fully trained on Lightning Experience yet or it's not a good time to introduce a major change, you can opt to leave everyone in Salesforce Classic when Lightning Experience is turned on.

-  **Tip:** Remember, everyone who's enabled for Lightning Experience automatically gets the Switcher. Meaning users who remain in Salesforce Classic can switch themselves to Lightning Experience whenever they're ready. And of course, users assigned to the new interface can switch back to Salesforce Classic as needed.

To assign the right interfaces for your users, use the Lightning Experience Migration Assistant. From Setup in Salesforce Classic, click **Lightning Experience**. In the "Decide Who Can Use Lightning Experience" section, find the "Switch Users to Lightning Experience" item and click **Select Users**.

-  **Note:** Any users you add to Salesforce after Lightning Experience is enabled are automatically assigned to the new user interface.

Turn on Lightning Experience for Your Org

You've knocked off the “Learn” and “Launch” items in your rollout plan. You've set up the Salesforce features that optimize the new user interface. You've enabled the right users and designated who gets the new interface right away and who stays in the classic interface. You're ready to go live! Fortunately, it's easy to turn on Lightning Experience using the Migration Assistant.

From Setup in Salesforce Classic, click **Lightning Experience**.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the Lightning Experience Migration Assistant:

- “View Setup and Configuration”

To edit the Lightning Experience Migration Assistant:

- “Customize Application”

On the Lightning Experience Migration Assistant page, click the **Lightning Experience** button to set it to **Enable**.

The image shows a screenshot of the 'Lightning Experience Migration Assistant' interface. The main header reads 'Lightning Experience Migration Assistant' with the subtitle 'Make the switch to the new, modern, and intelligent Salesforce experience'. Below this, there is a section titled 'Learn About Lightning Experience' with links for 'Introducing Lightning Experience' (Watch Video) and 'Evaluate if Lightning Experience Is Right for Your Org' (Compare). A callout box is overlaid on the right side of the page, titled 'Enable the New Salesforce Experience'. Inside this box, the text reads: 'Lightning Experience You didn't skip to the end, right? Great! You're ready to flip the switch on a powerful and intuitive user experience.' To the right of this text is a green toggle switch labeled 'Enabled'. At the bottom of the callout box, there is a smaller version of the same text and toggle switch.

That's it! The users you've enabled and set up to immediately switch to the new interface automatically start enjoying Lightning Experience when their current session refreshes or when they log in. The users you've enabled but opted to leave in Salesforce Classic now have access to the Switcher and can switch to Lightning Experience whenever they want.

Disable Lightning Experience for Your Org

If this release of Lightning Experience isn't a good fit for your org, it's easy to turn off the new user interface. When you disable Lightning Experience, all users immediately switch to Salesforce Classic.

From Setup, enter *Lightning Experience* in the `Quick Find` box.

From the Lightning Experience Migration Assistant, click the **Lightning Experience** button to set it to **Disabled**.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Find Your Way Around Lightning Experience

Feeling a little discombobulated by all the Lightning Experience newness? Perfectly understandable. Diving in to a redesigned app can be disorienting—especially when you're able to work in the original interface with your eyes closed. To hone your Lightning Experience chops, let's look at where some of the most common Salesforce features landed in the new interface.

[Find Profile and Personal Settings in Lightning Experience](#)

In Salesforce Classic, your profile and personal settings are located in the menu with your name. It's not too different in Lightning Experience. Find links to these options by clicking your profile picture. Want to switch between Lightning Experience and Salesforce Classic? You can find links to do so from here, too.

[Find Your Stuff in Lightning Experience](#)

In Salesforce Classic, you use tabs to access objects, like accounts and leads. Tabs also serve up other features, such as your Home page or Chatter. Lightning Experience replaces the tab bar with a collapsible navigation menu that includes objects, apps, and other goodies. Looking for connected apps? If an item isn't in the navigation menu, look in the App Launcher.

[Find List Views in Lightning Experience](#)

Lightning Experience improves the Salesforce Classic list view experience with a more intuitive layout, convenient navigation, and seamless list creation and editing.

[Find Your Way Around Records in Lightning Experience](#)

In Salesforce Classic, record details, related lists, and the record feed display on the same page. This layout can lead to a lot of scrolling, especially in records with a lot of data. In Lightning Experience, find record details, related information, and the record feed in dedicated tabs that are easy to switch between.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Find Actions and Buttons in Lightning Experience

While Salesforce Classic displays actions in the Chatter publisher, and buttons on a record's details page, Lightning Experience blurs the distinction between these elements. The new interface intermingles actions and buttons, locating them in different areas, based on function.

Find Related Lists in Lightning Experience

Records in Salesforce include details and links to other related records. Salesforce Classic displays related records in lists that appear near the bottom of the page. In Lightning Experience, related information appears in related list cards. For leads and opportunities—the objects that include a workspace—access related list cards from the Related tab. For reference objects like accounts and contacts, and on groups and people, related list cards display on the right side of the page.

Find Chatter Features in Lightning Experience

With Lightning Experience, you can connect with people and groups and share business information securely and in real time, just like you're used to in Salesforce Classic. The way you access Chatter feeds, groups, and profiles is a bit different in the new interface. But with this quick overview, you'll feel right at home.

Find Help in Lightning Experience

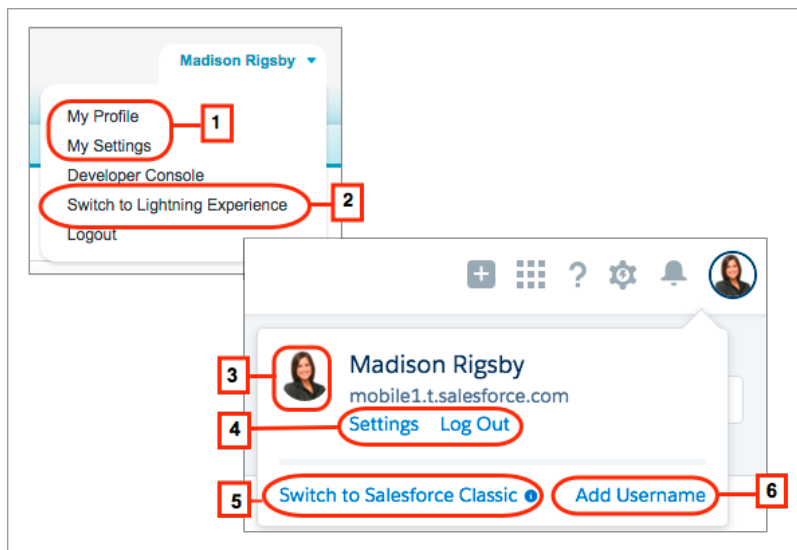

Help is here! And it's better than ever in Lightning Experience, where the contextual Help menu serves up targeted content like videos, walkthroughs, help topics, and trails. Bonanza!

Find Profile and Personal Settings in Lightning Experience

In Salesforce Classic, your profile and personal settings are located in the menu with your name. It's not too different in Lightning Experience. Find links to these options by clicking your profile picture. Want to switch between Lightning Experience and Salesforce Classic? You can find links to do so from here, too.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Salesforce Classic, click your username to find links to your profile and personal settings (1). In Lightning Experience, click your profile picture to access your profile and personal settings (4).

To return to Salesforce Classic, click **Switch to Salesforce Classic** (5). We remember your choice and set it as the default. Want to switch back to Lightning Experience? Click your name in the Salesforce Classic header, then click **Switch to Lightning Experience** (2).

By the way, before you add a photo, you look like this: . That's probably not a great likeness, so click it (3) to upload your own photo and become human!

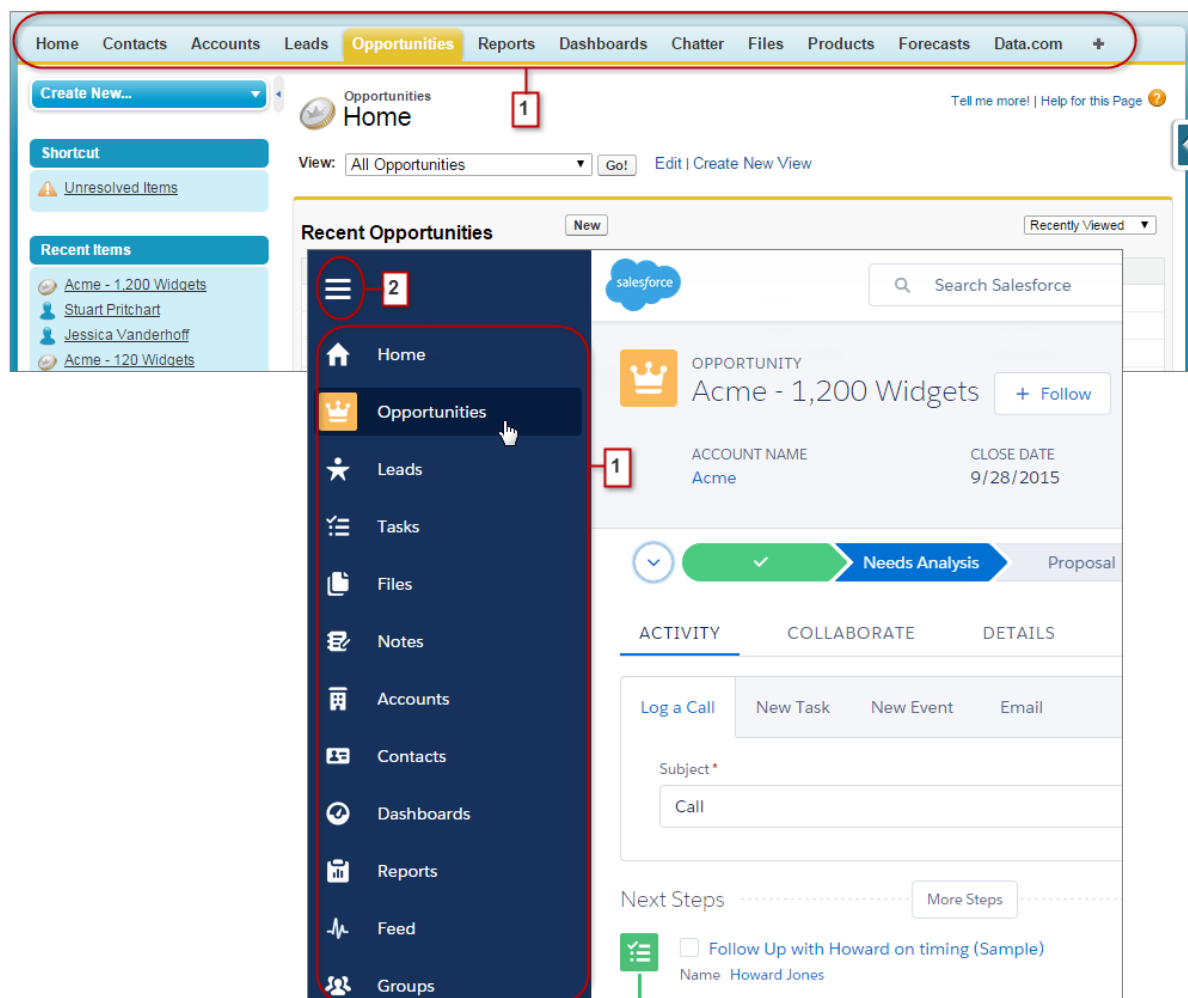

So what's Add Username (6)? That's a Lightning Experience feature for switching between your usernames. If you have multiple usernames on the same or different orgs, you can choose a username from a list. If you don't see it, your admin disabled the feature for your org.

Find Your Stuff in Lightning Experience

In Salesforce Classic, you use tabs to access objects, like accounts and leads. Tabs also serve up other features, such as your Home page or Chatter. Lightning Experience replaces the tab bar with a collapsible navigation menu that includes objects, apps, and other goodies. Looking for connected apps? If an item isn't in the navigation menu, look in the App Launcher.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Lightning Experience, use the navigation menu to access items like Home, Salesforce objects, the Chatter feed, groups, and people, dashboards and reports, productivity tools, and apps. Your org can use the default navigation menu or custom ones that are assigned to user profiles and give users just what they need. Simply click the icon for the item you want (1). Scroll down to see everything in the menu. Click the navigation menu icon (2) to expand the menu and show item names. Collapse it when you're familiar with the items' icons.

You use the App Launcher Force.com menu (1) in Salesforce Classic to access available apps. In Lightning Experience, hover over the App Launcher icon (1), watch it go all *rainbow*, then click to find your apps on the App Launcher page (2).

Looking for an item that's not in the navigation menu or not yet available in Lightning Experience? Click the tile for the feature's cloud, then scroll down for links to that feature. Clicking a link opens the feature in Salesforce Classic in a separate browser tab. For example, to use Collaborative Forecasts, click **Sales**, then scroll down for the **Forecasts** link. Click it to show the Forecasts tab in a separate browser tab in Salesforce Classic.

Find List Views in Lightning Experience

Lightning Experience improves the Salesforce Classic list view experience with a more intuitive layout, convenient navigation, and seamless list creation and editing.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The screenshot displays the Salesforce Lightning Experience interface for the 'Opportunities' list view. The interface is divided into several sections:

- Top Navigation:** Includes tabs for Home, Contacts, Accounts, Leads, Opportunities (selected), Reports, Dashboards, Chatter, Files, Products, Forecasts, and Data.com.
- Left Sidebar:** Contains 'Create New...' button, 'Unresolved Items', and 'Recent Items' (listing various widget sets like 'Acme - 1,200 Widgets').
- Main Content Area:** Shows a table of opportunities with columns: Opportunity Name, Account Name, Amount, Close Date, Stage, and Opportun... (truncated). The table lists several records, including 'Acme - 210 Widgets (S...', 'Acme - 500 Widgets (S...', 'Acme - 120 Widgets', and 'Global Media - 200 Widgets'.
- Right Sidebar:** Includes a search bar, a 'New' button, and a 'My Opportunities' dropdown menu.

Numbered callouts (1-8) highlight specific features:

- 1: 'My Opportunities' dropdown menu.
- 2: Filter icon (funnel) and 'New' button.
- 3: 'Create New...' button.
- 4: Record action menu (Edit, Delete, etc.) for a specific record.
- 5: Search bar for finding list views.
- 6: Toggle between list view and Opportunity Board.
- 7: Filter icon (funnel).
- 8: Record action menu (Edit, Delete, etc.) for a specific record.

- Select a list view from the drop-down menu (1).
- Create, edit, or delete list views (2). Use  to quickly modify a view's filters and refine which records are displayed.
- Create records (3) directly from a list view.
- Edit or delete (4) specific records.

List views in Lightning Experience include several new features that aren't available in Salesforce Classic.

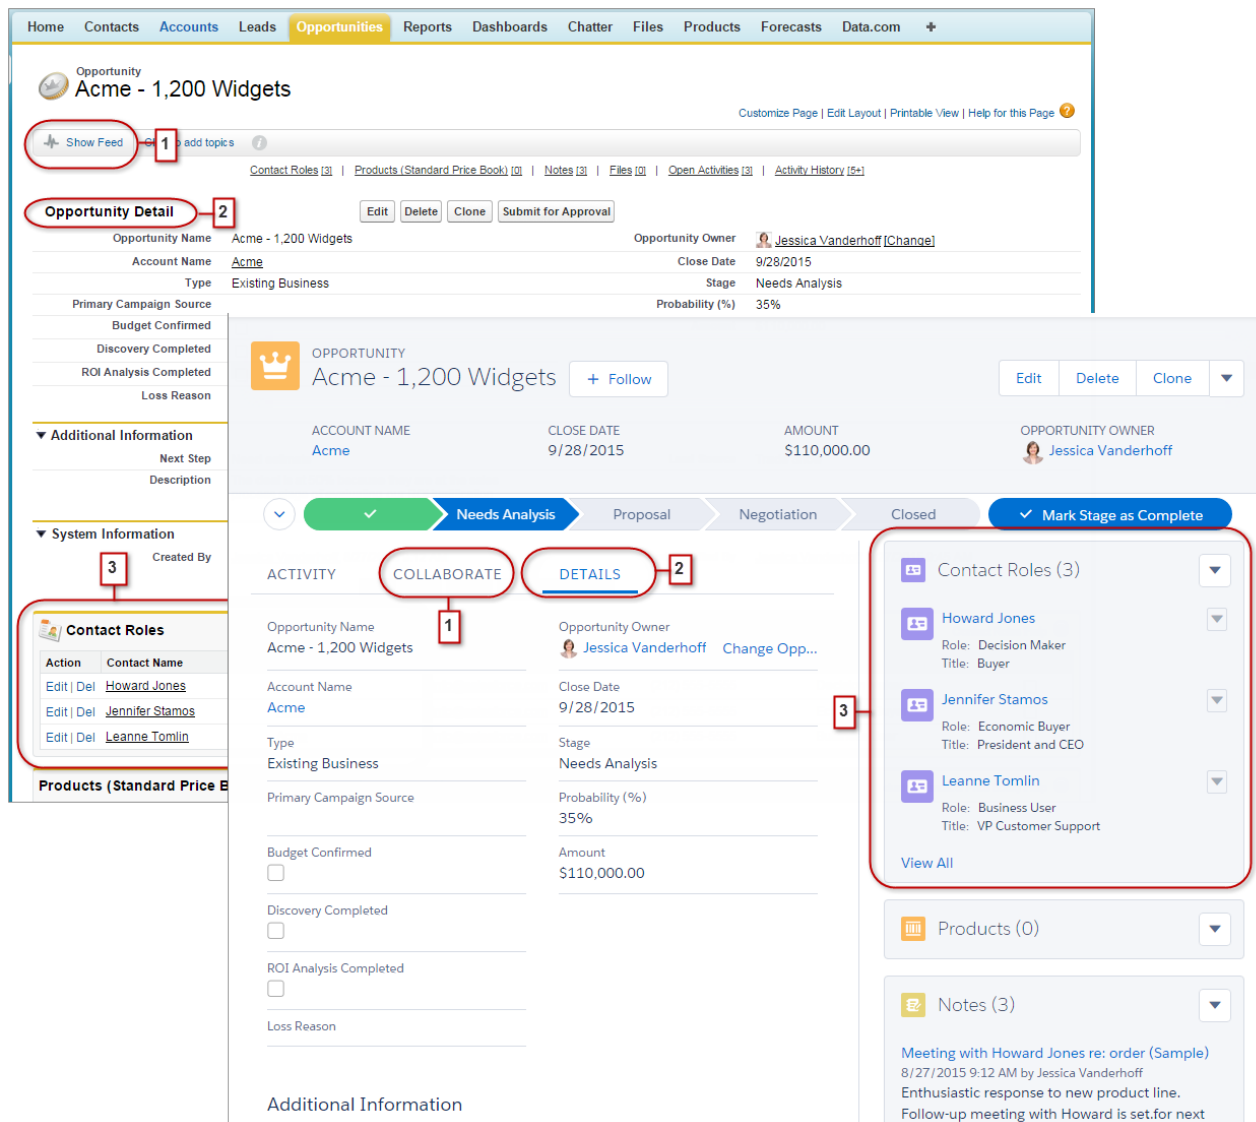

- Find a specific list view faster by searching for it (5).
- On opportunities only, toggle between the standard list view grid and the new Opportunity Board (6), a visual way to monitor the pipeline.
- Visualize list view data in one of several types of charts: vertical bar, horizontal bar, or donut (7).

Find Your Way Around Records in Lightning Experience

In Salesforce Classic, record details, related lists, and the record feed display on the same page. This layout can lead to a lot of scrolling, especially in records with a lot of data. In Lightning Experience, find record details, related information, and the record feed in dedicated tabs that are easy to switch between.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- In Salesforce Classic, Show Feed (1) controls whether a record's Chatter feed is visible. In Lightning Experience, the record's feed and the feed composer are always available on the Collaborate tab (1).
- See all record details on the Details tab (2).

- In Salesforce Classic, records include related lists (3), while Lightning Experience displays related information in related list cards (3). See [Find Related Lists in Lightning Experience](#) for a deeper examination of how related information is handled in the new and classic interfaces.

SEE ALSO:

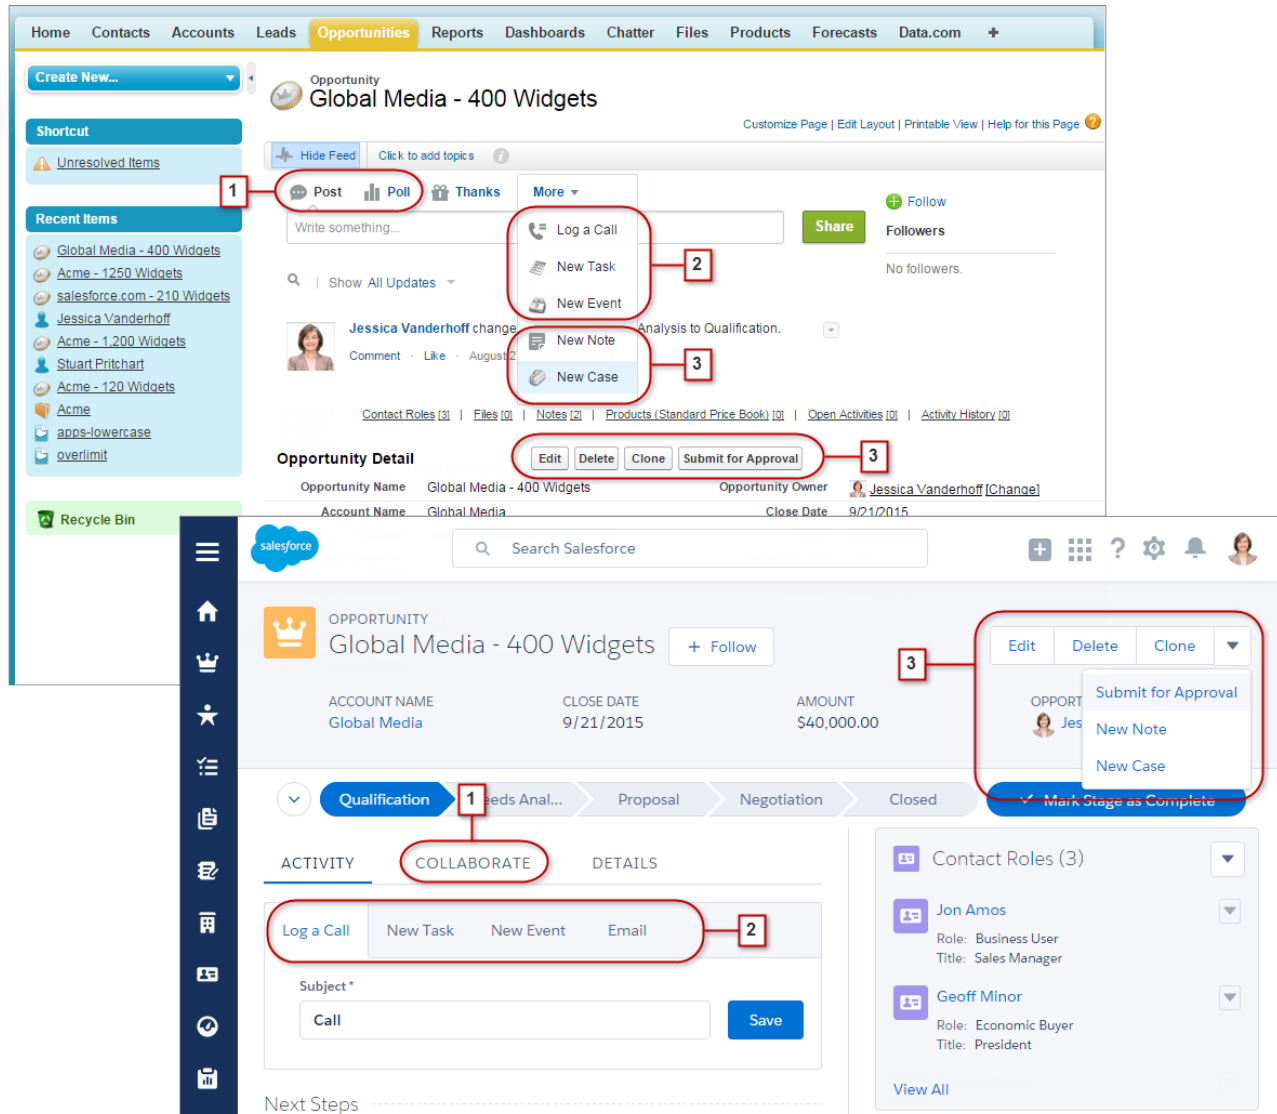

[Find Actions and Buttons in Lightning Experience](#)

Find Actions and Buttons in Lightning Experience

While Salesforce Classic displays actions in the Chatter publisher, and buttons on a record's details page, Lightning Experience blurs the distinction between these elements. The new interface intermingles actions and buttons, locating them in different areas, based on function.

EDITIONS

Available in: **Group**,
Professional, **Enterprise**,
Performance, **Unlimited**,
and **Developer** Editions

- The Post and Poll standard Chatter actions (1) appear in the composer on the Collaborate tab in Lightning Experience. Other standard actions like Thanks and Links, however, aren't available in the new interface.
- The Log a Call, New Task, and New Event actions (2) from an object's page layout appear in the composer on the Activity tab. And if the Send an Email button is included on the object's page layout, the Email action shows up in this composer too. These actions create records that are related to one the user is viewing.

Or use the Global Actions menu () in the header to log a call or create events, notes, and tasks that aren't related to the current record.

- Standard and supported custom buttons (3) on the page layout—including the Edit button—appear in the action menu. And any other global and object-specific actions, including Visualforce and Force.com Canvas actions, appear in the menu as well.

- As in Salesforce Classic, custom links are included with the record’s details. Click the Details tab to find them.

SEE ALSO:

- [Actions in Lightning Experience](#)
- [How Actions Are Ordered in Lightning Experience](#)
- [Navigation and Actions: What’s Not in Lightning Experience](#)

Find Related Lists in Lightning Experience

Records in Salesforce include details and links to other related records. Salesforce Classic displays related records in lists that appear near the bottom of the page. In Lightning Experience, related information appears in related list cards. For leads and opportunities—the objects that include a workspace—access related list cards from the Related tab. For reference objects like accounts and contacts, and on groups and people, related list cards display on the right side of the page.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

For the first eight related list cards on a record:

- Related list buttons (1) are located in the upper-right corner of each related list card. If there are multiple buttons, use the pull-down menu to access them.
- Each item in a related list card includes a link (2) that opens the related record.

- Record-specific actions (3) are located in the pull-down menu next to each related record.
- When related list cards are on the right side of the page, each card displays up to three records. On reference objects, related list cards display up to six records. In both cases, drill down (4) to see the full list of related records.

If there are more than eight related lists on a record, additional related list cards display the object's name only. Click the name in the related list card to open the full related list, which includes the related list buttons and record-specific actions that aren't included in the card.

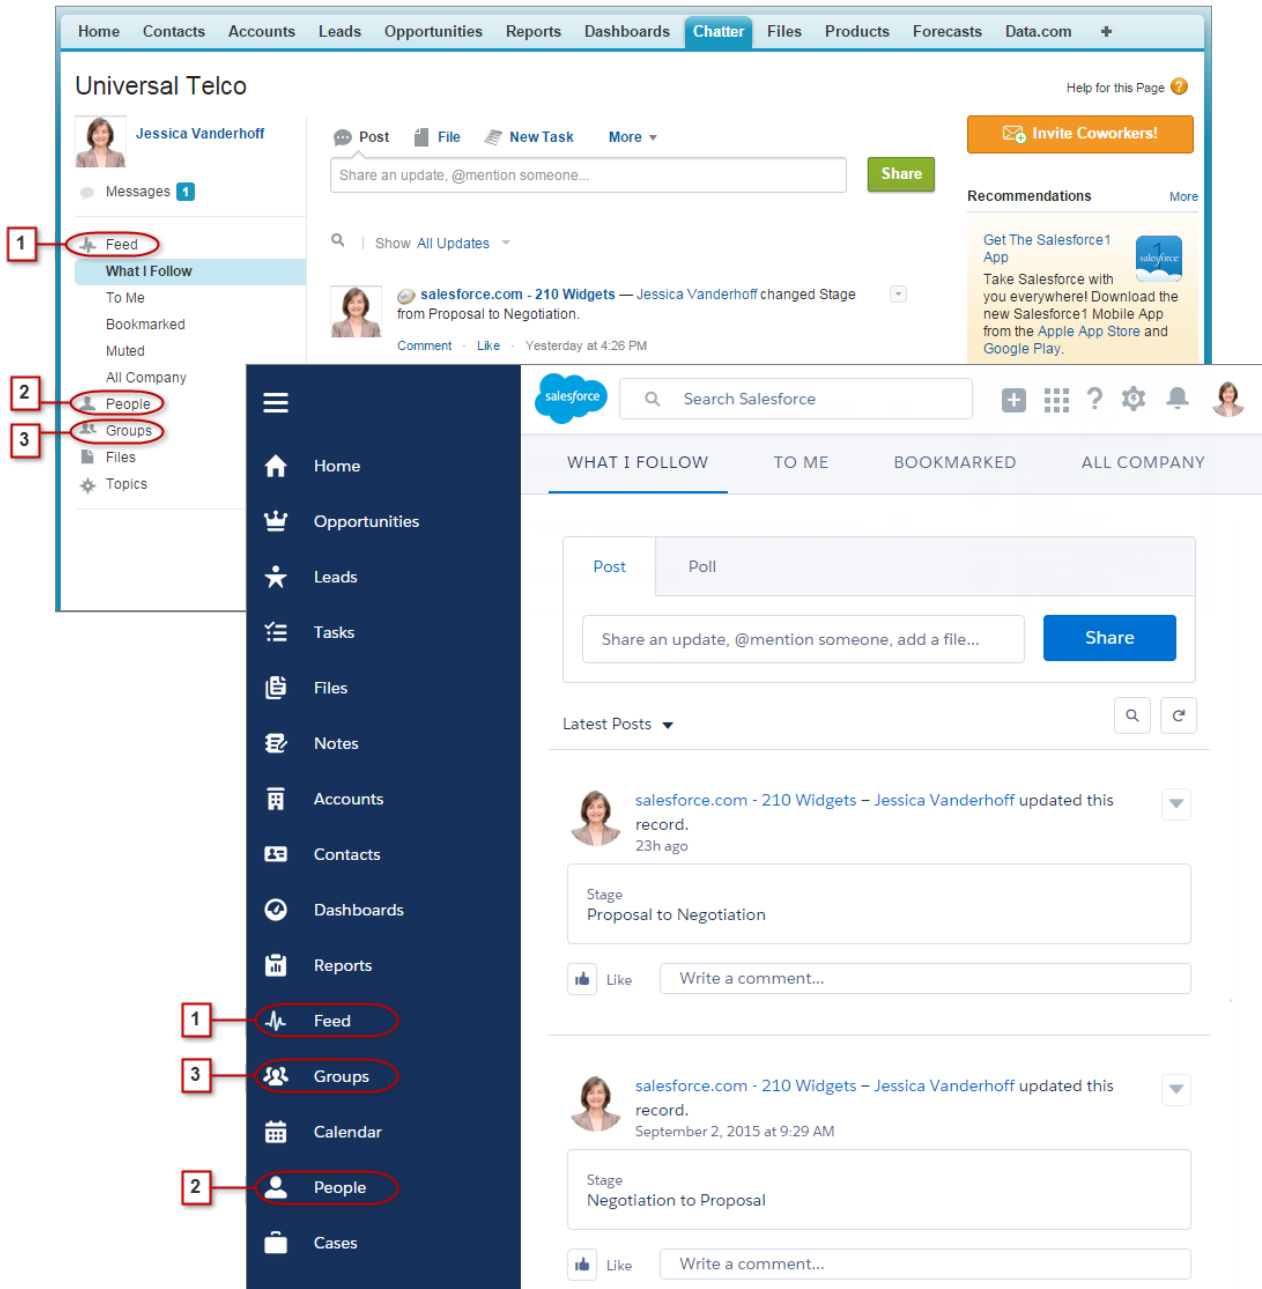

Find Chatter Features in Lightning Experience

With Lightning Experience, you can connect with people and groups and share business information securely and in real time, just like you're used to in Salesforce Classic. The way you access Chatter feeds, groups, and profiles is a bit different in the new interface. But with this quick overview, you'll feel right at home.

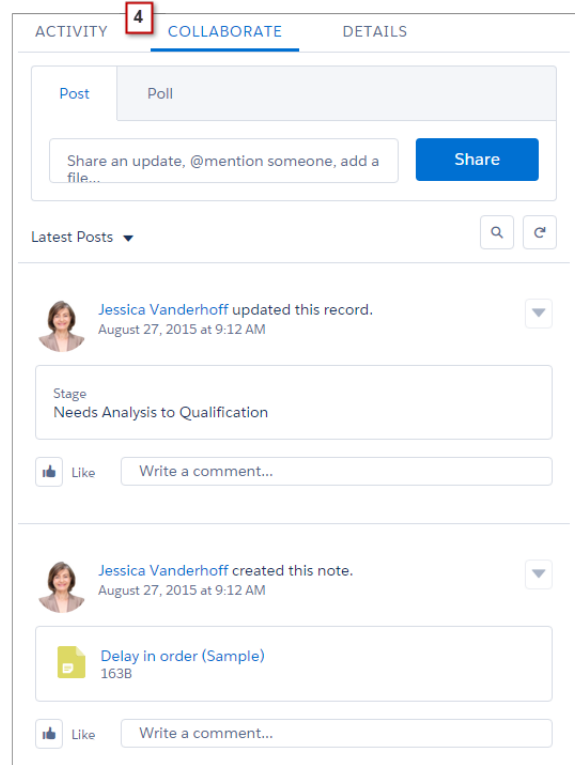

In Salesforce Classic, you typically access Chatter features from the sidebar on the Chatter tab. In Lightning Experience, access the main feed (1), colleagues' profiles (2), and groups (3) directly from the navigation menu.

EDITIONS

Available in: **Group**, **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

To collaborate on records (4), look for the Collaborate tab in Lightning Experience. You can post updates, create polls, and share files, just like in Salesforce Classic. But now there's no more fussing with the Hide Feed and Show Feed links.

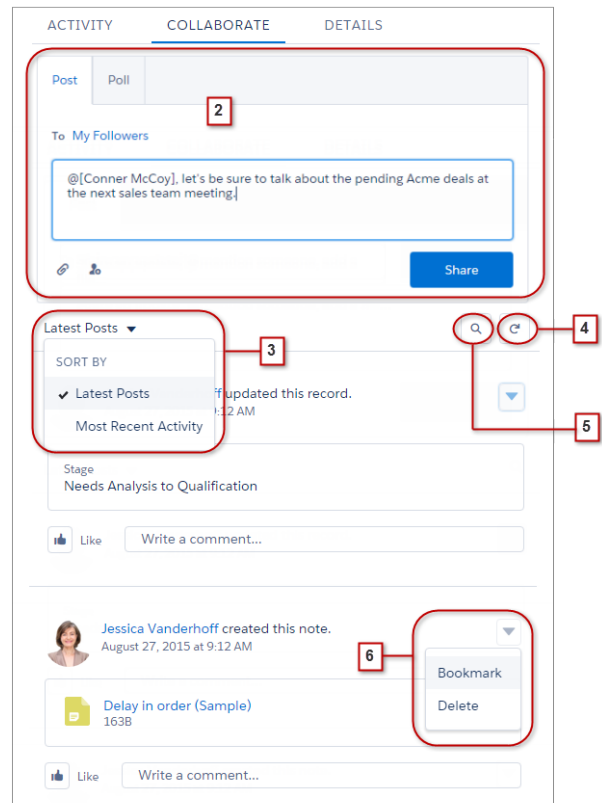

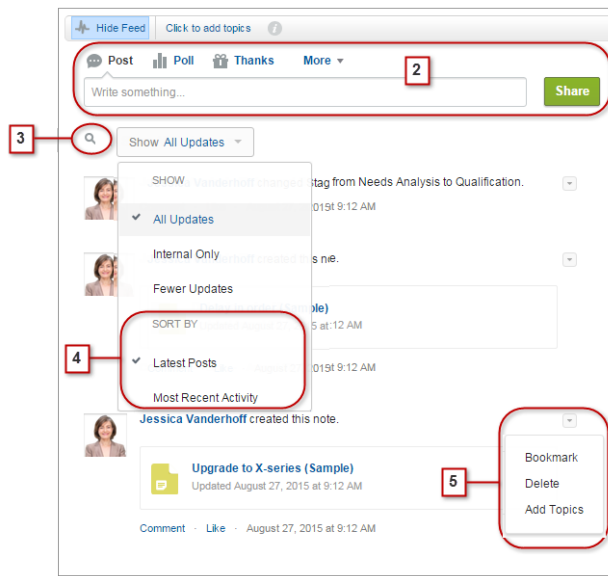

Work with Feeds

You can change the main Chatter feed to show a particular subset of posts (1). In Lightning Experience, use the tabs at the top of the page. The What I Follow feed continues to be the default feed.

Feeds in Lightning Experience include many of the options that are available in Salesforce Classic.

- The Post and Poll actions are available in the composer (2) on the Collaborate tab. Click the composer to access buttons for uploading a file or mentioning people. Other standard Chatter actions that appear in the publisher in Salesforce Classic, including Thanks and Links, aren't available in Lightning Experience.
- Sort the feed (3) by most recent posts or comments. Options to filter a feed aren't available in Lightning Experience.
- In Lightning Experience, refresh the feed (4) to see up to date information.
- Locate information in a specific feed with feed search (5).
- Acting on a post (6) is the same in both interfaces. But topics aren't available in Lightning Experience.

Find Help in Lightning Experience

Help is here! And it's better than ever in Lightning Experience, where the contextual Help menu serves up targeted content like videos, walkthroughs, help topics, and trails. Bonanza!

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Salesforce Classic, most pages and related lists link to a single contextual help topic. With the Lightning Experience Help menu (1), we provide lots more options, with links to videos, walkthroughs, help topics, and trails—whatever is most relevant to what you’re working on.

Both interfaces include links to the main Help & Training portal (2). But the link in Lightning Experience saves time, taking you right to the search page so that you can quickly find the help you need.

We need your feedback! Just click the Give Feedback link (3) to share your comments about Lightning Experience or anything else Salesforce. Thanks!

Lightning Experience Considerations

This release of Lightning Experience doesn’t include everything that’s available in Salesforce Classic. Review these topics to see if any functionality that’s critical to your business is limited or unavailable in this release. This information can also help you train users about what to expect when you do switch to Lightning Experience.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

[Gotchas If Users Switch Between Lightning Experience and Salesforce Classic](#)

Switching between Lightning Experience and Salesforce Classic is fast and easy. But switching between interfaces affects the underlying URL routing logic and can lead to some unexpected results when links are resolved. This means there can be snags with bookmarks and sharing links in emails or Chatter posts, especially if your organization has a subset of users authorized for Lightning Experience while others are still using Salesforce Classic.

[What's Not Available in Lightning Experience](#)

Learn about Salesforce features that aren't available in the new interface or that have gaps from what you're used to in Salesforce Classic. And remember that features not supported yet in the new interface are still available to your users—they can easily switch to Salesforce Classic and keep working.

[What to Expect in Lightning Experience When Chatter Is Turned Off](#)

If your organization doesn't use Chatter, several aspects of the Lightning Experience interface aren't available. Learn how Lightning Experience changes, and see if you're losing functionality that you'd rather not live without.

Gotchas If Users Switch Between Lightning Experience and Salesforce Classic

Switching between Lightning Experience and Salesforce Classic is fast and easy. But switching between interfaces affects the underlying URL routing logic and can lead to some unexpected results when links are resolved. This means there can be snags with bookmarks and sharing links in emails or Chatter posts, especially if your organization has a subset of users authorized for Lightning Experience while others are still using Salesforce Classic.

When you enable users for Lightning Experience, you can set it up so some or all of them immediately get the new interface as their default, *preferred* experience. And for the Lightning Experience-enabled users you opt to leave in the classic interface, their default experience is Salesforce Classic. Either way, any time a user switches interfaces via the Switcher, the user's default preference resets to the current environment. With this behavior in mind, here are the typical link routing interactions your users can encounter.

EDITIONS

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

User Has the "Lightning Experience User" Permission?	User's Default Experience	Where Links Open
Yes	Lightning Experience	<p>For pages supported in Lightning Experience, links open in the new interface (even for links generated in Salesforce Classic).</p> <p>Links to unsupported pages are directed to Salesforce Classic, which opens in a new tab. This temporary redirection doesn't change the user's default preference to Salesforce Classic. The next time the user selects a link that is supported in the new interface, the Salesforce Classic tab is reloaded to open the link in Lightning Experience.</p> <p>Links to unsupported pages are directed to Salesforce Classic, which opens in a new tab. This temporary redirection doesn't change the user's default preference to Salesforce Classic. The next time the user selects a link that is supported in the new interface, the Salesforce Classic tab is reloaded to open the link in Lightning Experience.</p>

User Has the "Lightning Experience User" Permission?	User's Default Experience	Where Links Open
Yes	Salesforce Classic	Links generally open in Salesforce Classic. If a link was generated in Lightning Experience (meaning it includes <code>/one/one.app</code> in the URL), the link opens in Lightning Experience. The user's default preference doesn't change to Lightning Experience.
No	Salesforce Classic	Links open in Salesforce Classic only. If a link was generated in Lightning Experience (meaning it includes <code>/one/one.app</code> in the URL), the link doesn't open, because the user can't access Lightning Experience.

Given these routing behaviors, you can see the potential for confusion if users share Lightning Experience links with Salesforce Classic users. To avoid this problem, we recommend enabling the new interface for all users who work closely together.

We also recommend training your Lightning Experience users to understand how links and bookmarks work across the two experiences.

Data Access and Views: What's Not in Lightning Experience

Learn about the issues to expect when accessing data in Lightning Experience. Some Salesforce data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Objects

These Salesforce objects are available in Lightning Experience. None of the other standard objects are supported in this release.

- Accounts
- Assets
- Campaigns
- Cases
- Contacts
- Dashboards
- Events
- Files
- Leads
- Notes
- Opportunities
- Person Accounts
- Price Books
- Products
- Reports
- Tasks
- Work Orders
- Custom objects
- External objects

Fields

- Fields for unsupported objects display in Lightning Experience, but they are read-only and don't include links to associated records.
- Formula fields with images aren't supported in search results. The field name displays but the field itself is empty.

- Field-level help isn't widely available in this release. You can't define custom help text or add field-level help for fields in custom objects.
- Lookup fields in Salesforce Classic show record names regardless of sharing permissions, so it's possible for users to see the name of records that they can't access. In Lightning Experience and the Salesforce1 mobile app, lookup fields respect sharing permissions and only show the name of records that the user can access. The one exception is owner lookup fields, which always display the name of the record's owner, regardless of sharing permissions.

Related Lists

- Related lists for supported standard objects and your custom objects are available in Lightning Experience.
Related lists for objects that aren't supported in Lightning Experience don't appear anywhere in the interface, even if they're included on an object's page layout.
- Lightning Experience includes new Files and Notes related lists, as well as the classic Notes & Attachments related list. If you're using Salesforce Files or the enhanced Notes feature, include all these related lists on your object page layouts.
 - Files and attachments are two different types of objects, and always have been. Unlike files, attachments are associated only with a particular record and can't be shared further. In Lightning Experience, uploads to the Notes & Attachments related list are files. In Salesforce Classic prior to Spring '16, uploads to this related list were always attachments instead of files. For existing orgs, this means that the Notes & Attachments list can contain a mix of attachments that were uploaded in Salesforce Classic and files added in Lightning Experience.

In the API, any existing integrations that retrieve attachments from the Notes & Attachments list don't include any files uploaded to the list in Lightning Experience. A new API call is necessary to retrieve files as well as attachments.
 - Notes created with the old note-taking tool in Salesforce Classic are available from the Notes & Attachments related list only. Any notes created with the enhanced version of Notes appear in the Notes related list only.
- For Group Edition users, the Contacts related list doesn't display on accounts.
- When the Opportunity related list is used on a contact record to add a new or existing opportunity to the contact, Salesforce adds the contact to the Contact Roles related list on the opportunity.
- Lightning Experience merges a product's standard and custom price book entries into a single Price Books related list. This is different from Salesforce Classic, which has separate related lists for Standard Prices and Price Books. If you previously removed the Price Books related list because your org uses standard prices only, you should add it back to the Product page layout so your users can see standard prices in Lightning Experience.
- On the detail page for objects that support activities, Lightning Experience doesn't display the Open Activities and Activity History related lists along with other related lists. It displays the activity timeline instead. Objects that support activities include opportunities, leads, accounts, contacts, and custom objects on which you enable activities.

Object Home

These features aren't available on object home pages in Lightning Experience.

- Quick Create tool
- Access to object-specific reports
- Any of the tools in the Tools section
- Summary report tool

List Views

These list view features aren't available in Lightning Experience.

- Following records directly from a list
- Sharing list views with groups
- Clone list views
- Mass actions, including modifying or deleting multiple items in a list at once, sending mass email, or adding multiple records to a campaign
- Custom actions
- Drag-and-drop scheduling for account, contact, and lead list views
- Feeds
- The  icon to create a printable view of a list

List views display and behave differently in Lightning Experience.

- You don't go to a new page to create a list view. Instead, you stay on the same page and give the list view a name in a pop-up dialog box. You add filters to customize your list with a panel that slides out on the right side of the page.
- You can only restrict list views by selecting All or My. Other options, such as restricting by queue, campaign, or price book, aren't available.
- Navigation through list views has changed. Because list views have infinite scrolling, you can't specify the number of records to show per page. Also, you can't navigate through pages with arrow buttons, and you can't jump to a specific page of results. Jumping to records with names that start with a particular letter isn't available.
- The drop-down menu shows up to 2000 views. The menu loads views in batches of 50 as you scroll down. Recently viewed lists appear first, followed by other list views in alphabetical order. Recently viewed lists and the Search box appear only if there are 11 or more list views.
- You can't change the order of columns by dragging the column heading to a new position in the table. Instead, you change the columns that appear and their order by choosing **Select Fields to Display** from the List View Controls drop-down menu. If you add or remove a column in Lightning Experience, all custom column widths are deleted. You can switch back to Salesforce Classic to adjust column widths.
- Limited row-level actions are available. For most objects, available actions are Edit and Delete. For leads, two more actions are available: Convert and Clone. For files, available actions are Edit, Delete, and Download.
- Custom buttons are available, but can't be configured to do record action or mass actions like mass edit or mass delete. For example an admin can create a button that launches a Visualforce page.
- For filter criteria, only these relative date ranges are supported: Today, Tomorrow, Yesterday, This Week, This Month, This Quarter, This Year, Last Week, Last Month, Last Quarter, Last Year.
- List views in Lightning Experience don't support *starts with* as a filter criterion for ID fields. An ID field is a 15-character field that identifies a record. For example, the `Account ID` field on the contact object identifies which account a contact is associated with. You *can* use *starts with* as a filter criterion for other fields.
- In filter logic statements, NOT doesn't work with parenthetical expressions. For example, the expression `1 AND NOT (2 AND 3)` evaluates as `1 AND (NOT 2 AND 3)`. In the filter results, no records are returned when you'd expect to see some records.
- Filters support values only between the minimum and maximum for a signed 23-bit integer, or between 1 and 2,147,483,648. A value outside of this range disables that filter.
- The name of the recent records list that displays on the home page for every standard and custom object is different in Lightning Experience. It's called Recently Viewed. This view isn't deletable, filterable, or editable. Salesforce admins can use the Object Manager in Setup to select and order columns for this view. Your users can sort items in the view by clicking inside a column header. An arrow in the column header shows if the list items are sorted in ascending or descending order.
- Another list view is available for most standard objects via the drop-down list with a name similar to Recently Viewed. The name of this view includes the name of the object. For example, this list view for accounts is called Recently Viewed Accounts. These two list views, Recently Viewed and Recently Viewed *Objects*, show the same records. The Recently Viewed *Objects* list view isn't deletable,

filterable, or editable. Your users can sort the records and chart this list view's data. They can switch to Salesforce Classic to reorder the columns displayed in the list view. The columns appear in the new order when the user switches back to Lightning Experience.

Work with Data

Create and Edit Data

Inline editing of fields on a record's Details tab is available in Lightning Experience. But it's not possible to edit individual fields in the Highlights panel on a record, or fields in list views.

These features aren't available in Lightning Experience.

- Inline editing on lists or records
- Editing multi-line layouts

Print Data

These features aren't available in Lightning Experience.

- Printing a page
- Generating a PDF file

Salesforce Sidebar

The Salesforce sidebar that appears on the left side of most pages in Salesforce Classic isn't replicated in Lightning Experience. Items from the sidebar aren't included either, including:

- The Tags link and Recent Tags drop-down list
- The Create New drop-down list; use the **New** button on object home pages
- The Calendar shortcut; access the Calendar from the navigation menu
- The Recent Items list; see recent items on the Home page or on object home pages
- Messages and Alerts
- Custom Links

Recycle Bin

The Recycle Bin isn't available. Records deleted in Lightning Experience still go to the Recycle Bin, but users have to switch to Salesforce Classic to view or restore recently deleted records.

Accessibility

- Accessibility mode isn't provided because it's not needed in Lightning Experience. The interface is designed according to the latest accessibility standards, so screen readers are supported natively.
- The color-blind palette isn't available in Lightning Experience.
- Users with Accessibility mode turned on must switch to Salesforce Classic to use the Report Builder to create and edit reports.
User with Accessibility mode turned on can use the Dashboard Editor to create and edit Lightning Experience dashboards, but should switch to Salesforce Classic for a fully accessible experience when using the Dashboard Editor.

[Productivity Features: What's Not in Lightning Experience](#)

[Files and Content: What's Not in Lightning Experience](#)

Sales Features: What's Not in Lightning Experience

Learn about the issues that your Sales team can encounter in Lightning Experience. Some Salesforce data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Sales Features

Social Accounts, Contacts, and Leads

- Twitter is the only social network available in Lightning Experience.
- Twitter is styled as its own card, visible directly on the record home page.

Sales Path for Opportunities and Leads

- You can include a maximum of five fields and 1,000 characters of rich text in each sales stage.
- You can't require different fields in different stages using the page layout. You can, however, set up validation rules based on the sales path stage.
- Dependent fields are ignored when moving an opportunity stage using the Sales Path.
- If you set fields to the Read-Only or Required permissions in page layouts, Sales Path doesn't enforce those permissions.
- Although not a limitation, keep in mind that deleting a record type that has a corresponding sales path also deletes the sales path.
- Validation rules appear as page-level messages, even if you configure the rules to appear near the fields.
- For lead sales paths, we recommend you place Unqualified statuses at the beginning of the sales paths.

Contacts to Multiple Accounts

- Only the row level actions that are specific to the Account Contact Relationship object are available on the Related Accounts and Related Contacts related lists. Therefore, you see actions to edit or remove the account-contact relationship, but not to edit or delete the contact or account record.
- In the Related Accounts related list, the `Account Name` field appears only if the user has access to the account. If they don't have access to the account, only the Account Contact Relationship fields appear.
- When a contact is created from the Related Contacts related list on an account, the contact's mailing address isn't populated with the account's billing address.

Features Not Available in Lightning Experience

- Contracts
- Forecasts (including Collaborative Forecasts and Customizable Forecasts)
- Orders
- Quotes
- Divisions
- Mass Division Transfer

Accounts

Person Accounts (Beta)

- Person accounts aren't accessible from Setup. Switch to Salesforce Classic to set up and configure person accounts.
- When hovering over a person account link, the quick view display differs based on where the person account link is. If the link is in the field that represents the contact (for example `Name` or `Contact`), then contact information is displayed. If the link is in the field that represents an account (for example `Related To` or `Account`), then person account information is displayed.

- The quick actions for business accounts are included on person account page layouts even though not all business account quick actions are valid for person accounts. For example, person account page layouts include the New Contact quick action even though contacts can't be associated with person accounts in this way. Admins can remove the invalid business account quick actions from person account page layouts.
- In some lookup fields, account or contact icons are shown instead of the person account icon.
- In contact lookup fields, person accounts don't appear in the list of most recent records. Person accounts do appear in lookup fields when they are searched. However, you must enter the full value of the person account's first name. Partial searches and wildcards aren't supported.
- When creating a case for a person account and users add the person account to either the `Contact Name` or `Account Name` field, the other field doesn't auto-populate with the person account until the case is saved.
- When creating an email from a person account record, the `To` field doesn't auto-populate with the person account's email address the way it does when creating an email from a contact record.
- When using a template to compose an email from a business account, the template could include person account merge fields, which prevents the email from being sent. Similarly, when using a template to compose an email from a person account, the template could include business account merge fields, which prevents the email from being sent.
- If using merge fields in an email to a person account, the contact merge fields don't show up in the merge field search results. Instead, contact merge fields must be entered manually.
- When creating an activity for a person account, the activity doesn't appear on the person account record unless the person account was specified in the activity's `Related To` field. This is true when Shared Activities is *not* enabled.

Contacts Related List on Accounts

- When a contact is created from the Contacts related list on an account, the contact's mailing address isn't populated with the account's billing address.
- For Group Edition users, the Contacts related list doesn't display on accounts.

Account Teams

It's possible to view, update, and delete account teams in Lightning Experience, with these differences from Salesforce Classic:

- Users can add, edit, or delete only one account team member at a time.
- The account team is always retained when the account owner is changed.

Switch back to Salesforce Classic to:

- Change the team member display order.
- Display access levels for all team members or delete all team members with a single button.
- Add multiple account team members on a single page.

Features Not Available in Lightning Experience

- Account Hierarchy
- Account History
- Account Merge
- Account Partners
- Account Territories
- Contact Roles on Accounts

Campaigns

Features Not Available in Lightning Experience

- Campaign results across hierarchies
- Campaign Influence
- Cloning campaign members
- Adding multiple campaign members from list views

Contacts

Opportunities Related List on Contacts

- When the Opportunity related list is used on a contact record to add a new or existing opportunity to the contact, Salesforce adds the contact to the Contact Roles related list on the opportunity.

Features Not Available in Lightning Experience

- Contact Hierarchy
- Contact Merge
- Contact Roles on Accounts
- Contact Roles on Cases
- Stay-in-Touch fields

Leads

When changing a lead's owner to a queue, all active queues are displayed, not just queues for leads.

Features Not Available in Lightning Experience

- Assignment rules when manually creating leads
- Identify and merge duplicate records from the lead workspace (but you can set up Duplicate Management to prevent the creation of duplicate leads)
- Identify and merge duplicate records during lead conversion (but you can set up Duplicate Management to prevent the creation of duplicate accounts and contacts)
- Automatic field population for accounts created during lead conversion

Opportunities

Opportunity Teams

It's possible to view, update, and delete opportunity teams in Lightning Experience, with these differences from Salesforce Classic:

- Users can add, edit, or delete only one opportunity team member at a time.
- The opportunity team is always retained when the opportunity owner is changed.

Switch back to Salesforce Classic to:

- Change the team member display order.
- Display access levels for all team members or delete all team members with a single button.
- Add multiple opportunity team members on a single page.

Opportunity Products

- Users can add only one product to opportunities or price books at a time in Lightning Experience. It's not yet possible to select multiple products from a list.
- When adding a product that has default schedules to an opportunity in Lightning Experience (or Salesforce1), Salesforce doesn't create the schedules.
- Opportunities with products can't be cloned.

Opportunity Kanban

- The Kanban is not available from the Recently Viewed list view. Users must select another list view before they can switch to the Kanban.
- The Kanban shows the opportunities for only 1 sales path at a time. If your organization uses multiple sales paths, create a separate list view for each and filter it by record type. Make the new list views public so your users can access them.
- The Kanban doesn't let users specify a reason when they change an opportunity's stage to Closed Lost. If your organization requires users to include a reason, they can still move opportunities to Closed Lost from the Kanban; however, when they switch back to Salesforce Classic, they'll be prompted for a reason.
- Users receive alerts on opportunities with overdue tasks, no open activities, or no activity in the last 30 days. The alert isn't customizable.
- Validation rules still apply when changing the stage of an opportunity using the Kanban view, but users must navigate to the opportunity workspace to address any validation rules.
- Dependent picklist fields are ignored when using the Kanban view. Users must navigate to the opportunity workspace to address any dependent fields.

Contact Roles on Opportunities

Users can add only one contact role to an opportunity at a time.

Features Not Available in Lightning Experience

- Big deal alerts
- Opportunity Splits
- Similar Opportunities
- Multi-line layout editing
- Opportunity stage history

The opportunity owner can't edit the `Probability` or `Forecast Category` fields. However, field values are automatically populated, based on the value of the `Stage Opportunities` field, when you save the record. The opportunity owner can manually edit the values for these fields in Salesforce Classic.

Products and Price Books

Products and Price Books

- Lightning Experience merges a product's standard and custom price book entries into a single Price Books related list. This is different from Salesforce Classic, which has separate related lists for Standard Prices and Price Books.

If you previously removed the Price Books related list because your org uses standard prices only, you should add it back to the Product page layout so your users can see standard prices in Lightning Experience.

- For organizations already activated, the Add to Price Book page doesn't include the `Use Standard Price` option by default. To make `Use Standard Price` available, add it to your Price Book Entry page layouts.

- For organizations already activated, the Price Books home page doesn't include an `All Price Books` list view by default. We recommend creating this list view to give your users access to price book records.

Features Not Available in Lightning Experience

- Archiving products and price books
 - 🔗 **Note:** As an alternative, deactivating products and price books preserves all the records related to them.
- Product revenue and quantity schedules

Territory Management and Enterprise Territory Management

Territory Management

Original Territory Management appears in the Lightning Experience Setup tree. From there, you can enable, configure, and maintain the feature. Territory information, assignments, and reports are available and viewable in Salesforce Classic only.

Enterprise Territory Management

Enterprise Territory Management is available in Salesforce Classic only.

Productivity Features: What's Not in Lightning Experience

Learn about the issues to expect when using Salesforce productivity tools in Lightning Experience. Some Salesforce features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Home

The Salesforce home page is reimagined in Lightning Experience. Home now focuses on top sales user priorities, including the sales reps' quarterly sales performance and notifications about leads and opportunities.

Home Features Not Available in Lightning Experience

- Alert banners
- Chatter feed and publisher
- Recommendations
- Full calendar

Home shows upcoming events for the current day and includes a link to see all events scheduled for the day. But Home doesn't include a full calendar like is available on the Salesforce Classic home page. Instead, access the Calendar item from the navigation menu.

Global Actions Menu

The contents of the Global Actions menu in Lightning Experience is pulled from global actions in the Salesforce1 and Lightning Experience Actions section on the global publisher layout. Currently, only actions with these action types are supported in this menu.

- Log a Call
- Create a Record—for events, notes, and tasks

Other global actions on the global publisher layout, including actions that create records for custom objects or accounts or opportunities, don't appear in this menu.

Activities: Events and Tasks

Overall activities features that behave differently or are unavailable in Lightning Experience include activity views and editing, activity reminders, recurring and follow-up activities, and activities related lists.

Activity Views and Editing

List views for events and tasks are unavailable in Lightning Experience. Users can't edit events or tasks owned by people below them in the role hierarchy. However, they can use reports to view events and tasks owned by people below them in the role hierarchy. They can also view tasks that they've reassigned to people below them in the role hierarchy by choosing the Delegated view in the task list.

Activity Reminders

Users can't set or view activity reminders (reminders of upcoming events or tasks due).

Recurring Activities

Lightning Experience doesn't support recurring events or tasks, including creating and editing series. However, users can view and edit individual occurrences of a recurring event created in Salesforce Classic.

Follow-Up Activities

Lightning Experience doesn't display the **Create Follow-Up Event** or **Create Follow-Up Task** buttons for creating an event or a task on a record. Instead, the composer on a record for an opportunity, a lead, an account, or a contact prefills the `Name` and `Related To` fields on events and tasks.

Activity Timeline and Activities Related Lists

On the detail page for objects that support activities, Lightning Experience doesn't display Open Activities or Activity History along with other related lists. It displays the activity timeline instead. Objects that support activities include opportunities, leads, accounts, contacts, and any custom objects on which you enable activities. You can customize the activity timeline using the Lightning App Builder.

To represent all activities from future to past, the activity timeline displays open activities in the opposite order from the Open Activities related list. Under Next Steps, the timeline displays open activities in chronological order from top to bottom. Undated tasks appear at the top and overdue tasks appear last.

Display and Order of Fields in Activity Timeline

In the activity timeline, you can customize the display and order of fields for events, tasks, and logged calls using event and task compact layouts. However, even if you remove certain fields from a layout, they remain in the timeline because they contain essential activity information. For example, suppose that you remove the due date, the date and time, or the task status fields from the compact layouts. The event start date and time, the task checkbox, the task due date, and the call logging date still appear on activities in the timeline. The description field on events and the comments field on tasks also always appear in the timeline, although they aren't available in the compact layout. The remaining fields visible in the timeline reflect the fields you include in the compact layout. The icons for activity types (events, tasks, calls, and email) in the timeline aren't customizable.

Activities: Events and Calendars Only

Event and calendar features that behave differently or are unavailable in Lightning Experience include business hours settings, Outlook appointments, event invitations, calendar views, sharing, and ownership, public calendars and resource calendars, a limit on calendar items displayed, and Cloud Scheduler.

Business Hours

Calendars don't indicate the business hours selected in personal settings.

Outlook Appointments

You can't create a Microsoft® Outlook® appointment from a Salesforce event.

Event Invitations

Event invitations are unavailable, including inviting others to events, updating invitations to events, accepting and declining invitations, and viewing a related list of invitees.

Calendar Views

The calendars in Lightning Experience have no month view or print view. You can't hide weekends.

List View Filtering

No list views are available for filtering calendars based on the Events or Tasks objects. For calendars created from other objects, list views with the scope My and All are supported, but list views with the scope My Team are not.

Calendar Item Limit

You can view up to 150 calendar items total in the day or week view, including Salesforce events and the items on calendars you create. Suppose that you select a calendar containing enough items to push the total past the limit in that view. Lightning Experience displays an alert and hides items on other calendars.

Calendar Sharing and Ownership

You can't share your calendars with your manager or other coworkers. Managers in the role hierarchy can use reports to view events owned by people below them in the role hierarchy, but not to edit them.

Only one person can own a meeting. If you reassign a meeting to someone else, it no longer appears on your calendar.

Public Calendars and Resource Calendars

You can't create public calendars or resource calendars, and if you use Lightning Experience, you can't view public calendars or resource calendars created in Salesforce Classic.

Cloud Scheduler

Lightning Experience doesn't support Cloud Scheduler meeting requests.

Activities: Tasks Only

Task features that behave differently or are unavailable in Lightning Experience include the task list, closing and reopening of tasks, task assignment notifications, and group tasks.

Display and Order of Fields in Task List

Use compact layouts to customize the display and order of fields for items in the task list. However, certain fields remain in the task list even if you remove them from a layout, because they contain essential task information. For example, suppose that you remove the status and due date fields from a compact layout. The task checkbox and the due date still appear on tasks in the list. The remaining fields visible in the list reflect the fields you include in the compact layout.

Overdue Tasks in Task List

Lightning Experience doesn't display any overdue tasks when you have more than 1,000 tasks that are overdue. You can switch to Salesforce Classic to view overdue tasks and close them, postpone them, or delete their due dates.

Closing and Reopening Tasks

Suppose that your Salesforce org has a validation rule for tasks; for example, you have to enter a comment before closing a task. If your org has more than one Closed status for tasks, you have to choose a status when you reopen or close a task. If your org has more than one Open status for tasks and you reopen a task, Lightning Experience remembers the last Open status.

Task Assignment Notifications

Lightning Experience displays no option to send an email when you assign a task to someone. It also displays no personal setting to receive an email when someone assigns you a task. However, suppose that you switch from Lightning Experience to Salesforce Classic. In that case, you can receive emails for tasks that you assign to yourself or tasks created with a status of Completed. These options depend on how your Salesforce admin sets up your org.

Group Tasks

You can't assign copies of a task to coworkers.

Notes

Notes created with the old note-taking tool in Salesforce Classic are available from the Notes & Attachments related list only. Any notes created with the enhanced version of Notes appear in the Notes related list only.

Integrated Email

Supported Objects

Integrated Email is fully supported for the Account, Campaign, Case, Contact, Leads, and Opportunity objects only, and not for custom objects. The Person account record type is partially supported: It doesn't offer Contact merge fields. From records for those objects, you can send email to contacts, leads, and users maintained in Salesforce, as well as to any valid external email address.

Fields available for templates are based on the object from which the template is created, plus user fields. For example, if you have an opportunity record open and create a template, you can add only Opportunity and User fields to your template. Similarly, email templates created for one object are not available for use from other objects. For example, templates created for use with the Lead object are not available for emails sent from opportunity records.

Mass Email

Mass Email is not supported.

Mass Mail Merge

Mass Mail Merge is not supported. However, you can use merge fields on individual emails and add merge fields to templates.

Hyperlink Fields in Mail Merge

Hyperlink formula fields are not supported as merge fields.

Email Activity

After you send an email, a task record is created to track the action and store email content. If you sent the email to a contact or lead, the task link is added to the Recent Activity feed for that record. If the recipient is not a contact or lead, a link to the email is added to the Recent Activity feed of the record that was open when you sent the email. The task record doesn't include a link to access attachments sent with the email.

Email Templates

Email templates in Lightning Experience support rich text and are sent as HTML.

Email templates created in Salesforce Classic (text, HTML with letterhead, and Visualforce) can't be used in Lightning Experience and vice versa.

All templates created in Lightning Experience are public. Any attachment in an email becomes public when that email is sent. Users no longer have to share the templates they create.

Email Attachments

If you don't have access to a file, you can't attach that file to an email or a template. If you select a template that has attached files, you need access to those files to send them. A file attached to an email is publicly available via a hyperlink when the email is sent.

Work.com

Work.com sales-management and service-management tools aren't available in Lightning Experience. But Lightning Experience users can see thanks badges and skills endorsements that they've received in the feed.

Customer Service Features: What's Not in Lightning Experience

Learn about the issues to expect if your organization uses customer service tools. In general, Service Cloud data and features aren't supported in this release of Lightning Experience. Assets and Work Orders are fully supported. Cases are supported but don't have full parity with what's available in Salesforce Classic.

Cases

When changing a case's owner to a queue, all active queues are displayed, not just queues for cases.

Case Layout

Cases look a little bit different than other records. Cases display a feed first rather than record details or related information, because support agents mainly collaborate and work with activities in a feed. Details appear next to the feed. You don't see the Activity or Collaboration tabs because this information displays directly in the feed.

If you turn off Case Feed, cases look like other records. Activities and collaboration appear, but the feed-first design disappears and adds more clicks and context-switching to cases. You can use collaboration (Chatter) instead of feed, but collaboration doesn't include useful case feed publishers, such as email, log a call, or change status.

You can add or remove case feed publishers, but rearranging the case layout or adding custom buttons and links isn't supported.

Close Case Layout

For simplicity, the close case layout isn't available, but you can add closed statuses to case edit pages. From the Support Settings page in Setup, select `Show Closed Statuses in Case Status Field`.

Case Comments

Now you add comments to the feed instead of the Case Comments related list. You can't add comments to the related list in Lightning Experience. The comments that appear there are from Salesforce Classic users.

Case Related Lists

These related lists aren't available on cases: Case History, Case Milestones, Case Team, Contact Roles, External Sharing, Content Deliveries, Live Chat Transcripts, Related Content, and SOS Sessions.

Case Setup

To fully benefit from the new feed-first design on cases, re-create the standard case feed publishers. The standard publishers aren't available, but you can quickly re-create them as quick actions on the Case object. One benefit of re-creating the publishers as quick actions is that they appear on mobile devices, whereas standard case feed publishers don't.

Case Assignment Rules

Case assignment rules aren't supported; however, you can create similar rules with the Lightning Process Builder. If you select `Case Assignment Checkbox` on case page layouts, `Assign using active assignment rules` appears on cases, but it doesn't trigger assignment rules when it's selected.

Features Not Available in Lightning Experience

- Salesforce Call Center
- Knowledge Articles
- Omni-Channel
- Entitlements
- Milestones
- Macros

Unsupported Service Cloud Features

Except for Assets, basic Cases, and Work Orders, Lightning Experience doesn't support any Service Cloud features, including the Salesforce Console.

 **Note:** Assets aren't available in the Object Manager, but you can add them to custom navigation menus. You can also access the assets object home from the App Launcher and individual asset records from the object home, search, and related lists.

For existing Salesforce to Salesforce customers, records shared by connections are available in the new user interface as long as their object type is supported in Lightning Experience.

Reports and Dashboards: What's Not in Lightning Experience

Learn about the issues to expect when using reports and dashboards in Lightning Experience. Some Salesforce data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Reports

Features Available with Limitations in Lightning Experience

Feature	Notes about Lightning Experience Availability
Object Support for Reporting	Even though Lightning Experience doesn't support all the standard Salesforce objects yet, the Report Builder in Lightning Experience does. Users can create and view reports for all standard objects. Reports related to objects not yet supported in Lightning Experience open directly in the new interface and behave like any other report.
Historical Trend Reporting	Historical trend reporting with charts is supported in Lightning Experience, but tabular views of historical trend reports aren't available.
Export Reports	Reports exported from Lightning Experience never include a disclaimer that reads "Confidential Information - Do not Distribute" in the report footer. The disclaimer is excluded even if you disable the Exclude Disclaimer from Exported Reports setting in setup.
Filters	<p>These filters are available when building or editing a report, but are not shown in the filter panel when viewing a report. Even though the filters are not shown, they still filter the report.</p> <ul style="list-style-type: none"> • Row limit filters • Historical field filters • Standard filters (except for date, picklist, and string filters) <p>Relative date filters, such as <i>Created Date equals LAST 7 DAYS</i>, aren't supported.</p>

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Joined Reports	
Schedule Report Refreshes	Users can't schedule report refreshes in Lightning Experience, but scheduled report refreshes from Salesforce Classic continue to work in Lightning Experience.
Print Reports	Lightning Experience doesn't offer a print option, but users can still print reports using their browser's print function.

Feature	Notes about Lightning Experience Availability
Subscribe to Reports	
Add to Campaign	
Role Hierarchies	
Accessibility Mode for the Report Builder	Users with Accessibility Mode turned on must switch to Salesforce Classic to create and edit reports.

Dashboards

Considerations When Using Dashboards in Lightning Experience

- After saving a dashboard in Lightning Experience, you can't edit it in Salesforce Classic. Instead of editing a Salesforce Classic dashboard in Lightning Experience, consider cloning the dashboard and editing the clone. That way, you can still edit the original dashboard in Salesforce Classic.
- When you drill into a report from a filtered dashboard in Lightning Experience, the report isn't filtered. When you drill into a report from a filtered dashboard in Salesforce Classic, the report is filtered in the same way as the dashboard.

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Create, Edit, or Delete Filtered Dashboards	Lightning Experience users can view filtered dashboards. Filtered dashboards always open with no filters applied. It's possible to apply or clear filters that were added in Salesforce Classic. Switch to Salesforce Classic to create, edit, or delete filtered dashboards, or to add, change, or remove dashboard filters.
Create, Edit, or Delete Dynamic Dashboards	Users can view dynamic dashboards, but must switch to Salesforce Classic to create, edit, or delete them.
Schedule Dashboard Refreshes	Users can't schedule dashboard refreshes in Lightning Experience, but scheduled dashboard refreshes from Salesforce Classic continue to work in Lightning Experience.
Post a Dashboard Component to Chatter	
Visualforce Components on Dashboards	
Link from a Dashboard Component to a Website or Email Address	
Accessibility Mode for the Dashboard Editor	Users with accessibility mode turned on can still create and edit Lightning Experience dashboards, but for a fully accessible experience they must switch to Salesforce Classic.

Folders

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Standard Folders, containing default reports and dashboards that come packaged with Salesforce	
Move Reports and Dashboards between Folders	
Create and Delete Report and Dashboard Folders	Folders created in Salesforce Classic and their contents are available in Lightning Experience. Users can save inside these folders when creating or cloning a report or dashboard.
Share Report and Dashboard Folders	Sharing permissions set on folders in Salesforce Classic are obeyed in Lightning Experience, but sharing permissions can't be set nor changed.
Search for Report and Dashboard Folders	Users can't search for report and dashboard folders in Lightning Experience. Global search results include reports and dashboards, but not report and dashboard folders.

Charts

Considerations When Using Charts in Lightning Experience

Feature	Notes about Lightning Experience Availability
Table Charts	To create table charts, or to edit them, switch to Salesforce Classic.
Combination Charts	<p>Combination charts are only available on dashboards. On reports, combination charts display as bar or donut charts.</p> <p>Combination charts which include both a stacked vertical bar chart and a line chart only show the stacked vertical bar chart. The line chart is not drawn.</p> <p>Combination charts with two groupings and a line chart display differently in Lightning Experience than they do in Salesforce Classic. In Lightning Experience, the line chart depicts both groupings. In Salesforce Classic, the line chart only depicts 1 grouping (the first one).</p> <p>To add a combination chart to a dashboard, or to edit one, switch to Salesforce Classic.</p> <p>A vertical combination chart with two groupings, two measures, and a line chart displays as a bar chart in Lightning Experience. The bar chart displays two groupings, but the measure depicted by the line chart isn't shown.</p>
Funnel Charts	To add a funnel chart to a dashboard, or to edit one, switch to Salesforce Classic.

Feature	Notes about Lightning Experience Availability
Gauge Charts	Breakpoints in gauge charts only accept whole numbers. For example, 5 is a valid breakpoint, but 5.1 isn't. On reports, gauge charts appear as a bar charts.
Scatter Charts	On reports, scatter charts display as bar charts. To add a scatter chart to a dashboard, or to edit one, switch to Salesforce Classic.
Cumulative Line Chart	On reports, cumulative line charts appear as bar charts.
Combine Small Groups into "Others"	To combine small groups, switch to Salesforce Classic.
Chart Editor	In the chart editor, users can't: <ul style="list-style-type: none"> • Limit the set of report data drawn on the chart • Change sorting direction • Change measurement units (for example, from meters to centimeters) • Add more than 2 aggregates • Use charts from source reports
Charts with More than 100 Dimensions	In Lightning Experience, if there are more than 100 dimensions, then only the first 100 dimensions are drawn on the chart. To avoid this limitation, set report filters that return 100 or fewer dimensions.
Chart Colors	The standard Lightning Experience color palette replaces custom colors that users set in Salesforce Classic.

Features Not Available in Lightning Experience

Feature	Notes about Lightning Experience Availability
Pie Charts	Pie charts from Salesforce Classic display as donut charts in Lightning Experience.

Files and Content: What's Not in Lightning Experience

Learn about the issues to expect when using Salesforce Files and other content features in Lightning Experience. Some data and features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Salesforce Files

- Sharing files with libraries isn't possible in Lightning Experience, but files in libraries are listed in Files home in Lightning Experience and when selecting a Salesforce file to attach to a feed post.
- Files and attachments are two different types of objects, and always have been. Unlike files, attachments are associated only with a particular record and can't be shared further. In Lightning Experience, uploads to the Notes & Attachments related list are files. In Salesforce Classic prior to Spring '16, uploads to this related list were always attachments instead of files. For existing orgs, this means that the Notes & Attachments list can contain a mix of attachments that were uploaded in Salesforce Classic and files added in Lightning Experience.

In the API, any existing integrations that retrieve attachments from the Notes & Attachments list don't include any files uploaded to the list in Lightning Experience. A new API call is necessary to retrieve files as well as attachments.

- In Lightning Experience, row-level actions (such as Edit or Delete) aren't available for the Files related list, Notes & Attachments related list, and related lists on the Files Detail page. Delete and manage files using the row-level actions on Files home, or the quick actions on a file's preview or detail page.

File Syncing

File syncing isn't available in Lightning Experience. But Files home includes a Synced filter, so users can easily access any files they synced in Salesforce Classic.

Salesforce CRM Content

You can't create or manage libraries in Lightning Experience, but files that are in libraries are available in the new interface. Files in libraries are available from Files home, and users can share them and interact with them just as with Salesforce Files. Users can browse any libraries they have access to, and access the files that are in them from a filtered view on Files home.

Documents

Documents isn't available in Lightning Experience.

Files Connect

Users can't browse content in external data sources from Files home in Lightning Experience, but they can do so when selecting files to attach to feed posts. Users can also access external file references that were created in Salesforce Classic.

Chatter: What's Not in Lightning Experience

Learn about the issues to expect when your users collaborate in Lightning Experience. Some Chatter features aren't supported. And some features don't have full parity with what's available in Salesforce Classic.

Feeds

Chatter Publisher

Users can compose these post types in Lightning Experience:

- Text posts, with or without a file attachment
- Polls
- Announcement posts in group feeds

Other post types, like Links and Thanks, aren't currently supported.

Sharing Posts

Users can't share posts with groups or followers.

Editing Posts and Comments

Users can't edit posts or comments.

Rich Text Editor

The rich text editor isn't available in Lightning Experience. However, posts that users compose or edit with the rich text editor in Salesforce Classic display as formatted posts and comments in Lightning Experience.

Filter and Sort Feeds

Users can't use filters to condense the number of posts that appear in feeds. Nor can they sort feeds by most recent posts or recent comments.

Approvals in Chatter

Lightning Experience users can't see approval requests in Chatter or in the activity timeline on records. To see the complete list of requests that are waiting for a user's approval, the user must switch to Salesforce Classic (or use the Salesforce1 mobile app).

Chatter Topics

Chatter Topics aren't available.

Chatter Questions

The Question action isn't available in Chatter, but existing questions do appear in the feed when viewed in Lightning Experience. Users still see best answers on a question and can select a best answer or post an answer.

Emoticons

Emoticons aren't available.

Highlighted Search Results

When a user runs a search on a feed, the keywords aren't highlighted in the search results.

Global Search Result Filters

Users can't filter global search results by feed.

Chatter Messages

Chatter Messages aren't available.

Mute Feed Item from Detail View

You can't mute a feed item from its detail view.

People and Profiles

These features aren't available when using people and profiles in Lightning Experience.

- All User list
- Chatter Influence
- Restrict visibility of Contact and About fields to employees, external users, or public (guest) users
- Add or reorder tabs on user profiles
- Moderator badge on profile photos
- Administrators can't add new actions to User Profile pages. Only Edit and User Detail options appear.
- Users with Chatter External licenses can't edit their profile.
- Your Community profile photo in Lightning Experience is larger and displays at a higher resolution than in Salesforce Classic. Profile photos uploaded in Salesforce Classic won't look great in Lightning Experience until you upload the photo in Lightning Experience.

Groups

These features aren't available when using groups in Lightning Experience.

- View group recommendations on the group list view pages.

- Add records to groups using the Add Record action in customer groups, even if you or another administrator included the action in the group publisher.
- Use the Invite People option to invite customers to join groups using their email addresses. Instead, you need to create users in your org for these customers, then use the Add Member action to add them to the group.
- View the group email address or the Post by email link.
Users can still email the group to post to the group via email if they know or have saved the group email address from Salesforce Classic.
- Access Chatter-wide notification settings from the group notification settings.
- Remove files from the group files list.

Other Salesforce Products: What's Not in Lightning Experience

These Salesforce products aren't supported in this release of Lightning Experience.

- Salesforce Communities
 -  **Note:** Communities use the Lightning Experience login experience. Additionally, Salesforce Communities setup pages are available in Lightning Experience.
- Community Builder
- Pardot
- RelateIQ

Navigation and Actions: What's Not in Lightning Experience

Learn about the issues to expect when navigating and using actions in Lightning Experience. Some Salesforce features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Navigation

Lightning Experience Navigation Menu Replaces the Tab Bar

The concept of tabs that represent objects doesn't exist in Lightning Experience. The new interface updates the old Salesforce Classic tab bar with a collapsible navigation menu that's located along the left side of the page.

The default navigation menu provides access to the standard Salesforce objects that are available in Lightning Experience, as well as Home, Chatter items (the main feed, people, and groups), files, dashboards, reports, and the user's task list and calendar.

Apps and Custom Objects Available from the App Launcher

By default, apps (including Salesforce *tabset apps* and connected apps) and custom objects aren't included in the default Lightning Experience navigation menu. If your org uses the default navigation menu, users can access these items from the App Launcher, by clicking  in the header. Custom objects appear in the list of **Other Items**.

Even though Lightning Experience doesn't use the Salesforce Classic tab paradigm, you still need to create custom object tabs to ensure that your custom objects are available in the new interface.

Custom Lightning Experience Navigation Menus Support Most Apps and Objects

You can create custom Lightning Experience navigation menus and assign them to user profiles, giving different types of users a navigation menu that's tailored to their business needs. With some exceptions, you can include many of the apps, objects, and other tabs (including Visualforce tabs and Lightning Component tabs) that appear in the Lightning Experience App Launcher.

You can include these Salesforce objects in custom navigation menus: Accounts, Assets, Campaigns, Cases, Contacts, Files, Dashboards, Events, Knowledge Articles, Leads, Opportunities, Price Books, Products, Reports, Tasks, Tenants, Work Orders, and your custom objects. You can also add Home, the main Chatter feed, Groups, and People.

In this release, you can't include these items in custom Lightning Experience navigation menus:

- Connected apps, such as Gmail™, Microsoft Office 365™, and other apps from Salesforce ISVs
- Lightning Page tabs

Users can continue to access these items from the App Launcher.

There's no connection between the Lightning Experience and Salesforce1 navigation menus. Changes that you make to the Salesforce1 navigation menu have no impact on the default or custom Lightning Experience navigation menus, and vice versa.

Open Links in New Browser Windows or Tabs

In general, Lightning Experience supports right-click and Windows or Mac keyboard shortcuts to open links in new browser windows or tabs. However, these options aren't supported in some areas of the app, including:

- Links in the Top Deals and Recent Records cards on Home
- Action icons, buttons, and menu items on records
- Links to Notes
- View Report links on dashboards
- Links on Setup pages in Lightning Experience

Shortcuts do work to open nodes from the Setup menu into a new tab or window. However, the Schema Builder and Data Import nodes open in Salesforce Classic instead of in Lightning Experience.

Return and Enter Keys Behave Like Save Action in Lightning Experience

The keys used to create line breaks in long text areas behave a bit differently in Lightning Experience. If your cursor is in the long text area and you press the Return or Enter key, the cursor leaves the text area and selects the Save button. To add a line break, press Shift+Enter instead.

Actions and Buttons

These actions and buttons aren't available in Lightning Experience.

- Deep Clone
- Mass Delete
- Mass actions on object home pages and list views, including modifying or deleting multiple items in a list at once, sending mass email, or adding multiple records to a campaign
- Sharing buttons (except for Salesforce Files, which includes file sharing options on Files home, file detail pages, and in the file preview player)
- Custom buttons with a content source of OnClick JavaScript
- Custom buttons with a content source of URL that pass parameters to standard pages in Salesforce Classic, such as pre-populating fields when creating a record

SEE ALSO:

[What's the Fate of Existing Salesforce Customizations?](#)

[Point-and-Click Customization: What's Not in Lightning Experience](#)

Search: What's Not in Lightning Experience

Learn about the issues to expect when searching in Lightning Experience. Some search-related features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Searchable Objects

Only the following objects can be found in search results: accounts, assets, campaigns, cases, Chatter feed, Chatter groups, contacts, custom objects, dashboards, documents, external objects, files, leads, notes, opportunities, people, person accounts, price books, products, reports, work orders, and work order line item. Task and event items aren't searchable.

Search Results Can't Be Filtered

The "exact phrase" and "limit to items I own" filter options aren't available on search results pages. In addition, you can't filter search results. Sorting is available, except for Chatter groups and files. If a text field in the search results is too long for the column width, you can't see the full text in the search results. You can't expand the column widths.

For lookups, user-defined lookup filter fields and admin-defined dependent lookup filters aren't supported.

Top Results Instead of Search All

There isn't a **Search All** option in search results. Top Results displays the most relevant records grouped by your most frequently used objects. If an object isn't visible on the Top Results page, use the More drop-down menu, which alphabetically lists all available objects.

No Sidebar or Advanced Search

To search, use the global search bar in the header in Lightning Experience.

No Pinning on the Search Scope Bar

You can't pin objects. Pinning from Salesforce Classic doesn't affect the order of the objects listed on the search scope bar beneath the global search box.

External Object Search Results Limited to 25 Items

When you perform a search for an external object, search displays only the top 25 results.

Applications Doesn't Support Wildcard Searches

You can't use wildcards to perform a partially matching search for apps, or when searching from the App Launcher.

Dependent Lookup Filters Not Supported

Admins can't set filters for lookups that reference fields on the current object record (the source). For example, configure the case `CONTACT` field to only show contacts associated with the account selected in the case `ACCOUNT NAME` field on the same record. However, related lookup filters, which restrict the valid values and search results, are supported. For example, configure the `ACCOUNT OWNER` lookup field to only show active users on the same record.

Search Results Used for Global and Lookup Dialog Search Layouts

To change the fields shown as columns in the global search and lookup dialog search results, use the **Search Results** search layout on an object detail page within the Object Manager. The other search layouts (Lookup Dialogs, Lookup Phone Dialogs, Tab, List Views, and Search Filter Fields) aren't applicable in Lightning Experience.

New Button in Lookup Dialog Search Doesn't Support All Objects

In Lightning Experience, you can create these objects from lookup dialog search windows: accounts, cases, contacts, custom objects, events, leads, notes, opportunities, price books, products, and tasks. For other objects, create the desired object or record before using the lookup dialog search to associate records.

Org Setup: What's Not in Lightning Experience

Lightning Experience doesn't support a few aspects of your basic Salesforce setup. And Setup in Lightning Experience doesn't include all of the setup pages that are available in Salesforce Classic.

Setup Pages

In most cases, Setup in Lightning Experience is limited to:

- Pages that support Lightning Experience features
- Administration pages that apply across your organization, such as company settings, security, user management, and mobile app setup

To access other setup pages, such as those for Service Cloud features, use the Setup tree in Salesforce Classic.

Advanced Currency Management

Advanced currency management, or dated exchange rates, isn't supported in general. But opportunities display the correct amount if the `Close Date` field is on a page layout for opportunities. Because page layouts control who sees what on object records, only users who have this page layout assigned to them see the correct amount.

Language Support

Languages that are read right to left, including Arabic and Hebrew, aren't supported. All other Salesforce-supported locales and languages are supported.

SEE ALSO:

[Point-and-Click Customization: What's Not in Lightning Experience](#)

[Programmatic Customization: What's Not in Lightning Experience](#)

Data Import and Management: What's Not in Lightning Experience

Learn about the issues to expect when importing and managing data in Lightning Experience. Some Salesforce features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

[Data Import](#)

[Data.com](#)

Data Import

These legacy data import tools aren't available in Lightning Experience:

- Accounts & Contacts
- Leads
- Solutions
- Custom Objects

Use the Data Import Wizard if you're importing fewer than 50,000 records. Use the Data Loader if you're importing more than 50,000 records.

Data.com

Data.com Prospector

These features aren't available in Lightning Experience.

- Ability to search for and add leads.

- Ability to do a user-defined search for contacts.
 -  **Tip:** In Lightning Experience, you can search and add contacts associated to an account record.
- Ability to search by industry classification for accounts.

Data.com Clean

In Lightning Experience, customers can only review the `Clean Status` field for a record, review the status of clean rules, and find out how well clean rules are working.

Process Automation: What's Not in Lightning Experience

Learn about the issues to expect when using process automation features in Lightning Experience. Process Builder and Workflow are fully supported. Visual Workflow and Approvals are also supported but have some limitations.

Approval Requests

- Users can see approval requests from either their notifications or through the Approval History related list on the record that needs to be approved.
- Lightning Experience users can't see approval requests in Chatter or in the activity timeline on records.
- To see the complete list of requests that are waiting for a user's approval, the user must switch to Salesforce Classic (or use the Salesforce1 mobile app).

Flow Distribution

How you distribute flows to your users depends on whether the relevant feature is available in Lightning Experience. For example, web tabs aren't supported, but Visualforce pages are.

Paused Flow Interviews

To resume paused flow interviews, your users must switch to Salesforce Classic or use Salesforce1.

Security: What's Not in Lightning Experience

Learn about the issues to expect for Salesforce security features in Lightning Experience. Some features aren't available in the new user interface. And some features don't have full parity with what's available in Salesforce Classic.

Sharing Settings

Lightning Experience respects your organization's sharing rules. The Sharing Settings page is available in Setup in Lightning Experience, but some options don't apply in Lightning Experience.

Manual User Record Sharing

This checkbox enables or disables manual sharing on user records via the **Sharing** button. This button is available in Salesforce Classic only.

Manager Groups

This checkbox enables or disables record sharing with managers and manager subordinates groups which is available via sharing rules, manual sharing, and Apex managed sharing. Manual sharing via the **Sharing** button is available in Salesforce Classic only.

Portal User Visibility

This checkbox enables portal users to be visible to other portal users in the same account or only to those users above them in the role hierarchy. Portals are available in Salesforce Classic only.

Session Security Levels

If your org sets a policy that requires a high-assurance session to access reports and dashboards, users with a standard assurance session are blocked from reports and dashboards in Lightning Experience. Also, the Reports and Dashboards items don't appear in the navigation menu. In Lightning Experience, you can't raise the session level to high assurance by redirecting the user to complete two-factor authentication.

As a workaround, users with a standard assurance session can log out and log in again using an authentication method that is defined as high assurance by your organization. They then have access to reports and dashboards. Alternatively, they can switch to Salesforce Classic, where they are prompted to raise the session level when they attempt to access reports and dashboards.

Session Privilege Levels

Sessions obtained in a Lightning Experience context, by using `$Api.Session_ID` or `GETSESSIONID()`, have similar privileges to the Lightning session. As with the Lightning session, you can't use these session IDs to make API calls.

Transaction Security

When selecting the action for a Transaction Security policy, two-factor authentication isn't available for the AccessResource event type. The Block action is used instead.

Platform Encryption

Encrypted data is not masked in Lightning Experience when using JSON serialization or `Database.Query()`. That data is rendered in plaintext, whether or not the user has the "View Encrypted Data" permission.

Point-and-Click Customization: What's Not in Lightning Experience

Many of your point-and-click customizations work seamlessly in Lightning Experience. But some customizations don't apply or aren't supported in the new interface.

Force.com Quick Access Menu

This menu, with shortcuts to various app and object customization features is available in Salesforce Classic only.

Custom Branding

It's not possible to apply custom branding, including custom logos or colors, to the new interface.

Custom JavaScript Buttons

Custom buttons that use a JavaScript content source aren't supported in Lightning Experience. You can replace some of the functions covered by these buttons by using point-and-click tools, like Process Builder, Visual Workflow, or code-driven approaches.

Custom Help

- You can't define custom field-level help text or add field-level help for fields in custom objects.
- You can't customize items in the help menus on Lightning Experience pages. However, if you created custom help for "Help for this Page" links in Salesforce Classic, these links continue to display your help when classic pages are embedded in the new user interface, such as in the Setup tree.

Object-Specific Customizations

An object-specific customization is something that you create for a given object. Examples include fields, page layouts, record types, and Apex triggers. Most object-specific customizations are available in the Object Manager instead of directly from the Setup tree. From Setup, enter *Object Manager* in the **Quick Find** box, then select **Object Manager**.

 **Note:** Objects don't appear in the Object Manager—or anywhere in Setup—if they're related to features that aren't supported in Lightning Experience, such as case milestones.

Standard Fields

To edit standard fields, click the field name, and then click **Edit**. Unlike in Salesforce Classic, you can't edit standard fields directly from the object detail page.

Page Layouts

Record page customizations made in Salesforce Classic—for custom and standard objects—also affect record pages in Lightning Experience. However, some page elements display differently in Lightning Experience, and some aren't supported.

You can't access page layouts for user profiles from Lightning Experience.

Cases have a special related list dedicated to case close page layouts.

These page layout elements aren't supported in Lightning Experience:

- Blank spaces
- Expanded lookups
- Mobile cards
- S-controls
- Sections
- Tags

You can't use the enhanced page layout editor to customize the layout of record pages when viewed in Lightning Experience. All Lightning Experience users see the same record layout, regardless of profile or record type.

 **Tip:** You can create a custom Lightning Experience record page with the Lightning App Builder.

Triggers

Triggers appear in the Object Manager only if you have the "Author Apex" user permission.

Triggers for some standard objects don't appear in the Object Manager—see [Object Customizations That Aren't in the Object Manager](#). Access these triggers directly from the Setup Quick Find box.

Field Sets

Field sets aren't available in Lightning Experience. If you or someone in your organization created a field set while using Salesforce Classic, you see the global variable for field sets in places such as formula fields and Visualforce pages, but you can't manage them in Lightning Experience.

Apex Sharing Rules

Not available in Lightning Experience.

Apex Sharing Recalculations

Not available in Lightning Experience.

Object Customizations That Aren't in the Object Manager

The Object Manager doesn't include some object customizations for standard objects, such as triggers for case comments. Access these object customizations via the **Quick Find** box. For example, from Setup, enter *Case Comment* in the **Quick Find** box, then select **Case Comment Triggers**.

Triggers

- Case Comment Triggers
- Email Message Triggers
- FeedComment Triggers
- FeedItem Triggers
- Group Triggers
- Group Member Triggers
- Group Record Triggers
- Topic Triggers
- TopicAssignment Triggers

Layouts

- Feed Item Layouts
- Group Layouts
- Publisher Layouts

[What's the Fate of Existing Salesforce Customizations?](#)

[Page Layouts in Lightning Experience](#)

Programmatic Customization: What's Not in Lightning Experience

Many of your programmatic customizations work in Lightning Experience. But the new interface affects the way some features, such as Lightning Pages and Visualforce, behave.

Lightning Pages

Lightning Page tabs and custom Lightning Pages are currently available for the Salesforce1 mobile app only, and aren't available in Lightning Experience.

Visualforce

Here are some of the most important considerations for organizations that have customized Salesforce with Visualforce. For complete details, score yourself a new developer badge by completing [Visualforce & Lightning Experience](#) in Trailhead.

Visualforce Is Wrapped in an iframe in Lightning Experience

In Salesforce Classic, Visualforce owns the entire page. In Lightning Experience, it's wrapped in an embedded iframe instead. This wrapper has a number of effects, and it's the main reason why a whole Trailhead module is devoted to covering the details.

`sfForce.one` No Longer Used Just for Salesforce1

The `sfForce.one` JavaScript utility object used to be available only on Visualforce pages when they ran in Salesforce1. If your organization enables Lightning Experience, it's also added to pages when they run in Lightning Experience.

In the past detecting the presence of `sfForce.one` was a way to tell what user experience context your code was running in. Today there are better, supported methods for determining the user experience context.

If you've written code that makes assumptions about what the presence of `sfForce.one` means, you'll want to update it to use the new functions.

You Can't Set `window.location`

A common technique in JavaScript to navigate to a new page is to manipulate the `window.location` value. This technique isn't possible in Lightning Experience. Use the `sfForce.one` navigation methods instead.

Object List Action Override Isn't Accessible

The object list action, one of the six standard actions you can override with a Visualforce page, isn't accessible in Lightning Experience. You can still override it, but your users can't access it.

Lightning Experience App User Interface Is Always Visible

When running in Lightning Experience, Visualforce pages ignore the `<apex:page>` `showHeader` and `showSidebar` attributes. You can't suppress the Lightning Experience header and navigation menu.

Home Doesn't Support Visualforce

You can't add Visualforce elements to Home in Lightning Experience.

Session Privilege Levels

Sessions obtained in a Lightning Experience context, by using `$Api.Session_ID` or `GETSESSIONID()`, have similar privileges to the Lightning session. As with the Lightning session, you can't use these session IDs to make API calls.

S-Controls

S-controls are an obsolete method of customizing the user interface of Salesforce. They are superseded by Visualforce and Lightning Components, which are superior in every way. S-controls aren't available in Lightning Experience, and never will be. If your org depends on s-controls, you'll need to replace them before you can move to Lightning Experience.

SEE ALSO:

[What's the Fate of Existing Salesforce Customizations?](#)

Apps and Packaging: What's Not in Lightning Experience

Apps on the AppExchange that are certified as Lightning Ready are supported in Lightning Experience. You can install and manage packages in Lightning Experience, but other packaging features aren't supported. You can use the License Management App and the Environment Hub in Lightning Experience, but other ISVforce apps aren't supported.

AppExchange

Some apps on the AppExchange are supported in Lightning Experience. If an app is supported, a *Lightning Ready* sash appears on its AppExchange listing. If an app isn't supported, use it in Salesforce Classic instead.

Apps without Lightning Ready certification can be used in Lightning Experience, but some features may not be available or work as expected. These apps may also appear visually inconsistent with Lightning Experience because they use Salesforce Classic styling. For the best experience, use Salesforce Classic for apps that aren't certified as Lightning Ready.

Packaging

You can install packages in Lightning Experience. But for packages that are already installed, you can't assign licenses to users from Lightning Experience. If you need to assign a license, switch to Salesforce Classic.

These packaging features aren't supported in Lightning Experience:

- Create a package
- Upload a package
- Upgrade a package
- Deprecate a package version
- Create branch or patch organizations

ISVforce Apps

You can use the License Management App to manage licenses and support subscribers in Lightning Experience. You can also use the Environment Hub to create and manage your development, testing, and trial orgs in Lightning Experience.

These ISVforce features aren't supported in Lightning Experience:

- Channel Order App
- Trialforce
- Usage Metrics Visualization App

What to Expect in Lightning Experience When Chatter Is Turned Off

If your organization doesn't use Chatter, several aspects of the Lightning Experience interface aren't available. Learn how Lightning Experience changes, and see if you're losing functionality that you'd rather not live without.

If you turn off Chatter for your entire organization or for a subset of users via permission sets:

- Feeds and groups aren't available.
- User profiles are still available, but feeds and groups aren't available on profiles.
- The Collaboration tab isn't available on records.
- Users can't follow records or other users.

EDITIONS

Chatter available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

SET UP AND MAINTAIN YOUR SALESFORCE ORGANIZATION

Welcome, Salesforce Administrators

As a Salesforce administrator—that is, a user assigned to the Administrator profile—you're responsible for setting up your online organization, which means adding users and configuring the system for your needs.

This guide contains the details you need to set up and maintain a Salesforce organization.

We hope this guide provides the complete content you need to get your organization up and running with Salesforce. If you need further support, contact the Support team at Salesforce.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All Editions

Salesforce Trials

Trial Orgs

Use a trial Salesforce org to evaluate Salesforce before you subscribe.

Your trial org includes:

- Sample data. You can [delete sample data](#) or [start a new trial](#).
- Admin privileges. The person who signed up becomes the Salesforce admin. You can add another admin when you [add more users](#).
- A variety of Salesforce features.
- The ability to subscribe to Salesforce.

 **Note:** Features your trial might not be available in the edition that you choose to purchase.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional** and **Enterprise** Editions

Start a New Trial

When you sign up for Salesforce, you can choose an industry-specific template with sample data. During your trial period, you can start a new trial with a blank template. To start a new trial abandon your current trial, including all data and customizations. Only usernames are preserved.

You can start a new trial if you have:

- Fewer than 1,000 rows of data
 - No additional user licenses added by Salesforce
 - No additional functionality enabled by Salesforce
1. From Setup, enter *Start a New Trial* in the **Quick Find** box, then select **Start a New Trial**. This link is available only during your trial period.
 2. Select your language and template preferences.
 3. Enter the requested text stating that you want to abandon your current trial org and all its data, including sample data and data that you've entered.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

User Permissions Needed

To start a new trial:

- "Modify All Data"

4. To confirm that all of your current data will be lost, select the checkbox.
5. Click **Submit**.
6. When the confirmation page appears, click **Submit**.

Delete Trial Data

When you sign up for Salesforce, your Salesforce org is initially populated with sample data. During your trial period, Salesforce admins can delete the sample data and all your org's data by using the Delete All Data link.

 **Note:** The Delete All Data link is visible only when all these conditions are met.

- The user has the "Modify All Data" user permission.
- The org is in a trial state.
- The org doesn't have portals enabled.
- The user isn't a Partner Administrator, acting on another user's behalf.

1. From Setup, enter *Delete All Data* in the *Quick Find* box, then select **Delete All Data**.
2. Enter the requested text stating that you understand that all data in your org will be deleted, including sample data and data that you entered. Your user and admin setup isn't affected.
3. Click **Submit**.

 **Note:** If data storage limits prevent you from deleting all your trial data this way, use Mass Delete Records to delete your accounts. Then use Delete All Data to delete your remaining trial data. For instructions for using Mass Delete Records, see [Deleting Multiple Records and Reports](#) on page 713.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To delete trial data:

- "Modify All Data"

Plan Your Salesforce Rollout

Before you roll up your sleeves and start setting up Salesforce, take a look at the resources available to help you plan your rollout.

[How Can a Salesforce Consulting Partner Help Me?](#)

Recently purchased Salesforce? Wondering how to get started? Consider working with a consulting partner to take full advantage of the product.

How Can a Salesforce Consulting Partner Help Me?

Recently purchased Salesforce? Wondering how to get started? Consider working with a consulting partner to take full advantage of the product.

Consulting partners are firms that employ Salesforce-certified consultants. Consultants work with you to learn what your company needs, design and build your Salesforce organization to meet those needs, and test the organization before you roll it out to your teams. Consulting partners have one goal in mind: Your success with Salesforce.

Rolling out an effective Salesforce organization takes time and thoughtful planning. Working with a partner can help your company harness the power of Salesforce in a way that can be difficult and time-consuming without expert guidance.

Not sure if your company needs expert guidance? Consider how you would respond to the following questions about your company's sales goals.

- Does your company have the internal resources with the time, expertise, and experience to develop the appropriate Salesforce features to solve your business needs?
- Is your company expanding into new business, countries, or industries?
- Do you need a decisive, objective perspective when making business decisions?
- Do you want to see results in weeks, not years?

Still on the fence? Check out this comparison between rolling out Salesforce yourself and rolling out Salesforce with a partner.

Compare	Rolling out Salesforce Yourself	Rolling out Salesforce with a Partner
Qualifications	Sometimes companies have Salesforce-certified employees who can assist with setup.	Consultants are Salesforce-certified.
Experience	Usually employees have little or no Salesforce experience.	Consultants have set up many Salesforce organizations and are knowledgeable about best practices.
Availability of resources for setup	Usually setup competes with your employees' other projects and priorities.	Consultants commit to and deliver on a scope of work for your Salesforce rollout.
External support	Salesforce offers basic support for all Salesforce organizations. Support includes access to self-help (online help articles) and Customer Support agents (guaranteed to respond within 2 days).	Consultants are experienced and well-connected, and can offer personalized support to companies during setup and rollout.
Time commitment	Usually rolling out Salesforce yourself is a significant time commitment unless experienced resources are available.	Usually rolling out Salesforce with a partner is faster, because experienced resources are fully engaged in your project.
Salesforce adoption by your sales teams	When Salesforce isn't rolled out properly, companies run the risk that their sales teams don't recognize the products' value, and don't adopt the product wholeheartedly.	When consultants roll out Salesforce, there is a greater chance that sales teams adopt the product from the start because its value is obvious.
Training resources	Companies are required to customize and roll out their own training plans for employees without mentorship from expert resources.	Salesforce partners can offer experienced mentorship and pre-designed training materials.

To learn more about consulting partners and how to connect with one, check out our website, [Successfully Implement with Salesforce Partners](#).

Set Up Your Organization

Find Company Information

Find the information that's provided when your company signed up with Salesforce on the Company Information page in Setup.

From the Company Information page, you can:

- [Edit your company's information](#).
- View the [user licenses](#), [feature licenses](#), [permission set licenses](#), and [usage-based entitlements](#) that your organization has access to.
- Add or remove licenses.
- (Sandbox organizations only) Match provisioned licenses in production to your sandbox organization. The matching process updates your sandbox organization with licenses from production and deletes any licenses in sandbox that aren't in production.

Company Information Fields

The Company Information page has the following fields (listed in alphabetical order), including the user and feature licenses purchased for your organization.

Field	Description
Address	Street address of the organization. Up to 255 characters are allowed in this field.
Admin Newsletter	Allow administrators in your organization to choose whether they want to receive administrator-targeted promotional emails from Salesforce.
API Requests, Last 24 Hours	The total number of API requests issued by the organization in the last 24 hours. The maximum number of requests depends on your Edition.
City	City in which organization is located. Up to 40 characters are allowed in this field.
Corporate Currency	The currency in which the organization's corporate headquarters reports revenue. Serves as the basis for all currency conversion rates. Only for organizations that use multiple currencies.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view company information:

- "View Setup and Configuration"

To change company information:

- "Modify All Data"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Created By	User who signed up the organization, including creation date and time. (Read only)
Currency Locale	The country or geographic region in which the organization is located. The setting affects the format of currency amounts. For single currency organizations only.
Default Language	<p>The default language that is selected for new users in the organization. This setting determines the language used for the user interface text and help. In all editions except Personal Edition and Database.com, individual users can separately set the language for their own login, which will override the organization setting. In Group Edition, this field is called <code>Display Language</code>.</p> <p>This setting also determines the language in which all customizations—such as custom fields, tabs, and user interface options—are stored. For customizations, individual users' language settings do not override this setting.</p> <p>If you edit or clone existing filter criteria, make sure this setting matches the default language that was configured when the filter criteria was originally set. Otherwise, the filter criteria may not be evaluated as expected.</p>
Default Locale	The default country or geographic region that is selected for new users in the organization. This setting determines the format of dates, times, and names in Salesforce. In Contact Manager, Group, Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, individual users can set their personal locale, which overrides the organization setting. In Group Edition, this field is called <code>Locale</code> .
Default Time Zone	<p>Primary time zone in which the organization is located. A user's individual <code>Time Zone</code> setting overrides the organization's <code>Default Time Zone</code> setting.</p> <p>Note: Organizations in Arizona should select "Mountain Standard Time," and organizations in parts of Indiana that do not follow Daylight Savings Time should select "Eastern Standard Time."</p>
Division	Group or division that uses the service, for example, PC Sales Group. Up to 40 characters are allowed in this field.
Fax	Fax number. Up to 40 characters are allowed in this field.
Fiscal Year Starts In	If using a standard fiscal year, the starting month and year for the organization's fiscal year. If using a custom fiscal year, the value will be "Custom Fiscal Year."

Field	Description
Hide Notices About System Downtime	Select this checkbox to prevent advance notices about planned system downtime from displaying to users when they log in to Salesforce.
Hide Notices About System Maintenance	Select this checkbox to prevent advance notices about planned system maintenance from displaying to users when they log in to Salesforce.
Modified By	User who last changed the company information, including modification date and time. (Read only)
Newsletter	Allow users in your organization to choose whether they want to receive user-targeted promotional emails from Salesforce.
Organization Edition	Edition of the organization, such as Developer Edition or Enterprise Edition.
Organization Name	Name of the organization. Up to 80 characters are allowed in this field.
Phone	Main phone number at organization. Up to 40 characters are allowed in this field.
Primary Contact	Person who is main contact or administrator at the organization. You can enter a name, or select a name from a list of previously defined users. Up to 80 characters are allowed in this field.
Restricted Logins, Current Month	Number of restricted login users who have logged in during the current month. This value resets to zero at the beginning of each month. The maximum number of restricted login users for the organization is in parentheses.
Salesforce Licenses	Number of Salesforce user accounts that can be defined for access to the service. This is the number of Salesforce user licenses for which the organization is billed, if charges apply.
Salesforce Organization ID	Code that uniquely identifies your organization to Salesforce.
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Streaming API Events, Last 24 Hours	The total number of Streaming API events used by the organization in the last 24 hours. The maximum number of events depends on your edition.
Zip	Zip or postal code of the organization. Up to 20 characters are allowed in this field.
Used Data Space	Amount of data storage in use; the value is expressed as a measurement (for example, 500 MB) and as a percentage of the total amount of data storage available (for example, 10%).

Field	Description
Used File Space	Amount of file storage in use; the value is expressed as a measurement (for example, 500 MB) and as a percentage of the total amount of file storage available (for example, 10%).

Required Domains

Salesforce uses these domains to deliver content.

- *.content.force.com
- *.force.com
- *.salesforce.com
- *.staticforce.com
- In addition, these domains are used to deliver content in the right frame of your login screen.
- *.sfdcstatic.com
- secure.eloqua.com
- www.google.*
- *.doubleclick.net
- www.facebook.com
- ssl.google-analytics.com

The right frame content is displayed in the followings URLs.

- login.salesforce.com
- test.salesforce.com
- <yourInstance>.salesforce.com
- A My Domain URL without custom branding (for example, norns.my.salesforce.com)

If you whitelist domains, add these to your list of allowed domains. If you've disabled third-party cookies (typically enabled by default in all major browsers), you must accept them for Salesforce to function properly. If your users have general access to the Internet, no action is required.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: All Editions.

The Setup Menu

Improved Setup User Interface in Salesforce Classic

The improved Setup user interface provides a streamlined experience for viewing and managing personal and administrative setup tasks.

When the improved Setup user interface is enabled in an organization, you might notice several differences from the original user interface.

- The Setup menu is accessed from the Setup link on the upper-right corner of any Salesforce page.
- The Setup menu is organized into goal-based categories: Administer, Build, Deploy, Monitor, and Checkout.
- Personal settings, which all Salesforce users can edit, are available from a separate My Settings menu.

To access My Settings, click your name in the upper-right corner of any Salesforce page, then click **My Settings**. You can also access My Settings from your Chatter profile page: in the right pane, click **My Settings**.

- The My Settings home page includes quick links for easily accessing the most commonly used personal settings tools and tasks.

 **Important:** When enabled, the improved Setup user interface is activated for every user in an organization. Be sure to notify your organization before enabling or disabling this setting.

To enable the improved Setup user interface, from Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface**, then select **Enable Improved Setup User Interface**.

 **Note:** The improved Setup user interface:

- Is not supported in Internet Explorer version 6
- Is available only when the new user interface theme is enabled

Searching Setup with Advanced Setup Search (Beta)

With Advanced Setup Search, users can search for many types of items in Setup, including approval items, custom objects and fields, custom profiles, permission sets, workflow items, users, and so on.

 **Note:** Advanced Setup Search is in beta. It is production quality but has known limitations.

To use Advanced Setup Search, be sure the Advanced Setup Search user interface setting is enabled. From Setup, enter *User Interface* in the *Quick Find* box, then select **User Interface**, then scroll to *Enable Advanced Setup Search (Beta)*. If Advanced Setup Search is disabled, the Setup search box returns only the titles of pages in the Setup menu, not individual items that you might have created or edited in Setup.

Advanced Setup Search is multipurpose, allowing you to use it in different ways.

- To find Setup pages, type part or all of a Setup page name in the Setup Search box. As you type in this box, you'll immediately see Setup pages whose names match what you're typing. Click the name of the page to open it.
- To find Setup metadata, enter at least two consecutive characters of the item you want and click  or press Enter. In the Setup Search Results page that appears, select the item you want from the list.

 **Note:** Some searchable items (such as permission sets) aren't available in some editions. Users can't search for items that aren't included in their edition.

 **Example:** For example, let's say you want to see all the installed packages in your organization. Enter *inst*. As you enter letters, the Setup menu shrinks to include only the menus and pages that match your search terms. You'll quickly see the link for the page you want (**Installed Packages**).

Next, perhaps you want to change the password for one of your users, Jane Smith. Enter *smi t* and click . From the Setup Search Results page, click the Jane Smith result to go directly to her user detail page.

SEE ALSO:

[Setup Search Results Page \(Beta\)](#)

Setup Search Results Page (Beta)

The Setup Search Results page displays various types of items in Setup that match your search terms, including approval items, custom objects and fields, custom profiles, permission sets, workflow items, users, and so on.

 **Note:** Advanced Setup Search is in beta. It is production quality but has known limitations.

In the Setup Search Results page:

- The left pane shows each category with the number of results in parentheses.
 - Click any category to see only that category's results.
 - If you've filtered your results by category, click **All Results** to show all search results.
- Click a result name to open it or click **Edit**.
- Use the search box at the top of the page to search Setup again.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To enable Advanced Setup Search:

- "Customize Application"

To search Setup:

- "View Setup and Configuration"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

-  **Note:** Search terms that match a user's name or community nickname (the `Nickname` field in the user detail page) return results that show the user's name only. If the nickname doesn't match the username, the result might not be obvious. For example, if a user who's named Margaret Smith has the nickname Peggy, a search for `peg` returns Margaret Smith.
-  **Tip:** When viewing setup search results, bookmark the results page in your Web browser to easily perform the same search in the future. For example, if you often search for "smit", you can bookmark the results page to perform the same search again. The URL for this bookmark would be something like `https://MyCompany.salesforce.com/ui/setup/SetupSearchResultsPage?setupSearch=smit`.

SEE ALSO:

[Searching Setup with Advanced Setup Search \(Beta\)](#)

Understanding Language, Locale, and Currency

The Salesforce settings for language, locale, time zone, and currency can affect how objects (Accounts, Leads, Opportunities, etc.) are displayed. In a single currency organization, the Salesforce administrators set the currency locale, default language, default locale, and default time zone for their organizations and the users can set their individual language, locale, and time zone on their personal settings pages. In a multiple currency organization, the Salesforce administrators set the corporate currency, default language, default locale, and default time zone for their organizations and the users can set their individual currency, language, locale, and time zone on their personal settings pages.

-  **Note:** Single language organizations cannot change their language, although they can change their locale.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Setting	Who can edit the setting
Currency	User in a multiple currency organization
Corporate Currency	Administrator in a multiple currency organization
Currency Locale	Administrator in a single currency organization
Default Currency ISO Code	Not editable
Default Language	Administrator
Default Locale	Administrator
Default Time Zone	Administrator
Information Currency	Not editable
Language	User
Locale	User

Setting	Who can edit the setting
Time Zone	User

SEE ALSO:

- [Language Settings Overview](#)
- [Supported Currencies](#)
- [Which Languages Does Salesforce Support?](#)
- [Supported Locales](#)
- [Supported Time Zones](#)
- [Set Your Personal or Organization-Wide Currency](#)

Language Settings Overview

The Salesforce Web user interface, Salesforce for Outlook, Connect Offline, and Connect for Office are available in [multiple languages](#).

The Salesforce Web user interface has two language settings:

- **Personal language**—All on-screen text, images, buttons, and online help display in this language. Edit your personal information to change this setting.
- **Default organization language**—This applies to all new users until they select their personal language. This setting also determines the language in which all customizations—such as custom fields, tabs, and user interface options—are stored. For customizations, users' personal language settings don't override this default setting. Some setup items that are manually entered by an administrator can be translated in the Translation Workbench.

Administrators can change this setting by editing the company information.

Text entered by users remains in the language in which it was entered.

SEE ALSO:

- [Understanding Language, Locale, and Currency](#)

Which Languages Does Salesforce Support?

Salesforce offers three levels of language support: [fully supported languages](#), [end-user languages](#), and [platform-only languages](#). Each language is identified by a two-character language code, such as en, or a five-character locale code, such as en_AU.

 **Note:** Setting a default locale is different from setting a default language.

In addition to the Salesforce language support, you can localize your organizations in two ways. The Translation Workbench lets you specify languages you want to translate, assign translators to languages, create translations for customizations you've made to your Salesforce organization, and override labels and translations from managed packages. Everything from custom picklist values to custom fields can be translated so your global users can use all of Salesforce in their language.

The second option is to rename tabs and fields in Salesforce. If your custom application uses only a few standard Salesforce tabs and fields, you can translate them.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Fully Supported Languages

You can change the language for all features, including Help, to one of the following fully supported languages from Setup by entering *Company Information* in the **Quick Find** box, selecting **Company Information**, then selecting **Edit**.

- Chinese (Simplified): zh_CN
- Chinese (Traditional): zh_TW
- Danish: da
- Dutch: nl_NL
- English: en_US
- Finnish: fi
- French: fr
- German: de
- Italian: it
- Japanese: ja
- Korean: ko
- Norwegian: no
- Portuguese (Brazil): pt_BR
- Russian: ru
- Spanish: es
- Spanish (Mexico): es_MX
- Swedish: sv
- Thai: th

Note:

- Spanish (Mexico) falls back to Spanish for customer-defined translations.
- Even though the Salesforce user interface is fully translated to Thai, Help remains in English.

End-User Languages

End-user languages are useful if you have a multilingual organization or partners who speak languages other than your company's default language. For end-user languages, Salesforce provides translated labels for all standard objects and pages, *except* administrative pages, Setup, and Help. When you specify an end-user language, labels and Help that aren't translated appear in English. End-user languages are intended only for personal use by end users. Don't use end-user languages as corporate languages. Salesforce doesn't provide customer support in end-user languages.

End-user languages include:

- Arabic: ar
- Bulgarian: bg
- Croatian: hr
- Czech: cs
- English (UK): en_GB
- Greek: el
- Hebrew: iw
- Hungarian: hu

- Indonesian: `in`
- Polish: `pl`
- Portuguese (Portugal): `pt_PT`
- Romanian: `ro`
- Slovak: `sk`
- Slovenian: `sl`
- Turkish: `tr`
- Ukrainian: `uk`
- Vietnamese: `vi`

 **Note:** Salesforce provides limited support for right-to-left languages—Arabic and Hebrew—for the following features.

- Live Agent
- Cases
- Accounts

These features are not supported in Lightning Experience, the Salesforce1 mobile app, any other mobile app or mobile browser, or any user interface except Salesforce Classic. There is no guarantee that right-to-left languages function correctly with any other Salesforce features. There are no plans to expand the list of supported features.

Features that aren't supported for right-to-left languages include, but are not limited to, the following.

- Report Builder
- Generating quote PDFs
- Customizable forecasting
- Emails
- Salesforce Knowledge
- Feeds
- Communities

The absence of a feature from this list does not imply support. Only Live Agent, Cases, and Accounts are supported with right-to-left languages.

Platform-Only Languages

In situations where Salesforce doesn't provide default translations, use platform-only languages to localize apps and custom functionality that you've built on the Salesforce App Cloud. You can translate items such as custom labels, custom objects, and field names. You can also rename most standard objects, labels, and fields. Informative text and non-field label text aren't translatable.

Platform-only languages are available in all places where you can select a language in the application. However, when you select a platform-only language, all standard Salesforce labels default to English or, in select cases, to an end-user or fully supported language.

When you specify a platform-only language, labels for standard objects and fields fall back to English, except:

- English (Australia), English (India), English (Malaysia), and English (Philippines) fall back to English (UK).
- German (Austria) and German (Switzerland) fall back to German.
- French (Canada) falls back to French.
- Romanian (Moldova) falls back to Romanian.
- Montenegrin falls back to Serbian (Latin).
- Portuguese (Portugal) falls back to Portuguese (Brazil).

The following platform-only languages are currently supported.

- Albanian: `sq`
- Arabic (Algeria): `ar_DZ`
- Arabic (Bahrain): `ar_BH`
- Arabic (Egypt): `ar_EG`
- Arabic (Iraq): `ar_IQ`
- Arabic (Jordan): `ar_JO`
- Arabic (Kuwait): `ar_KW`
- Arabic (Lebanon): `ar_LB`
- Arabic (Libya): `ar_LY`
- Arabic (Morocco): `ar_MA`
- Arabic (Oman): `ar_OM`
- Arabic (Qatar): `ar_QA`
- Arabic (Saudi Arabia): `ar_SA`
- Arabic (Sudan): `ar_SD`
- Arabic (Syria): `ar_SY`
- Arabic (Tunisia): `ar_TN`
- Arabic (United Arab Emirates): `ar_AE`
- Arabic (Yemen): `ar_YE`
- Armenian: `hy`
- Basque: `eu`
- Bosnian: `bs`
- Bengali: `bn`
- Chinese (Simplified—Singapore): `zh_SG`
- Chinese (Traditional—Hong Kong): `zh_HK`
- English (Australia): `en_AU`
- English (Canada): `en_CA`
- English (Hong Kong): `en_HK`
- English (India): `en_IN`
- English (Ireland): `en_IE`
- English (Malaysia): `en_MY`
- English (Philippines): `en_PH`
- English (Singapore): `en_SG`
- English (South Africa): `en_ZA`
- Estonian: `et`
- French (Belgium): `fr_BE`
- French (Canada): `fr_CA`
- French (Luxembourg): `fr_LU`
- French (Switzerland): `fr_CH`
- Georgian: `ka`

- German (Austria): `de_AT`
- German (Luxembourg): `de_LU`
- German (Switzerland): `de_CH`
- Hindi: `hi`
- Icelandic: `is`
- Irish: `ga`
- Italian (Switzerland): `it_CH`
- Latvian: `lv`
- Lithuanian: `lt`
- Luxembourgish: `lb`
- Macedonian: `mk`
- Malay: `ms`
- Maltese: `mt`
- Romanian (Moldova): `ro_MD`
- Montenegrin: `sh_ME`
- Romansh: `rm`
- Serbian (Cyrillic): `sr`
- Serbian (Latin): `sh`
- Spanish (Argentina): `es_AR`
- Spanish (Bolivia): `es_BO`
- Spanish (Chile): `es_CL`
- Spanish (Colombia): `es_CO`
- Spanish (Costa Rica): `es_CR`
- Spanish (Dominican Republic): `es_DO`
- Spanish (Ecuador): `es_EC`
- Spanish (El Salvador): `es_SV`
- Spanish (Guatemala): `es_GT`
- Spanish (Honduras): `es_HN`
- Spanish (Nicaragua): `es_NI`
- Spanish (Panama): `es_PA`
- Spanish (Paraguay): `es_PY`
- Spanish (Peru): `es_PE`
- Spanish (Puerto Rico): `es_PR`
- Spanish (United States): `es_US`
- Spanish (Uruguay): `es_UY`
- Spanish (Venezuela): `es_VE`
- Tagalog: `tl`
- Tamil: `ta`
- Urdu: `ur`

- Welsh: `cy`

- [Enable and Disable the Translation Workbench](#)

Supported Locales

The Salesforce locale settings determine the display formats for date and time, users' names, addresses, and commas and periods in numbers. For single-currency organizations, locales also set the default currency for the organization when you select them in the `Currency Locale` picklist on the Company Information page.

Name	Code	Default currency	Date and time format	Time format	Number format	Name format	Address format

Supported Time Zones

You can find a list of Salesforce supported times zones and codes for your organization under your personal settings.

1. From your personal settings, enter *Time Zone* in the *Quick Find* box, then select **Language and Time Zone**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**. Then click **Edit**.
2. Click the Time Zone drop-down list for a list of supported time zones.

For reference, the Salesforce supported times zones and codes (in chronological order) are as follows:

Time Zone Code	Time Zone Name
GMT+14:00	Line Is. Time (Pacific/Kiritimati)
GMT+13:00	Phoenix Is. Time (Pacific/Enderbury)
GMT+13:00	Tonga Time (Pacific/Tongatapu)
GMT+12:45	Chatham Standard Time (Pacific/Chatham)
GMT+12:00	New Zealand Standard Time (Pacific/Auckland)
GMT+12:00	Fiji Time (Pacific/Fiji)
GMT+12:00	Petropavlovsk-Kamchatski Time (Asia/Kamchatka)
GMT+11:30	Norfolk Time (Pacific/Norfolk)

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Database.com,** and **Developer** Editions

USER PERMISSIONS

To view currencies:

- "View Setup and Configuration"

To change currencies:

- "Customize Application"

Set Your Currency Locale

If you have a single-currency organization, you can set your default currency.

1. Search Setup for Company Information.
2. On the Company Information page, click **Edit**.
3. Select a locale from the Currency Locale drop-down list.
4. Click **Save**.

Set Your Corporate Currency

In multi-currency organizations, set your corporate currency to the currency in which your corporate headquarters reports revenue. All conversion rates are based on the corporate currency.

When Support enables multiple currencies, your corporate currency is set to the value specified on the Company Information page in Setup. You can change the corporate currency.

1. Search Setup for Manage Currencies.
2. On the Currency page, click **Change Corporate**.
3. Select a currency from the New Corporate Currency drop-down list.
4. Click **Save**.

Set Your Personal Currency

In multi-currency organizations, users can set a personal currency that's different from their organization's corporate currency.

1. From your personal settings, enter *Time Zone* in the *Quick Find* box, then select **Language and Time Zone**. No results? Enter *Personal Information* in the *Quick Find* box, then select **Personal Information**.
2. Select a currency from the Currency drop-down list.
3. Save your changes.

SEE ALSO:

[Personalize Your Salesforce Experience](#)

Edit Conversion Rates

You can manage static exchange rates between your active and inactive currencies and the corporate currency by editing the conversion rates. These exchange rates apply to all currency fields used in your organization. In addition to these conversion rates, some organizations use dated exchange rates for opportunities and opportunity products.

1. Search Setup for Manage Currencies.
2. If you use advanced currency management, click **Manage Currencies**.
3. In the Active Currencies or Inactive Currencies list, click **Edit Rates**.
4. Enter the conversion rate between each currency and your corporate currency.
5. Click **Save**.

When you change the conversion rates, currency amounts are updated using the new rates. Previous conversion rates are not stored. All conversions within opportunities, forecasts, and other amounts use the current conversion rate.

If your organization uses advanced currency management, you can also manage dated exchange rates for currency fields on opportunities and opportunity products.

Note:

- You cannot track revenue gain or loss based on currency fluctuations.
- Changing conversion rates causes a mass recalculation of roll-up summary fields. This recalculation can take up to 30 minutes, depending on the number of records affected.

To change currencies:

- "Customize Application"

- You can also change a conversion rate via the API. However, if another roll-up summary recalculation for the same currency field is in progress, the age of that job affects the recalculation job that you triggered. Here's what happens when you request a currency rate change via the API, and a related job is in progress.
 - If the other recalculation for the same currency field was kicked off less than 24 hours ago, your currency rate change isn't saved. You can try again later or instead change the currency rate from Manage Currencies in Setup. Initiating the change from Setup stops the old job and triggers your recalculation to run.
 - If the other recalculation job was kicked off more than 24 hours ago, you can save your currency rate change and your job starts.

To check the status of your recalculation job, see the Background Jobs page in Setup.

Fiscal Years

Define a fiscal year that fits your business needs.

If your fiscal year follows the Gregorian calendar, but does not start in January, you can simply and easily set your fiscal year by defining a standard fiscal year with a different starting month. If your fiscal year follows a different structure from the Gregorian calendar, you can define a custom fiscal year that meets your needs.

Whether you use a standard fiscal year or a custom fiscal year, you define individual fiscal years one time. These fiscal year definitions allow you to use these fiscal periods throughout Salesforce including in reporting, opportunities, and forecasting.

 **Tip:** As a best practice, update product schedules whenever a custom fiscal year is created or changed.

Standard Fiscal Years

Standard fiscal years follow the Gregorian calendar, but can start on the first day of any month of the year.

Custom Fiscal Years

For companies that break down their fiscal years, quarters, and weeks into custom fiscal periods based on their financial planning requirements, Salesforce allows you to flexibly define these periods using custom fiscal years. For example, as part of a custom fiscal year, you can create a 13-week quarter represented by three periods of 4, 4, and 5 weeks, rather than calendar months.

If you use a common fiscal year structure, such as 4-4-5 or a 13-period structure, you can rapidly define a fiscal year by specifying a start date and choosing an included template. If the fiscal year structure you need is not among the templates, you can easily modify a template to suit your business. For example, if you use three fiscal quarters per year (a trimester) rather than four, delete or modify quarters and periods to meet your needs.

Your custom fiscal periods can be named based on your standards. For example, a fiscal period could be called “P2” or “February.”

Fiscal years can be modified any time that you need to change their definition. For example, an extra week could be added to synchronize a custom fiscal year with a standard calendar in a leap year. Changes to fiscal year structure take effect immediately upon being saved. If you use forecasting, Salesforce recalculates your forecasts when you save changes to a fiscal year.

Considerations for Enabling Custom Fiscal Years

Before enabling custom fiscal years, consider these key points.

- After you enable custom fiscal years, you cannot disable the feature. However, if you need to revert to standard fiscal years, you can define custom fiscal years that follow the same Gregorian calendar structure as the Salesforce standard fiscal years.
- Fiscal year definitions are not automatically created. Define a custom fiscal year for each year you do business.
- Enabling or defining custom fiscal years impacts your forecasts, reports, and quotas.
 - After enabling custom fiscal years, when you define the first custom fiscal year, all existing forecasts, forecast history, and forecast adjustments from the first period of that year forward will be deleted. Forecasts for periods before the first custom fiscal year are not deleted and can be accessed as usual.
 - Subsequently, when you define a new custom fiscal year, any existing forecasts, forecast history, forecast adjustments, and quotas for the corresponding standard fiscal year are lost.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To define or edit fiscal years:

- “Customize Application”

To view fiscal years:

- “View Setup and Configuration”

- If you use Customizable Forecasting, reports for a period after the last defined fiscal year can be grouped only by date, not by period.
- If you use Customizable Forecasting, to ensure your reports have the most updated amounts, view the forecast for the period included in the report before running a forecast report. If you use Collaborative Forecasts, it is not necessary to view the forecast before running reports.
- You can't use fiscal period columns in opportunity, opportunity with product, or opportunity with schedule reports.
- Opportunity list views will not include a fiscal period columns.
- When custom fiscal years are enabled, you can't use the `FISCAL_MONTH()`, `FISCAL_QUARTER()`, or `FISCAL_YEAR()` date functions in SOQL.

SEE ALSO:

[Set the Fiscal Year](#)[Customize the Fiscal Year Structure](#)[Customize the Fiscal Year Labels](#)[Choosing a Custom Fiscal Year Template](#)[Define a Custom Fiscal Year](#)

Set the Fiscal Year

If your company follows the Gregorian calendar year but you want to change the fiscal year start month, use standard fiscal years. If your company does not observe a standard fiscal year, you can enable custom fiscal years, which define a more complex fiscal year structure.

Warning:

- Users of Customizable Forecasting: If you change your fiscal start month, you can lose all quotas, forecast history, and overrides. To preserve your data, change to a month previously used as the first month in a quarter. For example, if your start month is April and you change it to May, which isn't a month that starts a fiscal quarter, you lose data. If you change it to July, which is a month that starts a fiscal quarter, you preserve your data.
- Users of Collaborative Forecasts: If you change your fiscal year start month, quota and adjustment information is purged.

1. Back up your current data and export it into a set of comma-separated values (CSV) files.

 **Tip:** Run a data backup export because changing the fiscal year causes fiscal periods to shift. This change affects opportunities and forecasts organization-wide.

2. From Setup, enter *Fiscal Year* in the `Quick Find` box, then select **Fiscal Year**.

3. Select `Standard Fiscal Year` or `Custom Fiscal Year`.

- To create a standard fiscal year, choose the start month and specify whether the fiscal year name is based on the year in which it begins or ends.

If you want to apply the new fiscal year settings to your existing forecasts and quotas, select `Apply to All Forecasts and Quotas`. This option might not be available depending on your forecast settings.

- To create a custom fiscal year, click **Enable Custom Fiscal Years**, click **OK** and define your fiscal year. See [Define a Custom Fiscal Year](#) on page 336

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To view fiscal year:

- "View Setup and Configuration"

To change fiscal year:

- "Customize Application"

 **Warning:** Custom fiscal years cannot be disabled once enabled. Enabling custom fiscal years has impacts on your reports, forecasts, quotas, and other date-sensitive material. Do not enable custom fiscal years unless you understand and are prepared for all the implications. For detailed information on the impact, see [Fiscal Years](#).

4. Click **Save**.

For specific information on both types of fiscal years, see [Fiscal Years](#) on page 330.

Customize the Fiscal Year Structure

If your custom fiscal year needs a different structure than one available from the [templates](#), modify the details of your custom fiscal year definition.

Custom fiscal years let you:

- [Customize the period labels](#)
- [Reset the fiscal year to a template](#)
- [Add or remove fiscal periods](#)
- [Change the length of a fiscal week](#)

 **Warning:** Changing the length of a fiscal year has an impact on forecasting and reporting. For detailed information on the impact, see [Fiscal Years](#).

Customizing the Period Labels

You can change labels, or names of your fiscal year periods. Forecasting and reporting also use these period labels. For information about changing them, see [Customize the Fiscal Year Labels](#) on page 333.

Resetting the Fiscal Year to a Template

During customization, if you want to return to a fiscal year template, select a template from the `Reset Fiscal Year Structure` drop-down list.

 **Note:** Resetting the fiscal year structure to a template removes all the customizations you made to the fiscal year.

Adding or Removing Fiscal Periods

You can easily add or remove fiscal periods (such as quarters, periods, or weeks) from the fiscal year structure.

To add fiscal periods:

1. From Setup, click **Company Profile > Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Select the checkbox for the period before the new period. For example, to add a quarter, and you want it to be the second quarter, select the checkbox for the first quarter.
5. Click **Insert**.

 **Note:** The maximum number of fiscal periods is 250.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

To view fiscal years:

- “View Setup and Configuration”

To remove a fiscal period:

1. From Setup, click **Company Profile > Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Select the checkbox for the period you want to delete.
5. Click **Delete**.

 **Note:** You must have at least one quarter, one period, and one week. If you delete a fiscal period or quarter, you also delete forecast adjustments and quotas for that period or quarter.

Changing the Length of a Fiscal Week

To change the length of fiscal periods:

1. From Setup, click **Company Profile > Fiscal Year**.
2. Click **Edit** for the fiscal year you want to edit.
3. If it is not already expanded, expand the **Advanced Customization** section.
4. Choose the length from the **Duration** drop-down list for the fiscal week.

 **Note:** To change the duration of a fiscal period or quarter, insert or delete weeks, or change the length of weeks that compose the period or quarter.

After you have customized your fiscal year, preview the fiscal year definition. Then, save your work.

Customize the Fiscal Year Labels

Customize the labels of your fiscal years in two ways: Naming schemes and prefix choices or fiscal year picklist customization.

Fiscal Year Naming Schemes and Prefix Choices

When defining a custom fiscal year, you can choose the labeling scheme to use for your custom fiscal year. Each fiscal period type (quarter, period, and week) has a list of labeling schemes that you can select.

Quarter Name Scheme

Numbered by Year

This option allows you to add the quarter number to the quarter label. The quarter label is a combination of the label for the quarter prefix and the quarter number. For example, if the quarter prefix is "Q", the label for the third quarter Q3. To customize the quarter prefix, see [Quarter Prefix](#) on page 334. By default the number for each quarter is set by their order (the first quarter is labeled "1"); customize it by selecting a different value from the quarter detail drop-down list.

Custom Quarter Names

This option allows you to set the quarter label to any name. The quarter label is set to the name you select from [Quarter Name](#). By default the order of the quarter names is the same as the picklist order; customize it by selecting a different value from the quarter detail drop-down list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com.

USER PERMISSIONS

To define or edit fiscal years:

- "Customize Application"

To view fiscal years:

- "View Setup and Configuration"

Period Name Scheme

Numbered By Year

This option allows you to set the period label based on its position in the year. The period label is a combination of the period prefix and the period number. Period numbers do not reset in each quarter. For example, if the period prefix is "P," the label for the sixth period is P6. To customize the `Period Prefix`, see [Period Prefix](#) on page 334. By default the number for each period is set by their order (the first period is labeled "1"); customize it by selecting a different value from the period detail drop-down list.

Numbered By Quarter

This option allows you to set the period label based on its position in the quarter. The period label is a combination of the period prefix and the period number. Period numbers reset in each quarter. For example, if the period prefix is "P," and the sixth period is the second period in the second quarter, its label is P2. To customize the period prefix, see [Period Prefix](#) on page 334. By default the number for each period is set by their order within the quarter (the first period in a quarter is labeled "1"); customize it by selecting a different value from the period detail drop-down list.

Standard Month Names

This option allows you to set the period label to the month name of the start of the period. For example, if a period started on October 12 and ends on November 10, the period label would be October.

Custom Period Names

This option allows you to set the period label to any string. The period label is set to the string you select from [Period Name](#). By default the order of the period names is the same as the picklist order, which you can customize by selecting a different value from the period detail drop-down list.

Fiscal Year Picklists

Review these custom picklists to customize the labels for your custom fiscal year.

Quarter Prefix

The quarter prefix picklist is a list of options for the text that prefixes the quarter number or name if your fiscal year uses the **Numbered By Year** quarter naming scheme. For example, if the fiscal quarter is called "Q4," the "Q" is the quarter prefix.

Period Prefix

The period prefix picklist is a list of options for the text that prefixes the period number or name if your fiscal year uses the **Numbered By Year** period naming scheme. For example, if the fiscal quarter is called "P4," the "P" is the period prefix.

Quarter Name

The quarter name picklist is a list of options for the quarter name if your fiscal year uses the **Custom Quarter Names** quarter naming scheme. For example, if you want to name your quarters for the seasons (Spring, Summer, Fall, and Winter), you could set the quarter name list to those values.

Period Name

The period name picklist is a list of options for the quarter name if your fiscal year uses the **Custom Period Names** quarter naming scheme. Similar to the quarter name picklist, you can choose meaningful names for the period name picklist.

Customizing Fiscal Year Names

To customize one of these picklists:

1. From Setup, click **Company Profile > Fiscal Year**.

2. Click **Edit** next to the appropriate picklist.

[Fiscal Years](#)

Choosing a Custom Fiscal Year Template

When defining a new custom fiscal year, your first step is to choose a custom fiscal year template. These templates are available to make it easier for you to define your custom fiscal year. They create a simple custom fiscal year that you can customize to meet your exact needs.

 **Note:** If you choose a template and realize that it is not the best one for your fiscal year definition, you can reset it at any time using the **Reset Fiscal Year Structure** option.

Choose one of three types of templates:

4 Quarters per Year, 13 Weeks per Quarter

Choose one of these templates for your fiscal year if you want each quarter to have the same number of weeks per quarter. These templates all have 4 quarters, 12 periods, and 52 weeks per year. Each quarter is 13 weeks long and is composed of three periods. Two of the periods in each quarter are 4 weeks, and one is 5 weeks. In a 4-4-5 template, for example, the first and second period of a quarter are 4 weeks long, and the third period is 5 weeks long. Weeks are always 7 days long. A typical customization for these templates is to add extra weeks for leap years.

4-4-5

Within each quarter, period 1 has 4 weeks, period 2 has 4 weeks, and period 3 has 5 weeks

4-5-4

Within each quarter, period 1 has 4 weeks, period 2 has 5 weeks, and period 3 has 4 weeks

5-4-4

Within each quarter, period 1 has 5 weeks, period 2 has 4 weeks, and period 3 has 4 weeks

13 Periods per Year, 4 Weeks per Period

Choose one of these templates if your fiscal year has more than 12 periods and if one quarter is longer than the other quarters. These templates all have 4 quarters per year, 13 periods per year, 3 or 4 periods per quarter, 53 weeks per year, and 4 weeks per period (5 weeks in the final period). Weeks generally have 7 days, but will include a short week at the end of a year. The most common customization for this type of template is to create or change the length of a short week.

3-3-3-4

Quarter 1 has 3 periods, quarter 2 has 3 periods, quarter 3 has 3 periods, and quarter 4 has 4 periods

3-3-4-3

Quarter 1 has 3 periods, quarter 2 has 3 periods, quarter 3 has 4 periods, and quarter 4 has 3 periods

3-4-3-3

Quarter 1 has 3 periods, quarter 2 has 4 periods, quarter 3 has 3 periods, and quarter 4 has 3 periods

4-3-3-3

Quarter 1 has 4 periods, quarter 2 has 3 periods, quarter 3 has 3 periods, and quarter 4 has 3 periods

Gregorian Calendar

12 months/year, standard Gregorian calendar.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**.

USER PERMISSIONS

To change your fiscal year:

- “Customize Application”

Unlike the other template styles, you cannot do advanced customization of a fiscal year that has been created from a Gregorian calendar template. You should only use this template if you want to create a fiscal year that follows the Gregorian calendar. This template mimics the functionality of standard fiscal years.

SEE ALSO:

[Fiscal Years](#)

Define a Custom Fiscal Year

Set up your company's custom fiscal years to fit your company's calendar. If you define a custom fiscal year and need to change it, edit the existing fiscal year definition.

Before defining a custom fiscal year, enable custom fiscal years. See [Set the Fiscal Year](#) on page 331 for more information.

Before defining or editing any custom fiscal years, be aware of its impact on forecasting, reports, and other objects by reviewing [Fiscal Years](#) on page 330.

Custom fiscal years cannot be deleted.

Define a New Custom Fiscal Year

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click **New**. The Custom Fiscal Year template dialog opens.
3. Choose a template and click **Continue** to close the Custom Fiscal Year template dialog. For more information on the templates, see [Choosing a Custom Fiscal Year Template](#) on page 335.
4. Set the fiscal year start date, the fiscal year name, and choose the week start day. You can also add a description for the fiscal year.

 **Note:** If this is the first custom fiscal year you have defined, the `Fiscal Year Start Date` and the `Week Start Date` are set to today's date and day of week. If you have already defined a custom fiscal year, they will be set to the day after the last end date of your custom fiscal years.

To make changes other than the start date, year name, or week start day, see [Customize the Fiscal Year Structure](#) on page 332.

5. Optionally, review the fiscal year definition by clicking on **Preview**.

If it is correct, close the preview and click **Save** to save your fiscal year, or **Save & New** to save your fiscal year and define another fiscal year.

 **Warning:** If your company uses forecasting, creating the first custom fiscal year deletes any quotas and adjustments in the corresponding and subsequent standard fiscal years.

Edit a Custom Fiscal Year

1. From Setup, click **Company Profile** > **Fiscal Year**.
2. Click a defined fiscal year name to review the details. Close the fiscal year preview to continue.
3. Click **Edit** for the fiscal year you want to edit.
4. Change the `Fiscal Year Start Date`, the `Fiscal Year Name`, `Description`, or `Week Start Day`.

EDITIONS

Available in: **Salesforce Classic**

Available in: **All Editions** except for **Database.com**.

USER PERMISSIONS

To view fiscal year:

- "View Setup and Configuration"

To change your fiscal year:

- "Customize Application"

If changing the `Fiscal Year Start Date` causes this fiscal year to overlap with the previous fiscal year, or if it creates a gap between the fiscal years, the end date of the previous fiscal year is changed to the day before the start of this fiscal year.

If changing the end date causes this fiscal year to overlap the next fiscal year, or if it creates a gap between the fiscal years, the start date of the next fiscal year changes to the day after the end of this fiscal year.

 **Note:** You cannot change the start or end date of a fiscal year that causes it to overlap with a fiscal year that is defined using a Gregorian year template.

 **Warning:** If you change the start or end date of any quarter, period, or week, all forecast data (including quotas, forecast history, and forecast adjustments) that are within that date range, and all forecasts for date ranges automatically adjusted as a result of that change, will be lost. This includes end or start date changes resulting from inserting or deleting periods.

5. Click **Preview**.
6. Review the fiscal year definition. If it is correct, close the preview and click **Save** to save your fiscal year. To make more detailed edits, see [Customize the Fiscal Year Structure](#) on page 332.

 **Note:** Unless you specify them, the fiscal year period labels for forecasting and reporting are set by the default label values for the fiscal year periods. To change them, see [Customize the Fiscal Year Labels](#) on page 333.

Set Up Search

Customize Search Settings

To change your org's search settings, enter `Search Settings` in the `Quick Find` box, then select **Search Settings**.

Search Settings

Field	Description
Enable "Limit to Items I Own" Search Checkbox	<p>If this setting is enabled, the <code>Limit to Items I Own</code> option is available to users. The option allows users to include only records for which they are the record owner when entering search queries in the sidebar.</p> <p> Note: The <code>Limit to Items I Own</code> option that appears in advanced search is always available to users, regardless of this setting.</p>
Enable Document Content Search	<p>If this setting is enabled, users can perform a full-text document search. When a new document is uploaded or an old one is replaced, its contents are available as search terms to retrieve the document. This setting applies only to searches for the document object.</p>

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To modify search settings:

- "Customize Application"

Field	Description
Enable Search Optimization if your Content is Mostly in Japanese, Chinese, or Korean	<p>If this setting is enabled, search is optimized for the Chinese, Japanese, and Korean languages in the sidebar search. It affects sidebar search and the account search for Find Duplicates on a lead record in sidebar search and global search.</p> <p> Note: Enable this option only if users are searching mostly in Chinese, Japanese, or Korean, and if the text in searchable fields is mostly in those languages. Don't enable this option if you expect content and searches to be mostly in other languages.</p>
Use Recently Viewed User Records for Blank and Auto-Complete Lookups	<p>If this setting is enabled, the list of records that are returned from a user auto-complete lookup and from a blank user lookup is taken from the user's recently viewed user records. This setting applies only to lookups in the <i>user</i> object.</p> <p>If this setting isn't enabled, the dialog box shows a list of recently accessed user records from across the org.</p>
Enable Drop-Down List for Sidebar Search	<p>If this setting is enabled, a drop-down appears for users to choose whether to search within tags, within a specific object, or across all objects.</p>
Enable Sidebar Search Auto-Complete	<p>If this setting is enabled, when users start typing search terms, sidebar search displays a matching list of recently viewed records.</p>
Enable Single-Search-Result Shortcut for Sidebar and Advanced Search	<p>If this setting is enabled, users skip the search results page and go directly to the record's detail page when their search returns only a single item.</p> <p> Note: This setting doesn't apply to tags, case comments (in advanced search), and global search. If the search result is a single tag, case comment, or item in global search, the search results page still appears.</p>
Number of Search Results Displayed Per Object	<p>The Number of Search Results Displayed Per Object area allows you to configure the number of items that are returned for each object in the Search Results page.</p>
Lookup Settings	<p>The Lookup Settings area allows you to enable enhanced lookups and lookup auto-completion for enhanced lookup-enabled objects and any custom object lookups.</p>

[Guidelines for Making Search Faster](#)

Searchable Objects and Fields

Salesforce searches a unique set of fields for each object.

 **Note:** When you search for a value in a field that's hidden from you by field-level security, your results include the record that contains the field. However, you can't see the field.

[Searchable Fields by Object in Lightning Experience](#)

The records included in search results depend on whether the record's object type and its fields are searchable. If you search for an object with a value that's stored in a field that isn't searchable, your desired object doesn't appear in your search results.

[Searchable Fields by Object in Salesforce Classic](#)

Each search type—sidebar, advanced, global, and lookup—searches a unique set of fields for each object. Your search results for a particular object depend on two factors: the type of search and the searchable fields for that object.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The types of records you can search vary according to the edition you have.

Searchable Fields by Object in Lightning Experience

The records included in search results depend on whether the record's object type and its fields are searchable. If you search for an object with a value that's stored in a field that isn't searchable, your desired object doesn't appear in your search results.

 **Note:** When you search for a value in a field that's hidden from you by field-level security, your results include the record that contains the field. However, you can't see the field.

Reference the table to determine which objects you can find with a search. If an object has custom fields, you can find records of that object with the custom field values.

Not all object and fields are searchable, so see the table.

EDITIONS

Available in: Lightning Experience

The types of records you can search vary according to the edition you have.

Searchable Fields by Object in Salesforce Classic

Each search type—sidebar, advanced, global, and lookup—searches a unique set of fields for each object. Your search results for a particular object depend on two factors: the type of search and the searchable fields for that object.

For example, consider an account that contains "Acme" in its `Description` field. The `Description` field isn't queried by standard lookup search, but is queried by global search and enhanced lookup search when **All Fields** is selected. So a search for Acme returns this account record only if you use either global search or enhanced lookup search with **All Fields** selected.

A few things to note about searchable fields:

- Global search finds more fields per object compared to other search types.
- By default, enhanced lookups query a limited set of fields, primarily `Name` fields for each object. If available in the enhanced lookup search dialog, select **All Fields** and enter other search terms unique to the record, to search through all searchable fields.
- You can't search encrypted, formula, and lookup fields.

 **Note:** When you search for a value in a field that's hidden from you by field-level security, your results include the record that contains the field. However, you can't see the field.

This table shows the types of search supported for each object. Not all object and fields are searchable for every type, so follow the links to see the list of searchable fields for each object.

Searchable Fields: External Object

An external object accesses data that's stored outside your Salesforce org. Your Salesforce admin controls which external objects are searchable. Which external object fields are searched depends on how the external system handles searches. If the search results aren't as you expected, use case-sensitive search strings that contain only alphanumeric characters. If the results still aren't as expected, contact your admin for recommendations on searching your specific external system.

Customize Users' Search Results Filters

1. On the Search Results page, in an object's related list, click **Customize...** > **Filters for All Users**.
Alternatively, from the management settings for an object, go to Search Layouts, and then click **Edit** for **Search Filter Fields**.
2. To choose columns, use **Add** and **Remove**.
3. To reorder columns, use **Up** and **Down**.
4. Click **Save**.

EDITIONS

Available in: Salesforce Classic

The available fields vary according to which Salesforce edition you have.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

USER PERMISSIONS

To change search layouts:

- "Customize Application"

 **Note:** Search result filters defined for an object in the internal organization also apply for search results for that object in communities.

SEE ALSO:

[Find Object Management Settings](#)

Configure Lookup Search

Customize which columns appear to users in the lookup search results.

[Configure Lookup Search in Salesforce Classic](#)

Enable enhanced lookups and lookup auto-completion and customize lookup filter fields.

[Configure Lookup Dialog Search in Lightning Experience](#)

Customize which columns appear to users in the lookup dialog search results using the Search Results search layout customization setting. Users aren't able to filter using these columns. They are intended to provide contextual help for determining which record to associate.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions except Database.com**

Configure Lookup Search in Salesforce Classic

Enable enhanced lookups and lookup auto-completion and customize lookup filter fields.

[Enable Enhanced Lookups](#)

Enable enhanced lookups so users can use wildcards in their lookups and sort, filter, and page through their results. Enhanced lookups are available for the Business Account, Contact, Custom Object, Opportunity, Person Account, User, Work Order, and Work Order Line Item objects.

[Specify Lookup Search Filter Fields](#)

After enabling enhanced lookups, specify which fields users can use to filter lookup search results. If you don't specify any fields, your users can't use filters in enhanced lookup dialogs.

[Enable Lookup Auto-Completion](#)

Enable lookup auto-completion so users can select items from a dynamic list of matching, recently used records when editing a lookup field. It's supported for account, contact, user, opportunity, and custom object lookups.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

Enable Enhanced Lookups

Enable enhanced lookups so users can use wildcards in their lookups and sort, filter, and page through their results. Enhanced lookups are available for the Business Account, Contact, Custom Object, Opportunity, Person Account, User, Work Order, and Work Order Line Item objects.

 **Note:** Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren't required to add the tab for display.

1. From Setup, enter *Search Settings* in the *Quick Find* box, then select **Search Settings**.
2. In the Lookup Settings area, select the objects for which you want to enable enhanced lookup functionality. Currently, only account, contact, user, and custom object lookups can use this feature.
3. Click **Save**.

After enabling enhanced lookups, specify which fields users can use to filter lookup search results. If you don't specify any fields, your users can't use filters in enhanced lookup dialogs. Fields configured to use enhanced lookups don't support single character searches (except for searches in Chinese, Japanese, Korean, and Thai) or wildcards at the beginning of search terms.

 **Note:** If you enable enhanced lookups in your org, it is also enabled for any Visualforce pages you create.

SEE ALSO:

[Configure Lookup Search in Salesforce Classic](#)

Specify Lookup Search Filter Fields

After enabling enhanced lookups, specify which fields users can use to filter lookup search results. If you don't specify any fields, your users can't use filters in enhanced lookup dialogs.

1. From the management settings for accounts, contacts, opportunities, users, or custom objects, go to Search Layouts.
2. For the Lookup Filter Fields layout, click **Edit**.
3. Use the arrows to add or remove fields from the layout and to define the order in which the fields should display. You can add up to six filter fields to the Selected Fields list. To select more than one field, use CTRL+click, or SHIFT+click to select multiple items in a range.
4. Click **Save**.

Enable Lookup Auto-Completion

Enable lookup auto-completion so users can select items from a dynamic list of matching, recently used records when editing a lookup field. It's supported for account, contact, user, opportunity, and custom object lookups.

1. From Setup, enter *Search Settings* in the *Quick Find* box, then select **Search Settings**.
2. In the Search Settings area, select the object lookups for which you want to enable auto-completion. Currently, only account, contact, opportunity, user, and custom object lookups can use this feature.
3. Click **Save**.

SEE ALSO:

[Configure Lookup Search in Salesforce Classic](#)

Configure Lookup Dialog Search in Lightning Experience

Customize which columns appear to users in the lookup dialog search results using the Search Results search layout customization setting. Users aren't able to filter using these columns. They are intended to provide contextual help for determining which record to associate.

Use **Search Results** under the **Search Layouts** customization setting to change which fields appear in the search results for both global search and lookup dialog search. You don't need to separately update **Lookup Dialogs**.

The order of fields in the search layout also affects the secondary field displayed in instant results. The second usable field as chosen in this step appears as the secondary field in instant results. Examples of unusable fields are HTML-formatted fields, inline image fields, or long-text fields.

SEE ALSO:

[Find Object Management Settings in Lightning Experience](#)

Guidelines for Reducing Search Crowding

Are users reporting that records aren't appearing in their search results? Use these guidelines to help your users find the record they need.

The search engine applies limits to the number of records analyzed at each stage of the search process. Limits are important because they help maintain performance and don't overwhelm the user with irrelevant records. However, users don't always find all possible matching results because the record that they're looking for falls outside the result limit. This behavior is called search crowding or truncation. Search crowding typically happens when:

- Users have limited permissions or access to records. Therefore, the records they do have access to might not be part of the results set that is filtered by access permissions.
- Users search using a term that matches a huge number of records. Because the search matches so many records, the search engine can't determine what specific record the user is searching for.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions except Database.com**

USER PERMISSIONS

To enable lookup auto-completion:

- "Customize Application"

To use lookup auto-completion:

- "Edit" on the record that includes the lookup field

EDITIONS

Available in: **All Editions except Database.com**

USER PERMISSIONS

To specify lookup filter fields:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions except Database.com**

The search engine relevancy algorithms and sharing permissions decide the records returned in search results and the order of the results. To avoid search crowding and truncation:

Encourage users to use more specific search terms

Searches work best when users enter a unique search term. *Acme Company San Francisco* returns more relevant results than *Acme*.

Encourage users to narrow the search scope

When users are on the search results page, limit the search scope to the object type for the record desired. The search is rerun. Potentially, users could see more results, because the full result set limit is applied against a single object.

Create list views

Create a list view for a specific set of contacts, documents, or other object records that you search for repeatedly. List views have no limits to the number of records and have a set order. Sharing rules are also applied.

SEE ALSO:

[SOSL Limits](#)

Guidelines for Making Search Faster

Follow these guidelines to help your users find information faster.

Records are included in search results only if the object's field that contains the information matching the search term is searchable.

After a searchable object's record is created or updated, it could take about 15 minutes or more for the updated text to become searchable.

To make searches faster across your org:

Disable search for custom objects that your users aren't actively searching

Choose which custom objects your users can search by enabling the **Allow Search** setting on the custom object setup page. If you don't need a custom object's records to be searchable, disable search for that custom object. Making a custom object searchable when you don't need your users to find its records slows down searches across your org.

By default, search is disabled for new custom objects. Disabling search doesn't affect reports and list views.

 **Note:** Custom object records are searchable in the Salesforce user interface only if the custom object is associated with a custom tab. Users aren't required to add the tab for display.

Disable search for external objects that your users aren't actively searching

To disable search for an external object, deselect **Allow Search** on its setup page. To include an external object in SOSL and Salesforce searches, enable search on both the external object and the external data source.

By default, search is disabled for new external objects. However, you can validate and sync an external data source to automatically create external objects. Syncing always enables search on the external object when search is enabled on the external data source, and vice versa.

As with custom objects, unnecessarily making an external object searchable can slow down searches across your org.

Avoid making significant changes to your org at once

Creating or updating many records at the same time, such as via data imports, increases the time it takes for each record to become searchable. If you have a large org with many users who frequently make simultaneous updates, schedule bulk uploads and background processes to run during non-peak hours.

State and Country Picklists

State and Country Picklists

State and country picklists let users select states and countries from predefined, standardized lists, instead of entering state and country data into text fields. State and country picklists offer faster and easier data entry. They help to ensure cleaner data that can be leveraged for other uses—in reports and dashboards, for example. They protect data integrity by preventing typos, alternate spellings, and junk data—even in records updated through the API. The states and countries in the picklists are based on ISO-3166 standard values, making them compatible with other applications.

State and country picklists are available in the shipping, billing, mailing, and “other” address fields in the account, campaign members, contact, contract, lead, order, person accounts, quotes, and service contracts standard objects. The picklists are also available for managing users and companies in Setup. To use the picklists, first choose the country and then choose from the options that automatically populate the state or province picklist.

You can use the state and country picklists in most places that state and country fields are available in Salesforce, including:

- Record edit and detail pages
- List views, reports, and dashboards
- Filters, functions, rules, and assignments

State and country picklists can also be searched, and they’re supported in Translation Workbench.

State and Country Picklist Limitations

State and country picklists include 239 countries by default. They also include the states and provinces of the United States, Canada, Australia, Brazil, China, India, Ireland, Italy, and Mexico. State and country picklists that contain more than 1,000 states or countries can cause degraded performance. State and country picklists do not work with:

- Salesforce to Salesforce
- Salesforce Classic Mobile
- Connect Offline
- Visual Workflow or change sets
- Custom indexes

If your org uses Data.com, the Data.com records can contain states and countries not included in the standard state and country picklists. You need to add these states and countries to the picklist before Data.com users can add or clean these records. The states and countries that you need to add to the picklist, if your org uses them, are:

- American Samoa (AS)
- Guam (GU)
- Hong Kong (HK)
- Marshall Islands (MH)
- Netherlands Antilles (AN)
- Northern Mariana Islands (MP)
- Serbia and Montenegro (CS)
- United States Minor Outlying Islands (UM)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except Database.com

Picklist labels, not code values, are displayed in reports on state and country fields. To display code value abbreviations wherever your users see state or country names, manually change your State Name or Country Name labels to your code values. (For editing instructions, see [Configure State and Country Picklists](#) on page 385.) You can access your records' state and country code values by using the `StateCode` and `CountryCode` fields in Workbench or the Data Loader.

Implementing State and Country Picklists

Here's how to transition from text-based state and country fields to state and country picklists.

1. [Configure the state and country values you want to use in your org.](#)

This step is strongly recommended because it gives you the opportunity to customize state and country values. It ensures that state and country data continues to work with the third-party systems you have integrated with Salesforce.

2. [Scan your org's data and customizations to see how they'll be affected by the switch.](#)

Convert data and update customizations, such as list views, reports, and workflow rules, so that they continue to work with the new field type.

3. [Convert existing data.](#)

The conversion process lets you map the various values in your org to standard picklist values. For example, you might want to map U.S., USA, and United States to US.

4. [Turn on the picklists for your users.](#)

If you turn on state and country picklists without configuring values, scanning your org, and converting existing data, users can use the picklists in new records. However, all existing data is incompatible with the new format, which could compromise data consistency and integrity across the two field formats.

5. Optionally, rescan and fix customizations or records that have been created or edited since your first scan.

For a step-by-step guide to implementing state and country picklists, see [Implementing State and Country Picklists](#).

Integration Values for State and Country Picklists

An integration value is a customizable text value that is linked to a state or country code. Integration values for standard states and countries default to the full ISO-standard state and country names. Integration values function similarly to the API names of custom fields and objects. Configuring integration values allows integrations that you set up before enabling state and country picklists to continue to work.

When you enable state and country picklists, your text-typed `State/Province` and `Country` fields are repurposed as `Integration Value` fields. In reports and list views, your `Integration Value` fields are called `State/Province (text only)` and `Country (text only)`. In addition, for each of your `State/Province (text only)` and `Country (text only)` fields, a picklist-typed `State Code` or `Country Code` field is created. The state and country picklist values set up in your organization determine the available values on these code fields.

Among the fields on each state or country picklist value are `Active`, `Visible`, `Name`, `Code`, and `Integration Value`. All of your state and country picklists—for `Billing Address`, `Shipping Address`, and so on—can access the state and country picklist values you create. Storing a state or country code allows your records to access other information about your states and countries.

By default, `Name` and `Integration Value` fields for your states and countries contain identical values. The value in the `Name` field displays to users who interact with your picklist. `Integration Value` is used by:

- Apex classes and triggers

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

- Visualforce pages
- SOQL queries
- API queries and integrations
- Rules for assignment, AutoResponse, validation, and escalation
- Workflow rules
- Email templates
- Custom buttons and links
- Field set customizations
- Reports and list views

When you update a code value on a record, that record's `State/Province (text only)` or `Country (text only)` column is populated with the corresponding integration value. Likewise, when you update a state or country `(text only)` column with a valid integration value, we keep the corresponding state or country code column in sync. You can change your organization's integration values after you enable state and country picklists. However, when you update your picklists' state and country integration values, the integration values on your records aren't updated. Name values aren't stored on records. Instead, they're retrieved from Salesforce based on a record's `State Code` or `Country Code` value. If the states or countries in your picklists have different field values for `Name` and `Integration Value`, make sure your report or list view filters use the correct values. Use names in `State` and `Country` filters, and use integration values in `State (text only)` and `Country (text only)` filters. Otherwise, your reports can fail to capture all relevant records.

Edit your integration values in Setup or using the Metadata API. States' and countries' `Name` fields are editable only in Setup. In the Metadata API, `Name` and `Integration Value` fields are called `label` and `integrationValue`, respectively.

Configure State and Country Picklists

Configuring state and country picklists means choosing which states and countries you want to be available in your Salesforce org. It lets you make state and country picklists available for purposes like importing data, working with external systems, and accessing picklist data from the Metadata API.

Configuring picklists is not required for you to enable state and country picklists for users, but it's highly recommended. Configuring picklists helps ensure continuity and data integrity with existing state and country data and customizations.

When configuring states and countries, you start with countries and drill down to their states or provinces. State and country picklists include 239 countries by default. They also include the states and provinces of the United States, Canada, Australia, Brazil, China, India, Ireland, Italy, and Mexico. State and country picklists that contain more than 1,000 states or countries can cause degraded performance. For the complete list of default countries, see [Standard Countries for Address Picklists](#).

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except Database.com

USER PERMISSIONS

To configure state and country picklists:

- "Modify All Data"

 **Note:**

- Integration values for state and country picklists can also be configured through the Metadata API. For more information, read about the `AddressSettings` component in the *Metadata API Developer Guide*.
- State and country picklists aren't supported in Salesforce change sets or packages. However, you can move integration value changes for state and country picklists between sandbox and production orgs by using the Metadata API. First, configure your state and country picklists in your sandbox org. Then, use the Metadata API to retrieve the sandbox configurations, and deploy them to your production org.

1. From Setup, enter *State and Country Picklists* in the `Quick Find` box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Configure states and countries**.
3. Select from the following options:

Active

Makes the country available in the Metadata API so that records that contain the country can be imported. However, unless you also set it as visible, the country isn't available to users in Salesforce.

Visible

Makes the country available to users in Salesforce. A country has to be active before you can make it visible.

4. Click **Edit** to view and edit details for the country, including to configure its states or provinces.
5. (Optional) Under `Picklist Settings`, select a `Default Country`. The `Default Country` automatically populates country picklists for new records in your org, but users can select a different country. Default countries must be both active and visible.
6. Click **Save** to save your configuration.

 **Note:** Active states and countries not marked `visible` are still valid filter lookup values. You can use invisible states and countries when creating filters in reports, list views, workflows, and so on.

Edit State and Country Details

You can add states and countries to your organization or edit the values of existing states and countries on a state or country's detail page. To add or edit a state or province, navigate to its detail page through the detail page of its associated country.

1. From Setup, enter *state* in the **Quick Find** box, then select **State and Country Picklists**.
2. Click **Configure states and countries**.
3. Click **New Country** to add a country or click **Edit** for a listed country.
4. Under Country Information, specify your options.

Country Name

By default, the ISO-standard name. The name is what users see in the Salesforce user interface.

Country Code

By default, the two-letter ISO-standard code. If you change an ISO code, the new value must be unique. Codes are case insensitive and must contain only ASCII characters and numbers. You can't edit the ISO codes of standard states or countries. You can edit the country codes of custom states and countries only before you enable those states and countries for your users.

Integration Value

A customizable text value that is linked to a state or country code. Integration values for standard states and countries default to the full ISO-standard state and country names. Integration values function similarly to the API names of custom fields and objects. Configuring integration values allows integrations that you set up before enabling state and country picklists to continue to work.

You can edit integration values to match values that you use elsewhere in your organization. For example, let's say that you have a workflow rule that uses *USA* instead of the default *United States* as the country name. If you manually set the integration value for country code *US* to *USA*, the workflow rule doesn't break when you enable state and country picklists.

When you update a code value on a record, that record's *State/Province (text only)* or *Country (text only)* column is populated with the corresponding integration value. Likewise, when you update a state or country (*text only*) column with a valid integration value, we keep the corresponding state or country code column in sync. You can change your organization's integration values after you enable state and country picklists. However, when you update your picklists' state and country integration values, the integration values on your records aren't updated. Name values aren't stored on records. Instead, they're retrieved from Salesforce based on a record's *State Code* or *Country Code* value. If the states or countries in your picklists have different field values for *Name* and *Integration Value*, make sure your report or list view filters use the correct values. Use names in *State* and *Country* filters, and use integration values in *State (text only)* and *Country (text only)* filters. Otherwise, your reports can fail to capture all relevant records.

Active

Makes the country available in the Metadata API so that records can be imported that contain the country. However, unless you also set it as visible, the country isn't available to users in Salesforce.

Visible

Makes the country available to users in Salesforce. A country must be active before you can make it visible.

5. If you're adding a country, click **Add**.
6. If you're editing a country, specify the options for States:

Active

Makes the state available in the Metadata API so that records can be imported that contain the state. However, unless you also set it as visible, the state isn't available to users in Salesforce.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

USER PERMISSIONS

To add or edit state or country details:

- "Modify All Data"

Visible

Makes the state available to users in Salesforce. A state must be active before you can make it visible.

7. Click either of the following, if desired.
 - **New State** to add a custom state or province. On the New State page, specify a `State Name`, `State Code`, and `Integration Value`, and select whether the new state is `Active` or `Visible`. To save the new state, click **Add**.
 - **Edit** to view and edit state or province details, including the `State Name`, `State Code`, and `Integration Value`.
8. Click **Save**.

[Configure State and Country Picklists](#)

[State and Country Picklists](#)

[Integration Values for State and Country Picklists](#)

[State and Country Picklists and the Metadata API](#)

State and Country Picklists and the Metadata API

If you're editing many state and country picklist integration values, using the Metadata API is more efficient than editing values in Setup.

You can use the Metadata API to edit existing states and countries in state and country picklists. You can't use the Metadata API to create or delete new states or countries. First, configure your state and country picklists in your sandbox org. Then, use the Metadata API to retrieve the sandbox configurations, and deploy them to your production org. Search for "AddressSettings" in the [Metadata API Developer Guide](#) for information about working with state and country picklists in the Metadata API.

[Integration Values for State and Country Picklists](#)

[Edit State and Country Details](#)

Prepare to Scan State and Country Data and Customizations

Before switching from text-based state and country fields to standardized state and country picklists, scan your org to see how the change will affect it. This discovery process shows you where and how state and country data appears in your org. The process also shows where this data is used in customizations, such as list views and reports. After you've analyzed the scan results, you can plan to convert your data, update your customizations, and turn on state and country picklists.

Every org's discovery process is unique. For some orgs, transitioning from state and country text fields to standardized picklists is straightforward and manageable. However, if state and country metadata is used extensively throughout an org, the transition can be a complicated and time-consuming process. Salesforce recommends that you scan your org early and often so that you can transition smoothly to the new lists. Keep these best practices and considerations in mind.

- Scanning doesn't convert data or fix your customizations. Convert your data separately, and update your customizations individually.
- You can continue to work normally in your org during the scan.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

- The scanning process identifies affected managed packages but doesn't provide a mechanism for addressing packaging issues.
- Scanning doesn't find formulas that include state and country metadata.
- You can't use display values in validation rules or workflow rules that use comparison formula functions. If your validation or workflow rules on state or country fields use `BEGINS`, `CONTAINS`, `ISCHANGED`, or `REGEX`, use `ISPICKVAL` with state and country code values in your comparison functions.
- Scanning doesn't find personal list views and reports that use state and country metadata. Individual users must update those customizations themselves.
- Converted leads aren't scanned. State and country values aren't updated on converted lead records when you enable state and country picklists.
- Scan your org multiple times. After you update a customization, rescan to make sure that your changes fixed the problem and didn't create new ones.

SEE ALSO:

[Scan State and Country Data and Customizations](#)

[State and Country Picklists](#)

Scan State and Country Data and Customizations

Scanning an organization for text-based state and country values reveals where and how text-based state and country data appears in existing records. For example, you can see all the ways United States is saved as a text value, such as U.S., US, America, Estados Unidos, and even misspelled entries like Untied States. In addition, scanning shows you where state and country data is used in customizations, including:

- List views
- Reports
- Validation rules
- Custom buttons and links
- Workflow rules
- Email templates
- Field sets
- Apex classes and triggers
- Visualforce pages

When the scan is complete, you receive two emails with links to detailed reports: one on address data and one on customizations. After analyzing the reports, begin the tasks of converting existing data to picklist values and updating customizations so that they work with the new picklist fields.

1. From Setup, enter *State and Country Picklists* in the `Quick Find` box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Scan Now** and then click **Scan**.

[State and Country Picklists](#)

Prepare to Convert State and Country Data

If your Salesforce organization includes text-based state and country values, you can convert that data to standardized picklist values. Converting existing data allows you to keep working with the data after you switch to picklists. Say, for example, you have a report that culls all of your sales reps' leads in Washington state, and the report is generated from state picklist value Washington. To ensure that records with text-based state values such as Wash., WA, and Washington are included in the report, convert text-based state data to standardized picklist values.

Converting existing state and country text data into standardized picklist values helps ensure data integrity after you enable picklists in your organization. Your users encounter validation errors when

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except Database.com

saving records that contain state or country values not in your picklists. Also, reports become unreliable when records created before you enable state and country picklists contain different state and country values than records created using picklists.

When you convert data, Salesforce starts with countries, then goes on to states. As you go through the conversion process, here are a few things to keep in mind:

- Save frequently. You can exit the conversion tool and return to it at any time.
- You can continue to work normally in your organization while converting data.
- You can't convert data while you're scanning for affected data and customizations, or while state or country picklists are being deployed.
- Steps can be repeated and undone at any time until you enable the picklists for users. After the picklists are enabled, you can't undo the conversion.
- If you use Data.com Clean, we recommend that you suspend Clean jobs until the conversion is finished.

SEE ALSO:

[Convert State and Country Data](#)
[State and Country Picklists](#)

Convert State and Country Data

To convert text-based state and country data to picklist-compatible values, select specific text values and choose the standard values you want to map them to. For example, you can select all occurrences of "USA" and change them to "United States."

Before you convert state and country values in State and Country Picklists setup, [configure the picklists for your org](#). That way, when picklists are enabled, all new and updated records use your specified integration value, helping to ensure consistent and accurate data in your org.

Convert countries first, and then states and provinces.

You can convert up to 2,000 country values and up to 2,000 state values, but state and country picklists that contain more than 1,000 states or countries can degrade performance.

1. From Setup, enter *State and Country Picklists* in the Quick Find box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Convert now**. Salesforce opens the Convert Countries page. This page displays all the country text values that appear in your org and the number of times each value is used.
3. Select **Change** for one or more values you want to convert. For example, select **Change** for all the iterations of United States.
4. In the **Change To** area, choose the country you want to convert the text values to and click **Save to Changelist**.

 **Note:** If you map states or countries to `Unknown` value, users see states and countries in their records. However, your users encounter errors when they save records, unless they change each state or country to a valid value before saving.

5. Repeat Steps 3 and 4 for other country values, such as for Canada. Salesforce tracks planned changes in the Changelist area.
6. When all of the countries are mapped, click **Next** to convert state values. Use the Country of Origin column to identify the country associated with that state or province.
7. On the Confirm Changes page, click **Finish** to return to the setup overview page or **Finish and Enable Picklists** to convert the values and turn on state and country picklists in your org.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except Database.com

USER PERMISSIONS

To convert text-based state and country data:

- "Modify All Data"

A few words about undo:

- On the Convert Countries or Convert States page, click **Undo** at any time to revert values in the changelist.
- On the Convert States page, click **Previous** to return to the Convert Countries page and change country mappings.
- You can convert state and country values even after clicking **Finish**. After picklists are enabled, however, you can no longer edit your conversion mappings.

SEE ALSO:

[State and Country Picklists](#)

Enable and Disable State and Country Picklists

When you enable state and country picklists, the picklists are immediately available to users. However, it can take some time for Salesforce to populate the ISO code fields on existing records. If users try to edit the state or country on a record before the code field is populated, they are prompted to select a code value.

1. From Setup, enter *State and Country Picklists* in the Quick Find box, then select **State and Country Picklists**.
2. On the State and Country Picklists setup page, click **Enable** to turn on the picklists.

Note:

- You can also enable state and country picklists when you finish converting existing, text-based data to picklist values. See [Convert State and Country Data](#).

3. To turn off state and country picklists, click **Disable** on the State and Country Picklists setup page.

Important:

- If you disable state and country picklists:
 - For records that you haven't saved since enabling picklists, state and country values revert to their original text values.
 - For records that you have saved since enabling picklists, state and country integration values replace original text values.
 - References to state and country picklists in customizations—such as workflow field updates, email templates, and Visualforce pages—become invalid.
 - Columns and filters that refer to picklist fields in reports and list views disappear.

- “Modify All Data”

State and Country Picklist Field-Syncing Logic

When you save records with state and country picklist values, Salesforce syncs the records' integration and code values for states and countries. You can't directly edit state or country integration values on record detail pages. You can directly edit records' state or country integration values only with workflows, Apex code, API integrations, and so on.

Your Change	Result
You update a record's state or country code to a valid value.	Salesforce updates the record's state or country integration value to match the code.
You update a record's state or country integration value to a valid value.	Salesforce updates the record's state or country code to match the integration value.
You remove a record's country code, but don't remove the corresponding state code.	Salesforce removes the record's state code, as well as the state and country integration values.
You create or update a record with state and country values. The new state isn't in the new country.	No changes are saved. You get an error message.
You update the state or country integration and code values on an existing record. The new integration and code values don't match.	No changes are saved. You get an error message.
You create a record with mismatched state or country integration and code values.	Salesforce updates your new record's integration value to match the code value.

[State and Country Picklist Error Messages](#)

State and Country Picklist Error Messages

When you try to save records with mismatched code and text values for states or countries, various errors can occur. This information demystifies those error messages.

Error	Cause
Invalid country specified for field	Your country code doesn't match an existing country.
There's a problem with this country, even though it may appear correct. Please select a country from the list of valid countries.	Your country integration value doesn't match an existing country. Or, the country value was mapped to <code>Unknown</code> value during data conversion.
Mismatched integration value and ISO code for field	Your code and integration values match different states or countries.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except Database.com

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** Editions except Database.com

Error	Cause
A country must be specified before specifying a state value for field	Your record has a state code or integration value but no country code. You can't save a state without a corresponding country.
The existing country doesn't recognize the state value for field	Your state code and integration values belong to a state in a different country.
Invalid state specified for field	Your state code doesn't match an existing state.

Customize User Interface Settings

Modify your org's user interface by enabling or disabling these settings.

1. From Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface**.
2. Modify the settings for your org.
3. Save your changes.

User Interface Settings

Enable Collapsible Sections

Collapsible sections let users collapse or expand sections on their record detail pages by using the arrow icon next to the section heading. When enabling collapsible sections, make sure your section headings are displayed for each page layout. Sections remain expanded or collapsed until the user changes the settings for that tab. If your org has enabled record types, Salesforce remembers a different setting for each record type.

Show Quick Create

The Quick Create area on a tab home page allows users to create a record quickly with minimal information. It displays by default on the tab home pages for leads, accounts, contacts, forecasts, and opportunities. You can control whether the Quick Create area is displayed on all relevant tab home pages.

 **Note:** The **Show Quick Create** setting also affects whether users can create records from within the lookup dialog. Creating records in the lookup dialog is available only if Quick Create is available for your chosen record type. In addition, users always need the appropriate "Create" permission to use Quick Create even though it displays for all users.

Enable Hover Details

Hover detail displays an interactive overlay containing record details. Details appear when users hover over a link to that record in the Recent Items list on the sidebar, or in a lookup field on a record detail page. Users can quickly view information about a record before clicking to view or edit the record. The record's mini page layout determines which fields are included in the hover details. Users can't customize which fields appear. This option is enabled by default.

 **Note:** To view hover details for a record, users need the appropriate sharing access, and field-level security access for the fields in the mini page layout.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The available user interface settings vary according to which Salesforce Edition you have.

USER PERMISSIONS

To modify user interface settings:

- "Customize Application"

Enable Related List Hover Links

Related list hover links display at the top of record detail pages and custom object detail pages in Setup. Users can hover over a related list link to display the list and its number of records in an interactive overlay. Users quickly view and manage the related list items from the overlay. Users can also click a related list hover link to jump to the related list without having to scroll down the page. This option is enabled by default.

Enable Separate Loading of Related Lists

When enabled, users see primary record details immediately. As the related list data loads, users see a progress indicator. Separate loading can improve performance on record detail pages for orgs with large numbers of related lists. This option is disabled by default. The options for separately loading related lists don't apply to Visualforce pages, the Self-Service portal, or other pages for which you can't control the layout.

Enable Separate Loading of Related Lists of External Objects

When enabled, related lists of external objects are loaded separately from primary record details and related lists of standard and custom objects. External objects behave similarly to custom objects, except that they map to data that's stored outside your Salesforce organization. It can take awhile to retrieve data from an external system, depending on the network latency and availability of the external system. The `Enable Separate Loading of Related Lists of External Objects` option is conveniently selected by default. The options for separately loading related lists don't apply to Visualforce pages, the Self-Service portal, or other pages for which you can't control the layout.

Enable Inline Editing

Inline editing lets users quickly edit field values, right on a record's detail page. This option is enabled by default and applies to all users in your org.

Note: This option doesn't enable inline editing for profiles. Select `Enable Enhanced Profile List Views` under Setup.

Enable Enhanced Lists

Enhanced lists give you the ability to quickly view, customize, and edit list data to speed up your daily productivity. When enabled with the `Enable Inline Editing` setting, users can also edit records directly from the list, without navigating away from the page. This option is enabled by default.

Note: To enable enhanced lists for profiles in particular, select `Enable Enhanced Profile List Views` under Setup.

Enable the Salesforce Classic 2010 User Interface Theme

This option is not related to Lightning Experience. In this case, "Salesforce Classic 2010 user interface theme" refers to the newer version of Salesforce Classic, which is the interface that immediately precedes Lightning Experience. Enabling this option turns on the updated Salesforce Classic look and feel. Disabling it turns on the Salesforce Classic 2005 user interface theme—the *classic*, *classic* Salesforce interface.

Warning: Some features, like Chatter, require the Salesforce Classic 2010 user interface theme. Disabling this theme automatically disables Chatter in both Salesforce Classic and Lightning Experience.

Only users with supported browsers see the Salesforce Classic 2010 user interface theme.

The Salesforce Classic 2010 user interface theme is not supported in portals or on the Console tab.

Enable Tab Bar Organizer

The Tab Bar Organizer arranges tabs in the main tab bar to prevent horizontal scrolling of the page. The Organizer dynamically determines how many tabs can display based on the width of the browser window. It puts tabs that extend beyond the browser's viewable area into a drop-down list.

Note: Note the following limitations:

- The Tab Bar Organizer isn't available with the partner portal or Customer Portal.

- The Tab Bar Organizer is only available with the Salesforce Classic 2010 user interface theme. Orgs using the Salesforce Classic 2005 user interface theme can enable the feature, but it isn't available to users until the newer theme is also enabled.
- The Tab Bar Organizer isn't available on Internet Explorer 6.

Enable Printable List Views

Printable list views let users easily print list views. If it's enabled, users click the **Printable View** link from any list view to open a new browser window, displaying the list view in a print-ready format. The link is located next to the **Help for this Page** link in the colored title bar of the page.

Enable Spell Checker on Tasks and Events

Available in all Editions. Enables the **Check Spelling** button when users create or edit tasks or events. The spell checker analyzes the `Description` field on events and the `Comments` field on tasks.

Enable Customization of Chatter User Profile Pages

Enables administrators to customize the tabs on the Chatter user profile page. This includes adding custom tabs or removing default tabs. If disabled, users see the Feed and Overview tabs only.

Sidebar Settings

Enable Collapsible Sidebar

The collapsible sidebar enables users to show or hide the sidebar on every page that normally includes it. When enabled, the collapsible sidebar is available to all users in your org, but each user can choose how to display the sidebar. Users can leave the sidebar visible, or they can collapse it and show it only when needed by clicking the edge of the collapsed sidebar.

 **Note:** Call center users won't see incoming calls if they collapse the sidebar.

 **Tip:** If your org uses divisions, we recommend that you keep the sidebar pinned and visible so you always have access to the Divisions drop-down list.

Show Custom Sidebar Components on All Pages

If you have custom home page layouts that include components in the sidebar, this option makes the sidebar components available on all pages for all org users. If you only want certain users to view sidebar components on all pages, grant those users the "Show Custom Sidebar On All Pages" permission.

 **Note:** If the `Show Custom Sidebar Components on All Pages` user interface setting is selected, the "Show Custom Sidebar On All Pages" permission is not available.

Calendar Settings

Enable Home Page Hover Links for Events

Enables hover links in the calendar section of the Home tab. On the Home tab, users can hover the mouse over the subject of an event to see the details of the event in an interactive overlay. This option is enabled by default. This checkbox only controls the Home tab; hover links are always available on other calendar views.

The fields available in the event detail and edit overlays are defined in a mini page layout.

 **Note:** If you create all day events, we recommend adding the `All Day Event` field to the events mini page layout.

Enable Drag-and-Drop Editing on Calendar Views

Enables dragging of events on single-user, daily and weekly calendar views. This allows users to reschedule events without leaving the page. This option is enabled by default.

 **Note:** Calendar views can load less quickly when this checkbox is enabled.

Enable Click-and-Create Events on Calendar Views

Lets users create events on day and weekly calendar views by double-clicking a specific time slot and entering event details in an interactive overlay. The fields available in the event detail and edit overlays are defined in a mini page layout.

Recurring events and multi-person events aren't supported for click-and-create events on calendar views.

Enable Drag-and-Drop Scheduling on List Views

Lets users create events associated with records by dragging records from list views to weekly calendar views and entering event details in an interactive overlay. This option is disabled by default. The fields available in the event detail and edit overlays are defined in a mini page layout.

Enable Hover Links for My Tasks List

Enables hover links for tasks in the My Tasks section of the Home tab and on the calendar day view. This option is enabled by default. Users can hover the mouse over the subject of a task to see the details of that task in an interactive overlay.

Your administrator can configure the information presented on these overlays.

Setup Settings

Enable Enhanced Page Layout Editor

When enabled, the enhanced page layout editor replaces the current interface for editing page layouts with a feature-rich WYSIWYG editor that includes several improvements.

Enable Enhanced Profile List Views

Enables enhanced list views and inline editing on the profiles list page. With inline editing in enhanced profile list views, you can manage multiple profiles at once.

Enable Enhanced Profile User Interface

Enables the enhanced profile user interface, which allows you to easily navigate, search, and modify settings for a single profile.

Enable Streaming API

Enables Streaming API, which lets you receive notifications for changes to data that match a SOQL query that you define in a secure and scalable way. This field is selected by default. If your Salesforce edition has API access and you don't see this checkbox, contact Salesforce.

Enable Dynamic Streaming Channel Creation

Enables dynamic channel creation when using the generic streaming feature of Streaming API. When enabled, generic streaming channels get dynamically created when clients subscribe, if the channel hasn't already been created. This field is selected by default. If your Salesforce edition has API access and you don't see the checkbox, contact Salesforce.

Enable Custom Object Truncate

Enables truncating custom objects, which permanently removes all the records from a custom object while keeping the object and its metadata intact for future use.

Enable Improved Setup User Interface

When disabled, users with Salesforce Classic access their personal settings from the Setup menu. When enabled, users with Salesforce Classic access their personal settings from the My Settings menu, accessible from the username menu. The Setup link is also moved from the username menu to the Force.com App Menu. If you change this setting, be sure to notify all users in your org.

Enable Advanced Setup Search (Beta)

When enabled, users can search for Setup pages, custom profiles, permission sets, public groups, roles, and users from the sidebar in Setup. When disabled, users can search for Setup pages only.

**Note:**

- Advanced Setup Search is in beta; it is production quality but has known limitations.

- Some searchable items (such as permission sets) aren't available in some editions. Users can't search for items that aren't included in their edition.

Advanced Settings

Activate Extended Mail Merge

Enables Extended Mail Merge for your org. When selected, the **Mass Mail Merge** link is available in the Tools area on the home pages for accounts, contacts, and leads. Also, single mail merges requested from the Activity History related list on a record are performed using Extended Mail Merge functionality.

Extended Mail Merge is available by request only. Contact Salesforce Customer Support if you are interested in this feature.

Always save Extended Mail Merge documents to the Documents tab

Mail merge documents generated using Extended Mail Merge are added to the user's documents folder on the Documents tab, rather than delivered as email attachments. Users are sent confirmation emails when their mail merge requests have completed. Those emails include links for retrieving generated documents from the Documents tab. These documents count against your org's storage limits.

Customize Lightning Experience Navigation Menus

A Lightning Experience navigation menu is a shortcut to the most-used Salesforce features. Create different navigation menus tailored for your various types of users. What's most important to sales reps? Accounts, events, and organizations. How about sales managers? Reports and dashboards make the top of list. You can add, remove, and reorder items on the navigation menu so that users can navigate to what they use most often with a single click. Most items can appear on a navigation menu. Other items, such as connected apps and apps from the App Exchange, are available in the App Launcher.

[Lightning Experience Navigation Menu Items](#)

Most of the items that appear in the App Launcher can appear in a navigation menu. To add items to navigation menus, admins use a wizard that allows them to choose from a list of available items.

[Create a Navigation Menu with the Lightning Experience Navigation Menu Wizard](#)

The Navigation Menu wizard makes it easy to create custom Lightning Experience menus. It walks you through selecting navigation menu items and assigning user profiles.

[Considerations for Lightning Experience Navigation Menus](#)

Here's the fun part: Deciding what to put in your navigation menus. Think about these considerations when planning and creating Lightning Experience custom navigation menus for your org.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise, Professional, Performance, Unlimited, and Developer** Editions

Lightning Experience Navigation Menu Items

Most of the items that appear in the App Launcher can appear in a navigation menu. To add items to navigation menus, admins use a wizard that allows them to choose from a list of available items.

The list of available items contains only those items in your org that are eligible for navigation menus, which includes the following.

- Most standard objects, including Home, the main Chatter feed, Groups, and People
- Your org's custom objects and apps
- Visualforce tabs
- Lightning component tabs
- Canvas apps via Visualforcetabs
- Web tabs

 **Note:** You can't add Connected apps like Gmail™ and Microsoft Office 365™ or Lightning Pages to navigation menus. Users can continue to access them from the App Launcher.

A current limitation in the Navigation Menu wizard impacts large orgs. The limitation prevents admins from seeing more than the first 2,000 tabs (alphabetically) in the list of available items. This issue has been corrected in the next release of Salesforce. As a workaround, if a tab can't be added to a navigation menu, the user can always find it from the App Launcher.

Considerations for Lightning Experience Navigation Menus

Here's the fun part: Deciding what to put in your navigation menus. Think about these considerations when planning and creating Lightning Experience custom navigation menus for your org.

Make a Plan

The best time to create your menus is when you're rolling out Lightning Experience. So make creating navigation menus a part of your rollout strategy. Check out the Trailhead module Lightning Experience Rollout for many great ideas to help you make a smooth transition.

Talk to your users. Ask them what their priorities are. Customizing navigation menus gives you a unique opportunity to engage with your users. Each group of users has its own priorities. Find out which objects represent their highest priorities.

- Ask users to post feedback to a Chatter group.
- Publish polls.
- Schedule lunch sessions. Everyone likes a free lunch, and nearly everybody is happy to express their opinion.

Not all objects that appear in the App Launcher can appear in a navigation menu, but it's easy to figure out which ones can. When you start the wizard, it lists all available items for a menu.

Create a master list of objects that everyone in your org wants. Then trim down the list for each group—sales reps, sales managers, execs, and so on. The menus for every user group share some common objects, like Home, Tasks, and Feed. Keep the high-priority items for each group at the top. Put low-priority items at the bottom, or remove them altogether. Users can always go to the App Launcher to get the apps they use less often.

What to Know About Selecting Navigation Items

Clone your navigation menus.

The easiest way to create a navigation menu is to start with an existing one. Take that master list you created and add the items to your first navigation menu.

To create the second menu, use the wizard and select the first navigation menu. From the drop-down menu, click **Clone**. Reorder the navigation menu items, or remove them altogether.

Add apps to your navigation menu.

A Salesforce app is a group of tabs that work as a unit. When adding an app to a navigation menu, each tab appears as a separate item in the available list. Order the tabs so that they appear next to each other on the navigation menu.

What to Know About Assigning User Profiles

You can assign a navigation menu to multiple user profiles.

You tailor navigation menus for different types of users by assigning menus to user profiles. You can assign a single navigation menu to several user profiles. For instance, you have several groups involved with inside sales. Assign all the groups the same navigation menu.

You can have only one navigation menu per user profile.

A user profile can have only one navigation menu. If you assign a navigation menu to a user profile that already has a menu, the new menu overrides the previous one. Users belonging to that profile immediately see the new navigation menu. When you're reassigning a menu, keep in mind that if a user suddenly sees a different navigation menu, you could get some calls.

You have a fallback.

EDITIONS

Available in: Lightning Experience

Available in: **Enterprise, Professional, Performance, Unlimited, and Developer** Editions

Every user starts off with the navigation menu that comes with Salesforce—the default menu. You replace the default with your custom version by assigning the menu to user profiles. Salesforce makes sure that you don't remove a menu from a profile without replacing it.

- If you remove a user profile from a navigation menu without adding another one, the default menu is assigned to the user profile.
- If you delete a custom navigation menu from a user profile without replacing it, the profile switches back to the default menu.

Why Doesn't the Object Appear on a User's Navigation Menu?

A profile's tab settings determine whether an object appears in a navigation menu.

- Tab settings in profiles determine whether an object appears in the App Launcher or in a navigation menu. The tab setting must be Default On. Default On is the standard setting, so you typically don't have to do anything.
- Even if users create a custom app and add the tab to their profile, it doesn't appear in a navigation menu unless the tab setting is Default On.

Navigation menus respect user permissions.

If a user or user profile doesn't have permission to access an object, it doesn't appear on a navigation menu.

A Few More Considerations

Custom navigation menus depend on your Salesforce edition.

The number of custom navigation menus you can have depends on your edition. You can create up to 10 navigation menus with Enterprise, Performance, and Developer Editions. If you have the Professional Edition, you can have up to five menus. If you have an Unlimited Edition, you can have an unlimited number of navigation menus.

Large orgs can see only the first 2,000 tabs as available items in the Navigation Menu wizard.

A current limitation in the Navigation Menu wizard impacts large orgs. The limitation prevents admins from seeing more than the first 2,000 tabs (alphabetically) in the list of available items. This issue is corrected in the next release of Salesforce. As a workaround, if a tab can't be added to a navigation menu, the user can always find it from the App Launcher.

Maps and Location Services

Maps and location services uses Google Maps to display maps on standard address fields, enable creation of Visualforce maps, and helps users enter new addresses with autocomplete.

To generate a map image, an address must include the street and city fields and either the state, postal code, or the country. If an address field is missing any of the required information, a map won't display on the detail page of a record.

The map image on the address is static, but clicking the map image opens Google Maps in a new browser tab on the desktop, and opens a map app on a mobile device.

If your organization has Salesforce1 offline access enabled, a map doesn't display when a user's device is offline.

To enable your organization's map and location services:

1. From Setup, enter *Maps* in the *Quick Find* box, select **Maps and Location Settings**, then click **Edit**.
2. Check *Enable Maps and Location Services*.
3. Click **Save**.

Autocomplete on Standard Addresses

You can enable autocomplete on standard addresses for all Salesforce1 users. This allows users to enter text on standard address fields and see possible matching addresses in a picklist.

Autocomplete on standard address picklist results are optimized for these countries:

- USA
- Japan
- United Kingdom
- Canada
- Australia
- Germany
- France
- Netherlands
- Brazil
- Spain
- Russia
- Sweden

To enable autocomplete on standard address fields:

1. From Setup, enter *Maps* in the *Quick Find* box, select **Maps and Location Settings**, then click **Edit**.
2. Check *Enable autocomplete on standard address fields*.
3. Click **Save**.

Note:

- Autocomplete on standard address fields is available for all versions of Salesforce1 and the Lightning Experience.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** editions.

[Exclude the Confidential Information Disclaimer from Reports](#)

By default, report footers include a disclaimer that reads “Confidential Information - Do Not Distribute”. The disclaimer reminds users to be mindful of who they share reports with, helping to ensure that third parties don’t view your reports. At your discretion, exclude the disclaimer from your reports.

[Show Enhanced Charts in Salesforce 1](#)

Show your users enhanced charts in Salesforce 1. Enhanced charts are similar to Lightning Experience charts: see details before drilling into a report, filter reports by tapping on chart segments, and change chart types. This feature is available in all versions of Salesforce 1.

Let Users See Report Headers While Scrolling

Floating report headers keep column and row headings in sight no matter how far users scroll in report results.

With floating report headers, users can scroll to the bottom of lengthy reports without having to scroll back to the top to view the names of the column headings.

Users can also click floating report headers to sort data in a specific column. When users sort data by clicking a floating report heading, the report refreshes and redirects users to the beginning of report results.

Floating headers are available for tabular, summary, and matrix reports.

1. From Setup, enter *Reports* in the *Quick Find* box, then select **Reports and Dashboards Settings**.
2. Select or deselect **Enable Floating Report Headers**.
3. Click **Save**.

Help Users Find Dashboards Quickly

Dashboard finder uses auto-complete to help users quickly find dashboards in the Dashboards tab, just by entering the first few letters of its name in the search filter.

All dashboards matching that text are dynamically displayed in the drop-down list. The list first shows dashboards the user viewed recently, and then other dashboards appear in alphabetical order by folder. The first 1000 results are shown in a single list; above 1000, results are shown 500 per page. Users only see dashboards in folders they can access. Disable this option to use the static drop-down list instead.

This option is enabled by default.

1. From Setup, enter *Reports* in the *Quick Find* box, then select **Reports and Dashboards Settings**.
2. Select or deselect **Enable Dashboard Finder**.
3. Click **Save**.

Let Users Post Dashboard Components in Chatter

Dashboard component snapshots let users post static images of dashboard components to Chatter feeds, making the snapshot visible to all users.

1. Make sure Chatter feed tracking for dashboards is enabled.
2. From Setup, enter *Reports* in the *Quick Find* box, then select **Reports and Dashboards Settings**.
3. Select or deselect **Enable Dashboard Component Snapshots**.

 **Important:** This option lets users override dashboard visibility settings, making snapshots visible to all Chatter users. Though this makes it easy to share time-specific data without having to add people to dashboard folders, be aware that users can inadvertently post sensitive or confidential information.

Exclude the Confidential Information Disclaimer from Reports

By default, report footers include a disclaimer that reads “Confidential Information - Do Not Distribute”. The disclaimer reminds users to be mindful of who they share reports with, helping to ensure that third parties don’t view your reports. At your discretion, exclude the disclaimer from your reports.

1. From Setup, enter *Reports and Dashboards Settings* in the *Quick Find* box, then select **Reports and Dashboards Settings**.
2. Select **Exclude Disclaimer from Exported Reports** and **Exclude Disclaimer from Report Run Pages and from Printable View Pages**.
3. Click **Save**.

Show Enhanced Charts in Salesforce1

Show your users enhanced charts in Salesforce1. Enhanced charts are similar to Lightning Experience charts: see details before drilling into a report, filter reports by tapping on chart segments, and change chart types. This feature is available in all versions of Salesforce1.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To modify report and dashboard settings:

- “Customize Application”

After you enable enhanced charts, everyone sees them in Salesforce1 regardless of whether they use Lightning Experience or Salesforce Classic on the full Salesforce site.

1. From Setup, enter *Reports and Dashboards Settings* in the Quick Find box, then select **Reports and Dashboards Settings**.
2. Select **Enable Enhanced Charts in Salesforce1**.
3. Click **Save**.

Before enabling enhanced charts, take note of these limitations:

- Enhanced charts show only the first 100 groupings.
- You can't post enhanced charts to feeds.

Let Users Subscribe to Report Notifications

Allow users to subscribe to reports to be notified whenever certain metrics meet conditions they specify.

1. From Setup, enter *Report Notifications* in the Quick Find box, then select **Report Notifications**.
2. Select the option to enable report notifications.
3. Click **Save**.

Customize Report and Dashboard Email Notifications

Choose how users are notified when information changes in the reports and dashboards they use.

1. From Setup, enter *Email Notifications* in the Quick Find box, then select **Email Notifications**.
2. Select or clear the following options to modify the notifications for your organization:

Allow Reports and Dashboards to Be Sent to Portal Users

If you enable this option, all internal and portal users specified as recipients receive reports and dashboards. If this option isn't enabled, only internal Salesforce users can receive reports and dashboard refresh notifications.

This option, disabled by default, is available to Enterprise, Unlimited, and Performance Edition organizations that have a Customer Portal or partner portal set up.

Use Images Compatible with Lotus Notes in Dashboard Emails

Dashboard refresh notifications can be sent to specified users when a scheduled dashboard refresh completes. By default, Salesforce sends images in dashboard emails as `.png` (Portable Network Graphic) files, which are not supported in Lotus Notes. When you enable the `Use Images Compatible with Lotus Notes in Dashboard Emails` option, Salesforce uses `.jpg` images, which Lotus Notes supports, when sending dashboard emails. The "Schedule Dashboard" permission is required to view this option.

 **Note:** Dashboard emails that contain images compatible with Lotus Notes are substantially larger and the image quality may be lower.

3. Click **Save**.

Set Up a Custom Report Type

A *report type* defines the set of records and fields available to a report based on the relationships between a primary object and its related objects. Reports display only records that meet the criteria defined in the report type.

For example, an administrator can create a report type that shows only job applications that have an associated resume; applications without resumes won't show up in reports using that type. An administrator can also show records that *may* have related records—for example, applications with or without resumes. In this case, all applications, whether or not they have resumes, are available to reports using that type.

You can create custom report types from which users can report on your organization's reports and dashboards. When defining a custom report type, select Reports or Dashboards from the `Primary Object` drop-down list on the New Custom Report Type page.

 **Tip:** When you're done creating your report type, consider ways you can do more with it:

- Add the custom report type to apps you upload to Force.com AppExchange.
- Users designated as a translator with the "View Setup and Configuration" permission can translate custom report types using the Translation Workbench.

1. [Create a Custom Report Type](#)

Choose the primary object you'd like your new report type to support, then give it a name and a useful description. Mark it as "in development" until you're ready to make it available for users to create reports.

2. [Add Child Objects To Your Custom Report Type](#)

To enable reports to pull data from more than just the primary object, consider adding one or more related objects to your report type.

3. [Design the Field Layout for Reports Created From Your Custom Report Type](#)

After you define a custom report type and choose its object relationships, you can specify the standard and custom fields a report can display when created or run from a custom report type.

4. [Manage Custom Report Types](#)

After you create a custom report type, you can customize, edit, and delete it.

5. [Limits on Report Types](#)

Custom report types are subject to some limits to ensure high performance and usability.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

Create a Custom Report Type

Choose the primary object you'd like your new report type to support, then give it a name and a useful description. Mark it as "in development" until you're ready to make it available for users to create reports.

1. From Setup, enter *Report Types* in the *Quick Find* box, then select **Report Types**.
2. Click **New Custom Report Type**.
3. Select the *Primary Object* for your custom report type.

Tip:

- You can choose from all objects—even those you don't have permission to view. This lets you build report types for a variety of users.
- Once you save a report type, you can't change the primary object.
- If the primary object on a report type is a custom object, and the custom object is deleted, then the report type and any reports created from it are automatically deleted.
- If you remove an object from a report type, all references to that object and its associated objects are automatically removed from reports and dashboards based on that type.

4. Enter the *Report Type Label* and the *Report Type Name*.
The label can be up to 50 characters long. The name is used by the SOAP API.
5. Enter a description for your custom report type, up to 255 characters long.

Note: Provide a meaningful description so users have a good idea of which data is available for reports. For example: *Accounts with Contacts. Report on accounts and their contacts. Accounts without contacts are not shown..*

6. Select the category in which you want to store the custom report type.
7. Select a *Deployment Status*:
 - Choose *In Development* during design and testing as well as editing. The report type and its reports are hidden from all users except those with the "Manage Custom Report Types" permission. Only users with that permission can create and run reports using report types in development.
 - Choose *Deployed* when you're ready to let all users access the report type.

Note: A custom report type's *Deployment Status* changes from *Deployed* to *In Development* if its primary object is a custom object whose *Deployment Status* similarly changes.

8. Click **Next**.

Note: A developer can edit a custom report type in a managed package after it's released, and can add new fields. Subscribers automatically receive these changes when they install a new version of the managed package. However, developers can't remove objects from the report type after the package is released. If you delete a field in a custom report type that's part of a managed package, and the deleted field is part of bucketing or used in grouping, you receive an error message.

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

Add Child Objects To Your Custom Report Type

To enable reports to pull data from more than just the primary object, consider adding one or more related objects to your report type.

1. Click the box under the primary object.
2. Select a child object.

Only related objects are shown.

 **Tip:** Type in the search box to find objects quickly.

3. For each child object, select one of the following criteria:
 - Each "A" record must have at least one related "B" record. Only parent records with child records are shown in the report.
 - "A" records may or may not have related "B" records. Parent records are shown, whether or not they have child records.

When Users are the primary object, select child objects by field—for example, Accounts (Account Owner) or Accounts (Created By).

4. Add up to three child objects.
The number of children depends on the objects you choose.
5. Click **Save**.

 **Example:**

- If you select that object A may or may not have object B, then all subsequent objects automatically include the may-or-may-not association on the custom report type. For example, if accounts are the primary object and contacts are the secondary object, and you choose that accounts may or may not have contacts, then any tertiary and quaternary objects included on the custom report type default to may-or-may-not associations.
- Blank fields display on report results for object B when object A does not have object B. For example, if a user runs a report on accounts with or without contacts, then contact fields display as blank for accounts without contacts.
- On reports where object A may or may not have object B, you can't use the OR condition to filter across multiple objects. For example, if you enter filter criteria *Account Name starts with M OR Contact First Name starts with M*, an error message displays informing you that your filter criteria is incorrect.
- The `Row Limit` option on tabular reports shows only fields from the primary object on reports created from custom report types where object A may or may not have object B. For example, in an accounts with or without contacts report, only fields from accounts are shown. Fields from objects after a may-or-may-not association on custom report types aren't shown. For example, in an accounts with contacts with or without cases report, only fields from accounts and contacts are available to use. Also, existing reports may not run or disregard the `Row Limit` settings if they were created from custom report types where object associations changed from object A with object B to object A with or without object B.

Design the Field Layout for Reports Created From Your Custom Report Type

After you define a custom report type and choose its object relationships, you can specify the standard and custom fields a report can display when created or run from a custom report type.

 **Note:** Custom fields appear in custom report types only if they've been added to that report type's page layout.

1. From Setup, enter *Report Types* in the **Quick Find** box, then select **Report Types** to display the All Custom Report Types page.
2. Select the custom report type you want to edit and click **Edit Layout** on the Fields Available for Reports section.

You can click **Preview Layout** to preview which fields will display on the Select Columns page of a report customized or run from this report type.

 **Note:** When previewing the layout, all fields and objects are displayed, including fields and objects you may not have permission to access. However, you cannot access any data stored in the fields or objects that you do not have permission to access.

3. Select fields from the right-hand box and drag them to a section on the left.

 **Tip:** You can view a specific object's fields by selecting an object from the **View** drop-down list.

4. Optionally, click **Add fields related via lookup** to display the Add Fields Via Lookup overlay.

From here you can add fields via the lookup relationship the object selected in the **View** drop-down list has to other objects.

- A lookup field is a field on an object that displays information from another object. For example, the **Contact Name** field on an account.
- A custom report type can contain fields available via lookup through four levels of lookup relationships. For example, for an account, you can get the account owner, the account owner's manager, the manager's role, and that role's parent role.
- You can only add fields via lookup that are associated with objects included in the custom report type. For example, if you add the accounts object to the custom report type, then you can add fields from objects to which accounts have a lookup relationship.
- Selecting a lookup field on the Add Fields Via Lookup overlay may allow you to access additional lookup fields from other objects to which there is a lookup relationship. For example, if you select the **Contact Name** field from cases, you can then select the **Account** field from contacts because accounts have a lookup relationship to contacts which have a lookup relationship to cases.
- The fields displayed in the Add Fields Via Lookup overlay do not include lookup fields to primary objects. For example, if accounts are the primary object on your custom report type, and contacts are the secondary object, then the Add Fields Via Lookup overlay does not display lookup fields from contacts to accounts.
- Fields added to the layout via the **Add fields related via lookup** link are automatically included in the section of the object from which they are a lookup field. For example, if you add the **Contact** field as a lookup from accounts, then the **Contact** field is automatically included in the Accounts section. However, you can drag a field to any section.
- Fields added via lookup automatically display the lookup icon on the field layout of the custom report type.
- Reduce the amount of time it takes a user to find fields to report on by grouping similar fields together on custom report types' field layouts. You can create new page sections in which to group fields that are related to one another, and you can group fields to match specific detail pages and record types.
- If you include activities as the primary object on a custom report type, then you can only add lookup fields from activities to accounts on the select column layout of the custom report type.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

5. Arrange fields on sections as they should appear to users.
Fields not dragged onto a section will be unavailable to users when they generate reports from this report type.
6. Click **Preview Layout** and use the legend to determine which fields are included on the layout, added to the report by default, and added to the layout via a lookup relationship.
 -  **Warning:** Users can view roll-up summary fields on reports that include data from fields they do not have access to view. For example, a user that does not have access to view the `Price` field on an opportunity product can view the `Total Price` field on opportunity reports if he or she has access to the `Total Price` field.
7. To rename or set which fields are selected by default for users, select one or more fields and click **Edit Properties**.
 - Click the `Checked by Default` checkbox next to one or more fields.
Fields selected by default automatically display the checkbox icon (✓) on the field layout of the custom report type.
 - Change the text in the `Display As` field next to the field you want to rename.
 -  **Note:** Renamed fields from standard objects, as well as renamed standard objects, do not display as such on the field layout of the custom report type. However, renamed fields from standard objects and renamed standard objects do display their new names on the report and the preview page, which you can access by clicking **Preview Layout**.
8. To rename the sections, click **Edit** next to an existing section, or create a new section by clicking **Create New Section**.
9. Click **Save**.

[Create a Custom Report Type](#)

Manage Custom Report Types

After you create a custom report type, you can customize, edit, and delete it.

From Setup, enter `Report Types` in the `Quick Find` box, then select **Report Types** to display the All Custom Report Types page, which shows the list of custom report types defined for your organization.

- Select a list view from the `view` drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.
- Define a new custom report type by clicking **New Custom Report Type**.
- Update a custom report type's name, description, report type category, and deployment status by clicking **Edit** next to a custom report type's name.
- Delete a custom report type by clicking **Del** next to the custom report type's name. All the data stored in the custom report type will be deleted and cannot be restored from the Recycle Bin.
 -  **Important:** When you delete a custom report type, any reports based on it are also deleted. Any dashboard components created from a report based on a deleted custom report type display an error message when viewed.
- Display detailed information about a custom report type and customize it further by clicking a custom report type's name.

After you click a custom report type name you can:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

- Update which object relationships a report can display when run from the custom report type.
- Edit the page layout of the custom report type to specify which standard and custom fields a report can display when created or run from the custom report type.
- See how the fields display to users in reports run from the custom report type by clicking **Preview Layout** on the Fields Exposed for Reporting section.
- Create a new custom report type with the same object relationships and fields as the selected custom report type by clicking **Clone**.
- Rename fields in the report.
- Set which fields are selected by default.

When you edit a report, you can see the report type displayed above the report name in report builder. The report type isn't displayed on the report run page.

1. Report type
2. Report name

 **Note:** If the Translation Workbench is enabled for your organization, you can translate custom report types for international users.

Limits on Report Types

Custom report types are subject to some limits to ensure high performance and usability.

- You can add up to 1000 fields to each custom report type. A counter at the top of the Page Layout step shows the current number of fields included. If you have too many fields, you can't save the layout.
- You can't add the following fields to custom report types:
 - Product schedule fields
 - History fields
 - Person account fields
 - The `Age` field on cases and opportunities
- A custom report type can contain up to 60 object references. For example, if you select the maximum limit of four object relationships for a report type, then you could select fields via lookup from an additional 56 objects. However, users will receive an error message if they run a report from a custom report type and the report contains columns from more than 20 different objects.
- Object references can be used as the main four objects, as sources of fields via lookup, or as objects used to traverse relationships. Each referenced object counts toward the maximum limit even if no fields are chosen from it. For example, if you do a lookup from account to account owner to account owner's role, but select no fields from account owner, all the referenced objects still count toward the limit of 60.
- Reports run from custom report types that include cases do not display the `Units` drop-down list, which allows users to view the time values of certain case fields by hours, minutes, or days.
- You can't add forecasts to custom report types.

- Report types associated with custom objects in the Deleted Custom Objects list count against the maximum number of custom report types you can create.

[Opportunity Reports](#)

Turn On Enhanced Sharing for Reports and Dashboards

When you enable analytics sharing, Salesforce converts your users' existing folder access levels to use new, more detailed access levels.

-  **Note:** If your organization was created after the Summer '13 Salesforce release, you already have analytics folder sharing. If your organization existed before the Summer '13 release, follow these steps to make folder sharing available to your users.

When analytics sharing is in effect, all users in the organization get Viewer access by default to report and dashboard folders that are shared with them. Users might have more access if they are Managers or Editors on a given folder, or if they have more administrative user permissions. Each user's access to folders under the new capability is based on the combination of folder access and user permissions they had before enhanced folder sharing was enabled.

1. From Setup, enter *Folder Sharing* in the Quick Find box, then select **Folder Sharing**.
2. Select **Enable access levels for sharing report and dashboard folders**.
3. Click **Report and Dashboard Folder Sharing**.

-  **Important:** If you go back to the old folder sharing model, existing report and dashboard folders go back to the state they were in before.
- If a folder existed before analytics folder sharing was enabled, its properties and sharing settings are rolled back to their previous state.
 - If a folder was created while enhanced analytics folder sharing was in effect, it is hidden from the folder list and all its sharing settings are removed. Administrative user permissions are still in effect.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All** editions except **Database.com**

USER PERMISSIONS

To view the analytics folder sharing setting:

- "View Setup and Configuration"

To modify the analytics folder sharing setting:

- "Customize Application"

Set Up Historical Trend Reporting

To make historical trend reports available to your users, use filters to configure the amount of data that's captured for historical trend reporting. Then select the fields needed for historical reports.

Shape your historical trend data to have enough for users to exploit but doesn't exceed the space limits. Consider which fields contain useful historical data and which fields contain data you can leave out.

Important: Retaining historical data increases the amount of data you store. The effect depends on the ways your organization works. Say that someone updates the status of a typical opportunity record every day or two. Historical trending data for the Status field on the Opportunity object takes up more space than if the record changes once or twice a month. If any of your trended objects is in danger of exceeding the data limit, you receive an email alert.

1. From Setup, enter *Historical Trending* in the Quick Find box, then select **Historical Trending**.
2. Select the object that you want to do historical trend reporting on.
You can select Opportunities, Cases, Forecasting Item, and up to three custom objects. Historical trend reporting is available on only Collaborative forecasting, not Customizable forecasting.
3. Select **Enable Historical Trending**.
4. Use the filters under **Configure Data** to specify the total amount of data you can use to create historical trend reports.
You can narrow down historical data for Opportunities, Cases, and custom objects. For Forecasting Items, the available data is selected for you.
For example, to reduce the data stored for Opportunities reports, drop out the least likely deals by setting `Stage not equal to Prospecting`.
5. Under **Select Fields**, choose up to eight fields to make available for historical trend reporting.
These fields can be selected when creating historical trending reports.
 - For Opportunities reporting, five fields are preselected: Amount, Close Date, Forecast Category, Probability, and Stage. You can add three more.
 - For Forecasting, all eight available fields are pre-selected.

After you enable historical trending, a new custom report type is available when you create future reports. If you enable historical trending on a new field, that field is automatically added to the historical trending report layout.

When you turn off historical trending, keep these points in mind.

- Turning off historical trending for a field hides the historical data for that field. If you re-enable historical trending, historical data for the field can be viewed again, including data created after historical trending was turned off.
- Turning off historical trending for an object causes all historical data and configuration settings to be deleted for that object. This includes the object's historical trending report type and any reports that have been created with it.
- If you turn off historical trending for a field and delete it, the field's historical data is no longer available even if you re-enable historical trending.

Note:

- The historical fields available to each user depend on the fields that user can access. If your permissions change and you can no longer see a given field, that field's historical data also becomes invisible.

EDITIONS

Available in: both Salesforce Classic Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
AND
"Report Builder"

- Each historical field has the same field-level security as its parent field. If the field permissions for the parent field change, the historical field's permissions change accordingly.

SEE ALSO:

[Tip Sheet: Historical Trend Reporting for Opportunities](#)

Upgrade the Report Wizard

Report builder, a powerful drag-and-drop editor, is the standard tool for creating and editing reports. If your organization is still using the old report wizard, you should upgrade to report builder.

- All profiles get access to the report builder by default. (You may continue to see the “Report Builder” permission in permission sets and profiles and the PermissionSet and Profile objects in the API, though the upgrade overrides those settings.)
- The old report wizard is available only to users in Accessibility Mode.
- Group and Professional Edition organizations can use report builder.
- You get scatter charts, a new chart type for reports.

New organizations automatically get the latest version of report builder. If you don't see the Report Builder Upgrade section on the User Interface Settings page, the upgrade has already been enabled for your organization.

Assigning the “Report Builder” permission to all users through profiles or permission sets isn't the same thing as enabling report builder for your entire organization. To enable report builder for your organization, follow these steps.

 **Important:** Upgrading **does not affect** any of your existing reports. However, once you upgrade, you can't return to the old report wizard.

1. From Setup, enter *Reports* in the *Quick Find* box, then select **Reports and Dashboards Settings**.
2. Review the Report Builder Upgrade section of the page and click **Enable**. If you don't see the button, report builder has already been enabled for your entire organization.
3. Confirm your choice by clicking **Yes, Enable Report Builder for All Users**.

Critical Updates

Salesforce periodically releases updates that improve the performance, logic, and usability of Salesforce, but may affect your existing customizations. When these updates become available, Salesforce lists them in Setup at **Critical Updates** and displays a message when administrators go to Setup.

To ensure a smooth transition, each update has an opt-in period during which you can manually activate and deactivate the update an unlimited number of times to evaluate its impact on your organization and modify affected customizations as necessary. The opt-in period ends on the auto-activation date, at which time Salesforce permanently activates the update.

 **Warning:** Salesforce recommends testing each update by activating it in either your Developer Sandbox or your production environment during off-peak hours.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To modify report and dashboard settings:

- “Customize Application”

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: All Editions

To manage critical updates, from Setup, click **Critical Updates**. From this page, you can view the summary, status, and auto-activation date for any update that Salesforce has not permanently activated. To view more details about the update, including a list of customizations in your organization that the update might affect, click **Review**.

If an update has an **Activate** link, click it to test the update in your sandbox or production environment before Salesforce automatically activates it.

Notes on Critical Updates

- Salesforce analyzes your organization to determine if a critical update potentially affects your customizations. If your customizations are not affected, Salesforce automatically activates the update in your organization.
- On the scheduled auto-activation date, Salesforce permanently activates the update. After auto-activation, you cannot deactivate the update.
- Each update detail page describes how your customizations might be affected and how you can correct any unintended functionality.
- Salesforce displays a message the first time you access the setup menu after a critical update becomes available. The message lets you choose to have Salesforce display the updates immediately or remind you about the updates later.

Divisions Overview

Divisions let you segment your organization's data into logical sections, making searches, reports, and list views more meaningful to users. For example, you can create a report to show the opportunities for just the North American division, allowing you to get accurate sales numbers for the North American sales team. Divisions are useful for organizations with extremely large amounts of data.

 **Note:** Divisions do not restrict users' access to data and are not meant for security purposes.

Divisions can be assigned to users and to other records.

- **Record-level division**—Division is a field on individual records that marks the record as belonging to a particular division. A record can belong to a division created by the administrator, or it can belong to the standard “global” division, which is created automatically when your organization enables divisions. A record can belong to only one division at a time.
- **Default division**—Users are assigned a default division that applies to their newly created accounts, leads, and custom objects that are enabled for divisions.
- **Working division**—If you have the “Affected by Divisions” permission, you can set the division using a drop-down list in the sidebar. Then, searches will show only the data for the current working division. You can change your working division at any time. If you don't have the “Affected by Divisions” permission, you'll always see records in all divisions.

The following table shows how using divisions affects different areas.

Area	Description
Search	<p>If you have the “Affected by Divisions” permission:</p> <ul style="list-style-type: none"> • In sidebar search, you can select a single division, or all divisions. • In advanced search, you can select a single division or all divisions. • In global search, you can search a single division or all divisions.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Area	Description
List views	<ul style="list-style-type: none"> For searches in lookup dialogs, the results include records in the division you select from the drop-down list in the lookup dialog window. <p> Note: All searches within a specific division also include the global division. For example, if you search within a division called Western Division, your results will include records found in both the Western Division and the global division.</p> <p>If you do not have the “Affected by Divisions” permission, your search results always include records in all divisions.</p>
Chatter	<p>If you have the “Affected by Divisions” permission, list views include only the records in the division you specify when creating or editing the list view. List views that don’t include all records (such as My Open Cases) include records in all divisions.</p> <p>If you do not have the “Affected by Divisions” permission, your list views always include records in all divisions.</p>
Reports	<p>Chatter doesn’t support divisions. For example, you can’t use separate Chatter feeds for different divisions.</p> <p>If you have the “Affected by Divisions” permission, you can set your report options to include records in just one division or all divisions. Reports that use standard filters (such as My Cases or My team’s accounts) show records in all divisions, and can’t further limited to a specific division.</p> <p>If you do not have the “Affected by Divisions” permission, your reports always include records in all divisions.</p>
Viewing records and related lists	<p>When viewing the detail page of a record, the related lists show all associated records that you have access to, regardless of division.</p>
Creating new records	<p>When you create new accounts, leads, or custom objects that are enabled for divisions, the division is automatically set to your default division, unless you override this setting.</p> <p>When you create new records related to an account or other record that already has a division, the new record is assigned to the existing record’s division. For example, if you create a custom object record that is on the detail side of a master-detail relationship with a custom object that has divisions enabled, it is assigned the master record’s division.</p> <p>When you create records that are not related to other records, such as private opportunities or contacts not related to an account, the division is automatically set to the global division.</p>

Area	Description
Editing records	<p>When editing accounts, leads, or custom objects that are enabled for divisions, you can change the division. All records that are associated through a master-detail relationship are automatically transferred to the new division as well. For example, contacts and opportunities are transferred to the new division of their associated account, and detail custom objects are transferred to their master record's new division.</p> <p>When editing other types of records, you can't change the division setting.</p>
Custom objects	<p>When you enable divisions for a custom object, Salesforce initially assigns each record for that custom object to the global division.</p> <p>When you create a custom object record:</p> <ul style="list-style-type: none">• If the custom object is enabled for divisions, the record adopts your default division.• If the custom object is on the detail side of a master-detail relationship with a divisions-enabled custom object, the record adopts the division of the master record.
Relationships	<p>If you convert a lookup relationship to a master-detail relationship, detail records lose their current division and inherit the division of their master record.</p> <p>If you convert a master-detail relationship to a lookup relationship, the division for any detail records is determined by the previous master record.</p> <p>If you delete a master-detail relationship, the division for any detail records is determined by the previous master record.</p>

Setting Up Divisions

When setting up divisions, you must create divisions and assign records to divisions to make sure that your data is categorized effectively.

Before you can use the divisions feature for your organization, you must enable divisions. If you are using a standard object, contact Salesforce to enable divisions for your organization. For custom objects, select **Enable Divisions** on the custom object definition page to enable divisions.

1. Plan which divisions you need based on how you want to segment your data.
For example, you may want one division for all the records belonging to your North American sales team and one division for your European sales team.
100
2. [Create divisions](#) for your organization. All existing records are assigned to the “Global” division by default. You can change the default division name, create additional divisions, and move user and data records between divisions.
3. [Transfer leads, accounts, and custom objects into relevant divisions](#). When records are assigned to a division, associated records are assigned the same division.
For example, when you change the division assigned to an account, related records such as contacts and opportunities are assigned to the same division.
4. Add division fields to page layouts.
5. Add divisions to field-level security.
6. [Set the default division for all users](#). New accounts and leads are assigned to the user’s default division unless the user explicitly assigns a different division. New records related to existing records are assigned to the existing record’s division.
7. Enable the “Affected by Divisions” permission for users who should be able to limit list views by division, search within a division, or report within a division.
Users who don’t have the “Affected by Divisions” permission still have a default user-level division, can view division fields, change the division for a record, and specify a division when creating records.

- “Modify All Data”

Creating and Editing Divisions

Creating logical divisions for your organization helps you segment your records to make searching and reporting easier.

Divisions must be enabled for the organization.

All records are initially assigned to the default “Global” division until the user defines the division. You can create up to 100 divisions, including any inactive ones.

1. From Setup, enter *Manage Divisions* in the **Quick Find** box, then select **Manage Divisions**.
2. Click **New** to create a divisions, or **Edit** change an existing division.
3. Enter the division name.
4. Select the checkbox to make the division active.
 -  **Note:** You cannot deactivate a division if users or lead queues are assigned to that division.
5. Click **Save**.
6. If you want to change the order that divisions appears in the Divisions picklist, click **Sort**, then to use the arrow buttons to move divisions higher or lower in the list.

[Change the Default Division for Users](#)

Transferring Multiple Records Between Divisions

Select groups of records to move into or between divisions.

To reassign the divisions for multiple records at one time, transfer groups of accounts, leads, or users between divisions.

1. From Setup, enter *Mass Division Transfer* in the **Quick Find** box, then select **Mass Division Transfer**.
2. Select the type of record you want transferred, then click **Next**. When you change the division assigned to an account, related records such as contacts and opportunities are assigned to the same division. When you change the division assigned to a custom object, other custom objects belonging to it are also transferred to the new division.
3. Select search conditions that records must match and click **Next**.
4. Select the division you want to transfer the records to.
5. If you’re transferring user records, you can select *Change the division...* to also transfer the users’ records to the new division.

[Divisions Overview](#)[Setting Up Divisions](#)[Creating and Editing Divisions](#)[Change the Default Division for Users](#)

Change the Default Division for Users

If you can manage user settings, you can change a user's default division.

If your organization uses divisions to segment data, a default division is assigned to all users and is applied to new accounts, leads, and appropriate custom objects. The default division doesn't prevent users from viewing or creating records in other divisions. If, however, the new record is related to an existing record, the new record is assigned the same division as the existing record.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click the name, alias, or username of the user whose default division you want to change.
3. Next to the **Default Division** field, click **Change**.
4. Select a new default division.
5. Select an action to be applied to records the user already owns.
6. Click **Save**.

If you are changing your own default division, skip step 1 and go to your personal settings. Enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.

Manage Users

User Management

In Salesforce, each user is uniquely identified with a username, password, and profile. Together with other settings, the profile determines which tasks a user can perform, what data the user can see, and what the user can do with the data.

As an administrator, you perform user management tasks, such as:

- Create and edit users.
- Reset passwords.
- Create Google Apps accounts.
- Grant permissions.
- Create and manage other types of users.
- Create custom fields.
- Set custom links.
- Run reports on users.
- Delegate user administration tasks to other users.

Depending on your Salesforce edition and the additional features that your company purchased, you have specific licenses, such as Marketing or Connect Offline. The licenses let users access features that are not included in their user licenses. You can assign one or more of these licenses to users and also set up accounts for users outside your org to access a limited set of fields and objects. You can grant access to the Customer Portal, partner portal, or Self-Service through user licenses. Using Salesforce to Salesforce, create connections to share records with other Salesforce users outside of your org.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

SEE ALSO:

- [View and Manage Users](#)
- [Licenses Overview](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The available user management options vary according to which Salesforce Edition you have.

View and Manage Users

In the user list, you can view and manage all users in your org, partner portal, and Salesforce Customer Portal.

From Setup, enter *Users* in the *Quick Find* box, then select **Users**.

From the user list, you can:

- [Create one user](#).
- [Create multiple users](#).
- [Reset passwords for selected users](#).
- [Edit a user](#).
- View a user's detail page by clicking the name, alias, or username.
- View or edit a profile by clicking the profile name.
- If Google Apps™ is enabled in your org, export users to Google and create Google Apps accounts by clicking **Export to Google Apps**.

 **Note:** You can perform many of these tasks from the SalesforceA mobile app.

Tips for Managing Users

- Create custom fields for users and set custom links to display on the user detail page. To access these options, go to the object management settings for users.
- Use the sidebar search to search for any user in your org, regardless of the user's status. When using a lookup dialog from fields within records, the search results return only active users. You can also run user reports in the Reports tab.
- To simplify user management in orgs with many of users, delegate aspects of user administration to non-administrator users.

 **Note:** You cannot delegate administrative duties related to your org to partner portal or Customer Portal users. However, you can delegate some portal administrative duties to portal users.

Guidelines for Adding Users

Understand important options for adding users. Learn what to communicate to users about passwords and logging in.

- Your *username* must be unique across all Salesforce orgs. The username must be in the format of an email address, for example, jane@salesforce.com. This email username doesn't have to work. You *can* have the same functioning email address associated with your account across orgs—only the *username in the form of an email address* must remain unique.
- If your name includes non-English characters, add the specified language to the mail format settings within Outlook if viewing email in Outlook.
- The account verification link emailed to new users expires in six months, and users have to change their password the first time they log in. Users who click the account verification link but don't set a password need an admin to reset their password before they can log in.
- You can change a Salesforce license to a Force.com license, but you can't change a Force.com license to a Salesforce license.
- Not all options are available for all license types. For example, the `Marketing User` and `Allow Forecasting` options are not available for Force.com user licenses because the `Forecasts` and `Campaigns` tabs are not available to users with a Force.com license. Force.com user licenses are not available for Professional, Group, or Contact Manager Editions.
- In Performance, Unlimited, Enterprise, and Developer Edition orgs, you can select `Send Apex Warning Emails` to send email to the user when an application that invokes Apex uses more than half of the resources specified by the governor limits. You can use this feature during Apex code development to test the amount of resources used at runtime.

SEE ALSO:

[Add a Single User](#)

Add a Single User

Depending on the size of your organization or your new hire onboarding process, you may choose to add users one at a time. The maximum number of users you can add is determined by your Salesforce edition.

1. Read the guidelines for adding users.
2. From Setup, enter `Users` in the `Quick Find` box, then select **Users**.
3. Click **New User**.
4. Enter the user's name and email address and a unique username in the form of a email address. By default, the username is the same as the email address.

! **Important:** Your *username* must be unique across all Salesforce orgs. The username must be in the format of an email address, for example, jane@salesforce.com. This email username doesn't have to work. You *can* have the same functioning email address associated with your account across orgs—only the *username in the form of an email address* must remain unique.
5. In Professional, Enterprise, Unlimited, Performance, and Developer Editions, select a `Role`.
6. Select a `User License`. The user license determines which profiles are available for the user.
7. Select a profile, which specifies the user's minimum permissions and access settings.

3. Change the settings as needed.
4. Click **Save**.

 **Tip:** You can perform this and other administration tasks from the SalesforceA mobile app.

SEE ALSO:

- [User Fields](#)
- [Considerations for Editing Users](#)
- [Unlock Users](#)
- [SalesforceA](#)

Considerations for Editing Users

Be aware of the following behaviors when editing users.

Username

A username must be unique across all Salesforce organizations. It must use the format of an email address (such as xyz@abc.org), but doesn’t need to be a real email address. While users can have the same email address across organizations, usernames must be unique.

If you change a username, a confirmation email with a login link is sent to the email address associated with that user account. If an organization has multiple login servers, sometimes users can’t log in immediately after you’ve changed their usernames. The change can take up to 24 hours to replicate to all servers.

Changing email addresses

If `Generate new password and notify user immediately` is disabled when you change a user’s email address, Salesforce sends a confirmation message to the email address that you entered. Users must click the link provided in that message for the new email address to take effect. This process ensures system security.

Personal information

Users can change their personal information after they log in.

User sharing

If the organization-wide default for the user object is Private, users must have Read or Write access to the target user to access that user’s information.

Domain names

You can restrict the domain names of users’ email addresses to a list of specific domains. Any attempt to set an email address with another domain results in an error message. To enable this functionality for your organization, contact Salesforce.

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To deactivate users:

- "Manage Internal Users"

Considerations for Deactivating Users

Be aware of the following behaviors when deactivating users.

User licenses and billing

A deactivated user doesn't count against your organization's available user licenses. However, deactivating a user doesn't reduce the number of licenses for which your organization is billed. To change your billing, you must change your organization's license count.

Users in custom hierarchy fields

You can't deactivate a user that's selected in a custom hierarchy field even if you delete the field. To deactivate a user in a custom hierarchy field, delete and permanently erase the field first.

Workflow email alert recipients

You can't deactivate a user that's assigned as the sole recipient of a workflow email alert.

Customer Portal Administrator users

You can't deactivate a user that's selected as a Customer Portal Administrator.

Record access

Deactivated users lose access to any records that were manually shared with them, or records that were shared with them as team members. Users higher in the role hierarchy relative to the deactivated users also lose access to those records. However, you can still transfer their data to other users and view their names on the Users page.

Note: If your organization has Asynchronous Deletion of Obsolete Shares (Pilot) enabled, removal of manual and team shares is run during off-peak hours between 6 PM and 4 AM based on your organization's default time zone. For account records, manual and team shares are deleted right after user deactivation.

Deactivated users lose access to shared records immediately. Users higher in the role hierarchy continue to have access until that access is deleted asynchronously. If that visibility is a concern, remove the record access that's granted to the deactivated users before deactivation.

Chatter

If you deactivate users in an organization where Chatter is enabled, they're removed from Following and Followers lists. If you reactivate the users, the subscription information in the Following and Followers lists is restored.

If you deactivate multiple users, subscription information isn't restored for users that follow each other. For example, user A follows user B and user B follows user A. If you deactivate users A and B, their subscriptions to each other are deleted from Following and Followers lists. If user A and user B are then reactivated, their subscriptions to each other aren't restored.

Salesforce Files

Files owned by a deactivated user are not deleted. The deactivated user is the file owner until an admin reassigns the files to an active user. Files shared in a content library can be edited by other library members with author or delete permissions. Sharing rules remain active until an admin modifies them.

Created By fields

It's possible for inactive users to be listed in `Created By` fields even when they're no longer active in an organization. This happens because some system operations create records and toggle preferences, acting as an arbitrary administrator user to complete the task. This user can be active or inactive.

Accounts and opportunities owned by deactivated users

You can create and edit accounts, opportunities, and custom object records that are owned by inactive users. For example, you can edit the `Account Name` field on an opportunity record that's owned by an inactive user. To enable this feature, contact Salesforce.

Territories and forecasting

Deactivated users continue to own opportunities and appear in forecasts and territories. When users are deactivated, their opportunity forecast overrides, adjusted total overrides, and manager's choice overrides on subordinates' forecasts are frozen. However, the

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

manager of a deactivated user can apply manager's choice overrides to that user's forecasts. Rollup amounts are kept current. If a deactivated user is later reactivated, the user can resume normal work as before. If "Allow Forecasting" is disabled for a user who is deactivated, the user is removed from any territories he or she is assigned to.

Opportunity and account teams

Deactivated users are removed from the default opportunity and account teams of other users. The deactivated users' default opportunity and account teams are not removed.

Account teams

If a user on an account team has Read/Write access (**Account Access, Contact Access, Opportunity Access, and Case Access**) and is deactivated, the access will default to Read Only if the user is reactivated.

Opportunity teams

If you deactivate users in an organization where opportunity splitting is enabled, they aren't removed from any opportunity teams where they're assigned a split percentage. To remove a user from an opportunity team, first reassign the split percentage.

Delegated external user administrators

When a delegated external user administrator deactivates a portal user, the administrator doesn't have the option to remove the portal user from any teams that user is a member of.

SEE ALSO:

[Deactivate \(Delete\) Users](#)

Freeze or Unfreeze User Accounts

In some cases, you can't immediately deactivate an account, such as when a user is selected in a custom hierarchy field. To prevent users from logging in to your organization while you perform the steps to deactivate them, you can freeze user accounts.

Let's say a user just left your company. You want to deactivate the account, but the user is selected in a custom hierarchy field. Because you can't immediately deactivate the account, you can freeze it in the meantime.

 **Tip:** You can perform this and other administration tasks from the SalesforceA mobile app.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click the username of the account you want to freeze.
3. Click **Freeze** to block access to the account or **Unfreeze** to allow access to the account again.

 **Note:** Freezing user accounts doesn't make their user licenses available for use in your organization. To make their user licenses available, deactivate the accounts.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To freeze or unfreeze user accounts:

- "Manage Users"

Restrict User Email Domains

You can define a whitelist to restrict the email domains allowed in a user's `Email` field.

1. From Setup, enter *Allowed Email Domains* in the `Quick Find` box, then select **Allowed Email Domains**.

 **Note:** If you don't see this page, contact your Salesforce representative to enable it.

2. Click **New Allowed Email Domain**.

3. Enter a `Domain`.

You can enter a top-level domain, such as *sampledoc.org*, or a subdomain, such as *emea.sampledoc.org*.

4. Click **Save**.

You can repeat the steps to add more email domains to the whitelist.

Once you've added one or more whitelisted email domains, the `Email` field for each new user must match a whitelisted domain.

The `Email` field for existing users doesn't have to comply with the whitelist. However, if you edit an existing user, update the `Email` field to match a whitelisted email domain.

 **Note:** The email domain whitelist doesn't apply to users external to your organization, such as portal, Communities, or Chatter External users.

User Fields

The fields that comprise the Personal Information and other personal settings pages help to describe a user.

The visibility of fields depends on the specific page, your org's permissions, and which edition you have.

Field	Description
<code>Accessibility Mode</code>	When selected, enables a user interface mode designed for visually impaired users.
<code>Active</code>	Administrative checkbox that enables or disables user login to the service.
<code>Address</code>	Street address for user. Up to 255 characters are allowed in this field.
<code>Admin newsletter</code>	Opt in to receive administrator-targeted promotional emails from Salesforce. This field is

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To restrict user email domains:

- "Manage Users"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
Alias	not available if your organization has disabled your choice to receive emails from Salesforce.
Allow Forecasting	Indicates whether the user can use customizable forecasting.
Api Token	Indicates whether an API token has been reset. If issues occur, Salesforce uses this field to help you troubleshoot issues related to API tokens.
App Registration: One-Time Password Generator	<p>When connected, the user can verify identity with a code from an authenticator app such as Salesforce Authenticator. For example, the user enters a code from the app when logging in from an IP address outside the company's trusted IP range. This type of verification code is sometimes called a time-based one-time password, or TOTP. Only the currently shown code is valid.</p> <p>Users with "Two-Factor Authentication for User Interface Logins" permission need to use a second factor of authentication when logging in to Salesforce through the user interface. A current verification code generated by the authenticator app counts as a second factor.</p> <p>If the user has "Two-Factor Authentication for API Logins" permission and connects an authenticator app, the user enters the current code from the app to access the service. The user doesn't enter the standard security token.</p>
App Registration: Salesforce Authenticator	<p>When connected, the user can verify identity by responding to a push notification with the Salesforce Authenticator mobile app, version 2 or later. For example, the user approves a notification when logging in from an IP address outside the company's trusted IP network. If the user sets a trusted location in the app, Salesforce Authenticator can automatically verify the user's identity from that trusted location.</p> <p>Users with "Two-Factor Authentication for User Interface Logins" permission need to use a second factor of authentication when logging in to Salesforce through the user interface. A manual or automated response to a notification from Salesforce Authenticator counts as a second factor.</p> <p> Note: Salesforce Authenticator also generates verification codes (time-based one-time passwords). For users who connect Salesforce Authenticator, the <code>App Registration: One-Time Password Generator</code> field is also connected.</p>

Field	Description
Call Center	The name of the call center to which this user is assigned.
Checkout Enabled	Indicates whether the user is notified by email when his or her Checkout account is activated and available for login. Enabling this option requires the “Manage Billing” permission.
City	City portion of user’s address. Up to 40 characters are allowed in this field.
Color-Blind Palette on Charts	Indicates whether the option to set an alternate color palette for charts has been enabled. The alternate palette has been optimized for use by color-blind users. For dashboard emails, the alternate palette is not used.
Company	Company name where user works. Up to 40 characters are allowed in this field.
Contact	Name of the associated contact if the user is a partner user.
Country	Country portion of user’s address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Created By	User who created the user including creation date and time. (Read only)
Currency	User’s default currency for quotas, forecasts, and reports. Shown only in orgs using multiple currencies. This currency must be one of the active currencies for the org.
Custom Links	Listing of custom links for users as set up by your administrator.
Data.com User Type	Enables a user to find contact and lead records from Data.com and add them to Salesforce. Also indicates the type of Data.com user. Data.com Users get a limited number of account, contact, and lead records to add or export per month, and their unused additions expire at the end of each month. Data.com List Users get a limited number of account, contact, and lead records to add or export per month, and their unused additions expire at the end of each month. After the monthly limit is used, List Users draw record additions from a pool that is shared by all List Users in the organization. Unused pool additions expire one year from purchase.
Default Currency ISO Code	User’s default currency setting for new records. Available only for orgs that use multiple currencies.
Default Division	Division that is applied, by default, to all new accounts and leads created by the user, unless the user explicitly sets a different division. When users create records related to an account or other record that already has a division, the new record is assigned to the existing record’s division. The default division is not used.

Field	Description
	<p>This setting does not restrict the user from viewing or creating records in other divisions. Users can override change their default division at any time by setting a working division.</p> <p>Available only in orgs that use divisions to segment their data.</p>
Delegated Approver	User lookup field used to select a delegate approver for approval requests. Depending on the approval process settings, this user can also approve approval requests for the user.
Department	Group that user works for, for example, Customer Support. Up to 80 characters are allowed in this field.
Development Mode	<p>Enables development mode for creating and editing Visualforce pages.</p> <p>This field is visible only to orgs that have Visualforce enabled.</p>
Disable Auto Subscription For Feeds	Disables automatic feed subscriptions to records owned by a user. Only available in orgs with Chatter enabled.
Division	Company division to which user belongs for example, PC Sales Group. Up to 40 characters are allowed in this field.
Email	Email address of user. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field.
Email Encoding	Character set and encoding for outbound email sent by user from within Salesforce. English-speaking users use ISO-8859-1, which represents all Latin characters. UTF-8 (Unicode) represents characters for all languages, however some older email software doesn't support it. Shift_JIS, EUC-JP, and ISO-2022-JP are useful for Japanese users.
Employee Number	Identifying number for a user.
End of day	Time of day that user generally stops working. Used to define the times that display in the user's calendar.
Fax	Fax number for user.
Federation ID	The value used to identify a user for federated authentication single sign-on.
First Name	First name of user, as displayed on the user edit page. Up to 40 characters are allowed in this field.
Force.com Flow User	<p>Grants the ability to run flows. Available in Developer (with limitations), Enterprise, Unlimited, and Performance Editions.</p> <p>Enabling this option requires the "Manage Force.com Flow" permission.</p> <p>If the user has the "Run Flows" permission, don't enable this field.</p>

Field	Description
Force.com Quick Access Menu	Enables the Force.com quick access menu, which appears in object list view and record detail pages. The menu provides shortcuts to customization features for apps and objects.
Information Currency	The default currency for all currency amount fields in the user record. Available only for orgs that use multiple currencies.
Knowledge User	Grants access to Salesforce Knowledge. The user's profile determines whether the user has access to the Article Management tab or Articles tab. Available in Professional, Enterprise, Unlimited, and Performance Editions.
Language	<p>The primary language for the user. All text and online help is displayed in this language. In Professional, Enterprise, Unlimited, and Performance Edition orgs, a user's individual <code>Language</code> setting overrides the org's <code>Default Language</code>.</p> <p>Not available in Personal Edition, Contact Manager, or Group Edition™. The org's <code>Display Language</code> applies to all users.</p>
Last Login	The date and time when the user last successfully logged in. This value is updated if 60 seconds have elapsed since the user's last login. (Read only)
Last Name	Last name of user, as displayed on the user edit page. Up to 80 characters are allowed in this field.
Last Password Change or Reset	The date and time of this user's last password change or reset. This read-only field appears only for users with the "Manage Users" permission.
Locale	<p>Country or geographic region in which user is located.</p> <p>The <code>Locale</code> setting affects the format of date, date/time, and number fields, and the calendar. For example, dates in the English (United States) locale display as 06/30/2000 and as 30/06/2000 in the English (United Kingdom) locale. Times in the English (United States) locale display using a twelve-hour clock with AM and PM (for example, 2:00 PM), whereas in the English (United Kingdom) locale, they're displayed using a 24-hour clock (for example, 14:00).</p> <p>The <code>Locale</code> setting also affects the first and last name order on <code>Name</code> fields for users, leads, and contacts. For example, Bob Johnson in the English (United States) locale displays as Bob Johnson, whereas the Chinese (China) locale displays the name as Johnson Bob.</p> <p>For Personal Edition users, the locale is set at the organization level (from Setup, enter <i>Company Information</i> in the <code>Quick Find</code> box, then select Company Information). For all other users, their personal locale, available at their personal information page, overrides the organization setting.</p>

Field	Description
Make Setup My Default Landing Page	When this option is enabled, users land in the Setup page when they log in.
Manager	<p>Lookup field used to select the user's manager. This field:</p> <ul style="list-style-type: none"> • Establishes a hierarchical relationship, preventing you from selecting a user that directly or indirectly reports to itself. • Allows Chatter to recommend people and records to follow based on your org's reporting structure. <p>This field is especially useful for creating hierarchical workflow rules and approval processes without creating more hierarchy fields.</p> <p> Note: Unlike other hierarchy fields, you can inactivate users referenced in the <code>Manager</code> field.</p>
Marketing User	<p>When enabled, the user can create, edit, and delete campaigns, configure advanced campaign setup, and add campaign members and update their statuses with the Data Import Wizard. Available in Professional, Enterprise, Unlimited, and Performance Editions.</p> <p>If this option isn't selected, the user can only view campaigns and advanced campaign setup, edit the Campaign History for a single lead or contact, and run campaign reports.</p>
Middle Name	<p>Middle name of the user, as displayed on the user edit page. Up to 40 characters are allowed for this field.</p> <p> Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the <code>Quick Find</code> box, then select User Interface. Then select Enable Name Suffixes for Person Names.</p>
Mobile	<p>Cellular or mobile phone number. Up to 40 characters are allowed in this field.</p> <p>This number is used for SMS-based identity confirmation. Administrators enable SMS-based identity confirmation from Setup by entering <i>Session Settings</i> in the <code>Quick Find</code> box, then selecting Session Settings, and then selecting the Enable the SMS method of identity confirmation option.</p> <p>After the SMS method of identity confirmation is enabled, users without a verified mobile number in their profiles are asked after logging in to register for mobile verification. This process applies to users without mobile numbers. Users can take one of the following actions.</p> <ul style="list-style-type: none"> • Enter a mobile phone number and then have it verified with a text message containing a verification code. • Skip entering a mobile number now, but be asked again at the next login.

Field	Description
	<ul style="list-style-type: none"> Opt out of mobile verification. Users who select this action can register a mobile number later in their personal information. Chatter Free and Chatter External license users who select this action need an administrator to set the mobile number. <p>After a user's mobile phone number is verified, Salesforce uses it to authenticate the user when necessary. For example, verification occurs when a user logs in from an unknown IP address.</p> <p>Administrators can also enter users' mobile numbers and pre-verify them. If Enable the SMS method of identity confirmation is enabled when an administrator enters a mobile number for a user, or when a mobile number is set from an API using the <code>User</code> object, the mobile number is considered verified. If Enable the SMS method of identity confirmation is not enabled, the new mobile phone number is not considered verified.</p>
Mobile Configuration	<p>The mobile configuration assigned to the user. If no mobile configuration is specified, this field defaults to the mobile configuration assigned to the user's profile.</p> <p>This field is visible to orgs that use Salesforce to manage mobile configurations.</p>
Mobile User	<p>Allocates one Salesforce Classic Mobile license to the user, granting the user access to Salesforce Classic Mobile app. The number of user records enabled by this checkbox can't exceed the total number of mobile licenses your org has. Available in Professional, Enterprise, Unlimited, and Performance Editions.</p> <p>The Mobile User option is enabled by default for Unlimited, Performance, and Developer Edition users. To prevent users from activating the Salesforce Classic Mobile app on their mobile devices before you're ready to deploy it, disable this option for all users.</p> <p>If users have already activated their Salesforce Classic Mobile account, deselecting the Mobile User option revokes the user's mobile license. The next time the user's device synchronizes with Salesforce, all the Salesforce data is deleted from the device, and the device is no longer associated with the user.</p>
Modified By	<p>User who last changed the user fields, including modification date and time. (Read only)</p>
Monthly Contact and Lead Limit	<p>If the user's <code>Data.com User Type</code> is Data.com User, the number of Data.com contact and lead records the user can add each month.</p> <p>The default number of records per license is 300, but you can assign more or fewer, up to the org limit.</p>

Field	Description
Name	Combined first name, middle name (beta), last name, and suffix (beta) of user, as displayed on the user detail page.
Newsletter	Opt in to receive user-targeted promotional emails from Salesforce. This field is not available if your org has disabled your choice to receive emails from Salesforce.
Nickname	A nickname is the name used to identify this user in a community. Up to 40 alphanumeric characters are allowed. Standard users can edit this field.
Offline User	Administrative checkbox that grants the user access to Connect Offline. Available in Professional, Enterprise, Unlimited, and Performance Editions.
Partner Super User	Denotes whether a partner portal user is a super user.
Phone	Phone number of user. Up to 40 characters are allowed in this field.
Profile	Administrative field that specifies the user's base-level permissions to perform different functions within the application. You can grant more permissions to a user through permission sets.
Receive Approval Request Emails	Preference for receiving approval request emails. This preference also affects whether the user receives approval request notifications in Salesforce1 or Lightning Experience.
Receive Salesforce CRM Content Daily Digest	Specifies that non-portal users with a <code>Salesforce CRM Content User</code> license and Salesforce CRM Content subscription receive a daily email summary if activity occurs on their subscribed content, libraries, tags, or authors. To receive email, you must also select the <code>Receive Salesforce CRM Content Email Alerts</code> option. Portal users do not need the <code>Salesforce CRM Content User</code> license. They only need the <code>View Content in Portals</code> user permission.
Receive Salesforce CRM Content Email Alerts	Specifies that non-portal users with a <code>Salesforce CRM Content User</code> license and Salesforce CRM Content subscription receive email notifications if activity occurs on their subscribed content, libraries, tags, or authors. To receive real-time email alerts, select this option and do not select the <code>Receive Salesforce CRM Content Daily Digest</code> option. Portal users do not need the <code>Salesforce CRM Content User</code> license. They only need the <code>View Content in Portals</code> user permission.
Role	Administrative field that specifies position of user within an organization, for example, Western Region Support Manager. Roles are selected from a picklist of available roles, which can be changed by an administrator.

Field	Description
	Not available in Personal Edition, Contact Manager, or Group Edition.
Salesforce CRM Content User	Indicates whether a user can use Salesforce CRM Content. Available in Professional, Enterprise, Unlimited, and Performance Editions.
Salesforce1 User	Turns on automatic redirection to the Salesforce1 mobile browser app when a user logs in to Salesforce from a supported mobile Web browser. The Salesforce1 mobile browser app option must be enabled for your org.
Self-Registered via Customer Portal	When enabled, specifies that the user was created via self-registration to a Customer Portal. Available in Enterprise, Unlimited, and Performance Editions.
Send Apex Warning Emails	Specifies that users receive an email notification whenever they execute Apex that surpasses more than 50 percent of allocated governor limits. Available in Developer, Enterprise, Unlimited, and Performance Editions only.
Show View State in Development Mode	Enables the View State tab in the development mode footer for Visualforce pages. This field is only visible to orgs that have Visualforce enabled, and Development Mode selected.
Site.com Contributor User	Allocates one Site.com Contributor license to the user, granting the user limited access to Site.com Studio. Users with a Contributor license can use Site.com Studio to edit site content only. The number of user records with this checkbox enabled can't exceed the total number of Site.com Contributor licenses your org has. Available in Developer, Enterprise, Unlimited, and Performance Editions, only if Site.com is enabled for your org.
Site.com Publisher User	Allocates one Site.com Publisher license to the user, granting the user full access to Site.com Studio. Users with a Publisher license can build and style websites, control the layout and functionality of pages and page elements, and add and edit content. The number of user records with this checkbox enabled can't exceed the total number of Site.com Publisher licenses your org has. Available in Developer, Enterprise, Unlimited, and Performance Editions, only if Site.com is enabled for your org.
Start of day	Time of day that user generally starts working. Used to define the times that display in the user's calendar.

Field	Description
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Suffix	Name suffix of the user, as displayed on the user edit page. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .
Temporary Verification Code	Users can enter a temporary code when they lose the mobile phone or device that they usually use for identity verification. Only Salesforce admins can generate or expire a temporary code for a user. Users can expire their own code.
Time Zone	Primary time zone in which user works. Users in Arizona should select the setting with "America/Phoenix," and users in parts of Indiana that do not follow Daylight Savings Time should select the setting with "America/Indianapolis."
Title	Job title of user. Up to 80 characters are allowed in this field.
Used Space	Amount of disk storage space the user is using.
User License	Indicates the type of user license.
Username	Administrative field that defines the user's login. Up to 80 characters are allowed in this field.
Zip/Postal Code	Zip code or postal code portion of user's address. Up to 20 characters are allowed in this field.

Salesforce Adoption Manager

Quickly turn your mobile employees into Salesforce1 power users with Salesforce Adoption Manager. This tool trains and engages your users with intelligent email journeys aimed at driving adoption of the Salesforce1 mobile app. After inviting users to download the mobile app, Adoption Manager follows up with tips that help users get the most out of Salesforce1. It also encourages dormant Salesforce1 users to try using the app again.

Is Salesforce Adoption Manager Available for All Orgs?

Adoption Manager is currently available for orgs in the United States, the U.K., and Australia. Adoption Manager determines your country by the billing country for your Salesforce account. Note that Adoption Manager is not available for customers on the NA21 instance of Salesforce.

What Kind of Results Can I Expect from Salesforce Adoption Manager?

With customized tips and feedback, this program is designed to help you and your users get more out of Salesforce. Currently, this program is about making your users more effective with the Salesforce1 mobile app.

For example, here are some amazing results from our customers when effectively using Salesforce1:

- 40% increase in employee satisfaction
- 29% faster time to find information
- 26% increase in sales productivity

What Is User Data Used for When Salesforce Adoption Manager Is Enabled?

The only change when you enable Salesforce Adoption Manager is your users receive email messages from the program, based on their usage of Salesforce1. You can review our [privacy statement](#) for more detail.

What Happens After I Activate Salesforce Adoption Manager for My Users?

Once you activate the program, it starts with a personalized invite to users to download the Salesforce1 mobile app. All emails are optimized for desktop and mobile devices. If users access the email from a desktop, they can text a download link to their mobile devices.

After users downloaded Salesforce1, they receive emails based on their actual usage of the mobile app. These emails suggest top actions to take and also keep track of actions already taken. The goal is to get users up to speed with Salesforce1 so your company can start realizing more benefits from the product.

In the future, we plan to expand this program to help users become more effective with all Salesforce products.

Will My Users Get Notifications or Other Types of Messages in Addition to Emails?

Initially, Salesforce Adoption Manager sends email messages only. We plan to add mobile notifications in the future so users can get the tips they need while using Salesforce1.

What Do the Emails from Salesforce Adoption Manager Look Like?

[Check out this video](#) to see for yourself!

Can I Customize the Content of the Salesforce Adoption Manager Emails?

No.

Who Receives the Salesforce Adoption Manager Emails? How Frequently Are Emails Sent Out?

Emails are delivered to users with full Salesforce licenses only. Community, Partner, and Chatter users aren't included.

Adoption Manager is intelligent about who receives emails.

- The invitation to download Salesforce1 isn't sent to users who don't have permission to access the mobile app. Nor is it sent to users who have already installed the app.

- Five separate tips are sent to all users who downloaded Salesforce1 within the last 60 days.
- A single reminder to use Salesforce1 is sent to users who haven't accessed the mobile app for 30 days.

Are Salesforce Adoption Manager Emails Counted Against My Org's Limits?

No. The emails are sent from Salesforce Marketing Cloud servers instead of from your org.

How Can I Confirm That Salesforce Adoption Manager Emails Are Actually Going Out?

The Marketing Cloud Support team can help confirm that the emails are being sent. Contact Salesforce Customer Support for more information.

Can I Configure Salesforce Adoption Manager to Send Emails to a Specific Group of Users Only?

No. When you enable Adoption Manager, it's turned on for all users in your org. But users can opt out of receiving future messages from the footer of any email from the program.

Can Users Opt Back into Receiving Salesforce Adoption Manager Emails After Opting Out?

Yes. The first Adoption Manager email includes a link that allows users to opt back into receiving future emails. Consider encouraging your users to save this email, just in case.

If I Turn on Salesforce Adoption Manager, Can I Opt Out Later?

Yes. From Setup in the full Salesforce site, enter *Adoption* in the *Quick Find* box, select **Adoption Manager**, and then deselect *Enable Salesforce Adoption Manager*.

Licenses Overview

To enable specific Salesforce functionality for your users, you must choose one user license for each user. To enable additional functionality, you can assign permission set licenses and feature licenses to your users or purchase usage-based entitlements for your organization.

Specific features in Salesforce require specific permissions. For example, to view cases, a user must have the "Read" permission on cases. However, you can't assign permissions to any user you choose. Like the features that it enables, each permission has a requirement of its own. To assign a given permission to a user, that user's license (or licenses) must support the permission. A single permission can be supported by more than one license.

Think of permissions as locks, and think of licenses as rings of keys. Before you can assign users a specific permission, they must have a license that includes the key to unlock that permission. Although every user must have exactly one user license, you can assign one or more permission set licenses or feature licenses to incrementally unlock more permissions.

Continuing our example, the Salesforce user license includes the key to unlock the "Read" permission on cases, but the Force.com—App Subscription user license doesn't. If you try to assign that permission to a Force.com—App Subscription user, you get an error message.

EDITIONS

Available in: Salesforce Classic

Edition requirements vary for each user, permission set, and feature license type.

However, if that Force.com—App Subscription user is also assigned a Company Community for Force.com permission set license, you can assign “Read” on cases to that user.

Salesforce provides the following types of licenses and usage-based entitlements.

User Licenses

A user license determines the baseline of features that the user can access. Every user must have exactly one user license. You assign user permissions for data access through a profile and optionally one or more permission sets.

Permission Set Licenses

A permission set is a convenient way to assign users specific settings and permissions to use various tools and functions. Permission set licenses incrementally entitle users to access features that are not included in their user licenses. Users can be assigned any number of permission set licenses.

Feature Licenses Overview

A feature license entitles a user to access an additional feature that is not included with his or her user license, such as Marketing or Work.com. Users can be assigned any number of feature licenses.

Usage-based Entitlements

A usage-based entitlement is a limited resource that your organization can use on a periodic basis—such as the allowed number of monthly logins to a Partner Community or the record limit for Data.com list users.

User Licenses

A user license determines the baseline of features that the user can access. Every user must have exactly one user license. You assign user permissions for data access through a profile and optionally one or more permission sets.

Example:

- Assign a Force.com user license to Employee A. The Force.com user license only supports standard object permissions for accounts and contacts, so Employee A can't access cases.
- Assign a Salesforce user license to Employee B. Give “Read” access on cases to Employee B.

Salesforce offers these license types.

- [Standard User Licenses](#)
- [Chatter User Licenses](#)
- [Communities User Licenses](#)
- [Service Cloud Portal User Licenses](#)
- [Sites and Site.com User Licenses](#)
- [Authenticated Website User Licenses](#)

Note: If your company has purchased custom user licenses for other types of functionality, you can see other license types listed. Your Salesforce org can also have other licenses that are supported but no longer available for purchase. Contact Salesforce for more information.

The following license types are available only for orgs that use a Customer Portal or partner portal.

- [Customer Portal User Licenses](#)
- [Customer Portal—Enterprise Administration User Licenses](#)
- [Partner Portal User Licenses](#)

EDITIONS

Available in: **Salesforce Classic**

Edition requirements vary for each user license type.

If you don't have a Customer Portal or partner portal but want to share information with your customers or partners, see [Communities User Licenses](#) on page 462.

Authenticated Website User Licenses

Platform portal users have the Authenticated Website license, which is designed to be used with Force.com Sites. It gives named sites users unlimited logins to your Platform Portal to access customer support information.

License Type	Description	Available in
Salesforce	Designed for users who require full access to standard CRM and Force.com AppExchange apps. Users with this user license are entitled to access any standard or custom app. Each license provides additional storage for Enterprise, Unlimited, and Performance Edition users.	All editions
Knowledge Only User	Designed for users who only need access to the Salesforce Knowledge app. This license provides access to custom objects, custom tabs, and the following standard tabs: <ul style="list-style-type: none"> • Articles • Article Management • Chatter 	Enterprise, Unlimited, and Performance Editions

EDITIONS

Available in: Salesforce Classic

Edition requirements vary for each user license type.

License Type	Description	Available in
	<ul style="list-style-type: none"> Files Home Profile Reports Custom objects Custom tabs <p>The Knowledge Only User license includes a Knowledge Only profile that grants access to the Articles tab. To view and use the Article Management tab, a user must have the "Manage Articles" permission.</p> <p> Note: To view articles, a user must have the "AllowViewKnowledge" permission on their profile. However, this permission is off for default profiles. To give a user the "AllowViewKnowledge" permission on their profile, activate the permission on a cloned profile and assign the cloned profile to the user.</p>	
Identity	<p>Grants users access to Salesforce Identity features. Salesforce Identity connects Salesforce users with external applications and services, while giving administrators control over authentication and authorization for these users.</p> <p>For more information, see the Salesforce Identity Implementation Guide.</p>	<p>Enterprise, Unlimited, Performance, and Developer Editions</p> <p>Ten free Identity user licenses are included with each new Developer Edition organization.</p>
External Identity	<p>Provides Identity features for users outside of your organization's user base (such as non-employees). Store and manage these users, choose how they authenticate (username/password, or Single Sign-On social sign-on through Facebook, Google+, LinkedIn, and others), and allow self-registration.</p>	<p>Enterprise, Unlimited, Performance, and Developer Editions</p> <p>Five free External Identity user licenses are included with each new Developer Edition organization.</p>
Work.com Only User	<p>Designed for users who don't have a Salesforce license and need access to Work.com.</p> <p> Note: Chatter must be enabled for Work.com features to fully function.</p>	<p>Professional, Enterprise, Unlimited, Performance, and Developer Editions</p>

Force.com User License Types

License type	Description	Available in
Salesforce Platform	<p>Designed for users who need access to custom apps but not to standard CRM functionality. Users with this user license are entitled to use custom apps developed in your organization or installed from Force.com AppExchange. In addition, they are entitled to use core platform functionality such as accounts, contacts, reports, dashboards, documents, and custom tabs. However, these users are not entitled to some user permissions and standard apps, including standard tabs and objects such as forecasts and opportunities. Users with this license can also use Connect Offline.</p> <p> Note: Users with this license can only view dashboards if the running user also has the same license.</p> <p>Users with a Salesforce Platform user license can access all the custom apps in your organization.</p> <p>Each license provides additional storage for Enterprise, Unlimited, and Performance Edition users.</p> <p> Note: To view articles, a user must have the “AllowViewKnowledge” permission on their profile. However, this permission is off for default profiles. To give a user the “AllowViewKnowledge” permission on their profile, activate the permission on a cloned profile and assign the cloned profile to the user.</p>	Enterprise, Unlimited, Performance, and Developer Editions
Force.com - One App	<p> Note: This license is not available for new customers.</p> <p>Designed for users who need access to one custom app but not to standard CRM functionality. Force.com - One App users are entitled to the same rights as Salesforce Platform users, plus they have access to an unlimited number of custom tabs. However, they are limited to the use of one custom app, which is defined as up to 10 custom objects, and they are limited to read-only access to the Accounts and Contacts objects.</p> <p> Note: Users with this license can only view dashboards if the running user also has the same license.</p> <p>Each license provides an additional 20 MB of data storage and 100 MB of file storage, regardless of the Salesforce edition.</p> <p> Note: To view articles, a user must have the “AllowViewKnowledge” permission on their profile. However, this permission is off for default profiles. To give a user the “AllowViewKnowledge” permission on their profile, activate the permission on a cloned profile and assign the cloned profile to the user.</p>	Enterprise and Unlimited Editions

License type	Description	Available in
Force.com App Subscription	<p>Grants users access to a Force.com Light App or Force.com Enterprise App, neither of which include CRM functionality.</p> <p>A Force.com Light App has up to 10 custom objects and 10 custom tabs, has read-only access to accounts and contacts, and supports object-level and field-level security. A Force.com Light App can't use the Bulk API or Streaming API.</p> <p>A Force.com Enterprise App has up to 10 custom objects and 10 custom tabs. In addition to the permissions of a Force.com Light App, a Force.com Enterprise App supports record-level sharing, can use the Bulk API and Streaming API, and has read/write access to accounts and contacts.</p> <p> Note: Users with this license can only view dashboards if the running user also has the same license.</p> <p>Each Force.com App Subscription license provides an additional 20 MB of data storage per user for Enterprise Edition and 120 MB of data storage per user for Unlimited and Performance Editions, as well as 2 GB of file storage regardless of the edition.</p> <p> Note: To view articles, a user must have the "AllowViewKnowledge" permission on their profile. However, this permission is off for default profiles. To give a user the "AllowViewKnowledge" permission on their profile, activate the permission on a cloned profile and assign the cloned profile to the user.</p>	Enterprise, Unlimited, and Performance Editions
Company Community User	<p>This is an internal user license for employee communities. It's designed for users to access custom tabs, Salesforce Files, Chatter (people, groups, feeds), and a Community that includes a Site.com site.</p> <p>Company Community users have read-only access to Salesforce Knowledge articles. They can also:</p> <ul style="list-style-type: none"> • Access up to 10 custom objects and 10 custom tabs • Use Content, Ideas, Assets, and Identity features • Use activities, tasks, calendar, and events • Have access to accounts, contacts, cases, and documents. 	Enterprise, Unlimited, Performance, and Developer Editions

[User Licenses](#)

Chatter User Licenses

All standard Salesforce licenses allow free Chatter access for everyone in your organization. Salesforce also offers Chatter-specific licenses: Chatter External, Chatter Free, and Chatter Only (also known as Chatter Plus).

Chatter External

This license is for users who are outside of your company's email domain. These external users, also called customers, can be invited to Chatter groups that allow customers. Customers can access information and interact with users only in the groups they're invited to. They have no access to Chatter objects or data.

Chatter Free

The Chatter Free license is for users who don't have Salesforce licenses but need access to Chatter. These users can access standard Chatter items such as people, profiles, groups, and files, but they can't access any Salesforce objects or data. Chatter Free users can also be Chatter moderators.

Chatter Free users don't see tabs like other Salesforce users. Chatter Free users access feeds, people, groups, and files using the links in the sidebar of the page.

Salesforce administrators can upgrade a Chatter Free license to a standard Salesforce or Chatter Only license at any time. You can't convert a standard Salesforce or Chatter Only license to a Chatter Free license.

Chatter Only (Chatter Plus)

The Chatter Only license is also known as the Chatter Plus license. It is for users that don't have Salesforce licenses but need access to some Salesforce objects in addition to Chatter. Chatter Plus users can be Chatter moderators and have access to standard Chatter people, profiles, groups, and files pages. They also can

- View Salesforce accounts and contacts
- Use Salesforce CRM Content, Ideas, and Answers
- Access dashboards and reports
- Use and approve workflows
- Use the calendar to create and track activities
- View and modify up to ten custom objects
- Add records to groups

By default, the tabs for standard Salesforce objects are hidden from Chatter Plus users. Expose these tabs, if you want to make them available to Chatter Plus users. For more information on Chatter Plus users, see [Chatter Plus Frequently Asked Questions](#)

Chatter License Overview

This table shows the list of features that are available for Chatter External, Chatter Free, and Chatter Only licenses.

EDITIONS

Available in: Salesforce Classic

Chatter External and Chatter Free licenses are available in: **Group, Professional, Enterprise, Performance, Unlimited, Contact Manager, and Developer** Editions

Chatter Only (also known as Chatter Plus) licenses are available in: **Professional, Enterprise Unlimited, and Performance** Editions

Feature	Chatter External (Access limited to items and people in the groups customers are invited to)	Chatter Free	Chatter Only (a.k.a. Chatter Plus)
Chatter Desktop client	✓	✓	✓
Use the Salesforce1 mobile app (Downloadable apps require the "API Enabled" profile permission)	✓ Downloadable app users can't access Groups or People list views.	✓	✓
Feeds	✓	✓	✓
File sharing	✓	✓	✓
Files Connect			✓
Groups	✓	✓	✓
Invitations to join groups	✓ Only customers who are also group managers can invite Chatter users from groups they have access to or people outside Chatter.	✓	✓
Profiles	✓	✓	✓
Topics and hash tags	✓	✓	✓
Private messages	✓	✓	✓
Global search	✓ Search results include only those items that customers have access to via groups.	✓	✓
Custom objects			✓ Up to 10 custom objects
Accounts and contacts			✓ Read only
Calendar and events			✓
Content library			✓
Ideas and answers			✓
Reports and dashboards			✓

Feature	Chatter External (Access limited to items and people in the groups customers are invited to)	Chatter Free	Chatter Only (a.k.a. Chatter Plus)
Tasks and activities			✓
Using and approving workflows			✓

Communities User Licenses

We have three Communities licenses for external users: Customer Community, Customer Community Plus, and Partner Community. We also have an Employee Apps and Community license for employee communities.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance, Unlimited, Developer, and Enterprise** Editions

Learn About the Licenses

Are community licenses associated with users or a community?

Communities licenses are associated with users, not a specific community. If needed, you can move users with these licenses between communities. If you have unused licenses, you can assign them to users in any community in your org.

Here's another way to think about it: Your community is like an airplane. Each passenger has a different type of ticket (license), and therefore, different levels of access. They're all together on the same ride, but each person has a slightly different experience based on how much the ticket cost.

In addition to supporting communities licenses, Communities supports all internal and portal licenses, including existing Customer Portal, Authenticated Website, and partner portal licenses.

How is a license used in an employee community?

The Employee Apps and Community permission set license includes the same permissions provided by the Employee Apps and Community license. Use this add-on license to give employees who hold an existing Salesforce Platform or Force.com App Subscription license access to your employee community.

The Employee Apps and Community license appears as Company Community in the User License related list in Setup.

How do community licenses compare to legacy portal licenses?

Here's a quick correlation of the new communities licenses with their older portal counterparts and their main use case.

Important: Users who have portal licenses can access your community as long as you include them by adding the profiles or permission sets that they're associated with. You don't have to purchase new Communities licenses for them.

Community License Name	Best Used For	Comparable Portal License
Customer Community	Business-to-consumer communities with large numbers of external users	High Volume Customer Portal, Service Cloud Portal, Authenticated Sites Portal
Customer Community Plus	Business-to-business communities for support and non-sales scenarios, such as eCommerce	Customer Portal — Enterprise Administration

Community License Name	Best Used For	Comparable Portal License
Partner Community	Business-to-business communities that need access to sales data such as partner relationship management	Partner

Here's a simple decision tree to help pick the license type for your community's needs.

 **Note:** Different license types can access your community. Your community is not limited to just one type of license.

What about monthly login-based licenses?

The following community licenses are also available as a monthly login-based license, with the following names.

Community License Name	Monthly Login-Based License Name
Customer Community	Customer Community Login License
Customer Community Plus	Customer Community Plus Login License
Partner Community	Partner Community Login License

When using a monthly login-based license, a user consumes a login when signing in to a community. Already logged-in users don't consume licenses when switching between their communities. Overages are calculated at the end of the year rather than on a monthly basis.

If users with a login-based community license access their communities through Salesforce1, they consume a login the first time they log in or if their session times out. A login is counted each time a login-based user authenticates to the community. Salesforce calculates logins from the LoginHistory table. The timeout period for a login is configurable up to a maximum of 12 hours.

Is an extra license required to use Community Builder?

Each community using a Community Builder-based template can use the Community Builder to add custom, branded pages to your community. Communities users with the “Create and Set Up Communities” permission automatically have full site administrator access to a community’s Community Builder.

Do communities have user limits?

You can have up to 50 communities in your Salesforce org. Active, inactive, and preview communities, including Force.com sites, count against this limit.

To avoid deployment problems and any degradation in service quality, we recommend that the number of users in your community not exceed the limits listed below. If you require additional users beyond these limits, contact your Salesforce account executive. If your growing community needs more users, contact your Salesforce account representative to understand how the product can scale to meet your demands.

Type of Community	Number of Users
Partner or Customer Community Plus	300,000
Customer	10 million

Will unauthenticated users count against my community’s licenses?

Not at all! Unauthenticated or guest users who access your community do not use up any of your community’s licenses.

These are the limits for guest users, based on your Salesforce edition. Overages are calculated on a yearly basis. If your growing community exceeds this number of guest users, contact your Salesforce account representative to understand how the product can scale to meet your demands.

Salesforce Edition	Number of Guest Users
Enterprise Edition	500,000/month
Unlimited Edition	One million/month

License Detail

This table shows which features are available to the default user profiles with Customer Community, Customer Community Plus, Partner Community, or Employee Apps and Community licenses.

	Customer Community	Customer Community Plus	Partner Community	Employee Apps and Community
Salesforce Standard Objects				
Account Contact Relationships ¹	✔	✔	✔	✔

¹ To view or create relationships between accounts and contacts, you must have “Read” on accounts and contacts. To edit or delete relationships between account and contacts, you must have “Read” on accounts and “Edit” on contacts.

	Customer Community	Customer Community Plus	Partner Community	Employee Apps and Community
Accounts	 Read, Edit ²	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit, Delete, View All Data, Manage All Data
Assets	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit
Campaigns			 Read, Create, and Edit ³	
Cases	 Read, Create, Edit ⁴	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit, Delete ⁵
Contacts	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit, Delete, View All Data, Manage All Data
Contracts	 Read, Create, Edit, Delete	 Read, Create, Edit, Delete	 Read, Create, Edit, Delete	
Documents	 Read Only	 Read Only	 Read Only	 Read, Create, Edit, Delete, View All Data, Manage All Data
Entitlements	 Read, Create, Edit	 Read, Create, Edit	 Read, Create, Edit	
Events & Calendar			 Read, Create, Edit	
Ideas	 Read, Create	 Read, Create	 Read, Create	 Read, Create

² For Customer Community licenses, access can also be controlled using sharing sets.

³ For the Partner Community license, to read, create, and edit campaigns in the user interface, the partner user also needs the "Marketing User" permission. With these permissions, a partner user can: search for and add their contacts or leads as campaign members, access reports on their campaigns, and mass-email or mass-assign their contacts and leads on a campaign.

⁴ For the Customer Community license, cases can't be created on behalf of another user.

⁵ In employee communities, cases can track internal and employee issues, but should not be used for customer cases.

	Customer Community	Customer Community Plus	Partner Community	Employee Apps and Community
Leads			✓ Read, Create, Edit	
Opportunities			✓ Read, Create, Edit	
Orders ⁶	✓ Read, Create, Edit, Delete	✓ Read, Create, Edit, Delete	✓ Read, Create, Edit, Delete	
Price Books	✓ Read Only	✓ Read Only	✓ Read Only	
Products	✓ Read Only	✓ Read Only	✓ Read Only	
Quotes			✓ Read, Create, Edit	
Reports & Dashboards ⁷		✓ Create and Manage	✓ Create and Manage	✓ Create and Manage
Service Contracts		✓ Read, Create, Edit	✓ Read, Create, Edit	
Work Orders	✓ Read, Create, Edit	✓ Read, Create, Edit	✓ Read, Create, Edit	✓ Read, Create, Edit, Delete
Salesforce Features, Capability, and Custom Objects				
Additional Storage		2 MB per member (member-based license) 1 MB per member (login-based license)	5 MB per member (member-based license) 1 MB per member (login-based license)	20 MB per user (user-based license) ⁸

⁶ Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren't appropriate for them, consider creating custom profiles that don't include these object permissions.

⁷ For the Customer Community Plus, Employee Apps and Community, and Partner Community licenses to create and edit reports, the user also needs the "Create and Customize Reports," "Report Builder," and "Edit My Reports" permissions. For more information see, [Set Up Report Management for External Users—Create and Edit Reports](#).

⁸ For the Employee Apps and Community license, the data storage limit is 20 MB per user license, and the file storage limit is 2 GB per user license.

	Customer Community	Customer Community Plus	Partner Community	Employee Apps and Community
Chatter (People, Groups, Feeds, Files, Private Messages) ⁹	✓	✓	✓	✓
Content		View and Upload	View and Upload	View, Upload, and Manage
Custom Objects	✓ 10 custom objects per license (custom objects in managed packages don't count towards this limit)	✓ 10 custom objects per license (custom objects in managed packages don't count towards this limit)	✓ 10 custom objects per license (custom objects in managed packages don't count towards this limit)	✓ 10 custom objects per license (custom objects in managed packages don't count towards this limit)
Delegated Administration		✓	✓	
Knowledge	✓ Read Only	✓ Read Only	✓ Read Only	✓ Read Only
Roles and Sharing		✓	✓	✓

Service Cloud Portal User Licenses

Service Cloud Portal users have the High Volume Customer Portal license. This license gives contacts unlimited logins to your Service Cloud Portal to access customer support information. Users with this license can access accounts, assets, cases, contacts, custom objects, documents, ideas, and questions, depending on their permission settings.

The Overage High Volume Customer Portal license is the same as the High Volume Customer Portal license, except that users do not have unlimited logins. Contact Salesforce for information about the number of Customer Portal licenses you can activate.

This table lists the permissions that can be assigned to Service Cloud portal users.

SEE ALSO:

[User Licenses](#)

Sites and Site.com User Licenses

Sites and Site.com users can have Guest User or Site.com Only user licenses.

EDITIONS

Available in: Salesforce Classic

Edition requirements vary by user license type.

Guest User Designed for public users who access your Site.com or Force.com sites. If Communities is enabled, these users also have access to public pages in your communities. Site visitors have access to any information made available in an active public site. For each Guest User license, you can develop one site for your organization.

For Site.com, **Developer, Enterprise, Unlimited,** and **Performance** Editions each come with unlimited Guest User licenses.

For Force.com sites, **Enterprise, Unlimited,** and **Performance** Editions come with 25 Guest User licenses. **Developer** Edition comes with one Guest User license.

 **Note:**

- You can't purchase additional Guest User licenses for Force.com sites.
- The Authenticated Website high-volume portal user license is specifically designed to be used with Force.com sites. Because it's designed for high volumes, it should be a cost-effective option to use with Force.com sites.

Site.com Only Designed for **Performance, Unlimited,** and **Enterprise** Edition users who need access to Site.com but not to standard CRM functionality. Site.com Only users are entitled to the same rights as Force.com - One App users, plus they have access to the Content app. However, they don't have access to the Accounts and Contacts objects. Users have access to an unlimited number of custom tabs but are limited to the use of one custom app, which is defined as up to 20 custom objects.

Each Site.com Only user also needs either a Site.com Contributor or Site.com Publisher feature license to access Site.com.

SEE ALSO:

[User Licenses](#)

Authenticated Website User Licenses

Platform portal users have the Authenticated Website license, which is designed to be used with Force.com Sites. It gives named sites users unlimited logins to your Platform Portal to access customer support information.

The Overage Authenticated Website license is the same as the Authenticated Website license, except that users do not have unlimited logins.

 **Note:** Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren't appropriate for them, consider creating custom profiles that don't include these object permissions.

This table lists the permissions that can be given to Authenticated Website users.

Customer Portal User Licenses

Users of a Customer Portal site have the Customer Portal Manager Standard license.

 **Note:** Starting with Summer '13, these licenses are only available for organizations that already have a Customer Portal. If you don't have a Customer Portal but want to easily share information with your customers, see [Communities User Licenses](#) on page 462.

It allows contacts to log in to your Customer Portal to manage customer support. You can associate users who have a Customer Portal Manager Standard license with the Customer Portal User profile or a profile cloned and customized from the Customer Portal User profile. This standard profile lets users view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy. These users can also view and edit cases where they are listed in the `Contact` Name field.

Users with the Customer Portal Manager Standard license can:

- View contacts, price books, and products.
- View and edit accounts and cases.
- Create and edit assets.
- Create, view, edit, and delete custom objects.
- Access custom objects depending on their permissions.
- Receive the "Portal Super User" permission.
- Access Salesforce CRM Content if they have a Salesforce CRM Content feature license or the appropriate permissions.

The Overage Customer Portal Manager Standard license is the same as the Customer Portal Manager Standard license, except that users are limited to one login per month.

 **Note:** Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren't appropriate for them, consider creating custom profiles that don't include these object permissions.

This table lists the permissions that can be given to Customer Portal users.

[User Licenses](#)

Customer Portal—Enterprise Administration User Licenses

Customer Portal—Enterprise Administration users have the Customer Portal Manager Custom license. This license gives contacts unlimited logins to your Salesforce Customer Portal to manage customer support.

-  **Note:** Starting with Summer '13, these licenses are only available for organizations that already have a Customer Portal. If you don't have a Customer Portal but want to easily share information with your customers, see [Communities User Licenses](#) on page 462.

You can associate users who have a Customer Portal Manager Custom license with the Customer Portal User profile or a profile cloned and customized from the Customer Portal User profile, which lets them view and edit data they directly own and view, create, and edit cases where they're listed in the `Contact Name` field.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** editions

Users with this license can:

- Create, read, or update accounts, assets, and cases.
- View contacts.
- View custom objects and run reports depending on their permissions.
- Receive the “Portal Super User” and “Delegated External User Administrator” permissions.
- Access Salesforce CRM Content if they have a Salesforce CRM Content feature license or the appropriate permissions.

The Overage Customer Portal Manager Custom license is the same as the Customer Portal Manager Custom license, except that users do not have unlimited logins. Contact Salesforce for information about the number of Customer Portal licenses you can activate.

 **Note:** Once orders are enabled, standard profiles automatically include all object permissions for orders, as well as read access for products and price books. If your external users are assigned to a standard profile and these object permissions aren’t appropriate for them, consider creating custom profiles that don’t include these object permissions.

Permission Set Licenses

A permission set is a convenient way to assign users specific settings and permissions to use various tools and functions. Permission set licenses incrementally entitle users to access features that are not included in their user licenses. Users can be assigned any number of permission set licenses.

[What Are Permission Set Licenses?](#)

Permission set licenses incrementally entitle users to access features that are not included in their user licenses. Users can be assigned any number of permission set licenses.

[Available Permission Set Licenses](#)

For each permission set license available for purchase, see which permissions it enables you to assign to your users.

[View Your Salesforce Org’s Permission Set Licenses](#)

View the permission set licenses your organization has purchased to know what you have available to assign to your users.

[Assign a Permission Set License to a User](#)

You might need to assign a permission set license to a user before you can assign some permissions.

[Remove a Permission Set License from a User](#)

First remove or modify the relevant assigned permission sets that require the license, and then remove the assigned permission set license.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

The availability of each permission set license depends on the edition requirements for permission sets and the related feature.

What Are Permission Set Licenses?

Permission set licenses incrementally entitle users to access features that are not included in their user licenses. Users can be assigned any number of permission set licenses.

 **Tip:** Permission sets and permission set licenses have different purposes. Read on to save yourself some trouble later.

- **Permission set licenses** extend functionality of *user licenses*. With permission set licenses, you can assign more permissions to users than their user license supports.
- **Permission sets** contain settings and permissions that are also found in *profiles*. Permission sets extend users' functional access without changing their profiles.

After you assign a permission set license to a user, assign permissions as needed to the user through a permission set.

- For example, if you have an Identity Connect permission set *license*, first assign it to a user. This permission set license assignment extends the functional ability of the user license associated with the user. Then you can assign a permission set that contains the "Use Identity Connect" permission to the same user.
- Here's another example. Assign the Orders Platform permission set license to users with the Force.com user license. Then you can assign a permission set with "Read" or "Edit" on orders to the users so that they can update order records.

Not all permissions require permission set license assignment for users to access features. For example, you can assign the "Read" or "Edit" permissions to users with a Salesforce user license even if they don't have a corresponding permission set license. In fact, it's likely you've done so at some point.

So why use the Orders Platform permission set license for a Force.com user, as described in the example, but not a Salesforce user? Remember, permission set licenses are additive, so only add on to a user license if the functionality isn't already included. The Salesforce user license includes "Read" and "Edit" permissions. However these permissions aren't included with the Force.com user license, so we used a permission set to extend access.

 **Note:** The CRM User, Sales User, and Service User permission set licenses let you track your org's user license usage. For example, to track Sales user license usage, assign the Sales User permission set licenses to your users in sales roles. When you assign these permission set licenses, you don't need to assign permission sets to the assigned users.

Usage-based Entitlements

A usage-based entitlement is a limited resource that your organization can use on a periodic basis—such as the allowed number of monthly logins to a Partner Community or the record limit for Data.com list users.

Some entitlements are persistent. These entitlements give your Salesforce org a set number of the resource, and the amount allowed doesn't change unless your contract is changed. For example, if your company purchases monthly subscriptions for 50 members to access a Partner Community, you can assign up to 50 individuals the ability to log into the community as many times as they want.

Other entitlements are not persistent; these work like credit. Your org can use up to the amount allowed of that entitlement over the time indicated by the resource's frequency. If the entitlement has a frequency of Once, your org will have to purchase more of the resource to replenish the allowance. If the entitlement has a frequency of Monthly, the start and end of the month is determined by your contract, rather than the calendar month.

For example:

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, and Unlimited** Editions

- Company A purchases 50 monthly logins for a Partner Community, and on January 15 that org has a pool of 50 logins. Each time someone logs in, one login is used. On February 15, no matter how many were used in the previous month, the pool is refreshed and 50 logins are available through March 14.
 - Company B purchases 2,000 records for Data.com list users with an end date of May 15. That org's list users can add or export up to 2,000 records until that date. If the org reaches that limit before May 15, the Data.com list users won't be able to add or export additional records. To unblock users, Company B can purchase additional allowance for that resource.
-  **Note:** If your org has multiple contracts with the same `Resource` and the `Resource ID` is `(tenant)`, you will still only see one row for that entitlement, but the data in that row will reflect your combined contracts. In this case, `Start Date` reflects the earliest start date among those contracts, and `End Date` reflects the latest end date among those contracts.

Like feature licenses, usage-based entitlements don't limit what you can do in Salesforce; they add to your functionality. If your usage exceeds the allowance, Salesforce will contact you to discuss additions to your contract.

Usage-based Entitlement Fields

The Usage-based Entitlements related list displays the following information. These fields aren't editable, and they are only visible if your Salesforce org is entitled to a resource.

Column name	Description
Resource	What your company can use.
Resource ID	Unique identifier for this line item.
Start Date	Day your contract begins.  Note: If you have multiple contracts affecting this resource, this field reflects the earliest start date among your contracts.
End Date	Day your contract ends.  Note: If you have multiple contracts affecting this resource, this field reflects the latest end date among your contracts.
Frequency	If Monthly, <code>Allowance</code> is reset at the beginning of each month. If Once, <code>Allowance</code> is available until <code>End Date</code> .
Allowance	Amount of a resource that your org can use. If <code>Frequency</code> is Monthly, the month begins on your <code>Start Date</code> .
Amount Used	The amount of this resource that your org is using.
Last Updated	The most recent date and time when Salesforce took a snapshot of your org's usage for this resource.

For more information about resources your org is entitled to, contact Salesforce.

Passwords

Salesforce provides each user in your organization with a unique username and password that must be entered each time a user logs in. As an administrator, you can configure several settings to ensure that your users' passwords are strong and secure.

- Password policies—Set various password and login policies, such as specifying an amount of time before all users' passwords expire and the level of complexity required for passwords. See [Set Password Policies](#) on page 818.
- User password expiration—Expire the passwords for all users in your organization, except for users with "Password Never Expires" permission. See [Expire Passwords for All Users](#) on page 821.
- User password resets—Reset the password for specified users. See [Reset Passwords for Your Users](#) on page 488.
- Login attempts and lockout periods—If a user is locked out of Salesforce because of too many failed login attempts, you can unlock them. See [Edit Users](#) on page 439.

Password Requirements

A password can't contain a user's username and can't match a user's first or last name. Passwords also can't be too simple. For example, a user can't change their password to *password*.

For all editions, a new organization has the following default password requirements. You can change these password policies in all editions, except for Personal Edition.

- A password must contain at least eight characters, including one alphabetic character and one number.
- The security question's answer can't contain the user's password.
- When users change their password, they can't reuse their last three passwords.

Password policies available in: **All Editions**

USER PERMISSIONS

To set password policies:

- "Manage Password Policies"

To reset user passwords and unlock users:

- "Reset User Passwords and Unlock Users"

Set Password Policies

Improve your Salesforce org security with password protection. You can set password history, length, and complexity requirements along with other values. In addition, you can specify what to do if a user forgets their password.

For your organization's security, you can set various password and login policies.

 **Note:** User passwords cannot exceed 16,000 bytes.

Logins are limited to 3,600 per hour per user. This limit applies to organizations created after Summer '08.

1. From Setup, enter *Password Policies* in the *Quick Find* box, then select **Password Policies**.
2. Customize the password settings.

Field	Description
User passwords expire in	<p>The length of time until user passwords expire and must be changed. The default is 90 days. This setting isn't available for Self-Service portals. This setting doesn't apply to users with the "Password Never Expires" permission.</p> <p>If you change the <i>User passwords expire in</i> setting, the change affects a user's password expiration date if that user's new expiration date is earlier than the old expiration date or if you remove an expiration by selecting <i>Never expires</i>.</p>
Enforce password history	<p>Save users' previous passwords so that they must always reset their password to a new, unique password. Password history is not saved until you set this value. The default is <i>3 passwords remembered</i>. You cannot select <i>No passwords remembered</i> unless you select <i>Never expires</i> for the <i>User passwords expire in</i> field. This setting isn't available for Self-Service portals.</p>
Minimum password length	<p>The minimum number of characters required for a password. When you set this value, existing users aren't affected until the next time they change their passwords. The default is <i>8 characters</i>.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To set password policies:

- "Manage Password Policies"

Field	Description
Password complexity requirement	<p>The requirement for which types of characters must be used in a user's password.</p> <p>Complexity levels:</p> <ul style="list-style-type: none"> • No restriction—allows any password value and is the least secure option. • Must mix alpha and numeric characters—requires at least one alphabetic character and one number, which is the default. • Must mix alpha, numeric, and special characters—requires at least one alphabetic character, one number, and one of the following characters: ! # \$ % - _ = + < >. • Must mix numbers and uppercase and lowercase letters—requires at least one number, one uppercase letter, and one lowercase letter. • Must mix numbers, uppercase and lowercase letters, and special characters—requires at least one number, one uppercase letter, and one lowercase letter, and one of the following characters: ! # \$ % - _ = + < >.
Password question requirement	<p>The values are <code>Cannot contain password</code>, meaning that the answer to the password hint question cannot contain the password itself; or <code>None</code>, the default, for no restrictions on the answer. The user's answer to the password hint question is required. This setting is not available for Self-Service portals, Customer Portals, or partner portals.</p>
Maximum invalid login attempts	<p>The number of login failures allowed for a user before they become locked out. This setting isn't available for Self-Service portals.</p>
Lockout effective period	<p>The duration of the login lockout. The default is 15 minutes. This setting isn't available for Self-Service portals.</p> <p> Note: If users are locked out, they must wait until the lockout period expires. Alternatively, a user with the "Reset User Passwords and Unlock Users" permission can unlock them from Setup with the following procedure:</p> <ol style="list-style-type: none"> Enter <code>Users</code> in the <code>Quick Find</code> box. Select Users. Selecting the user. Click Unlock. <p>This button is only available when a user is locked out.</p>

Field	Description
Obscure secret answer for password resets	<p>This feature hides answers to security questions as you type. The default is to show the answer in plain text.</p> <p> Note: If your organization uses the Microsoft Input Method Editor (IME) with the input mode set to Hiragana, when you type ASCII characters they're converted into Japanese characters in normal text fields. However, the IME does not work properly in fields with obscured text. If your organization's users cannot properly enter their passwords or other values after enabling this feature, disable the feature.</p>
Require a minimum 1 day password lifetime	When you select this option, a password can't be changed more than once in a 24-hour period.

3. Customize the forgotten password and locked account assistance information.

 **Note:** This setting is not available for Self-Service portals, Customer Portals, or partner portals.

Field	Description
Message	<p>If set, this message appears in the “We can't reset your password” email. Users receive this email when they lock themselves out by trying to reset their password too many times. The text also appears at the bottom of the Answer Your Security Question page when users reset their passwords.</p> <p>You can tailor the text to your organization by adding the name of your internal help desk or a system administrator. For the email, the message appears only for accounts that need an administrator to reset them. Lockouts due to time restrictions get a different system email message.</p>
Help link	<p>If set, this link displays with the text defined in the <code>Message</code> field. In the “We can't reset your password” email, the URL displays exactly as typed in the <code>Help link</code> field, so the user can see where the link goes. This URL display format is a security feature, because the user is not within a Salesforce organization.</p> <p>On the Answer Your Security Question page, the <code>Help link</code> URL combines with the text in the <code>Message</code> field to make a clickable link. Security isn't an issue, because the user is in a Salesforce organization when changing passwords.</p> <p>Valid protocols:</p> <ul style="list-style-type: none"> • http • https • mailto

- Specify an alternative home page for users with the “API Only User” permission. After completing user management tasks such as resetting a password, API-only users are redirected to the URL specified here, rather than to the login page.
- Click **Save**.

Reset Passwords for Your Users

As an administrator, you can reset a user’s password for better protection or to unlock a user if the user is locked out.

To reset a user’s password:

- From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
- Select the checkbox next to the user’s name. Optionally, to change the passwords for all currently displayed users, check the box in the column header to select all rows.
- Click **Reset Password**. The user receives an email that contains a link and instructions to reset the password.

A password created this way doesn’t expire, but users must change the password the first time they log in.

 **Tip:** You can perform this and other administration tasks from the SalesforceA mobile app.

Considerations for Resetting Passwords

- Only an administrator can reset single sign-on user passwords. Single sign-on users can’t reset their own passwords.
- After resetting a password, users might be required to activate their computers to successfully log in to Salesforce.
- Resetting a locked-out user’s password automatically unlocks the user’s account.
- When a user loses a password, the user can click the forgot password link on the login page to receive an email with steps to reset a password. The user must correctly answer the security question to reset the password. In Password Policies, you can customize the security question page that the user sees with information about where to go to for help.

 **Note:** If the user hasn’t set a security question, or doesn’t answer the security question correctly, the password isn’t reset. A user can request to reset a password through the forgot password link a maximum of five times in a 24-hour period. Administrators can reset a user’s password as often as needed.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To reset passwords:

- “Reset User Passwords and Unlock Users”

- Resetting a password also resets the user's security token.

Expire Passwords for All Users

As an administrator, you can expire passwords for all users any time you want to enforce extra security for your organization. After expiring passwords, all users are prompted to reset their password the next time they log in.

To expire passwords for all users, except those users with the "Password Never Expires" permission:

1. From Setup, enter *Expire All Passwords* in the Quick Find box, then select **Expire All Passwords**.
2. Select **Expire all user passwords**.
3. Click **Save**.

The next time users log in, they are prompted to reset their password.

Considerations When Expiring Passwords

- Users might need to activate their computers to log in to Salesforce.
- `Expire all user passwords` doesn't affect Self-Service portal users, because they aren't direct Salesforce users.

SEE ALSO:

[Passwords](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

USER PERMISSIONS

To expire all passwords:

- "Manage Internal Users"

Control Login Access

Control whether your users are prompted to grant account access to Salesforce admins, and whether users can grant access to publishers.

1. From Setup, enter *Login Access Policies* in the *Quick Find* box, then select **Login Access Policies**.
2. To allow Salesforce admins to log in as any user in the org without first asking them to grant access, enable **Administrators Can Log in as Any User**.

To have this feature removed from your org, contact Salesforce. If you remove the feature, a user must grant login access before a Salesforce admin can log in to that user's account for troubleshooting.

3. To prevent users from granting access to a publisher—for example, to comply with regulatory or privacy concerns—click **Available to Administrators Only** for that publisher.

 **Note:** Users can't grant login access to managed packages that are licensed to your entire Salesforce org. Only admins with the "Manage Users" permission enabled on their profiles can grant access to these publishers. Also, some managed packages don't have login access. If a package isn't listed on the Login Access Policies page, login access isn't available for that package.

4. Click **Save**.

SEE ALSO:

[Log In as Another User](#)
[Grant Login Access](#)

Log In as Another User

To assist other users, administrators can log in to Salesforce as another user. Depending on your organization settings, individual users might need to grant login access to administrators.

 **Note:** As a security measure, when administrators are logged in as another user, they can't authorize OAuth data access for that user. For example, admins can't authorize OAuth access to user accounts, including single sign-on to third-party applications.

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Click the **Login** link next to the username. This link is available only for users who have granted login access to an administrator or in organizations where administrators can log in as any user.
3. To return to your administrator account, click *User's Name* > **Logout**.

Delegate Administrative Duties

Use delegated administration to assign limited admin privileges to users in your org who aren't administrators. For example, let's say you want the Customer Support team manager to manage users in the Support Manager role and all subordinate roles. Create a delegated admin for this purpose so that you can focus on other administration tasks.

Delegated administrators can:

- Create and edit users in specified roles and all subordinate roles. User editing tasks include resetting passwords, setting quotas, creating default opportunity teams, and creating personal groups for those users.
- Unlock users.
- Assign users to specified profiles.
- Assign or remove permission sets for users in their delegated groups.
- Create public groups and manage membership in specified public groups.
- Log in as a user who has granted login access to the administrator.
- Manage custom objects and customize nearly every aspect of a custom object. However, a delegated admin can't create or modify relationships on the object or set org-wide sharing defaults.
- Administer users across all delegated groups to which the delegated admin is assigned. For example, Sam Smith is specified as a delegated administrator in two delegated groups, Group A and Group B. Sam can assign a permission set or public group from Group A to users in Group B.

 **Note:** When delegating administration, keep the following in mind. Delegated administrators:

- Can't assign profiles or permission sets with the "Modify All Data" permission.
- Need access to custom objects to access the merge fields on those objects from formulas.
- Can't modify permission sets.

To delegate administration of particular objects, use object permissions, such as "View All" and "Modify All," instead.

SEE ALSO:

[Define Delegate Administrators](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To manage delegated administration:

- "Customize Application"

To be a delegated administrator:

- "View Setup and Configuration"

Define Delegate Administrators

Enable delegated administrators to manage users in specified roles and all subordinate roles. You can assign specified profiles to those users, and log in as users who have granted login access to administrators. A delegated administration group is a group of users who have the same admin privileges. These groups are not related to public groups used for sharing.

[Walk Through It: Delegate Administration](#)

[Walk Through It: Delegate Administration in Lightning Experience](#)

1. From Setup, enter *Delegated Administration* in the **Quick Find** box, then select **Delegated Administration** and click **New**.
2. Select or create a delegated group.
3. To allow the users in this group to log in as users in the role hierarchy that they administer, select **Enable Group for Login Access**. Depending on your org settings, individual users need to grant login access to allow their administrators to log in as them.
4. Click **Save**.
5. For each related list, click **Add** to define your delegated group details.

SEE ALSO:

[Delegate Administrative Duties](#)

Topics and Tags Settings

With or without Chatter enabled, administrators can enable topics for objects, letting users add topics to records so they can quickly retrieve related items using list views. With Chatter enabled, users can also see related items on the Records tab of each topic detail page. Enabling topics for an object disables public tags on records of that object type. Personal tags aren't affected.

To use topics to organize records, [enable topics](#) for accounts, assets, campaigns, cases, contacts, contracts, files, leads, opportunities, orders, solutions, custom objects, and English articles.

Administrators set up and manage personal and public tags by:

- [Enabling tags](#) for accounts, activities, assets, campaigns, cases, contacts, contracts, dashboards, documents, events, leads, notes, opportunities, reports, solutions, tasks, and any custom objects (except relationship group members)
- [Adding tags to the sidebar](#) for their users
- [Deleting personal tags](#) for deactivated users

- "Customize Application"

Enable and Configure Topics for Objects

Enable topics for objects so users can add topics to records and organize them by common themes. This powerful feature is available with or without Chatter.

Administrators can enable topics for accounts, assets, campaigns, cases, contacts, contracts, files, leads, opportunities, orders, solutions, custom objects, and English articles. For each object type, administrators specify which fields to use for topic suggestions.

 **Note:** Topics are only supported on English Knowledge articles.

 **Warning:** When topics are enabled for an object, public tags are disabled for records of that object type.

1. From Setup, enter *Topics for Objects* in the Quick Find box, then select **Topics for Objects**.
2. Select an object.
3. At the right, select **Enable Topics**.
4. Select the text fields that you want to use for topic suggestions. (From a combination of the selected fields, up to 3 suggestions are made from the first 2,000 characters.)
5. Click **Save** to save changes for all objects.

Now, users with access to the enabled objects and appropriate topics permissions can:

- See topic assignments and suggestions on records of that object type
- Add and remove topics from records of that object type
- Use topics on records of that object type to filter their list views

Additionally, if your organization uses Chatter, users can click any topic assigned to a record to go directly to a topic page. There, they'll find other records on the topic, people who are knowledgeable about the topic, and other related information.

Enable Tags

Allow users to add personal or public tags to most records. Tags are words or short phrases that users associate to records to describe and organize data in a personalized way.

1. From Setup, enter *Tag Settings* in the **Quick Find** box, then select **Tag Settings**.
2. Select **Enable Personal Tags** and **Enable Public Tags** to allow users to add personal and public tags to records. Deselect both options to disable tags.
3. Specify which objects and page layouts display tags in a tag section at the top of record detail pages. The tag section is the only place where a user can add tags to a record.

For example, if you select only account page layouts, users in your org can only tag account records. If you select only account page layouts for personal tags and not public tags, users can tag account records only with personal tags.
4. Click **Save**.

When enabling tags, keep these guidelines in mind.

- You can also add tags to page layouts by editing a layout directly. However, you can't add tags to feed-based page layouts.
- Search results and the Tags page don't display custom objects without an associated tab, even if tags are enabled for the custom object. If you want custom object records to appear, create an associated tab. The tab doesn't have to be visible to users.
- Customer Portal users can't view the tags section of a page, even if it is included in a page layout.
- When Chatter is disabled, joined reports can't be tagged.

Adding Tags to the Sidebar

When you [enable tags](#) for your organization, you can add the Tags component to your users' sidebar. This component allows users to navigate to the Tags page where they can browse, search, and manage their tags. It also lists each user's most recently used tags. To add this component:

1. From Setup, enter *Home Page Layouts* in the **Quick Find** box, then select **Home Page Layouts**.
2. Next to a home page layout that you want to modify, click **Edit**.
3. Select the **Tags** checkbox and click **Next**.
4. Arrange the Tags component on your page layout as desired, and click **Save**.

 **Tip:** If you want the Tags component to appear on all pages and not just the Home tab, from Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface**, and select **Show Custom Sidebar Components on All Pages**.

Delete Personal Tags for Deactivated Users

Your org can have up to 5,000,000 personal and public tags applied to records across all users. If your org is approaching this limit, delete personal tags for deactivated users.

1. From Setup, enter *Personal Tag Cleanup* in the **Quick Find** box, then select **Personal Tag Cleanup**.
2. Select one or more deactivated users and click **Delete**.

You can't restore personal tags after you delete them.

[Topics and Tags Settings](#)

Securing Data Access

Salesforce provides a flexible, layered data sharing design that allows you to expose different data sets to different sets of users, so users can do their job without seeing data they don't need to see. Use permission sets and profiles to specify the objects and fields users can access. Use organization-wide sharing settings, user roles, sharing rules to specify the individual records that users can view and edit.

 **Note:** [Who Sees What: Overview](#)

Watch a demo on controlling access to and visibility of your data.

 **Tip:** When implementing security and sharing rules for your organization, make a table of the various types of users in your organization. In the table, specify the level of access to data that each type of user needs for each object and for fields and records within the object. You can refer to this table as you set up your security model.

Object-Level Security (Permission Sets and Profiles)

Object-level security—or object permissions—provide the bluntest way to control data. Using object permissions you can prevent a user from seeing, creating, editing, or deleting any instance of a particular type of object, such as a lead or opportunity. Object permissions let you hide whole tabs and objects from particular users, so that they don't even know that type of data exists.

You specify object permissions in permission sets and profiles. *Permission sets* and *profiles* are collections of settings and permissions that determine what a user can do in the application, similar to a group in a Windows network, where all of the members of the group have the same folder permissions and access to the same software.

Profiles are typically defined by a user's job function (for example, system administrator or sales representative). A profile can be assigned to many users, but a user can be assigned to only one profile. You can use permission sets to grant additional permissions and access settings to users. It's easy to manage users' permissions and access with permission sets, because you can assign multiple permission sets to a single user.

Field-Level Security (Permission Sets and Profiles)

In some cases, you may want users to have access to an object, but limit their access to individual fields in that object. Field-level security—or field permissions—control whether a user can see, edit, and delete the value for a particular field on an object. They let you protect sensitive fields without having to hide the whole object from users. Field permissions are also controlled in permission sets and profiles.

EDITIONS

Available in: Salesforce Classic

Personal Tag Cleanup available in: **All** Editions

USER PERMISSIONS

To delete personal tags for deactivated users:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

The available data management options vary according to which Salesforce Edition you have.

Unlike page layouts, which only control the visibility of fields on detail and edit pages, field permissions control the visibility of fields in any part of the app, including related lists, list views, reports, and search results. To ensure that a user can't access a particular field, use field permissions. No other settings provide the same level of protection for a field.

 **Note:** Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

Record-Level Security (Sharing)

After setting object- and field-level access permissions, you may want to configure access settings for the actual records themselves. Record-level security lets you give users access to some object records, but not others. Every record is owned by a user or a queue. The owner has full access to the record. In a hierarchy, users higher in the hierarchy always have the same access to users below them in the hierarchy. This access applies to records owned by users, as well as records shared with them.

To specify record-level security, set your organization-wide sharing settings, define a hierarchy, and create sharing rules.

- Organization-wide sharing settings—The first step in record-level security is to determine the organization-wide sharing settings for each object. Organization-wide sharing settings specify the default level of access users have to each others' records.

You use organization-wide sharing settings to lock down your data to the most restrictive level, and then use the other record-level security and sharing tools to selectively give access to other users. For example, let's say users have object-level permissions to read and edit opportunities, and the organization-wide sharing setting is Read-Only. By default, those users can read all opportunity records, but can't edit any unless they own the record or are granted additional permissions.

- Role hierarchy—Once you've specified organization-wide sharing settings, the first way you can give wider access to records is with a role hierarchy. Similar to an organization chart, a role hierarchy represents a level of data access that a user or group of users needs. The role hierarchy ensures that users higher in the hierarchy always have access to the same data as people lower in their hierarchy, regardless of the organization-wide default settings. Role hierarchies don't have to match your organization chart exactly. Instead, each role in the hierarchy should represent a level of data access that a user or group of users needs.

You can also use a territory hierarchy to share access to records. A territory hierarchy grants users access to records based on criteria such as zip code, industry, revenue, or a custom field that is relevant to your business. For example, you could create a territory hierarchy in which a user with the "North America" role has access to different data than users with the "Canada" and "United States" roles.

 **Note:** Although it's easy to confuse permission sets and profiles with roles, they control two very different things. Permission sets and profiles control a user's object and field access permissions. Roles primarily control a user's record-level access through role hierarchy and sharing rules.

- Sharing rules—Sharing rules let you make automatic exceptions to organization-wide sharing settings for particular sets of users, to give them access to records they don't own or can't normally see. Sharing rules, like role hierarchies, are only used to give additional users access to records—they can't be stricter than your organization-wide default settings.
- Manual sharing—Sometimes it's impossible to define a consistent group of users who need access to a particular set of records. In those situations, record owners can use manual sharing to give read and edit permissions to users who would not have access to the record any other way. Although manual sharing isn't automated like organization-wide sharing settings, role hierarchies, or sharing rules, it gives record owners the flexibility to share particular records with users that need to see them.
- Apex managed sharing—If sharing rules and manual sharing don't give you the control you need, you can use Apex managed sharing. Apex managed sharing allows developers to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

Profiles

Profiles define how users access objects and data, and what they can do within the application. When you create users, you assign a profile to each one.

User Permissions and Access

User permissions and access settings are specified in profiles and permission sets. It's important to understand the differences between profiles and permission sets so you can use them effectively.

User permissions and access settings specify what users can do within an organization. For example, permissions determine a user's ability to edit an object record, view the Setup menu, empty the organizational Recycle Bin, or reset a user's password. Access settings determine other functions, such as access to Apex classes, app visibility, and the hours when users can log in.

Every user is assigned only one profile, but can also have multiple permission sets.

When determining access for your users, use profiles to assign the minimum permissions and access settings for specific groups of users. Then use permission sets to grant additional permissions as needed.

The following table shows the types of permissions and access settings that are specified in profiles and permission sets.

Permission or Setting Type	In Profiles?	In Permission Sets?
Assigned apps	✓	✓
Tab settings	✓	✓
Record type assignments	✓	✓
Page layout assignments	✓	
Object permissions	✓	✓

Profiles

Profiles define how users access objects and data, and what they can do within the application. When you create users, you assign a profile to each one.

Watch how you can grant users access to objects using profiles.

[Who Sees What: Object Access](#)

Your org includes several standard profiles where you can edit a limited number of settings. With editions that contain custom profiles, you can edit all permissions and settings except the user license. In Contact Manager and Group Edition orgs, you can assign standard profiles to your users, but you can't view or edit the standard profiles, and you can't create custom profiles.

Every profile belongs to exactly one user license type.

[Work in the Enhanced Profile User Interface Page](#)

In the enhanced profile user interface, the profile overview page provides an entry point for all settings and permissions for a profile.

[Work in the Original Profile Interface](#)

To view a profile on the original profile page, from Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**, then select the profile you want.

[Standard Profiles](#)

Every org includes standard profiles that you can assign to users. In standard profiles, you can edit some settings.

[Manage Profile Lists](#)

Profiles define how users access objects and data, and what they can do within the application. When you create users, you assign a profile to each one. To view the profiles in your organization, from Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.

[Clone Profiles](#)

Instead of creating profiles, save time by cloning existing profiles and customizing them.

[Viewing a Profile's Assigned Users](#)

To view all users that are assigned to a profile from the profile overview page, click **Assigned Users** (in the enhanced profile user interface) or **View Users** (in the original profile user interface). From the assigned users page, you can:

Enhanced Profile User Interface Overview

The enhanced profile user interface provides a streamlined experience for managing profiles. With it, you can easily navigate, search, and modify settings for a profile.

To enable the enhanced profile user interface, from Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface**, then select **Enable Enhanced Profile User Interface** and click **Save**. Your organization can only use one profile user interface at a time.

-  **Note:** You can't use the enhanced profile user interface if:
- You use Microsoft® Internet Explorer® 6 or earlier to manage your profiles (unless you've installed the Google Chrome Frame™ plug-in for Internet Explorer).
 - Your organization uses category groups on guest profiles used for sites.
 - Your organization delegates partner portal administration to portal users.

SEE ALSO:

[Work in the Enhanced Profile User Interface Page Profiles](#)

App and System Settings in the Enhanced Profile User Interface

In the enhanced profile user interface, administrators can easily navigate, search, and modify settings for a single profile. Permissions and settings are organized into pages under app and system categories, which reflect the rights users need to administer and use app and system resources.

App Settings

Apps are sets of tabs that users can change by selecting the drop-down menu in the header. All underlying objects, components, data, and configurations remain the same, regardless of the selected app. In selecting an app, users navigate in a set of tabs that allows them to efficiently use the underlying functionality for app-specific tasks. For example, let's say you do most of your work in the sales app, which includes tabs like Accounts and Opportunities. To track a new marketing campaign, rather than adding the Campaigns tab to the sales app, you select Marketing from the app drop-down to view your campaigns and campaign members.

In the enhanced profile user interface, the Apps section of the overview page contains settings that are directly associated with the business processes that the apps enable. For example, customer service agents may need to manage cases, so the "Manage Cases" permission is in the Call Center section of the App Permissions page. Some app settings aren't related to app permissions. For example, to enable the Time-Off Manager app from the AppExchange, users need access to the appropriate Apex classes and Visualforce pages, as well as the object and field permissions that allow them to create new time-off requests.

-  **Note:** Regardless of the currently selected app, all of a user's permissions are respected. For example, although the "Import Leads" permission is under the Sales category, a user can import leads even while in the Call Center app.

USER PERMISSIONS

To enable the enhanced profile user interface:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

System Settings

Some system functions apply to an organization and not to any single app. For example, login hours and login IP ranges control a user's ability to log in, regardless of which app the user accesses. Other system functions apply to all apps. For example, the "Run Reports" and "Manage Dashboards" permissions allow managers to create and manage reports in all apps. In some cases, such as with "Modify All Data," a permission applies to all apps, but also includes non-app functions, like the ability to download the Data Loader.

SEE ALSO:

[Enhanced Profile User Interface Overview](#)

Search in the Enhanced Profile User Interface

To locate an object, tab, permission, or setting name on a profile page, type at least three consecutive letters in the  **Find Settings** box. As you type, suggestions for results that match your search terms appear in a list. Click an item in the list to go to its settings page.

Search terms aren't case-sensitive. For some categories, you can search for the specific permission or setting name. For other categories, search for the category name.

Item	Search for	Example
Assigned apps	App name	Type <i>sales</i> in the Find Settings box, then select <i>Sales</i> from the list.
Objects	Object name	Let's say you have an Albums custom object. Type <i>albu</i> , then select <i>Albums</i> .
<ul style="list-style-type: none"> • Fields • Record types • Page layout assignments 	Parent object name	Let's say your Albums object contains a Description field. To find the <i>Description</i> field for albums, type <i>albu</i> , select <i>Albums</i> , and scroll down to <i>Description</i> under Field Permissions.
Tabs	Tab or parent object name	Type <i>rep</i> , then select <i>Reports</i> .
App and system permissions	Permission name	Type <i>api</i> , then select <i>API Enabled</i> .
All other categories	Category name	To find Apex class access settings, type <i>apex</i> , then select <i>Apex Class Access</i> . To find custom permissions, type <i>cust</i> , then select <i>Custom Permissions</i> . And so on.

If no results appear in a search:

- Check if the permission, object, tab, or setting you're searching for is available in the current organization.
- Verify that the item you're searching for is available for the user license that's associated with the current profile. For example, a profile with the High Volume Customer Portal license doesn't include the "Modify All Data" permission.
- Ensure that your search term contains at least three consecutive characters that match the name of the item you want to find.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available profile permissions and settings vary according to which Salesforce edition you have.

USER PERMISSIONS

To find permissions and settings in a profile:

- "View Setup and Configuration"

- Make sure that you spelled the search term correctly.

SEE ALSO:

[Enhanced Profile User Interface Overview](#)

Assign Record Types and Page Layouts in the Enhanced Profile User Interface

In the enhanced profile user interface, Record Types and Page Layout Assignments settings determine the record type and page layout assignment mappings that are used when users view records. They also determine which record types are available when users create or edit records.

To specify record types and page layout assignments:

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. In the **Find Settings...** box, enter the name of the object you want and select it from the list.
4. Click **Edit**.
5. In the Record Types and Page Layout Assignments section, make changes to the settings as needed.

Setting	Description
Record Types	Lists all existing record types for the object. --Master-- is a system-generated record type that's used when a record has no custom record type associated with it. When --Master-- is assigned, users can't set a record type to a record, such as during record creation. All other record types are custom record types.
Page Layout Assignment	The page layout to use for each record type. The page layout determines the buttons, fields, related lists, and other elements that users with this profile see when creating records with the associated record type. Since all users can access all record types, every record type must have a page layout assignment, even if the record type isn't specified as an assigned record type in the profile.
Assigned Record Types	Record types that are checked in this column are available when users with this profile create records for the object. If --Master-- is selected, you can't select any custom record types; and if any custom record types are selected, you can't select --Master--.
Default Record Type	The default record type to use when users with this profile create records for the object.

The Record Types and Page Layout Assignments settings have some variations for the following objects or tabs.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Record types available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit record type and page layout access settings:

- "Manage Profiles and Permission Sets"

Object or Tab	Variation
Accounts	If your organization uses person accounts, the accounts object additionally includes Business Account Default Record Type and Person Account Default Record Type settings, which specify the default record type to use when the profile's users create business or person account records from converted leads.
Cases	The cases object additionally includes Case Close settings, which show the page layout assignments to use for each record type on closed cases. That is, the same record type may have different page layouts for open and closed cases. With this additional setting, when users close a case, the case may have a different page layout that exposes how it was closed.
Home	You can't specify custom record types for the home tab. You can only select a page layout assignment for the --Master-- record type.

6. Click **Save**.

[How is record type access specified?](#)

[Assign Custom Record Types in Permission Sets](#)

[Work in the Enhanced Profile User Interface Page](#)

View and Edit Login Hours in the Enhanced Profile User Interface

For each profile, you can specify the hours when users can log in.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, scroll down to Login Hours and click **Edit**.
4. Set the days and hours when users with this profile can log in to the organization.

To allow users to log in at any time, click **Clear all times**. To prohibit users from using the system on a specific day, set the start and end times to the same value.

If users are logged in when their login hours end, they can continue to view their current page, but they can't take any further action.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Custom Profiles available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view login hour settings:

- "View Setup and Configuration"

To edit login hour settings:

- "Manage Profiles and Permission Sets"

 **Note:** The first time login hours are set for a profile, the hours are based on the organization's `Default Time Zone` as specified on the Company Information page in Setup. After that, any changes to the organization's `Default Time Zone` won't change the time zone for the profile's login hours. As a result, the login hours are always applied at those exact times even if a user is in a different time zone or if the organization's default time zone is changed.

Depending on whether you're viewing or editing login hours, the hours may appear differently. On the Login Hours edit page, hours are shown in your specified time zone. On the profile overview page, they appear in the organization's original default time zone.

SEE ALSO:

[Enhanced Profile User Interface Overview](#)

Restrict Login IP Ranges in the Enhanced Profile User Interface

Control login access at the user level by specifying a range of allowed IP addresses on a user's profile. When you define IP address restrictions for a profile, a login from any other IP address is denied.

1. From Setup, enter `Profiles` in the `Quick Find` box, then select **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, click **Login IP Ranges**.
4. Specify allowed IP addresses for the profile.
 - To add a range of IP addresses from which users can log in, click **Add IP Ranges**. Enter a valid IP address in the `IP Start Address` and a higher-numbered IP address in the `IP End Address` field. To allow logins from only a single IP address, enter the same address in both fields.
 - To edit or remove ranges, click **Edit** or **Delete** for that range.

Important:

- The IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses both inside and outside of the IPv4-mapped IPv6 address space. Ranges like `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` aren't allowed.
 - Partner User profiles are limited to five IP addresses. To increase this limit, contact Salesforce.
 - The Salesforce Classic Mobile app can bypass IP ranges that are defined for profiles. Salesforce Classic Mobile initiates a secure connection to Salesforce over the mobile carrier's network. However, the mobile carrier's IP addresses can be outside of the IP ranges allowed for the user's profile. To prevent bypassing IP definitions on a profile, [disable Salesforce Classic Mobile](#) on page 1048 for that user.
5. Optionally enter a description for the range. If you maintain multiple ranges, use the `Description` field to provide details, like which part of your network corresponds to this range.

 **Note:** You can further restrict access to Salesforce to only those IPs in Login IP Ranges. To enable this option, in Setup, enter `Session Settings` in the `Quick Find` box, then select **Session Settings** and select **Enforce login IP ranges on every request**. This option affects all user profiles that have login IP restrictions.

Profile Settings in the Original Profile Interface

Profiles define how users access objects and data and what they can do within the application. View or edit these settings from the original profile detail page.

Setting	To view or edit, go to
Profile name and description (custom profiles only)	Profile Detail
Administrative and general permissions (custom profiles only)	Administrative Permissions
App visibility settings	Custom App Settings
Console layouts for all profiles	Console Settings
Custom permissions	Enabled Custom Permissions
Desktop client access settings	Desktop Integration Clients
External data sources	Enabled External Data Source Access
Field access in objects	Field-Level Security
Login hours	Login Hours
Login IP address ranges	Login IP Ranges section, click New , or click Edit next to an existing IP range.
	 Note: You can further restrict access to Salesforce to only those IPs in Login IP Ranges. To enable this option, in Setup, enter <i>Session Settings</i> in the Quick Find box, then select Session Settings and select Enforce login IP ranges on every request . This option affects all user profiles that have login IP restrictions.
Object permissions	Standard Object Permissions
Page layouts	Page Layouts
Record types	Record Type Settings section. You see the Edit link only if record types exist for the object.
Tab visibility settings	Tab Settings
Executable Apex classes	Enabled Apex Class Access
Executable Visualforce pages	Enabled Visualforce Page Access

View and Edit Desktop Client Access in the Original Profile User Interface

Connect Offline and Connect for Office are desktop clients that integrate Salesforce with your PC. As an administrator, you can control which desktop clients your users can access as well as whether users are automatically notified when updates are available.

 **Note:** To access desktop clients, users must also have the “API Enabled” permission.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click **Edit** next to a profile name, and scroll to the Desktop Integration Clients section at the bottom of the page.

SEE ALSO:

[Work in the Original Profile Interface](#)

Assign Record Types to Profiles in the Original Profile User Interface

After you create record types and include picklist values in them, add record types to user profiles. If you assign a default record type to a profile, users with that profile can assign the record type to records that they create or edit.

 **Note:** Users can view records of any record type, even if the record type is not associated with their profile.

You can associate several record types with a profile. For example, a user needs to create hardware and software sales opportunities. In this case, you can create and add both “Hardware” and “Software” record types to the user’s profile.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile. The record types available for that profile are listed in the Record Type Settings section.
3. Click **Edit** next to the appropriate type of record.
4. Select a record type from the Available Record Types list and add it to the Selected Record Types list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To assign record types to profiles:

- “Customize Application”

Master is a system-generated record type that's used when a record has no custom record type associated with it. When you assign **Master**, users can't set a record type to a record, such as during record creation. All other record types are custom record types.

- From **Default**, choose a default record type.

If your organization uses person accounts, this setting also controls which account fields display in the **Quick Create** area of the accounts home page.

- If your organization uses person accounts, set default record type options for both person accounts and business accounts. From the **Business Account Default Record Type** and then the **Person Account Default Record Type** drop-down list, choose a default record type.

These settings are used when defaults are needed for both kinds of accounts, such as when converting leads.

- Click **Save**.

Options in the Record Type Settings section are blank wherever no record types exist. For example, if you have two record types for opportunities but no record types for accounts, the **Edit** link only displays for opportunities. In this example, the picklist values and default value for the master are available in all accounts.

-  **Note:** If your organization uses person accounts, you can view the record type defaults for business accounts and person accounts. Go to Account Record Type Settings in the profile detail page. Clicking **Edit** in the Account Record Type Settings is another way to begin setting record type defaults for accounts.

View and Edit Login Hours in the Original Profile User Interface

Specify the hours when users can log in based on the user profile.

- From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**, and select a profile.
- Click **Edit** in the Login Hours related list.
- Set the days and hours when users with this profile can use the system.

To allow users to log in at any time, click **Clear All Times**. To prohibit users from using the system on a specific day, set the start and end times to the same value.

If users are logged in when their login hours end, they can continue to view their current page, but they can't take any further action.

- Click **Save**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, **Developer**, and **Database.com** Editions

USER PERMISSIONS

To set login hours:

- "Manage Profiles and Permission Sets"

 **Note:** The first time login hours are set for a profile, the hours are based on the organization's `Default Time Zone` as specified on the Company Information page in Setup. After that, any changes to the organization's `Default Time Zone` won't change the time zone for the profile's login hours. As a result, the login hours are always applied at those exact times even if a user is in a different time zone or if the organization's default time zone is changed.

Depending on whether you're viewing or editing login hours, the hours appear differently. On the profile detail page, hours are shown in your specified time zone. On the Login Hours edit page, they appear in the organization's default time zone.

[Work in the Original Profile Interface](#)

[Restrict Login IP Addresses in the Original Profile User Interface](#)

Restrict Login IP Addresses in the Original Profile User Interface

Control login access at the user level by specifying a range of allowed IP addresses on a user's profile. When you define IP address restrictions for a profile, a login from any other IP address is denied.

- How you restrict the range of valid IP addresses on a profile depends on your Salesforce edition.
 - If you're using an Enterprise, Unlimited, Performance, or Developer edition, from Setup, enter *Profiles* in the `Quick Find` box, then select **Profiles**, and select a profile.
 - If you're using a Professional, Group, or Personal edition, from Setup, enter *Session Settings* in the `Quick Find` box, then select **Session Settings**.
- Click **New** in the Login IP Ranges related list.
- Enter a valid IP address in the `IP Start Address` field and a higher-numbered IP address in the `IP End Address` field.

The start and end addresses define the range of allowable IP addresses from which users can log in. To allow logins from a single IP address, enter the same address in both fields.

- The IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses both inside and outside of the IPv4-mapped IPv6 address space. Ranges like `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` aren't allowed.
 - Partner User profiles are limited to five IP addresses. To increase this limit, contact Salesforce.
 - The Salesforce Classic Mobile app can bypass IP ranges that are defined for profiles. Salesforce Classic Mobile initiates a secure connection to Salesforce over the mobile carrier's network. However, the mobile carrier's IP addresses can be outside of the IP ranges allowed for the user's profile. To prevent bypassing IP definitions on a profile, [disable Salesforce Classic Mobile](#) on page 1048 for that user.
- Optionally enter a description for the range. If you maintain multiple ranges, use the Description field to provide details, such as which part of your network corresponds to this range.
 - Click **Save**.

 **Note:** Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.

Standard Profiles

Every org includes standard profiles that you can assign to users. In standard profiles, you can edit some settings.

Every org includes standard profiles. In Professional, Enterprise, Unlimited, Performance, and Developer Editions, you can use standard profiles or create, edit, and delete custom profiles. In orgs where you can't create custom profiles (such as Contact Manager and Group Editions), you can assign standard profiles to your users, but you can't view or edit them.

The following table lists commonly used permissions in standard profiles.

Profile Name	Available Permissions
System Administrator	Can configure and customize the application. Has access to all functionality that does not require an additional license. For example, administrators cannot manage campaigns unless they also have a Marketing User license. Can manage price books and products. Can edit any quota, override forecasts, and view any forecast.
Standard Platform User	Can use custom Force.com AppExchange apps developed in your org or installed from AppExchange. In addition, can use core platform functionality such as accounts, contacts, reports, dashboards, and custom tabs.
Standard Platform One App User	Can use one custom AppExchange app developed in your org or installed from AppExchange. The custom app is limited to five tabs. In addition, can use core platform functionality such as accounts, contacts, reports, dashboards, and custom tabs.
Standard User	Can create and edit most major types of records, run reports, and view the org's setup. Can view, but not manage, campaigns. Can create, but not review, solutions. Can edit personal quota and override forecasts.

EDITIONS

Available in: **Salesforce Classic**

Your edition determines which standard profiles are available.

Profile Name	Available Permissions
Customer Community User	Can log in via a community. Your community settings and sharing model determine their access to tabs, objects, and other features. For more information, see Communities User Licenses .
Customer Community Plus User	
Partner Community User	
Customer Portal User	Can log in via a Customer Portal or a community. Can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy; and they can view and edit cases where they are listed in the <code>Contact</code> Name field.
High Volume Customer Portal	Can log in via a Customer Portal or a community.
Authenticated Website	The High Volume Customer Portal and Authenticated Website profiles are high-volume portal users.
Customer Portal Manager	Can log in via a Customer Portal or a community. Can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy; and they can view and edit cases where they are listed in the <code>Contact</code> Name field.
Partner User	Can log in via a partner portal or a community.
Solution Manager	Can review and publish solutions. Also has access to the same functionality as the Standard User.
Marketing User	Can manage campaigns, create letterheads, create HTML email templates, manage public documents, and add campaign members and update their statuses with the Data Import Wizard. Also has access to the same functionality as the Standard User.
Contract Manager	Can create, edit, activate, and approve contracts. This profile can also delete contracts as long as they are not activated. Can edit personal quota and override forecasts.
Read Only	Can view the org's setup, run and export reports, and view, but not edit, other records.
Chatter Only User	Can only log in to Chatter. Can access all standard Chatter people, profiles, groups, and files. Additionally, they can: <ul style="list-style-type: none"> • View Salesforce accounts and contacts • Use Salesforce CRM Content, Ideas, and Answers • Access dashboards and reports • Use and approve workflows • Use the calendar to create and track activities • View and modify up to ten custom objects • Add records to groups

Profile Name**Available Permissions**

Profile Name	Available Permissions
Chatter Free User	<p data-bbox="812 254 1459 359"> Note: You must expose the tabs for the standard Salesforce objects that the Chatter Only user profile can access, as they are hidden by default for these users.</p> <p data-bbox="873 380 1459 478">Professional Edition organizations must have Profiles enabled to perform these tasks. [Edit Multiple Profiles with Profile List Views](#)

If enhanced profile list views are enabled for your organization, you can change permissions in up to 200 profiles directly from the list view, without accessing individual profile pages.

SEE ALSO:

[Edit Multiple Profiles with Profile List Views](#)
[Profiles](#)

Creating and Editing Profile List Views

If [enhanced profile list views](#) are enabled for your organization, you can create profile list views to show a set of profiles with the fields you choose. For example, you could create a list view of all profiles in which “Modify All Data” is enabled.

1. In the Profiles page, click **Create New View**, or select a view and click **Edit**.
2. Enter the view name.
3. Under Specify Filter Criteria, specify the conditions that the list items must match, such as *Modify All Data equals True*.
 - a. Type a setting name, or click the lookup icon  to search for and select the setting you want.
 - b. Choose a filter operator.
 - c. Enter the value that you want to match.
 - d. To specify another filter condition, click **Add New**. You can specify up to 25 filter condition rows.

To remove a filter condition row and clear its values, click the remove row icon .

4. Under Select Columns to Display, specify the profile settings that you want to appear as columns in the list view.
 - a. From the Search drop-down list, select the type of setting you want to search for.
 - b. Enter part or all of a word in the setting you want to add and click **Find**.

 **Note:** If the search finds more than 500 values, no results appear. Use the preceding steps to refine your search criteria and show fewer results.

- c. To add or remove columns, select one or more column names and click the **Add** or **Remove** arrow.
 - d. Use the **Top**, **Up**, **Down**, and **Bottom** arrows to arrange the columns in the sequence you want.

You can add up to 15 columns in a single list view.
5. Click **Save**, or if you're cloning an existing view, rename it and click **Save As**.

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Custom Profiles available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, and delete profile list views:

- “Manage Profiles and Permission Sets”

Edit Multiple Profiles with Profile List Views

If enhanced profile list views are enabled for your organization, you can change permissions in up to 200 profiles directly from the list view, without accessing individual profile pages.

Editable cells display a pencil icon (✎) when you hover over the cell, while non-editable cells display a lock icon (🔒). In some cases, such as in standard profiles, the pencil icon appears but the setting is not actually editable.

 **Warning:** Use care when editing profiles with this method. Because profiles affect a user's fundamental access, making mass changes may have a widespread effect on users in your organization.

1. Select or [create](#) a list view that includes the profiles and permissions you want to edit.
2. To edit multiple profiles, select the checkbox next to each profile you want to edit.
If you select profiles on multiple pages, Salesforce remembers which profiles are selected.
3. Double-click the permission you want to edit.
For multiple profiles, double-click the permission in any of the selected profiles.
4. In the dialog box that appears, enable or disable the permission.
In some cases, changing a permission may also change other permissions. For example, if "Customize Application" and "View Setup and Configuration" are disabled and you enable "Customize Application," then "View Setup and Configuration" is also enabled. In this case, the dialog box lists the affected permissions.
5. To change multiple profiles, select **All n selected records** (where n is the number of profiles you selected).
6. Click **Save**.

 **Note:**

- For standard profiles, inline editing is available only for the "Single Sign-On" and "Affected By Divisions" permissions.
- If you edit multiple profiles, only those profiles that support the permission you are changing will change. For example, if you use inline editing to add "Modify All Data" to multiple profiles, but because of its user license the profile doesn't have "Modify All Data," the profile won't change.

If any errors occur, an error message appears, listing each profile in error and a description of the error. Click the profile name to open the profile detail page. The profiles you've clicked appear in the error window in gray, strike-through text. To view the error console, you must have pop-up blockers disabled for the Salesforce domain.

Any changes you make are recorded in the setup audit trail.

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To edit multiple profiles from the list view:

- "Manage Profiles and Permission Sets"
- AND
- "Customize Application"

Clone Profiles

Instead of creating profiles, save time by cloning existing profiles and customizing them.

 **Tip:** If you clone profiles to enable certain permissions or access settings, consider using permission sets. For more information, see [Permission Sets](#). Also, if your profile name contains more than one word, avoid extraneous spacing. For example, “Acme User” and “Acme User” are identical other than spacing between “Acme” and “User.” Using both profiles in this case can result in confusion for admins and users.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. In the Profiles list page, do one of the following:
 - Click **New Profile**, then select an existing profile that’s similar to the one you want to create.
 - If enhanced profile list views are enabled, click **Clone** next to a profile that’s similar to the one you want to create.
 - Click the name of a profile that’s similar to the one you want to create, then in the profile page, click **Clone**.

A new profile uses the same [user license](#) as the profile it was cloned from.

3. Enter a profile name.
4. Click **Save**.

View and Edit Tab Settings in Permission Sets and Profiles

Tab settings specify whether a tab appears in the All Tabs page or is visible in a tab set.

- From Setup, either:
 - Enter *Permission Sets* in the Quick Find box, then select **Permission Sets**, or
 - Enter *Profiles* in the Quick Find box, then select **Profiles**
 - Select a permission set or profile.
 - Do one of the following:
 - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the tab you want and select it from the list, then click **Edit**.
 - Original profile user interface—Click **Edit**, then scroll to the Tab Settings section.
 - [Specify the tab settings.](#)
 - (Original profile user interface only) To reset users' tab customizations to the tab visibility settings that you specify, select **Overwrite users' personal tab customizations**.
 - Click **Save**.
-  **Note:** If Salesforce CRM Content is enabled for your organization but the **Salesforce CRM Content User** checkbox isn't enabled on the user detail page, the Salesforce CRM Content app has no tabs.

Tab Settings

Tab settings specify whether a tab appears in the All Tabs page or is visible in its associated app. They also determine whether objects appear in the Lightning Experience App Launcher and navigation menus. Tab settings labels in permission sets differ from the labels in profiles.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Tab settings available in: **All Editions except Database.com**

Permission sets available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer, and Database.com Editions**

Profiles available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com Editions**

USER PERMISSIONS

To view tab settings:

- “View Setup and Configuration”

To edit tab settings:

- “Manage Profiles and Permission Sets”

Tab Settings

Tab settings specify whether a tab appears in the All Tabs page or is visible in its associated app. They also determine whether objects appear in the Lightning Experience App Launcher and navigation menus. Tab settings labels in permission sets differ from the labels in profiles.

Enabled Settings in Permission Sets	Enabled Setting in Profiles	Description
Available	Default Off	The tab is available on the All Tabs page. Individual users can customize their display to make the tab visible in any app.
Available and Visible	Default On	The tab is available on the All Tabs page and appears in the visible tabs for its associated app. In Lightning Experience, this setting determines whether an object appears in the App Launcher and in navigation menus. Individual users can customize their display to hide the tab or make it visible in other apps.
None	Tab Hidden	The tab isn't available on the All Tabs page or visible in any apps.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Tab settings available in: **All Editions** except **Database.com**

Permission sets available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer,** and **Database.com Editions**

Profiles available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com Editions**

 **Note:** If a user has another permission set or profile with enabled settings for the same tab, the most permissive setting applies. For example, let's say permission set A has no settings enabled for the Accounts tab, and permission set B enables the `Available` setting for the Accounts tab. If permission sets A and B are assigned to a user, the user sees the Accounts tab on the All Tabs page.

SEE ALSO:

[View and Edit Tab Settings in Permission Sets and Profiles](#)

View and Edit Assigned Apps in Profiles

Assigned app settings specify the apps that users can select in the Force.com app menu.

Every profile must have at least one visible app, except profiles associated with Customer Portal users because apps are not available to them.

To specify app visibility:

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following:
 - Enhanced profile user interface—Click **Assigned Apps**, then click **Edit**.
 - Original profile user interface—Click **Edit**, then scroll to the Custom App Settings section.
4. Select one default app. The default app appears when users log in for the first time.
5. Select **Visible** for any other apps you want to make visible.

SEE ALSO:

[Profiles](#)

Enable Custom Permissions in Profiles

Custom permissions give you a way to provide access to custom processes or apps. After you've created a custom permission and associated it with a process or app, you can enable the permission in profiles.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following.
 - Enhanced profile user interface: Click **Custom Permissions**, and then click **Edit**.
 - Original profile user interface: In the Enabled Custom Permissions related list, click **Edit**.
4. To enable custom permissions, select them from the Available Custom Permissions list and click **Add**. To remove custom permissions from the profile, select them from the Enabled Custom Permissions list and click **Remove**.
5. Click **Save**.

USER PERMISSIONS

To edit app visibility settings:

- "Manage Profiles and Permission Sets"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

In Group and Professional Edition organizations, you can't create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

To enable custom permissions in profiles:

- "Manage Profiles and Permission Sets"

View and Edit Session Timeout Settings in Profiles

Use Session Settings to set how many minutes or hours of inactivity elapse before a user's authentication session times out. At the end of the session, the user needs to log in again.

Until you set the `Session times out after` value on a profile, the `Timeout value` in the organization Session Settings applies to users of the profile. When set, the profile `Session times out after` value overrides the org-wide `Timeout value`. Changes to the org-wide `Timeout value` don't apply to users of a profile with its own `Session times out after` value.

1. From Setup, enter *Profiles* in the `Quick Find` box, then select **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following.
 - Enhanced profile user interface—Click **Session Settings**, then click **Edit**.
 - Original profile user interface—Click **Edit**, then scroll to the Session Settings section.
4. Select a timeout value from the drop-down list.
5. Click **Save**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Custom Profiles available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit session and password settings in profiles:

- "Manage Profiles and Permission Sets"

View and Edit Password Policies in Profiles

To ensure that the appropriate level of password security is used for your organization, specify password requirements with Password Policies settings for users assigned to a profile. Profile Password Policies settings override the organization-wide Password Policies for that profile's users. If you do not set Password Policies on a profile, the organization-wide Password Policies apply. New profile Password Policies take effect for existing profile users when they reset their passwords.

Changes to the organization-wide Password Policies don't apply to users of a profile with its own Password Policies.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile.
3. Depending on which user interface you're using, do one of the following.
 - Enhanced profile user interface—Click **Password Policies**, then click **Edit**.
 - Original profile user interface—Click **Edit**, then scroll to the Password Policies section.
4. Change the values for the profile.

 **Note:** If you change the `User passwords expire in` setting, the change affects a user's password expiration date if that user's new expiration date is earlier than the old expiration date or if you remove an expiration by selecting `Never expires`.

5. Click **Save**.

SEE ALSO:

[Password Policy Fields in Profiles](#)

Password Policy Fields in Profiles

Specify password requirements with Password Policies settings. Refer to these field descriptions to understand how each one impacts a profile's password requirements.

Changes to the organization-wide password policies don't apply to users of a profile with its own password policies.

Field	Description
<code>User passwords expire in</code>	<p>The length of time until user passwords expire and must be changed. The default is 90 days. This setting isn't available for Self-Service portals. This setting doesn't apply to users with the "Password Never Expires" permission.</p> <p>If you change the <code>User passwords expire in</code> setting, the change affects a user's password expiration date if that user's new expiration date is earlier than the old expiration date or if you remove an expiration by selecting <code>Never expires</code>.</p>
<code>Enforce password history</code>	<p>Save users' previous passwords so that they must always reset their password to a new, unique password. Password history is not saved until you set this value. The default is <code>3 passwords remembered</code>. You cannot select <code>No passwords</code></p>

USER PERMISSIONS

To edit session and password settings in profiles:

- "Manage Profiles and Permission Sets"

To set password policies:

- "Manage Password Policies"

Field	Description
Minimum password length	<p>remembered unless you select <code>Never expires</code> for the <code>User passwords expire in</code> field. This setting isn't available for Self-Service portals.</p> <p>The minimum number of characters required for a password. When you set this value, existing users aren't affected until the next time they change their passwords. The default is <code>8 characters</code>.</p>
Password complexity requirement	<p>The requirement for which types of characters must be used in a user's password.</p> <p>Complexity levels:</p> <ul style="list-style-type: none"> • <code>No restriction</code>—allows any password value and is the least secure option. • <code>Must mix alpha and numeric characters</code>—requires at least one alphabetic character and one number, which is the default. • <code>Must mix alpha, numeric, and special characters</code>—requires at least one alphabetic character, one number, and one of the following characters: <code>! # \$ % - _ = + < ></code>. • <code>Must mix numbers and uppercase and lowercase letters</code>—requires at least one number, one uppercase letter, and one lowercase letter. • <code>Must mix numbers, uppercase and lowercase letters, and special characters</code>—requires at least one number, one uppercase letter, and one lowercase letter, and one of the following characters: <code>! # \$ % - _ = + < ></code>.
Password question requirement	<p>The values are <code>Cannot contain password</code>, meaning that the answer to the password hint question cannot contain the password itself; or <code>None</code>, the default, for no restrictions on the answer. The user's answer to the password hint question is required. This setting is not available for Self-Service portals, Customer Portals, or partner portals.</p>
Maximum invalid login attempts	<p>The number of login failures allowed for a user before they become locked out. This setting isn't available for Self-Service portals.</p>
Lockout effective period	<p>The duration of the login lockout. The default is 15 minutes. This setting isn't available for Self-Service portals.</p> <p> Note: If users are locked out, they must wait until the lockout period expires. Alternatively, a user with the "Reset User Passwords and Unlock Users" permission can unlock them from Setup with the following procedure:</p> <ol style="list-style-type: none"> 1. Enter <code>Users</code> in the <code>Quick Find</code> box.

Field	Description
	<ol style="list-style-type: none"> 2. Select Users. 3. Selecting the user. 4. Click Unlock. <p>This button is only available when a user is locked out.</p>
Obscure secret answer for password resets	<p>This feature hides answers to security questions as you type. The default is to show the answer in plain text.</p> <p> Note: If your organization uses the Microsoft Input Method Editor (IME) with the input mode set to Hiragana, when you type ASCII characters they're converted into Japanese characters in normal text fields. However, the IME does not work properly in fields with obscured text. If your organization's users cannot properly enter their passwords or other values after enabling this feature, disable the feature.</p>
Require a minimum 1 day password lifetime	<p>When you select this option, a password can't be changed more than once in a 24-hour period.</p>

[View and Edit Password Policies in Profiles](#)

Permission Sets

A permission set is a collection of settings and permissions that give users access to various tools and functions. The settings and permissions in permission sets are also found in profiles, but permission sets extend users' functional access without changing their profiles.

Watch a Video Tutorial:  [Who Sees What: Permission Sets](#)

Users can have only one profile but, depending on the Salesforce edition, they can have multiple permission sets. You can assign permission sets to various types of users, regardless of their profiles.

 **Note:** In Contact Manager and Group, you can create one permission set. In Professional Edition, you can create two permission sets.

If a permission isn't enabled in a profile but is enabled in a permission set, users with that profile and permission set have the permission. For example, if "Manage Password Policies" isn't enabled in Jane Smith's profile but is enabled in one of her permission sets, she can manage password policies.

Use permission sets to grant access among logical groupings of users, regardless of their primary job function. For example, let's say you have an Inventory custom object in your organization. Many users need "Read" access to this object and a smaller number of users need "Edit" access. You can create a permission set that grants "Read" access and assign it to the appropriate users. You can then create another permission set that gives "Edit" access to the Inventory object and assign it to the smaller group of users.

[Walk Through It: Create, Edit, and Assign a Permission Set](#)[Walk Through It: Create, Assign, and Add a Permission Set in Lightning Experience](#)**SEE ALSO:**[Edit Permission Sets from a List View](#)[Assign Permission Sets to a Single User](#)[Permission Sets Considerations](#)[What Are Session-Based Permission Sets?](#)

Create Permission Sets

You can clone a permission set or create a new one. A cloned permission set starts with the same user license and enabled permissions as the permission set that it's cloned from. A new permission set starts with no user license selected and no permissions enabled.

[Walk Through It: create, edit, and assign a permission set](#)

User Licenses in Permission Sets

Use user licenses with permission sets to control which types of users have access to settings in your permission set.

If you know some basics, it's easy to create a permission set. For example, when you create a permission set, you select a specific user license or **--None--**. If only users with one type of license can use the permission set, choose the same license that's associated with the users. For example, if you want to assign a permission set to users with the Salesforce license, select Salesforce.

You can also assign a permission set to users with different licenses. Just select **--None--**. This option lets you assign the permission set to any users whose license allows the enabled permissions. So, to assign the permission set to users with the Salesforce license and *also* to users with the Salesforce Platform license, select **--None--**.

**Note:**

- Permission sets with no user license *don't* include all possible permissions and settings.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

USER PERMISSIONS

To create permission sets:

- "Manage Profiles and Permission Sets"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

- Only assign a permission set with no license to users whose user licenses allow the enabled permissions and settings. For example, don't create a permission set with no user license, enable "Author Apex," and assign it to Salesforce Platform users. You can't assign this permission set to Salesforce Platform users since the Salesforce Platform user license doesn't allow Apex authoring.

Permission Sets Considerations

Be aware of these considerations and special behaviors for permission sets.

Differences between new and cloned permission sets

A new permission set starts with no user license selected and no permissions enabled. A cloned permission set has the same user license and enabled permissions as the permission set that it's cloned from. You can't change the user license in a cloned permission set. Clone a permission set only if the new one requires the same user license as the original.

Limits

In Enterprise, Performance, Unlimited, Developer, and Database.com editions, you can create up to 1,000 permission sets. In Contact Manager and Group Editions, you can create one permission set. In Profession Edition, you can create up to two permission sets.

In Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com editions, orgs can have more permission sets if they're added as part of an installed managed package that's publicly listed on AppExchange. In this case, orgs can have up to 1,500 permission sets.

User license restrictions

Some user licenses restrict the number of custom apps or tabs that a user can access. In this case, you can assign only the allotted number through the user's assigned profile and permission sets. For example, a user with the Force.com App Subscription user license with access to one Force.com Light App can access only that app's custom tabs.

Assigned apps

Assigned app settings specify the apps that users can select in the Force.com app menu. Unlike profiles, you can't assign a default app in permission sets. You can only specify whether apps are visible.

Apex class access

You can specify which methods in a top-level Apex class are executable for a permission set. Apex class access settings apply only to:

- Apex class methods, such as Web service methods
- Any method used in a custom Visualforce controller or controller extension applied to a Visualforce page

Triggers always fire on trigger events (such as `insert` or `update`), regardless of permission settings.

Using Permission Set Lists

To view the permission sets in your Salesforce org, from Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**. In the permission sets list page, you can:

- Show a filtered list of permission sets by selecting a view from the drop-down list
- [Create a list view or edit an existing view](#)
- Delete a list view by selecting it from the drop-down list and clicking **Delete**
- Create a permission set by clicking **Create**
- Print a list view by clicking .
- Refresh the list view by clicking .
- [Edit permissions directly in a list view](#)
- View or edit a permission set by clicking its name
- If it's not assigned to any users, remove a permission set by clicking **Del**

SEE ALSO:

[Permission Sets](#)

Create and Edit Permission Set List Views

You can create and edit permission set list views to show a list of permission sets with specific fields and permissions. For example, you could create a list view of all permission sets in which "Modify All Data" is enabled.

1. In the Permission Sets page, click **Create New View**, or select a view and click **Edit**.
2. Enter the view name.
3. Under Specify Filter Criteria, specify the conditions that the list items must match, such as *Modify All Data equals True*.
 - a. Type a setting name, or click  to search for and select the setting you want.
 - b. Choose a filter operator.
 - c. Enter the value that you want to match.

 **Tip:** To show only permission sets with no user license, enter *User License* for the Setting, set the Operator to *equals*, and enter "" in the Value field.
 - d. To specify another filter condition, click **Add Row**. You can specify up to 25 filter condition rows.
4. Under Select Columns to Display, specify the settings that you want to appear as columns in the list view. You can add up to 15 columns.
 - a. From the Search drop-down list, select a setting type.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

USER PERMISSIONS

To view permission sets, and print permission set lists:

- "View Setup and Configuration"

To delete permission sets and permission set list views:

- "Manage Profiles and Permission Sets"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

USER PERMISSIONS

To create, edit, and delete permission set list views:

- "Manage Profiles and Permission Sets"

- b. Enter the first few letters of the setting you want to add and click **Find**.

 **Note:** If the search finds more than 500 values, no results appear. Refine your search criteria to show fewer results.

5. Click **Save**, or if you're cloning an existing view, rename it and click **Save As**.

SEE ALSO:

[Edit Permission Sets from a List View](#)

[Create a List View in Salesforce Classic](#)

Edit Permission Sets from a List View

You can change permissions in up to 200 permission sets directly from the list view, without accessing individual permission sets.

 **Note:** Use care when editing permission sets with this method. Making mass changes can have a widespread effect on users in your organization.

1. Select or [create a list view](#) that includes the permission sets and permissions you want to edit.
2. To edit multiple permission sets, select the checkbox next to each one you want to edit. If you select permission sets on multiple pages, the selections on each page are remembered.
3. Double-click the permission you want to edit. For multiple permission sets, double-click the permission in any of the selected permission sets.
4. In the dialog box that appears, enable or disable the permission. In some cases, changing a permission can also change other permissions. For example, if “Manage Cases” and “Transfer Cases” are enabled in a permission set and you disable “Transfer Cases,” then “Manage Cases” is also disabled. In this case, the dialog box lists the affected permissions.
5. To change multiple permission sets, select **All n selected records** (where n is the number of permission sets you selected).
6. Click **Save**.

If you edit multiple permission sets, only the permission sets that support the permission you are editing change. For example, let's say you use inline editing to enable “Modify All Data” in ten permission sets, but one permission set doesn't have “Modify All Data.” In this case, “Modify All Data” is enabled in all the permission sets, except the one without “Modify All Data.”

Any changes you make are recorded in the setup audit trail.

EDITIONS

To edit multiple permission sets from the list view:

- “Manage Profiles and Permission Sets”

Permission Set Overview Page

A permission set's overview page provides an entry point for all of the permissions in a permission set. To open a permission set overview page, from Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets** and select the permission set you want to view.

[Walk Through It: create, edit, and assign a permission set](#)

Session-based Permission Sets

Create session-based permission sets that allow access only during specified sessions. For example, create a session-based permission set that grants access to an application only during an authenticated session.

[What Are Session-Based Permission Sets?](#)

Session-based permission sets can only be used during a specific session. Understand why and when to create a session-based permission set.

What Are Session-Based Permission Sets?

Session-based permission sets can only be used during a specific session. Understand why and when to create a session-based permission set.

Note: Session-based permission sets is currently available as a Developer Preview.

Important: Managed packages with permission sets that require session activation cannot be installed on customer orgs without this feature.

Use a session-based permission set to allow functional access only during a predefined session type. For example, your org might have a custom object called "Conference Room." A mobile app called "Conference Room Sync" has read and update access to the object. Create a permission set to permit updates to the object only when the "Conference Room Sync" connected mobile app generates the user's session.

Or, let's say you have a web application that accesses confidential information. For security, you want to limit user access to specific types of sessions for a predetermined length of time. You can create a session-based permission set that activates only when users authenticate into your environment using a token. When the token expires, the user must reauthenticate to access the application again.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

USER PERMISSIONS

To delete permission sets and edit permission set properties:

- "Manage Profiles and Permission Sets"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Developer** Edition

EDITIONS

Available in: Salesforce Classic and Lightning Experience

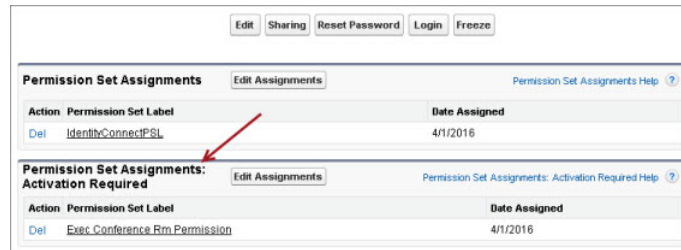

Available in: **Developer** Edition

To activate session-based permission sets, see the SessionPermSetActivation object in the [SOAP API Developer Guide](#). You'll need the "Manage Session Permission Set Activation" permission.

Before assigning session-based permission sets to users, ensure that they can meet the conditions of the permission set. For example, grant user access to appropriate tools, such as authenticators. As a best practice, inform users of the conditions in which they can access certain applications and tools.

 **Tip:** When you create your permission set list view, filter by and select columns to include **Session Activation Required** to view which permission sets are session-based.

User assignment information appears on the user detail page in a related list called Permission Set Assignments: Activation Required.

[Permission Sets](#)

App and System Settings in Permission Sets

In permission sets, permissions and settings are organized into app and system categories, which reflect the rights users need to administer and use system and app resources.

App Settings

Apps are sets of tabs that users can change by selecting the drop-down menu in the header. All underlying objects, components, data, and configurations remain the same, regardless of the selected app. In selecting an app, users navigate in a set of tabs that allows them to efficiently use the underlying functionality for app-specific tasks. For example, let's say you do most of your work in the sales app, which includes tabs like Accounts and Opportunities. To track a new marketing campaign, rather than adding the Campaigns tab to the sales app, you select Marketing from the app drop-down to view your campaigns and campaign members.

The Apps section of the permission sets overview page contains settings that are directly associated with the business processes the apps enable. For example, customer service agents might need to manage cases, so the "Manage Cases" permission is in the Call Center section of the App Permissions page. Some app settings aren't related to app permissions. For example, to enable the Time-Off Manager app from the AppExchange, users need access to the appropriate Apex classes and Visualforce pages, as well as the object and field permissions that allow them to create new time-off requests.

System Settings

Some system functions apply to an organization and not to any single app. For example, "View Setup and Configuration" allows users to view setup and administrative settings pages. Other system functions apply to all apps. For example, the "Run Reports" and "Manage Dashboards" permissions allow managers to create and manage reports in all apps. In some cases, such as with "Modify All Data," a permission applies to all apps, but also includes non-app functions, like the ability to download the Data Loader.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Search Permission Sets

To quickly navigate to other pages in a permission set, you can enter search terms in any permission set detail page.

On any of the permission sets detail pages, type at least three consecutive letters of an object, setting, or permission name in the  **Find Settings...** box. The search terms aren't case-sensitive. As you type, suggestions for results that match your search terms appear in a list. Click an item in the list to go to its settings page.

For some categories, you can search for the specific permission or setting name. For other categories, search for the category name.

Item	Search for	Example
Assigned apps	App name	Type <code>saLes</code> in the Find Settings box, then select <code>Sales</code> from the list.
Objects	Object name	Let's say you have an Albums custom object. Type <code>albu</code> , then select <code>Albums</code> .
<ul style="list-style-type: none"> Fields Record types 	Parent object name	Let's say your Albums object contains a Description field. To find the <code>Description</code> field for albums, type <code>albu</code> , select <code>Albums</code> , and scroll down to <code>Description</code> under Field Permissions.
Tabs	Tab or parent object name	Type <code>rep</code> , then select <code>Reports</code> .
App and system permissions	Permission name	Type <code>api</code> , then select <code>API Enabled</code> .
All other categories	Category name	To find Apex class access settings, type <code>apex</code> , then select <code>Apex Class Access</code> . To find custom permissions, type <code>cust</code> , then select <code>Custom Permissions</code> . And so on.

If no results appear in a search:

- Be sure that the search term has at least three consecutive characters that match the object, setting, or permission name.
- Be sure that the search term is spelled correctly.
- The permission, object, or setting you're searching for may not be available in the current Salesforce org.
- The item you're searching for may not be available for the user license that's associated with the current permission set. For example, a permission set with the Standard Platform User license doesn't include the "Modify All Data" permission.

How is record type access specified?

You can assign record types to users in their profile or permission sets, or a combination of both. Record type assignment behaves differently in profiles and permission sets.

- A user's default record type is specified in the user's personal settings. You can't specify a default record type in permission sets.
- You can assign the `--Master--` record type in profiles. In permission sets, you can assign only custom record types. The behavior for record creation depends on which record types are assigned in profiles and permission sets.

If users have this record type on their profile...	And this total number of custom record types in their permission sets...	When they create a record...
<code>--Master--</code>	None	The new record is associated with the Master record type
<code>--Master--</code>	One	The new record is associated with the custom record type. Users can't select the Master record type.
<code>--Master--</code>	Multiple	Users are prompted to select a record type.
Custom	One or more	Users are prompted to select a record type. In their personal settings, users can set an option to use their default record type and not be prompted to choose a record type.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- Page layout assignments are specified in profiles only—they're not available in permission sets. When a permission set specifies a custom record type, users with that permission set get the page layout assignment that's specified for that record type in their profile. (In profiles, page layout assignments are specified for every record type, even when record types aren't assigned.)
- For lead conversion, the default record type specified in a user's profile is used for the converted records.
- Users can view records assigned to any record type. As a result, a page layout is assigned to every record type on a user's profile. A record type assignment on a user's profile or permission set doesn't determine whether a user can view a record with that record type. The record type assignment simply specifies that the user can use that record type when creating or editing a record.
- Record types in permission sets aren't supported in packages and change sets. As a result, any record type assignments in permission sets in a sandbox organization must be manually reproduced in a production organization.

Enable Custom Permissions in Permission Sets

Custom permissions give you a way to provide access to custom processes or apps. After you've created a custom permission and associated it with a process or app, you can enable the permission in permission sets.

1. From Setup, enter *Permission Sets* in the Quick Find box, then select **Permission Sets**.
2. Select a permission set, or create one.
3. On the permission set overview page, click **Custom Permissions**.
4. Click **Edit**.
5. To enable custom permissions, select them from the Available Custom Permissions list and then click **Add**. To remove custom permissions from the permission set, select them from the Enabled Custom Permissions list and then click **Remove**.
6. Click **Save**.

SEE ALSO:

[Custom Permissions](#)

Manage Permission Set Assignments

You can assign permission sets to a single user from the user detail page or assign multiple users to a permission set from any permission set page.

- [Assign Permission Sets to a Single User](#)
- [Assign a Permission Set to Multiple Users](#)
- [Remove User Assignments from a Permission Set](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

In Group and Professional Edition organizations, you can't create or edit custom permissions, but you can install them as part of a managed package.

USER PERMISSIONS

To enable custom permissions in permission sets:

- "Manage Profiles and Permission Sets"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Professional, Group, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Permission Set Assigned Users Page

From the Assigned Users page, you can view all users who are assigned to a permission set, assign additional users, and remove user assignments.

To view all users that are assigned to a permission set, from any permission set page, click **Manage Assignments**. From the Assigned Users page, you can:

- [Assign users to the permission set](#)
- [Remove user assignments from the permission set](#)
- [Edit a user](#)
- View a user's detail page by clicking the name, alias, or username
- View a profile by clicking the profile name

SEE ALSO:

[Assign Permission Sets to a Single User](#)

Assign Permission Sets to a Single User

You can assign permission sets or remove permission set assignments for a single user from the user detail page.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Select a user.
3. In the Permission Set Assignments related list, click **Edit Assignments**.
4. To assign a permission set, select it from the Available Permission Sets box and click **Add**. To remove a permission set assignment, select it from the Enabled Permission Sets box and click **Remove**.

Note:

- The Permission Set Assignments page shows permission sets with no associated license and permission sets that match the user's license. For example, if a user's license is Chatter Only, you can assign permission sets with the Chatter Only license and permission sets with no associated license to that user.

If you assign a permission set with no associated user license, all of its enabled settings and permissions must be allowed by the user's license, or the assignment will fail.

- Some permissions require users to have *permission set licenses* before the user can have those permissions. For example, if you add the "Use Identity Connect" permission to the "Identity" permission set, only users with the Identity Connect permission set license can be assigned the "Identity" permission set.

5. Click **Save**.

Revoking Permissions and Access

You can use profiles and permission sets to grant access, but not to deny access. Any permission granted from either a profile or permission set is honored. For example, if “Transfer Record” isn't enabled in Jane Smith's profile, but is enabled in two of her permission sets, she can transfer records regardless of whether she owns them. To revoke a permission, you must remove all instances of the permission from the user. You can do this with the following actions—each has possible consequences.

Action	Consequence
Disable a permission or remove an access setting in the profile and any permission sets that are assigned to the user.	The permission or access setting is disabled for all other users assigned to the profile or permission sets.
If a permission or access setting is enabled in the user's profile, assign a different profile to the user.	The user may lose other permissions or access settings associated with the profile or permission sets.
AND	
If the permission or access setting is enabled in any permission sets that are assigned to the user, remove the permission set assignments from the user.	

To resolve the consequence in either case, consider all possible options. For example, you can clone the assigned profile or any assigned permission sets where the permission or access setting is enabled, disable the permission or access setting, and assign the cloned profile or permission sets to the user. Another option is to create a base profile with the least number of permissions and settings that represents the largest number of users possible, then create permission sets that layer additional access.

What Determines Field Access?

Several factors control whether users can view and edit specific fields in Salesforce. You can control users' access to fields at the record type, user, or field level.

- **Page layouts**—Set whether fields are visible, required, editable, or read only for a particular record type.
- **Field-level security**—Further restrict users' access to fields by setting whether those fields are visible, editable, or read only. These settings override field properties set in the page layout if the field-level security setting is more restrictive.
- **Permissions**—Some user permissions override both page layouts and field-level security settings. For example, users with the "Edit Read Only Fields" permission can always edit read-only fields regardless of any other settings.
- **Universally required fields**—Override field-level security or any less-restrictive settings on page layouts by making a custom field universally required.

After setting these items, confirm users' access to specific fields using the [field accessibility grid](#).

SEE ALSO:

[Modifying Field Access Settings](#)

Verify Access for a Particular Field

See whether access to a field is restricted and at what level—record type, user profile, or field.

1. Navigate to the fields area of the appropriate object:
 - For Knowledge validation status picklists, from Setup, enter *Validation Statuses* in the **Quick Find** box, then select **Validation Statuses**.
2. Select a field and click **View Field Accessibility**.
3. Confirm that the field access is correct for different profiles and record types.
4. Hover over any field access setting to see whether the field is required, editable, hidden, or read only based on the page layout or field-level security.
5. Click any field access setting to change it.

To verify field accessibility by a specific profile, record type, or field, from Setup, enter *Field Accessibility* in the **Quick Find** box, then select **Field Accessibility**. From this page, choose a particular tab to view and then select whether you want to check access by profiles, record types, or fields.

 **Note:** In this user interface, you can't check access for permission sets.

USER PERMISSIONS

To view field accessibility:

- "View Setup and Configuration"

Modifying Field Access Settings

From the field accessibility grid, you can click any field access setting to change the field's accessibility in the page layout or in field-level security. The Access Settings page then lets you modify the field access settings.

- In the Field-Level Security section of the page, specify the field's access level for the profile.

Access Level	Enabled Settings
Users can read and edit the field.	Visible
Users can read but not edit the field.	Visible and Read-Only
Users can't read or edit the field.	None

We recommend that you use field-level security to control users' access to fields rather than creating multiple page layouts to control field access.

- In the Page Layout section of the page, you can:
 - Select the `Remove or change editability` radio button and then change the field access properties for the page layout. These changes will affect all profile and record type combinations that currently use this page layout.
 - Alternatively, you can select the `Choose a different page layout` radio button to assign a different page layout to the profile and record type combination.

SEE ALSO:

[What Determines Field Access?](#)

Field-Level Security

Field-level security settings let you restrict users' access to view and edit specific fields.

 **Note:**  [Who Sees What: Field-Level Security](#)

Watch how you can restrict access to specific fields on a profile-by-profile basis.

Your Salesforce org contains a lot of data, but you probably don't want every field accessible to everyone. For example, your payroll manager probably wants to keep salary fields accessible only to select employees. You can restrict user access in:

- Detail and edit pages
- Related lists
- List views
- Reports
- Connect Offline
- Email and mail merge templates
- Custom links
- The partner portal

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

- The Salesforce Customer Portal
- Synchronized data
- Imported data

The fields that users see on detail and edit pages are a combination of page layouts and field-level security settings. The most restrictive field access settings of the two always applies. For example, you can have a field that's required in a page layout but is read-only in the field-level security settings. The field-level security overrides the page layout, so the field remains read-only.

 **Important:** Field-level security doesn't prevent searching on the values in a field. When search terms match on field values protected by field-level security, the associated records are returned in the search results without the protected fields and their values.

You can define field-level security in either of these ways.

- [For multiple fields on a single permission set or profile](#)
- [For a single field on all profiles](#)

After setting field-level security, you can:

- Create page layouts to organize the fields on detail and edit pages.

Tip: Use field-level security to restrict users' access to fields, and then use page layouts to organize detail and edit pages within tabs. This approach reduces the number of page layouts for you to maintain.

- Verify users' access to fields by checking field accessibility.
- Customize search layouts to set the fields that appear in search results, in lookup dialog search results, and in the key lists on tab home pages.

Note: Roll-up summary and formula fields are read-only on detail pages and not available on edit pages. They can also be visible to users even though they reference fields that your users can't see. Universally required fields appear on edit pages regardless of field-level security.

The relationship group wizard allows you to create and edit relationship groups regardless of field-level security.

Set Field Permissions in Permission Sets and Profiles

Field permissions specify the access level for each field in an object.

- From Setup, either:
 - Enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, or
 - Enter *Profiles* in the **Quick Find** box, then select **Profiles**
- Select a permission set or profile.
- Depending on which interface you're using, do one of the following:
 - Permission sets or enhanced profile user interface—In the **Find Settings...** box, enter the name of the object you want and select it from the list. Click **Edit**, then scroll to the Field Permissions section.
 - Original profile user interface—In the Field-Level Security section, click **View** next to the object you want to modify, and then click **Edit**.
- Specify the field's access level.
- Click **Save**.

Set Field-Level Security for a Single Field on All Profiles

- From the management settings for the field's object, go to the fields area.
- Select the field you want to modify.
- Click **View Field Accessibility**.
- Specify the field's access level.

User Permissions

User permissions specify what tasks users can perform and what features users can access. For example, users with the “View Setup and Configuration” permission can view Setup pages, and users with the “API Enabled” permission can access any Salesforce API.

You can enable user permissions in permission sets and custom profiles. In permission sets and the enhanced profile user interface, these permissions—as well as their descriptions—are listed in the App Permissions or System Permissions pages. In the original profile user interface, user permissions are listed under Administrative Permissions and General User Permissions.

To view permissions and their descriptions, from Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**, then select or create a permission set. Then from the Permission Set Overview page, click **App Permissions** or **System Permissions**.

SEE ALSO:

[Profiles](#)

[Permission Sets](#)

[Standard Profiles](#)

Object Permissions

Object permissions specify the base-level access users have to create, read, edit, and delete records for each object. You can manage object permissions in permission sets and profiles.

Object permissions either respect or override sharing rules and settings. The following permissions specify the access that users have to objects.

Permission	Description	Respects or Overrides Sharing?
Read	Users can only view records of this type.	Respects sharing
Create	Users can read and create records.	Respects sharing
Edit	Users can read and update records.	Respects sharing
Delete	Users can read, edit, and delete records.	Respects sharing
View All	Users can view all records associated with this object, regardless of sharing settings.	Overrides sharing

EDITIONS

Available in: Salesforce Classic

The user permissions available vary according to which edition you have.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Permission	Description	Respects or Overrides Sharing?
Modify All	<p>Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings.</p> <p> Note: “Modify All” on documents allows access to all shared and public folders, but not the ability to edit folder properties or create new folders. To edit folder properties and create new folders, users must have the “Manage Public Documents” permission.</p>	Overrides sharing

SEE ALSO:

[“View All” and “Modify All” Permissions Overview](#)
[Comparing Security Models](#)
[Field Permissions](#)

“View All” and “Modify All” Permissions Overview

The “View All” and “Modify All” permissions ignore sharing rules and settings, allowing administrators to grant access to records associated with a given object across the organization. “View All” and “Modify All” can be better alternatives to the “View All Data” and “Modify All Data” permissions.

Be aware of the following distinctions between the permission types.

Permissions	Used for	Users who Need them
View All Modify All	Delegation of object permissions	Delegated administrators who manage records for specific objects
View All Data Modify All Data	Managing all data in an organization; for example, data cleansing, deduplication, mass deletion, mass transferring, and managing record approvals	Administrators of an entire organization
View All Users	Viewing all users in the organization. Grants Read access to all users, so that you can see their user record details, see them in searches, list views, and so on.	Users who view all users in the organization, especially if the organization-wide default for the user object is Private. Administrators with the “Manage Users” permission are automatically granted the “View All Users” permission.

EDITIONS

Available in: Salesforce Classic

Available in all editions

“View All” and “Modify All” are not available for ideas, price books, article types, and products.

“View All” and “Modify All” allow for delegation of object permissions only. To delegate user administration and custom object administration duties, [define delegated administrators](#).

“View All Users” is available if your organization has User Sharing, which controls user visibility in the organization. To learn about User Sharing, see [User Sharing](#).

SEE ALSO:

[Object Permissions](#)

Comparing Security Models

Salesforce user security is an intersection of [sharing](#), and [user](#) and [object](#) permissions. In some cases, such as in end-user record level access, it is advantageous to use sharing to provide access to records. In other cases, such as when delegating record administration tasks like transferring records, cleansing data, deduplicating records, mass deleting records, and delegating workflow approval processes, it is advantageous to override sharing and use permissions to provide access to records.

The “Read,” “Create,” “Edit,” and “Delete” permissions respect sharing settings, which control access to data at the record level. The “View All” and “Modify All” permissions override sharing settings for specific objects. Additionally, the “View All Data” and “Modify All Data” permissions override sharing settings for *all* objects.

The following table describes the differences between the security models.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

	Permissions that Respect Sharing	Permissions that Override Sharing
Target audience	End-users	Delegated data administrators
Where managed	“Read,” “Create,” “Edit,” and “Delete” object permissions; Sharing settings	“View All” and “Modify All”
Record access levels	Private, Read-Only, Read/Write, Read/Write/Transfer/Full Access	“View All” and “Modify All”
Ability to transfer	Respects sharing settings, which vary by object	Available on all objects with “Modify All”
Ability to approve records, or edit and unlock records in an approval process	None	Available on all objects with “Modify All”
Ability to report on all records	Available with a sharing rule that states: the records owned by the public group “Entire Organization” are shared with a specified group, with Read-Only access	Available on all objects with “View All”
Object support	Available on all objects except products, documents, solutions, ideas, notes, and attachments	Available on most objects via object permissions  Note: “View All” and “Modify All” are not available for ideas, price books, article types, and products.
Group access levels determined by	Roles, Roles and Subordinates, Roles and Internal Subordinates, Roles, Internal and	Profile or permission sets

	Permissions that Respect Sharing	Permissions that Override Sharing
	Portal Subordinates, Queues, Teams, and Public Groups	
Private record access	Not available	Available on private contacts, opportunities, and notes and attachments with "View All" and "Modify All"
Ability to manually share records	Available to the record owner and any user above the record owner in the role hierarchy	Available on all objects with "Modify All"
Ability to manage all case comments	Not available	Available with "Modify All" on cases

Field Permissions

Field permissions specify the access level for each field in an object. In permission sets and the enhanced profile user interface, the setting labels differ from those in the original profile user interface and in field-level security pages for customizing fields.

Access Level	Enabled Settings in Permission Sets and Enhanced Profile User Interface	Enabled Settings in Original Profile and Field-Level Security Interfaces
Users can read and edit the field.	Read and Edit	Visible
Users can read but not edit the field.	Read	Visible and Read-Only
Users can't read or edit the field.	None	None

[Field-Level Security](#)

[Object Permissions](#)

Sharing Settings

In Salesforce, you can control access to data at many different levels. For example, you can control the access your users have to objects with object permissions. Within objects, you can control the access users have to fields using field-level security. To control access to data at the record level, use sharing settings.

 **Note:**  [Who Sees What: Overview](#)

Watch how you can control who sees what data in your organization.

Organization-Wide Defaults

Your organization-wide default sharing settings give you a baseline level of access for each object and enable you to extend that level of access using hierarchies or sharing rules. For example, you can set the organization-wide default for leads to Private if you only want users to view and edit the leads they own. Then, you can create lead sharing rules to extend access of leads to particular users or groups.

Sharing Rules

Sharing rules represent the exceptions to your organization-wide default settings. If you have organization-wide sharing defaults of Public Read Only or Private, you can define rules that give additional users access to records they do not own. You can create sharing rules based on record owner or field values in the record.

 **Tip:** Sometimes it's impossible to define a consistent group of users who need access to a particular set of records. In those situations, record owners can use manual sharing to give read and edit permissions to users who would not have access to the record any other way. Although manual sharing isn't automated like organization-wide sharing settings, role hierarchies, or sharing rules, it gives record owners the flexibility to share particular records with users that need to see them.

Apex Managed Sharing

Apex managed sharing allows developers to programmatically share custom objects. When you use Apex managed sharing to share a custom object, only users with the "Modify All Data" permission can add or change the sharing on the custom object's record, and the sharing access is maintained across record owner changes.

Other Methods for Allowing Access to Records

In addition to sharing settings, there are a few other ways to allow multiple users access to given records:

Map category groups to roles

Control access to data categories by mapping them to user roles.

Queues

Queues help you prioritize, distribute, and assign records to teams who share workloads. You can access queues from list views, and queue members can jump in to take ownership of any record in a queue. Queues are available for cases, leads, orders, custom objects, service contracts, and knowledge article versions. Use queues to route lead, order, case, and custom object records to a group.

Teams

For accounts, opportunities, and cases, record owners can use teams to allow other users access to their records. A *team* is a group of users that work together on an account, sales opportunity, or case. Record owners can build a team for each record that they own. The record owner adds team members and specifies the level of access each team member has to the record, so that some team

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Teams are not available in **Database.com**

members can have read-only access and others can have read/write access. The record owner can also specify a role for each team member, such as “Executive Sponsor.” In account teams, team members also have access to any contacts, opportunities, and cases associated with an account.

 **Note:** A team member may have a higher level of access to a record for other reasons, such as a role or sharing rule. In this case, the team member has the highest access level granted, regardless of the access level specified in the team.

SEE ALSO:

[Organization-Wide Sharing Defaults](#)

[Sharing Rules](#)

[User Role Hierarchy](#)

[Sharing Considerations](#)

Organization-Wide Sharing Defaults

Administrators can use organization-wide sharing settings to define the default sharing settings for an organization.

Organization-wide sharing settings specify the default level of access to records and can be set separately for accounts (including contracts), activities, assets, contacts, campaigns, cases, leads, opportunities, calendars, price books, orders, and custom objects.

For most objects, organization-wide sharing settings can be set to Private, Public Read Only, or Public Read/Write. In environments where the organization-wide sharing setting for an object is Private or Public Read Only, an administrator can grant users additional access to records by setting up a role hierarchy or defining sharing rules. However, sharing rules can only be used to grant additional access—they cannot be used to restrict access to records beyond what was originally specified with the organization-wide sharing defaults.

 **Important:** If your organization uses a Customer Portal, before you enable contacts to access the portal, set the organization-wide sharing defaults on accounts, contacts, contracts, assets, and cases to Private. This ensures that by default your customers can view only their own data. You can still grant your Salesforce users Public Read/Write access by creating sharing rules in which all internal users share with all internal users.

By default, Salesforce uses hierarchies, like the role or territory hierarchy, to automatically grant access of records to users above the record owner in the hierarchy.

Setting an object to Private makes those records visible only to record owners and those above them in the role hierarchy. Use the **Grant Access Using Hierarchies** checkbox to disable access to records to users above the record owner in the hierarchy for custom objects in Professional, Enterprise, Unlimited, Performance, and Developer Edition. If you deselect this checkbox for a custom object, only the record owner and users granted access by the organization-wide defaults receive access to the records.

[Sharing Default Access Settings](#)

[Default Organization-Wide Sharing Settings](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions.

Customer Portal is not available in **Database.com**

Set Your Organization-Wide Sharing Defaults

Organization-wide sharing defaults set the baseline access for your records. You can set the defaults separately for different objects.

 **Note:**  [Who Sees What: Organization-Wide Defaults](#)

Watch how you can restrict access to records owned by other users.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. For each object, select the default access you want to use. If you have external organization-wide defaults, see [External Organization-Wide Defaults Overview](#).
4. To disable automatic access using your hierarchies, deselect **Grant Access Using Hierarchies** for any custom object that does not have a default access of Controlled by Parent.

 **Note:** If **Grant Access Using Hierarchies** is deselected, users that are higher in the role or territory hierarchy don't receive automatic access. However, some users—such as those with the “View All” and “Modify All” object permissions and the “View All Data” and “Modify All Data” system permissions—can still access records they don't own.

When you update organization-wide defaults, sharing recalculation applies the access changes to your records. If you have a lot of data, the update can take longer.

- If you are increasing the default access, such as from Public Read Only to Public Read/Write, your changes take effect immediately. All users get access based on the updated default access. Sharing recalculation is then run asynchronously to ensure that all redundant access from manual or sharing rules are removed.

 **Note:** When the default access for contacts is Controlled by Parent and you increase the default access for accounts, opportunities, or cases, the changes take effect after recalculation is run.

- If you are decreasing the default access, such as from Public Read/Write to Public Read Only, your changes take effect after recalculation is run.

You'll receive a notification email when the recalculation completes. Refresh the Sharing Settings page to see your changes. To view the update status, from Setup, enter *View Setup Audit Trail* in the **Quick Find** box, then select **View Setup Audit Trail**.

Limitations

The organization-wide sharing default setting can't be changed for some objects:

- Service contracts are always Private.
- User provisioning requests are always Private.
- The ability to view or edit a document, report, or dashboard is based on a user's access to the folder in which it's stored.
- Users can only view the forecasts of other users who are placed below them in the role hierarchy, unless forecast sharing is enabled.
- When a custom object is on the detail side of a master-detail relationship with a standard object, its organization-wide default is set to Controlled by Parent and it is not editable.
- The organization-wide default settings can't be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom

Sharing Default Access Settings

You can use organization-wide defaults to set the default level of record access for the following objects.

- Accounts and their associated contracts
- Activities
- Calendars
- Campaigns
- Cases
- Contacts
- Custom objects
- Leads
- Opportunities
- Orders
- Price books
- Service contracts
- Users

You can assign the following access levels to accounts, campaigns, cases, contacts, contracts, leads, opportunities, orders, users, and custom objects.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Only Custom Objects are available in **Database.com**

USER PERMISSIONS

To set default sharing access:

- "Manage Sharing"

Field	Description
Controlled by Parent	<p>A user can perform an action (such as view, edit, or delete) on a contact or order based on whether he or she can perform that same action on the record associated with it.</p> <p>For example, if a contact is associated with the Acme account, then a user can only edit that contact if he or she can also edit the Acme account.</p>
Private	<p>Only the record owner, and users above that role in the hierarchy, can view, edit, and report on those records.</p> <p>For example, if Tom is the owner of an account, and he is assigned to the role of Western Sales, reporting to Carol (who is in the role of VP of Western Region Sales), then Carol can also view, edit, and report on Tom's accounts.</p>

Field	Description
Public Read Only	<p>All users can view and report on records but not edit them. Only the owner, and users above that role in the hierarchy, can edit those records.</p> <p>For example, Sara is the owner of ABC Corp. Sara is also in the role Western Sales, reporting to Carol, who is in the role of VP of Western Region Sales. Sara and Carol have full read/write access to ABC Corp. Tom (another Western Sales Rep) can also view and report on ABC Corp, but cannot edit it.</p>
Public Read/Write	<p>All users can view, edit, and report on all records.</p> <p>For example, if Tom is the owner of Trident Inc., all other users can view, edit, and report on the Trident account. However, only Tom can alter the sharing settings or delete the Trident account.</p>
Public Read/Write/Transfer	<p>All users can view, edit, transfer, and report on all records. Only available for cases or leads.</p> <p>For example, if Alice is the owner of ACME case number 100, all other users can view, edit, transfer ownership, and report on that case. But only Alice can delete or change the sharing on case 100.</p>
Public Full Access	<p>All users can view, edit, transfer, delete, and report on all records. Only available for campaigns.</p> <p>For example, if Ben is the owner of a campaign, all other users can view, edit, transfer, or delete that campaign.</p>

 **Note:** To use cases effectively, set the organization-wide default for Account, Contact, Contract, and Asset to Public Read/Write.

You can assign the following access levels to personal calendars.

Field	Description
Hide Details	Others can see whether the user is available at given times, but can not see any other information about the nature of events in the user's calendar.
Hide Details and Add Events	In addition to the sharing levels set by Hide Details, users can insert events in other users' calendars.
Show Details	Users can see detailed information about events in other users' calendars.
Show Details and Add Events	In addition to the sharing levels set by Show Details, users can insert events in other users' calendars.
Full Access	Users can see detailed information about events in other users' calendars, insert events in other users' calendars, and edit existing events in other users' calendars.

 **Note:** Regardless of the organization-wide defaults that have been set for calendars, all users can invite all other users to events.

You can assign the following access levels to price books.

Field	Description
Use	All users can view price books and add them to opportunities. Users can add any product within that price book to an opportunity.
View Only	All users can view and report on price books but only users with the "Edit" permission on opportunities or users that have been manually granted use access to the price book can add them to opportunities.
No Access	Users cannot see price books or add them to opportunities. Use this access level in your organization-wide default if you want only selected users to access selected price books. Then, manually share the appropriate price books with the appropriate users.

You can assign the following access levels to activities.

Field	Description
Private	Only the activity owner, and users above the activity owner in the role hierarchy, can edit and delete the activity; users with read access to the record to which the activity is associated can view and report on the activity.
Controlled by Parent	A user can perform an action (such as view, edit, transfer, and delete) on an activity based on whether he or she can perform that same action on the records associated with the activity. For example, if a task is associated with the Acme account and the John Smith contact, then a user can only edit that task if he or she can also edit the Acme account and the John Smith record.

You can assign the following access levels to users.

Field	Description
Private	All users have read access to their own user record and those below them in the role hierarchy.
Public Read Only	All users have read access on one another. You can see all users' detail pages. You can also see all users in lookups, list views, ownership changes, user operations, and search.

[Set Your Organization-Wide Sharing Defaults](#)

Default Organization-Wide Sharing Settings

The default organization-wide sharing settings are:

Object	Default Access
Account	Public Read/Write
Activity	Private
Asset	Controlled by Parent
Calendar	Hide Details and Add Events
Campaign	Public Full Access
Case	Public Read/Write/Transfer
Contact	Controlled by Parent
Contract	Public Read/Write
Custom Object	Public Read/Write
Lead	Public Read/Write/Transfer
Opportunity	Public Read Only
Price Book	Use
Service Contract	Private
Users	Public Read Only Private for external users

[Set Your Organization-Wide Sharing Defaults](#)

External Organization-Wide Defaults Overview

External organization-wide defaults provide separate organization-wide defaults for internal and external users. They simplify your sharing rules configuration and improve recalculation performance. Additionally, administrators can easily see which information is being shared to portals and other external users.

The following objects support external organization-wide defaults.

- Accounts and their associated contracts and assets
- Cases
- Contacts
- Opportunities
- Custom Objects

EDITIONS

Accounts, cases, contacts, leads, opportunities, and custom objects available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions.

Except for Custom Objects, all object types are not available in **Database.com**

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- Users

External users include:

- Authenticated website users
- Chatter external users
- Community users
- Customer Portal users
- Guest users
- High-volume portal users
- Partner Portal users
- Service Cloud Portal users

 **Note:** Chatter external users have access to the User object only.

Previously, if your organization wanted Public Read Only or Public Read/Write access for internal users but Private for external users, you would have to set the default access to Private and create a sharing rule to share records with all internal users.

With separate organization-wide defaults, you can achieve similar behavior by setting the default internal access to Public Read Only or Public Read/Write and the default external access to Private. These settings also speed up performance for reports, list views, searches, and API queries.

SEE ALSO:

[Organization-Wide Sharing Defaults](#)

[Setting the External Organization-Wide Defaults](#)

[Sharing Default Access Settings](#)

Setting the External Organization-Wide Defaults

External Organization-Wide Defaults enable you to set a different default access level for external users.

Before you set the external organization-wide defaults, make sure that it is enabled. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**, and click the **Enable External Sharing Model** button.

When you first enable external organization-wide defaults, the default internal access and default external access are set to the original default access level. For example, if your organization-wide default for contacts is Private, the default internal access and default external access will be Private as well.

To set the external organization-wide default for an object:

1. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**
2. Click **Edit** in the Organization-Wide Defaults area.
3. For each object, select the default access you want to use.

You can assign the following access levels.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To set default sharing access:

- “Manage Sharing”

Access Level	Description
Controlled by Parent	Users can perform actions (such as view, edit, delete) on a record on the detail side of a master-detail relationship if they can perform the same action on all associated master records.  Note: For contacts, <code>Controlled by Parent</code> must be set for both the default internal and external access.
Private	Only users who are granted access by ownership, permissions, role hierarchy, manual sharing, or sharing rules can access the records.
Public Read Only	All users can view all records for the object.
Public Read/Write	All users can view and edit all records for the object.

 **Note:** The default external access level must be more restrictive or equal to the default internal access level. For example, you can have a custom object with default external access set to Private and default internal access set to Public Read Only.

4. Click **Save**.

SEE ALSO:

[External Organization-Wide Defaults Overview](#)

Disabling External Organization-Wide Defaults

Disabling External Organization-Wide Defaults results in one organization-wide default for each object.

Before disabling this feature, set **Default External Access** and **Default Internal Access** to the same access level for each object.

To disable the external organization-wide defaults:

1. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**
2. Click **Disable External Sharing Model** in the Organization-Wide Defaults area.

After disabling the external organization-wide defaults, you'll see the **Default Access** setting instead of the **Default External Access** and **Default Internal Access** settings in the organization-wide defaults area. If you have User Sharing, the **Default External Access** settings for the account, contact, case, and opportunity objects remain visible but they are disabled.

SEE ALSO:

[External Organization-Wide Defaults Overview](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To disable external organization-wide defaults:

- "Manage Sharing"

Controlling Access Using Hierarchies

Determine whether users have access to records they don't own, including records to which they don't have sharing access, but someone below them in the hierarchy does.

Beyond setting the organization-wide sharing defaults for each object, you can specify whether users have access to the data owned by or shared with their subordinates in the hierarchy. For example, the role hierarchy automatically grants record access to users above the record owner in the hierarchy. By default, the `Grant Access Using Hierarchies` option is enabled for all objects, and it can only be changed for custom objects.

To control sharing access using hierarchies for any custom object, from Setup, enter *Sharing Settings* in the `Quick Find` box, then select **Sharing Settings**. Next, click **Edit** in the Organization Wide Defaults section. Deselect `Grant Access Using Hierarchies` if you want to prevent users from gaining automatic access to data owned by or shared with their subordinates in the hierarchies.

Implementation Notes

- Regardless of your organization's sharing settings, users can gain access to records they do not own through other means such as user permissions like "View All Data," sharing rules, or manual sharing of individual records.
- The `Grant Access Using Hierarchies` option is always selected on standard objects and is not editable.
- If you disable the `Grant Access Using Hierarchies` option, sharing with a role or territory and subordinates only shares with the users directly associated with the role or territory selected. Users in roles or territories above them in the hierarchies will not gain access.
- If your organization disables the `Grant Access Using Hierarchies` option, activities associated with a custom object are still visible to users above the activity's assignee in the role hierarchy.
- If a master-detail relationship is broken by deleting the relationship, the former detail custom object's default setting is automatically reverted to Public Read/Write and `Grant Access Using Hierarchies` is selected by default.
- The `Grant Access Using Hierarchies` option affects which users gain access to data when something is shared with public groups, personal groups, queues, roles, or territories. For example, the **View All Users** option displays group members and people above them in the hierarchies when a record is shared with them using a sharing rule or manual sharing and the `Grant Access Using Hierarchies` option is selected. When the `Grant Access Using Hierarchies` option is not selected, some users in these groups no longer have access. The following list covers the access reasons that depend on the `Grant Access Using Hierarchies` option.

These reasons always gain access:

- Group Member
- Queue Member
- Role Member
- Member of Subordinate Role
- Territory Member
- Member of Subordinate Territory

These reasons only gain access when using hierarchies:

- Manager of Group Member

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Territories are not available in **Database.com**

USER PERMISSIONS

To set default sharing access and change the `Grant Access Using Hierarchies` option:

- "Manage Sharing"

Manager of Queue Member
 Manager of Role
 Manager of Territory
 User Role Manager of Territory

Best Practices

- When you deselect **Grant Access Using Hierarchies**, notify users of the changes in report results that they can expect due to losing visibility of their subordinates' data. For example, selecting **My team's...** in the View drop-down list returns records owned by the user; it will not include records owned by their subordinates. To be included in this type of report view, records from subordinates must be explicitly shared with that user by some other means such as a sharing rule or a manual share. So, if no records are shared with you manually, the **My...** and **My team's...** options in the View drop-down list return the same results. However, choosing the **Activities with...** any custom object report type when creating a custom report returns activities assigned to you as well as your subordinates in the role hierarchy.

SEE ALSO:

[User Role Hierarchy](#)

User Role Hierarchy

Salesforce offers a user role hierarchy that you can use with sharing settings to determine the levels of access that users have to your Salesforce org's data. Roles within the hierarchy affect access on key components such as records and reports.

If your organization-wide defaults are more restrictive than Public Read/Write, use role hierarchy to make records more accessible to users.

Watch a Demo: [Who Sees What: Record Access via the Role Hierarchy](#)

Users at any role level can view, edit, and report on all data that's owned by or shared with users below them in the role hierarchy, unless your Salesforce org's sharing model for an object specifies otherwise. Specifically, in the Organization-Wide Defaults related list, you can disable the **Grant Access Using Hierarchies** option for a custom object. When disabled, only the record owner and users who are granted access by the organization-wide defaults receive access to the object's records.

Roles determine user access to cases, contacts, and opportunities, regardless of who owns those records. The access level is specified on the Role Edit page. For example, you can set the contact access so that users in a role can edit all contacts associated with accounts that they own, regardless of who owns the contacts. And you can set the opportunity access so that users in a role can edit all opportunities associated with accounts that they own, regardless of who owns the opportunities.

After you share a folder with a role, it's visible only to users in that role, not to superior roles in the hierarchy.

USER PERMISSIONS

To create, edit, and delete roles:

- "Manage Roles"

To assign users to roles:

- "Manage Internal Users"

Guidelines for Success with Roles

Understand key rule behaviors and apply best practices for success with roles.

For best practices on designing record access in a large organization, see [Designing Record Access for Enterprise Scale](#).

- To simplify user management in organizations with large numbers of users, enable delegated administrators to manage users in specified roles and all subordinate roles.
- You can create up to 500 roles for your organization.
- Every user must be assigned to a role, or their data will not display in opportunity reports, forecast roll-ups, and other displays based on roles.
- All users that require visibility to the entire organization should belong to the highest level in the hierarchy.
- It is not necessary to create individual roles for each title at your company. Instead, define a hierarchy of roles to control access of information entered by users in lower level roles.
- When you change a user's role, the sharing rules for the new role are applied.
- If you are a Salesforce Knowledge user, you can modify category visibility settings on the role detail page.
- To avoid performance issues, no single user should own more than 10,000 records of an object. Users who need to own more than that number of objects should either not be assigned a role or placed in a separate role at the top of the hierarchy. It's also important to keep that user out of public groups that might be used as the source for sharing rules.
- When an account owner is not assigned a role, the sharing access for related contacts is Read/Write, provided the organization-wide default for contacts is not Controlled by Parent. Sharing access on related opportunities and cases is No Access.
- If your organization uses Territory Management, forecasts are based on the territory hierarchy rather than the role hierarchy.

EDITIONS

Assign Users to Roles

Quickly assign users to a particular role.

1. From Setup, enter *Roles* in the **Quick Find** box, then select **Roles**.
2. Click **Assign** next to the name of the desired role.

Note: You can also access this page by clicking **Assign Users to Role** from the Users in Role related list. Large organizations should consider assigning roles via the [SOAP API](#) for efficiency.

3. Make a selection from the drop-down list to show the available users.
4. Select a user on the left, and click **Add** to assign the user to this role.

Note: Removing a user from the Selected Users list deletes the role assignment for that user.

Role Fields

The fields that comprise a role entry have specific purposes. Refer to this table for descriptions of each field and how it functions in a role.

The visibility of fields depends on your organization's permissions and sharing settings.

Field	Description
Case Access	Specifies whether users can access other users' cases that are associated with accounts the users own. This field is not visible if your organization's sharing model for cases is Public Read/Write.
Contact Access	Specifies whether users can access other users' contacts that are associated with accounts the users own. This field is not visible if your organization's sharing model for contacts is Public Read/Write or Controlled by Parent.
Label	The name used to refer to the role or title of position in any user interface pages, for example, Western Sales VP.
Modified By	The name of the user who last modified this role's details, and the date and time that the role was modified.
Opportunity Access	Specifies whether users can access other users' opportunities that are associated with accounts the users own. This field is not visible if your organization's sharing model for opportunities is Public Read/Write.
Partner Role	Indicates whether this role is associated with a partner account. This field is available only when a Customer Portal or partner portal is enabled for the organization. If this checkbox is selected, you cannot edit the role. The default number of roles in portal accounts is three. You can reduce the number of roles or add roles to a maximum of three.
Role Name	The unique name used by the API and managed packages.
Role Name as displayed on reports	A role name that appears in reports. When editing a role, if the Role Name is long, you can enter an abbreviated name in this field.
Sharing Groups	These groups are automatically created and maintained. The Role group contains all users in this role plus all users in roles above this role.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To create or edit roles:

- "Manage Roles"

Field	Description
	The Role and Subordinates group contains all users in this role plus all users in roles above and below this role in the hierarchy. The Role and Internal Subordinates group (available if Customer Portals or partner portals are enabled for your organization) contains all users in this role. It also contains all users in roles above and below this role, excluding Customer Portal and partner portal users.
This role reports to	The role above this role in the hierarchy.

SEE ALSO:

[User Role Hierarchy](#)

What Is a Group?

A group consists of a set of users. A group can contain individual users, other groups, or the users in a particular role or territory. It can also contain the users in a particular role or territory plus all the users below that role or territory in the hierarchy.

There are two types of groups.

Public groups

Administrators and delegated administrators can create public groups. Everyone in the organization can use public groups. For example, an administrator can create a group for an employee carpool program. All employees can then use this group to share records about the program.

Personal groups

Each user can create groups for their personal use. For example, users might need to ensure that certain records are always shared within a specified workgroup.

You can use groups in the following ways.

- To set up default sharing access via a sharing rule
- To share your records with other users
- To specify that you want to synchronize contacts owned by other users
- To add multiple users to a Salesforce CRM Content library
- To assign users to specific actions in Salesforce Knowledge

[Public Group Considerations](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Public Group Considerations

For organizations with a large number of users, consider these tips when creating public groups to optimize performance.

- Create a group when at least a few users need the same access.
- Create a group for members who don't need to frequently move in or out of the groups.
- Avoid creating groups within groups that result in more than five levels of nesting.
- Enable automatic access to records using role hierarchies for public groups by selecting **Grant Access Using Hierarchies** when creating the group. However, don't use this option if you're creating a public group with All Internal Users as members.

SEE ALSO:

[What Is a Group?](#)

Group Member Types

Many types of groups are available for various internal and external users.

When you create or edit a group, you can select the following types of members from the `Search` drop-down list. Depending on your organization settings, some types may not be available.

Member Type	Description
Customer Portal Users	All of your Customer Portal users. This is only available when a Customer Portal is enabled for your organization.
Partner Users	All of your partner users. This is only available when a partner portal is enabled for your organization.
Personal Groups	All of your own groups. This is only available when creating other personal groups.
Portal Roles	All roles defined for your organization's partner portal or Customer Portal. This includes all users in the specified portal role, except high-volume portal users.  Note: A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user <code>Alias</code> .
Portal Roles and Subordinates	All roles defined for your organization's partner portal or Customer Portal. This includes all of the users in the specified portal role plus all of the users below that role in the portal role hierarchy, except for high-volume portal users.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The member types that are available vary depending on your Edition.

USER PERMISSIONS

To create or edit a public group:

- "Manage Users"

To create or edit another user's personal group:

- "Manage Users"

Member Type	Description
Public Groups	All public groups defined by your administrator.
Roles	All roles defined for your organization. Adding a role to a group includes all of the users in that role, but does not include portal roles.
Roles and Internal Subordinates	Adding a role and its subordinate roles includes all of the users in that role plus all of the users in roles below that role. This doesn't include portal roles or users.
Roles and Subordinates	Adding a role and its subordinate roles includes all of the users in that role plus all of the users in roles below that role. This is only available when no portals are enabled for your organization.
Roles, Internal and Portal Subordinates	Adding a role and its subordinate roles includes all of the users in that role plus all of the users in roles below that role. This is only available when a partner or Customer Portal is enabled for your organization. This includes portal users.
Users	All users in your organization. This doesn't include portal users.

Create and Edit Groups

Only administrators and delegated administrators can create and edit public groups, but anyone can create and edit their own personal groups.

To create or edit a group:

1. Click the control that matches the type of group:
 - For personal groups, go to your personal settings and click **My Personal Information** or **Personal**—whichever one appears. Then click **My Groups**. The Personal Groups related list is also available on the user detail page.
 - For public groups, from Setup, enter *Public Groups* in the **Quick Find** box, then select **Public Groups**.
2. Click **New**, or click **Edit** next to the group you want to edit.
3. Enter the following:

Field	Description
Label	The name used to refer to the group in any user interface pages.
Group Name (public groups only)	The unique name used by the API and managed packages.
Grant Access Using Hierarchies (public groups only)	<p>Select Grant Access Using Hierarchies to allow automatic access to records using your role hierarchies. When selected, any records shared with users in this group are also shared with users higher in the hierarchy.</p> <p>Deselect Grant Access Using Hierarchies if you're creating a public group with All Internal Users as members, which optimizes performance for sharing records with groups.</p> <p> Note: If Grant Access Using Hierarchies is deselected, users that are higher in the role hierarchy don't receive automatic access. However, some users—such as those with the "View All" and "Modify All" object permissions and the "View All Data" and "Modify All Data" system permissions—can still access records they don't own.</p>
Search	<p>From the Search drop-down list, select the type of member to add. If you don't see the member you want to add, enter keywords in the search box and click Find.</p> <p> Note: For account owners to see child records owned by high-volume portal users, they must be members of any portal share groups with access to the portal users' data.</p>

[What Is a Group?](#)

Sharing Records with Manager Groups

Share records up or down the management chain using sharing rules or manual sharing.

The role hierarchy controls the level of visibility that users have into your organization's data. With Spring '15, you can use manager groups to share records with your management chain, instead of all managers in the same role based on the role hierarchy. Manager groups can be used wherever other groups are used, such as in a manual share or sharing rule. But they cannot be added to other groups and don't include portal users. Manager groups can contain Standard and Chatter Only users only.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To edit a public group:

- "Manage Users"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Every user has two manager groups—Managers Group (1) and Manager Subordinates Group (2)—where (1) includes a user’s direct and indirect managers, and (2) includes a user and the user’s direct and indirect reports. On a sharing rule setup page, these groups are available on the Share with drop-down list.

To find out who a user’s manager is, from Setup, enter *Users* in the *Quick Find* box, then select **Users**. Click a user’s name. The *Manager* field on the user detail page displays the user’s manager.

To enable users to share records with the manager groups, follow these steps.

1. From Setup, enter *Sharing Settings* in the *Quick Find* box, then select **Sharing Settings**.
2. On the Sharing Settings page, click **Edit**.
3. In Other Settings, select *Manager Groups* and then click **Save**.

 **Note:** You can’t disable manager groups if your organization uses Work.com or have any sharing rules that uses manager groups.

With manager groups, you can share records to these groups via manual sharing, sharing rules, and Apex managed sharing. Apex sharing reasons is not supported. For Apex managed sharing, include the row cause ID, record ID, and the manager group ID. For more information, see the [Force.com Apex Code Developer’s Guide](#).

Inactive users remain in the groups of which they are members, but all relevant sharing rules and manual sharing are retained in the groups.

 **Note:** If your organization has User Sharing enabled, you can’t see the users whom you don’t have access to. Additionally, a querying user who doesn’t have access to another user can’t query that user’s groups.

 **Example:** You might have a custom object for performance reviews whose organization-wide default is set to Private. After deselecting the *Grant Access Using Hierarchies* checkbox, only the employee who owns the review record can

view and edit it. To share the reviews up the management chain, administrators can create a sharing rule that shares to a user's Managers Group. Alternatively, the employee can share the review record with the user's Managers Group by using manual sharing.

[Sharing Rule Categories](#)

Sharing Rules

Make automatic exceptions to your organization-wide sharing settings for defined sets of users.

Note: [Who Sees What: Record Access via Sharing Rules](#)

Watch how you can grant access to records using sharing rules.

For example, use sharing rules to extend sharing access to users in public groups, roles, or territories. Sharing rules can never be stricter than your organization-wide default settings. They simply allow greater access for particular users.

You can create these types of sharing rules.

Type	Based on	Set Default Sharing Access for
Account sharing rules	Account owner or other criteria, including account record types or field values	Accounts and their associated contracts, opportunities, cases, and optionally, contacts and orders
Account territory sharing rules	Territory assignment	Accounts and their associated cases, contacts, contracts, and opportunities
Asset sharing rules	Asset owner or other criteria, including asset record types or field values	Individual asset records
Campaign sharing rules	Campaign owner or other criteria, including campaign record types or field values	Individual campaign records
Case sharing rules	Case owner or other criteria, including case record types or field values	Individual cases and associated accounts
Contact sharing rules	Contact owner or other criteria, including contact record types or field values	Individual contacts and associated accounts

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Account, asset, and contact sharing rules are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Account territory, case, lead, opportunity, order, and custom object sharing rules are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Campaign sharing rules are available in **Enterprise, Performance, Unlimited,** and **Developer** Editions and in **Professional** Edition for an additional cost

Record types are available in **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Type	Based on	Set Default Sharing Access for
Custom object sharing rules	Custom object owner or other criteria, including custom object record types or field values	Individual custom object records
Lead sharing rules	Lead owner or other criteria, including lead record types or field values	Individual leads
Opportunity sharing rules	Opportunity owner or other criteria, including opportunity record types or field values	Individual opportunities and their associated accounts
Order sharing rules	Order owner or other criteria, including order record types or field values	Individual orders
User sharing rules	Group membership or other criteria, including username and whether the user is active	Individual user records
User provisioning request sharing rules	User provisioning request owner, only; criteria-based sharing rules aren't available	Individual user provisioning request records

 **Note:**

- You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.
- Developers can use Apex to programmatically share custom objects (based on record owners, but not other criteria). This does not apply to User Sharing.

SEE ALSO:

[Criteria-Based Sharing Rules](#)

[Sharing Rule Considerations](#)

Criteria-Based Sharing Rules

Criteria-based sharing rules determine whom to share records with based on field values in records. For example, let's say you use a custom object for job applications, with a custom picklist field named "Department." A criteria-based sharing rule could share all job applications in which the Department field is set to "IT" with all IT managers in your organization.

 **Note:**

- Although criteria-based sharing rules are based on values in the records and not the record owners, a role or territory hierarchy still allows users higher in the hierarchy to access the records.
- You can't use Apex to create criteria-based sharing rules. Also, criteria-based sharing cannot be tested using Apex.
- You can use the **SharingRules** type in the Metadata API to create criteria-based sharing rules starting in API version 24.0.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Accounts, Opportunities, Cases, Contacts, and record types are not available in **Database.com**

- You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

You can create criteria-based sharing rules for accounts, opportunities, cases, contacts, leads, campaigns, and custom objects. You can create up to 50 criteria-based sharing rules per object.

- Record types
- These field types:
 - Auto Number
 - Checkbox
 - Date
 - Date/Time
 - Email
 - Number
 - Percent
 - Phone
 - Picklist
 - Text
 - Text Area
 - URL
 - Lookup Relationship (to user ID or queue ID)

Note: Text and Text Area are case-sensitive. For example, a criteria-based sharing rule that specifies "Manager" in a text field doesn't share records that have "manager" in the field. To create a rule with several common cases of a word, enter each value separated by a comma.

Sharing Rule Categories

When you define a sharing rule, you can choose from the following categories in the `owned by members of` and `Share with` drop-down lists. Depending on the type of sharing rule and the features enabled for your organization, some categories may not appear.

 **Note:** You can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

Category	Description
Managers Groups	All direct and indirect managers of a user.
Manager Subordinates Groups	A manager and all direct and indirect reports who he or she manages.
Queues	All records owned by the queue, excluding records owned by individual members of the queue. Available only in the <code>owned by members of</code> list.
Public Groups	All public groups defined by your administrator. If a partner portal or Customer Portal is enabled for your organization, the All Partner Users or All Customer Portal Users group displays. These groups includes all users allowed to access your partner portal or Customer Portal, except for high-volume portal users.
Roles	All roles defined for your organization. This includes all of the users in the specified role.
Portal Roles	All roles defined for your organization's partner portal or Customer Portal. This includes all users in the specified portal role, except high-volume portal users. A portal role name includes the name of the account that it's associated with, except for person accounts, which include the user Alias .
Roles and Subordinates	All roles defined for your organization. This includes all of the users in the specified role plus all of the users in roles below that role, including partner portal and Customer Portal roles that contain users with a portal license type. Portal roles are only included in this category if a partner portal or Customer Portal is enabled for your organization. The Roles, Internal and Portal Subordinates data set category is only available in your organization after you create at least one role in the role hierarchy.
Portal Roles and Subordinates	All roles defined for your organization's partner portal or Customer Portal. This includes all of the users in the specified portal role plus all of the users below that role in the portal role hierarchy, except for high-volume portal users.

Creating Lead Sharing Rules

Lead sharing rules are based on the record owner or on other criteria, including record type and certain field values. You can define up to 300 lead sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
2. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**.
3. In the Lead Sharing Rules related list, click **New**.
4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
6. Select a rule type.
7. Depending on the rule type you selected, do the following:

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

USER PERMISSIONS

To create sharing rules:

- "Manage Sharing"

- **Based on record owner**—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
- **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

 **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.

8. In the `Share with` line, specify the users who get access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
9. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

10. Click **Save**.

Campaign sharing rules can be based on the record owner or on other criteria, including record type and certain field values. You can define up to 300 campaign sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
 2. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**.
 3. In the Campaign Sharing Rules related list, click **New**.
 4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
 5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
 6. Select a rule type.
 7. Depending on the rule type you selected, do the following:
 - **Based on record owner**—In the *owned by members of* line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
 - **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.
-  **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.
8. In the *Share with* line, specify the users who get access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
 9. Select the sharing access setting for users.

EDITIONS

USER PERMISSIONS

To edit sharing rules:

- "Manage Sharing"

Sharing Rule Considerations

Sharing rules allow you to selectively grant data access to defined sets of users. Review the following notes before using sharing rules:

Granting Access

- You can use sharing rules to grant wider access to data. You cannot restrict access below your organization-wide default levels.
- If multiple sharing rules give a user different levels of access to a record, the user gets the most permissive access level.
- Sharing rules automatically grant additional access to related records. For example, opportunity sharing rules give role or group members access to the account associated with the shared opportunity if they do not already have it. Likewise, contact and case sharing rules provide the role or group members with access to the associated account as well.
- Users in the role hierarchy are automatically granted the same access that users below them in the hierarchy have from a sharing rule, provided that the object is a standard object or the **Grant Access Using Hierarchies** option is selected.
- Regardless of sharing rules, users can, at a minimum, view the accounts in their territories. Also, users can be granted access to view and edit the contacts, opportunities, and cases associated with their territories' accounts.

Updating

- Creating an owner-based sharing rule with the same source and target groups as an existing rule overwrites the existing rule.
- Once a sharing rule has been saved, you can't change the `Share with` field settings when you edit the sharing rule.
- Sharing rules apply to all new and existing records that meet the definition of the source data set.
- Sharing rules apply to both active and inactive users.
- When you change the access levels for a sharing rule, all existing records are automatically updated to reflect the new access levels.
- When you delete a sharing rule, the sharing access created by that rule is automatically removed.
- When you modify which users are in a group, role, or territory, the sharing rules are reevaluated to add or remove access as necessary.
- When you transfer records from one user to another, the sharing rules are reevaluated to add or remove access to the transferred records as necessary.
- Making changes to sharing rules may require changing a large number of records at once. To process these changes efficiently, your request may be queued and you may receive an email notification when the process has completed.
- Lead sharing rules do not automatically grant access to lead information after leads are converted into account, contact, and opportunity records.

Portal Users

- You can create rules to share records between most types of Customer Portal users and Salesforce users. Similarly, you can create sharing rules between Customer Portal users from different accounts as long as they have the Customer Portal Manager user license. However, you can't include high-volume portal users in sharing rules because they don't have roles and can't be in public groups.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Account and contact sharing rules are available in:

Professional, Enterprise, Performance, Unlimited, and Developer Editions

Account territory, case, lead, opportunity, order, and custom object sharing rules are available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise, Performance, Unlimited, and Developer** Editions

Only custom object sharing rules are available in **Database.com**

- You can easily convert sharing rules that include Roles, Internal and Portal Subordinates to include Roles and Internal Subordinates instead by using the Convert Portal User Access wizard. Furthermore, you can use this wizard to convert any publicly accessible report, dashboard, and document folders to folders that are accessible by all users except for portal users.

Managed Package Fields

If a criteria-based sharing rule references a field from a licensed managed package whose license has expired, (`expired`) is appended to the label of the field. The field label is displayed in the field drop-down list on the rule's definition page in Setup. Criteria-based sharing rules that reference expired fields aren't recalculated, and new records aren't shared based on those rules. However, the sharing of existing records prior to the package's expiration is preserved.

SEE ALSO:

[Sharing Rules](#)

User Sharing

User Sharing enables you to show or hide an internal or external user from another user in your organization.

Watch a demo: [Who Sees Whom: User Sharing](#)

For example, you might be a manufacturer who wants to include all dealers in your organization but keep them from seeing or interacting with each other. If so, set the organization-wide defaults for the user object to Private. Then, open up access to specified dealers with sharing rules or manual sharing.

With User Sharing, you can:

- Assign the "View All Users" permission to users who need to see or interact with all users. This permission is automatically enabled for users who have the "Manage Users" permission.
- Set the [organization-wide default](#) for user records to Private or Public Read Only.
- Create [user sharing rules](#) based on group membership or other criteria.
- Create [manual shares](#) for user records to open up access to individual users or groups.
- Control the visibility of external users in customer or partner portals and communities.

Manual sharing, portals, and communities available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Understanding User Sharing

Set organization-wide defaults for internal and external user records. Then, extend access using sharing rules based on membership to public groups, roles, or territories, or use manual sharing to share individual user records with other users or groups.

When you enable user sharing, users can see other users in search, list views, and so on only if they have Read access on those users.

Review these considerations before you implement user sharing.

“View All Users” permission

This permission can be assigned to users who need Read access to all users, regardless of the sharing settings. If you already have the “Manage Users” permission, you are automatically granted the “View All Users” permission.

Organization-wide defaults for user records

This setting defaults to Private for external users and Public Read Only for internal users. When the default access is set to Private, users can only read and edit their own user record. Users with subordinates in the role hierarchy maintain read access to the user records of those subordinates.

User sharing rules

General [sharing rule considerations](#) apply to user sharing rules. User sharing rules are based on membership to a public group, role, or territory. Each sharing rule shares members of a source group with those of the target group. You must create the appropriate public groups, roles, or territories before creating your sharing rules. Users inherit the same access as users below them in the role hierarchy.

Manual sharing for user records

Manual sharing can grant read or edit access on an individual user, but only if the access is greater than the default access for the target user. Users inherit the same access as users below them in the role hierarchy. Apex managed sharing is not supported.

User sharing for external users

Users with the “Manage External Users” permission have access to external user records for Partner Relationship Management, Customer Service, and Customer Self-Service portal users, regardless of sharing rules or organization-wide default settings for User records. The “Manage External Users” permission does not grant access to guest or Chatter External users.

User Sharing Compatibility

When the organization-wide default for the user object is set to Private, User Sharing does not fully support these features.

- Chatter Messenger is not available for external users. It is available for internal users only when the organization-wide default for the user object is set to Public Read Only.
- Customizable Forecasts—Users with the “View All Forecast” permission can see users to whom they don't have access.
- Salesforce CRM Content—A user who can create libraries can see users they don't have access to when adding library members.
- Standard Report Types—Some reports based on standard report types expose data of users to whom a user doesn't have access. For more information, see [Control Standard Report Visibility](#).

Set the Org-Wide Sharing Defaults for User Records

Set the org-wide sharing defaults for the user object before opening up access.

For user records, you can set the organization-wide sharing default to Private or Public Read Only. The default must be set to Private if there is at least one user who shouldn't see a record.

Let's say that your organization has internal users (employees and sales agents) and external users (customers/portal users) under different sales agents or portal accounts, with these requirements:

- Employees can see everyone.
- Sales agents can see employees, other agents, and their own customer user records only.
- Customers can see other customers only if they are under the same agent or portal account.

To meet these requirements, set the default external access to Private, and extend access using sharing rules, manual sharing, or user permissions.

When the feature is first turned on, the default access setting is Private for external users. The default for internal users is Public Read Only. To change the organization-wide defaults for external access to the user object:

1. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Select the default internal and external access you want to use for user records.
The default external access must be more restrictive or equal to the default internal access.
4. Click **Save**.

Users have Read access to those below them in the role hierarchy and full access on their own user record.

Creating User Sharing Rules

Share members of a group to members of another group, or share users based on criteria.

User sharing rules can be based on membership to public groups, roles, or territories, or on other criteria such as Department and Title. By default, you can define up to 300 user sharing rules, including up to 50 criteria-based sharing rules. Contact Salesforce for information about increasing these limits.

User sharing rules based on membership enable user records belonging to members of one group to be shared with members of another group. Before you can create a membership-based user sharing rule, confirm that the appropriate groups have been created.

Users inherit the same access as users below them in the role hierarchy.

1. From Setup, enter *Sharing Settings* in the Quick Find box, then select **Sharing Settings**.
2. In the User Sharing Rules related list, click **New**.
3. Enter the **Label Name** and click the **Rule Name** field to auto-populate it.
4. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
5. Select a rule type.
6. Depending on the rule type you selected, do the following:
 - a. **Based on group membership**—Users who are members of a group can be shared with members of another group. In the *Users who are members of* line, select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 groups, roles, or territories).
 - b. **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.
7. In the *Share with* line, specify the group that should have access to the user records. Select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
8. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records. They can see target users in list views, lookups, search, and interact with them on Chatter.
Read/Write	Users can view and update records.

9. Click **Save**.

[User Sharing](#)

Share User Records

Your administrator defines your organization's sharing model and default access levels for user records. If the organization-wide default access is set to Private or Public Read Only, you can extend sharing privileges for your own user record. However, you can't restrict access below your organization's default access levels.

You can share external user records, such as external community users and customer portal or partner portal users. You can also share an internal user record with an external user. To view and manage sharing details, click **Sharing** on the user detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the user record. On this page, you can perform these tasks.

- To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the **View** drop-down list and click **Edit**.
- [Grant access](#) to the record for other users, groups, roles, or territories by clicking **Add**. This method of granting access is also known as *manual sharing* of your user records.
- Edit or delete the manual share by clicking **Edit** or **Del** next to the rule.

- "Read" on user records

An administrator can [disable or enable manual user record sharing](#) for all users.

SEE ALSO:

[User Sharing](#)

[Differences Between User Sharing with Manual Sharing and Sharing Sets](#)

Grant Access to User Records

You can manually grant access to your user records so that others can access them. Users inherit the same access permissions as users below them in the role hierarchy. Granting access to a user record makes the user's detail page visible to others. It also makes the user visible in lookups, list views, search, and so on.

You can share your user record manually if others cannot access it through the organization-wide defaults, sharing rules, or role hierarchy. If you gain access through more than one method, the higher level of access is maintained. High-volume portal users can be shared with other users using manual shares, but not in sharing rules.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click the name of the user you want to share.
2. On the User Detail page, click **Sharing**.
3. Click **Add**.
4. From the drop-down list, select the group, user, role, or territory to share with.
5. Choose which users have access by adding them to the Share With list.
6. Select the access level for the record you are sharing.

Possible values are Read/Write or Read Only, depending on your organization-wide defaults for users. You can only grant a higher access level than your organization-wide default.

7. Click **Save**.
8. To change record access, on the user's Sharing Detail page, click **Edit** or **Del**.

Controlling Who Community or Portal Users Can See

If your organization has enabled a community and has portal licenses provisioned for it, User Sharing is enabled automatically. When User Sharing is on, you can choose which other users community users can see by default. If your organization has Customer or Partner Portals, you can choose a default for them as well. Users who can see one another can interact on all the communities or portals in your organization. For example, if you would like to have a more private community, you can deselect the **Community User Visibility** checkbox and use other sharing features like sharing rules, manual shares, or portal access.

For Communities and Portals, you can choose different defaults.

Communities

The initial default is to allow community users to be seen by all other internal and external users in communities they are a member of. You can change the default to allow external users in communities to be seen only by themselves and their superiors in the role hierarchy. The setting provides Read access only and applies to all communities in your organization.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To grant access to your own user record:

- "Read" on the user with whom you're sharing

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To set Community and Portal User Visibility:

- "Manage Sharing"

Visibility to users as a result of the **Community User Visibility** preference is not inherited through the role hierarchy. If a manager in the role hierarchy is not a member of a community, but their subordinate is, the manager does not gain access to other members of the community.

Portals

The initial default is to allow portal users to be seen by other portal users within the same account. You can change the default to allow external users in portals to be seen by only themselves and their superiors in the role hierarchy. The setting provides Read access only and applies to all of the portals in your organization.

 **Note:** Partner portal users also have access to their channel manager.

1. From Setup, enter *Sharing Settings* in the *Quick Find* box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Deselect the **Portal User Visibility** checkbox to allow users to be seen by only themselves and their superiors. Or select the checkbox to let portal users be seen by all other portal users within the same account.
4. For **Community User Visibility**, deselect the checkbox to allow users to be seen only by themselves and their superiors. Select the checkbox to allow community users to be seen by all other users in their communities.

 **Note:** This option only appears if Salesforce Communities is enabled.

5. Click **Save**.

Selecting either of these options is a quick way of overriding an organization-wide default setting of Private for external access to the User object for Community or Portal users.

Once you have set these defaults, you can selectively expand access to users.

[Set the Org-Wide Sharing Defaults for User Records](#)

[Creating User Sharing Rules](#)

[Control Standard Report Visibility](#)

[User Sharing](#)

Control Standard Report Visibility

Show or hide standard reports that might expose data of users to whom a user doesn't have access.

You can control whether users can see reports based on standard report types that can expose data of users to whom they don't have access. When User Sharing is first enabled, all reports that contain data of users to whom a viewing user doesn't have access are hidden.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. To allow users to view reports based on standard report types that can expose data of users to whom they don't have access, select the **Standard Report Visibility** checkbox. Or, to hide these reports, deselect this checkbox.
4. Click **Save**.

If the organization-wide default for the user object is Private and the Standard Report Visibility checkbox is selected, a viewing user can see only the names of the users that they don't have access to in the report. User details such as username and email are hidden. When you deselect the **Standard Report Visibility** checkbox, users with the "View All Users" permission can still see all reports based on standard report types. All users can also see these reports if the organization-wide default for the user object is Public Read Only.

! **Important:** When Analytics sharing is in effect, all users in the organization get Viewer access to report and dashboard folders that are shared with them. Users who have been designated Manager or Editor on a folder, and users with additional administrative permissions, can have more access. Each user's access to folders is based on the combination of folder access and user permissions. To ensure that standard report folders are hidden as needed, remove sharing for all users from the folders. Then deselect the **View Dashboards in Public Folders** and **View Reports in Public Folders** checkboxes for the users' profiles.

SEE ALSO:

[User Sharing](#)

[Report Types Support for User Sharing](#)

Control Manual Sharing for User Records

Enable or prevent users from sharing their own user records with other users across the organization.

You can control whether the **Sharing** button is displayed on user detail pages. This button enables a user to grant others access to the user's own user record. You can hide or display this button for all users by following these steps.

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. Click **Edit** in the Organization-Wide Defaults area.
3. Select the **Manual User Record Sharing** checkbox to display the **Sharing** button on user detail pages, which enables users to share their records with others. Or deselect the checkbox to hide the button, which prevents users from sharing their user records with others.
4. Click **Save**.

USER PERMISSIONS

To set standard report visibility:

- "Manage Sharing"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To enable or disable manual user record sharing:

- "Manage Users"

When the organization-wide default for users is set to Public Read Only, users get read access to all other user records, can see those users in search and list views, and can interact with those users on Chatter and Communities.

 **Example:** For example, a partner user wants to collaborate with the sales representative in Communities. If you have disabled the `Community User Visibility` checkbox in the Sharing Settings page, community users can only be seen by themselves and their superiors in the role hierarchy. You can use manual sharing to grant the partner user read access to the sales representative by using the **Sharing** button on the sales representative's user detail page. This access enables both parties to interact and collaborate in Communities.

SEE ALSO:

[Controlling Who Community or Portal Users Can See](#)

Restoring User Visibility Defaults

User Sharing enables you to control who sees who in the organization. You can restore your defaults if you have previously used User Sharing.

To restore user visibility defaults:

1. From Setup, enter *Sharing Settings* in the `Quick Find` box, then select **Sharing Settings**.
2. Set the organization-wide defaults to Public Read Only for internal access and Private for external access.
3. Enable portal account user access.
On the Sharing Settings page, select the **Portal User Visibility** checkbox. This option enables customer portal users to see other users under the same portal account. Additionally, partner portal users can see the portal account owner.
4. Enable network member access.
On the Sharing Settings page, select the **Community User Visibility** checkbox. This option enables community members to be seen by all other users in their communities.
5. Remove user sharing rules.
On the Sharing Settings page, click **Del** next to all available user sharing rules.
6. Remove HVPU access to user records.
On the Customer Portal Setup page, click **Del** next to all available sharing sets for HVPU.

After user visibility is restored to the defaults, all internal users are visible to each other, portal users under the same portal account are visible to each other, and community members in the same community are visible to each other.

Report Types Support for User Sharing

Reports based on standard report types might expose data of users to whom a user doesn't have access.

The following report types might expose data of users to whom a viewing user doesn't have access.

- Accounts
- Account Owners
- Accounts with Assets
- Accounts with Custom Objects
- Accounts with Partners
- API Usage
- Campaigns with Opportunities
- Customizable Forecasting: Forecast History
- Customizable Forecasting: Opportunity Forecasts
- Custom Object Opportunity with Quotes Report
- Events with Invitees
- Opportunity
- Opportunity Field History
- Opportunity History
- Opportunity Trends
- Opportunities and Connections
- Opportunities with Competitors
- Opportunities with Contact Roles
- Opportunities with Contact Roles and Products
- Opportunities with Custom Objects
- Opportunities with Partners
- Opportunities with Products
- Opportunities with Products and Schedules
- Opportunities with Quotes and Quote Documents
- Opportunities with Quotes and Quote Line Items
- Opportunities with Sales Teams
- Opportunities with Sales Teams and Products
- Split Opportunities
- Split Opportunities with Products
- Split Opportunities with Products and Schedules

By default, these reports are accessible only to users who have the appropriate access. However, you can change the setting such that users without the appropriate access to the relevant users can see those reports.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Additionally, some reports may display a user's role. When a user can see a record but does not have access to the record owner, the user can see the owner's role on those reports.

Differences Between User Sharing with Manual Sharing and Sharing Sets

Manual sharing and sharing sets provide access to different groups of users.

You can control who sees whom in the organization, including internal and external users, if your organization has User Sharing enabled. Manual sharing and sharing sets provide additional access beyond the organization-wide defaults and sharing rules. External users, such as high-volume portal or community users (HVPU), don't have roles and can't be used in sharing rules.

 **Example:** Grant internal and non-HVPU users access to a user by creating a manual share using the Sharing button on the user detail page of that user. Grant HVPU access to other users by creating a sharing set for your portals or communities.

The following table shows when to use manual sharing and sharing sets.

	Users Getting Access		
	Internal	Non-HVPU ¹	HVPU ²
Internal	Manual Sharing	Manual Sharing	Sharing Set
Non-HVPU	Manual Sharing	Manual Sharing	Sharing Set
HVPU	Manual Sharing	Manual Sharing	Sharing Set

¹ Non-HVPU refers to an external user who is not using an HVPU profile.

² HVPU refers to an external user that has one of these profiles:

- Authenticated Website
- Customer Community User
- Customer Community Login User
- High Volume Customer Portal
- High Volume Portal
- Overage Authenticated Website User
- Overage High Volume Customer Portal User

Sharing Considerations

Learn how sharing models give users access to records they don't own.

The sharing model is a complex relationship between role hierarchies, user permissions, sharing rules, and exceptions for certain situations. Review the following notes before setting your sharing model:

Exceptions to Role Hierarchy-based Sharing

Users can always view and edit all data owned by or shared with users below them in the role hierarchy. Exceptions to this include:

- An option on your organization-wide default allows you to ignore the hierarchies when determining access to data.
- Contacts that are not linked to an account are always private. Only the owner of the contact and administrators can view it. Contact sharing rules do not apply to private contacts.
- Notes and attachments marked as private via the `Private` checkbox are accessible only to the person who attached them and administrators.
- Events marked as private via the `Private` checkbox are accessible only by the event owner. Other users cannot see the event details when viewing the event owner's calendar. However, users with the "View All Data" or "Modify All Data" permission can see private event details in reports and searches, or when viewing other users' calendars.
- Users above a record owner in the role hierarchy can only view or edit the record owner's records if they have the "Read" or "Edit" object permission for the type of record
- Visibility to users as a result of the **Community User Visibility** preference is not inherited through the role hierarchy. If a manager in the role hierarchy is not a member of a community, but their subordinate is, the manager does not gain access to other members of the community. This only applies if Salesforce Communities is enabled in your organization.

Deleting Records

- The ability to delete individual records is controlled by administrators, the record owner, users in a role hierarchy above the record owner, and any user that has been granted "Full Access."
- If the sharing model is set to Public Read/Write/Transfer for cases or leads or Public Full Access for campaigns, any user can delete those types of records.

Adding Related Items to a Record

- You must have "Read/Write" access to a record to be able to add notes or attachments to the record.
- You must have at least "Read" access to a record to be able to add activities or other associated records to it.

Adding or Removing Sharing Access Manually

- The ability to manually extend the sharing access of individual records is controlled by administrators, the record owner, users in a role hierarchy above the record owner, and any user that has been granted "Full Access."
- Changing your sharing model deletes any manual shares your users have created.

User Permissions and Object-Level Permissions

While your sharing model controls visibility to records, user permissions and object-level permissions control what users can do to those records.

- Regardless of the sharing settings, users must have the appropriate object-level permissions. For example, if you share an account, those users can only see the account if they have the “Read” permission on accounts. Likewise, users who have the “Edit” permission on contacts may still not be able to edit contacts they do not own if they are working in a Private sharing model.
- Administrators, and users with the “View All Data” or “Modify All Data” permissions, have access to view or edit all data.

Account Sharing

- To restrict users’ access to records they do not own that are associated with accounts they do own, set the appropriate access level on the role. For example, you can restrict a user’s access to opportunities they do not own yet are associated with accounts they do own using the `Opportunity Access` option.
- Regardless of the organization-wide defaults, users can, at a minimum, view the accounts in their territories. Also, users can be granted access to view and edit the contacts, opportunities, and cases associated with their territories’ accounts.

Apex Sharing

The organization-wide default settings can’t be changed from private to public for a custom object if Apex code uses the sharing entries associated with that object. For example, if Apex code retrieves the users and groups who have sharing access on a custom object `Invoice__c` (represented as `Invoice__share` in the code), you can’t change the object’s organization-wide sharing setting from private to public.

Campaign Sharing

- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, designate all users as Marketing Users when enabling campaign sharing. This simplifies administration and troubleshooting because access can be controlled using sharing and profiles.
- To segment visibility between business units while maintaining existing behavior within a business unit:
 1. Set the campaign organization-wide default to Private.
 2. Create a sharing rule to grant marketing users Public Full Access to all campaigns owned by users within their business unit.
 3. Create a sharing rule to grant all non-marketing users in a business unit Read Only access to all campaigns owned by users in their business unit.
- When a single user, such as a regional marketing manager, owns multiple campaigns and needs to segment visibility between business units, share campaigns individually instead of using sharing rules. Sharing rules apply to all campaigns owned by a user and do not allow segmenting visibility.
- Create all campaign sharing rules prior to changing your organization-wide default to reduce the affect the change has on your users.
- To share all campaigns in your organization with a group of users or a specific role, create a sharing rule that applies to campaigns owned by members of the “Entire Organization” public group.
- Minimize the number of sharing rules you need to create by using the “Roles and Subordinates” option instead of choosing a specific role.
- If campaign hierarchy statistics are added to the page layout, a user can see aggregate data for a parent campaign and all the campaigns below it in the hierarchy regardless of whether that user has sharing rights to a particular campaign within the hierarchy. Therefore, consider your organization’s campaign sharing settings when enabling campaign hierarchy statistics. If you do not want users to see aggregate hierarchy data, remove any or all of the campaign hierarchy statistics fields from the Campaign Hierarchy related list. These fields will still be available for reporting purposes.
- If the sharing model is set to Public Full Access for campaigns, any user can delete those types of records.

Campaign Member Sharing

Campaign member sharing is controlled by campaign sharing rules. Users that can see a campaign can also see associated campaign members.

Contact Sharing

The organization-wide sharing default for contacts is not available to organizations that have person accounts enabled.

Price Book Sharing

- Sharing on price books controls whether users can add the price book and its products to opportunities.
- User permissions control whether users can view, create, edit, and delete price books.

SEE ALSO:

[Sharing Rules](#)

[Sharing Settings](#)

Viewing Sharing Overrides

When you select an object in the Sharing Settings page, the page includes a Sharing Overrides related list, which shows any profiles that ignore sharing settings for that object.

To view the Sharing Overrides list, from Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**. Next, select an object from the Manage Sharing Settings For list.

For each profile, the list specifies the permissions that allow it to override sharing settings. The “View All Data” and “Modify All Data” permissions override sharing settings for all objects in the organization, while the object permissions “View All” and “Modify All” override sharing settings for the named object.

 **Note:** The Sharing Overrides list doesn't show permissions granted through permission sets, which may also override sharing settings for an object.

To override sharing settings for specific objects, you can create or edit permission sets or profiles and enable the “View All” and “Modify All” object permissions. These permissions provide access to all records associated with an object across the organization, regardless of the sharing settings. Before setting these permissions, compare the different ways to control data access.

USER PERMISSIONS

To view sharing overrides:

- “View Setup and Configuration”

Recalculate Sharing Rules

When you make changes to groups, roles, and territories, sharing rules are usually automatically reevaluated to add or remove access as necessary.

Changes could include adding or removing individual users from a group, role, or territory, changing which role a particular role reports to, changing which territory a particular territory is subordinate to, or adding or removing a group from within another group.

 **Note:** You don't need to recalculate each time you edit or create a sharing rule. Only use the Recalculate buttons on the Sharing Rules related lists if sharing rule updates have failed or are not working as expected. The administrator will receive a notification email if sharing rule updates have failed.

To manually recalculate an object's sharing rules:

1. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
2. In the Sharing Rules related list for the object you want, click **Recalculate**.
3. If you want to monitor the progress of a recalculation, from Setup, enter *Background Jobs* in the **Quick Find** box, then select **Background Jobs**.

 **Note:** The **Recalculate** button is disabled when group membership or sharing rule calculations are deferred. Sharing rules for related objects are automatically recalculated; for example, account sharing rules are recalculated when opportunity sharing rules are recalculated since the opportunity records are in a master-detail relationship on account records.

When sharing is recalculated, Salesforce also runs all Apex sharing recalculations. During sharing rule recalculation, related object sharing rule will be calculated as well. You'll receive an email that notifies you when the recalculation is completed. For example, when recalculating sharing rule for opportunities, account sharing rules are recalculated as well since opportunity is a detail of an account object.

Automatic sharing rule calculation is enabled by default. You can defer sharing rule calculation by suspending and resuming at your discretion.

Account and contact sharing rules are available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Account territory, case, lead, opportunity, order sharing rules, and custom object sharing rules are available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Campaign sharing rules are available in **Professional** Edition for an additional cost, and **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To recalculate sharing rules:

- "Manage Sharing"

Asynchronous Parallel Recalculation of Sharing Rules

Speed up sharing rule recalculation by running it asynchronously and in parallel.

When you create, update, or delete sharing rules, the resulting recalculation is now processed asynchronously and in parallel. The recalculation is run in parallel and asynchronously in the background, which speeds up the process and provides better resilience to site operations such as patches and server restarts. You'll receive an email notification upon completion. Before the recalculation is completed, you can't run other sharing operations such as creating a sharing rule or updating the organization-wide defaults.

If the number of impacted records from an owner-based sharing rule insert or update is less than 25,000, recalculation runs synchronously and you won't receive an email notification when it's completed. Owner-based sharing rule inserts and updates impacting less than 25,000 records are not available on the Background Jobs page.

Parallel sharing rule recalculation is also run in these cases.

- Click the Recalculate button for the sharing rules on the Sharing Settings page
- Recalculate your sharing rules on the Defer sharing page

You can monitor the progress of your parallel recalculation on the Background Jobs page or view your recent sharing operations on the View Setup Audit Trail page.

Recalculation of sharing rules maintains implicit sharing between accounts and child records. In the Background Jobs page, these processes corresponds to these job sub types; **Account — Extra Parent Access Removal** and **Account — Parent Access Grant**. Additionally, deleting a sharing rule corresponds to the job sub type **Object — Access Cleanup**, denoting that irrelevant share rows are removed.

 **Note:** For an in-depth look at record access, see [Designing Record Access for Enterprise Scale](#).

SEE ALSO:

[Monitoring Background Jobs](#)

[Recalculate Sharing Rules](#)

[Built-in Sharing Behavior](#)

Defer Sharing Calculations

Performing a large number of configuration changes can lead to very long sharing rule evaluations or timeouts. To avoid these issues, an administrator can suspend these calculations and resume calculations during an organization's maintenance period.

 **Note:** The defer sharing calculation feature isn't enabled by default. To enable it for your organization, contact Salesforce.

Deferring sharing calculation is ideal if you make a large number of changes to roles, territories, groups, users, portal account ownership, or public groups participating in sharing rules, and want to suspend the automatic sharing calculation to a later time.

Group membership and sharing rule calculation are enabled by default.

To suspend, resume, or recalculate sharing rule calculation, see [Deferring Sharing Rule Calculations](#).

SEE ALSO:

[Recalculate Sharing Rules](#)

Manage Group Membership Calculations

If you are making changes to groups that affect a lot of records, you may want to suspend automatic group membership calculation and resume at a later time. Note that you might experience sharing inconsistencies in your records if you don't resume calculation.

When you make changes to roles, territories, groups, or users, or change ownership of portal accounts, group membership is automatically recalculated to add or remove access as necessary. Changes can include adding or removing a user from a group or changing a role to allow access to different sets of reports.

To suspend or resume group membership calculation:

- From Setup, enter *Defer Sharing Calculations* in the Quick Find box, then select **Defer Sharing Calculations**.
- In the Group Membership Calculations related list, click **Suspend**.
 -  **Note:** If sharing rule calculations are enabled, suspending group membership calculations also suspends sharing rule calculations. Resuming group membership calculations also requires full sharing rule recalculation.
- Make your changes to roles, territories, groups, users, or portal account ownership.
- To enable group membership calculation, click **Resume**.

Object-Specific Share Locks (Pilot)

When you create, edit, or delete a sharing rule, recalculation runs to update record access in the organization. This operation can take some time if you have many users and a lot of data. The object-specific share locks feature enables you to make changes to a sharing rule for other objects, without waiting for recalculation across all objects to complete. Depending on the object, sharing rule type, and target group of the users, you can make changes to sharing rules on another object or the same object via the UI or API.

 **Note:** We provide this feature to selected customers through a pilot program that requires agreement to specific terms and conditions. To be nominated to participate in the program, contact Salesforce. Because pilot programs are subject to change, we can't guarantee acceptance. This pilot feature isn't generally available, as referenced in this document or in press releases or public statements. We can't guarantee general availability within any particular time frame or at all. Make your purchase decisions only on the basis of generally available features.

Without object-specific share locks, you can't submit simultaneous sharing changes until recalculation across all objects is complete. If you are enabling object-specific share locks, consider the following changes in your organization.

Criteria-based and ownership-based sharing rules

Recalculation is run if a sharing rule has changed or when you click the **Recalculate** button on the Sharing Settings page. Clicking this button locks sharing rules for that object (1), but you can still make changes to sharing rules for another object.

 **Note:** You don't need to recalculate each time you edit or create a sharing rule. Only use the Recalculate buttons on the Sharing Rules related lists if sharing rule updates have failed or are not working as expected. The administrator will receive a notification email if sharing rule updates have failed.

Sharing Rules

Lead Sharing Rules New Recalculate Lead Sharing Rules Help ?

 A sharing rule recalculation on Leads has been initiated by Diana Widjaja on 8/10/2015 12:44 PM. You can't submit any changes for Leads prior to the completion of the operation. Diana Widjaja will receive an email when the operation finishes.

Action	Criteria	Shared With	Lead
Edit Del	Lead: Company EQUALS AW Computing	All Internal Users	Read/Write

Account Sharing Rules New Recalculate Account Sharing Rules Help ?

No sharing rules specified.

Opportunity Sharing Rules New Recalculate Opportunity Sharing Rules Help ?

Action	Criteria	Shared With	Opportunity
Edit Del	Opportunity: Opportunity Name CONTAINS Acme Computing	All Internal Users	Read Only

When an ownership-based sharing recalculation is in progress, you can't create, edit, or delete ownership-based sharing rules for an object that targets the affected group of users. For example, let's say you're creating an ownership-based lead sharing rule targeting all internal users. You can create, update, or delete another ownership-based sharing rules for leads targeting all internal users only after the recalculation finishes. You'll receive an email notification when the recalculation is complete. However, you can still create another ownership-based sharing rules for leads targeting any other public group except the All Internal Users group, while the recalculation from the creation of the first sharing rule is still in progress.

When a criteria-based sharing recalculation is in progress, you can't edit or delete that rule (2). But you can simultaneously create, edit, or delete any other criteria-based or ownership-based sharing rule.

You can't modify the organization-wide defaults when a recalculation is running and vice versa.

Sharing Settings

This page displays your organization's sharing settings. These settings specify the level of access your users have to each others' data.

⚠ An organization-wide default update has been initiated by Diana Widjaja on 8/7/2015 10:40 AM. You can't submit any changes prior to the completion of the operation. Diana Widjaja will receive an email when the operation finishes.

Account, cases, contacts, and opportunities

Sharing rules can affect accounts and the associated account children—cases, contacts, and opportunities, so they are locked together to ensure that recalculation runs properly. For example, creating and editing account sharing rules prevents you from creating or editing a case, contact, or opportunity sharing rule. Similarly, creating or editing an opportunity sharing rule prevents you from creating or editing a case, contact, or account sharing rule before recalculation is complete. Note that locks are not shared across objects, except in the case of accounts and associated account children.

 **Note:** Clicking the **Recalculate** button for any of these four objects' sharing rules prevents anyone from making changes to any sharing rules for those objects until recalculation is completed.

In the following example, an ownership-based account sharing rule has been deleted and recalculation is in progress. Although you can't create, edit, or delete another ownership-based sharing rule belonging to any of these objects, you can make changes to a criteria-based sharing rule (3) belonging to those objects.

Account Sharing Rules New Recalculate [Account Sharing Rules Help ?](#)

Built-in Sharing Behavior

Salesforce provides implicit sharing between accounts and child records (opportunities, cases, and contacts), and for various groups of portal users.

Sharing between accounts and child records

- **Access to a parent account**—If you have access to an account's child record, you have implicit Read Only access to that account.
- **Access to child records**—If you have access to a parent account, you have access to the associated child records. The account owner's role determines the level of access to child records.

Sharing behavior for portal users

- **Account and case access**—An account's portal user has Read Only access to the parent account and to all of the account's contacts.
- **Management access to data owned by Service Cloud portal users**—Since Service Cloud portal users don't have roles, portal account owners can't access their data via the role hierarchy. To grant them access to this data, you can add account owners to the portal's

EDITIONS

Available in: Salesforce Classic

Sharing for accounts and contacts is available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Sharing for cases and opportunities is available in: **Enterprise, Performance, Unlimited, and Developer** Editions

share group where the Service Cloud portal users are working. This step provides access to all data owned by Service Cloud portal users in that portal.

- **Case access**—If a portal user is a contact on a case, then the user has Read Only access on the case.

Group membership operations and sharing recalculation

Simple operations such as changing a user's role, moving a role to another branch in the hierarchy, or changing a portal account's owner can trigger a recalculation of sharing rules. Salesforce must check access to user's data for people who are above the user's new or old role in the hierarchy, and either add or remove shares to any affected records.

- 📌 **Note:** These sharing behaviors simplify administration for data access but can make mass inserts and mass updates slow. For best practices on designing record access in a large organization, see [Designing Record Access for Enterprise Scale](#).

SEE ALSO:

[Securing Data Access](#)

Resolving Insufficient Privileges Errors

Most Insufficient Privileges errors are caused by a missing permission or sharing setting that's preventing you from accessing a record or performing a task, like running a report.

A user might not have the right access on different levels, such as an object, a record, or a process. For example, a user's profile might be preventing the user from accessing the account object, or a user's role might be preventing the user from accessing a case record. You might also see this error when you click a link to a record or a Visualforce page tab to which you don't have access.

Most cases can be resolved by using the Sharing button on the record detail page, which enables you to share the record to another user if necessary. Administrators can also resolve this issue using the API, such as querying the UserRecordAccess object to check a user's access to a set of records. For more information, see the [SOAP API Developer's Guide](#).

If these tools can't help you resolve the issue, an administrator can try to diagnose it with this troubleshooting flow.

- [Resolve object-level access errors by reviewing the user profiles and permission sets.](#)
- [Resolve record-level access errors by reviewing the sharing settings, such as organization-wide defaults and sharing rules.](#)
- [Resolve process-level errors by reviewing validation rules and Apex triggers.](#)

It's a good idea for an administrator to log in to the application using your login to help you resolve an issue. You can [grant administrators access for a specified duration](#).

- 📌 **Note:** Watch this video series to understand how to grant users the access they need. ▶ [Who Sees What](#)

Resolve Permission and Object-Level Access Errors

Insufficient Privileges errors might be caused by a lack of object and user permissions. You can troubleshoot this type of errors through a user's profile and permission sets.

Generally, the best method for investigating object and permission access issues is through the API. However, you can use the following steps to investigate via point-and-click tools.

1. Verify the object permissions in the user's profile.

Object permissions, configured on profiles and permission sets, determine which objects a user can read, create, edit, or delete.

a. On the user detail page, click the user's profile.

b. On the profile overview page, go to **Object Settings** or **Object Permissions**.

Note the permissions for the object. For example, if the user is trying to view an account, check that the "Read" permission for the account and contact objects on the user profile is enabled.

Or if the user is trying to run a report, he or she might not have "Read" permission on an object that the report references.

2. Verify the user permissions in one of the following ways, depending on your profile user interface.

- From the enhanced profile user interface, review the permissions in the App Permissions and System Permissions sections.
- From the original profile user interface, review the permissions under Administrative Permissions and General User Permissions.

Note the relevant user permissions. For example, if the user is trying to send an email to a lead, check that the "Send Email" permission is enabled.

3. Verify the permissions in the user's permission sets.

a. On the user detail page, scroll to the Permission Set Assignments related list and click each permission set.

b. On the permission set overview page, click Object Settings and review the assigned object permissions.

c. Review the user permissions in the App Permissions and System Permissions sections.

d. Repeat these steps for each permission set assigned to the user.

4. If needed, assign the necessary permission using a permission set or by updating the profile. Permission sets provide access on an individual basis. Assign permissions on the user profile *only* if all users of this profile require access. Be sure you're aware of your organization's security policy and take action accordingly.

Resolve Record-Level Access Errors

Insufficient Privileges errors might be caused by your sharing settings, such as roles or sharing rules.

To verify if your error is at record-level, follow these steps. Alternatively, you can also use the API to query a user's access to a set of records or use the Sharing button on the record detail page.

1. If your organization uses roles, check the user's role in relation to the record owner.

For example, users can delete records only if they are the record owner, higher in the role hierarchy than the record owner, or the administrator. Similarly, users always have read access to records whose owners are below them in the role hierarchy, unless **Grant Access Using Hierarchies** is deselected (custom objects only).

- a. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.

Verify the role of the user and that of the user whose record is being accessed.

For example, a user can't delete or merge accounts owned by someone in an unrelated role hierarchy, even if the user has the appropriate permissions on the objects.

2. If the user should have gotten access via a sharing rule, review your sharing rules.

The user might have been unintentionally left out from a sharing rule.

- a. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.

- b. Check the public group (or other categories such as roles or queues) that the user should belong to for that sharing rule.

3. Verify your sales teams.

If your organization uses teams for accounts, opportunities, or cases, you might have missed the user when setting up the teams. Review your teams to determine if the user should have gotten access through a team.

- a. From Setup, enter the team that you want to check, such as *Account Teams*, in the **Quick Find** box, then select the team.

Add the user to the team, if appropriate.

4. Review your manual shares.

The user might have gained access via a manual share but lost this access because the record owner changed, causing the manual share to be automatically dropped. The manual share might have been removed using the **Sharing** button on the record detail page. Only the record owner, an administrator, or a user above the owner in the role hierarchy can create or remove a manual share on the record.

- a. On the record detail page, click **Sharing**.

The Sharing Detail page shows the users, groups, roles, and territories that have access to the record.

- b. If the user must gain access via a manual share, create a manual share by clicking **Add**.

5. Review your territories.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

USER PERMISSIONS

To create or edit sharing rules:

- "Manage Sharing"

To set up teams:

- "Customize Application"

To manage territories:

- "Manage Territories"

If your organization is using territories, the user might be missing from the territories or the record might not be under the correct territory where the user is a member. Otherwise, you must be a forecast manager, `Forecast managers can manage territories` is selected, and you are working below your position in the territory hierarchy.

[User Role Hierarchy](#)

[Sharing Rules](#)

Resolve Process-Level Access Errors

Insufficient Privileges errors might be caused by a validation rule.

To resolve Insufficient Privileges errors, you would typically determine if they are caused by misconfigured permission sets, profiles, or sharing settings. Otherwise, you might want to review your organization's validation rules.

1. Review your validation rules.
A validation rule might be preventing the user from completing a task, such as transferring a case record after it's closed.
2. From your object management settings, find the object that you want to check, and then scroll down to Validation Rules.
3. Verify that none of the validation rules are causing the error. Or fix the validation rule if the user must gain access through it.

Record Access FAQ

- [Why does a user have access to an account?](#)

Why does a user have access to an account?

A user may have access to an account from:

- Record Ownership
- Implicit access from an associated child record such as a case, contact, or opportunity
- Organization-wide sharing defaults
- Role hierarchy
- Sharing rules
- Manual sharing
- Account team or territory

To find out why a user has access to the record, click the **Sharing** button on the account detail page to see a list of users who have access and for which reasons. Click **Expand List** to see all users who have access.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

USER PERMISSIONS

To view and change validation rules:

- "View Setup and Configuration"

AND

"Customize Application"

To view and define Apex triggers:

- "Author Apex"

The following users don't show up in the list even if they may have access:

- All users, if the organization-wide defaults are set to Public Read Only or Public Read/Write
- High-volume portal users

 **Note:** If the **Sharing** button does not appear, the organization-wide sharing defaults may have been set to Controlled by Parent or Public Read. Otherwise, only the record owner, an administrator, or a user above the owner in the role hierarchy can see the Sharing Detail page.

Table 2: Troubleshooting guideline for user access to a record

Access Type	Description
Record owner	The record owner always gets access to his or her own record.
Implicit access	Corresponds to the "Associated record owner or sharing" entry in the Reason column of the Sharing Detail page. The user may have access to a child record of an account (opportunity, case, or contact), which grants them Read access on that account. You cannot overwrite this access. For example, if the user has access to a case record, he or she has implicit Read access to the parent account record.
Organization-wide sharing default	Check if the defaults for the account object are set to Private. If it is, the user may have gained access via other methods listed here. It must be set to Private if at least one of your users should not see a record.
Role hierarchy	The user may have inherited Read access from a subordinate in the role hierarchy. You can't override this behavior for non-custom objects. If the user who has access is on a different branch of the hierarchy from the account owner, check the sharing rules, account teams, and account territory.
Sharing rules	The user may have gotten access because he or she has been included in a relevant sharing rule. If the sharing rule uses public groups (or other categories such as roles) to grant access, check your public groups to see if the user has been included in the group.
Manual shares	The user may have gotten access through the Sharing button of the record. Only the record owner, an administrator, or a user above the owner in the role hierarchy can create or remove a manual share on the record.
Account Teams and Territory	The user may have been added to an Account Team by the account owner, an administrator, a user above the owner in the role hierarchy, or an account team member. If your organization uses territory management, check if the user who has access is higher in the territory hierarchy than the account owner. Managers gain the same access as their subordinates. Additionally, if the user is a member of Group A, which is a member of Group B, he or she gets access to all accounts shared to Group B, at the same level of access as members of Group B.

Managing Folders

A *folder* is a place where you can store reports, dashboards, documents, or email templates. Folders can be public, hidden, or shared, and can be set to read-only or read/write. You control who has access to its contents based on roles, permissions, public groups, and license types. You can make a folder available to your entire organization, or make it private so that only the owner has access.

- To access document folders, click the **Documents** tab.
- To access email template folders, from Setup, enter *Email Templates* in the Quick Find box, then select **Email Templates**.

To create a folder, click **Create New Folder**.

To edit a folder, click **Edit** next to the folder name. Alternatively, select a folder name from the Folder drop-down list and click **Edit**.

 **Note:** You can modify the contents of a folder only if the folder access level is set to read/write. Only users with the “Manage Public Documents” or “Manage Public Templates” permission can delete or change a read-only folder. Regardless of permissions or folder settings, users can’t edit unfiled or personal folders. Users with the “Manage Reports in Public Folders” permission can edit all reports in public folders but not reports in other users’ personal folders.

[Deleting Folders](#)

[Filing Items in Folders](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

USER PERMISSIONS

To create, edit, or delete public document folders:

- “Manage Public Documents”

To create, edit, and delete public email template folders:

- “Manage Public Templates”

To create, edit, and delete public report folders:

- “Manage Reports in Public Folders”

To create, edit, and delete public dashboard folders:

- “Manage Dashboards” AND “View All Data”

Creating and Editing Folders

Click **Create New Folder** or **Edit** from most pages that list folders.

1. Enter a `Folder Label`. The label is used to refer to the folder on user interface pages.
2. If you have the "Customize Application" permission, enter a unique name to be used by the API and managed packages.
3. Choose a `Public Folder Access` option. Select read/write if you want users to be able to change the folder contents. A read-only folder can be visible to users but they can't change its contents.
4. Select an unfiled report, dashboard, or template and click **Add** to store it in the new folder. Skip this step for document folders.
5. Choose a folder visibility option:
 - `This folder is accessible by all users, including portal users` gives folder access to all users in your organization, including portal users.
 - `This folder is accessible by all users, except for portal users` gives folder access to all users in your organization, but denies access to portal users. This option is only available for report and dashboard folders in organizations with a partner portal or Customer Portal enabled. If you don't have a portal, you won't see it.
 - `This folder is hidden from all users` makes the folder private.
 - `This folder is accessible only by the following users` allows you to grant access to a desired set of users:
 - a. Choose "Public Groups", "Roles", "Roles and Subordinates", "Roles, Internal and Portal Subordinates" (if you have portals enabled), "Territories," or "Territories and Subordinates" from the `Search` drop-down list. The choices vary by Edition and whether your organization has territory management.

 **Note:** When you share a folder with a group, managers of the group members have no access to the folder unless those managers are also members of the group.
 - b. If the `Available for Sharing` list does not immediately display the desired value, enter search criteria and click **Find**.
 - c. Select the desired value from the `Available for Sharing` list and click **Add** to move the value to the `Shared To` list.

 **Note:** You can use enhanced folder sharing to give your users more detailed levels of access to reports folders and dashboard folders. For more information, see [Turn On Enhanced Sharing for Reports and Dashboards](#) and [Share a Report or Dashboard Folder](#).

6. Click **Save**.

SEE ALSO:

[Managing Folders](#)

EDITIONS

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

Document folder restriction not available in: **Developer Edition**

USER PERMISSIONS

To create, edit, or delete public document folders:

- "Manage Public Documents"

To create, edit, and delete public email template folders:

- "Manage Public Templates"

To create, edit, and delete public report folders:

- "Manage Reports in Public Folders"

To create, edit, and delete public dashboard folders:

- "Manage Dashboards" AND "View All Data"

Deleting Folders

You can only delete folders that are empty. Before you begin, remove all the documents, dashboards, templates, or reports from the folder you would like to delete.

1. Click **Edit** next to the folder name from any page that lists folders. On the Reports tab, click  then **Edit** in the Folders pane.
2. Click **Delete** or  then **Delete**.
3. Click **OK** to confirm.

SEE ALSO:

[Managing Folders](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

USER PERMISSIONS

To create, edit, or delete public document folders:

- "Manage Public Documents"

To create, edit, and delete public email template folders:

- "Manage Public Templates"

To create, edit, and delete public report folders:

- "Manage Reports in Public Folders"

To create, edit, and delete public dashboard folders:

- "Manage Dashboards" AND "View All Data"

Filing Items in Folders

To move a document, dashboard, report, or email template to a different folder:

1. Select the item to be stored in a folder.
2. Click **Edit Properties**.
3. Choose another folder.
4. Click **Save**.

Just like report folders contain reports and email template folders contain email templates, document folders can only contain documents. To store an attachment in a document folder, save the attachment to your computer and upload it to the document library.

 **Note:** Email templates that are used by Web-to-Case, Web-to-Lead, assignment rules, or escalation rules must be marked as “Available for Use.”

SEE ALSO:

[Managing Folders](#)

Import Your Data

Importing Records

You can import up to 50,000 records into Salesforce.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. The options you see depend on your permissions.

You can import data from ACT!, Outlook, and any program that can save data in comma-delimited text format (.csv), such as Excel or GoldMine.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Report folders not available in: **Contact Manager, Group, and Personal Editions**

USER PERMISSIONS

To create, edit, or delete public document folders:

- “Manage Public Documents”

To create, edit, and delete public email template folders:

- “Manage Public Templates”

To create, edit, and delete public report folders:

- “Manage Reports in Public Folders”

To create, edit, and delete public dashboard folders:

- “Manage Dashboards” AND “View All Data”

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Your edition determines the types of objects you can import.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

The number of records you can import depends on your permissions and the type of data you're importing. You can import as many records as allowed, as long as you don't exceed the overall data storage limits for your org.

Which records can be imported?

Type of record	Import record limit	Users permissions needed	Learn more
Business accounts and contacts owned by you	500 at a time via the Import My Accounts & Contacts wizard	None	What Is Imported for Business Accounts and Contacts?
	50,000 at a time via the Data Import Wizard	"Create" on accounts AND "Edit" on accounts AND "Import Personal Contacts"

What Is Imported for Business Accounts and Contacts?

The import wizards for contacts and business accounts allow you to match records in a variety of ways in order to prevent duplicates. Contacts can be matched by Salesforce ID, name, email, or external ID. Business accounts can be matched by Salesforce ID, external ID, or by name and site. Matching by Salesforce ID is inclusive of both contacts and business accounts; if you match one by Salesforce ID, the other will also be matched by Salesforce ID.

Matching by Name and Site

If you choose to match contacts by name and business accounts by name and site (which are the recommended options), the import wizards automatically create a business account for each unique business account name and site in the import file. They also create a separate contact for each contact name listed in the file. The contacts are then associated with the appropriate business accounts.

If the business account or contact already exists in the system, and you have read/write access to the record, the wizards add your import data to the existing data in Salesforce.

Matching by Salesforce ID

You can also choose to match contacts and business accounts by Salesforce ID. With this selected, the Salesforce ID will be the criteria for de-duplication. That is, if you are matching by ID and a record in your source file has the same ID as a record in Salesforce, then that record will be updated in Salesforce. Note that record IDs are case-sensitive and must match exactly.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

Organization import not available in: **Personal Edition**, **Database.com**

Matching by External ID

An external ID is a custom field that has the External ID attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the Data Import Wizard detects existing records in Salesforce with external IDs that match those in the import file. This operation is not case-sensitive. For example, "ABC" is matched with "abc". However, if the external ID field also has the case-sensitive Unique attribute, uppercase and lowercase letters aren't considered identical.

Scan and standardize your external ID values before performing the import to prevent unintended matches.

If the Data Import Wizard finds duplicate records, only the first three duplicate records are reported in the confirmation email.

Overwriting Existing Account Values

The wizards never overwrite your existing business account fields unless you check the `Overwrite existing account values` checkbox in the wizard. With this box checked, you can insert or update existing business account fields with new data. However, you cannot use this checkbox to update existing field data with blank values. With this box unchecked, the wizard updates any empty business account fields, but does not touch any fields with existing data.

If you do not have read/write access to an existing business account or contact, the wizards create a new business account or contact owned by you. In addition, the wizards create new business accounts and contacts based on specific fields in your import file.

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, the import wizards can also import new business account and contact notes. The wizards do not import notes that are exact duplicates of existing contact or business account notes.

[Import My Contacts from Other Sources](#)

[Choosing a Method for Importing Data](#)

[Importing Records](#)

What Is Imported for Person Accounts?

The Data Import Wizard prevents creating duplicate person accounts by matching records according to one of the following fields: `Account Name`, `Salesforce ID`, `Email`, or an external ID field. In your import file, include a column for the field that you're using for record matching.

 **Note:** Your administrator could have renamed "person account" to another term. If so, the Data Import Wizard refers to the new name.

Matching by Name

When you select this option, the Data Import Wizard detects existing records in Salesforce that have the same name. This type of matching is not case-sensitive. For example, names that begin with a capital letter are matched with the same name that begins with a lowercase letter. If necessary, scan and standardize your record names before performing the import to prevent unintended matches.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the Data Import Wizard detects existing records in Salesforce that have the same Salesforce ID. You can obtain Salesforce IDs by running reports that include the ID field of the record.

Matching by Email

With this option, records in your import file are matched with existing records in Salesforce according to the exact value in the `Email` field.

Matching by External ID

An external ID is a custom field that has the External ID attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the Data Import Wizard detects existing records in Salesforce with external IDs that match those in the import file. This operation is not case-sensitive. For example, "ABC" is matched with "abc". However, if the external ID field also has the case-sensitive Unique attribute, uppercase and lowercase letters aren't considered identical.

Scan and standardize your external ID values before performing the import to prevent unintended matches.

If the Data Import Wizard finds duplicate records, only the first three duplicate records are reported in the confirmation email.

Ignoring or Updating Matching Records

When the Data Import Wizard detects existing records in Salesforce that match according to your chosen field, you can choose one of these actions.

- **Add new records**—If records in your file are new and don't match existing records, insert them into Salesforce. Ignore records in your file that match existing records, and do nothing to the existing records.
- **Update existing records**—If records in your file match existing records, update the existing records. Ignore records in your file that don't match existing records, and don't insert them as new records.
- **Add new and update existing records**—If records in your file are new and don't match existing records, insert them into Salesforce. If records in your file match existing records, update the existing records.

What Is Imported for Leads?

You can import data into standard lead fields and custom lead fields, even if a field is hidden or read only in your page layout or field-level security settings for leads.

Importing Leads with Matching Types

You can choose whether to match leads in your import file with existing leads in Salesforce. Leads can be matched according to the following types: Salesforce ID, name, email, or external ID. Choosing a matching type sets the criteria for avoiding duplicate leads. For example, if you're matching by email and a lead in your source file has the same email as a lead in Salesforce, that lead is updated in Salesforce. If you aren't matching by email and a lead in your source file has the same email as a lead in Salesforce, a lead is created.

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Importing Leads Without Matching Types

If you choose a matching type of “None” in the Data Import Wizard, for each lead in your import file, the Data Import Wizard creates a lead in Salesforce. You can merge leads after they are imported.

Matching by Name

When you select this option, the Data Import Wizard detects existing records in Salesforce that have the same name. This type of matching is not case-sensitive. For example, names that begin with a capital letter are matched with the same name that begins with a lowercase letter. If necessary, scan and standardize your record names before performing the import to prevent unintended matches.

Matching by Email

With this option, records in your import file are matched with existing records in Salesforce according to the exact value in the `Email` field.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the Data Import Wizard detects existing records in Salesforce that have the same Salesforce ID. You can obtain Salesforce IDs by running reports that include the ID field of the record.

Matching by External ID

An external ID is a custom field that has the External ID attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the Data Import Wizard detects existing records in Salesforce with external IDs that match those in the import file. This operation is not case-sensitive. For example, “ABC” is matched with “abc”. However, if the external ID field also has the case-sensitive Unique attribute, uppercase and lowercase letters aren’t considered identical.

Scan and standardize your external ID values before performing the import to prevent unintended matches.

If the Data Import Wizard finds duplicate records, only the first three duplicate records are reported in the confirmation email.

[Data Import Wizard](#)

[Choosing a Method for Importing Data](#)

What’s Imported for Campaign Members?

You can use the Data Import Wizard to update the statuses of campaign members.

You can also import campaign members. For each contact, lead, or person account in your import file, the Data Import Wizard:

- Imports the record
- Associates the record with the specified campaign, making the contact, lead, or person account a campaign member
- Inserts a Member Status value for the campaign member

If your import file has duplicate records, the Data Import Wizard doesn’t merge them. If an imported record matches an existing record, the Data Import Wizard doesn’t merge the duplicate data into one record.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Matching by External ID

An external ID is a custom field that has the External ID attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the Data Import Wizard detects existing records in Salesforce with external IDs that match those in the import file. This operation is not case-sensitive. For example, “ABC” is matched with “abc”. However, if the external ID field also has the case-sensitive Unique attribute, uppercase and lowercase letters aren’t considered identical.

Scan and standardize your external ID values before performing the import to prevent unintended matches.

If the Data Import Wizard finds duplicate records, only the first three duplicate records are reported in the confirmation email.

What Is Imported for Custom Objects?

The Data Import Wizard prevents creating duplicate records by matching records according to one of the following fields: custom object name, Salesforce ID, or external ID. In your import file, include a column for the field that you are using for record matching.

Matching by Name

When you select this option, the Data Import Wizard detects existing records in Salesforce that have the same name. This type of matching is not case-sensitive. For example, names that begin with a capital letter are matched with the same name that begins with a lowercase letter. If necessary, scan and standardize your record names before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the Data Import Wizard detects existing records in Salesforce that have the same Salesforce ID. You can obtain Salesforce IDs by running reports that include the ID field of the record.

Matching by External ID

An external ID is a custom field that has the External ID attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the Data Import Wizard detects existing records in Salesforce with external IDs that match those in the import file. This operation is not case-sensitive. For example, “ABC” is matched with “abc”. However, if the external ID field also has the case-sensitive Unique attribute, uppercase and lowercase letters aren’t considered identical.

Scan and standardize your external ID values before performing the import to prevent unintended matches.

If the Data Import Wizard finds duplicate records, only the first three duplicate records are reported in the confirmation email.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Custom object import available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To import custom object data via the Data Import Wizard:

- “Import Custom Objects”
- AND
- “Edit” on the custom object

 **Note:** You can't use the Data Import Wizard to import custom objects with two master-detail relationships.

What Is Imported for Solutions?

The Data Import Wizard prevents creating duplicate records by matching records according to one of the following fields: solution title, Salesforce ID, or external ID. In your import file, include a column for the field that you are using for record matching.

Matching by Solution Title

When you select this option, the import wizard detects existing solutions in Salesforce that have the same title. This type of matching isn't case-sensitive. For example, titles that begin with a capital letter are matched with the same title that begins with a lowercase letter. If necessary, scan and standardize your solution titles before performing the import to prevent unintended matches.

Matching by Salesforce ID

A Salesforce ID is a system-generated, case-sensitive string of 15 or 18 letters and numbers that uniquely identifies each Salesforce record. When you select this option, the Data Import Wizard detects existing records in Salesforce that have the same Salesforce ID. You can obtain Salesforce IDs by running reports that include the ID field of the record.

Matching by External ID

An external ID is a custom field that has the External ID attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the Data Import Wizard detects existing records in Salesforce with external IDs that match those in the import file. This operation is not case-sensitive. For example, "ABC" is matched with "abc". However, if the external ID field also has the case-sensitive Unique attribute, uppercase and lowercase letters aren't considered identical.

Scan and standardize your external ID values before performing the import to prevent unintended matches.

If the Data Import Wizard finds duplicate records, only the first three duplicate records are reported in the confirmation email.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To import solutions:

- "Import Solutions"

Notes on Importing Data

- **Field Accessibility**—You can import values into a field only if you have read and edit access. Field access is determined by user permissions, page layout assignments, and field-level security settings.

Field-level security is available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.

- **New Values for Picklists and Multi-Select Picklists**—If you import a picklist value that doesn't match an existing picklist value:
 - For an unrestricted picklist, the Data Import Wizard uses the value that's in the import file.
 - For a restricted picklist, the Data Import Wizard uses the picklist's default value.

- **Multi-Select Picklists**—To import multiple values into a multi-select picklist, separate the values by a semicolon in your import file.

You can import up to 100 values at a time in a multi-select picklist field. If you have more than 100 values in your import file for any one record, the import wizard leaves the field blank in that record.

- **Checkboxes**—To import data into a checkbox field, use 1 for checked values and 0 for unchecked values.
- **Default Values**—For picklist, multi-select picklist, and checkbox fields, if you do not map the field in the import wizard, the default value for the field, if any, is automatically inserted into the new or updated record.
- **Date/Time Fields**—Ensure that the format of any date/time fields you are importing matches how they display in Salesforce per your locale setting.
- **Formula Fields**—Formula fields cannot accept imported data because they are read only.
- **Field Validation Rules**—Salesforce runs validation rules on records before they are imported. Records that fail validation aren't imported. Consider deactivating the appropriate validation rules before running an import if they affect the records you are importing.

[Importing Records](#)

Importing Multiple Currencies

If your organization has set up the ability to use multiple currencies, you can import amounts in different currencies.

Import My Accounts and Contacts

For personal imports, all amounts in new accounts and contacts are imported in your personal currency. When import updates amounts in existing records, the amounts in your file are converted from your personal currency to the currency of the account or contact.

For example, suppose your personal currency is U.S. dollars, and your import file has 100 as the annual revenue of an existing account with `Account Currency` of euros. The new `Annual Revenue` value of the account is EUR 92, assuming a conversion rate of 0.92 and "EUR" as the currency code for euros.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Your edition determines the types of objects you can import.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Organization Import

When importing accounts, contacts, custom objects, leads, or solutions for your organization, you can specify the currency type for amount fields using the `Currency ISO Code` column in your import file. The following rules apply.

- **Entering currency codes** - Enter a currency code in the `Currency ISO Code` column in your import file. Currency codes are three letter codes that follow an international standard. For example, USD is the currency code for U.S. dollars. From Setup, enter *Manage Currencies* in the `Quick Find` box, then select **Manage Currencies** to see a list of valid codes for your organization.
- **Using one currency for accounts and contacts** - If you are importing accounts and contacts, the `Currency ISO Code` column applies to both an account and its associated contact. You cannot specify different currencies for associated accounts and contacts.
- **Updating the currency code** - When updating the currency code but not the currency amount for accounts and contacts, the amount isn't converted to the corresponding number in the new currency.
- **Entering inactive currencies** - If you enter an inactive currency in your import file, your personal currency is used instead. However, amounts aren't modified. For example, if your file has AUD 100 for 100 Australian dollars but AUD is an inactive currency for your organization, it's imported as USD 100, assuming your personal currency is U.S. dollars.
- **Omitting the Currency ISO Code column** - When creating records via importing, if you don't use the `Currency ISO Code` column or fail to map it, your personal currency is used. For example, if your file has 100 and your personal currency is U.S. dollars (currency code = USD), it's imported as USD 100.

When updating existing records via importing, if you don't use the `Currency ISO Code` column or fail to map it, any amounts are interpreted as having the currency of the record. For example, if your file has 100 for a record that has a currency of EUR (the currency code for euros), this amount is interpreted as EUR 100.

[Data Import Wizard](#)

Create Export Files for Import Wizards

Before you can import data into Salesforce, use your existing software to create a data export file.

An export file contains all the information you want to import.

Your export file can contain a mixture of new records and updates to existing records. You'll choose how records are matched to avoid duplication. For example, you can choose to match accounts and contacts by name or by email address. If you choose to match by email address, then the contact already in Salesforce will be updated if a record in your imported data has the same email address. However, if records have the same name but different email addresses, the records will remain separate.

1. Use your existing software to create a data export file.
 - [Exporting from ACT!](#)
 - [Exporting from LinkedIn®](#)
 - [Exporting from Outlook](#)
 - [Exporting from Other Data Sources](#)
 - [Exporting from Salesforce](#)
2. Review data you will import to ensure that it is more up-to-date than what is already in Salesforce. Your Salesforce data will be replaced with data from your import file, even if it is out of date.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

3. Compare your data fields with the Salesforce fields you can import into, and verify that your data will be mapped into the appropriate Salesforce fields. See [Preparing Your Data for Import](#) on page 634.
4. If you are the administrator and are importing for multiple users, combine export data from multiple sources into a single comma delimited text file (.csv) using Excel.

Note: When importing records from multiple users, your export file must include a `Record Owner` field for all new records which must contain the full usernames or first and last names of existing, active users. Existing record owners will not be changed; new records will be assigned to the user listed in the `Record Owner` field. For example, records that should be owned by Joe Smith in your organization must have that user's username ("jsmith@acme.com") or first and last names (for example, "Joe Smith", or "Smith Joe" for Asian locales). For lead imports, you can also specify the name of a lead queue.

When importing leads, you can alternatively use a lead assignment rule to specify the owners of the imported data, instead of using a `Record Owner` field.

Exporting from ACT!

ACT! allows you to export contact data in a text-delimited format which can then be imported. To export contact data from ACT! (versions 4.0 or 2000):

1. Launch ACT! and open your database.
2. Select **File > Data Exchange > Export...**
3. Select the file type **Text-Delimited**.
4. Choose a file name and location for the exported data and click **Next**.
5. Select **Contact records only**.
6. Click the **Options...** button.
7. Select **Comma** for the field separator character.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

8. Select **Yes, export field names** and click **OK**.
9. Click **Next**.
10. Select **All Records** and then click **Next**.
11. Leave the export field order list alone, and click **Finish**.

SEE ALSO:

[Default Field Mapping for ACT!](#)

[Create Export Files for Import Wizards](#)

Exporting from LinkedIn®

You can export contact data from LinkedIn in a text-delimited format, which you can then import.

- Open www.linkedin.com/addressBookExport and follow the steps on the page using the **Microsoft Outlook (.CSV file)** option.

Exporting from Outlook

Export data directly from Microsoft® Outlook® in a CSV (comma-separated values) format. Then import that data into Salesforce.

1. In Outlook, navigate to the export feature.
2. Choose **Comma Separated Values (Windows)** and click **Next**.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

3. Select the folder containing the contacts you want to export, and click **Next**.
4. Choose a file name for the exported data and click **Next**.
5. Click **Finish**.

SEE ALSO:

- [Default Field Mapping for Outlook](#)
- [Create Export Files for Import Wizards](#)

Exporting from Other Data Sources

You can import data into the system from any other application that can create a CSV (comma-separated values) file.

1. Save your data source as a CSV file.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

2. Ensure your file includes only one name per field. The system cannot accept more than one name per field.
3. Ensure your file separates names and titles into two fields. The system cannot accept fields containing both names and titles.
4. Ensure your file includes only one phone number per field.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions** except **Database.com**

Exporting from Salesforce

You can export account, campaign member, contact, custom object, lead, or solution reports from Salesforce to create an import file. Include the `Account ID`, `Campaign Member ID`, `Contact ID`, `Custom Object ID`, `Lead ID`, or `Solution ID` value for each respective record in your report. These ID fields are unique Salesforce identifiers and are used to accurately match your data with existing Salesforce records.

To create an import file with these ID fields, first export the data from Salesforce.

1. Run an account, campaign member, contact, custom object, lead, or solution report in Salesforce. Include the respective ID field and any other fields that are required for the import.
2. Export the report to Excel.

 **Note:** Remember that Salesforce record IDs are case-sensitive. Don't manually change Salesforce IDs in your import file.

Preparing Your Data for Import

After exporting your data from Salesforce or your existing application, prepare your data before importing it.

 **Note:** If your data has information in fields that do not match any of the standard fields, your administrator can create custom fields for that data prior to import.

Preparing Contacts

When importing from ACT! or Outlook, the Import My Contacts wizard automatically maps fields from ACT! and Outlook to Salesforce.

When importing from other data sources, you must use Excel® to label the columns in your import file as specified in [Field Mapping for Other Data Sources and Organization Import](#) on page 641.

Preparing Person Accounts

When importing person accounts, use the field labels in Salesforce as the column labels in your import file.

Preparing Org Business Accounts and Contacts

When importing business accounts and contacts for your org, you must use Excel® to label the columns in your import file as specified in [Field Mapping for Other Data Sources and Organization Import](#) on page 641.

Preparing Org Leads

When importing general leads or leads for campaigns, use the import file labels specified in [Field Mapping for Importing Leads](#) on page 645.

Preparing Custom Objects

When importing a custom object, use the field labels shown on the custom object detail page in Salesforce as the column labels in your import file.

Preparing Solutions

When importing solutions, use the field labels in Salesforce as the column labels in your import file.

You can enter HTML into the solutions you plan to import into Salesforce. However, unless your org has enabled HTML solutions, HTML tags will display in the solutions after they are imported.

For security purposes, Salesforce automatically filters all HTML solutions for potentially malicious HTML. If potentially malicious HTML is detected in an HTML solution, the potentially malicious HTML is either removed or transformed into text for users who view the HTML solution. Users can't notice when potentially malicious HTML is removed from an HTML solution.

You can import solutions written in HTML format into Salesforce. However, for security purposes, only the HTML tags listed below are allowed. The content of any HTML tags not listed below is automatically removed when saved in HTML solutions. Furthermore, the content of all `<script>` and `<iframe>` tags, as well as all JavaScript, is automatically removed when saved in HTML solutions. Additionally, Cascading Style Sheets (CSS) are not supported in HTML solutions.

The following HTML tags are allowed in HTML solutions imported into Salesforce:

<code><a></code>	<code><dt></code>	<code><q></code>
<code><abbr></code>	<code></code>	<code><samp></code>
<code><acronym></code>	<code></code>	<code><small></code>
<code><address></code>	<code><h1></code>	<code></code>
<code></code>	<code><h2></code>	<code><strike></code>
<code><bdo></code>	<code><h3></code>	<code></code>
<code><big></code>	<code><h4></code>	<code><sub></code>
<code><blockquote></code>	<code><h5></code>	<code><sup></code>
<code>
</code>	<code><h6></code>	<code><table></code>
<code><caption></code>	<code><hr></code>	<code><tbody></code>
<code><cite></code>	<code><i></code>	<code><td></code>
<code><code></code>	<code></code>	<code><tfoot></code>
<code><col></code>	<code><ins></code>	<code><th></code>
<code><colgroup></code>	<code><kbd></code>	<code><thead></code>
<code><dd></code>	<code></code>	<code><tr></code>
<code></code>	<code></code>	<code><tt></code>
<code><dfn></code>	<code><p></code>	<code></code>
<code><div></code>	<code><pre></code>	<code><var></code>
<code><dl></code>		

Within the above tags, you can include the following attributes:

<code>alt</code>	<code>face</code>	<code>size</code>
<code>background</code>	<code>height</code>	<code>src</code>

border	href	style
class	name	target
colspan	rowspan	width

The above attributes, which can include a URL, are limited to URLs that begin with the following:

- http:
- https:
- file:
- ftp:
- mailto:
- #
- / for relative links

Field Mapping for Other Data Sources and Organization Import

If you are importing accounts and contacts for an organization, or importing individual data from sources other than Outlook or ACT!, the Import Wizards map the fields as correctly as possible. You must fine-tune the mapping before completing the import. Before importing your data, Salesforce recommends that you use Excel to label the columns in your import file with the labels listed below. Field length limits for each object are listed in the [Salesforce Field Reference Guide](#).

 **Note:** The default mappings listed below are offered as a guide for importing; they do not ensure 100% accuracy in mapping your data. **You must fine-tune the mapping in the Import Wizards.** Remember that you can map the same field multiple times if necessary—for example, for the account and contact address fields.

Field Mapping for Importing Leads

Before you import leads, we recommend labeling the columns in your import file with the labels in the following table. When you import leads, the Data Import Wizard maps the fields in your import file as correctly as possible, and if necessary, you fine-tune the mappings.

 **Note:** The following default mappings are offered as a guide. They don't ensure 100% accuracy in mapping your data, so you must fine-tune the mapping in the Data Import Wizard.

Label for Your Import File	Salesforce Lead Field
Annual Revenue	Annual Revenue
City	City
Company	Company
Country	Country
Currency ISO Code	Lead Currency
(Note: You can use this field only for orgs that use multiple currencies; see Importing Multiple Currencies on page 630.)	
Description	Description

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Label for Your Import File	Salesforce Lead Field
Email (The Data Import Wizard verifies that this is a valid email address in the form jsmith@acme.com.)	Email
Email Opt Out (Use "1" to indicate that the user opts out; use "0" to indicate that the user wants emails.)	Email Opt Out
No. of Employees	No. of Employees
Fax	Fax
Full Name or First Name & Last Name (Note: When importing lead names, use either Full Name or First Name and Last Name, but not both.)	First Name and Last Name
Industry	Industry
Lead Division (Note: You do not need to specify this field if you choose to assign the division via the drop-down list on Step 1 of the Data Import Wizard. If you do not map this field or use the division drop-down list, the division is set to the record owner's default division for each record.)	Lead Division
Lead ID (Note: Record IDs are case-sensitive and should not be changed.)	Lead ID
Lead Source (Note: You do not need to specify this field if you choose to assign the same Lead Source to all leads on the first page of the Data Import Wizard.)	Lead Source
Lead Status	Lead Status
Mobile Phone	Mobile
Phone	Phone
Postal Code	Postal Code
Rating	Rating
Record Owner	Lead Owner

Label for Your Import File	Salesforce Lead Field
(Note: You do not need this field if assigning ownership via a lead assignment rule. In addition, when importing records by Salesforce record ID, this field is ignored.)	
Salutation	Added to beginning of First Name
State	State
Status	Status (in the Campaign History related list of a lead)
Street 1	Address
Street 2	Address
Street 3	Address
Title	Title
Website	Website

If you include record types in this list, the Data Import Wizard uses the record owner's default record type when creating new records. For existing records, the Data Import Wizard does not update the record type field.

If you choose to use assignment rules, the Data Import Wizard uses the new owner's default record type when creating new records. When the assignment rules assign the record to a queue, the queue owner's default record type is used.

[Preparing Your Data for Import](#)

Import My Contacts from Outlook or ACT!

Individual users can import up to 500 contacts and business accounts from Outlook or ACT! with the Import My Accounts and Contacts wizard.

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the Quick Find box, then select **Data Import Wizard**. The options you see depend on your permissions.

Before starting the Import My Accounts and Contacts wizard, create an export file and correctly prepare your data. If you are not importing from ACT! or Outlook, use the instructions in [Import My Contacts from Other Sources](#).

Tip: You can only import data into fields that you can edit.

1. From your personal settings, enter *Import* in the Quick Find box, select **Import My Accounts & Contacts**, and click **Start the Import Wizard!**. Alternatively, click the **Import My Accounts & Contacts** link in the Tools area of the account home page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To import your contacts and accounts:

- "Import Personal Contacts"

Labels for contacts and business accounts may have been renamed by your administrator, in which case the “Import My...” links may have customized text.

2. Specify whether your data came from Act! or Outlook. Click **Next**.
3. Click **Choose File** to upload your file.

 **Note:** Import a small test file to make sure that you’ve prepared your import file correctly.

4. Optionally, click **Customize Mappings** to verify field mappings.
5. Click **Import Now!** to complete your import.

You can also view the following video playlist to get more information:  [Importing Your Accounts and Contacts](#).

[Import My Contacts from Other Sources](#)

With the Import My Accounts and Contacts wizard, you can import up to 500 contacts and associated business accounts from almost any source.

[Data Import Wizard](#)

The Data Import Wizard makes it easy to import data for many standard Salesforce objects, including accounts, contacts, leads, solutions, and person accounts. You can also import data for custom objects and update campaign member statuses. You can import up to 50,000 records at a time.

[Add Person Accounts with the Data Import Wizard](#)

To add person accounts to your Salesforce org, launch the Data Import Wizard from the accounts home page.

[Data Import Wizard FAQ](#)

[Importing Records](#)

Import My Contacts from Other Sources

With the Import My Accounts and Contacts wizard, you can import up to 500 contacts and associated business accounts from almost any source.

Before starting the Import My Accounts and Contacts wizard, create an export file and correctly prepare your data. If you're importing from ACT! or Outlook, see [Import My Contacts from Outlook or ACT!](#).

Your export file format must be a comma-delimited text file (.csv).

 **Tip:** You can import data only into fields that you can edit.

1. From Setup, enter *Import* in the **Quick Find** box, select **Import My Accounts & Contacts**, and then click **Start the Import Process**. Alternatively, click the **Import My Accounts & Contacts** link in the Tools area of the account home page.

Your administrator can rename labels for contacts and business accounts, in which case, the "Import My..." links can have customized text.

2. Click **Next**.
3. To upload your file, click **Choose File**.

 **Note:** To make sure that you've prepared your import file correctly, import a small test file.

4. If necessary, change the default character encoding setting.
5. Choose whether duplicates will be identified by email address or name, and then click **Next**.
6. To ensure that contact data is entered into the correct fields, review the default mappings and correct any incorrect mappings, and then click **Next**.
 - You're automatically assigned as the owner for any contacts or business accounts that you import, so mapping to a **Record Owner** field isn't necessary.
 - To overwrite your existing business account information with imported data, select **Overwrite existing account values**. If imported data fields are blank, existing data isn't deleted.
7. If some fields don't map, and your organization is a Professional, Enterprise, Unlimited, Performance, or Developer Edition organization, you can choose not to import unmapped fields or choose to have data from unmapped fields imported as a Note for the contact or business account. All unmapped imported data for a record is included in a single note.
8. To complete your import, click **Import Now!**.

View this video playlist for more information:  [Importing Your Accounts and Contacts](#).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

USER PERMISSIONS

To import your contacts:

- "Read", "Create", "Edit" and "Delete" on contacts
- AND
- "Modify All Data" on contacts

Data Import Wizard

The Data Import Wizard makes it easy to import data for many standard Salesforce objects, including accounts, contacts, leads, solutions, and person accounts. You can also import data for custom objects and update campaign member statuses. You can import up to 50,000 records at a time.

Salesforce recommends that you test a small file first to make sure that you've prepared your source data correctly.

These browsers support the Data Import Wizard:

- Google Chrome™ version 29 and later
- Mozilla® Firefox® version 23 and later
- Microsoft® Internet Explorer® version 9 and later
- Apple® Safari® version 5 and later

Dragging and dropping CSV files is not supported in Internet Explorer 9.

Add Person Accounts with the Data Import Wizard

To add person accounts to your Salesforce org, launch the Data Import Wizard from the accounts home page.

Before you begin, make sure that your import file is in CSV format and contains values for these fields.

- First Name
- Last Name
- Email
- Phone

 **Tip:** To obtain Salesforce IDs or other values from your org, run reports and then export the report data.

These steps describe one recommended method of importing data. You can import data into Salesforce fields that aren't listed here. You can also customize your import by using other options that appear in the Data Import Wizard.

1. From the accounts home page, click **Import Data**.
2. Click **Launch Wizard**.
The Data Import Wizard appears.
3. Select **Person Accounts**, then select **Add new and update existing records**.
4. Set `Match Account by` to **Email**.
5. Select the CSV file that contains your import data, and click **Next**.
6. Map column headers from your CSV file to these fields.
 - First Name
 - Last Name
 - Email
 - Phone
7. Click **Next**.
8. Review the import settings, and then click **Start Import**.

When we finish importing your data, we notify you by email. Review the results and resolve any errors that occurred.

Data Import Wizard FAQ

[How many records can I import?](#)

[What kind of objects can I import?](#)

[Can I do simultaneous imports?](#)

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create person accounts that you own via the Data Import Wizard:

- "Create" on accounts
- AND
- "Edit" on accounts
- AND
- "Import Personal Contacts"

To create person accounts owned by others via the Data Import Wizard:

- "Create" on accounts
- AND
- "Edit" on accounts and contacts
- AND
- "Modify All Data"

How many records can I import?

The Data Import Wizard lets you import up to 50,000 records at a time.

SEE ALSO:

[Data Import Wizard FAQ](#)

What kind of objects can I import?

You can use the Data Import Wizard to import accounts, contacts, leads, solutions, and custom objects.

SEE ALSO:

[Data Import Wizard FAQ](#)

Can I do simultaneous imports?

The Data Import Wizard does not support simultaneous—or concurrent—data import jobs. You must finish one data import before beginning the next.

SEE ALSO:

[Data Import Wizard FAQ](#)

How long does it take to complete an import?

The time it takes to complete an import using the Data Import Wizard varies, depending on the amount of data you're importing. Imports are generally not immediate, and can take up to several minutes.

If you're a Salesforce administrator, you can check the status of an import on the Bulk Downloads page. (From Setup, enter *Bulk Data Load Jobs* in the *Quick Find* box, then select **Bulk Data Load Jobs**.)

If you're not a Salesforce administrator, and you want to know the status of an import, you'll need to wait until you receive the status email. You can also monitor the import manually by checking the relevant tabs in Salesforce.

SEE ALSO:

[Data Import Wizard FAQ](#)

Undoing an Import

If you import accounts, contacts, leads, or solutions by mistake, your administrator can from Setup, enter *Mass Delete Records* in the Quick Find box, then select **Mass Delete Records** to delete the items you mistakenly imported. View the [Using Mass Delete to Undo Imports](#) document for instructions.

The Mass Delete Records tools do not support custom objects. If you import custom objects by mistake in Enterprise, Unlimited, Performance, or Developer Edition, your administrator can use the Data Loader to mass delete the mistakenly imported records. See [Perform Mass Deletes](#) on page 666.

Data Loader

Data Loader

Data Loader is a client application for the bulk import or export of data. Use it to insert, update, delete, or export Salesforce records.

When importing data, Data Loader reads, extracts, and loads data from comma separated values (CSV) files or from a database connection. When exporting data, it outputs CSV files.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

You can use Data Loader in two different ways:

- User interface—When you use the user interface, you work interactively to specify the configuration parameters, CSV files used for import and export, and the field mappings that map the field names in your import file with the field names in Salesforce.
- Command line (Windows only)—When you use the command line, you specify the configuration, data sources, mappings, and actions in files. This enables you to set up Data Loader for automated processing.

Data Loader offers the following key features:

- An easy-to-use wizard interface for interactive use
- An alternate command-line interface for automated batch operations (Windows only)
- Support for large files with up to 5 million records
- Drag-and-drop field mapping
- Support for all objects, including custom objects
- Can be used to process data in both Salesforce and Database.com
- Detailed success and error log files in CSV format
- A built-in CSV file viewer
- Support for Windows XP, Windows 7, and Mac OS X

To get started, see the following topics:

- [When to Use Data Loader](#)
- [Considerations for Installing Data Loader](#)

 **Note:** In previous versions, Data Loader has been known as “AppExchange Data Loader” and “Sforce Data Loader.”

SEE ALSO:

[Encrypt Fields](#)

[Encrypt Files and Attachments](#)

When to Use Data Loader

Data Loader complements the web-based import wizards that are accessible from the Setup menu in the online application. Refer to the following guidelines to determine which method best suits your business needs:

Use Data Loader when:

- You need to load 50,000 to 5,000,000 records. Data Loader is supported for loads of up to 5 million records. If you need to load more than 5 million records, we recommend you work with a Salesforce partner or visit the [App Exchange](#) for a suitable partner product.
- You need to load into an object that is not yet supported by the import wizards.
- You want to schedule regular data loads, such as nightly imports.
- You want to export your data for backup purposes.

Use the import wizards when:

- You are loading less than 50,000 records.
- The object you need to import is supported by import wizards. To see what import wizards are available and thus what objects they support, from Setup, enter *Data Management* in the **Quick Find** box, then select **Data Management**.
- You want to prevent duplicates by uploading records according to account name and site, contact email address, or lead email address.

For more information about the import wizards, see [Importing Records](#) on page 621.

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Install and Configure Data Loader

Considerations for Installing Data Loader

Before you download and install Data Loader, understand the system requirements, installation considerations, and login considerations. From Setup, enter *Data Loader* in the *Quick Find* box, then select **Data Loader**.

System Requirements for Windows

To use Data Loader for Windows, you need:

- Microsoft® Windows® 7 or Windows XP
- 120 MB of free disk space
- 256 MB of available memory
- Java JRE 1.8 (32-bit)

 **Note:** Salesforce no longer bundles Java with the Data Loader for Windows installer. Download and install Java on your Windows computer.

We recommend that you set the `JAVA_HOME` environment variable to the directory where the Java Runtime Environment (JRE) is installed. Doing so ensures that you can run Data Loader in batch mode from the command line.

System Requirements for Mac OS

To use Data Loader for Mac, you need:

- Mac® OS X
- 120 MB of free disk space
- 256 MB of available memory
- Java JRE 1.8
- Administrator privileges on the machine

Installation Considerations

Over time, several versions of the Data Loader client application have been available for download. Some earlier versions were called “AppExchange Data Loader” or “Sforce Data Loader.” You can run different versions at the same time on one computer. However, do not install more than one copy of the same version.

The latest version is always available in Salesforce. If you have installed the latest version and want to install it again, first remove the version on your computer.

 **Tip:** If you experience login issues in the command line interface after upgrading to a new version of Data Loader, please try re-encrypting your password to solve the problem. For information on the password encryption utility, see [Encrypt from the Command Line](#) on page 670.

 **Note:** The Data Loader command-line interface is supported for Windows only.

To make changes to the source code, download the open-source version of Data Loader from <https://github.com/forcedotcom/dataloader>.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To access the page to download Data Loader:

- “Modify All Data”

To use Data Loader:

- “API Enabled”

AND

The appropriate user permission for the operation you are doing, for example, “Create” on accounts to insert new accounts

AND

“Bulk API Hard Delete” (only if you configure Data Loader to use Bulk API to hard-delete records)

Login Considerations

- If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.
- Data Loader version 36.0 and later supports Web Server OAuth Authentication. See [OAuth Authentication](#) for more information.
- Data Loader version 36.0 and later supports Salesforce Communities. Communities users always log in with the OAuth option in Data Loader. To enable OAuth for Communities, the user modifies the `config.properties` file as follows.
 - Change the portion in bold in the following line to the login URL of the community. Don't add a forward slash (/) to the end of the line.

```
sfdc.oauth.Production.server=https://login.salesforce.com
```

For example:

```
sfdc.oauth.Production.server=  
https://johnsmith-developer-edition.yourInstance.force.com/test
```

- Change the portion in bold in the following line to the hostname of the community.

```
sfdc.oauth.Production.redirecturi=https://login.salesforce.com/services/oauth2/success
```

For example:

```
sfdc.oauth.Production.redirecturi=  
https://johnsmith-developer-edition.yourInstance.force.com/services/oauth2/success
```

The `config.properties` file is in the `conf` default configuration directory, which is installed in these locations.

- Mac: `/Applications/Data Loader.app/Contents/Resources/conf/`
- Windows: `%LOCALAPPDATA%\salesforce.com\Data Loader\samples\conf\` for the current user, and `C:\ProgramData\salesforce.com\Data Loader\samples\conf\` for all users

Configure Data Loader

Use the Settings menu to change the default operation settings of Data Loader.

1. Open the Data Loader.
2. Choose **Settings > Settings**.
3. Edit the fields as desired:

Field	Description
Batch size	In a single insert, update, upsert, or delete operation, records moving to or from Salesforce are processed in increments of this size. The maximum value is 200. We recommend a value between 50 and 100. The maximum value is 10,000 if the <code>Use Bulk API</code> option is selected.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Field	Description
Insert null values	<p>Select this option to insert blank mapped values as <code>null</code> values during data operations. Note that when you are updating records, this option instructs Data Loader to overwrite any existing data in mapped fields.</p> <p>This option is not available if the <code>Use Bulk API</code> option is selected. Empty field values are ignored when you update records using the Bulk API. To set a field value to <code>null</code> when the <code>Use Bulk API</code> option is selected, use a field value of <code>#N/A</code>.</p>
Assignment rule	Specify the ID of the assignment rule to use for inserts, updates, and upserts. This option applies to inserts, updates, and upserts on cases and leads. It also applies to updates on accounts if your organization has territory assignment rules on accounts. The assignment rule overrides <code>Owner</code> values in your CSV file.
Server host	Enter the URL of the Salesforce server with which you want to communicate. For example, if you are loading data into a sandbox, change the URL to <code>https://test.salesforce.com</code> .
Reset URL on Login	By default, Salesforce resets the URL after login to the one specified in Server host . To turn off this automatic reset, disable this option.
Compression	Compression enhances the performance of Data Loader and is turned on by default. You may want to disable compression if you need to debug the underlying SOAP messages. To turn off compression, enable this option.
Timeout	Specify how many seconds Data Loader waits to receive a response back from the server before returning an error for the request.
Query request size	In a single export or query operation, records are returned from Salesforce in increments of this size. The maximum value is 2,000 records. Larger values may improve performance but use more memory on the client.
Generate status files for exports	Select this option to generate success and error files when exporting data.
Read all CSVs with UTF-8 encoding	Select this option to force files to open in UTF-8 encoding, even if they were saved in a different format.
Write all CSVs with UTF-8 encoding	Select this option to force files to be written in UTF-8 encoding.
Use European date format	Select this option to support the date formats <code>dd/MM/yyyy</code> and <code>dd/MM/yyyy HH:mm:ss</code> .

Field	Description
Allow field truncation	<p>Select this option to truncate data in the following types of fields when loading that data into Salesforce: Email, Multi-select Picklist, Phone, Picklist, Text, and Text (Encrypted).</p> <p>In Data Loader versions 14.0 and earlier, values for fields of those types are truncated by Data Loader if they are too large. In Data Loader version 15.0 and later, the load operation fails if a value is specified that is too large.</p> <p>Selecting this option allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Data Loader versions 15.0 and later. This option is selected by default and has no effect in versions 14.0 and earlier.</p> <p>This option is not available if the <code>Use Bulk API</code> option is selected. In that case, the load operation fails for the row if a value is specified that is too large for the field.</p>
Use Bulk API	<p>Select this option to use the Bulk API to insert, update, upsert, delete, and hard delete records. The Bulk API is optimized to load or delete a large number of records asynchronously. It's faster than the default SOAP-based API due to parallel processing and fewer network round-trips.</p> <p> Warning: You can hard delete records when you configure Data Loader to <code>Use Bulk API</code>. Keep in mind that hard deleted records are immediately deleted and can't be recovered from the Recycle Bin.</p>
Enable serial mode for Bulk API	<p>Select this option to use serial instead of parallel processing for Bulk API. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load.</p> <p>This option is only available if the <code>Use Bulk API</code> option is selected.</p>
Upload Bulk API Batch as Zip File	<p>Select this option to use Bulk API to upload zip files containing binary attachments, such as Attachment records or Salesforce CRM Content.</p> <p>This option is only available if the <code>Use Bulk API</code> option is selected.</p>
Time Zone	<p>Select this option to specify a default time zone.</p> <p>If a date value does not include a time zone, this value is used.</p> <ul style="list-style-type: none"> If no value is specified, the time zone of the computer where Data Loader is installed is used.

Field	Description
	<ul style="list-style-type: none"> If an incorrect value is entered, GMT is used as the time zone and this fact is noted in the Data Loader log. <p>Valid values are any time zone identifier which can be passed to the Java <code>getTimeZone(java.lang.String)</code> method. The value can be a full name such as <code>America/Los_Angeles</code>, or a custom ID such as <code>GMT-8:00</code>.</p>
Proxy host	The host name of the proxy server, if applicable.
Proxy port	The proxy server port.
Proxy username	The username for proxy server authentication.
Proxy password	The password for proxy server authentication.
Proxy NTLM domain	The name of the Windows domain used for NTLM authentication.
Start at row	If your last operation failed, you can use this setting to begin where the last successful operation finished.

- Click **OK** to save your settings.

SEE ALSO:

[Data Loader Behavior with Bulk API Enabled](#)

[Configure the Data Loader to Use the Bulk API](#)

Data Loader Behavior with Bulk API Enabled

Enabling the Bulk API in Data Loader allows you to load or delete a large number of records faster than using the default SOAP-based API. However, there are some differences in behavior in Data Loader when you enable the Bulk API. One important difference is that it allows you to execute a hard delete if you have the permission and license. See [Configure Data Loader](#) on page 656.

The following settings are not available on the **Settings > Settings** page in Data Loader when the `Use Bulk API` option is selected:

Insert null values

This option enables Data Loader to insert blank mapped values as `null` values during data operations when the Bulk API is disabled. Empty field values are ignored when you update records using the Bulk API. To set a field value to `null` when the `Use Bulk API` option is selected, use a field value of `#N/A`.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Allow field truncation

This option directs Data Loader to truncate data for certain field types when the Bulk API is disabled. A load operation fails for the row if a value is specified that is too large for the field when the `Use Bulk API` option is selected.

SEE ALSO:

[Configure Data Loader](#)

Configure the Data Loader to Use the Bulk API

The Bulk API is optimized to load or delete a large number of records asynchronously. It is faster than the SOAP-based API due to parallel processing and fewer network round-trips. By default, Data Loader uses the SOAP-based API to process records.

To configure Data Loader to use the Bulk API for inserting, updating, upserting, deleting, and hard deleting records:

1. Open the Data Loader.
2. Choose **Settings > Settings**.
3. Select the `Use Bulk API` option.
4. Click **OK**.

 **Note:**

- You can also select the `Enable serial mode for Bulk API` option. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load.
- **Caution:** You can hard delete records when you configure Data Loader to `Use Bulk API`. Keep in mind that hard deleted records are immediately deleted and can't be recovered from the Recycle Bin.

SEE ALSO:

[Configure Data Loader](#)

Use Data Loader**Data Types Supported by Data Loader**

Data Loader supports the following data types:

Base64

String path to file (converts the file to a base64–encoded array). Base64 fields are only used to insert or update attachments and Salesforce CRM Content. For more information, see [Uploading Attachments](#) on page 666 and [Upload Content with the Data Loader](#) on page 667.

Boolean

- True values (case insensitive) = `yes, y, true, on, 1`
- False values (case insensitive) = `no, n, false, off, 0`

Date Formats

We recommend you specify dates in the format `yyyy-MM-ddTHH:mm:ss.SSS+/-HHmm`.

- `dd` is the two-digit day (01-31)
- `HH` is the two-digit hour (00-23)
- `mm` is the two-digit minute (00-59)
- `ss` is the two-digit seconds (00-59)
- `SSS` is the three-digit milliseconds (000-999)
- `+/-HHmm` is the Zulu (UTC) time zone offset

The following date formats are also supported:

- `yyyy-MM-dd'T'HH:mm:ss.SSS'Z'`
- `yyyy-MM-dd'T'HH:mm:ss.SSS Pacific Standard Time`
- `yyyy-MM-dd'T'HH:mm:ss.SSSPacific Standard Time`
- `yyyy-MM-dd'T'HH:mm:ss.SSS PST`
- `yyyy-MM-dd'T'HH:mm:ss.SSSPST`
- `yyyy-MM-dd'T'HH:mm:ss.SSS GMT-08:00`
- `yyyy-MM-dd'T'HH:mm:ss.SSSGMT-08:00`
- `yyyy-MM-dd'T'HH:mm:ss.SSS -800`
- `yyyy-MM-dd'T'HH:mm:ss.SSS-800`
- `yyyy-MM-dd'T'HH:mm:ss`
- `yyyy-MM-dd HH:mm:ss`
- `yyyyMMdd'T'HH:mm:ss`
- `yyyy-MM-dd`
- `MM/dd/yyyy HH:mm:ss`
- `MM/dd/yyyy`
- `yyyyMMdd`

Note the following tips for date formats:

- To enable date formats that begin with the day rather than the month, select the `Use European date format` box in the Settings dialog. European date formats are `dd/MM/yyyy` and `dd/MM/yyyy HH:mm:ss`.
- If your computer's locale is east of Greenwich Mean Time (GMT), we recommend that you change your computer setting to GMT in order to avoid date adjustments when inserting or updating records.
- Only dates within a certain range are valid. The earliest valid date is 1700-01-01T00:00:00Z GMT, or just after midnight on January 1, 1700. The latest valid date is 4000-12-31T00:00:00Z GMT, or just after midnight on December 31, 4000. These values are offset by your time zone. For example, in the Pacific time zone, the earliest valid date is 1699-12-31T16:00:00, or 4:00 PM on December 31, 1699.

Double

Standard double string

ID

A Salesforce ID is a case-sensitive 15-character or case-insensitive 18-character alphanumeric string that uniquely identifies a particular record.

Tip: To ensure data quality, make sure that all Salesforce IDs you enter in Data Loader are in the correct case.

Integer

Standard integer string

String

All valid XML strings; invalid XML characters are removed.

Export Data

You can use the Data Loader export wizard to extract data from any Salesforce object. When you export, you can choose to include (**Export All**) or exclude (**Export**) soft-deleted records.

1. Open the Data Loader.
2. Click **Export** or **Export All**. These commands can also be found in the File menu.
3. Enter your Salesforce username and password. Click **Log in** to log in. After your login completes successfully, click **Next**. (Until you log out or close the program, you will not be asked to log in again.)

If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

4. Choose an object. For example, select the Account object. If your object name does not display in the default list, check *Show all objects* to see a complete list of objects that you can access. The objects will be listed by localized label name, with developer name noted in parentheses. For object descriptions, see the [SOAP API Developer's Guide](#).
5. Click **Browse...** to select the CSV file to which the data will be exported. You can enter a new file name to create a new file or choose an existing file.

If you select an existing file, the contents of that file are replaced. Click **Yes** to confirm this action, or click **No** to choose another file.

6. Click **Next**.
7. Create a SOQL query for the data export. For example, check *Id* and *Name* in the query fields and click **Finish**. As you follow the next steps, you will see that the CSV viewer displays all the Account names and their IDs. SOQL is the Salesforce Object Query Language that allows you to construct simple but powerful query strings. Similar to the SELECT command in SQL, SOQL allows you to specify the source object, a list of fields to retrieve, and conditions for selecting rows in the source object.
 - a. Choose the fields you want to export.
 - b. Optionally, select conditions to filter your data set. If you do not select any conditions, all the data to which you have read access will be returned.
 - c. Review the generated query and edit if necessary.

Tip: You can use a SOQL relationship query to include fields from a related object. For example:

```
Select Name, Pricebook2Id, Pricebook2.Name, Product2Id, Product2.ProductCode FROM PricebookEntry WHERE IsActive = true
```

Or:

```
Select Id, LastName, Account.Name FROM Contact
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To export records:

- "Read" on the records

To export all records:

- "Read" on the records

When using relationship queries in Data Loader, the fully specified field names are case-sensitive. For example, using `ACCOUNT.NAME` instead of `Account.Name` does not work.

Data Loader doesn't support nested queries or querying child objects. For example, queries similar to the following return an error:

```
SELECT Amount, Id, Name, (SELECT Quantity, ListPrice,
PriceBookEntry.UnitPrice, PricebookEntry.Name,
PricebookEntry.product2.Family FROM OpportunityLineItems)
FROM Opportunity
```

Also, Data Loader doesn't support queries that make use of polymorphic relationships. For example, the following query results in an error:

```
SELECT Id, Owner.Name, Owner.Type, Owner.Id, Subject FROM Case
```

For more information on SOQL, see the [Force.com SOQL and SOSL Reference](#).

8. Click **Finish**, then click **Yes** to confirm.
9. A progress information window reports the status of the operation.
10. After the operation completes, a confirmation window summarizes your results. Click **View Extraction** to view the CSV file, or click **OK** to close. For more details, see [Reviewing Data Loader Output Files](#) on page 668.

Note:

- Data Loader currently does not support the extraction of attachments. As a workaround, we recommend that you use the weekly export feature in the online application to export attachments.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.

Define Data Loader Field Mappings

When you insert, delete, or update files, use the Mapping Dialog window to associate Salesforce fields with the columns of your CSV file. For more information, see [Insert, Update, or Delete Data Using Data Loader](#) on page 664.

1. To automatically match fields with columns, click **Auto-Match Fields to Columns**. The Data Loader populates the list at the bottom of the window based on the similarity of field and column names. For a delete operation, automatic matching works only on the ID field.
2. To manually match fields with columns, click and drag fields from the list of Salesforce fields at the top to the list of CSV column header names at the bottom. For example, if you are inserting new Account records where your CSV file contains the names of new accounts, click and drag the `Name` field to the right of the `NAME` column header field.
3. Optionally, click **Save Mapping** to save this mapping for future use. Specify a name for the SDL mapping file. If you select an existing file, the contents of that file are replaced. Click **Yes** to confirm this action, or click **No** to choose another file.
4. Click **OK** to use your mapping for the current operation.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Insert, Update, or Delete Data Using Data Loader

USER PERMISSIONS

To insert records:	“Create” on the record
To update records:	“Edit” on the record
To upsert records:	“Create” or “Edit” on the record
To delete records:	“Delete” on the record
To hard delete records:	“Delete” on the record
To mass delete records:	“Modify All Data”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

The insert, update, upsert, delete, and hard delete wizards in Data Loader allow you to add new records, modify existing records, or delete existing records. Note that “upsert” is a combination of inserting and updating. If a record in your file matches an existing record, the existing record is updated with the values in your file. If no match is found, then the record is created as new. When you hard delete records, the deleted records are not stored in the Recycle Bin and become immediately eligible for deletion. For more information, see [Configure Data Loader](#) on page 656.

1. Open the Data Loader.
2. Click **Insert, Update, Upsert, Delete** or **Hard Delete**. These commands can also be found in the File menu.
3. Enter your Salesforce username and password. Click **Log in** to log in. After your login completes successfully, click **Next**. (Until you log out or close the program, you are not asked to log in again.)

If your organization restricts IP addresses, logins from untrusted IPs are blocked until they’re activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.
4. Choose an object. For example, if you are inserting Account records, select **Account**. If your object name does not display in the default list, check **Show all objects** to see a complete list of the objects that you can access. The objects are listed by localized label name, with developer name noted in parentheses. For object descriptions, see the [Object Reference for Salesforce and Force.com](#).
5. Click **Browse...** to select your CSV file. For example, if you are inserting Account records, you could specify a CSV file named `insertaccounts.csv` containing a `Name` column for the names of the new accounts.
6. Click **Next**. After the object and CSV file are initialized, click **OK**.
7. If you are performing an upsert:
 - a. Your CSV file must contain a column of ID values for matching against existing records. The column may be either an external ID (a custom field with the “External ID” attribute), or `Id` (the Salesforce record ID). From the drop-down list, select which field to use for matching. If the object has no external ID fields, `Id` is automatically used. Click **Next** to continue.
 - b. If your file includes the external IDs of an object that has a relationship to your chosen object, enable that external ID for record matching by selecting its name from the drop-down list. If you make no selection here, you can use the related object’s `Id` field for matching by mapping it in the next step. Click **Next** to continue.
8. Define how the columns in your CSV file map to Salesforce fields. Click **Choose an Existing Map** to select an existing field mapping, or click **Create or Edit a Map** to create a new map or modify an existing map. For more details and an example of usage, see [Define Data Loader Field Mappings](#) on page 663.
9. Click **Next**.

10. For every operation, the Data Loader generates two unique CSV log files; one file name starts with “success,” while the other starts with “error.” Click **Browse...** to specify a directory for these files.
11. Click **Finish** to perform the operation, and then click **Yes** to confirm.
12. As the operation proceeds, a progress information window reports the status of the data movement.
13. After the operation completes, a confirmation window summarizes your results. Click **View Successes** to view your success file, click **View Errors** to open your errors file, or click **OK** to close. For more information, see [Reviewing Data Loader Output Files](#) on page 668.

 **Tip:**

- If you are updating or deleting large amounts of data, review [Perform Mass Updates](#) and [Perform Mass Deletes](#) for tips and best practices.
- There is a five-minute limit to process 100 records when the Bulk API is enabled. Also, if it takes longer than 10 minutes to process a file, the Bulk API places the remainder of the file back in the queue for later processing. If the Bulk API continues to exceed the 10-minute limit on subsequent attempts, the file is placed back in the queue and reprocessed up to 10 times before the operation is permanently marked as failed. Even if the processing failed, some records could have completed successfully, so you must check the results. If you get a timeout error when loading a file, split your file into smaller files, and try again.

Perform Mass Updates

To update a large number of records at one time, we recommend the following steps:

1. Obtain your data by performing an export of the objects you wish to update, or by running a report. Make sure your report includes the record ID.
2. As a backup measure, save an extra copy of the generated CSV file.
3. Open your working file in a CSV editor such as Excel, and update your data.
4. Launch Data Loader and follow the update wizard. Note that matching is done according to record ID. See [Insert, Update, or Delete Data Using Data Loader](#) on page 664.
5. After the operation, review your success and error log files. See [Reviewing Data Loader Output Files](#) on page 668.
6. If you made a mistake, use the backup file to update the records to their previous values.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Perform Mass Deletes

To delete a large number of records at one time using Data Loader, we recommend the following steps:

1. As a backup measure, export the records you wish to delete, being sure to select all fields. (See [Export Data](#) on page 662.) Save an extra copy of the generated CSV file.
2. Next, export the records you wish to delete, this time using only the record ID as the desired criterion.
3. Launch the Data Loader and follow the delete or hard delete wizard. Map only the ID column. See [Insert, Update, or Delete Data Using Data Loader](#) on page 664.
4. After the operation, review your success and error log files. See [Reviewing Data Loader Output Files](#) on page 668.

Uploading Attachments

You can use Data Loader to upload attachments to Salesforce. Before uploading attachments, note the following:

- If you intend to upload via the Bulk API, verify that `Upload Bulk API Batch as Zip File` on the **Settings > Settings** page is enabled.
- If you are migrating attachments from a source Salesforce organization to a target Salesforce organization, begin by requesting a data export for the source organization. On the Schedule Export page, make sure to select the `Include Attachments...` checkbox, which causes the file `Attachment.csv` to be included in your export. You can use this CSV file to upload the attachments. For more information on the export service, see [Exporting Backup Data](#) on page 706.

To upload attachments:

1. Confirm that the CSV file you intend to use for attachment importing contains the following required columns (each column represents a Salesforce field):
 - `ParentId` - the Salesforce ID of the parent record.
 - `Name` - the name of the attachment file, such as `myattachment.jpg`.
 - `Body` - the absolute path to the attachment on your local drive.

Ensure that the values in the `Body` column contain the full file name of the attachments as they exist on your computer. For example, if an attachment named `myattachment.jpg` is located on your computer at `C:\Export`, `Body` must specify `C:\Export\myattachment.jpg`. Your CSV file might look like this:

```
ParentId,Name,Body
50030000000VDowAAG,attachment1.jpg,C:\Export\attachment1.gif
70130000000iNHAAY,attachment2.doc,C:\Export\files\attachment2.doc
```

The CSV file can also include other optional Attachment fields, such as `Description`.

2. Proceed with an insert or upsert operation; see [Insert, Update, or Delete Data Using Data Loader](#) on page 664. At the `Select data objects` step, make sure to select the `Show all Salesforce objects` checkbox and the Attachment object name in the list.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To mass delete records:

- "Modify All Data"

Upload Content with the Data Loader

You can use Data Loader to bulk upload documents and links into libraries in Salesforce CRM Content. Before uploading documents or links, note the following.

- If you intend to upload via the Bulk API, verify that `Upload Bulk API Batch as Zip File` on the **Settings > Settings** page is enabled.
- When you upload a document from your local drive using Data Loader, specify the path in the `VersionData` and `PathOnClient` fields in the CSV file. `VersionData` identifies the location and extracts the format, and `PathOnClient` identifies the type of document being uploaded.
- When you upload a link using the Data Loader, specify the URL in `ContentUrl`. Don't use `PathOnClient` or `VersionData` to upload links.
- You can't export content using the Data Loader.
- If you're updating content that you've already uploaded:
 - Perform the Insert function.
 - Include a `ContentDocumentId` column with an 18-character ID. Salesforce uses this information to determine that you're updating content. When you map the `ContentDocumentId`, the updates are added to the content file. If you don't include the `ContentDocumentId`, the content is treated as new, and the content file isn't updated.

1. Create a CSV file with the following fields.

- `Title` - file name.
- `Description` - (optional) file or link description.

 **Note:** If there are commas in the description, use double quotes around the text.

- `VersionData` - complete file path on your local drive (for uploading documents only).

 **Note:** Files are converted to base64 encoding on upload. This action adds approximately 30% to the file size.

- `PathOnClient` - complete file path on your local drive (for uploading documents only).
- `ContentUrl` - URL (for uploading links only).
- `OwnerId` - (optional) file owner, defaults to the user uploading the file.
- `FirstPublishLocationId` - library ID.
- `RecordTypeId` - record type ID.

 **Note:** If you publish to a library that has restricted record types, specify `RecordTypeId`.

To determine the `RecordTypeId` values for your organization using Data Loader, follow the steps in [Exporting Data](#). The following is a sample SOQL query:

```
Select Id, Name FROM RecordType WHERE SubjectType = 'ContentVersion'
```

To determine the `RecordTypeId` values for your organization using the AJAX Toolkit:

- a. Log in to Salesforce.
- b. Enter this URL in your browser:
`http://instanceName.salesforce.com/soap/ajax/37.0/debugshell.html`. Enter the `instanceName` for your organization. You can see the `instanceName` in the URL field of your browser after logging in to Salesforce.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- c. In the AJAX Toolkit Shell page, type:

```
sforce.connection.describeSObject("ContentVersion")
```

- d. Press **Enter**.
e. Click the arrows for `recordTypeInfo`s.

The `RecordTypeId` values for your organization are listed.

- `TagsCsv` - (optional) tag.

A sample CSV file is:

```
Title,Description,VersionData,PathOnClient,OwnerId,FirstPublishLocationId,RecordTypeId,TagsCsv
testfile,"This is a test file, use for bulk
upload",c:\files\testfile.pdf,c:\files\testfile.pdf,0050000000000000,058700000004Cd0,012300000008o2sAQG,one
```

2. Upload the CSV file for the `ContentVersion` object (see [Insert, Update, or Delete Data Using Data Loader](#) on page 664). All documents and links are available in the specified library.

Reviewing Data Loader Output Files

After every import or export, Data Loader generates two CSV output files that contain the results of the operation. One file name starts with “success,” while the other starts with “error.” During every export, Data Loader saves the extracted data to a CSV file that you specify in the wizard. Data Loader has a built-in CSV file viewer with which you can open and view these files.

To view output files from a Data Loader operation:

1. Choose **View > View CSV**.
2. Specify the number of rows to view. Each row in the CSV file corresponds to one Salesforce record. The default is 1000.
3. To view a CSV file of your choice, click **Open CSV**. To view the last success file, click **Open Success**. To view the last error file, click **Open Error**. The CSV file opens in a new window.
4. Optionally, click **Open in External Program** to open the file in the associated external program, such as Microsoft® Office Excel.

The “success” file contains all of the records that were successfully loaded. In this file, there’s a column for the newly generated record IDs. The “error” file contains all of the records that were rejected from the load operation. In this file, there’s a column that describes why the load failed.

5. Click **Close** to return to the CSV Chooser window, and then click **OK** to exit the window.

 **Note:** To generate success files when exporting data, select the `Generate status files for exports` setting. For more information, see [Configure Data Loader](#) on page 656.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

View the Data Loader Log File

If you need to investigate a problem with Data Loader, or if requested by Salesforce Customer Support, you can access log files that track the operations and network connections made by Data Loader.

The log file, `sd1.log`, contains a detailed chronological list of Data Loader log entries. Log entries marked “INFO” are procedural items, such as logging in to and out of Salesforce. Log entries marked “ERROR” are problems such as a submitted record missing a required field. The log file can be opened with commonly available text editor programs, such as Microsoft Notepad.

If you are using Data Loader for Windows, view the log file by entering `%TEMP%\sd1.log` in either the Run dialog or the Windows Explorer address bar.

If you are using Data Loader for Mac OSX, view the log file by opening terminal and entering `open $TMPDIR/sd1.log`.

If you are having login issues from the command line, ensure that the password provided in the configuration parameters is encrypted. If you are having login issues from the UI, you may need to obtain a new security token.

EDITIONS

Run Batch Processes (Windows Only)

Batch Mode

 **Note:** The Data Loader command-line interface is supported for Windows only.

You can run Data Loader in batch mode from the command line. See the following topics:

- [Installed Directories and Files](#)
- [Encrypt from the Command Line](#)
- [Upgrade Your Batch Mode Interface](#)
- [Data Loader Command-Line Interface](#)
- [Configure Batch Processes](#)
- [Data Loader Process Configuration Parameters](#)
- [Data Loader Command-Line Operations](#)
- [Configure Database Access](#)
- [Map Columns](#)
- [Run Individual Batch Processes](#)
- [Data Access Objects](#)

 **Note:** If you have used the batch mode from the command line with a version earlier than 8.0, see [Upgrade Your Batch Mode Interface](#) on page 671.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Installed Directories and Files

 **Note:** The Data Loader command-line interface is supported for Windows only.

In versions 8.0 and later, [installing the Data Loader](#) creates several directories under the installation directory. The following directories are involved in running the program from the command line for automated batch processing:

bin

Contains the batch files `encrypt.bat` for [encrypting passwords](#) and `process.bat` for [running batch processes](#).

For information on running the Data Loader from the command line, see [Data Loader Command-Line Interface](#) on page 671.

conf

The default configuration directory. Contains the configuration files `config.properties`, `Loader.class`, and `log-conf.xml`.

The `config.properties` file that is generated when you modify the Settings dialog in the graphical user interface is located at `C:\Documents and Settings\your Windows username\Application Data\Salesforce\Data Loader version_number`. You can copy this file to the `conf` installation directory to use it for batch processes.

The `log-conf.xml` file is included with version 35.0 of the Data Loader for Windows installer. The `log-conf.xml` is located at `%LOCALAPPDATA%\salesforce.com\Data Loader\samples\conf\log-conf.xml` for the current user, and `C:\Program Files (x86)\salesforce.com\Data Loader\samples\conf\log-conf.xml` for all users.

samples

Contains subdirectories of sample files for reference.

File Path Convention

The file paths provided in these topics start one level below the installation directory. For example, `\bin` means `C:\Program Files\Salesforce\Data Loader version_number\bin`, provided you accepted the default installation directory. If you installed the program to a different location, please substitute that directory path as appropriate.

Encrypt from the Command Line

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, you must encrypt the following configuration parameters:

- `sfdc.password`
- `sfdc.proxyPassword`

Data Loader offers an encryption utility to secure passwords specified in configuration files. This utility is used to encrypt passwords, but data that you transmit using Data Loader is not encrypted.

1. Run `\bin\encrypt.bat`.
2. At the command line, follow the prompts provided to execute the following actions:

Generate a key

Key text is generated on screen from the text you provide. Carefully copy the key text to a key file, omitting any leading or trailing spaces. The key file can then be used for encryption and decryption.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Encrypt text

Generates an encrypted version of a password or other text. Optionally, you can provide a key file for the encryption. In the configuration file, make sure that the encrypted text is copied precisely and the key file is mentioned.

Verify encrypted text

Given encrypted and decrypted versions of a password, verifies whether the encrypted password provided matches its decrypted version. A success or failure message is printed to the command line.

Upgrade Your Batch Mode Interface

 **Note:** The Data Loader command-line interface is supported for Windows only.

The batch mode interface in Data Loader versions 8.0 and later aren't backward-compatible with earlier versions. If you're using a version earlier than 8.0 to run batch processes, your options are as follows:

Maintain the old version for batch use

Do not uninstall your old version of Data Loader. Continue to use that version for batch processes. You can't take advantage of newer features such as database connectivity, but your integrations will continue to work. Optionally, install the new version alongside the old version and dedicate the old version solely to batch processes.

Generate a new config.properties file from the new GUI

If you originally generated your `config.properties` file from the graphical user interface, use the new version to set the same properties and generate a new file. Use this new file with the new batch mode interface. For more information, see [Data Loader Command-Line Interface](#) on page 671.

Manually update your config.properties file

If your old `config.properties` file was created manually, you must manually update it for the new version. For more information, see [Installed Directories and Files](#) on page 670.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Data Loader Command-Line Interface

 **Note:** The Data Loader command-line interface is supported for Windows only.

For automated batch operations such as nightly scheduled loads and extractions, run Data Loader from the command line. Before running any batch operation, be sure to include your encrypted password in the configuration file. For more information, see [Data Loader Introduction](#) on page 688 and [Encrypt from the Command Line](#) on page 670. From the command line, navigate to the `bin` directory and type `process.bat`, which takes the following parameters:

- The directory containing `config.properties`.
- The name of the batch process bean contained in `process-conf.xml`.

The `log-conf.xml` file is included with version 35.0 of the Data Loader for Windows installer. The `log-conf.xml` is located at `%LOCALAPPDATA%\salesforce.com\Data Loader\samples\conf\log-conf.xml` for the current user, and `C:\Program Files (x86)\salesforce.com\Data Loader\samples\conf\log-conf.xml` for all users.

For more information about using `process.bat`, see [Run Individual Batch Processes](#) on page 687.

To view tips and instructions, add `-help` to the command contained in `process.bat`.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Data Loader runs whatever operation, file, or map is specified in the configuration file that you specify. If you do not specify a configuration directory, the current directory is used. By default, Data Loader configuration files are installed at the following location:

```
C:\Program Files\Salesforce\Data Loader version number\conf
```

You use the `process-conf.xml` file to configure batch processing. Set the name of the process in the bean element's `id` attribute: (for example `<bean id="myProcessName">`).

If you want to implement enhanced logging, use a copy of `log-conf.xml`.

You can change parameters at runtime by giving `param=value` as program arguments. For example, adding `process.operation=insert` to the command changes the configuration at runtime.

You can set the minimum and maximum heap size. For example, `-Xms256m -Xmx256m` sets the heap size to 256 MB.

 **Note:** These topics only apply to Data Loader version 8.0 and later.

 **Tip:** If you experience login issues in the command line interface after upgrading to a new version of Data Loader, please try re-encrypting your password to solve the problem. For information on the password encryption utility, see [Encrypt from the Command Line](#) on page 670.

Configure Batch Processes

 **Note:** The Data Loader command-line interface is supported for Windows only.

Use `\samples\conf\process-conf.xml` to configure your Data Loader processes, which are represented by `ProcessRunner` beans. A process should have `ProcessRunner` as the `class` attribute and the following properties set in the configuration file:

name

Sets the name of the `ProcessRunner` bean. This value is also used as the non-generic thread name and for configuration backing files (see below).

configOverrideMap

A property of type `map` where each entry represents a configuration setting: the key is the setting name; the value is the setting value.

enableLastRunOutput

If set to `true` (the default), output files containing information about the last run, such as `sendAccountsFile_lastrun.properties`, are generated and saved to the location specified by `lastRunOutputDirectory`. If set to `false`, the files are not generated or saved.

lastRunOutputDirectory

The directory location where output files containing information about the last run, such as `sendAccountsFile_lastrun.properties`, are written. The default value is `\conf`. If `enableLastRunOutput` is set to `false`, this value is not used because the files are not generated.

The configuration backing file stores configuration parameter values from the last run for debugging purposes, and is used to load default configuration parameters in `config.properties`. The settings in `configOverrideMap` take precedence over those in the configuration backing file. The configuration backing file is managed programmatically and does not require any manual edits.

For the names and descriptions of available process configuration parameters, see [Data Loader Process Configuration Parameters](#) on page 673.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Data Loader Process Configuration Parameters

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader from the command line, you can specify the following configuration parameters in the `process-conf.xml` file. In some cases, the parameter is also represented in the graphical user interface at **Settings > Settings**.

 **Tip:** A sample `process-conf.xml` file can be found in the `\samples` directory that's installed with Data Loader.

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>dataAccess.readUTF8</code>	boolean	Read all CSVs with UTF-8 encoding	Select this option to force files to open in UTF-8 encoding, even if they were saved in a different format. Sample value: <code>true</code>
<code>dataAccess.writeUTF8</code>	boolean	Write all CSVs with UTF-8 encoding	Select this option to force files to be written in UTF-8 encoding. Sample value: <code>true</code>
<code>dataAccess.name</code>	string	Not applicable (N/A)	Name of the data source to use, such as a CSV file name. For databases, use the name of the database configuration in <code>database-conf.xml</code> . Sample value: <code>c:\dataLoader\data\extractLead.csv</code>
<code>dataAccess.readBatchSize</code>	integer	N/A	Number of records read from the database at a time. The maximum value is 200. Sample value: 50
<code>dataAccess.type</code>	string	N/A	Standard or custom data source type. Standard types are <code>csvWriter</code> , <code>csvRead</code> , <code>databaseWrite</code> , and <code>databaseRead</code> . Sample value: <code>csvWrite</code>

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise**, **Performance**, **Unlimited**, **Developer**, and **Database.com** Editions

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>dataAccess.writeBatchSize</code>	integer	N/A	Number of records written to the database at a time. The maximum value is 2,000. Note the implication for a large parameter value: if an error occurs, all records in the batch are rolled back. In contrast, if the value is set to 1, each record is processed individually (not in batch) and errors are specific to a given record. We recommend setting the value to 1 when you need to diagnose problems with writing to a database. Sample value: 500
<code>process.enableExtractStatusOutput</code>	boolean	Generate status files for exports	Select this option to generate success and error files when exporting data. Sample value: <code>true</code>
<code>process.enableLastRunOutput</code>	boolean	N/A	When running Data Loader in batch mode, you can disable the generation of output files such as <code>sendAccountsFile_lastRun.properties</code> . Files of this type are saved by default to the <code>conf</code> directory. To stop the writing of these files, set this option to <code>false</code> . Alternatively, you can change the location of the directory where these files are saved, using process.lastRunOutputDirectory . Sample value: <code>true</code>
<code>process.encryptionKeyFile</code>	string (file name)	N/A	Name of the file that contains the encryption key. See Encrypt from the Command Line on page 670. Sample value: <code>c:\dataloader\conf\my.key</code>
<code>process.initialLastRunDate</code>	date	N/A	The initial setting for the <code>process.lastRunDate</code> parameter, which can be used in a SQL string and is automatically updated when a process has run successfully. For an explanation of the date format syntax, see Date Formats on page 660. Format must be <code>yyyy-MM-ddTHH:mm:ss.SSS+/-HHmm</code> . For example: <code>2006-04-13T13:50:32.423-0700</code>

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>process.lastRunOutputDirectory</code>	string (directory)	N/A	<p>When running Data Loader in batch mode, you can change the location where output files such as <code>sendAccountsFile_lastRun.properties</code> are written. Files of this type are saved by default to the <code>\conf</code> directory. To change the location, change the value of this option to the full path where the output files should be written.</p> <p>Alternatively, you can stop the files from being written, using <code>process.enableLastRunOutput</code>.</p>
<code>process.loadRowToStartAt</code>	number	Start at row	<p>If your last operation failed, you can use this setting to begin where the last successful operation finished.</p> <p>Sample value: 1008</p>
<code>process.mappingFile</code>	string (file name)	N/A	<p>Name of the field mapping file to use. See Map Columns on page 686.</p> <p>Sample value: <code>c:\dataloader\conf\accountExtractMap.sdl</code></p>
<code>process.operation</code>	string	N/A	<p>The operation to perform. See Data Loader Command-Line Operations on page 681.</p> <p>Sample value: <code>extract</code></p>
<code>process.statusOutputDirectory</code>	string (directory)	N/A	<p>The directory where “success” and “error” output files are saved. The file names are automatically generated for each operation unless you specify otherwise in <code>process-conf.xml</code>.</p> <p>Sample value: <code>c:\dataloader\status</code></p>
<code>process.outputError</code>	string (file name)	N/A	<p>The name of the CSV file that stores error data from the last operation.</p> <p>Sample value: <code>c:\dataloader\status\myProcessErrors.csv</code></p>
<code>process.outputSuccess</code>	string (file name)	N/A	<p>The name of the CSV file that stores success data from the last operation. See also <code>process.enableExtractStatusOutput</code> on page 674.</p> <p>Sample value: <code>c:\dataloader\status\myProcessSuccesses.csv</code></p>

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>process.useEuropeanDates</code>	boolean	Use European date format	Select this option to support the date formats <code>dd/MM/yyyy</code> and <code>dd/MM/yyyy HH:mm:ss</code> . Sample value: <code>true</code>
<code>sfdc.assignmentRule</code>	string	Assignment rule	Specify the ID of the assignment rule to use for inserts, updates, and upserts. This option applies to inserts, updates, and upserts on cases and leads. It also applies to updates on accounts if your organization has territory assignment rules on accounts. The assignment rule overrides <code>Owner</code> values in your CSV file. Sample value: <code>03Mc00000026J7w</code>
<code>sfdc.bulkApiCheckStatusInterval</code>	integer	N/A	The number of milliseconds to wait between successive checks to determine if the asynchronous Bulk API operation is complete or how many records have been processed. See also sfdc.useBulkApi . We recommend a value of 5000. Sample value: 5000
<code>sfdc.bulkApiSerialMode</code>	boolean	Enable serial mode for Bulk API	Select this option to use serial instead of parallel processing for Bulk API. Processing in parallel can cause database contention. When this is severe, the load may fail. Using serial mode guarantees that batches are processed one at a time. Note that using this option may significantly increase the processing time for a load. See also sfdc.useBulkApi . Sample value: <code>false</code>
<code>sfdc.bulkApiZipContent</code>	boolean	Upload Bulk API Batch as Zip File	Select this option to use Bulk API to upload zip files containing binary attachments, such as Attachment records or Salesforce CRM Content. See also sfdc.useBulkApi . Sample value: <code>true</code>
<code>sfdc.connectionTimeoutSecs</code>	integer	N/A	The number of seconds to wait for a connection during API calls. Sample value: 60
<code>sfdc.debugMessages</code>	boolean	N/A	If true, enables SOAP message debugging. By default, messages are sent to STDOUT unless you specify an

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
			alternate location in <code>sfdc.debugMessagesFile</code> . Sample value: <code>false</code>
<code>sfdc.debugMessagesFile</code>	string (file name)	N/A	See process.enableExtractStatusOutput on page 674. Stores SOAP messages sent to or from Salesforce. As messages are sent or received, they are appended to the end of the file. As the file does not have a size limit, please monitor your available disk storage appropriately. Sample value: <code>\lexiloader\status\sfdcSoapTrace.log</code>
<code>sfdc.enableRetries</code>	boolean	N/A	If true, enables repeated attempts to connect to Salesforce servers. See sfdc.maxRetries on page 678 and sfdc.minRetrySleepSecs on page 678. Sample value: <code>true</code>
<code>sfdc.endpoint</code>	URL	Server host	Enter the URL of the Salesforce server with which you want to communicate. For example, if you are loading data into a sandbox, change the URL to <code>https://test.salesforce.com</code> . Sample production value: <code>https://login.salesforce.com/services/Soap/u/37.0</code>
<code>sfdc.entity</code>	string	N/A	The Salesforce object used in the operation. Sample value: <code>Lead</code>
<code>sfdc.externalIdField</code>	string	N/A	Used in upsert operations; specifies the custom field with the "External ID" attribute that is used as a unique identifier for data matching. Sample value: <code>LegacySKU__c</code>
<code>sfdc.extractionRequestSize</code>	integer	Query request size	In a single export or query operation, records are returned from Salesforce in increments of this size. The maximum value is 2,000 records. Larger values may improve performance but use more memory on the client. Sample value: <code>500</code>

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>sfdc.extractionSOQL</code>	string	N/A	The SOQL query for the data export. Sample value: <code>SELECT Id, LastName, FirstName, Rating, AnnualRevenue, OwnerId FROM Lead</code>
<code>sfdc.insertNulls</code>	boolean	Insert null values	Select this option to insert blank mapped values as null values during data operations. Note that when you are updating records, this option instructs Data Loader to overwrite any existing data in mapped fields. Sample value: <code>false</code>
<code>sfdc.loadBatchSize</code>	integer	Batch size	In a single insert, update, upsert, or delete operation, records moving to or from Salesforce are processed in increments of this size. The maximum value is 200. We recommend a value between 50 and 100. Sample value: 100
<code>sfdc.maxRetries</code>	integer	N/A	The maximum number of repeated attempts to connect to Salesforce. See sfdc.enableRetries on page 677. Sample value: 3
<code>sfdc.minRetrySleepSecs</code>	integer	N/A	The minimum number of seconds to wait between connection retries. The wait time increases with each try. See sfdc.enableRetries on page 677. Sample value: 2
<code>sfdc.noCompression</code>	boolean	Compression	Compression enhances the performance of Data Loader and is turned on by default. You may want to disable compression if you need to debug the underlying SOAP messages. To turn off compression, enable this option. Sample value: <code>false</code>
<code>sfdc.password</code>	encrypted string	N/A	An encrypted Salesforce password that corresponds to the username provided in sfdc.username . See also Encrypt from the Command Line on page 670. Sample value: 4285b36161c65a22

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
<code>sfdc.proxyHost</code>	URL	Proxy host	The host name of the proxy server, if applicable. Sample value: <code>http://myproxy.internal.company.com</code>
<code>sfdc.proxyPassword</code>	encrypted string	Proxy password	An encrypted password that corresponds to the proxy username provided in <code>sfdc.proxyUsername</code> . See also Encrypt from the Command Line on page 670. Sample value: <code>4285b36161c65a22</code>
<code>sfdc.proxyPort</code>	integer	Proxy port	The proxy server port. Sample value: <code>8000</code>
<code>sfdc.proxyUsername</code>	string	Proxy username	The username for proxy server authentication. Sample value: <code>jane.doe</code>
<code>sfdc.resetUrlOnLogin</code>	boolean	Reset URL on Login	By default, Salesforce resets the URL after login to the one specified in <code>sfdc.endpoint</code> . To turn off this automatic reset, disable this option by setting it to <code>false</code> . Valid values: <code>true</code> (default), <code>false</code>
<code>sfdc.timeoutSecs</code>	integer	Timeout	Specify how many seconds Data Loader waits to receive a response back from the server before returning an error for the request. Sample value: <code>540</code>
<code>sfdc.timezone</code>	string	Time Zone	If a date value does not include a time zone, this value is used. <ul style="list-style-type: none"> If no value is specified, the time zone of the computer where Data Loader is installed is used. If an incorrect value is entered, GMT is used as the time zone and this fact is noted in the Data Loader log. Valid values are any time zone identifier which can be passed to the Java <code>getTimeZone(java.lang.String)</code> method. The value can be a full name such as <code>America/Los_Angeles</code> , or a custom ID such as <code>GMT-8:00</code> .

Parameter Name	Data Type	Equivalent Option in Settings Dialog	Description
			You can retrieve the default value by running the <code>TimeZone.getDefault()</code> method in Java. This value is the time zone on the computer where Data Loader is installed.
			Select this option to truncate data in the following types of fields when loading that data into Salesforce: Email, Multi-select Picklist, Phone, Picklist, Text, and Text (Encrypted). In Data Loader versions 14.0 and earlier, values for fields of those types are truncated by Data Loader if they are too large. In Data Loader version 15.0 and later, the load operation fails if a value is specified that is too large. Selecting this option allows you to specify that the previous behavior, truncation, be used instead of the new behavior in Data Loader versions 15.0 and later. This option is selected by default and has no effect in versions 14.0 and earlier. This option is not available if the <code>Use Bulk API</code> option is selected. In that case, the load operation fails for the row if a value is specified that is too large for the field.
<code>sfdc.truncateFields</code>	boolean	Allow field truncation	Sample value: <code>true</code>
			Select this option to use the Bulk API to insert, update, upsert, delete, and hard delete records. The Bulk API is optimized to load or delete a large number of records asynchronously. It's faster than the default SOAP-based API due to parallel processing and fewer network round-trips. See also sfdc.bulkApiSerialMode .
<code>sfdc.useBulkApi</code>	boolean	Use Bulk API	Sample value: <code>true</code>
			Salesforce username. See sfdc.password .
<code>sfdc.username</code>	string	N/A	Sample value: <code>jdoe@mycompany.com</code>

Data Loader Command-Line Operations

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, several operations are supported. An operation represents the flow of data between Salesforce and an external data source such as a CSV file or a database. See the following list of operation names and descriptions.

Extract

Uses a [Salesforce Object Query Language](#) to export a set of records from Salesforce, then writes the exported data to a data source. Soft-deleted records are not included.

Extract All

Uses a Salesforce Object Query Language to export a set of records from Salesforce, including both existing and soft-deleted records, then writes the exported data to a data source.

Insert

Loads data from a data source into Salesforce as new records.

Update

Loads data from a data source into Salesforce, where existing records with matching ID fields are updated.

Upsert

Loads data from a data source into Salesforce, where existing records with a matching custom external ID field are updated; records without matches are inserted as new records.

Delete

Loads data from a data source into Salesforce, where existing records with matching ID fields are deleted.

Hard Delete

Loads data from a data source into Salesforce, where existing records with matching ID fields are deleted without being stored first in the Recycle Bin.

Configure Database Access

 **Note:** The Data Loader command-line interface is supported for Windows only.

When you run Data Loader in batch mode from the command line, use `\samples\conf\database-conf.xml` to configure database access objects, which you use to extract data directly from a database.

DatabaseConfig Bean

The top-level database configuration object is the `DatabaseConfig` bean, which has the following properties:

sqlConfig

The [SQL configuration bean](#) for the data access object that interacts with a database.

dataSource

The bean that acts as database driver and authenticator. It must refer to an implementation of `javax.sql.DataSource` such as `org.apache.commons.dbcp.BasicDataSource`.

The following code is an example of a `DatabaseConfig` bean:

```
<bean id="AccountInsert"
      class="com.salesforce.dataloader.dao.database.DatabaseConfig"
```

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

```

    singleton="true">
    <property name="sqlConfig" ref="accountInsertSql"/>
</bean>

```

DataSource

The `DataSource` bean sets the physical information needed for database connections. It contains the following properties:

driverClassName

The fully qualified name of the implementation of a JDBC driver.

url

The string for physically connecting to the database.

username

The username for logging in to the database.

password

The password for logging in to the database.

Depending on your implementation, additional information may be required. For example, use `org.apache.commons.dbcp.BasicDataSource` when database connections are pooled.

The following code is an example of a `DataSource` bean:

```

<bean id="oracleRepDataSource"
    class="org.apache.commons.dbcp.BasicDataSource"
    destroy-method="close">
    <property name="driverClassName" value="oracle.jdbc.driver.OracleDriver"/>
    <property name="url" value="jdbc:oracle:thin:@myserver.salesforce.com:1521:TEST"/>
    <property name="username" value="test"/>
    <property name="password" value="test"/>
</bean>

```

Versions of Data Loader from API version 25.0 onwards do not come with an Oracle JDBC driver. Using Data Loader to connect to an Oracle data source without a JDBC driver installed will result in a “Cannot load JDBC driver class” error. To add the Oracle JDBC driver to Data Loader:

- Download the latest JDBC driver from <http://www.oracle.com/technetwork/database/features/jdbc/index-091264.html>.
- Copy the JDBC.jar file to `data loader install folder/java/bin`.

SEE ALSO:

[Spring Framework](#)
[Data Access Objects](#)
[SQL Configuration](#)

Spring Framework

 **Note:** The Data Loader command-line interface is supported for Windows only.

The Data Loader configuration files are based on the [Spring Framework](#), which is an open-source, full-stack Java/J2EE application framework.

The Spring Framework allows you to use XML files to configure beans. Each bean represents an instance of an object; the parameters correspond to each object's setter methods. A typical bean has the following attributes:

id

Uniquely identifies the bean to `XmlBeanFactory`, which is the class that gets objects from an XML configuration file.

class

Specifies the implementation class for the bean instance.

For more information on the Spring Framework, see [the official documentation](#) and the [support forums](#). Note that Salesforce cannot guarantee the availability or accuracy of external websites.

SEE ALSO:

[Configure Database Access](#)

Data Access Objects

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, several data access objects are supported. A data access object allows access to an external data source outside of Salesforce. They can implement a read interface (`DataReader`), a write interface (`DataWriter`), or both. See the following list of object names and descriptions.

csvRead

Allows the reading of a comma or tab-delimited file. There should be a header row at the top of the file that describes each column.

csvWrite

Allows writing to a comma-delimited file. A header row is added to the top of the file based on the column list provided by the caller.

databaseRead

Allows the reading of a database. Use `database-conf.xml` to configure database access.

databaseWrite

Allows writing to a database. Use `database-conf.xml` to configure database access.

SQL Configuration

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, the `SqlConfig` class contains configuration parameters for accessing specific data in the database. As shown in the code samples below, queries and inserts are different but very similar. The bean must be of type `com.salesforce.dataloader.dao.database.SqlConfig` and have the following properties:

sqlString

The SQL code to be used by the data access object.

The SQL can contain replacement parameters that make the string dependent on configuration or operation variables. Replacement parameters must be delimited on both sides by “@” characters. For example, `@process.lastRunDate@`.

sqlParams

A property of type `map` that contains descriptions of the replacement parameters specified in `sqlString`. Each entry represents one replacement parameter: the key is the replacement parameter's name, the value is the fully qualified Java type to be used when the parameter is set on the SQL statement. Note that “java.sql” types are sometimes required, such as `java.sql.Date` instead of `java.util.Date`. For more information, see [the official JDBC API documentation](#).

columnNames

Used when queries (SELECT statements) return a `JDBC ResultSet`. Contains column names for the data outputted by executing the SQL. The column names are used to access and return the output to the caller of the `DataReader` interface.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

SQL Query Bean Example

```
<bean id="accountMasterSql"
  class="com.salesforce.dataloader.dao.database.SqlConfig"
  singleton="true">
  <property name="sqlString"/>
  <value>
    SELECT distinct
      '012x00000000Ij7' recordTypeId,
      accounts.account_number,
      org.organization_name,
      concat (concat(parties.address1, ' '), parties.address2) billing_address,

      locs.city,
      locs.postal_code,
      locs.state,
      locs.country,
      parties.sic_code
    from
      ar.hz_cust_accounts accounts,
      ar.hz_organization_profiles org,
      ar.hz_parties parties,
      ar.hz_party_sites party_sites,
      ar.hz_locations locs
    where
      accounts.PARTY_ID = org.PARTY_ID
      and parties.PARTY_ID = accounts.PARTY_ID
      and party_sites.PARTY_ID = accounts.PARTY_ID
```

```

        and locs.LOCATION_ID = party_sites.LOCATION_ID
        and (locs.last_update_date > @process.lastRunDate@ OR
accounts.last_update_date > @process.lastRunDate@
    </value>
</property>
<property name="columnNames">
    <list>
        <value>recordTypeId</value>
        <value>account_number</value>
        <value>organization_name</value>
        <value>billing_address</value>
        <value>city</value>
        <value>postal_code</value>
        <value>state</value>
        <value>country</value>
        <value>sic_code</value>
    </list>
</property>
<property name="sqlParams">
    <map>
        <entry key="process.lastRunDate" value="java.sql.Date"/>
    </map>
</property>
</bean>

```

SQL Insert Bean Example

```

<bean id="partiesInsertSql"
    class="com.salesforce.dataloader.dao.database.SqlConfig"
    singleton="true">
    <property name="sqlString"/>
        <value>
            INSERT INTO REP.INT_PARTIES (
                BILLING_ADDRESS, SIC_CODE)
            VALUES (@billing_address@, @sic_code@)
        </value>
    </property>
    <property name="sqlParams"/>
        <map>
            <entry key="billing_address" value="java.lang.String"/>
            <entry key="sic_code" value="java.lang.String"/>
        </map>
    </property>
</bean>

```

SEE ALSO:

[Configure Database Access](#)

Map Columns

 **Note:** The Data Loader command-line interface is supported for Windows only.

When running Data Loader in batch mode from the command line, you must create a properties file that maps values between Salesforce and data access objects.

1. Create a new mapping file and give it an extension of `.sdl`.
2. Observe the following syntax:
 - On each line, pair a data source with its destination.
 - In an import file, put the data source on the left, an equals sign (=) as a separator, and the destination on the right. In an export file, put the destination on the left, an equals sign (=) as a separator, and the data source on the right.
 - Data sources can be either column names or constants. Surround constants with double quotation marks, as in "sampleconstant". Values without quotation marks are treated as column names.
 - Destinations must be column names.
 - You may map constants by surrounding them with double quotation marks, as in:

```
"Canada"=BillingCountry
```

3. In your configuration file, use the parameter `process.mappingFile` to specify the name of your mapping file.

 **Note:** If your field name contains a space, you must escape the space by prepending it with a backslash (\). For example:

```
Account\ Name=Name
```

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Column Mapping Example for Data Insert

The Salesforce fields are on the right.

```
SLA__C=SLA__c
BILLINGCITY=BillingCity
SYSTEMMODSTAMP=
OWNERID=OwnerId
CUSTOMERPRIORITY__C=CustomerPriority__c
ANNUALREVENUE=AnnualRevenue
DESCRIPTION=Description
BILLINGSTREET=BillingStreet
SHIPPINGSTATE=ShippingState
```

Column Mapping Example for Data Export

The Salesforce fields are on the left.

```
Id=account_number
Name=name
Phone=phone
```

Column Mapping for Constant Values

Data Loader supports the ability to assign constants to fields when you insert, update, and export data. If you have a field that should contain the same value for each record, you specify that constant in the `.sdl` mapping file instead of specifying the field and value in the CSV file or the export query.

The constant must be enclosed in double quotation marks. For example, if you're importing data, the syntax is

```
"constantvalue"=field1.
```

If you have multiple fields that should contain the same value, you must specify the constant and the field names separated by commas. For example, if you're importing data, the syntax would be `"constantvalue"=field1, field2`.

Here's an example of an `.sdl` file for inserting data. The Salesforce fields are on the right. The first two lines map a data source to a destination field, and the last three lines map a constant to a destination field.

```
Name=Name
NumEmployees=NumberOfEmployees
"Aerospace"=Industry
"California"=BillingState, ShippingState
"New"=Customer_Type__c
```

A constant must contain at least one alphanumeric character.

 **Note:** If you specify a constant value that contains spaces, you must escape the spaces by prepending each with a backslash (`\`). For example:

```
"Food\ &\ Beverage"=Industry
```

Run Individual Batch Processes

 **Note:** The Data Loader command-line interface is supported for Windows only.

To start an individual batch process, use `\bin\process.bat`, which requires the following parameters:

A configuration directory

The default is `\conf`.

To use an alternate directory, create a new directory and add the following files to it:

- If your process is not interactive, copy `process-conf.xml` from `\samples\conf`.
- If your process requires database connectivity, copy `database-conf.xml` from `\samples\conf`.
- Copy `config.properties` from `\conf`.

A process name

The name of the ProcessRunner bean from `\samples\conf\process-conf.xml`.

Process Example

```
process ../conf accountMasterProcess
```

 **Note:** You can configure external process launchers such as the Microsoft Windows XP Scheduled Task Wizard to run processes on a schedule.

Command-Line Quick Start (Windows Only)

Data Loader Introduction

 **Note:** The Data Loader command-line interface is supported for Windows only.

In addition to using Data Loader interactively to import and export data, you can run it from the command line. You can use commands to automate the import and export of data.

This quick start shows you how to use the Data Loader command-line functionality to import data. Follow these steps.

- [Step 1: Create the encryption key](#)
- [Step 2: Create the encrypted password for your login username](#)
- [Step 3: Create the Field Mapping File](#)
- [Step 4: Create a `process-conf.xml` file that contains the import configuration settings](#)
- [Step 5: Run the process and import the data](#)

Prerequisites

 **Note:** The Data Loader command-line interface is supported for Windows only.

To step through this quick start requires the following:

- Data Loader installed on the computer that runs the command-line process.
- The Java Runtime Environment (JRE) installed on the computer that runs the command-line process.
- Familiarity with importing and exporting data by using the Data Loader interactively through the user interface. This makes it easier to understand how the command-line functionality works.

 **Tip:** When you install Data Loader, sample files are installed in the samples directory. This directory is found below the program directory, for example, `C:\Program Files (x86)\salesforce.com\Apex Data Loader 22.0\samples\`. Examples of files that are used in this quick start can be found in the `\samples\conf` directory.

Step One: Create the Encryption Key

 **Note:** The Data Loader command-line interface is supported for Windows only.

When you use Data Loader from the command line, there's no user interface. Therefore, you need to provide the information that you would normally enter in the user interface by using a text file named `process-conf.xml`. For example, you add the username and password that Data Loader uses to log in to Salesforce. The password must be encrypted before you add it to the `process-conf.xml` file, and creating the key is the first step in that process.

1. Open a command prompt window by clicking **Start > All Programs > Accessories > Command Prompt**. Alternatively, you can click **Start > Run**, enter `cmd` in the **Open** field, and click **OK**.
2. In the command window, enter `cd \` to navigate to the root directory of the drive where Data Loader is installed.

EDITIONS

Available in: Salesforce Classic

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

3. Navigate to the Data Loader `\bin` directory by entering this command. Be sure to replace the file path with the path from your system.

```
cd C:\Program Files (x86)\salesforce.com\Apex Data Loader 22.0\bin
```

4. Create an encryption key by entering the following command. Replace `<seedtext>` with any string.

```
encrypt.bat -g <seedtext>
```

 **Note:** To see a list of command-line options for `encrypt.bat`, type `encrypt.bat` from the command line.

5. Copy the generated key from the command window to a text file named `key.txt` and make a note of the file path. In this example, the generated key is `e8a68b73992a7a54`.

 **Note:** Enabling quick edit mode on a command window can make it easier to copy data to and from the window. To enable quick edit mode, right-click the top of the window and select **Properties**. On the **Options** tab, select **QuickEdit Mode**.

The encryption utility is used to encrypt passwords, but data that you transmit using Data Loader is not encrypted.

SEE ALSO:

[Step Two: Create the Encrypted Password](#)

Step Two: Create the Encrypted Password

 **Note:** The Data Loader command-line interface is supported for Windows only.

In this step, you create the encrypted password using the key that you generated in the previous step.

1. In the same command prompt window, enter the following command. Replace `<password>` with the password that Data Loader uses to log in to Salesforce. Replace `<filepath>` with the file path to the `key.txt` file that you created in the previous step.

```
encrypt.bat -e <password> "<filepath>\key.txt"
```

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

- Copy the encrypted password that is generated by the command. You use this value in a later step.

SEE ALSO:

[Step Three: Create the Field Mapping File](#)

Step Three: Create the Field Mapping File

 **Note:** The Data Loader command-line interface is supported for Windows only.

In this step, you create a mapping file with an `.sdl` file extension. In each line of the mapping file, pair a data source with its destination.

- Copy the following to a text file and save it with a name of `accountInsertMap.sdl`. This is a data insert, so the data source is on the left of the equals sign and the destination field is on the right.

```
#Mapping values
#Thu May 26 16:19:33 GMT 2011
Name=Name
NumberOfEmployees=NumberOfEmployees
Industry=Industry
```

 **Tip:** For complex mappings, you can use the Data Loader user interface to map source and destination fields and then save those mappings to an `.sdl` file. This is done on the Mapping dialog box by clicking **Save Mapping**.

SEE ALSO:

[Step Four: Create the Configuration File](#)

Step Four: Create the Configuration File

 **Note:** The Data Loader command-line interface is supported for Windows only.

The `process-conf.xml` file contains the information that Data Loader needs to process the data. Each `<bean>` in the `process-conf.xml` file refers to a single process such as an insert, upsert, export, and so on. Therefore, this file can contain multiple processes. In this step, you edit the file to insert accounts into Salesforce.

- Make a copy of the `process-conf.xml` file from the `\samples\conf` directory. Be sure to maintain a copy of the original because it contains examples of other types of Data Loader processing such as upserts and exports.
- Open the file in a text editor, and replace the contents with the following XML:

```
<!DOCTYPE beans PUBLIC "-//SPRING//DTD BEAN//EN"
"http://www.springframework.org/dtd/spring-beans.dtd">
<beans>
  <bean id="accountInsert"
    class="com.salesforce.dataloader.process.ProcessRunner"
    singleton="false">
```

<description>accountInsert job gets the account record from the CSV file
  and inserts it into Salesforce.</description>
<property name="name" value="accountInsert"/>
<property name="configOverrideMap">
  <map>
    <entry key="sfdc.debugMessages" value="true"/>
    <entry key="sfdc.debugMessagesFile"
      value="C:\DLTest\Log\accountInsertSoapTrace.log"/>
    <entry key="sfdc.endpoint" value="https://servername.salesforce.com"/>
    <entry key="sfdc.username" value="admin@Org.org"/>
    <!--Password below has been encrypted using key file,
      therefore, it will not work without the key setting:
      process.encryptedKeyFile.
      The password is not a valid encrypted value,
      please generate the real value using the encrypt.bat utility -->
    <entry key="sfdc.password" value="e8a68b73992a7a54"/>
    <entry key="process.encryptedKeyFile"
      value="C:\DLTest\Command Line\Config\key.txt"/>
    <entry key="sfdc.timeoutSecs" value="600"/>
    <entry key="sfdc.loadBatchSize" value="200"/>
    <entry key="sfdc.entity" value="Account"/>
    <entry key="process.operation" value="insert"/>
    <entry key="process.mappingFile"
      value="C:\DLTest\Command Line\Config\accountInsertMap.sdl"/>
    <entry key="dataAccess.name"
      value="C:\DLTest\In\insertAccounts.csv"/>
    <entry key="process.outputSuccess"
      value="c:\DLTest\Log\accountInsert_success.csv"/>
    <entry key="process.outputError"
      value="c:\DLTest\Log\accountInsert_error.csv"/>
    <entry key="dataAccess.type" value="csvRead"/>
    <entry key="process.initialLastRunDate"
      value="2005-12-01T00:00:00.000-0800"/>
  </map>
</property>
</bean>
</beans>

```

3. Modify the following parameters in the `process-conf.xml` file. For more information about the process configuration parameters, see [Data Loader Process Configuration Parameters](#) on page 673.

- `sfdc.endpoint`—Enter the URL of the Salesforce instance for your organization; for example, `https://yourInstance.salesforce.com/`.
- `sfdc.username`—Enter the username Data Loader uses to log in.
- `sfdc.password`—Enter the encrypted password value that you created in step 2.
- `process.mappingFile`—Enter the path and file name of the mapping file.
- `dataAccess.Name`—Enter the path and file name of the data file that contains the accounts that you want to import.
- `sfdc.debugMessages`—Currently set to `true` for troubleshooting. Set this to `false` after your import is up and running.
- `sfdc.debugMessagesFile`—Enter the path and file name of the command line log file.
- `process.outputSuccess`—Enter the path and file name of the success log file.
- `process.outputError`—Enter the path and file name of the error log file.

Warning: Use caution when using different XML editors to edit the `process-conf.xml` file. Some editors add XML tags to the beginning and end of the file, which causes the import to fail.

[Step Five: Import the Data](#)

Step Five: Import the Data

USER PERMISSIONS

To insert records:	"Create" on the record
To update records:	"Edit" on the record
To upsert records:	"Create" or "Edit" on the record
To delete records:	"Delete" on the record
To hard delete records:	"Delete" on the record

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Note: The Data Loader command-line interface is supported for Windows only.

Now that all the pieces are in place, you can run Data Loader from the command line and insert some new accounts.

1. Copy the following data to a file name `accountInsert.csv`. This is the account data that you import into your organization.

```
Name, Industry, NumberOfEmployees
Dickenson plc, Consulting, 120
GenePoint, Biotechnology, 265
Express Logistics and Transport, Transportation, 12300
Grand Hotels & Resorts Ltd, Hospitality, 5600
```

2. In the command prompt window, enter the following command:

```
process.bat "<file path to process-conf.xml>" <process name>
```

- Replace `<file path to process-conf.xml>` with the path to the directory containing `process-conf.xml`.
- Replace `<process name>` with the process specified in `process-conf.xml`.

Your command should look something like this:

```
process.bat "C:\DLTest\Command Line\Config" accountInsert
```

After the process runs, the command prompt window displays success and error messages. You can also check the log files: `insertAccounts_success.csv` and `insertAccounts_error.csv`. After the process runs successfully, the `insertAccounts_success.csv` file contains the records that you imported, along with the ID and status of each record. For more information about the status files, see [Reviewing Data Loader Output Files](#) on page 668.

Data Loader Third-Party Licenses

- Can Customer Support help me import my data?
- Can I import data in more than one language?
- How do I perform mass updates to records?
- How do I update fields with blank values?
- What is an external ID?

Can I mass upload data into Salesforce?

Group, Professional, Performance, Unlimited, Enterprise, and Developer editions have the Data Import Wizard for accounts, contacts, leads, and custom objects that allow you to mass import data. To access them, from Setup, click **Data Management**. In addition, Performance, Unlimited, Enterprise, and Developer editions have API access to use database mass upload tools like Data Loader.

Should I sync Outlook or use import wizards to upload my data into Salesforce?

Use the following information to determine how to upload data into your Salesforce organization.

- To upload accounts and contacts for multiple users at the same time, use the Data Import Wizard, and select **Accounts and Contacts**.
 - To upload your contacts from any application other than Microsoft Outlook, use the Data Import Wizard, and select **Accounts and Contacts**.
 - To keep your Outlook contacts, accounts, and calendar events up-to-date with Salesforce, we recommend that you use Lightning Sync or Salesforce for Outlook to initially sync your data and for all subsequent updates.
 - To upload custom objects, leads, and solutions, use the Data Import Wizard and select the appropriate object to import those kinds of records into Salesforce. You can't sync those records using Lightning Sync or Salesforce for Outlook.
 - To upload business accounts and contacts for multiple users at the same time, use the Data Import Wizard, and select **Accounts and Contacts**.
 - To upload person accounts, use the Import My Person Accounts wizard.
-  **Note:** When you import person accounts, the following limitations apply.
- The unified Data Import Wizard doesn't support person accounts.
 - You can't upload person accounts by using Salesforce for Outlook.
 - You can sync contacts in Outlook to person accounts in Salesforce only if the person accounts already exist. (Syncing doesn't convert Outlook contacts to person accounts in Salesforce.)

For more information about importing person accounts, see [Data Import Wizard](#) on page 650.

Who in my organization can use the import wizards?

All users in your organization can use the Import My Contacts wizard. In Enterprise, Unlimited, Performance, or Developer Edition organizations with person accounts enabled, all users can use the Import My Person Accounts wizard.

Only an administrator can use the organization-wide Data Import Wizard to import accounts, contacts, leads, solutions, or custom objects for multiple users at one time. In Personal Edition, the Data Import Wizard isn't available. In Contact Manager Edition, leads and solutions in the Data Import Wizard aren't available. In Group Edition, solutions in the Data Import Wizard isn't available.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. The options you see depend on your permissions.

What permissions do I need to import records?

Data Loader

Importing records with the Data Loader requires these permissions.

- "Read," "Create," "Edit," and "Delete" on the objects
- "API Enabled"
- "Bulk API Hard Delete" (only if you configure Data Loader to use Bulk API to hard-delete records)

Data Import Wizard

Import Option	User Permissions Needed
To import accounts and contacts that you own via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts AND "Import Personal Contacts"
To import accounts and contacts owned by others via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts and contacts AND "Modify All Data"
To import leads via the Data Import Wizard:	"Import Leads"
To import custom object data via the Data Import Wizard:	"Import Custom Objects" AND "Edit" on the custom object
To import solutions via the Data Import Wizard:	"Import Solutions"

Import Option	User Permissions Needed
To update campaign member statuses via the Data Import Wizard:	Marketing User selected in your user information AND "Read" on contacts OR "Import Leads" AND "Edit" on campaigns
To add contacts that you own to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Create" on accounts AND "Read" on contacts AND "Edit" on accounts and campaigns AND "Import Personal Contacts"
To create contacts that you own and add them to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Create" on accounts AND "Read" on contacts AND "Edit" on accounts and campaigns AND "Import Personal Contacts"
To add contacts owned by others to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Create" on accounts AND "Read" on contacts AND "Edit" on accounts, contacts, and campaigns AND "Modify All Data"
To create contacts owned by others and add them to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND

Import Option	User Permissions Needed
	"Create" on accounts AND "Read" on contacts AND "Edit" on accounts, contacts, and campaigns AND "Modify All Data"
To add existing leads to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Edit" on campaigns AND "Import Leads"
To create leads and add them to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Edit" on campaigns AND "Import Leads"
To add person accounts that you own to a campaign via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts AND "Import Personal Contacts"
To create person accounts that you own via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts AND "Import Personal Contacts"
To add person accounts owned by others to a campaign via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts and contacts AND "Modify All Data"

Import Option	User Permissions Needed
To create person accounts owned by others via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts and contacts AND "Modify All Data"

Important: Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. The options you see depend on your permissions.

What file formats can the import wizards handle?

You can import contacts and business accounts directly from an ACT! or Outlook file, or from any CSV (comma-separated values) file, such as a GoldMine or Excel file. You can import leads, solutions, custom objects, or person accounts from any CSV file.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

Which data can I import?

You can use import wizards to import the following records.

Campaign Member status

In Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs, use the Data Import Wizard to import the status of campaign members.

Contacts and business accounts

Use the Import My Contacts wizard and the Data Import Wizard to import contacts and business accounts.

In Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs, you can also import contact and business account notes.

Person accounts

In Enterprise, Unlimited, Performance, and Developer Edition orgs, use the Import My Person Accounts wizard to import person accounts that you own. Administrators can use the Import My Organization's Person Accounts wizard to import person accounts for multiple users.

Leads

In Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs, use the Data Import Wizard to import leads.

Solutions

In Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs, use the Data Import Wizard to import solutions.

Custom objects

In Contact Manager, Group, Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs, use the Data Import Wizard to import custom objects.

You can import values into a field only if you have read and edit access. Field access is determined by user permissions, page layout assignments, and field-level security settings.

Import wizards for other records are not available.

! **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the `Quick Find` box, then select **Data Import Wizard**. The options you see depend on your permissions.

Are there size restrictions on my import data?

Yes. Your import file can't exceed 100 MB, and each record in the file can't exceed 400 KB. In addition, each imported note and each imported description can't exceed 32 KB. Descriptions longer than 32 KB are truncated.

In addition to the import file limits, your import is also subject to the overall storage limits for your organization. Note that the size of your import file does not directly correlate to the storage space needed for those records. For example, an import file of 50MB in size may not create 50MB of data in Salesforce.

! **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the `Quick Find` box, then select **Data Import Wizard**. The options you see depend on your permissions.

Why can't I log in to Data Loader?

If you're having trouble logging in to Data Loader, try the following solutions.

- Add a security token to the end of your password to log in to Data Loader.
- Change the `Server host` to point to the appropriate server in Data Loader by following these steps:
 1. Start the Data Loader.
 2. Navigate to **Settings > Settings**.
 3. Set `Server host` to `https://yourInstance.salesforce.com/`, where `instance_name` is the Salesforce instance you're on.
 4. Click **OK** to save your settings.
- Ask your administrator whether you're working behind a proxy server. If so, adjust your Data Loader settings. If you're using APIs that are behind a proxy server, the proxy server prevents the APIs from connecting with Salesforce servers; you won't see information about the APIs under Login History.
- Try to log in on another computer to verify that your local device settings aren't causing the problem.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and Database.com Editions

[Reset Your Security Token](#)

[Set Trusted IP Ranges for Your Organization](#)

Why isn't Data Loader importing special characters?

If Data Loader fails to import special characters such as ö, ñ, or é, your source data file might not be properly encoded. To ensure the file is properly encoded:

1. Make any modifications to your source data file in .xls format.
2. In Microsoft® Excel®, save a copy of your file as a Unicode Text file.
3. Open the Unicode Text file you just saved with a text editor.

4. Click **File** > **Save As** to change the following file settings:

- File name extension—`.csv`
- Save as type—**All Files**
- Encoding—**UTF-8**

5. Click **Save**, and close the file.

 **Note:** Don't open the file after you have saved the settings or you may revert the encoding changes.

6. Import the data using Data Loader as you normally would, and select the newly created `.csv` file.

Can I import into custom fields?

Yes. Your administrator must create the custom fields prior to import.

For checkbox fields, records with a value of `1` in the field are imported as checked while a value of `0` is not checked.

SEE ALSO:

[Importing Records](#)

Can I import into fields that are not on my page layout?

No. You can import values into a field only if you have read and edit access. Field access is determined by user permissions, page layout assignments, and field-level security settings.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. The options you see depend on your permissions.

Can I import data into a picklist field if the values don't match?

We recommend that you import your data into an existing picklist when that picklist accurately represents your data, even if the exact values don't match. The import wizards warn you before importing any new picklist values. However, the wizards accept any value for a picklist field, even if the value isn't predefined. Your administrator can later edit the picklist to include the needed values. Note that the import wizards don't allow you to import more than 100 new picklist or multi-select picklist values for any field during a single import.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. The options you see depend on your permissions.

Can I delete my imported data if I make a mistake?

From Setup, your administrator can enter *Mass Delete Records* in the **Quick Find** box, then select **Mass Delete Records** to perform a mass delete of accounts, contacts, leads, or solutions that you mistakenly imported. You cannot mass delete mistakenly imported custom objects.

View the [Using Mass Delete to Undo Imports](#) document for instructions.

How do I use the Data Import Wizard to update records that match specified Salesforce IDs?

You can use the Data Import Wizard to update leads, contacts, or accounts using the record's ID as the unique identifier. These steps do not apply to custom objects.

 **Note:** These steps assume you have administrator-level of knowledge with Salesforce.

Before you begin, prepare the data you're updating.

1. Create a tabular report for the records you're updating, including the record ID and the fields you're updating.
2. Save the report locally as a .csv file for backup purposes.
3. Click **Save As** to create a new version of the .csv file and make your changes to the data.
4. Click **Save**.

After you have updated the report, import the .csv file into Salesforce. The steps vary based on the records you're updating.

To Update Leads

1. From Setup, enter *Data Import Wizard* in the *Quick Find* box, then select **Data Import Wizard**.
2. Click **Launch Wizard**.
3. Select **Leads**, then select **Update existing records**.
4. Set *Match Lead by* to Salesforce.com ID.
5. Select the CSV file that contains your import data, and click **Next**.
6. Map the *Lead ID* field to the Lead ID column in your CSV file, and map the other fields.
7. Click **Next**.
8. Review the import settings, and then click **Start Import**.

To Update Accounts or Contacts

1. From Setup, enter *Data Import Wizard* in the *Quick Find* box, then select **Data Import Wizard**.
2. Click **Launch Wizard**.
3. Select **Accounts and Contacts**, then select **Update existing records**.
4. Set *Match Contact by* to Salesforce.com ID.
5. Set *Match Account by* to Salesforce.com ID.
6. Select *Update existing Account information*.
7. Select the CSV file that contains your import data, and click **Next**.
8. Map the contact ID, phone, and address fields to the relevant columns in your CSV file.
9. Map the account ID and other fields to the relevant columns in your CSV file.
10. Click **Next**.
11. Review the import settings, and then click **Start Import**.

The Data Import Wizard matches the record IDs in your file with the record IDs in Salesforce and updates the fields that were mapped.

SEE ALSO:

[Data Import Wizard](#)

Why do date fields import incorrectly when I use the Data Loader?

When importing date fields using the Data Loader, sometimes dates import incorrectly because the Data Loader converts the date specified in the imported .csv file to GMT. If your machine's time zone isn't GMT or if your machine's clock adjusts for daylight savings time (DST), your dates may be off by a day.

To prevent the Data Loader from adjusting the date when it converts to GMT, directly change the format of cells containing dates to reflect the native time zone.

1. Open your .csv file in Microsoft® Excel®.
2. In each cell in which you entered dates, add hour data to represent the native time zone. For example, if the date is June 9, 2011 and the time zone is GMT+8, enter *June 9, 2011 8:00*. Excel will reformat this to *6/9/2011 8:00*.
3. Right-click the cell in which you entered dates, and click **Format Cells**.
4. Click **Number > Custom**.
5. In **Type**, enter *yyyy-mm-ddThh:mm:ss.sssZ*. For example, if the cell was *6/9/2011 8:00*, it's now *2011-06-09T08:00:00.00Z*.

How long does it take to import a file?

For the individual user import wizard, the length of time required depends on the amount of data, but on average it only takes a few minutes.

The administrator import wizards work asynchronously, and you will receive a notification email after your file has been successfully imported. The asynchronous import can take a few minutes to no more than 24 hours.

 **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the **Quick Find** box, then select **Data Import Wizard**. The options you see depend on your permissions.

Why might there be a delay in importing my file?

In order to manage the volume of imports and ensure that all users receive the highest level of performance, organization import files are accepted in "asynchronous" mode. This means that your file passes through a controlled queue and will be imported when the system can best manage the data, however your organization import will not take longer than 24 hours to complete. You will receive a notification email when the import is complete.

Can I import amounts in different currencies?

If your Group, Professional, Enterprise, Unlimited, Performance, or Developer Edition organization has set up the ability to use multiple currencies, you can import amounts in different currencies using the **Currency ISO Code** column in your import file.

Can Customer Support help me import my data?

Customer Support is available to assist Group, Contact Manager, Professional, Enterprise, Unlimited, and Performance Edition organizations throughout the import process.

Can I import data in more than one language?

The import wizard imports one language at a time, the language of the user doing the import. If you have the same data in different languages, run an import for each additional language.

! **Important:** Salesforce has replaced the individual import wizards for accounts, contacts, and other objects with the Data Import Wizard. Individual import wizards open in small popup windows, while the Data Import Wizard opens in a full browser with `dataimporter.app` at the end of the URL. From Setup, enter *Data Import Wizard* in the `Quick Find` box, then select **Data Import Wizard**. The options you see depend on your permissions.

How do I perform mass updates to records?

To update more than 50,000 but less than 5 million records, use Data Loader.

To update more than 5 million records, we recommend you work with a Salesforce partner or visit the [AppExchange](#) for a suitable partner product.

How do I update fields with blank values?

To replace fields with null values, you must use Data Loader.

1. Choose **Start > All Programs > Salesforce > Data Loader > Data Loader** to open Data Loader.
2. Click **Export** and complete the wizard. When the operation finishes, click **View Extraction**.
3. Click **Open in external program** to open your data in Excel. Blank out the fields you want to update.
4. In Data Loader, choose **Settings > Settings**, and select **Insert null values**. Click **OK** to save your settings.
5. Click **Update** and follow the wizard to reimport your data.

What is an external ID?

When importing custom objects, solutions, or person accounts, you can use external IDs to prevent the import from creating duplicate records.

An external ID is a custom field that has the External ID attribute, meaning that it contains unique record identifiers from a system outside of Salesforce. When you select this option, the Data Import Wizard detects existing records in Salesforce with external IDs that match those in the import file. This operation is not case-sensitive. For example, "ABC" is matched with "abc". However, if the external ID field also has the case-sensitive Unique attribute, uppercase and lowercase letters aren't considered identical.

Why are there two import options under Manage Members for campaigns?

You can access the Data Import Wizard from any campaign detail page. Click **Manage Members** and select one of these options.

- **Add Members - Import File**—Add contacts, leads, or person accounts to the campaign.
- **Update Members - Import File**—Update the statuses of campaign members.

SEE ALSO:

[Importing Campaign Members](#)

How many campaign members can I import?

With the Data Import Wizard, your import file can have up to 50,000 record rows. Your imports are also subject to the overall storage limits for your org.

Who can import campaign members?

Only users with the required permissions can import campaign members with the Data Import Wizard.

Import Option	User Permissions Needed
To update campaign member statuses via the Data Import Wizard:	Marketing User selected in your user information AND "Read" on contacts OR "Import Leads" AND "Edit" on campaigns
To add contacts that you own to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Create" on accounts AND "Read" on contacts AND "Edit" on accounts and campaigns AND "Import Personal Contacts"
To create contacts that you own and add them to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Create" on accounts AND "Read" on contacts AND "Edit" on accounts and campaigns AND "Import Personal Contacts"
To add contacts owned by others to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Create" on accounts AND "Read" on contacts AND "Edit" on accounts, contacts, and campaigns AND

Import Option	User Permissions Needed
	"Modify All Data"
To create contacts owned by others and add them to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Create" on accounts AND "Read" on contacts AND "Edit" on accounts, contacts, and campaigns AND "Modify All Data"
To add existing leads to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Edit" on campaigns AND "Import Leads"
To create leads and add them to a campaign via the Data Import Wizard:	Marketing User selected in your user information AND "Edit" on campaigns AND "Import Leads"
To add person accounts that you own to a campaign via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts AND "Import Personal Contacts"
To add person accounts owned by others to a campaign via the Data Import Wizard:	"Create" on accounts AND "Edit" on accounts and contacts AND "Modify All Data"

What status is assigned to campaign members?

With the Data Import Wizard, you can map a column in your import file to the `STATUS` field. Blank or invalid status values are set to the default status.

Manage Data

Exporting Backup Data

Your Salesforce org can generate backup files of your data on a weekly or monthly basis depending on your edition. You can export all your org's data into a set of comma-separated values (CSV) files.

 **Note:** Users with the “Weekly Export” permission can view all exported data and all custom objects and fields in the Export Service page. This permission is granted by default only to the System Administrator profile because it enables wide visibility.

You can generate backup files manually once every six days (for weekly export) or 28 days (for monthly export). You can also schedule backup files to generate automatically at weekly or monthly intervals.

Heavy traffic can delay an export delivery. For example, assume that you schedule a weekly export to run until the end of the month, beginning April 1. The first export request enters the queue, but due to heavy traffic, the export isn't delivered until April 8. On April 7, when your second export request is scheduled to be processed, the first request is still in the queue, so the second request isn't processed until April 14.

- From Setup, enter `Data Export` in the `Quick Find` box, then select **Data Export** and **Export Now** or **Schedule Export**.
 - The **Export Now** option prepares your files for export immediately. This option is only available if enough time has passed since your last export.
 - The **Schedule Export** option allows you to schedule the export process for weekly or monthly intervals.
- Select the desired encoding for your export file.
- Select `Include images, documents, and attachments` and `Include Chatter files and Salesforce CRM Content document versions` to include these items in your export data.

 **Note:** Selecting `Include images, documents, and attachments` and `Include Chatter files and Salesforce CRM Content document versions` increases data export processing time.
- Select `Replace carriage returns with spaces` to have spaces instead of carriage returns or line breaks in your export files. This selection is useful if you plan to use your export files for importing or other integrations.
- If you're scheduling your export, select the frequency (only available for orgs with monthly exports), start and end dates, and time of day for your export.
- Under `Exported Data`, select the types of data to include in your export. We recommend that you select **Include all data** if you are not familiar with the terminology used for some of the types of data. Note the following:
 - Formula and roll-up summary fields are always excluded from exports.
 - If your org uses divisions, data from all divisions is included in the export.
 - If your org uses person accounts and you are exporting accounts, all account fields are included in the account data.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Weekly export available in: **Enterprise, Performance,** and **Unlimited** Editions

Monthly export available in: **All** editions, except for Database.com

USER PERMISSIONS

To export data:

- “Weekly Export”

- If your org uses person accounts and you are exporting contacts, person account records are included in the contact data. However, the contact data only includes the fields shared by contacts and person accounts.
- For information on field limitations, see the [Salesforce Field Reference Guide](#).

7. Click **Start Export** or **Save**.

Salesforce creates a zip archive of CSV files and emails the user who scheduled the export when it's ready. Exports complete as soon as possible, however we can't guarantee the date and time of completion. Large exports are broken up into multiple files. Follow the link in the email or click **Data Export** to download the zip file. Zip files are deleted 48 hours after the email is sent.

 **Note:** For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

 **Tip:** Any automated processes that process the export files should rely on the column headings in the CSV files, rather than the position of the columns.

Depending on the encoding selected, you might have to make adjustments to the export file before viewing it. Use the following instructions that apply to the character encoding you selected.

Backup Data Export Considerations

No Sandbox Support

The data export service isn't supported in sandboxes. You can request an export in your sandbox, but the export doesn't get processed and doesn't complete. The only way to remove the export request after it's been queued is to refresh your sandbox.

File Size Considerations

Multiple .csv files and .zip archives are created if the size of data in the org is large.

- A single .csv file can hold up to approximately 150 MB of data. If an object contains more than 150 MB of data, multiple .csv files are created for the object.
- Each .zip archive file contains one or more .csv files and can be to 512 MB (approximately). The export generates multiple .zip files if the total size of exported data is greater than 512 MB.

Viewing Unicode (UTF-8) Encoded Export Files

If you have Microsoft Excel 2003:

1. Open Microsoft Excel.
2. Click **File > New**.
3. Click **Data > Import External Data > Import Data**.
4. Select the CSV file to open and Microsoft Excel launches the text import wizard.
5. Select "Delimited" and choose the "Unicode (UTF-8)" option for File origin.
6. Click **Next**.
7. Select "Comma" in the Delimiters section and click **Finish**. You might be prompted to select a range of cells.

 **Note:** If commas are not appropriate for your locale, use a tab or other delimiter.

8. Repeat these steps for each file.

If you have an earlier version of Microsoft Excel (pre-2003):

1. Open the file in Microsoft Excel.
2. Select **File > Save As**.
3. Save the file as type Web Page.
4. Select **Tools > Options > General** tab and click the **Web Options** button.
5. Select the Encoding tab, and then choose the "Unicode (UTF-8)" option.
6. Click **OK** to close the dialog boxes.
7. Select **File > Save** to save the file with selected encoding.
8. Repeat these steps for each file.

Viewing Unicode (UTF-16, Big Endian) Encoded Export Files

Open the export files in a text editor that supports this character set. Microsoft Excel does not support this character set.

Viewing Unicode (Little Endian) Encoded Export Files

1. Open the file in Microsoft Excel.
2. Click column A to highlight the entire first column.
3. Open the **Data** menu and choose **Text to Columns**.
4. Select the "Delimited" radio button and click **Next**.
5. Select "Comma" in the Delimiters section and click **Finish**.

Note: If commas are not appropriate for your locale, use a tab or other delimiter.

6. Repeat these steps for each file.

Transferring Records

A record owner, or any user above the owner in the role or territory hierarchy, can transfer a single record to another user. With some objects, like cases, leads, and campaigns, a user may be granted access to transfer records through sharing. Depending on the type of object, there may be multiple ways to transfer records to another user:

Method	Available for
Transfer a single record	Accounts, campaigns, cases, contacts, contracts, leads, and custom objects
Transfer multiple records by selecting the records from a list view and clicking Change Owner	Cases, leads, and custom objects, which can belong to either a user or a queue
Transfer multiple records using the Mass Transfer tool	Accounts, leads, and custom objects

Ability to Change Ownership

- Users with the “Modify All Data” permission, or users with the “Modify All” permission for the given object, can transfer any record, regardless of who owns the record.
- To transfer a single record or multiple records from a list view, the new owner must have at least the “Read” permission on the object type. This rule does not apply if you use the mass transfer tool.
- To transfer ownership of any single record in an organization that does not use territory management, a user must have the appropriate “Edit” permission and either own the record or be above the owner in the role hierarchy.

For example, to transfer ownership of an account, a user must have “Read” and “Edit” access to the account. Additionally, the new owner of the record must have at least “Read” permission on accounts.

The Public Full Access and Public Read/Write/Transfer sharing settings give all users the ability to transfer ownership of that type of record as long as they have the appropriate “Edit” permission.

- In organizations that use territory management, users that have been assigned to territories can be enabled to transfer the accounts in their territories, even if they are not the record owner.
- To transfer campaigns, users must also have the `Marketing User` checkbox selected on their user record.

Changing Ownership for Portal Accounts

- To transfer a Partner account, you must have the “Manage Users” or “Manage External Users” permission.
- If you are the owner of a Customer Portal account and want to transfer the account, you can transfer the account to any user in your same role without the need for special permission. You cannot transfer a Customer Portal account to a user with a higher or lower role.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Accounts, Campaigns, Contacts, Contracts, Leads, and Cases are not available in **Database.com**.

Contracts are available in: **Performance** and **Developer** Editions and in **Professional, Enterprise, and Unlimited** Editions with the Sales Cloud.

USER PERMISSIONS

To transfer multiple accounts, campaigns, contacts, contracts, and custom objects:

- “Transfer Record”
AND
“Edit” on the object type

To transfer multiple leads:

- “Transfer Leads” OR
“Transfer Record”
AND
“Edit” on leads

To transfer multiple cases:

- “Transfer Cases” OR
“Transfer Record”
AND
“Edit” on cases

- Partner accounts can only be transferred to users with the “Manage External Users” permission.
- To transfer a Portal account with both Customer and Partner Portal users, you must have the “Manage Users” permission.
- You cannot assign an account with Customer Portal users to an owner who is a partner user.

SEE ALSO:

[Mass Transfer Records](#)

Mass Transfer Records

Use the Mass Transfer tool to transfer multiple accounts, leads, service contracts, and custom objects from one user to another.

 **Note:** To transfer any records that you do not own, you must have the required user permissions as well as read sharing access on the records.

1. From Setup, enter *Mass Transfer Records* in the **Quick Find** box, then select **Mass Transfer Records**.
2. Click the link for the type of record to transfer.
3. Optionally, fill in the name of the existing record owner in the **Transfer from** field. For leads, you can transfer from users or queues.
4. In the **Transfer to** field, fill in the name of new record owner. For leads, you can transfer to users or queues.
5. If your organization uses divisions, select the **Change division...** checkbox to set the division of all transferred records to the new owner's default division.
6. When transferring accounts, you can:
 - Select **Transfer open opportunities not owned by the existing account owner** to transfer open opportunities owned by other users that are associated with the account.
 - Select **Transfer closed opportunities** to transfer closed opportunities associated with the account. This option applies only to closed opportunities owned by the account owner; closed opportunities owned by other users are not changed.
 - Select **Transfer open cases owned by the existing account owner** to transfer open cases that are owned by the existing account owner and associated with the account.
 - Select **Transfer closed cases** to transfer closed cases that are owned by the existing account owner and associated with the account.
 - Select **Keep Account Team** to maintain the existing account team associated with the account. Deselect this checkbox if you want to remove the existing account team associated with the account.
 - Select **Keep Opportunity Team on all opportunities** to maintain the existing team on opportunities associated with this account. Any opportunity splits are preserved, and split percentages assigned to the previous owner transfer to the new one. If this box is unchecked, all opportunity team members and splits are deleted when the opportunity is transferred.

 **Note:** If you transfer closed opportunities, the opportunity team is maintained, regardless of this setting.
7. Enter search criteria that the records you are transferring must match. For example, you could search accounts in California by specifying *Billing State/Province equals CA*.
8. Click **Find**.
9. Select the checkbox next to the records you want to transfer. Optionally, check the box in the column header to select all currently displayed items.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer** and **Database.com** Editions

Service Contracts available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions with the Service Cloud

Accounts and Leads not available in: **Database.com**

USER PERMISSIONS

To mass transfer accounts and service contracts:

- "Transfer Record"
- AND
- "Edit" on the object type
- AND
- "Transfer Leads"

To mass transfer custom objects:

- "Transfer Record"
- AND
- "Edit" on the object type

To mass transfer leads:

- "Transfer Leads" OR "Transfer Record"
- AND
- "Edit" on leads

 **Note:** If duplicate records are found, you must select only one of the records to transfer. Transferring duplicate records results in an error.

Duplicate records may display if you filter leads based on Campaign Member Status and a matching lead has the same campaign member status on multiple campaigns. For example, if you specify *Campaign Member Status equals Sent*, and a matching lead named John Smith has the status Sent on two campaigns, his record will display twice.

10. Click **Transfer**.

Transfer of Associated Items

When you change record ownership, some associated items that are owned by the current record owner are also transferred to the new owner.

Record	Associated items that are also transferred
Accounts	Contacts (on business accounts only), attachments, notes, open activities, open opportunities owned by the current account owner, and optionally, closed opportunities and open opportunities owned by other users.
Leads	Open activities. When transferring leads to a queue, open activities are not transferred.

Access to Transferred Items

When transferring accounts and their related data in Professional, Enterprise, Unlimited, Performance, and Developer Editions, all previous access granted by manual sharing, Apex managed sharing, or sharing rules is removed. New sharing rules are then applied to the data based on the new owner. The new owner may need to manually share the transferred accounts and opportunities as necessary to grant access to certain users.

SEE ALSO:

[Transferring Records](#)

Deleting Multiple Records and Reports

You can delete multiple reports or records at one time.

The record types you can mass-delete include cases, solutions, accounts, contacts, leads, products, and activities.

Here are some ways mass delete might be handy.

- You've identified multiple reports that are no longer used and you want to unclutter the list of reports on the Reports tab.
- You imported your organization's leads incorrectly and you want to start over.
- A user who recently left your organization had contacts that were duplicates of other users' data and you want to delete these duplicate contacts.
- Your organization used to enter leads as accounts with the `Type` field set to "Prospect." You now want to convert these accounts into leads.

Tip: Run a report of these accounts, export it to Excel, and then use the Import My Organization's Leads wizard to import the data as leads. Then using mass delete, select accounts as the record type to delete and enter "Type equals Prospect" to locate all accounts you want to delete.

- You want to delete all the leads that have been converted for your organization. Select the lead record type, enter "Converted equals 1" for the search criteria, then choose Search.
 - You want to clean up web-generated leads that were created incorrectly, or delete accounts and contacts with whom you no longer do business.
1. We strongly suggest you run a report to archive your information. You should also run a weekly export of your data; see [Exporting Backup Data](#) on page 706.
 2. From Setup, enter *Mass Delete Records* in the `Quick Find` box, then select **Mass Delete Records** and click the link for the type of record to delete.
 3. Review the information that will be deleted along with the records.
 4. Specify conditions that the selected items must match, for example, "State equals California."
 5. If you're deleting accounts, specify whether you want to delete accounts with attached closed/won opportunities or attached opportunities owned by other users.
 6. If you're deleting products, check **Archive Products** if you also want to delete products that are on opportunities. Check this option to:
 - Delete products that are not on opportunities and move them to the Recycle Bin.
 - Archive products that are on opportunities. These products are not moved to the Recycle Bin and cannot be recovered.

Leave this box unchecked to delete only those products that are not on opportunities. Selected products that are on opportunities will remain checked after the deletion to indicate they were not included in the deletion.
 7. Choose **Search** to find records that match, and select the items you want to delete. Optionally, check the box in the column header to select all currently displayed items.
 8. To permanently delete records, select `Permanently delete the selected records`.

Important: Selecting this option prevents you from recovering the selected records from the Recycle Bin.
 9. Click **Delete**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions**

This feature is only available in **Database.com** via the API. You can only mass delete records of custom objects in **Database.com**.

USER PERMISSIONS

To mass delete data:

- "Modify All Data"

If you did not select `Permanently delete the selected records`, deleted items are moved to the Recycle Bin.

SEE ALSO:

[Notes on Using Mass Delete](#)

[Undoing an Import](#)

[Using Mass Delete to Undo Imports](#)

Notes on Using Mass Delete

Consider the following when using mass delete:

General Notes About Mass-Deleting

- You can delete up to 250 items at one time.
- When you delete a record, any associated records that display on that record's related lists are also deleted.
- Only reports in public report folders can be mass-deleted.
- You can't mass-delete reports that are attached to dashboards, scheduled, or used in reporting snapshots.

Notes About Mass Delete for Sales Teams

- You can't delete partner accounts that have partner users.
- Products on opportunities cannot be deleted, but they can be archived.
- When you mass-delete products, all related price book entries are deleted with the deleted products.
- When you delete activities, any archived activities that meet the conditions are also deleted.
- When you delete activities, requested meetings aren't included in the mass-delete until they are confirmed and automatically converted to events.
- When you delete recurring events, their child events are not displayed in the list of possible items to delete, but they are deleted.

Notes About Mass Delete for Service Teams

- Accounts and contacts associated with cases cannot be deleted.
- Contacts enabled for Self-Service, and their associated accounts, cannot be deleted.
- Deleting a master solution does not delete the translated solutions associated with it. Instead, each translated solution becomes a master solution.
- Deleting a translated solution removes the association with its master solution.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

This feature is only available in **Database.com** via the API. You can only mass delete records of custom objects in **Database.com**.

USER PERMISSIONS

To mass delete data:

- "Modify All Data"

Mass Update Addresses

When your data is consistent, your reports and related metrics are more accurate and easier to understand. For example, having different abbreviations for a country or state can skew your data. To make your addresses consistent, you can update country and state/province information in existing fields at one time.

You can mass update addresses in contacts, contracts, and leads.

 **Tip:** To ensure data consistency in new records, consider using state and country picklists.

1. From Setup, enter *Mass Update Addresses* in the **Quick Find** box, then select **Mass Update Addresses**.
2. Select **Countries** or **State/Province**. If you chose State/Province, enter the country in which to update the state or province.
3. Click **Next**.
4. Select the values to update and click **Add**. The Selected Values box displays the values to update. The Available Values box displays the address values found in existing records. To find more addresses to update, enter all or part of a value and click **Find**.
If your organization has large amounts of data, instead of using the Available Values box, enter existing values to update in the text area. Separate each value with a new line.
5. In the **Replace selected values with** field, enter the value with which to replace the specified address data, and click **Next**. If your organization has large amounts of data, this field is called **Replace entered values with**.
The number and type of address records to update are displayed. If you have large amounts of data, only the values to update are displayed.
6. Click **Replace** to update the values.

Scalability FAQ

- [How scalable is Salesforce?](#)
- [Will I see a degradation in performance as Salesforce's subscriber base grows?](#)

How scalable is Salesforce?

The service has the capacity to scale to the largest of teams. The architecture behind the service was designed to handle millions of users. We scale as rapidly as our customers require.

Will I see a degradation in performance as Salesforce's subscriber base grows?

No. We are very conscious of performance and have designed the service to be scalable in such a way that we can constantly stay ahead of customer demand. Our architecture allows us to easily add web and application servers to accommodate more users. The system architecture also allows us to add more database servers as needed to accommodate more users. In addition, the facility that houses our servers provides us with guaranteed bandwidth, which we can increase as needed.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **All Editions** except for **Database.com**.

To mass update addresses of contracts:

- "Modify All Data"

AND

"Activate Contracts"

Force.com Platform Cache

Define Partitions for Data Cached with Force.com Platform Cache

Using the Platform Cache can enable applications to run faster, by allowing them to store reusable data in memory. Applications can quickly access this data, removing the need to duplicate calculations and requests to the database on subsequent transactions.

To use Platform Cache, first set up partitions using the Platform Cache Partition tool in Setup. Once you've set up partitions, you can add, access, and remove data from them using the Platform Cache Apex API.

Use Platform Cache partitions to improve the performance of your applications. Partitions allow you to distribute cache space in the way that works best for your applications. Caching data to designated partitions ensures that it's not overwritten by other applications or less-critical data.

To access the Partition tool in Setup, enter *Platform Cache* in the **Quick Find** box, then select **Platform Cache**.

Use the Platform Cache Partition tool to:

- Request trial cache.
- Create, edit, or delete cache partitions.
- Allocate the session cache and org cache capacities of each partition to balance performance across apps.
- View a snapshot of the org's current cache capacity, breakdown, and partition allocations (in KB or MB).
- View details about each partition.
- Make any partition the default partition.

To use Platform Cache, create at least one partition. Each partition has one session cache and one org cache segment and you can allocate separate capacity to each segment. Session cache can be used to store data for individual user sessions, and org cache is for data that any users in an org can access. You can distribute your org's cache space across any number of partitions. Session and org cache allocations can be zero, or five or greater, and they must be whole numbers. The sum of all partition allocations, including the default partition, equals the Platform Cache total allocation. The total allocated capacity of all cache segments must be less than or equal to the org's overall capacity.

You can define any partition as the default partition, but you can have only one default partition. When the capacity of the default partition is used up and is zero, you can't create more partitions. When a partition has no allocation, cache operations (such as get and put) are not invoked and no error is returned.

Capacity calculations occur every 5 minutes by default. To make sure you're seeing the latest capacity and allocation, click **Recalculate**.

SEE ALSO:

[Apex Developer Guide](#)

[Request a Platform Cache Trial](#)

[Purchase Platform Cache](#)

Request a Platform Cache Trial

If you want to test performance improvements by using Platform Cache in your own org, you can request trial cache for your production org. Enterprise, Unlimited, and Performance editions come with some cache, but adding more cache often provides greater performance. When your trial request is approved, you can allocate capacity to partitions and experiment with using the cache for different scenarios. Testing the cache on a trial basis lets you make an informed decision about whether to purchase cache.

Salesforce usually approves trial cache requests in three days. When your request is approved, you receive 30 MB of trial cache space (10 MB if you have Developer Edition). If you need more trial cache space, contact Salesforce.

 **Note:** You can make up to 10 trial cache requests, and you must wait 90 days between trials.

After you request trial cache, you receive emails at the following intervals.

At activation

You can now allocate capacity to partitions and test the trial cache in your org.

Three days before expiration

Before expiration, be sure to reconfigure your partitions to deallocate the added trial space.

At expiration

The trial cache is removed from your org.

 **Note:** If you haven't deallocated enough space, Salesforce reduces your partition sizes to remove the granted trial cache space.

Developer Edition Orgs

You can request trial cache for a Developer Edition org. After you sign up for the org, request trial cache from the Platform Cache Partition tool. ISVs who are using Developer Edition orgs to create managed packages can get 10 MB of trial cache for up to two Developer Edition orgs. ISVs can contact their Salesforce representative to get trial cache in Developer Edition orgs.

Cache Reduction Algorithm

At the end of your trial period, Salesforce removes the granted trial cache space from your org. Before your trial ends, make sure that you've deallocated your trial cache space. You can deallocate space from the Platform Cache Partition tool by resetting partition allocations. If you don't deallocate the cache space, Salesforce removes the granted cache using the following process.

- The system removes cache from the smallest non-default partition first.

 **Note:** The size of a partition is the total allocation for the partition, which includes org-wide cache and namespace-specific cache.

- The system then works its way through the partitions from smallest to largest in size. If multiple partitions have the same size, the system proportionally removes cache from these partitions.
- The system reduces partitions to a minimum size of 5 MB, unless all the trial cache space can't be removed. In this case, partitions are reduced to 0 MB.
- The default partition (if it exists) is reduced last only if the trial cache space can't be removed from all other partitions.

If unallocated space is present:

- If the amount of unallocated space is greater than the amount of space that must be removed, the system removes only unallocated space.
- If the amount of unallocated space is less than the amount of space that must be removed, the system removes the unallocated space first. The system then follows the cache reduction process to remove the remaining amount.

SEE ALSO:

[Define Partitions for Data Cached with Force.com Platform Cache](#)

[Purchase Platform Cache](#)

Purchase Platform Cache

You can purchase Platform Cache space to improve the performance of your application.

Platform Cache is available to customers with Enterprise Edition orgs and above. The following editions come with some default cache space, but often, adding more cache gives even greater performance enhancements.

- Enterprise Edition (10 MB by default)
- Unlimited Edition (30 MB by default)
- Performance Edition (30 MB by default)

To determine how much cache would be beneficial to your applications, you can request trial cache and try it out in your org. Platform Cache can improve performance in the following situations, among many others.

- Orgs with a large amount of Apex customization
- Orgs with large numbers of concurrent users
- Orgs or applications with complex calculations or queries

In addition, ISVs can purchase cache for use with the applications they provide to customers.

Cache space is sold in 10-MB blocks, with an annual subscription. To purchase Platform Cache, contact your Salesforce representative.

Manage Duplicate Records in Salesforce

Maintaining clean and accurate data is one of the most important things you can do to help your organization get the most out of Salesforce. Use Data.com Duplicate Management to control whether and when users can create duplicate records in Salesforce; customize the logic that's used to identify duplicates; and create reports on the duplicates that users save.

 **Note:** Duplicate Management uses Data.com technology, but does *not* require a Data.com license.

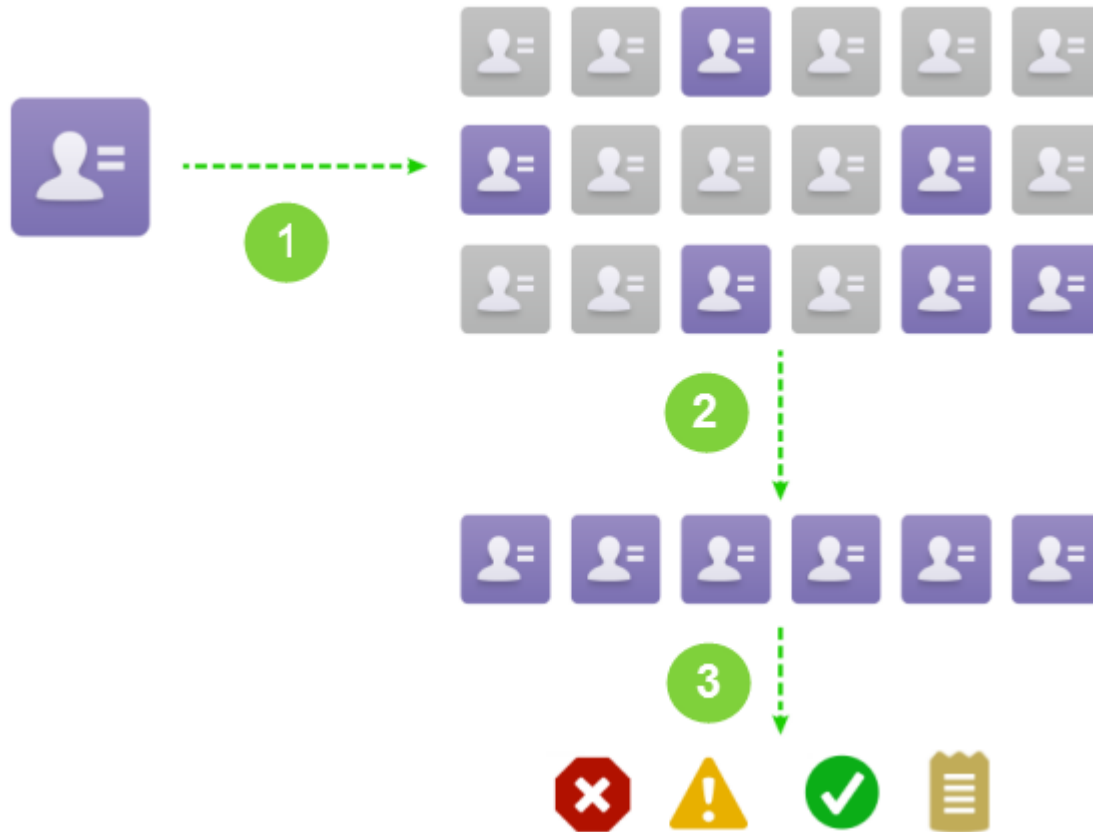

Starting in Spring '16, all new Salesforce orgs come with Duplicate Management features already set up and turned on for accounts, contacts, and leads. Other orgs must manually set up and activate Duplicate Management features. After Duplicate Management is set up, here's how it works.

- *When a user attempts to save a new record*, the record is first compared with existing Salesforce records to identify possible duplicates (1). The criteria used to compare records and identify the possible duplicates are defined by a *matching rule*. Next, a list of possible duplicates is returned (2). What happens when the record being saved is identified as a possible duplicate depends on what's defined in the *duplicate rule* (3). For example, the duplicate rule could block users from saving the possible duplicate record or allow them to save it anyway. Both the Block and Allow options include an alert, which tells users why they can't save the record and what they need to do. The Allow option includes the ability to report on the duplicate records.
- *When a user attempts to save an edited record*, the record is first checked to see if the user has changed the value of a matching rule field. If so, the duplicate management process works as described for new records. If not, no further action is taken and duplicates are not detected.

Here's some additional information that will help you understand how matching rules work and how to use them.

[Duplicate Rule Reference](#)

Here's some additional information that will help you understand how duplicate rules work and how to use them.

[Duplicate Management FAQs](#)

Answers to common questions about Data.com Duplicate Management.

Considerations for Using Duplicate Management

Data.com Duplicate Management includes limits for duplicate rules, matching rules, and duplicate record sets.

Considerations for Duplicate Rules

- Duplicate rules are available for accounts, contacts, leads, and custom objects. All other objects, including Opportunities and Person Accounts, are not currently supported.
- Duplicate rules don't run when:
 - Records are created using Quick Create.
 - Leads are converted to accounts or contacts *and* your organization doesn't have the "Use Apex Lead Convert" permission.
 - Records are restored with the **Undelete** button.
 - Records are added using Lightning Sync.
 - Records are manually merged.
 - A Self-Service user creates records and the rules include conditions based on the User object.
 - Duplicate rule conditions are set for lookup relationship fields and records with no value for these fields are saved. For example, you have a condition that specifies a duplicate rule only runs when `Campaign DOES NOT CONTAIN 'Salesforce'`. Then, if you add a record with *no value* for the `Campaign` field, the duplicate rule doesn't run.
- Sometimes, if duplicate rules are set for an alert to show when duplicates are found, users are *always* blocked from saving records and *do not* see a list of duplicates. This situation happens when:
 - Records are added using the data import tools.
 - A person account is converted to a business account (and the newly created business account matches existing business accounts).
 - Records are added or edited using Salesforce APIs.
- If you're saving multiple records at the same time and your duplicate rules are set to *Block* or *Alert*, records within the same save aren't compared to each other; they are only compared with records already in Salesforce. This behavior doesn't affect the *Report* action, and duplicate record sets include records that match other records in the same save.
- Custom picklists are not supported when they're included in a matching rule that's used in a cross-object duplicate rule.
- The customizable alert text in duplicate rules isn't supported by the Translation Workbench.
- Up to 5 active duplicate rules are allowed per object.
- Up to three matching rules are allowed per duplicate rule, and each matching rule must be of a different object.
- Starting in Spring '15, all new Salesforce orgs come with Duplicate Management features turned on for accounts, contacts, and leads. New orgs come with standard account, contact, and lead duplicate rules. Each duplicate rule is associated with a matching rule. You can deactivate these rules or create custom rules.

Considerations for Matching Rules

- Matching rules are available for accounts, contacts, leads, and custom objects. All other objects, including Opportunities and Person Accounts, are not currently supported.
- Standard and custom matching rules that use fuzzy matching methods only support Latin characters, and, if you're using international data, we recommend using the Exact matching method with your matching rules.
- If a field on an object is no longer available to your organization, it could cause matching rules with mappings to this field to be ignored and duplicate detection to be affected. Check all duplicate rule field mappings for an object if there is a change to the fields available to your organization. For example, the `Clean Status` field is only available to customers with a Data.com license. If your organization no longer has a Data.com license, this field is no longer available and matching rules with mappings to this field are ignored.
- Only 1 lookup relationship field is allowed per matching rule.

- Up to 5 active matching rules are allowed per object.
- Up to 25 total active matching rules are allowed.
- Up to 100 total matching rules are allowed (both active and inactive).
- Up to 5 matching rules can be activated or deactivated at a time.
- Matching rules that include fields with Platform Encryption do not detect duplicates. If your organization has Platform Encryption enabled, make sure that your matching rules do not include encrypted fields.

Considerations for Duplicate Record Sets

- By default, duplicate record sets are visible to only administrators, but the administrator can grant visibility to other users.
- If a lead is identified as a duplicate but converted before the duplicate record set is created, the converted lead isn't included in a duplicate set.

Duplicate Rules

Duplicate rules are used to control whether and when you can save duplicate records within Salesforce.

Duplicate rules tell Salesforce what action to take when you attempt to create a duplicate record. Each duplicate rule requires at least one matching rule to identify which existing records are possible duplicates.

You can configure your duplicate rule to do something when a record is created and edited. However, the rule only runs for edited records if the fields being edited are included in the associated matching rule.

Starting in Spring '15, all new Salesforce orgs come with standard duplicate rules already set up and activated for accounts, contacts, and leads. We recommend that you use the standard duplicate rules, because they're designed to work with the standard matching rules to return the best possible match candidates. You can deactivate the standard duplicate rules at any time. You can also create custom duplicate rules.

 **Example:** The duplicate rule can block you from saving records that have been identified as possible duplicates or allow them to save them anyway. Both the Block and Allow options include an alert, which tells you why you can't save the record and what you need to do. The Allow option includes the ability to report on the duplicate records.

SEE ALSO:

[Create or Edit Duplicate Rules](#)

[Manage Duplicate Records in Salesforce](#)

Matching Rules

Matching rules are used to identify duplicate records within Salesforce.

Watch a video:  [Understanding Matching Rules](#)

A matching rule is made up of individual fields that are assembled into an equation. Each field contains matching criteria that tell the rule how to compare the fields and what conditions need to be met for the specific field to be considered a match.

After a matching rule is activated, one or more match keys are automatically created and applied to existing records. (Also known as indexing, this process improves performance and returns a better set of match candidates because the matching rule is only looking for duplicates among records with the same match key.)

When the matching rule is run, it compares the record's match keys against those for existing records. Then, for records that share the same match keys, the matching rule uses matching algorithms to compare fields and determine how closely the fields, and ultimately the records, match. If two records' don't share the same match keys, they are not considered duplicates and the matching algorithms will not even be applied to them.

 **Example:** A simple matching rule might specify that if two records' `Email` and `Phone` values match exactly, they are possible duplicates. Or you can use a variety of "fuzzy" matching methods to compare the fields.

Use matching rules with duplicate rules to manage whether and when users are allowed to create duplicate records within Salesforce.

You can use the standard matching rules or create your own custom matching rule. We recommend you use the standard matching rules because they've been carefully designed to return the best possible set of match candidates.

SEE ALSO:

[Create or Edit Custom Matching Rules](#)

[Matching Rule Reference](#)

Duplicate Record Sets

Quickly see a list of duplicate records, grouped into duplicate sets, by clicking the Duplicate Record Sets tab. To do so, your organization needs to use the report action with its duplicate rules.

When a user saves a record that's identified as a duplicate by a duplicate rule with the report action:

- The saved record and all its duplicates, up to 100, will be assigned to a new or existing duplicate record set.
- The saved record and each of its duplicates will be listed as a duplicate record item within the duplicate record set.
- If the duplicate rule is configured to find duplicates across objects, all cross-object duplicates will be listed as duplicate record items within the duplicate record set.

Duplicate record sets and duplicate record items can be used to do the following.

- [Create custom report types](#)
- Create custom fields
- Write validation rules, triggers, and workflow rules
- Modify the fields that can appear on the respective page layouts

SEE ALSO:

[Considerations for Using Duplicate Management](#)

Duplicate Error Logs

If your organization uses Data.com Duplicate Management, you can view any system errors that prevent the duplicate rules or matching rules from running successfully.

From Setup, enter *Duplicate Error Logs* in the Quick Find box, then select **Duplicate Error Logs**. There, you can see which, if any, errors occurred. Error logs are deleted after 90 days.

 **Example:** Here are some scenarios that could produce an error on the log.

- The match engine used for fuzzy matching is temporarily unavailable. Therefore, any matching rules that include fuzzy matching methods will not run.
- The Report action on duplicate rules fails because the system is unable to create a duplicate record set.

Title			

- All duplicate rules include a system-generated message (1) that tells the user how many possible duplicates were found. The number of possible duplicates includes only the records the user has access to, even if the duplicate rule's record-level security was set to *Bypass sharing rules*. (The *Bypass sharing rule* option tells the associated matching rule to compare all records, regardless of the user's access.) If the user doesn't have access to any of the records that are identified as possible duplicates, then this message just says there are duplicates detected and the number of duplicates isn't included. The list of possible duplicates displayed only includes records the user has access to.
- If your duplicate rule includes an alert, it will appear beneath the system-generated message (2).
- If your duplicate rule allows users to save a record even though it might be a possible duplicate, the **Save (Ignore Alert)** button is present (3). If your duplicate rule blocks users from saving a record that is a possible duplicate, the **Save** button is present but the record cannot be saved successfully until the user makes the necessary changes to the record so it's no longer flagged as a possible duplicate.
- The list of possible duplicates (4) includes only records the user has access to. The fields shown in the list include only fields the user has access to (up to the first 7 fields that were compared by the associated matching rule). A maximum of 5 records are displayed in this list, but if more than 5 duplicates are found, users can click **Show All >>** to see full list of records, up to 100. Records are listed in the order they were last modified. Users can go directly to one of the records in the list by clicking on its link.
- The highlighted fields (5) are the fields that were compared by the associated matching rule and determined to match.

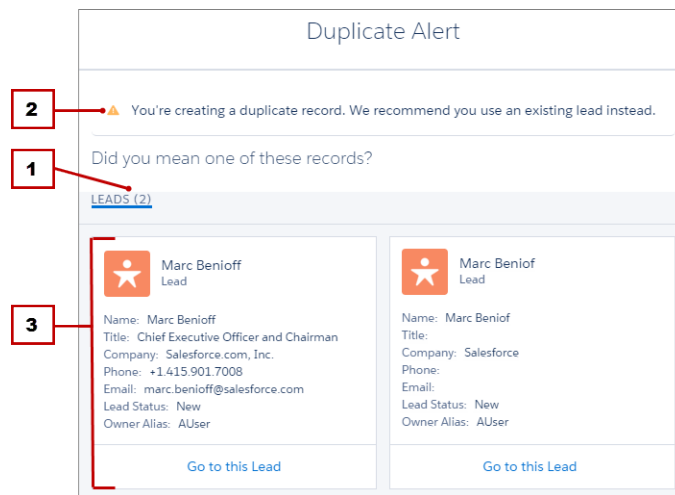

How Duplicate Management Affects Your Users in Lightning Experience

In Lightning Experience, when you've created and activated duplicate rules, duplicates are detected even before a record is saved. It's like a magic show without the cape and wand! If your users try to enter data on a record, edit data on a record, or save a record identified as a possible duplicate, here's what they see.

As soon as a user enters or edits data on a record, duplicate rules run. A general alert appears if duplicates are detected—not the customizable alert associated with your duplicate rules. The alert includes the number of potential duplicates. This number includes only the records the user has access to, even if the duplicate rule's record-level security was set to *Bypass sharing rules*. Users can click the alert to review the matching Salesforce records.

If your users try to save a record identified as a possible duplicate, here's what they see.

- All duplicate rules include a system-generated message (1) that tells the user how many possible duplicates were found. The number of possible duplicates includes only the records the user has access to, even if the duplicate rule's record-level security was set to *Bypass sharing rules*. (The *Bypass sharing rule* option tells the associated matching rule to compare all records, regardless of the user's access.) If the user doesn't have access to any of the records that are identified as possible duplicates, then this message just says there are duplicates detected and the number of duplicates isn't included. The list of possible duplicates displayed only includes records the user has access to.
- If your duplicate rule includes an alert, it will appear above the system-generated message (2).

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- If your duplicate rule allows users to save a record even though it might be a possible duplicate, they can close this dialog and save the record like they normally would. If your duplicate rule blocks users from saving a record that is a possible duplicate, the record cannot be saved successfully until the user makes the necessary changes to the record so it's no longer flagged as a possible duplicate.
- The list of possible duplicates (3) includes only records the user has access to. The fields shown in the list include only fields the user has access to (up to the first 7 fields that were compared by the associated matching rule). Records are listed in the order they were last modified. Users can go directly to one of the records in the list by clicking on its link.

Set Up Duplicate Management in Salesforce

To use Data.com Duplicate Management in your organization, you need two separate rules: a duplicate rule and a matching rule. The duplicate rule tells Salesforce what action to take when duplicates are identified. The matching rule defines how records are compared to one another to identify possible duplicates.

- ❗ **Important:** Starting in Spring '15, all new Salesforce orgs come with Duplicate Management features set up and activated for accounts, contacts, and leads. New orgs come with standard account, contact, and lead duplicate and matching rules.

[Create or Edit Duplicate Rules](#)

Use duplicate rules to define what happens when a user tries to save a duplicate record.

[Create or Edit Custom Matching Rules](#)

Use matching rules to determine how two records are compared and identified as duplicates.

[Create Custom Report Types for Duplicate Record Reports](#)

If your organization uses the Report action with its duplicate rules, you can run reports to analyze the quality of your data and to see how well your duplicate rules are working. That way, you can fine tune your duplicate rules if needed. First, you'll need to set up the appropriate custom report types.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Create or Edit Duplicate Rules

Use duplicate rules to define what happens when a user tries to save a duplicate record.

Watch a demo: [Managing Duplicate Records in Salesforce with Duplicate Rules](#)

In order for users to see the list of possible duplicates detected by the duplicate rule, they must have read access to the object defined in the rule.

1. From Setup, enter *Duplicate Rules* in the **Quick Find** box, then select **Duplicate Rules**.

2. To edit an existing rule, click the rule name, then click **Edit**. To create a new rule, click **New Rule**, then select the object you want the rule to apply to.

3. Enter the rule details, including the rule's name, description, and record-level security settings.

4. Select which action will occur when a user tries to save a duplicate record.

If the action includes an alert to users, we'll provide default alert text that you can customize. Only the Allow action includes the report option.

5. In the Matching Rules section, first select the object that records will be compared with. Then select which matching rule will determine how records are identified as duplicates.

The list includes all available matching rules for the selected object. If none of the matching rules in the list are what you want, select **Create New Matching Rule**.

 **Tip:** We recommend you use the standard matching rules because they've been carefully designed to return the best possible set of match candidates. Just be sure you've activated them.

If, however, you decide to create a new matching rule, we recommend you first finish creating your duplicate rule. Then create and activate the new matching rule. When you come back to the duplicate rule, it will automatically have the newly created matching rule associated it, as long as it didn't already have an associated matching rule.

6. Make sure you've selected the field mapping for each matching rule, if needed.

If the matching rule is comparing records from two different objects or uses custom fields:

- You'll need to decide how you want the fields from the first object to be compared to the fields from the second object. For example, you might map a custom field called `work_email` to the standard `Email` field.
- Some data may be truncated prior to matching two text fields with different maximum lengths.

7. If you want your duplicate rule to run only if specific conditions are met, specify the conditions.

For example, you could add a condition that tells the rule to run only if the record was entered by a user with a certain profile or role, or if the record includes a specific country or state.

8. Save the rule.

9. Activate the rule.

For the activation to succeed, all associated matching rules must be active.

10. If you have more than one active duplicate rule for a particular object, you may want to adjust the order in which the rules are processed. You can reorder rules by clicking **Reorder** from any rule's detail page.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create, edit, or delete duplicate rules:

- "Customize Application"

To activate and deactivate duplicate rules:

- "Customize Application"

To view duplicate rules:

- "View Setup and Configuration"

 **Tip:** If the first duplicate rule finds a match for a particular record, that record will not be evaluated by subsequent duplicate rules. Therefore, you should order your duplicate rule so that rules with the Block action are run before rules with the Allow action.

SEE ALSO:

[Duplicate Rules](#)[Matching Rules](#)

Create or Edit Custom Matching Rules

Use matching rules to determine how two records are compared and identified as duplicates.

 [Watch a Demo](#) (3:39)

1. From Setup, enter *Matching Rules* in the **Quick Find** box, then select **Matching Rules**.
2. If editing an existing matching rule, make sure the rule is inactive.
3. Click **New Rule** or **Edit** next to the existing rule you want to edit.
4. Select which object this matching rule will apply to.
5. Enter a name and description for the rule.
6. Enter the [matching criteria](#).

The matching criteria is where you define which fields to compare and how. To add additional fields (up to 10 total) click **Add Filter Logic...** and then **Add Row**.

7. If you need to adjust the matching equation, click **Add Filter Logic...** Here you can, for example, manually change an AND expression to an OR expression.
8. Save the rule.
9. Activate the rule.

The activation process may take some time, so we'll send you an email when the process is complete and your matching rule is ready to use.

After the matching rule is active, it's available to use with other Data.com Duplicate Management tools. For example, using a matching rule with a [duplicate rule](#) tells Salesforce to take certain actions when users try to save a record the matching rule has identified as a duplicate.

Create Custom Report Types for Duplicate Record Reports

If your organization uses the Report action with its duplicate rules, you can run reports to analyze the quality of your data and to see how well your duplicate rules are working. That way, you can fine tune your duplicate rules if needed. First, you'll need to set up the appropriate custom report types.

The only records that will appear in these reports are:

- Records identified as duplicates by duplicate rules that include the report action.
 - Records that were manually added to the Duplicate Record Set object.
1. Make sure you're familiar with custom report types and the general steps for creating and maintaining them.
 2. Create custom report types with the appropriate object relationships and configure them as necessary.

Here are some examples of custom report types to get you started.

Report Type	Possible Use	A (Primary Object)	B	Additional Steps
Account Duplicates	Create reports on the duplicate accounts that were found by your duplicate rules.	Accounts	Duplicate Record Items	
Contact Duplicates	Create reports on the duplicate contacts that were found by your duplicate rules.	Contacts	Duplicate Record Items	
Lead Duplicates	Create reports on the duplicate leads that were found by your duplicate rules.	Leads	Duplicate Record Items	
All Duplicates	Create reports to see how well your duplicate rules are performing.	Duplicate Record Set	Duplicate Record Items	Add the Duplicate Rule Name lookup field to the Duplicate Record Set page layout.

3. Deploy the report types you want to make available to users.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

4. Let users know that they can create reports using these custom report types.

[Duplicate Record Sets](#)

Matching Rule Reference

Here's some additional information that will help you understand how matching rules work and how to use them.

[Standard Matching Rules](#)

We've provided several standard matching rules that you can use with Data.com Duplicate Management tools, such as duplicate rules. Each standard matching rule has been carefully designed to return the best possible set of match candidates for accounts, contacts, or leads.

[Matching Criteria for Matching Rules](#)

Matching rules use criteria to determine how closely a field on a new or edited record matches the same field on an existing record, and, ultimately, whether the two records are duplicates. When you create a custom matching rule, you need to define certain criteria. For standard matching rules, the criteria are already defined for you.

[Matching Methods Used with Matching Rules](#)

The matching method is the part of the matching rule's matching criteria that determines how a specific field in one record is compared to the same field in another record. Each matching method is further defined by normalization criteria, match key definitions, matching algorithms, and other criteria.

[Matching Algorithms Used with Matching Methods](#)

The matching method and its corresponding matching algorithms are part of the matching rule's matching criteria. They help determine how a specific field in one record is compared to the same field in another record and whether the fields are considered matches.

[Match Keys Used with Matching Rules](#)

Match keys increase the effectiveness of matching rules. Review how match keys are used to create match key values for standard matching rules. By understanding match keys, you'll get a better sense of how duplicate detection works.

[Normalization Criteria for Matching Rule Match Keys](#)

As part of the process of creating match key values, matching rule field values are normalized. How a field value is normalized depends on several factors, including the matching method for that field, as specified in the matching rule. In addition, some commonly-used fields, which are used in the standard matching rules, are specially normalized to optimize duplicate detection.

[Matching Examples](#)

Check out some examples of matching rules in action to help you understand how records are compared and evaluated as duplicates.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Standard Matching Rules

We've provided several standard matching rules that you can use with Data.com Duplicate Management tools, such as duplicate rules. Each standard matching rule has been carefully designed to return the best possible set of match candidates for accounts, contacts, or leads.

Standard Account Matching Rule

Like all matching rules, the standard matching rule used for account records is made up of fields that are arranged into an equation. Each field contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

Standard Contact and Lead Matching Rule

Like all matching rules, the standard matching rule used for contact and lead records is made up of fields that are arranged into an equation. Each field also contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Standard Account Matching Rule

Like all matching rules, the standard matching rule used for account records is made up of fields that are arranged into an equation. Each field contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

Matching Equation

Important: In order for the Standard Account Matching Rule to return matches accurately, the new or edited record must include a value in the `Account Name` and either the `City` or `ZIP` fields.

Rule Name	Matching Equation
Standard Account Matching Rule	$(Account\ Name\ AND\ Billing\ Street)$ OR $(Account\ Name\ AND\ City)$ OR $(Account\ Name\ AND\ ZIP)$ OR $(Account\ Name\ AND\ Phone)$ OR $(Website\ AND\ Phone)$ OR $(Website\ AND\ Billing\ Street)$

Matching Criteria

For a definition of each matching criterion, see [Matching Criteria for Matching Rules](#) on page 737.

Field	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
Account Name	Acronym Edit Distance Exact	Maximum	70	Don't match	Removes words such as Inc and Corp before comparing fields. Also, company names are normalized. For example, 1st National Bank is normalized to First National Bank.

Field	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
Phone	Exact	Weighted Average	80	Don't match on all sections expect Area Code, which ignores blank fields	<p>Phone numbers are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • International code (Exact, 10% of field's match score) • Area code (Exact, 50% of field's match score) • Next 3 digits (Exact, 30% of field's match score) • Last 4 digits (Exact, 10% of field's match score) <p>For example, suppose these two phone numbers are being compared: <i>1-415-555-1234</i> and <i>1-415-555-5678</i>.</p> <p>All sections match exactly <i>except</i> the last 4 digits, so the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.</p>
Billing Street	Edit Distance Exact	Weighted Average	80	Don't match	<p>Addresses are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • Street Number (Exact, 20% of field's match score) • Street Name (Edit Distance, 50% of field's match score) • Street Suffix (Exact, 15% of field's match score) • Suite Number (Exact, 15% of field's match score) <p>For example, suppose these two billing streets are being compared: <i>123 Market Street, Suite 100</i> and <i>123 Market Drive, Suite 300</i>.</p> <p>Because only the street number and street name match, the field has a match score of 70, which is not considered a match because it's less than the threshold of 80.</p>
ZIP	Exact	Weighted Average	80	Don't match	<p>ZIP codes are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field.</p> <ul style="list-style-type: none"> • First 5 digits (Exact, 90% of field's match score) • Next 4 digits(Exact, 10% of field's match score) <p>For example, suppose these two ZIP codes are being compared: <i>94104-1001</i> and <i>94104</i>.</p> <p>Because only the first 5 digits match, the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.</p>

Field	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
City	Edit Distance Exact	Maximum	85	Don't match	
Website	Exact	Maximum	100	Don't match	Only the website domain is compared. For example, a field value <code>http://www.salesforce.com</code> becomes <code>salesforce.com</code> .

Standard Contact and Lead Matching Rule

Like all matching rules, the standard matching rule used for contact and lead records is made up of fields that are arranged into an equation. Each field also contains matching criteria that the rule uses to determine how closely the field matches the same field in an existing record, and ultimately whether the record is a match.

Matching Equation

Rule Name	Matching Equation
Standard Contact Matching Rule	<i>(First Name AND Last Name AND Title AND Company Name)</i>
Standard Lead Matching Rule	<i>OR (First Name AND Last Name AND Email)</i>
	<i>OR (First Name AND Last Name AND Phone AND Company Name)</i>
	<i>OR (First Name AND Last Name AND Mailing Street AND (City OR ZIP OR Phone))</i>
	<i>OR (First Name AND Last Name AND Mailing Street AND Title)</i>
	<i>OR (First Name AND Last Name AND Title AND Email)</i>
	<i>OR (First Name AND Last Name AND Phone)</i>

Matching Criteria

For a definition of each matching criteria, see [Matching Criteria for Matching Rules](#) on page 737.

Fields on Contacts	Fields on Leads	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
First Name	First Name	Exact Initials Jaro-Winkler Distance Metaphone 3 Name Variant	Maximum	85	Don't match (Ignores blank fields when Email is included in field grouping)	<p>If record contains a value for the both <code>First Name</code> and <code>Last Name</code> fields, those values will be transposed to account for possible data entry mistakes.</p> <p>For example, if the first name is <i>George</i> and the last name is <i>Michael</i>, the matching rule will also evaluate first name as <i>Michael</i> and the last name as <i>George</i>.</p>
Last Name	Last Name	Exact Keyboard Distance Metaphone 3	Maximum	90	Don't match (Ignores blank fields when Email is included in field grouping)	<p>If record contains a value for the both <code>First Name</code> and <code>Last Name</code> fields, those values will be transposed to account for possible data entry mistakes.</p> <p>For example, if the first name is <i>George</i> and the last name is <i>Michael</i>, the matching rule will also evaluate first name as <i>Michael</i> and the last name as <i>George</i>.</p>
Title	Title	Acronym Exact Kullback-Liebler Distance	Maximum	50	Don't match	
Account Name	Company	Acronym Edit Distance Exact	Maximum	70	Don't match	
Email	Email	Exact	Maximum	100	Don't match	
Phone	Phone	Exact	Weighted Average	80	Don't match on all sections except Area Code, which ignores blank fields	<p>Phone numbers are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • International code (Exact, 10% of field's match score) • Area code (Exact, 50% of field's match score) • Next 3 digits (Exact, 30% of field's match score) • Last 4 digits (Exact, 10% of field's match score) <p>For example, suppose these two phone numbers are being compared: <i>1-415-555-1234</i> and <i>1-415-555-5678</i>.</p>

Fields on Contacts	Fields on Leads	Matching Algorithms	Scoring Method	Threshold	Blank Fields	Special Handling
						All sections match exactly <i>except</i> the last 4 digits, so the field has a match score of 90, which is considered a match because it exceeds the threshold of 80.
Mailing Street	Street	Exact	Weighted Average`	80	Don't match	<p>Addresses are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data.</p> <ul style="list-style-type: none"> • Street Name (Edit Distance, 50% of field's match score) • Street Number (Exact, 20% of field's match score) • Street Suffix (Exact, 15% of field's match score) • Suite Number (Exact, 15% of field's match score) <p>For example, suppose these two addresses are being compared: <i>123 Market Street, Suite 100</i> and <i>123 Market Drive, Suite 300</i>.</p> <p>Because only the street number and street name match, the field has a match score of 70, which is not considered a match because it's less than the threshold of 80.</p>
Mailing ZIP/Postal Code	ZIP/Postal Code	Exact	Weighted Average	80		<p>ZIP codes are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field.</p> <ul style="list-style-type: none"> • First 5 digits (Exact, 90% of field's match score) • Next 4 digits(Exact, 10% of field's match score)
Mailing City	City	Edit Distance Exact	Maximum	85	Don't match

Matching Criteria for Matching Rules

Matching rules use criteria to determine how closely a field on a new or edited record matches the same field on an existing record, and, ultimately, whether the two records are duplicates. When you create a custom matching rule, you need to define certain criteria. For standard matching rules, the criteria are already defined for you.

Criterion Definition

**Automatically
Defined
for
Custom
Matching
Rules**

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	<p>Indicates which field to compare. When selecting fields, keep in mind that:</p> <ul style="list-style-type: none"> The available fields depend on which object the matching rule applies to and include both standard and custom fields. The supported input field types are email, lookup relationship, master-detail relationship, number, phone, standard picklists, custom picklists (single-select only), text, and URL. An auto-numbered lookup relationship field cannot be used in a matching rule. If you enable <code>State</code> and <code>Country</code> picklists for your organization, we recommend using State/Province Code and Country Code in your matching rules. These fields yield better duplicate detection results than the state and country text fields.
-------	---

Matching Method	<p>Defines the method for how the fields are compared. We've provided an exact matching method that can be used for almost any field, including custom fields. A fuzzy matching method is available for commonly used standard fields. Each matching method is further defined by normalization and match key definitions, matching algorithms, and other criteria.</p>
-----------------	---

For more information about matching methods, see [Matching Methods Used with Matching Rules](#) on page 739.

Match Blank Fields	<p>Specifies how blank fields affect whether the 2 fields being compared are considered matches. If you select the <code>Match Blank Fields</code> checkbox for any field, and that field is blank in <i>both</i> records being compared, the fields are considered matches. If, however, you select the <code>Match Blank Fields</code> checkbox for any field, and that field is blank in <i>only one</i> of the records being compared, the fields are not considered matches.</p>
--------------------	---

If you don't select the `Match Blank Fields` checkbox for any field, and that field is blank in *both* records being compared, the fields are *not* considered matches.

Criterion	Definition	Automatically Defined for Custom Matching Rules
Match Key	<p>A formula that allows the matching rule to quickly return a list of possible duplicates. Once a matching rule is activated, match keys are used to generate match key values for all records. When a matching rule runs, it compares the match key values of the saved record with existing records. If the saved record has the same match key value as an existing record, it's a potential duplicate and evaluated further. If the saved record has a unique match key value, it's not considered a duplicate. This process improves the speed and performance of duplicate detection.</p> <p>For more information about match keys, including examples, see Match Keys Used with Matching Rules on page 743.</p>	✔
Matching Algorithm	<p>Defines the logic that determines whether 2 fields match. For the Exact matching method, the Exact matching algorithm is automatically used. For the Fuzzy matching method, various fuzzy matching algorithms can be used. Each matching algorithm used is automatically given a match score based on how closely it's able to match the two fields. For example, if you select Exact matching and the two fields match, the match score is 100. If the 2 fields don't match, the match score is 0.</p> <p>For more information about matching algorithms, see Matching Algorithms Used with Matching Methods on page 741.</p>	✔
Scoring Method	<p>Determines how the matching algorithms' match scores are calculated to come up with one match score for the field. Each matching algorithm used is automatically given a match score based on how closely it's able to match the two fields. Scoring method is used only by the standard matching rules.</p> <p><i>Average:</i> Uses the average match score.</p> <p><i>Maximum:</i> Uses the highest match score.</p> <p><i>Minimum:</i> Uses the lowest match score.</p> <p><i>Weighted Average</i> Uses the weight of each matching method to determine the average match score.</p>	✔
Threshold	<p>Determines the minimum match score needed for the field to be considered a match. The field is automatically given a match score based on how closely it matches the same field in an existing record.</p>	✔

[Considerations for Using Duplicate Management](#)

Matching Methods Used with Matching Rules

The matching method is the part of the matching rule's matching criteria that determines how a specific field in one record is compared to the same field in another record. Each matching method is further defined by normalization criteria, match key definitions, matching algorithms, and other criteria.

The *Exact* matching method looks for strings that match a pattern exactly. If you're using international data, we recommend you use the Exact matching method with your matching rules. We've provided an exact matching method that can be used for almost any field, including custom fields.

The *Fuzzy* matching methods look for strings that match a pattern approximately. A fuzzy matching method is available for commonly used standard fields on accounts, contacts, and leads.

Matching Method	Matching Algorithms	Scoring Method	Threshold	Special Handling
Exact	Exact			
Fuzzy: First Name	Exact Initials Jaro-Winkler Name Variant	Maximum	85	The <code>Middle Name</code> field, if used in your matching rule, is compared by the Fuzzy: First Name matching method.
Fuzzy: Last Name	Exact Keyboard Distance Metaphone 3	Maximum	90	
Fuzzy: Company Name	Acronym Exact Syllable Alignment	Maximum	70	Removes words such as <code>Inc</code> and <code>Corp</code> before comparing fields. Also, company names are normalized. For example, <code>IBM</code> is normalized to <code>International Business Machines</code> .
Fuzzy: Phone	Exact	Weighted Average	80	Phone numbers are broken into sections and compared by those sections. Each section has its own matching method and match score. The section scores are weighted to come up with one score for the field. This process works best with North American data. <ul style="list-style-type: none"> International code (Exact, 10% of field's match score) Area code (Exact, 50% of field's match score)

[Matching Criteria for Matching Rules](#)

[Matching Algorithms Used with Matching Methods](#)

Matching Algorithms Used with Matching Methods

The matching method and its corresponding matching algorithms are part of the matching rule's matching criteria. They help determine how a specific field in one record is compared to the same field in another record and whether the fields are considered matches.

We've provided an exact matching method and a variety of fuzzy matching methods. If the exact matching method is selected, then the exact matching algorithm is automatically used to compare the fields. If one of the fuzzy matching method is selected, then a variety of fuzzy matching algorithms is used to compare the fields. A field can be compared using more than one matching algorithm, and a matching score is given to each matching algorithm based on how closely it's able to match the fields. The fields being compared by the matching algorithms are *not* case sensitive.

For more information about the matching methods, see [Matching Methods Used with Matching Rules](#) on page 739.

Matching Algorithms Available with Exact Matching Method

Matching Algorithm	Description
Exact	Determines whether two strings are the same. For example, <i>salesforce.com</i> and <i>Salesforce</i> are not considered a match because they're not exactly the same, and return a match score of 0.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Matching Algorithms Available with Fuzzy Matching Methods

Matching Algorithm	Description
Acronym	Determines whether a business name matches its acronym. For example, Advanced Micro Devices and its acronym AMD are considered a match and return a match score of 100.
Edit Distance	Determines the similarity between two strings based on the number of deletions, insertions, and character replacements needed to transform one string into the other. For example, VP Sales matches VP of Sales with match score of 73.
Initials	Determines the similarity of two sets of initials in personal names. For example, the first name Jonathan and its initial J match and return a match score of 100.
Jaro-Winkler Distance	Determines the similarity between two strings based on the number of character replacements needed to transform one string into the other. This method is best for short strings, such as personal names. For example, Johnny matches Johny with a match score of 97.
Keyboard Distance	Determines the similarity between two strings based on the number of deletions, insertions, and character replacements needed to transform one string into the other, weighted by the position of the keys on the keyboard.
Kullback Liebler Distance	Determines the similarity between two strings based on the percentage of words in common. For example Director of Engineering matches Engineering Director with a match score of 65.
Metaphone 3	Determines the similarity between two strings based on their sounds. This algorithm attempts to account for the irregularities among languages and works well for first and last names. For example, Joseph matches Josef with a match score of 100.
Name Variant	Determines whether two names are variation of each other. For example, Bob is a variation of Robert and returns a match score of 100. Bob is not a variation of Bill and returns a match score of 0.
Syllable Alignment	Determines the similarity between two strings based on their sounds. First, the character strings are converted into syllables strings. Then the syllable strings are also compared and scored using the Edit Distance algorithm. This matching algorithm works well for company names. For example, Syllable Alignment gives Department of Energy and Department of Labor have a relatively low match score of 59 because the syllable sequences of these two company names differ more than their character sequences (“energy” sounds very different than “labor”). Edit Distance gives the two strings a score of 74. Therefore, Syllable Alignment works better because the two strings should not be considered a match.

[Matching Methods Used with Matching Rules](#)

Match Keys Used with Matching Rules

Match keys increase the effectiveness of matching rules. Review how match keys are used to create match key values for standard matching rules. By understanding match keys, you'll get a better sense of how duplicate detection works.

A *match key* is a formula that allows a matching rule to quickly return a list of possible duplicates.

Once a matching rule is activated, match keys are used to create match key values for all records. When a matching rule runs, it compares the match key values of the saved record and existing records. If the saved record has the same match key value as an existing record, it's a potential duplicate and evaluated further. If the saved record has a unique match key value, it's not considered a duplicate. On rare occasions, the use of match keys causes duplicates to be missed. It almost never happens, and we're pretty sad when it does. Fortunately, the performance benefits of using match keys greatly outweighs the drawbacks.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

How Match Keys and Match Key Values Are Created

1. The matching rule equation (that is, the arrangement of fields) is rewritten into a standardized format that translates OR statements into AND statements.
2. Values for fields in the matching rule are normalized.
3. A match key is created using the field combinations specified in the standardized field format. Matching rules can have multiple match keys. For standard matching rules or custom rules with standard field combinations, pre-defined match keys are used.
4. The match key is used to combine normalized field values for each record. And, voila, glorious match key values are born!

 **Note:** We currently don't create match keys for the `Title` and `Address` fields. Therefore, if those fields are included in your matching rule, they won't generate match keys.

Match Key Notation

The common match key notation shows which fields and which characters in those fields are used in the match key.

- The field used in the match key (1)
- Number of words (or tokens) in the field value to include in match key (2). If no number is present, then all words are included.
- Number of characters per word to include in the match key (3). If no number is present, then all characters are included.
- Additional field used in the match key (4)

 **Note:** Each custom matching rule can have a maximum of 10 match keys; you're prevented from saving a matching rule that would require more.

Pre-Defined Match Keys for Standard Matching Rules

Standard matching rules use pre-defined match keys.

Match Key Notation	Objects Applied To	Match Key Value Examples
Company (2,6) City (__, 6)	Account	Account: Orange Sporting Company = orangesporti City: San Francisco = sanfra Key: orangesportisanfra
Company (2,6) ZIP (1,3)	Account	Account Name: salesforce.com = orangesports ZIP: 94105-5188 = 941 Key: salesf941
Email	Contact Lead	Email: john_doe@us.ibm.com = johndoe@ibm.com Key: johndoe@ibm.com
First_Name (1,1) Last_Name Email	Contact Lead	First Name: John = j Last: Doe = doe = t (with double metaphone applied) Email: john_doe@us.salesforce.com = johndoe@salesforce.com Key: jt@salesforce.com
First_Name (1,1) Last_Name Company (2,5)	Contact Lead	First Name: Marc = m Last Name: Benioff = pnf (with double metaphone applied) Company: salesforce.com = sales Key: mpnfsales
First_Name (1,1) Last_Name Phone	Contact Lead	First Name: Marc = m Last Name: Benioff = pnf (with double metaphone applied) Phone: 1-415-555-1234 = 415555 Key: mpnf415555
Website City (__,6)	Account	Website: https://www.salesforce.com = salesforce.com City: San Francisco = sanfra Key: salesforce.comsanfra
Website ZIP (1,3)	Account	Website: https://www.salesforce.com = salesforce.com ZIP: 94105-5188 = 941 Key: salesforce.com941

Custom matching rules may also use these pre-defined match keys. For example, assume the matching rule equation for a custom contact matching rule is (`First Name AND Last Name AND Company`), and the Fuzzy matching method is selected for at least one of the fields. Then, the notation for its match key will be: `First_Name (1,1) Last_Name Company (2,6)`.

[Matching Criteria for Matching Rules](#)

[Normalization Criteria for Matching Rule Match Keys](#)

Normalization Criteria for Matching Rule Match Keys

As part of the process of creating match key values, matching rule field values are normalized. How a field value is normalized depends on several factors, including the matching method for that field, as specified in the matching rule. In addition, some commonly-used fields, which are used in the standard matching rules, are specially normalized to optimize duplicate detection.

Field	Normalization Details	Applies to Standard and Custom Matching Rules?	Examples
<code>Company</code>	Expands acronyms. Lowercases all characters. Removes suffixes, such as <code>Corporation</code> , <code>Incorporated</code> , <code>Inc</code> , <code>Limited</code> , <code>Ltd</code> . Removes stopwords <code>and</code> , <code>the</code> , <code>of</code> . Removes special characters and accents.	Yes. But on custom matching rules, <i>Fuzzy: Company</i> must be selected for the Matching Method.	IBM = international business machines Intel Corp. = intel
<code>First Name</code>	Replaces first name with alias, if applicable. Removes salutations, special characters, and accents. Keeps only the first letter of the first word and lowercases this letter.	Yes. But on custom matching rules, <i>Fuzzy: First Name</i> must be selected for the Matching Method.	Dr. Jane = j Mr. Bob = robert = r
<code>Last Name</code>	Removes special characters and suffixes. Replaces consecutive identical consonants with single consonant. Lowercases first letter. After normalization, the double metaphone algorithm is applied so that misspellings and spelling variants are accounted for.	Yes. But on custom matching rules, <i>Fuzzy: Last Name</i> must be selected for the Matching Method.	O'Reilly, Jr. = oreily (without double metaphone) O'Reilly, Jr. = oreily = arl (with double metaphone)
<code>Email</code>	Removes special characters, such as underscores and periods, from both parts of the email address. Retains the "@" character.	No. Only applies to standard matching rules.	john.doe@us.salesforce.com = johndoe@salesforcecom

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Field	Normalization Details	Applies to Standard and Custom Matching Rules?	Examples
Phone	Removes all non-digit and non-alpha characters. For all U.S. phone numbers, converts alpha characters to numeric characters and removes leading international code. Removes last 4 digits.	Yes. But on custom matching rules, <i>Fuzzy: Phone</i> must be selected for the Matching Method.	1-800-555-1234 = 800555 44 20 0540 0202 = 44200540
Website	Removes protocol (http), subdomain (www), and any file path. Then takes only the last two or three tokens, depending on if there are international designations. Retains the periods.	No. Only applies to standard matching rules.	http://www.us.salesforce.com/product = salesforce.com http://www.ox.ac.uk/ = ox.ac.uk

 **Note:** Other fields, including custom fields and fields using the Exact matching method in the matching rule, are normalized by lowercasing all letters and removing leading and trailing spaces.

[Match Keys Used with Matching Rules](#)

Matching Examples

Check out some examples of matching rules in action to help you understand how records are compared and evaluated as duplicates.

 **Example:** **Custom Lead Matching Rule with Fuzzy Matching Methods**

Table 3: Matching Criteria

	Field	Matching Method
1	Company	<i>Fuzzy: Company Name</i>
2	Email	<i>Exact</i>
3	Phone	<i>Fuzzy: Phone</i>
	Matching equation is (Company OR Email) AND (Phone)	

Based on this matching criteria, here's how matching works.

- 1. Match key values are generated for existing leads.** Based on the matching equation and the specified matching methods, 2 match keys are created. From these, match key values are generated.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Table 4: Match Keys

Matching Equation in Standardized Format	Match Key	Sample Matching Field Values	Sample Match Key Values
(Company AND Phone) OR	Company (2,6) Phone	Company = Global Guitars Inc. Phone = 415-123-4567	globalguitar415123
(Email AND Phone)	Email Phone	Email = sally.smith@globalguitars.com Phone = 415-123-4567	sally.smith@globalguitars.com415123

2. **Match key values for the new record are generated.** This happens as soon as the new record is saved.

Table 5: New Record

Matching Field Values	Match Key Values
Company = Eltie Sports Email = john.doe@elitesport.com Phone = 1-415-555-1234	eltiesports415555 john.doe@elitesport.com415555

3. **Match key values for the new record are compared with those from existing records.**

Table 6: Existing Records Compared with New Record

Record	Matching Field Values	Match Key Values	Match?
1	Company = Elite Sports Email = john.doe@elitesports.com Phone = 1-415-555-1234	elitesports415555 john.doe@elitesports.com415555	No. Not considered a duplicate.
2	Company = Elite Sport Email = john.doe@elitesport.com Phone = 1-415-555-1234	elitesport415555 john.doe@elitesport.com415555	Yes. The first match key values don't match. However, the second match key values are identical, so the record is considered a potential duplicate. Only one match key value match is needed.

4. **Determine if the new record is a potential duplicate.** Does the new record have the same match key value as an existing record?
- Yes—The new record is considered a potential duplicate. It's evaluated further using other matching resources, including matching algorithms.
 - No—The new record is not considered a duplicate.

 **Example: Custom Contact Matching Rule with Exact Matching Methods**
Table 7: Matching Criteria

	Field	Matching Method
1	City	<i>Exact</i>
2	Email	<i>Exact</i>
3	Phone	<i>Exact</i>
	Matching equation is (City OR Email) AND (Phone)	

Based on this matching criteria, here's how matching works.

- 1. Match key values are generated for existing contacts.** Based on the matching equation and the specified matching methods, 2 match keys is created. From these, match key values are generated.

Table 8: Match Key

Matching Equation in Standardized Format	Match Key	Sample Matching Field Values	Sample Match Key Values
(City AND Email) OR	City Email	City = San Francisco Email = john.doe@elitesports.com	san frnciscojohn.doe@elitesports.com
(City AND Phone)	City Phone	City = San Francisco Phone = 415-555-1234	san francisco415-555-1234

- 2. Match key values for the new record are generated.** This happens as soon as the new record is saved.

Table 9: New Record

Matching Field Values	Match Key Values
City = San Francisco Email = john.doe@elitesports.com Phone = 1-415-555-1234	san franciscojohn.doe@elitesports.com san francisco1-415-555-1234

- 3. Match key values for the new record are compared with those from existing records.**

Table 10: Existing Records Compared with New Record

Record	Matching Field Values	Match Key Values	Match?
1	City = San Francisco Email = john.doe@elitesports.com Phone = 1-415-555-1234	san frnciscojohn.doe@elitesports.com san frncisco1-415-555-1234	No. Not considered a duplicate.

Record	Matching Field Values	Match Key Values	Match?
2	City = San Francisco Email = john.doe@elitesports.com Phone = 1-415-555-1111	san franciscojohn.doe@elitesports.com san francisco1-415-555-1111	Yes. The first match key values are identical, so the record is considered a potential duplicate. Only one match key value match is needed.

4. **Determine if the new record is a potential duplicate.** Does the new record have the same match key value as an existing record?
- Yes—The new record is considered a potential duplicate. It's evaluated further using other matching resources, including matching algorithms.
 - No—The new record is not considered a duplicate.

Duplicate Rule Reference

Here's some additional information that will help you understand how duplicate rules work and how to use them.

Standard Duplicate Rules

Starting in Spring '15, new Salesforce orgs come with standard account, contact, and lead duplicate rules already set up and activated. These rules define what happens when you try to save a duplicate record. Each standard duplicate rule has a corresponding standard matching rule that determines how two records are identified as duplicates.

Standard Duplicate Rules

Starting in Spring '15, new Salesforce orgs come with standard account, contact, and lead duplicate rules already set up and activated. These rules define what happens when you try to save a duplicate record. Each standard duplicate rule has a corresponding standard matching rule that determines how two records are identified as duplicates.

Standard Account Duplicate Rule

Like all duplicate rules, the standard duplicate rule used for account records defines what happens when you try to save a duplicate record. If you try to save a new account, an alert is shown.

Standard Contact Duplicate Rule

Like all duplicate rules, the standard duplicate rule used for contact records defines what happens when you try to save a duplicate record. If you try to save a new contact, an alert is shown.

Standard Lead Duplicate Rule

Like all duplicate rules, the standard duplicate rule used for lead records defines what happens when you try to save a duplicate record. If you try to save a new lead, an alert is shown.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Standard Account Duplicate Rule

Like all duplicate rules, the standard duplicate rule used for account records defines what happens when you try to save a duplicate record. If you try to save a new account, an alert is shown.

Rule Details

Rule Name	Standard Account Duplicate Rule
Description	Duplicate rule for account records
Object	Account
Record-Level Security	Enforce Sharing Rules

Actions

Actions specify what happens when you try to save a duplicate record.

Action On Create	Allow: Alert and Report
Action On Edit	Allow: Report
Alert Text	Duplicate Alert

Matching Rules

Matching rules define how duplicates are identified. At least 1 matching rule must be specified for a duplicate rule.

Compare Account With	Accounts
Matching Rule	Standard Account Matching Rule
Matching Criteria	Matching rule for account records
Field Mapping	Mapping Selected

Standard Contact Duplicate Rule

Like all duplicate rules, the standard duplicate rule used for contact records defines what happens when you try to save a duplicate record. If you try to save a new contact, an alert is shown.

Rule Details

Rule Name	Standard Contact Duplicate Rule
Description	Duplicate rule for contact records
Object	Contact
Record-Level Security	Enforce Sharing Rules

Actions

Actions specify what happens when you try to save a duplicate record.

Action On Create	Allow: Alert and Report
Action On Edit	Allow: Report
Alert Text	Duplicate Alert

Matching Rules

Matching rules define how duplicates are identified. At least 1 matching rule must be specified for a duplicate rule.

Compare Account With	Contacts
Matching Rule	Standard Contact Matching Rule
Matching Criteria	Matching rule for contact records
Field Mapping	Mapping Selected

Standard Lead Duplicate Rule

Like all duplicate rules, the standard duplicate rule used for lead records defines what happens when you try to save a duplicate record. If you try to save a new lead, an alert is shown.

Rule Details

Rule Name	Standard Lead Duplicate Rule
Description	Duplicate Rule for Lead Records
Object	Lead
Record-Level Security	Enforce Sharing Rules

Actions

Actions specify what happens when you try to save a duplicate record.

Action On Create	Allow: Alert and Report
Action On Edit	Allow: Report
Alert Text	Duplicate Alert

Matching Rules

Matching rules define how duplicates are identified. At least 1 matching rule must be specified for a duplicate rule.

Compare Account With	Leads
Matching Rule	Standard Lead Matching Rule
Matching Criteria	Matching rule for lead records
Field Mapping	Mapping Selected

Duplicate Management FAQs

Answers to common questions about Data.com Duplicate Management.

[How does duplicate prevention work with Data.com Prospector and Data.com Clean?](#)

[Why am I getting an error saying my matching rule uses too many OR operators within groupings?](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

How does duplicate prevention work with Data.com Prospector and Data.com Clean?

Adding Records with Data.com Prospector

It depends on what your organization's Data.com duplicate preferences are.

If your organization does not allow duplicate records to be added to Salesforce from Data.com, then Data.com will block duplicate records from being added to Salesforce and the duplicate rule won't need to run. The user trying to add records from Data.com will receive an error log detailing which records couldn't be added because they are duplicates.

If your organization allows duplicate records to be added to Salesforce from Data.com, then the duplicate rules will run. The duplicate rule will determine if the duplicate record is allowed or blocked. Records that are blocked by the duplicate rule will appear in the error log.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Updating Records with Data.com Clean

It depends on what your organization's duplicate rules are. If your duplicate rule is set to block duplicates on edit, then a record can't be cleaned if cleaning creates a duplicate.

For Clean jobs, if your duplicate rule is set to block or alert, then a record can't be cleaned if the cleaning creates a duplicate. An entity error appears in the Clean Jobs History table for any record that can't be cleaned during a job.

If your duplicate rule is set to allow duplicates on edit, then a record can be cleaned even if it creates a duplicate. In addition, no alert displays when manually cleaning records even if your duplicate rule is set to alert.

Why am I getting an error saying my matching rule uses too many OR operators within groupings?

A matching rule has a limit of 10 fields that are arranged into an equation. When a matching rule is saved, we rewrite the equation into a standardized format that translates the OR statements to AND statements. The standardized format has a limit of 10 rows.

 **Example:** If your matching rule includes the following equation...

(Field 1 OR Field 2) AND

(Field 3 OR Field 4) AND

(Field 5 OR Field 6) AND

(Field 7 OR Field 8)

...it would be rewritten as

(Field 1 AND Field 3 AND Field 5 AND Field 7) OR

(Field 1 AND Field 3 AND Field 5 AND Field 8) OR

(Field 1 AND Field 3 AND Field 6 AND Field 7) OR

(Field 1 AND Field 3 AND Field 6 AND Field 8) OR

(Field 1 AND Field 4 AND Field 5 AND Field 7) OR

(Field 1 AND Field 4 AND Field 5 AND Field 8) OR

(Field 1 AND Field 4 AND Field 6 AND Field 7) OR

(Field 1 AND Field 4 AND Field 6 AND Field 8) OR

(Field 2 AND Field 3 AND Field 5 AND Field 7) OR

(Field 2 AND Field 3 AND Field 5 AND Field 8) OR

(Field 2 AND Field 3 AND Field 6 AND Field 7) OR

(Field 2 AND Field 3 AND Field 6 AND Field 8) OR

(Field 2 AND Field 4 AND Field 5 AND Field 7) OR

(Field 2 AND Field 4 AND Field 5 AND Field 8) OR

(Field 2 AND Field 4 AND Field 6 AND Field 7) OR

(Field 2 AND Field 4 AND Field 6 AND Field 8)

Although this matching rule is within the field limit, it exceeds the row limit of 10 when written in the standardized format, and therefore can't be saved. You need to refine the matching rule so it uses fewer OR operators within groupings.

[Match Keys Used with Matching Rules](#)

Security

Salesforce is built with security to protect your data and applications. You can also implement your own security scheme to reflect the structure and needs of your organization. Protecting your data is a joint responsibility between you and Salesforce. The Salesforce security features enable you to empower your users to do their jobs safely and efficiently.

[Salesforce Security Basics](#)

Salesforce limits exposure of data to the users that act on it. Implement security controls that you think are appropriate for the sensitivity of your data. Your data is protected from unauthorized access from outside your company. Also safeguard it from inappropriate usage by your users.

[Protect Your Salesforce Data with Shield Platform Encryption](#)

Shield Platform Encryption gives your data a whole new layer of security while preserving critical platform functionality. It enables you to encrypt sensitive data at rest, and not just when transmitted over a network, so your company can confidently comply with privacy policies, regulatory requirements, and contractual obligations for handling private data.

[Session Security](#)

After logging in, a user establishes a session with the platform. Use session security to limit exposure to your network when a user leaves the computer unattended while still logged in. It also limits the risk of internal attacks, such as when one employee tries to use another employee's session. Choose from several session settings to control session behavior.

[Activations](#)

Activation tracks information about devices from which users have verified their identity. Salesforce prompts users to verify their identity when they access Salesforce from an unrecognized browser or application. Identity verification adds an extra layer of security on top of username and password authentication. The Activations page lists the login IP addresses and client browsers used.

[Authenticate Users](#)

Authentication means preventing unauthorized access to your organization or its data by making sure each logged in user is who they say they are.

[Transaction Security](#)

Transaction Security is a framework that intercepts real-time Salesforce events and applies appropriate actions and notifications based on security policies you create. Transaction Security monitors events according to the policies that you set up. These policies are applied against events in your org and specify actions to take when certain event combinations occur. When a policy is triggered, you can have an action taken and receive an optional notification.

[Single Sign-On](#)

Single sign-on allows users to access all authorized network resources without having to log in separately to each resource. You validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

[My Domain](#)

Add a custom domain to your Salesforce org URL with the My Domain Salesforce feature. Having a custom domain lets you highlight your brand and makes your org more secure. A custom domain is convenient and allows you to personalize your login page.

[App Launcher](#)

The App Launcher presents users with logos that link to their on-premise applications, connected apps, and Salesforce apps, all from a unified user interface. Administrators can set the default app order for their organizations.

[Configure File Upload and Download Security Settings](#)

For security reasons, your organization may want to configure the way some file types are handled during upload and download.

[Certificates and Keys](#)

Salesforce certificates and key pairs are used for signatures that verify a request is coming from your organization. They are used for authenticated SSL communications with an external web site, or when using your organization as an Identity Provider. You only need to generate a Salesforce certificate and key pair if you're working with an external website that wants verification that a request is coming from a Salesforce organization.

Salesforce Security Basics

Salesforce limits exposure of data to the users that act on it. Implement security controls that you think are appropriate for the sensitivity of your data. Your data is protected from unauthorized access from outside your company. Also safeguard it from inappropriate usage by your users.

Phishing and Malware

Trust starts with transparency. That's why Salesforce displays real-time information on system performance and security on the trust site at <http://trust.salesforce.com>. This site provides live data on system performance, alerts for current and recent phishing and malware attempts, and tips on best security practices for your organization.

Security Infrastructure

Salesforce utilizes some of the most advanced technology for Internet security available today. When you access the application using a Salesforce-supported browser, Transport Layer Security (TLS) technology protects your information using both server authentication and Classic Encryption, ensuring that your data is safe, secure, and available only to registered users in your organization.

Security Health Check

As an administrator, Health Check lets you identify and fix security vulnerabilities in your security settings, all from a single page. A summary score shows how your org measures against the Salesforce-recommended baseline.

Auditing

Auditing provides information about use of the system, which can be critical in diagnosing potential or real security issues. The Salesforce auditing features don't secure your organization by themselves; someone in your organization should do regular audits to detect potential abuse.

Salesforce Shield

Salesforce Shield is a trio of security tools that admins and developers can use to build a new level of trust, transparency, compliance, and governance right into business-critical apps. It includes Platform Encryption, Event Monitoring, and Field Audit Trail. Ask your Salesforce administrator if Salesforce Shield is available in your organization.

[Security Implementation Guide](#)

Phishing and Malware

Trust starts with transparency. That's why Salesforce displays real-time information on system performance and security on the trust site at <http://trust.salesforce.com>. This site provides live data on system performance, alerts for current and recent phishing and malware attempts, and tips on best security practices for your organization.

The Security tab on the trust site includes valuable information that can help you to safeguard your company's data. In particular, be on the alert for phishing and malware.

- Phishing is a social engineering technique that attempts to acquire sensitive information such as usernames, passwords and credit card details by masquerading as a trustworthy entity in an electronic communication. Phishers often direct users to enter details at a fake website whose URL and look-and-feel are almost identical to the legitimate one. As the Salesforce community grows, it has become an increasingly appealing target for phishers. You will never get an email or a phone call from a Salesforce employee asking you to reveal a password, so you should refuse to reveal it to anyone. You can report any suspicious activities by clicking the **Report a Suspicious Email** link under the **Trust** tab at <http://trust.salesforce.com>.
- Malware is software designed to infiltrate or damage a computer system without the owner's informed consent. It is a general term used to cover a variety of forms of hostile, intrusive, or annoying software, and it includes computer viruses and spyware.

What Salesforce is Doing About Phishing and Malware

Customer security is the foundation of customer success, so Salesforce will continue to implement the best possible practices and technologies in this area. Recent and ongoing actions include:

- Actively monitoring and analyzing logs to enable proactive alerts to customers who have been affected.
- Collaborating with leading security vendors and experts on specific threats.
- Executing swift strategies to remove or disable fraudulent sites (often within an hour of detection).
- Reinforcing security education and tightening access policies within Salesforce.
- Evaluating and developing new technologies both for our customers and for deployment within our infrastructure.

What Salesforce Recommends You Do

Salesforce is committed to setting the standards in software-as-a-service as an effective partner in customer security. So, in addition to internal efforts, Salesforce strongly recommends that customers implement the following changes to enhance security:

- Modify your Salesforce implementation to activate IP range restrictions. This will allow users to access Salesforce only from your corporate network or VPN. For more information, see [Restrict Where and When Users Can Log In to Salesforce](#) on page 811.
- Set session security restrictions to make spoofing more difficult. For more information, see [Modify Session Security Settings](#) on page 822.
- Educate your employees not to open suspect emails and to be vigilant in guarding against phishing attempts.
- Use security solutions from leading vendors such as Symantec to deploy spam filtering and malware protection.
- Designate a security contact within your organization so that Salesforce can more effectively communicate with you. Contact your Salesforce representative with this information.
- Consider using two-factor authentication techniques, such as RSA tokens, to restrict access to your network. For more information, see [Two-Factor Authentication](#) on page 805.
- Use Transaction Security to monitor events and take appropriate actions. For more information, see [Transaction Security Policies](#) on page 842.

Salesforce has a Security Incident Response Team to respond to any security issues. To report a security incident or vulnerability to Salesforce, please contact security@salesforce.com. Describe the issue in detail, and the team will respond promptly.

Security Infrastructure

Salesforce utilizes some of the most advanced technology for Internet security available today. When you access the application using a Salesforce-supported browser, Transport Layer Security (TLS) technology protects your information using both server authentication and Classic Encryption, ensuring that your data is safe, secure, and available only to registered users in your organization.

One of the core features of a multi-tenant platform is the use of a single pool of computing resources to service the needs of many different customers. Salesforce protects your organization's data from all other customer organizations by using a unique organization identifier, which is associated with each user's session. Once you log in to your organization, your subsequent requests are associated with your organization, using this identifier.

In addition, Salesforce is hosted in a secure server environment that uses a firewall and other advanced technology to prevent interference or access from outside intruders.

Security Health Check

As an administrator, Health Check lets you identify and fix security vulnerabilities in your security settings, all from a single page. A summary score shows how your org measures against the Salesforce-recommended baseline.

From Setup, enter *Health Check* in the *Quick Find* box, then select **Health Check**.

The Salesforce Baseline standard (1) consists of recommended values for settings in the Login Access Policies, Network Access, Password Policies, Remote Site Settings, and Session Settings groups (2). If you change settings to be less restrictive than what’s in the Salesforce Baseline standard, your health check score can decrease.

Your high- and medium-risk settings are shown with information about how they compare against the standard value (3). To remediate a risk, edit the setting (4) and refresh your score (5) to see whether it improved. Your settings that meet the standard are listed at the bottom.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view Health Check:

- “View Setup and Configuration”
- AND
- “Modify All Data”

How well does your org meet Salesforce security standards? Reduce your security risk and limit data loss by optimizing the areas below. [Video: Learn More about Health Check](#)

1 Salesforce Baseline Standard **5** Refresh

50% of the standard met
How did we calculate this score?

High-Risk Security Settings (5)

Your values in these settings are considered high-risk security vulnerabilities.

STATUS	SETTING	2 GROUP	YOUR VALUE	3 STANDARD VALUE	4 ACTIONS
High Risk	Minimum password length	Password Policies	5	8	Edit ⚙
High Risk	Password complexity requirement	Password Policies	No restriction	Must mix alpha, numeric, and special characters	Edit ⚙
High Risk	Maximum invalid login attempts	Password Policies	10	3	Edit ⚙
High Risk	Enable clickjack protection for customer Visualforce pages with standard headers	Session Settings	Disabled	Enabled	Edit ⚙

 **Example:** Suppose that you changed your password minimum length from 8 (the default value) to 5, and changed other Password Policies settings to be less restrictive. These changes make your users' passwords more vulnerable to guessing and other brute force attacks. As a result, your overall score decreases, and the settings are listed as risks.

How Is the Health Check Score Calculated?

The Health Check score is calculated by a proprietary formula that measures how well your security settings meet the Salesforce Baseline standard. Settings that meet or exceed the standard raise your score, and settings at risk lower your score.

SEE ALSO:

[How Is the Health Check Score Calculated?](#)

[Security Implementation Guide](#)

How Is the Health Check Score Calculated?

The Health Check score is calculated by a proprietary formula that measures how well your security settings meet the Salesforce Baseline standard. Settings that meet or exceed the standard raise your score, and settings at risk lower your score.

Some settings like Minimum Password Length have a heavier weight, so they have a higher impact on your score. For details, see [Salesforce Baseline Standard](#) on page 759.

If all settings in your setting groups meet or exceed the standard, your total score is 100%. As you update your settings, refresh Health Check (1) to see how the updates affect your total score. Hopefully your green bar moves to the right!

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Recommended Actions Based on Your Score

If your total score is...	We recommend to...
0-33%	Remediate high risks immediately.
34-66%	Remediate high risks in the short term, and medium risks in the long term.
67-100%	Review Health Check periodically to remediate risks.

 **Note:** New Salesforce orgs have an initial score less than 100%. Use Health Check to quickly improve your score by eliminating high risks in your Password Policies and other setting groups.

The Salesforce Baseline Standard

Following are the setting values that meet the standard and their risk levels.

Login Access Policies

Setting	Standard Value	Medium Risk Value	High Risk Value
Administrators Can Log In As Any User	Checkbox deselected	Checkbox selected	N/A

Network Access

Setting	Standard Value	Medium Risk Value	High Risk Value
Trusted IP Ranges	One or more ranges set	No range set	N/A

Password Policies

Setting	Standard Value	Medium-Risk Value	High-Risk Value
User passwords expire in	90 days or less	180 days	One year or Never expires
Enforce password history	3 or more passwords remembered	1 or 2 passwords remembered	No passwords remembered
Minimum password length (see Note)	8	6 or 7	5 or less
Password complexity requirement (see Note)	Must mix alpha, numeric, and special characters, or more complex	Must mix alpha and numeric characters	No restriction
Password question requirement	Cannot contain password	None	N/A
Maximum invalid login attempts	3	5	10 or No Limit
Lockout effective period	15 minutes	30 or 60 minutes	Forever (must be reset by admin)
Obscure secret answer for password resets	Checkbox selected	Checkbox deselected	N/A
Require a minimum 1 day password lifetime	Checkbox selected	Checkbox deselected	N/A

 **Note:** The Minimum password length and Password complexity requirement settings count twice as much as other settings in the calculation of your Password Policies group score.

Remote Site Settings

Setting	Standard Value	Medium Risk Value	High Risk Value
Remote Site	No remote site created, or at least one site created with the Disable Protocol Security option deselected.	N/A	At least one remote site created with the Disable Protocol Security option selected.

Session Settings

Setting	Standard Value	Medium Risk Value	High Risk Value
Timeout Value	2 hours or less	4, 8, or 12 hours	N/A
Disable session timeout warning popup	Checkbox selected	Checkbox deselected	N/A
Force logout on session timeout	Checkbox selected	Checkbox deselected	N/A
Lock sessions to the IP address from which they originated (see Note)	Checkbox selected	Checkbox deselected	N/A
Lock sessions to the domain in which they were first used	Checkbox selected	N/A	Checkbox deselected
Force relogin after Login-As-User	Checkbox selected	N/A	Checkbox deselected
Enforce login IP ranges on every request	Checkbox selected	Checkbox deselected	N/A
Enable caching and autocomplete on login page	Checkbox deselected	Checkbox selected	N/A
Enable the SMS method of identity confirmation	Checkbox selected	N/A	Checkbox deselected
Enable clickjack protection for Setup pages	Checkbox selected	N/A	Checkbox deselected
Enable clickjack protection for non-Setup Salesforce pages	Checkbox selected	N/A	Checkbox deselected
Enable clickjack protection for customer Visualforce pages with standard headers	Checkbox selected	N/A	Checkbox deselected
Enable clickjack protection for customer Visualforce pages with headers disabled	Checkbox selected	N/A	Checkbox deselected

Setting	Standard Value	Medium Risk Value	High Risk Value
Enable CSRF protection on GET requests on non-setup pages	Checkbox selected	N/A	Checkbox deselected
Enable CSRF protection on POST requests on non-setup pages	Checkbox selected	N/A	Checkbox deselected

 **Note:** The Lock sessions to the IP address from which they originated setting is available in **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions.

[Security Health Check](#)

Auditing

Auditing provides information about use of the system, which can be critical in diagnosing potential or real security issues. The Salesforce auditing features don't secure your organization by themselves; someone in your organization should do regular audits to detect potential abuse.

To verify that your system is actually secure, you should perform audits to monitor for unexpected changes or usage trends.

Record Modification Fields

All objects include fields to store the name of the user who created the record and who last modified the record. This provides some basic auditing information.

Login History

You can review a list of successful and failed login attempts to your organization for the past six months. See [Monitor Login History](#) on page 979.

Field History Tracking

You can also enable auditing for individual fields, which will automatically track any changes in the values of selected fields. Although auditing is available for all custom objects, only some standard objects allow field-level auditing. See [Field History Tracking](#) on page 990.

Setup Audit Trail

Administrators can also view a Setup Audit Trail, which logs when modifications are made to your organization's configuration. See [Monitor Setup Changes](#) on page 987.

Salesforce Shield

Salesforce Shield is a trio of security tools that admins and developers can use to build a new level of trust, transparency, compliance, and governance right into business-critical apps. It includes Platform Encryption, Event Monitoring, and Field Audit Trail. Ask your Salesforce administrator if Salesforce Shield is available in your organization.

Platform Encryption

Platform Encryption allows you to natively encrypt your most sensitive data at rest across all your Salesforce apps. This helps you protect PII, sensitive, confidential, or proprietary data and meet both external and internal data compliance policies while keeping critical app functionality — like search, workflow, and validation rules. You keep full control over encryption keys and can set encrypted data permissions to protect sensitive data from unauthorized users. See [Platform Encryption](#) on page 762.

Event Monitoring

Event Monitoring gives you access to detailed performance, security, and usage data on all your Salesforce apps. Every interaction is tracked and accessible via API, so you can view it in the data visualization app of your choice. See who is accessing critical business data when, and from where. Understand user adoption across your apps. Troubleshoot and optimize performance to improve end-user experience. Event Monitoring data can be easily imported into any data visualization or application monitoring tool like Wave Analytics, Splunk, or New Relic. To get started, check out our [Event Monitoring](#) training course.

Field Audit Trail

Field Audit Trail lets you know the state and value of your data for any date, at any time. You can use it for regulatory compliance, internal governance, audit, or customer service. Built on a big data backend for massive scalability, Field Audit Trail helps companies create a forensic data-level audit trail with up to 10 years of history, and set triggers for when data is deleted. See [Field Audit Trail](#) on page 993.

Protect Your Salesforce Data with Shield Platform Encryption

Shield Platform Encryption gives your data a whole new layer of security while preserving critical platform functionality. It enables you to encrypt sensitive data at rest, and not just when transmitted over a network, so your company can confidently comply with privacy policies, regulatory requirements, and contractual obligations for handling private data.

Shield Platform Encryption builds on the data encryption options that Salesforce offers out of the box. Data stored in many standard and custom fields and in files and attachments is encrypted using an advanced HSM-based key derivation system, so it is protected even when other lines of defense have been compromised.

[Encrypt Fields and Files](#)

Specify the fields and files you want to encrypt. Remember that encryption is not the same thing as field-level security or object-level security. Those should already be in place before you implement your encryption strategy.

[Set Up Shield Platform Encryption](#)

To provide Shield Platform Encryption for your organization, contact your Salesforce account executive. They'll help you provision the correct license so you can get started on creating your own unique tenant secret.

[How Shield Platform Encryption Works](#)

Shield Platform Encryption relies on a unique tenant secret that you control and a master secret that's maintained by Salesforce. We combine these secrets to create your unique data encryption key. We use that key to encrypt data that your users put into Salesforce, and to decrypt data when your authorized users need it.

[Platform Encryption Best Practices](#)

Take the time to identify the most likely threats to your organization. This will help you distinguish data that needs encryption from data that doesn't, so that you can encrypt only what you need to. Make sure your tenant secret and keys are backed up, and be careful who you allow to manage your secrets and keys.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

[Tradeoffs and Limitations of Shield Platform Encryption](#)

A security solution as powerful as Shield Platform Encryption doesn't come without some trade-offs. When your data is strongly encrypted, some users may see limitations to some functionality, and a few features aren't available at all. Consider the impact on your users and your overall business solution as you design your encryption strategy.

SEE ALSO:

[Salesforce Platform Encryption Implementation Guide](#)

Encrypt Fields and Files

Specify the fields and files you want to encrypt. Remember that encryption is not the same thing as field-level security or object-level security. Those should already be in place before you implement your encryption strategy.

[Encrypt Fields](#)

Select the fields you want to encrypt. When a field is encrypted, its value is masked for users who don't have permission to view encrypted data.

[Encrypt Files and Attachments](#)

For another layer of data protection, encrypt files and attachments. If Shield Platform Encryption is on, the body of each file or attachment is encrypted when it's uploaded.

[Fix Compatibility Problems](#)

When you select fields or files to encrypt, Salesforce automatically checks for potential side effects and warns you if any existing settings may pose a risk to data access or your normal use of Salesforce. You have some options for how to clear these problems up.

SEE ALSO:

[Platform Encryption Overview](#)

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Encrypt Fields

Select the fields you want to encrypt. When a field is encrypted, its value is masked for users who don't have permission to view encrypted data.

Depending on the size of your organization, enabling a standard field for encryption can take a few minutes.

1. Make sure that your organization has an active encryption key. If you're not sure, check with your administrator.
2. From Setup, use the `Quick Find` box to find the Platform Encryption setup page.
3. Click **Encrypt Fields**.
4. Click **Edit**.
5. Select the fields you want to encrypt, and save your settings.

The automatic Platform Encryption validation service will now check for settings in your organization that might block encryption. You'll receive an email with suggestions for fixing any incompatible settings.

Field values are automatically encrypted only in records created or updated after you've enabled encryption. Salesforce recommends updating existing records to ensure that their field values are encrypted. For example, if you encrypt the `Description` field on the Case object, use the Data Loader to update all case records. Contact Salesforce if you need help with this.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

- "Customize Application"

Encrypt Files and Attachments

For another layer of data protection, encrypt files and attachments. If Shield Platform Encryption is on, the body of each file or attachment is encrypted when it's uploaded.

 **Note:** Before you begin, make sure that your organization has an active encryption key; if you're not sure, check with your administrator.

1. From Setup, enter *Platform Encryption* in the Quick Find box, then select **Platform Encryption**.
2. Select **Encrypt Files and Attachments**.
3. Click **Save**.

 **Important:** Users with access to the file can work normally with it regardless of their encryption-specific permissions. Users who are logged in to your org and have read access can search and view the body content.

Users can continue to upload files and attachments per the usual file size limits. Expansion of file sizes caused by encryption doesn't count against these limits.

Turning on file and attachment encryption affects new files and attachments. It doesn't automatically encrypt files and attachments that were already in Salesforce. To encrypt existing files, contact Salesforce.

To check whether a file or attachment is encrypted, look for the encryption indicator on the detail page of the file or attachment. You can also query the `isEncrypted` field on the ContentVersion object (for files) or on the Attachment object (for attachments).

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

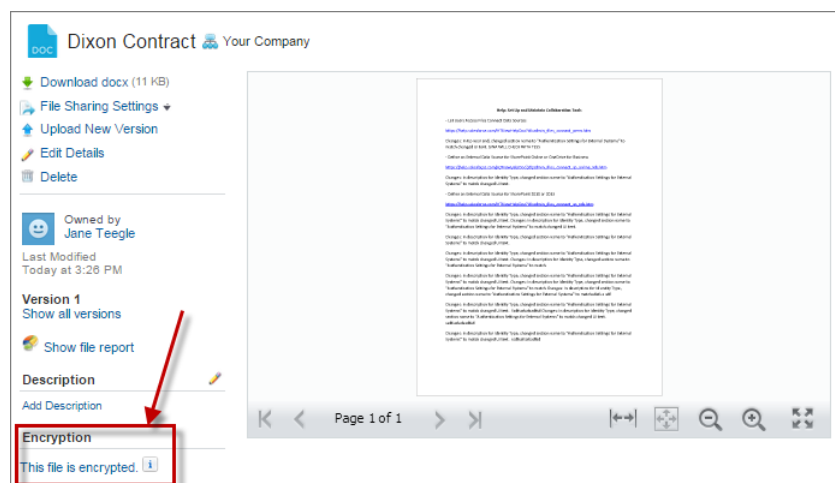

To view setup:

- "View Setup and Configuration"

To encrypt files:

- "Customize Application"

Here's What It Looks Like When a File Is Encrypted.

[Data Loader](#)

Fix Compatibility Problems

When you select fields or files to encrypt, Salesforce automatically checks for potential side effects and warns you if any existing settings may pose a risk to data access or your normal use of Salesforce. You have some options for how to clear these problems up.

 **Note:** If you configure encryption via the Setup page, you get an email with the results. If you use the API, the results are returned synchronously.

If your results include error messages, you're probably running into one or more of these limitations:

Portals

A legacy portal is enabled in your organization, so you can't encrypt standard fields. Deactivate all portals to enable encryption on standard fields. (Communities are supported.)

Criteria-Based Sharing Rules

You've selected a field that is used in a filter in a criteria-based sharing rule.

SOQL/SOSL queries

You've selected a field that's used in an aggregate function in a SOQL query, or in a WHERE, GROUP BY, or ORDER BY clause.

Formula fields

You've selected a field that's referenced by a custom formula field.

Skinny tables

You've selected a field that's used in a skinny table.

Microsoft Integration Products

If Lightning Sync or Lightning for Outlook is activated, Platform Encryption can't be enabled. If Platform Encryption is enabled, Lightning Sync and Lightning for Outlook can't be activated.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Set Up Shield Platform Encryption

To provide Shield Platform Encryption for your organization, contact your Salesforce account executive. They'll help you provision the correct license so you can get started on creating your own unique tenant secret.

Shield Platform Encryption is automatically available for Developer Edition orgs, but is not available in sandboxes.

You'll also need these permissions:

- "Manage Encryption Keys" allows you to upload and rotate tenant secrets.
- "Customize Application" allows you to manage certificates.

Once your license is provisioned and you have the correct permissions, you can access all Shield Platform Encryption features.

[Generate a Tenant Secret](#)

Generate a unique tenant secret for your organization, then authorize specific people to use it to produce new data encryption keys. You manage your own tenant secret: you can rotate it, archive it, and designate other users to share responsibility for it.

[Rotate Your Encryption Keys](#)

You should regularly generate a new tenant secret and archive the previously active one. By controlling the lifecycle of your organization's tenant secrets, you control the lifecycle of the data encryption keys that are derived from them.

[Back Up Your Tenant Secret](#)

Your tenant secret is unique to your organization and to the specific data to which it applies. Salesforce recommends that you export your secret to ensure continued data access in cases where you need to gain access to the related data again.

[Destroy A Tenant Secret](#)

Only destroy tenant secrets in extreme cases where access to related data is no longer needed. Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce.

[Turn Shield Platform Encryption Off](#)

At some point, you may need to disable Shield Platform Encryption for fields, files, or both. You can turn field encryption on or off individually, but file encryption is all or nothing.

SEE ALSO:

[Which User Permissions Does Shield Platform Encryption Require?](#)

[Tenant Secret API](#)

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

- "Manage Encryption Keys"

Generate a Tenant Secret

Generate a unique tenant secret for your organization, then authorize specific people to use it to produce new data encryption keys. You manage your own tenant secret: you can rotate it, archive it, and designate other users to share responsibility for it.

Your data encryption key is never saved or shared across organizations. Instead, it is derived on demand from a master secret and your organization-specific tenant secret, and cached on an application server.

Authorized developers can generate, rotate, export, destroy and re-import tenant secrets by coding a call to the TenantSecret object in the Salesforce API.

 **Important:** Only authorized users can generate tenant secrets from the Platform Encryption page. Ask your Salesforce administrator to assign you the "Manage Encryption Keys" permission.

1. Assign the "Manage Encryption Keys" permission to people you trust to manage tenant secrets for your organization.

You can add this permission to a profile or a permission set: from Setup, enter *Profiles* or *Permission Sets* in the Quick Find box.

2. Generate your tenant secret.

- a. In Setup, use the Quick Find box to find the Platform Encryption setup page.
- b. Click **Generate Tenant Secret**.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

SEE ALSO:

[Permission Sets](#)

[Profiles](#)

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

- "Manage Encryption Keys"

Rotate Your Encryption Keys

You should regularly generate a new tenant secret and archive the previously active one. By controlling the lifecycle of your organization's tenant secrets, you control the lifecycle of the data encryption keys that are derived from them.

Consult your organization's security policies to decide how often to rotate your tenant secret. You can rotate it once every 24 hours in a production organization, and every four hours in a sandbox environment.

The key derivation function itself uses a master secret, which is rotated with each major Salesforce release. This has no impact on your encryption keys or your encrypted data, until you rotate your tenant secret.

1. To check the status of your organization's keys, go to Setup and use the `Quick Find` box to find the Platform Encryption setup page. Keys can be active, archived, or destroyed.

ACTIVE

Can be used to encrypt and decrypt new or existing data.

ARCHIVED

Cannot encrypt new data. Can be used to decrypt data previously encrypted with this key when it was active.

DESTROYED

Cannot encrypt or decrypt data. Data encrypted with this key when it was active can no longer be decrypted. Files and attachments encrypted with this key can no longer be downloaded.

2. In Setup, use the `Quick Find` box to find the Platform Encryption setup page.
3. Click **Generate New Tenant Secret**.
4. If you want to re-encrypt existing field values with a newly generated tenant secret, contact Salesforce support. Get the data to update by exporting the objects via the API or by running a report that includes the record ID. This triggers the encryption service to encrypt the existing data again using the newest key.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

- "Manage Encryption Keys"

Back Up Your Tenant Secret

Your tenant secret is unique to your organization and to the specific data to which it applies. Salesforce recommends that you export your secret to ensure continued data access in cases where you need to gain access to the related data again.

1. In Setup, use the **Quick Find** box to find the Platform Encryption setup page.
2. In the table that lists your keys, find the tenant secret you want and click **Export**.
3. Confirm your choice in the warning box, then save your exported file.

The file name is `tenant-secret-org-<organization ID>-ver-<tenant secret version number>.txt`. For example, `tenant-secret-org-00DD0000007eTR-ver-1.txt`.

4. Note the specific version you're exporting, and give the exported file a meaningful name. Store the file in a safe location in case you need to import it back into your organization.

 **Note:** Your exported tenant secret is itself encrypted.

5. To import your tenant secret again, click **Import > Choose File** and select your file. Make sure you're importing the correct version of the tenant secret.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

Destroy A Tenant Secret

Only destroy tenant secrets in extreme cases where access to related data is no longer needed. Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce.

1. In Setup, use the **Quick Find** box to find the Platform Encryption setup page.
2. In the table that lists your tenant secrets, go to the row that contains the one you want to destroy and click **Destroy**.
3. A warning box appears. Type in the text as shown and select the checkbox acknowledging that you're destroying a tenant secret, then click **Destroy**.

File previews and content that was already cached in the user's browser may still be visible in cleartext after you destroy the key that encrypted that content, until the user logs in again.

If you create a sandbox organization from your production organization and then destroy the tenant secret in your sandbox organization, the tenant secret still exists in the production organization.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

- "Manage Encryption Keys"

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

USER PERMISSIONS

To manage tenant secrets:

- "Manage Encryption Keys"

Turn Shield Platform Encryption Off

At some point, you may need to disable Shield Platform Encryption for fields, files, or both. You can turn field encryption on or off individually, but file encryption is all or nothing.

When you turn off Shield Platform Encryption, encrypted data is not mass-decrypted and any functionality that is affected by encryption is not restored. Contact Salesforce after disabling Platform Encryption for help finalizing your changes.

1. From Setup, use the **Quick Find** box to find **Platform Encryption**.
2. Click **Encrypt Fields**, then click **Edit**.
3. Deselect the fields you want to stop encrypting, then click **Save**.
Users can see data in these fields.
4. To disable encryption for files, deselect **Encrypt Files and Attachments** and click **Save**.

The limitations and special behaviors that apply to encrypted fields persist after encryption is disabled. The values can remain encrypted at rest and masked in some places. All previously encrypted files and attachments remain encrypted at rest.

Encrypted fields remain accessible after you disable encryption, as long as the key used to encrypt them has not been destroyed.

How Shield Platform Encryption Works

Shield Platform Encryption relies on a unique tenant secret that you control and a master secret that's maintained by Salesforce. We combine these secrets to create your unique data encryption key. We use that key to encrypt data that your users put into Salesforce, and to decrypt data when your authorized users need it.

Encrypting files, fields, and attachments has no effect on your organization's storage limits.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

[Which Fields Can I Encrypt?](#)

You can encrypt certain fields on the Account, Contact, Case, and Case Comment objects. When Shield Platform Encryption is on, users with the "View Encrypted Data" permission can see the contents of encrypted fields, but users without that permission see only masked values.

[Which Files are Encrypted?](#)

When you enable Shield Platform Encryption for files and attachments, all files and attachments that can be encrypted are encrypted. The body of each file or attachment is encrypted when it's uploaded.

[Which User Permissions Does Shield Platform Encryption Require?](#)

Assign permissions to your users according to their roles regarding encryption. Some users need the “View Encrypted Data” permission, while some need other combinations of permissions to select data for encryption or work with encryption keys. You can enable these permissions just like you would any other user permission.

[What Does My Encrypted Data Look Like?](#)

How encrypted information looks to users and admins depends on their permissions, whether it’s in a file or field, and other factors. However, admins control who has access to sensitive data.

[Behind the Scenes: The Shield Platform Encryption Process](#)

When users submit data, the application server looks for the org-specific data encryption key in its cache. If it isn’t there, the application server gets the encrypted tenant secret from the database and asks the key derivation server to derive the key. The encryption service then encrypts the data on the application server.

[How Do I Deploy Shield Platform Encryption?](#)

When you deploy Shield Platform Encryption to your organization with a tool such as Force.com IDE, Migration Tool, or Workbench, the Encrypted field attribute persists. However, if you deploy to organizations with different encryption settings, the effect depends on whether Shield Platform Encryption is enabled in the target organization.

[How Does Shield Platform Encryption Work In a Sandbox?](#)

Refreshing a sandbox from a production organization creates an exact copy of the production organization. If Shield Platform Encryption is enabled on the production organization, all encryption settings are copied, including tenant secrets created in production.

[Shield Platform Encryption Terminology](#)

Encryption has its own specialized vocabulary. To get the most out of your Shield Platform Encryption features, it’s a good idea to familiarize yourself with the key terms, such as hardware security module, key rotation, and master secret.

[What’s the Difference Between Classic Encryption and Shield Platform Encryption?](#)

Classic encryption lets you protect a special type of custom text field, which you create for that purpose. With Shield Platform Encryption you can encrypt a variety of widely-used standard fields, along with some custom fields and many kinds of files. Shield Platform Encryption also supports person accounts, cases, search, approval processes, and other key Salesforce features.

SEE ALSO:

[Platform Encryption Overview](#)

Which Fields Can I Encrypt?

You can encrypt certain fields on the Account, Contact, Case, and Case Comment objects. When Shield Platform Encryption is on, users with the “View Encrypted Data” permission can see the contents of encrypted fields, but users without that permission see only masked values.

In either case, encrypted fields work normally throughout the Salesforce user interface, business processes, and APIs. (There are some exceptions; for example, encrypted fields can't be filtered.)

When you encrypt a field, existing values aren't encrypted immediately. Values are encrypted only after they are touched. Contact Salesforce for help encrypting existing data.

Encrypted Standard Fields

You can encrypt the contents of these standard field types.

- On the Account object:
 - Account Name
 - Description
 - Fax
 - Website
 - Phone
- On the Contact object:
 - Description
 - Email
 - Fax
 - Home Phone
 - Mailing Address (Encrypts only Mailing Street and Mailing City)
 - Mobile
 - Name (Encrypts First Name, Middle Name, and Last Name)
 - Other Phone
 - Phone
- On the Case object:
 - Subject
 - Description
- On Case Comments:
 - Body (including Internal Comments)

Encrypted Custom Fields

You can encrypt the contents of fields that belong to one these custom field types:

- Email
- Phone
- Text

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

- Text Area
- Text Area (Long)
- URL
- Date
- Date/Time

 **Important:** Once a custom field is encrypted, you can't change the field type. For custom phone and email fields, you also can't change the field format.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

SEE ALSO:

[Encrypt Fields](#)

[Back to Parent Topic](#)

Which Files are Encrypted?

When you enable Shield Platform Encryption for files and attachments, all files and attachments that can be encrypted are encrypted. The body of each file or attachment is encrypted when it's uploaded.

These kinds of files are encrypted when you enable file encryption:

- Files attached to email
- Files attached to feeds
- Files attached to records
- Files on the Content, Libraries, and Files tabs (Salesforce Files, including file previews, and Salesforce CRM Content files)
- Files managed with Salesforce Files Sync and stored in Salesforce
- Files attached to Chatter posts, comments, and the sidebar
- Notes body text using the new Notes tool
- Files attached to Knowledge articles

Some types of files and attachments are not encrypted:

- Chatter group photos
- Chatter profile photos
- Documents
- Note previews in the new Notes tool
- Notes in the old Notes tool

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

SEE ALSO:

[Encrypt Files and Attachments](#)

Which User Permissions Does Shield Platform Encryption Require?

Assign permissions to your users according to their roles regarding encryption. Some users need the “View Encrypted Data” permission, while some need other combinations of permissions to select data for encryption or work with encryption keys. You can enable these permissions just like you would any other user permission.

	View Encrypted Data	Manage Encryption Keys	Customize Application	View Setup and Configuration
View data in encrypted fields	✓			
View Platform Encryption setup page			✓	✓
Edit Platform Encryption setup Page, excluding key management			✓	
Generate, destroy, export, and import tenant secrets		✓		
Query TenantSecret object via the API		✓		

The “View Encrypted Data” Permission

As an administrator, you decide which users can see field values unmasked by granting the “View Encrypted Data” permission in profiles or permission sets. Admins do not automatically have the permission, and standard profiles do not include it by default.

 **Tip:** When you have the “View Encrypted Data” permission and grant login access to other users, they can see encrypted field values in plain text. To avoid exposing sensitive data, clone your profile, remove the “View Encrypted Data” permission from the cloned profile, and assign yourself to the cloned profile. Then grant login access to the other user.

When you turn on encryption, existing field values aren’t encrypted immediately. Values are encrypted only after they are touched.

When you add or remove the “View Encrypted Data” permission for a user, the change takes effect only after the user logs in again.

Who can see data in cleartext partly depends on whether it is in a file or field. Encrypted files are always visible to users who have access to them. Encrypted fields are visible only to users who have access to them and have the “View Encrypted Data” permission. Use appropriate sharing settings if data in a file must remain hidden.

Users without the “View Encrypted Data” permission can’t:

- Edit required encrypted lookup fields.
- Use Chatter publisher related lists.
- Use the Copy Mailing Address to Other Address functionality in contacts.
- Choose which value to keep from two merged account records if the same value is encrypted in both. When this happens, Salesforce retains the value from the master account record.
- Create records that contain a lookup field that requires a value, if that lookup field points to an encrypted standard field.

Users without the “View Encrypted Data” permission can still do these things with encrypted fields:

- Change the value of an encrypted field, unless the field-level security is set to read only.
- See encrypted fields in search results, although their values are masked.
- Create contact and opportunity records from Chatter actions, related lists on account detail pages, and Quick Create.

When the running user on a report or dashboard has the “View Encrypted Data” permission, readers of the report chart or dashboard who don’t have the permission may still see encrypted data.

When users without the “View Encrypted Data” permission clone a record with encrypted, non-lookup fields, the encrypted field values are blank in the new cloned record.

When a user who doesn’t have the “View Encrypted Data” permission clones a record, encrypted fields show masked data.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

[Permission Sets](#)

[User Permissions](#)

[Back to Parent Topic](#)

What Does My Encrypted Data Look Like?

How encrypted information looks to users and admins depends on their permissions, whether it’s in a file or field, and other factors. However, admins control who has access to sensitive data.

It’s important to understand the differences between encrypted data *at rest* and data *masking*. Encrypted data *at rest* refers to data encrypted when stored. For example, servers, databases, and files all store data at rest. *Masking* refers to hiding visible data in a field by replacing the characters. For example, a Social Security number field can have the characters appear as asterisks for added security.

Users can view some data as cleartext instead of masked, depending on permissions or whether the data resides in a file or field. There are a couple of reasons for this behavior:

- **Field-Level Security:** Users with Field-Level Security permissions can access certain data even when that data is encrypted at rest. For example, a human resources director might need to view sensitive employee information in a field, while a clerk doesn’t. Although the human resources director can view the sensitive data, it remains encrypted at rest.
- **Encrypted files remain visible:** Files remain visible to users who have access to them even when they are encrypted. In contrast, to view encrypted data in fields, a user must have the View Encrypted Data permission. If data in a file must remain hidden, use the appropriate sharing settings.

Masks You’ll See

Shield Platform Encryption uses a variety of masks. Some of these simply hide data from view, while others give you additional information about the hidden data.

 **Note:** Masking doesn’t apply to data in custom Lightning components.

Field Type	Mask	What It Means
Email, Phone, Text, Text Area, Text Area (Long), URL	*****	This field is encrypted, and you don’t have permission to view encrypted data.
	!!!!	This field is encrypted, and the encryption key has been destroyed.
	?????	This service is unavailable right now. For help accessing this service, contact Salesforce.

Field Type	Mask	What It Means
Custom Date	07/07/1777	This field is encrypted, and you don't have permission to view encrypted data.
	08/08/1888	This field is encrypted, and the encryption key has been destroyed.
	01/01/1777	This service is unavailable right now. For help accessing this service, contact Salesforce.
Custom Date/Time	07/07/1777 12:00 PM	This field is encrypted, and you don't have permission to view encrypted data.
	08/08/1888 12:00 PM	This field is encrypted, and the encryption key has been destroyed.
	01/01/1777 12:00 PM	This service is unavailable right now. For help accessing this service, contact Salesforce.

 **Note:** You can't put masking characters into an encrypted field. For example, if a Phone field is encrypted and you enter a phone number as *****, or a Date field is encrypted and you enter 07/07/1777, that data is not saved.

Behind the Scenes: The Shield Platform Encryption Process

When users submit data, the application server looks for the org-specific data encryption key in its cache. If it isn't there, the application server gets the encrypted tenant secret from the database and asks the key derivation server to derive the key. The encryption service then encrypts the data on the application server.

Salesforce securely generates the master and tenant secrets by using Hardware Security Modules (HSMs). The unique key is derived by using PBKDF2, a Key Derivation Function (KDF), with the master and tenant secrets as inputs.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Shield Platform Encryption Process Flow

1. When a Salesforce user saves encrypted data, the runtime engine determines from metadata whether to encrypt the field, file, or attachment before storing it in the database.
2. If so, the encryption service checks for the matching data encryption key in cached memory.
3. The encryption service determines whether the key exists.
 - a. If so, the encryption service retrieves the key.
 - b. If not, the service sends a derivation request to a key derivation server and returns it to the encryption service running on the App Cloud.
4. After retrieving or deriving the key, the encryption service generates a random initialization vector (IV) and encrypts the data using 256-bit AES encryption.
5. The ciphertext is saved in the database or file storage. The IV and corresponding ID of the tenant secret used to derive the data encryption key are saved in the database.

Salesforce generates a new master secret at the start of each release.

How Do I Deploy Shield Platform Encryption?

When you deploy Shield Platform Encryption to your organization with a tool such as Force.com IDE, Migration Tool, or Workbench, the Encrypted field attribute persists. However, if you deploy to organizations with different encryption settings, the effect depends on whether Shield Platform Encryption is enabled in the target organization.

You can use change sets to deploy Shield Platform Encryption to custom fields. Regardless of how you deploy, Salesforce automatically checks to see if the implementation violates Shield Platform Encryption guidelines.

Source Organization	Target Organization	Result
Shield Platform Encryption enabled	Shield Platform Encryption enabled	The source Encrypted field attribute indicates enablement
Shield Platform Encryption enabled	Shield Platform Encryption not enabled	The Encrypted field attribute is ignored
Shield Platform Encryption not enabled	Shield Platform Encryption enabled	The target Encrypted field attribute indicates enablement

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

SEE ALSO:

[Back to Parent Topic](#)

How Does Shield Platform Encryption Work In a Sandbox?

Refreshing a sandbox from a production organization creates an exact copy of the production organization. If Shield Platform Encryption is enabled on the production organization, all encryption settings are copied, including tenant secrets created in production.

Once a sandbox is refreshed, tenant secret changes are confined to your current organization. This means that when you rotate or destroy a tenant secret on sandbox, it doesn't affect the production organization.

As a best practice, rotate tenant secrets on sandboxes after a refresh. Rotation ensures that production and sandbox use different tenant secrets. Destroying tenant secrets on a sandbox renders encrypted data unusable in cases of partial or full copies.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Shield Platform Encryption Terminology

Encryption has its own specialized vocabulary. To get the most out of your Shield Platform Encryption features, it's a good idea to familiarize yourself with the key terms, such as hardware security module, key rotation, and master secret.

Data Encryption

The process of applying a cryptographic function to data that results in ciphertext. The platform encryption process uses symmetric key encryption and a 256-bit Advanced Encryption Standard (AES) algorithm using CBC mode, PKCS5 padding, and a randomized, 128-bit initialization vector (IV) to encrypt field-level data and files stored on the Salesforce platform. Both data encryption and decryption occur on the application servers.

Data Encryption Keys

Shield Platform Encryption uses data encryption keys to encrypt and decrypt data. Data encryption keys are derived on a key derivation server using keying material split between a per-release master secret and an organization-specific tenant secret stored encrypted in the database as a part of your organization. The 256-bit derived keys exist in memory until evicted from the cache.

Encrypted Data at Rest

Data that is encrypted when stored on disk. Salesforce supports encryption for fields stored in the database, documents stored in Files, Content Libraries, and Attachments, and archived data.

Encryption Key Management

Refers to all aspects of key management, such as key creation, processes, and storage. Tenant secret management is performed by administrators or users who have the "Manage Encryption Keys" permission.

Hardware Security Module (HSM)

Used to provide cryptography processing as well as key management for authentication. Shield Platform Encryption uses HSMs to generate and store secret material and run the function that derives data encryption keys used by the encryption service to encrypt and decrypt data.

Initialization Vector (IV)

A random sequence used with a key to encrypt data.

Key Derivation Function (KDF)

Uses a pseudorandom number generator and input such as a password to derive keys. Shield Platform Encryption uses PBKDF2 (Password-based Key Derivation Function 2) with HMAC-SHA-256.

Key (Tenant Secret) Rotation

The process of generating a new tenant secret and archiving the previously active one. Active tenant secrets are used for both encryption and decryption. Archived ones are used only for decryption until all data has been re-encrypted using the new, active tenant secret.

Master HSM

The master HSM consists of a USB device used to generate secure, random secrets each Salesforce release. The master HSM is "air-gapped" from Salesforce's production network and stored securely in a bank safety deposit box.

Master Secret

Used in conjunction with the tenant secret and key derivation function to generate a derived data encryption key. The master secret is updated each release by Salesforce and encrypted using the per-release master wrapping key, which is in turn encrypted with the Key Derivation Servers' public key so it can be stored encrypted on the file system. Only HSMs can decrypt it. *No Salesforce employees have access to these keys in cleartext.*

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Master Wrapping Key

A symmetric key is derived and used as a master wrapping key, also known as a key wrapping key, encrypting all the per-release keys and secrets bundle.

Tenant Secret

An organization-specific secret used in conjunction with the master secret and key derivation function to generate a derived data encryption key. When an organization administrator rotates a key, a new tenant secret is generated. To access the tenant secret via the API, refer to the TenantSecret object. *No Salesforce employees have access to these keys in cleartext.*

What's the Difference Between Classic Encryption and Shield Platform Encryption?

Classic encryption lets you protect a special type of custom text field, which you create for that purpose. With Shield Platform Encryption you can encrypt a variety of widely-used standard fields, along with some custom fields and many kinds of files. Shield Platform Encryption also supports person accounts, cases, search, approval processes, and other key Salesforce features.

Feature	Classic Encryption	Shield Platform Encryption
Pricing	Included in base user license	Additional fee applies
Encryption at Rest	✓	✓
Native Solution (No Hardware or Software Required)	✓	✓
Encryption Algorithm	128-bit Advanced Encryption Standard (AES)	256-bit Advanced Encryption Standard (AES)
HSM-based Key Derivation		✓
"Manage Encryption Keys" Permission		✓
Generate, Export, Import, and Destroy Keys	✓	✓
PCI-DSS L1 Compliance	✓	✓ (for fields only)
Masking	✓	✓
Mask Types and Characters	✓	
"View Encrypted Data" Permission Required to Read Encrypted Field Values	✓	✓
Email Template Values Respect "View Encrypted Data" Permission		✓
Encrypted Standard Fields		✓

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Feature	Classic Encryption	Shield Platform Encryption
Encrypted Attachments, Files, and Content		✓
Encrypted Custom Fields	Dedicated custom field type, limited to 175 characters	✓
Encrypt Existing Fields for Supported Custom Field Types		✓
Search (UI, Partial Search, Lookups, Certain SOSL Queries)		✓
API Access	✓	✓
Available in Workflow Rules and Workflow Field Updates		✓
Available in Approval Process Entry Criteria and Approval Step Criteria		✓

Platform Encryption Best Practices

Take the time to identify the most likely threats to your organization. This will help you distinguish data that needs encryption from data that doesn't, so that you can encrypt only what you need to. Make sure your tenant secret and keys are backed up, and be careful who you allow to manage your secrets and keys.

1. Define a threat model for your organization.

Walk through a formal threat modeling exercise to identify the threats that are most likely to affect your organization. Use your findings to create a data classification scheme, which can help you decide what data to encrypt.

2. Encrypt only where necessary.

- Not all data is sensitive. Focus on information that requires encryption to meet your regulatory, security, compliance, and privacy requirements. Unnecessarily encrypting data impacts functionality and performance.
- Evaluate your data classification scheme early and work with stakeholders in security, compliance, and business IT departments to define requirements. Balance business-critical functionality against security and risk measures and challenge your assumptions periodically.

3. Create a strategy early for backing up and archiving keys and data.

If your tenant secrets are destroyed, reimport them to access your data. You are solely responsible for making sure your data and tenant secrets are backed up and stored in a safe place. Salesforce cannot help you with deleted, destroyed or misplaced tenant secrets.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

4. Understand that encryption applies to all users, regardless of their permissions.
 - You control who reads encrypted field values in plaintext using the “View Encrypted Data” permission. However, the data stored in these fields is encrypted at rest, regardless of user permissions.
 - Functional limitations are imposed on users who interact with encrypted data. Consider whether encryption can be applied to a portion of your business users and how this application affects other users interacting with the data.
5. Read the Shield Platform Encryption considerations and understand their implications on your organization.
 - Evaluate the impact of the considerations on your business solution and implementation.
 - Test Shield Platform Encryption in a sandbox environment before deploying to a production environment.
 - Before enabling encryption, fix any violations that you uncover. For example, referencing encrypted fields in a SOQL WHERE clause triggers a violation. Similarly, if you reference encrypted fields in a SOQL ORDER BY clause, a violation occurs. In both cases, fix the violation by removing references to the encrypted fields.
6. Analyze and test AppExchange apps before deploying them.
 - If you use an app from the AppExchange, test how it interacts with encrypted data in your organization and evaluate whether its functionality is affected.
 - If an app interacts with encrypted data that’s stored outside of Salesforce, investigate how and where data processing occurs and how information is protected.
 - If you suspect Shield Platform Encryption could affect the functionality of an app, ask the provider for help with evaluation. Also discuss any custom solutions that must be compatible with Shield Platform Encryption.
 - Apps on the AppExchange that are built exclusively using Force.com inherit Shield Platform Encryption capabilities and limitations.
7. Platform Encryption is not a user authentication or authorization tool. Use field-level security settings, page layout settings, and validation rules, not Platform Encryption, to control which users can see which data. Make sure that a user inadvertently granted the “View Encrypted Data” permission would still see only appropriate data.

By default, any user can edit encrypted fields, even users without the “View Encrypted Data” permission.
8. Grant the “Manage Encryption Keys” user permission to authorized users only.

Users with the “Manage Encryption Keys” permission can generate, export, import, and destroy organization-specific keys. Monitor the key management activities of these users regularly with the setup audit trail.
9. Grant the “View Encrypted Data” user permission to authorized users only.

Grant the “View Encrypted Data” permission to users who must view encrypted fields in plaintext, including integration users who must read sensitive data in plaintext. Encrypted files are visible to all users who have access to the files, regardless of the “View Encrypted Data” permission.
10. Mass-encrypt your existing data.

Existing field and file data is not automatically encrypted when you turn on Shield Platform Encryption. To encrypt existing field data, update the records associated with the field data. This action triggers encryption for these records so that your existing data is encrypted at rest. To encrypt existing files, contact Salesforce.
11. Don’t use Currency and Number fields for sensitive data.

You can often keep private, sensitive, or regulated data safe without encrypting associated `Currency` or `Number` fields. Encrypting these fields could have broad functional consequences across the platform, such as disruptions to roll-up summary reports, report timeframes, and calculations, so they are not encryptable.
12. Communicate to your users about the impact of encryption.

Before you enable Shield Platform Encryption in a production environment, inform users about how it affects your business solution. For example, share the information described in Shield Platform Encryption considerations, where it's relevant to your business processes.

13. Use discretion when granting login access.

If a user with the "View Encrypted Data" permission grants login access to another user, the other user is able to view encrypted fields in plaintext.

14. Encrypt your data using the most current key.

When you generate a new tenant secret, any new data is encrypted using this key. However, existing sensitive data remains encrypted using previous keys. In this situation, Salesforce strongly recommends re-encrypting these fields using the latest key. Contact Salesforce for help with this.

Tradeoffs and Limitations of Shield Platform Encryption

A security solution as powerful as Shield Platform Encryption doesn't come without some trade-offs. When your data is strongly encrypted, some users may see limitations to some functionality, and a few features aren't available at all. Consider the impact on your users and your overall business solution as you design your encryption strategy.

[General Shield Platform Encryption Considerations](#)

These considerations apply to all data that you encrypt using Shield Platform Encryption.

[Which Salesforce Apps Support Encrypted Data?](#)

Some Salesforce feature sets work normally when you work with data that's encrypted at rest. Others don't.

[Shield Platform Encryption and the Lightning Experience](#)

Shield Platform Encryption works the same way in the Lightning experience as it does in Salesforce Classic, with a few minor exceptions.

[Field Limits With Shield Platform Encryption](#)

Under certain conditions, encrypting a given field can impose limits on the values you store in that field. Before deciding to encrypt a field, make sure you know what functionality will be affected.

[Platform Encryption Overview](#)

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

General Shield Platform Encryption Considerations

These considerations apply to all data that you encrypt using Shield Platform Encryption.

Custom Fields

You can't use encrypted custom fields in custom formula fields or criteria-based sharing rules.

Some custom fields can't be encrypted:

- Fields that have the `Unique` or `External ID` attributes or include these attributes on previously encrypted custom fields
- Fields that are used in custom formula fields
- Fields on external data objects
- Fields that are used in an account contact relation

You can't use Schema Builder to create an encrypted custom field.

SOQL/SOSL

- Encrypted fields can't be used with the following SOQL and SOSL clauses and functions:
 - Aggregate functions such as `MAX()`, `MIN()`, and `COUNT_DISTINCT()`
 - `WHERE` clause
 - `GROUP BY` clause
 - `ORDER BY` clause

Tip: Consider whether you can replace a `WHERE` clause in a SOQL query with a `FIND` query in SOSL.

- When you query encrypted data, invalid strings return an `INVALID_FIELD` error instead of the expected `MALFORMED_QUERY`.

Microsoft Integration Products

With Shield Platform Encryption enabled, Salesforce for Outlook syncs between Microsoft Outlook and Salesforce only if the user has the "View Encrypted Data" permission.

If Lightning Sync or Lightning for Outlook is activated, Platform Encryption can't be enabled. If Platform Encryption is enabled, Lightning Sync and Lightning for Outlook can't be activated.

Portals

If a portal is enabled in your organization, you can't encrypt standard fields. Deactivate all portals to enable encryption on standard fields. (Communities are supported.)

Search

- Search index files are not encrypted.

Tip: Encrypted search indexes are available to some customers on a pilot basis. Talk to your Salesforce representative if you'd like to join the pilot program. See the [Summer '16 Release Notes](#) for details.

- If you encrypt fields with a key and then destroy the key, the corresponding search terms remain in the search index. However, you can't decrypt the data associated with the destroyed key.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Accounts, Person Accounts, and Contacts

When Person Accounts are turned on, encrypting any of the following Account fields encrypts the equivalent Contact fields, and vice versa.

- Name
- Description
- Phone
- Fax

When you encrypt any of the following Account or Contact fields, the equivalent fields in Person Accounts are also encrypted.

- Name
- Description
- Mailing Address
- Phone
- Fax
- Mobile
- Home Phone
- Other Phone
- Email

When the Account Name or Contact Name field is encrypted, searching for duplicate accounts or contacts to merge doesn't return any results.

When you encrypt the First Name or Last Name field on a contact, that contact appears in the Calendar Inviter lookup only if you haven't filtered by First Name or Last Name.

Salutation and Suffix field values in Contact records can appear masked to users without the "View Encrypted Data" permission, even if the field values aren't encrypted.

Email

- When encrypted field values are included in email templates, they appear in plaintext to users with the "View Encrypted Data" permission. Otherwise, the running user's permissions determine whether the recipient sees plaintext or masked data.
- Users without the "View Encrypted Data" permission can't send Stay-in-Touch requests.
- Users without the "View Encrypted Data" permission can't send emails using Mass Email Contacts.
- When the standard Email field is encrypted, email to Salesforce can't receive inbound emails.

Activities

- When the Contact Name field is encrypted, Shared Activities lookup is not supported.
- Items in an Activity History related list may be displayed in plaintext even if the fields they refer to are encrypted.

Campaigns

Campaign member search isn't supported when you search by encrypted fields.

Notes

You can encrypt the body text of Notes created with the new Notes tool, but the Preview file and Notes created with the old Notes tool aren't supported.

Field Audit Trail

Data in a previously archived Field Audit Trail isn't encrypted when you turn on Platform Encryption. For example, say your org uses Field Audit Trail to define a data history retention policy for an account field, such as the phone number field. When you turn on encryption for that field, new phone number records are encrypted as they are created. Previous updates to the phone number field that are stored in the Account History related list are also encrypted. However, phone number history data that is already archived in the `FieldHistoryArchive` object is stored without encryption. If you need to encrypt previously archived data, contact Salesforce.

Page Layouts

If you preview a page layout as a profile without the "View Encrypted Data" permission, the preview's sample data isn't masked. Instead, the sample data could be blank or appear in plaintext.

Communities

- For community users with the "View Encrypted Data" permission, data encryption doesn't change anything about the community experience. However, if you encrypt the Account Name field and you're not using Person Accounts, encryption affects how users' roles are displayed to admins. Normally, a community user's role name is displayed as a combination of their account name and the name of their user profile. When you encrypt the Account Name field, the account ID is displayed instead of the account name.

For example, when the Account Name field is not encrypted, users belonging to the Acme account with the Customer User profile would have a role called `Acme Customer User`. When Account Name is encrypted (and Person Accounts aren't in use), the role is displayed as something like `001D000000IRt53 Customer User`.
- Custom fields encrypted with Classic Encryption are masked for Community users even if they have the "View Encrypted Data" permission.

REST API

You don't get autosuggestions via the REST API when a field is encrypted.

Data Import

You can't use the Data Import Wizard to perform matching using master-detail relationships or update records that contain encrypted fields. You can use it to add new records, however.

Reports, Dashboards, and List Views

- Report charts and dashboard components that display encrypted field values may be cached unencrypted.
- You can't sort records in list views by fields that are encrypted.

General

- Encrypted fields can't be used in:
 - Criteria-based sharing rules
 - Similar opportunities searches

- External lookup relationships
 - Skinny tables
 - Filter criteria for data management tools
 - Duplicate Management matching rules
- Live Agent chat transcripts are not encrypted at rest.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

[Back to Parent Topic](#)

Which Salesforce Apps Support Encrypted Data?

Some Salesforce feature sets work normally when you work with data that's encrypted at rest. Others don't.

These apps don't support encrypted data. However, you can enable encryption for other apps when these apps are in use.

- Chatter Desktop
- Connect Offline
- Data.com
- Heroku (Heroku Connect does support encrypted data.)
- Marketing Cloud (Marketing Cloud Connect does support encrypted data.)
- Pardot
- Process Builder
- Salesforce Classic Mobile
- Salesforce IQ
- Social Customer Service
- Steelbrick
- Thunder
- Visual Workflows
- Wave

These apps don't support encrypted data, and encryption cannot be enabled if they are present.

- Legacy portals (customer, self-service, and partner, with standard fields encrypted)
- Lightning for Outlook
- Lightning Sync
- Pardot Connector (with Contact's Email encrypted)

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

[Back to Parent Topic](#)

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

Shield Platform Encryption and the Lightning Experience

Shield Platform Encryption works the same way in the Lightning experience as it does in Salesforce Classic, with a few minor exceptions.

Custom Lightning Components

When viewed in a custom Lightning component, encrypted data is not masked, even if the user doesn't have the "View Encrypted Data" permission.

Notes

Note previews in Lightning are not encrypted.

File Encryption Icon

The icon that indicates that a file is encrypted doesn't appear in Lightning.

Date Fields

Lightning shows 12/30/0001 as the dummy date for masking encrypted date values.

Custom Field Masking

When the encryption key is destroyed, the values of encrypted custom field values may appear in plaintext until the page is refreshed.

Field Limits With Shield Platform Encryption

Under certain conditions, encrypting a given field can impose limits on the values you store in that field. Before deciding to encrypt a field, make sure you know what functionality will be affected.

Non-ASCII Fields

If you expect users to enter non-ASCII values, such as CJK-encoded data, we recommend creating validation rules to enforce these limits:

- Email custom field values that contain only non-ASCII characters are limited to 70 characters.
- Phone custom fields values that contain only non-ASCII characters are limited to 22 characters.

Multi-Line Fields

Multi-line text fields, such as Case Comments, have a limit of 4,000 characters. The actual limit is lower when the field is encrypted. How much shorter depends on the content of the field.

 **Note:** This page is about Shield Platform Encryption, not Classic Encryption.

[Encrypt Fields](#)

[Back to Parent Topic](#)

Session Security

After logging in, a user establishes a session with the platform. Use session security to limit exposure to your network when a user leaves the computer unattended while still logged in. It also limits the risk of internal attacks, such as when one employee tries to use another employee's session. Choose from several session settings to control session behavior.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

EDITIONS

Available as add-on subscription in: **Enterprise**, **Performance**, and **Unlimited** Editions. Requires purchasing Salesforce Shield. Available in **Developer** Edition at no charge for organizations created in Summer '15 and later.

Available in both Salesforce Classic and Lightning Experience.

You can control when an inactive user session expires. The default session timeout is two hours of inactivity. When the session timeout is reached, users are prompted with a dialog that allows them to log out or continue working. If they don't respond to this prompt, they are logged out.

 **Note:** When users close a browser window or tab, they aren't automatically logged off from their Salesforce session. Ensure that your users are aware of this behavior and that they end all sessions properly by selecting *Your Name* > **Logout**.

By default, Salesforce uses TLS (Transport Layer Security) and requires secure connections (HTTPS) for all communication. The `Require secure connections (HTTPS)` setting determines whether TLS (HTTPS) is required for access to Salesforce, apart from Force.com sites, which can be accessed using HTTP. If you ask Salesforce to disable this setting and change the URL from `https://` to `http://`, you can still access the application. However, for added security, require all sessions to use TLS. For more information, see [Modify Session Security Settings](#) on page 822.

You can restrict access to certain types of resources based on the level of security associated with the authentication (login) method for the user's current session. By default, each login method has one of two security levels: Standard or High Assurance. You can change the session security level and define policies so specified resources are only available to users with a High Assurance level. For details, see [Session-level Security](#) on page 826.

You can control whether your org stores user logins and whether they can appear from the User Switcher with the settings `Enable caching and autocomplete on login page`, `Enable user switching`, and `Remember me until logout`.

[Modify Session Security Settings](#)

You can modify session security settings to specify session connection type, timeout settings, and IP address ranges to protect against malicious attacks and more.

[Set Trusted IP Ranges for Your Organization](#)

Trusted IP Ranges define a list of IP addresses from which users can log in without receiving a login challenge for verification of their identity, such as a code sent to their mobile phone.

[User Sessions](#)

Monitor and protect your Salesforce org by reviewing active sessions and session details on the User Session Information page. You can create custom list views, view details about a user associated with a specific session, and easily end suspicious sessions. Salesforce admins can view all user sessions for an org; non-admins see only their own sessions.

[Understanding Session Types](#)

Learn about the session types in the User Session Information page to help you monitor and protect your organization.

SEE ALSO:

[Set Trusted IP Ranges for Your Organization](#)

[Identity Verification History](#)

Modify Session Security Settings

You can modify session security settings to specify session connection type, timeout settings, and IP address ranges to protect against malicious attacks and more.

1. From Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings**.
2. Customize the session security settings.

Field	Description
Timeout value	<p>Length of time after which the system logs out inactive users. For Portal users, the timeout is between 10 minutes and 12 hours even though you can only set it as low as 15 minutes. Select a value between 15 minutes and 12 hours. Choose a shorter timeout period if your org has sensitive information and you want to enforce stricter security.</p> <p> Note: The last active session time value isn't updated until halfway through the timeout period. So if you have a 30-minute timeout, the system doesn't check for activity until 15 minutes have passed. For example, if you update a record after 10 minutes, the last active session time value isn't updated because there was no activity after 15 minutes. You're logged out in 20 more minutes (30 minutes total), because the last active session time wasn't updated. Suppose that you update a record after 20 minutes. That's 5 minutes after the last active session time is checked. Your timeout resets, and you have another 30 minutes before being logged out, for a total of 50 minutes.</p>
Disable session timeout warning popup	<p>Determines whether the system prompts inactive users with a timeout warning message. Users are prompted 30 seconds before timeout as specified by the <code>Timeout value</code>.</p>
Force logout on session timeout	<p>Requires that when sessions time out for inactive users, current sessions become invalid. The browser refreshes and returns to the login page. To access the org, the user must log in again.</p> <p> Note: Do <i>not</i> select <code>Disable session timeout warning popup</code> when using this setting.</p>

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

The `Lock sessions to the IP address from which they originated` setting is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

All other settings available in: **Personal, Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To modify session security settings:

- "Customize Application"

Field	Description
Lock sessions to the IP address from which they originated	<p>Determines whether user sessions are locked to the IP address from which the user logged in, helping to prevent unauthorized persons from hijacking a valid session.</p> <p> Note: This setting can inhibit various applications and mobile devices.</p>
Lock sessions to the domain in which they were first used	<p>Associates a current UI session for a user, such as a community user, with a specific domain. The setting helps prevent unauthorized use of the session ID in another domain. This setting is enabled by default for orgs created with the Spring '15 release or later.</p>
Require secure connections (HTTPS)	<p>Determines whether HTTPS is required to log in to or access Salesforce, apart from Force.com sites, which can be accessed using HTTP.</p> <p>This setting is enabled by default for security reasons.</p> <p> Note: The Reset Passwords for Your Users page can only be accessed using HTTPS.</p>
Force relogin after Login-As-User	<p>Determines whether an administrator who is logged in as another user is returned to their previous session after logging out as the secondary user.</p> <p>If the setting is enabled, an administrator must log in again to continue using Salesforce after logging out as the user. Otherwise, the administrator is returned to the original session after logging out as the user. This setting is enabled by default for new orgs beginning with the Summer '14 release.</p>
Require HttpOnly attribute	<p>Restricts session ID cookie access. A cookie with the HttpOnly attribute is not accessible via non-HTTP methods, such as calls from JavaScript.</p> <p> Note: If you have a custom or packaged application that uses JavaScript to access session ID cookies, selecting <code>Require HttpOnly attribute</code> breaks your application. It denies the application access to the cookie. If <code>Require HttpOnly attribute</code> is selected, the AJAX Toolkit debugging window isn't available.</p>
Use POST requests for cross-domain sessions	<p>Sets the org to send session information using a POST request, instead of a GET request, for cross-domain exchanges. An example of a cross-domain exchange is when a user is using a Visualforce page. In this context, POST requests are more secure than GET requests because POST requests keep the session information in the body of the request. However, if you enable this setting, embedded content from another domain, such as:</p> <pre data-bbox="716 1650 1446 1696" style="border: 1px solid #ccc; padding: 5px;"><code></code></pre> <p>sometimes doesn't display.</p>
Enforce login IP ranges on every request	<p>Restricts the IP addresses from which users can access Salesforce to only the IP addresses defined in <code>Login IP Ranges</code>. If this setting is enabled, login IP ranges are enforced on each page request, including requests from client</p>

Field	Description
Enable caching and autocomplete on login page	<p>applications. If this setting isn't enabled, login IP ranges are enforced only when a user logs in. This setting affects all user profiles that have login IP restrictions.</p> <p>Allows the user's browser to store usernames. If enabled, after initial login, usernames are auto-filled into the <code>Username</code> field on the login page. If the user selected Remember me on the login page, the username persists after the session expires or the user logs out. The username also appears on the User Switcher. This setting is selected by default for all organizations.</p> <p> Note: If you disable this setting, the Remember me option doesn't appear on your org's login page or from the User Switcher.</p>
Enable secure and persistent browser caching to improve performance	<p>Enables secure data caching in the browser to improve page reload performance by avoiding extra round trips to the server. This setting is selected by default for all organizations. We don't recommend disabling this setting, but if your company's policy doesn't allow browser caching even if the data is encrypted, you can disable it.</p>
Enable user switching	<p>Determines whether the User Switcher appears when your org's users select their profile picture. This setting is selected by default for all organizations. The <code>Enable caching and autocomplete on login page</code> setting must also be enabled. Deselect the <code>Enable user switching</code> setting to prevent your org from appearing in User Switchers on other orgs. It also prevents your org users from seeing the User Switcher when they select their profile picture.</p>
Remember until logout	<p>Normally, usernames are cached only while a session is active or if a user selects Remember Me. For SSO sessions, the remember option isn't available. So, once the session expires, the username disappears from the login page and the User Switcher. By enabling <code>Remember me until logout</code>, the cached usernames are deleted only if the user explicitly logs out. If the session times out, they appear on the User Switcher as inactive. This way, if the users are on their own computer and allow a session to timeout, they can select the username to reauthenticate. If they're on a shared computer, the username is deleted immediately when the user logs out.</p> <p>This setting applies to all your org's users. This option isn't enabled by default. However, we encourage you to enable it as a convenience to your users. Keep this setting disabled if your org doesn't expose all your SSO or authentication providers on your login page.</p>
Enable the SMS method of identity confirmation	<p>Allows users to receive a one-time PIN delivered via SMS. If this setting is selected, administrators or users must verify their mobile phone number before taking advantage of this feature. This setting is selected by default for all organizations.</p>
Require security tokens for API logins from callouts (API version 31.0 and earlier)	<p>In API version 31.0 and earlier, requires the use of security tokens for API logins from callouts. Examples are Apex callouts or callouts using the AJAX proxy. In API version 32.0 and later, security tokens are required by default.</p>

Field	Description
Login IP Ranges (for Contact Manager, Group, and Professional Editions)	<p>Specifies a range of IP addresses users must log in from (inclusive), or the login fails.</p> <p>To specify a range, click New and enter a Start IP Address and End IP Address to define the range, which includes the start and end values.</p> <p>This field is not available in Enterprise, Unlimited, Performance, and Developer Editions. In those editions, you can specify a valid Login IP Range in the user profile settings.</p>
Enable clickjack protection for Setup pages	Protects against clickjack attacks on setup Salesforce pages. Clickjacking is also known as a user interface redress attack. (Setup pages are available from the Setup menu.)
Enable clickjack protection for non-Setup Salesforce pages	Protects against clickjack attacks on non-setup Salesforce pages. Clickjacking is also known as a user interface redress attack. Setup pages already include protection against clickjack attacks. (Setup pages are available from the Setup menu.) This setting is selected by default for all organizations.
Enable clickjack protection for customer Visualforce pages with standard headers	<p>Protects against clickjack attacks on your Visualforce pages with headers enabled. Clickjacking is also known as a user interface redress attack.</p> <p> Warning: If you use custom Visualforce pages within a frame or iframe, you sometimes see a blank page or the page displays without the frame. For example, Visualforce pages in a page layout don't function when clickjack protection is on.</p>
Enable clickjack protection for customer Visualforce pages with headers disabled	<p>Protects against clickjack attacks on your Visualforce pages with headers disabled when setting <code>showHeader="false"</code> on the page. Clickjacking is also known as a user interface redress attack.</p> <p> Warning: If you use custom Visualforce pages within a frame or iframe, you sometimes see a blank page or the page displays without the frame. For example, Visualforce pages in a page layout don't function when clickjack protection is on.</p>
Enable CSRF protection on GET requests on non-setup pages	Protects against Cross Site Request Forgery (CSRF) attacks by modifying non-Setup pages. Non-Setup pages include a random string of characters in the URL parameters or as a hidden form field. With every GET and POST request, the application checks the validity of this string of characters. The application doesn't execute the command unless the value found matches the expected value. This setting is selected by default for all organizations.
Enable CSRF protection on POST requests on non-setup pages	
Logout URL	Redirects users to a specific page after they log out of Salesforce, such as an authentication provider's page or a custom-branded page. This URL is used only if no logout URL is specified in the identity provider, SAML single sign-on, or external authentication provider settings. If no value is specified for Logout URL, the default is <code>https://login.salesforce.com</code> , unless MyDomain is enabled. If My Domain is enabled, the default is <code>https://customdomain.my.salesforce.com</code> .

3. Click **Save**.

Session Security Levels

You can restrict access to certain types of resources based on the level of security associated with the authentication (login) method for the user's current session. By default, each login method has one of two security levels: Standard or High Assurance. You can change the session security level and define policies so specified resources are only available to users with a High Assurance level.

The different authentication methods are assigned these security levels, by default.

- Username and Password — Standard
- Delegated Authentication — Standard
- Activation — Standard
- Two-Factor Authentication — High Assurance
- Authentication Provider — Standard
- SAML — Standard

Note: The security level for a SAML session can also be specified using the `SessionLevel` attribute of the SAML assertion sent by the identity provider. The attribute can take one of two values, `STANDARD` or `HIGH_ASSURANCE`.

To change the security level associated with a login method:

1. From Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings**.
2. Under Session Security Levels, select the login method.
3. To move the method to the proper category, click the **Add** or **Remove** arrow.

Currently, the only features that use session-level security are reports and dashboards in Salesforce and connected apps. You can set policies requiring High Assurance on these types of resources. You can also specify an action to take if the session used to access the resource is not High Assurance. The supported actions are:

- Block — Blocks access to the resource by showing an insufficient privileges error.
- Raise session level — Prompts users to complete two-factor authentication. When users authenticate successfully, they can access the resource. For reports and dashboards, you can apply this action when users access reports or dashboards, or just when they export and print them.

Warning: Raising the session level to high assurance by redirecting the user to complete two-factor authentication is not a supported action in Lightning Experience. If your org has Lightning Experience enabled, and you set a policy that requires a high assurance session to access reports and dashboards, Lightning Experience users with a standard assurance session are blocked from reports and dashboards. Also, they don't see the icons for these resources in the navigation menu. As a workaround, users with a standard assurance session can log out and log in again using an authentication method that is defined as high assurance by their org. Then they have access to reports and dashboards. Or, they can switch to Salesforce Classic, where they're prompted to raise the session level when they attempt to access reports and dashboards.

To set a High Assurance required policy for accessing a connected app:

1. From Setup, enter *Connected Apps* in the Quick Find box, then select the option for managing connected apps.
2. Click **Edit** next to the connected app.
3. Select **High Assurance session required**.
4. Select one of the actions presented.
5. Click **Save**.

To set a High Assurance required policy for accessing reports and dashboards:

1. From Setup, enter *Access Policies* in the **Quick Find** box, then select **Access Policies**.
2. Select **High Assurance session required**.
3. Select one of the actions presented.
4. Click **Save**.

Session levels have no impact on resources in the app other than connected apps, reports, and dashboards for which explicit security policies have been defined.

[Identity Verification History](#)

Set Trusted IP Ranges for Your Organization

Trusted IP Ranges define a list of IP addresses from which users can log in without receiving a login challenge for verification of their identity, such as a code sent to their mobile phone.

 **Note:**  [Who Sees What: Organization Access](#)

Watch how you can restrict login through IP ranges and login hours.

To help protect your organization's data from unauthorized access, you can specify a list of IP addresses from which users can log in without receiving a login challenge. However, this does not restrict access, entirely, for users outside of the Trusted IP Range. After these users complete the login challenge (usually by entering a code sent to their mobile device or email address), they can log in.

1. From Setup, enter *Network Access* in the **Quick Find** box, then select **Network Access**.
2. Click **New**.
3. Enter a valid IP address in the **Start IP Address** field and a higher IP address in the **End IP Address** field.

The start and end addresses define the range of allowable IP addresses from which users can log in, including the start and end values. If you want to allow logins from a single IP address, enter the same address in both fields.

The start and end IP addresses must be in an IPv4 range and include no more than 33,554,432 addresses (2^{25} , a /7 CIDR block).

4. Optionally, enter a description for the range. For example, if you maintain multiple ranges, enter details about the part of your network that corresponds to this range.
5. Click **Save**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view network access:

- "Login Challenge Enabled"

To change network access:

- "Manage IP Addresses"

 **Note:** For organizations that were activated before December 2007, Salesforce automatically populated your organization's trusted IP address list in December 2007, when this feature was introduced. The IP addresses from which trusted users had already accessed Salesforce during the past six months were added.

[Restrict Where and When Users Can Log In to Salesforce](#)

[Security Implementation Guide](#)

User Sessions

Monitor and protect your Salesforce org by reviewing active sessions and session details on the User Session Information page. You can create custom list views, view details about a user associated with a specific session, and easily end suspicious sessions. Salesforce admins can view all user sessions for an org; non-admins see only their own sessions.

When you manually end a user's session by clicking the **Remove** button, the user must log in again to the organization.

The following table contains information about the fields you can view on this page. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Field	Description
City	The city where the user's IP address is physically located. This value is not localized.
Country	The country where the user's IP address is physically located. This value is not localized.
Country Code	The ISO 3166 code for the country where the user's IP address is physically located. This value is not localized. For more information, see Country Codes - ISO 3166 .
Created	The date and time stamp of when the session began.
Latitude	The latitude where the user's IP address is physically located.
Location	The approximate location of the IP address from where the user logged in. To show more geographic information, such as approximate city and postal code, create a custom view to include those fields. This value is not localized.
Longitude	The longitude where the user's IP address is physically located.
Login Type	The type of login associated with the session. Some login types include Application, SAML, and Portal.
Parent Session ID	If a session has a parent, this ID is the parent's unique ID.
Postal Code	The postal code where the user's IP address is physically located. This value is not localized.
Session ID	The unique ID for the session.
Session Type	The type of session the user is logged in to. For example, common ones are UI, Content, API, and Visualforce.
Source IP	The IP address associated with the session.

Field	Description
Subdivision	The name of the subdivision where the user's IP address is physically located. This value is not localized.
User Type	The profile type associated with the session.
Username	The username used when logged in to the session. To view the user's profile page, click the username.
Updated	The date and time stamp of the last session update due to activity. For example, during a UI session, users make frequent changes to records and other data as they work. With each change, both the <code>Updated</code> and <code>Valid Until</code> date and time stamps are refreshed.
Valid Until	If you don't end the session manually, the date and time stamp of when the session automatically expires.

[Understanding Session Types](#)

Understanding Session Types

Learn about the session types in the User Session Information page to help you monitor and protect your organization.

You can view the session type for a specific user on the User Session Information page. To access the page from Setup, enter *Session Management* in the *Quick Find* box, then select **Session Management**.

Session types indicate the type of session a user is utilizing to access an organization. Session types can be persistent or temporary and accessed via the user interface, API, or other methods, such as an OAuth authentication process.

The following table describes the session types.

Session Type	Description
API	Created when accessing an organization through the API.
APIOnlyUser	Created to enable a password reset in the user interface for API-only users.
Chatter Networks	Created when using Chatter Networks or Chatter Communities.
ChatterNetworksAPIOnly	Created when using the Chatter Networks or Chatter Communities API.
Content	Created when serving user-uploaded content.
OauthApprovalUI	A session that only allows access to the OAuth approval page.
Oauth2	Created via OAuth flows. For example, if you use OAuth authentication for a connected app, this type of session is created.
SiteStudio	Created when using the Sites Studio user interface.
SitePreview	A session that is initiated when an internal canvas app is invoked. This will always be a child session with a UI parent session.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Session Type	Description
SubstituteUser	A session created when one user logs in via another user. For example, if an administrator logs in as another user, a SubstituteUser session is created.
TempContentExchange	A temporary user interface session to switch to the content domain, such as the user interface into which users type in their credentials.
TempOAuthAccessTokenFrontdoor	A temporary session via the OAuth access token assertion flow that cannot be refreshed and must be mapped to a regular session type.
TempVisualforceExchange	A temporary session to switch to the Visualforce domain.
TempUIFrontdoor	A temporary session that cannot be refreshed and must be mapped to a regular session type.
UI	Created when using a user interface page.
UserSite	Initiated when a canvas application is invoked. Always a child session with a UI parent session.
Visualforce	Created via a Visualforce page.
WDC_API	A session using the Work.com API. This is always a child session and cannot be used in the user interface.

[User Sessions](#)

Activations

Activation tracks information about devices from which users have verified their identity. Salesforce prompts users to verify their identity when they access Salesforce from an unrecognized browser or application. Identity verification adds an extra layer of security on top of username and password authentication. The Activations page lists the login IP addresses and client browsers used.

When a user logs in from outside a trusted IP range and uses a browser or app we don't recognize, the user is challenged to verify identity. We use the highest-priority verification method available for each user. In order of priority, the methods are:

1. Verification via push notification or location-based automated verification with the Salesforce Authenticator mobile app (version 2 or later) connected to the user's account.
2. Verification code generated by a mobile authenticator app connected to the user's account.
3. Verification code sent via SMS to the user's verified mobile phone.
4. Verification code sent via email to the user's email address.

After identity verification is successful, the user doesn't have to verify identity again from that browser or app, unless the user:

- Manually clears browser cookies, sets the browser to delete cookies, or browses in private or incognito mode
- Deselects **Don't ask again** on the identity verification page

The Activations page in Setup lists the login IP addresses and client browser information of devices from which users have verified their identity. You can revoke the browser activation status for one, many, or all users.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in all editions

For example, a user reports a lost device and is issued a new one. You can revoke the activation status of the browser on the lost device so that anyone attempting to access the org from that device has to verify their identity. This identity verification adds a layer of security while allowing users to stay productive.

Users can view their own Activations page to check their login IP addresses and client browser information. End users can revoke the activation status only for their own activated browsers.

For example, a user logs in to the org. On the user's Activations page, several different browsers are activated, but the user has only logged in from a single browser on a work laptop. The user immediately revokes the activation status of those browsers the user doesn't recognize. Because this user is challenged for identity verification using a code sent via SMS to the user's mobile device, anyone else who tries to log in from one of the deactivated browsers can't get the texted verification code. Without the code, the hacker fails the identity verification challenge. The user can then report the potential security breach.

[Use Activations](#)

View your users' activations and revoke activation status to prevent security breaches.

SEE ALSO:

[Use Activations](#)

[Identity Verification History](#)

Use Activations

View your users' activations and revoke activation status to prevent security breaches.

To see login IP and browser information about devices from which users have verified their identity, from Setup, enter *Activations* in the **Quick Find** box, then select **Activations**.

You can revoke activation status by selecting one or more entries in the Activated Client Browser list, clicking **Remove**, and confirming the action. Users can view and revoke only their own activated browsers. A user who logs in from a deactivated browser is prompted to verify identity, unless the login IP address is within a trusted IP range.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in all editions

 **Note:** When a user deselects the **Don't ask again** option that appears on the identity verification page, the browser isn't activated. Advise your users to deselect this option whenever they log in from a public or shared device.

[Identity Verification History](#)

Authenticate Users

Authentication means preventing unauthorized access to your organization or its data by making sure each logged in user is who they say they are.

[The Elements of User Authentication](#)

Salesforce provides a variety of ways to authenticate users. Build a combination of authentication methods that fits the needs of your organization and your users' use patterns.

[Configure User Authentication](#)

Choose login settings to ensure that your users are who they say they are.

The Elements of User Authentication

Salesforce provides a variety of ways to authenticate users. Build a combination of authentication methods that fits the needs of your organization and your users' use patterns.

[Single Sign-On](#)

Salesforce has its own system of user authentication, but some companies prefer to use an existing single sign-on capability to simplify and standardize their user authentication.

[Network-Based Security](#)

Network-based security limits where users can log in from, and when they can log in. This is different from user authentication, which only determines who can log in. Use network-based security to limit the window of opportunity for an attacker and to make it more difficult for an attacker to use stolen credentials.

[CAPTCHA Security for Data Exports](#)

By request, Salesforce can require users to pass a simple text-entry user verification test to export data from Salesforce. This type of network-based security helps prevent malicious users from accessing your organization's data, and can reduce the risk of automated attacks.

[Restrict Where and When Users Can Log In to Salesforce](#)

You can restrict the hours during which users can log in and the range of IP addresses they can log in and access Salesforce from. If IP address restrictions are defined for a user's profile and a login originates from an unknown IP address, Salesforce does not allow the login. These restrictions help protect your data from unauthorized access and phishing attacks.

[Two-Factor Authentication](#)

As a Salesforce admin, you can enhance your org's security by requiring a second level of authentication for every user login. You can also require two-factor authentication when a user meets certain criteria, such as attempting to view reports or access a connected app.

[Custom Login Flows](#)

Login flows allow administrators to build post-authentication processes to match their business practices, associate the flow with a user profile, and send the user through that flow when logging in. Use login flows to collect registration information from users, provide a terms of service acceptance form, prompt the user for a second factor of authentication, and other customization.

SEE ALSO:

[Single Sign-On](#)

[Network-Based Security](#)

[CAPTCHA Security for Data Exports](#)

[User Sessions](#)

Single Sign-On

Salesforce has its own system of user authentication, but some companies prefer to use an existing single sign-on capability to simplify and standardize their user authentication.

You have two options to implement single sign-on—federated authentication using Security Assertion Markup Language (SAML) or delegated authentication.

- Federated authentication using Security Assertion Markup Language (SAML) allows you to send authentication and authorization data between affiliated but unrelated Web services. This enables you to sign on to Salesforce from a client application. Federated authentication using SAML is enabled by default for your organization.

- Delegated authentication single sign-on enables you to integrate Salesforce with an authentication method that you choose. This enables you to integrate authentication with your LDAP (Lightweight Directory Access Protocol) server, or perform single sign-on by authenticating using a token instead of a password. You manage delegated authentication at the permission level, allowing some users to use delegated authentication, while other users continue to use their Salesforce-managed password. Delegated authentication is set by permissions, not by organization.

The primary reasons for using delegated authentication include:

- Using a stronger type of user authentication, such as integration with a secure identity provider
- Making your login page private and accessible only behind a corporate firewall
- Differentiating your organization from all other companies that use Salesforce in order to reduce phishing attacks

You must request that this feature be enabled by Salesforce. Contact Salesforce to enable delegated authentication single sign-on for your organization.

- Authentication providers let your users log in to your Salesforce organization using their login credentials from an external service provider. Salesforce supports the OpenID Connect protocol that allows users to log in from any OpenID provider such as Google, PayPal, LinkedIn and other services supporting OpenID Connect. When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from the external service provider to establish authentication credentials.

Identity Providers

An *identity provider* is a trusted provider that lets you use single sign-on to access other websites. A *service provider* is a website that hosts applications. You can enable Salesforce as an identity provider and define one or more service providers. Your users can then access other applications directly from Salesforce using single sign-on. Single sign-on can be a great help to your users: instead of having to remember many passwords, they only have to remember one. Plus, the applications can be added as tabs to your Salesforce organization, which means users don't have to switch between programs.

For more information, see "Identity Providers and Service Providers" in the Salesforce online help.

[The Elements of User Authentication](#)

Network-Based Security

Network-based security limits where users can log in from, and when they can log in. This is different from user authentication, which only determines who can log in. Use network-based security to limit the window of opportunity for an attacker and to make it more difficult for an attacker to use stolen credentials.

SEE ALSO:

[The Elements of User Authentication](#)

CAPTCHA Security for Data Exports

By request, Salesforce can require users to pass a simple text-entry user verification test to export data from Salesforce. This type of network-based security helps prevent malicious users from accessing your organization's data, and can reduce the risk of automated attacks.

To pass the test, users must type two words displayed on an overlay into the overlay's text box field, and click a **Submit** button. Salesforce uses CAPTCHA technology provided by [reCaptcha](#) to verify that a person, as opposed to an automated program, has correctly entered the text into the overlay. CAPTCHA stands for "Completely Automated Public Turing test to tell Computers and Humans Apart."

SEE ALSO:

[The Elements of User Authentication](#)

Restrict Where and When Users Can Log In to Salesforce

You can restrict the hours during which users can log in and the range of IP addresses they can log in and access Salesforce from. If IP address restrictions are defined for a user's profile and a login originates from an unknown IP address, Salesforce does not allow the login. These restrictions help protect your data from unauthorized access and phishing attacks.

Login Hours

For each profile, you can set the hours when users can log in. See:

- [View and Edit Login Hours in the Enhanced Profile User Interface](#)
- [View and Edit Login Hours in the Original Profile User Interface](#)

Two-Factor Authentication for User Interface Logins

For each profile, you can require users to use a second form of authentication when they log in via the user interface. See [Set Two-Factor Authentication Login Requirements](#) on page 832 and [Set Two-Factor Authentication Login Requirements for Single Sign-On, Social Sign-On, and Communities](#).

Two-Factor Authentication for API Logins

For each profile, you can require a verification code (also called a time-based one-time password, or TOTP) instead of the standard security token. Users connect an authenticator app that generates verification codes to their account. Users with the "Two-Factor Authentication for API Logins" permission use a code instead of the standard security token whenever it's requested, such as when resetting the account's password. See [Set Two-Factor Authentication Login Requirements for API Access](#) on page 835.

Login IP Address Ranges

For Enterprise, Performance, Unlimited, Developer, and Database.com editions, you can set the Login IP Range addresses from which users can log in on an individual profile. Users outside of the Login IP Range set on a profile can't access your Salesforce organization.

For Contact Manager, Group, and Professional Editions, set the Login IP Range. From Setup, enter *Session Settings* in the **Quick Find** box, then select **Session Settings**.

Login IP Address Range Enforcement for All Access Requests

You can restrict all access to Salesforce to the IP addresses included in Login IP Ranges in users' profiles. For example, suppose a user logs in successfully from an IP address defined in Login IP Ranges. The user then moves to a different location and has a new IP address that is outside of Login IP Ranges. When the user refreshes the browser or tries to access Salesforce, including access from a client application, the user is denied. To enable this option, from Setup, enter *Session Settings* in the **Quick Find** box, select **Session Settings**, and then select **Enforce login IP ranges on every request**. This option affects all user profiles that have login IP restrictions.

Org-wide Trusted IP Ranges

For all users, you can set a list of IP address ranges from which they can always log in without receiving a login challenge. These users can log in to your org after they provide the additional verification. See [Set Trusted IP Ranges for Your Organization](#).

When users log in to Salesforce via the user interface, the API, or a desktop client such as Salesforce for Outlook, Connect Offline, Connect for Office, or the Data Loader, Salesforce confirms that the login is authorized as follows.

1. Salesforce checks whether the user's profile has login hour restrictions. If login hour restrictions are specified for the user's profile, any login outside the specified hours is denied.
2. If the user has the "Two-Factor Authentication for User Interface Logins" permission, Salesforce prompts the user for a second form of authentication upon logging in. If the user's account isn't already connected to a mobile authenticator app such as Salesforce Authenticator, Salesforce first prompts the user to connect the app.
3. If the user has the "Two-Factor Authentication for API Logins" permission and has connected an authenticator app to the account, Salesforce returns an error if the user uses the standard security token. The user has to enter a verification code (time-based one-time password) generated by the authenticator app instead.
4. Salesforce then checks whether the user's profile has IP address restrictions. If IP address restrictions are defined for the user's profile, logins from an undesignated IP address are denied, and logins from a specified IP address are allowed. If the **Enforce login IP ranges on every request** session setting is enabled, the IP address restrictions are enforced for each page request, including requests from client applications.
5. If profile-based IP address restrictions are not set, Salesforce checks whether the user is logging in from a device used to access Salesforce before.
 - If the user's login is from a device and browser that Salesforce recognizes, the login is allowed.
 - If the user's login is from an IP address in your organization's trusted IP address list, the login is allowed.
 - If the user's login is not from a trusted IP address or a device and browser Salesforce recognizes, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce has to verify the user's identity:

- For access via the user interface, the user is prompted to verify using Salesforce Authenticator (version 2 or later), or to enter a verification code.

Note: Users aren't asked for a verification code the first time they log in to Salesforce.

- For access via the API or a client, users must add their security token to the end of their password to log in. Or, if "Two-Factor Authentication on API Logins" is set on the user profile, users enter a verification code generated by an authenticator app.

A security token is an automatically generated key from Salesforce. For example, if a user's password is *mypassword*, and the security token is *XXXXXXXXXX*, the user must enter *mypasswordXXXXXXXXXX* to log in. Or some client applications have a separate field for the security token.

Users can obtain their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes a password or resets a security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until the user resets the security token, changes a password, or has a password reset.

Tip: Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using **Reset My Security Token**.

Tips on Setting Login Restrictions

Consider the following when setting login restrictions:

- When a user's password is changed, the security token is reset. Login via the API or a client can be blocked until the user adds the automatically generated security token to the end of the password.

- Partner Portal and Customer Portal users aren't required to activate their browser to log in.
- For more information on API login faults, see the Core Data Types Used in API Calls topic in the [SOAP API Developer's Guide](#).
- If single sign-on is enabled for your org, API and desktop client users can log in to Salesforce unless their profile has IP address restrictions set, and they try to log in from outside of the range defined. Furthermore, the single sign-on authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However, if the security token is enabled for your org, then your org's login lockout settings determine how many times users can attempt to log in with an invalid security token before being locked out of Salesforce.
- These events count toward the number of times users can attempt to log in with an invalid password before being locked out of Salesforce, as defined in your org's login lockout settings:
 - Each time users are prompted to verify identity
 - Each time users incorrectly add the security token or verification code to the end of their password to log in to Salesforce via the API or a client

[Restrict Login IP Ranges in the Enhanced Profile User Interface](#)

Control login access at the user level by specifying a range of allowed IP addresses on a user's profile. When you define IP address restrictions for a profile, a login from any other IP address is denied.

[Restrict Login IP Addresses in the Original Profile User Interface](#)

Control login access at the user level by specifying a range of allowed IP addresses on a user's profile. When you define IP address restrictions for a profile, a login from any other IP address is denied.

[View and Edit Login Hours in the Enhanced Profile User Interface](#)

For each profile, you can specify the hours when users can log in.

[View and Edit Login Hours in the Original Profile User Interface](#)

Specify the hours when users can log in based on the user profile.

[Set Trusted IP Ranges for Your Organization](#)

Trusted IP Ranges define a list of IP addresses from which users can log in without receiving a login challenge for verification of their identity, such as a code sent to their mobile phone.

Two-Factor Authentication

As a Salesforce admin, you can enhance your org's security by requiring a second level of authentication for every user login. You can also require two-factor authentication when a user meets certain criteria, such as attempting to view reports or access a connected app.

Salesforce Identity Verification

When a user logs in from outside a trusted IP range and uses a browser or app we don't recognize, the user is challenged to verify identity. We use the highest-priority verification method available for each user. In order of priority, the methods are:

1. Verification via push notification or location-based automated verification with the Salesforce Authenticator mobile app (version 2 or later) connected to the user's account.
2. Verification code generated by a mobile authenticator app connected to the user's account.
3. Verification code sent via SMS to the user's verified mobile phone.
4. Verification code sent via email to the user's email address.

After identity verification is successful, the user doesn't have to verify identity again from that browser or app, unless the user:

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

- Manually clears browser cookies, sets the browser to delete cookies, or browses in private or incognito mode
- Deselects **Don't ask again** on the identity verification page

Org Policies That Require Two-Factor Authentication

You can set policies that require a second level of authentication on every login, every login through the API (for developers and client applications), or for access to specific features. Your users download and install a mobile authenticator app, such as the Salesforce Authenticator app or the Google Authenticator app, on their mobile device. They connect the app to their account in Salesforce. They use the app whenever your org's policies require two-factor authentication.

The Salesforce Authenticator mobile app (version 2 and later) sends a push notification to the user's mobile device when activity on the Salesforce account requires identity verification. The user responds on the mobile device to verify or block the activity. The user can enable location services for the app and automate verifications from trusted locations, such as a home or office. Salesforce Authenticator also generates verification codes, sometimes called "time-based one-time passwords" (TOTPs). Users can choose to enter a password plus the code instead of responding to a push notification from the app for two-factor verification. Or they can get a verification code from another authenticator app.

If users lose or forget the mobile device they usually use for two-factor authentication, you can generate a temporary verification code for them. You set when the code expires, from 1 to 24 hours after you generate it. Your user can use the code multiple times until it expires. A user can have only one temporary code at a time. If a user needs a new code while the old code is still valid, you can expire the old code, then generate a new one. Users can expire their own valid codes in their personal settings.

Custom Login Flows

Login flows allow administrators to build post-authentication processes to match their business practices, associate the flow with a user profile, and send the user through that flow when logging in. Use login flows to collect registration information from users, provide a terms of service acceptance form, prompt the user for a second factor of authentication, and other customization.

Use the Flow Designer to create login flows, and then associate those flows with specific profiles in your organization. You can connect the same flow to multiple profiles. Users with the profile are directed to the login flow after they authenticate, but before the user is directed to the organization's content. The login flow screens are embedded within the standard Salesforce login page for an integrated user login experience.

Login flows support all the Salesforce user interface authentication methods, including username and password, delegated authentication, SAML single sign-on, and social sign-on through a third-party authentication provider. You can apply login flows to Salesforce organizations, communities, and portals.

 **Note:** You can't apply login flows to API logins or when sessions are passed to the UI through `frontdoor.jsp` from a non-UI login process. Only flows of type Flow are supported.

[Create a Login Flow](#)

Use the Cloud Flow Designer to build a login flow process, then associate the finished flow with a profile.

[Connect a Login Flow to a Profile](#)

After you create a login flow in Flow Designer and activate the flow, you associate it with a profile in your organization. Users with that profile are then directed to the login flow.

SEE ALSO:

[Cloud Flow Designer](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Create a Login Flow

Use the Cloud Flow Designer to build a login flow process, then associate the finished flow with a profile.

When a user's profile is associated with a login flow, the user is directed to the flow as part of the authentication process. The login flow screens are embedded in the standard Salesforce login page. During the authentication process, these users have restricted access to the login flow screens. At the end of a successful authentication and completion of the login flow, the user is redirected to the organization. Otherwise, an explicit action can be defined within the flow to deny access.

For example, an administrator can create a login flow that implements a custom two-factor authentication process to add a desired security layer. A flow like this uses Apex methods to get the session context, extract the user's IP address, and verify if the request is coming from a Trusted IP Range. (To find or set the Trusted IP Range, from Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.) If the request is coming from within a Trusted IP Range address, Salesforce skips the flow and logs the user into the organization. Otherwise, Salesforce invokes the flow providing one of three options.

1. Direct the user to log in with additional credentials, such as a time-based one-time password (TOTP).
2. Force the user to log out.
3. Direct the user to a page with more options.

You can also build login flows that direct users to customized pages, such as forms to gather more information, or pages providing users with additional information.

Build Your Own Login Flow

Use the following process to build your own login flow.

1. Create a new flow using the Flow Designer and Apex.

For example, you can design a custom IP-based two-factor authentication flow that requires a second factor of authentication only if the user is logging in from outside of the corporate Trusted IP Range. (To find or set the Trusted IP Range, from Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.)

 **Note:** Do not set the Login IP Ranges directly in the user profile. The Login IP Ranges set directly in a profile restrict access to the organization for users of that profile who are outside that range, entirely, and those users cannot enter the login flow process.

The flow should contain the following.

- a. A new Apex class defining an Apex plugin that implements from the (`Process.Plugin`) and uses the `Auth.SessionManagement` class to access the time-based one-time password (TOTP) methods and services. The new Apex class for the plugin generates a time-based key with a quick response (QR) code to validate the TOTP provided by the user against the TOTP generated by Salesforce.
- b. A screen element to scan a QR code.
- c. A decision element to handle when the token is valid and when the token is invalid.

EDITIONS

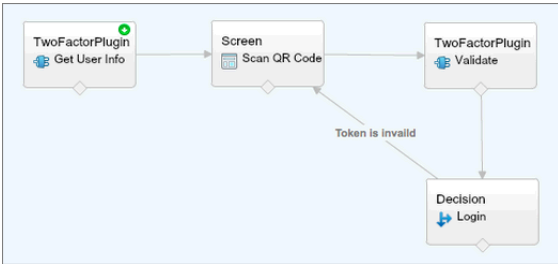

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

Within the flow, you can set input variables. If you use the following specified names, these values will be populated for the flow when it starts.

Name	Value Description
LoginFlow_LoginType	The user type, such as Chatter Community external user
LoginFlow_IpAddress	The user's current IP address
LoginFlow_LoginIpAddress	The user's IP address used during login, which can change after authentication
LoginFlow_UserAgent	The user agent string provided by the user's browser
LoginFlow_Platform	The operating system for the user
LoginFlow_Application	Application used to request authentication
LoginFlow_Community	Current Community, if this login flow applies to a Community
LoginFlow_SessionLevel	The current session security level, Standard or High Assurance
LoginFlow_UserId	The user's 18-character ID.

During the flow, you can assign the following, pre-defined variables values for specific behavior.

 **Note:** The flow loads these values only *after* a UI screen is refreshed (a user clicking a button does not load the values, a new screen must be added to the flow for the values to be loaded).

Name	Value Description
LoginFlow_FinishLocation	A Text value. Provide a string that defines where the user goes after completing the login flow. The string should be a valid Salesforce URL (the user cannot leave the organization and stay in the flow) or relative path.
LoginFlow_ForceLogout	A Boolean value. Set this variable to <code>true</code> to log the user out, immediately, and force the user to exit the flow.

2. Save the flow.
3. Activate the flow.

4. Connect the login flow to a profile.

[Custom Login Flows](#)

<https://developer.salesforce.com/page/Login-Flows>

[Connect a Login Flow to a Profile](#)

[Cloud Flow Designer](#)

Connect a Login Flow to a Profile

After you create a login flow in Flow Designer and activate the flow, you associate it with a profile in your organization. Users with that profile are then directed to the login flow.

1. From Setup, enter *Login Flows* in the *Quick Find* box, then select **Login Flows**.
2. Click **New**.
3. Enter a name to reference the login flow association when you edit or delete it. The name doesn't need to be unique.
4. Select the login flow for the profile. The drop-down list includes all the available flows saved in the Flow Designer. Only active flows of type Flow are supported.
5. Select a user license for the profile to which you want to connect the flow. The profile list then shows profiles with that license.
6. Select the profile to connect to the login flow.
7. Click **Save**.

Users of the profile are now directed to the login flow.

After you associate the login flow, you can edit or delete the flows listed on this login flows page.

You can associate a login flow with one or more profiles. However, a profile can't be connected to more than one login flow.

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Configure User Authentication

Choose login settings to ensure that your users are who they say they are.

[Restrict Where and When Users Can Log In to Salesforce](#)

You can restrict the hours during which users can log in and the range of IP addresses they can log in and access Salesforce from. If IP address restrictions are defined for a user's profile and a login originates from an unknown IP address, Salesforce does not allow the login. These restrictions help protect your data from unauthorized access and phishing attacks.

[Set Password Policies](#)

Improve your Salesforce org security with password protection. You can set password history, length, and complexity requirements along with other values. In addition, you can specify what to do if a user forgets their password.

[Expire Passwords for All Users](#)

As an administrator, you can expire passwords for all users any time you want to enforce extra security for your organization. After expiring passwords, all users are prompted to reset their password the next time they log in.

[Modify Session Security Settings](#)

You can modify session security settings to specify session connection type, timeout settings, and IP address ranges to protect against malicious attacks and more.

[Create a Login Flow](#)

Use the Cloud Flow Designer to build a login flow process, then associate the finished flow with a profile.

[Connect a Login Flow to a Profile](#)

After you create a login flow in Flow Designer and activate the flow, you associate it with a profile in your organization. Users with that profile are then directed to the login flow.

[Set Up Two-Factor Authentication](#)

Admins enable two-factor authentication through permissions or profile settings. Users add the mobile authenticator app through their own personal settings.

Restrict Where and When Users Can Log In to Salesforce

You can restrict the hours during which users can log in and the range of IP addresses they can log in and access Salesforce from. If IP address restrictions are defined for a user's profile and a login originates from an unknown IP address, Salesforce does not allow the login. These restrictions help protect your data from unauthorized access and phishing attacks.

Login Hours

For each profile, you can set the hours when users can log in. See:

- [View and Edit Login Hours in the Enhanced Profile User Interface](#)
- [View and Edit Login Hours in the Original Profile User Interface](#)

Two-Factor Authentication for User Interface Logins

For each profile, you can require users to use a second form of authentication when they log in via the user interface. See [Set Two-Factor Authentication Login Requirements](#) on page 832 and [Set Two-Factor Authentication Login Requirements for Single Sign-On, Social Sign-On, and Communities](#).

Two-Factor Authentication for API Logins

For each profile, you can require a verification code (also called a time-based one-time password, or TOTP) instead of the standard security token. Users connect an authenticator app that generates verification codes to their account. Users with the "Two-Factor Authentication for API Logins" permission use a code instead of the standard security token whenever it's requested, such as when resetting the account's password. See [Set Two-Factor Authentication Login Requirements for API Access](#) on page 835.

Login IP Address Ranges

For Enterprise, Performance, Unlimited, Developer, and Database.com editions, you can set the Login IP Range addresses from which users can log in on an individual profile. Users outside of the Login IP Range set on a profile can't access your Salesforce organization.

For Contact Manager, Group, and Professional Editions, set the Login IP Range. From Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings**.

Login IP Address Range Enforcement for All Access Requests

You can restrict all access to Salesforce to the IP addresses included in Login IP Ranges in users' profiles. For example, suppose a user logs in successfully from an IP address defined in Login IP Ranges. The user then moves to a different location and has a new IP address that is outside of Login IP Ranges. When the user refreshes the browser or tries to access Salesforce, including access from a client application, the user is denied. To enable this option, from Setup, enter *Session Settings* in the Quick Find box, select **Session Settings**, and then select **Enforce login IP ranges on every request**. This option affects all user profiles that have login IP restrictions.

Org-wide Trusted IP Ranges

For all users, you can set a list of IP address ranges from which they can always log in without receiving a login challenge. These users can log in to your org after they provide the additional verification. See [Set Trusted IP Ranges for Your Organization](#).

When users log in to Salesforce via the user interface, the API, or a desktop client such as Salesforce for Outlook, Connect Offline, Connect for Office, or the Data Loader, Salesforce confirms that the login is authorized as follows.

1. Salesforce checks whether the user's profile has login hour restrictions. If login hour restrictions are specified for the user's profile, any login outside the specified hours is denied.
2. If the user has the "Two-Factor Authentication for User Interface Logins" permission, Salesforce prompts the user for a second form of authentication upon logging in. If the user's account isn't already connected to a mobile authenticator app such as Salesforce Authenticator, Salesforce first prompts the user to connect the app.
3. If the user has the "Two-Factor Authentication for API Logins" permission and has connected an authenticator app to the account, Salesforce returns an error if the user uses the standard security token. The user has to enter a verification code (time-based one-time password) generated by the authenticator app instead.
4. Salesforce then checks whether the user's profile has IP address restrictions. If IP address restrictions are defined for the user's profile, logins from an undesignated IP address are denied, and logins from a specified IP address are allowed. If the **Enforce login IP ranges on every request** session setting is enabled, the IP address restrictions are enforced for each page request, including requests from client applications.
5. If profile-based IP address restrictions are not set, Salesforce checks whether the user is logging in from a device used to access Salesforce before.
 - If the user's login is from a device and browser that Salesforce recognizes, the login is allowed.
 - If the user's login is from an IP address in your organization's trusted IP address list, the login is allowed.
 - If the user's login is not from a trusted IP address or a device and browser Salesforce recognizes, the login is blocked.

Whenever a login is blocked or returns an API login fault, Salesforce has to verify the user's identity:

- For access via the user interface, the user is prompted to verify using Salesforce Authenticator (version 2 or later), or to enter a verification code.

 **Note:** Users aren't asked for a verification code the first time they log in to Salesforce.

- For access via the API or a client, users must add their security token to the end of their password to log in. Or, if "Two-Factor Authentication on API Logins" is set on the user profile, users enter a verification code generated by an authenticator app.

A security token is an automatically generated key from Salesforce. For example, if a user's password is *mypassword*, and the security token is *xxxxxxxxxx*, the user must enter *mypasswordxxxxxxxxxx* to log in. Or some client applications have a separate field for the security token.

Users can obtain their security token by changing their password or resetting their security token via the Salesforce user interface. When a user changes a password or resets a security token, Salesforce sends a new security token to the email address on the user's Salesforce record. The security token is valid until the user resets the security token, changes a password, or has a password reset.

 **Tip:** Before you access Salesforce from a new IP address, we recommend that you get your security token from a trusted network using **Reset My Security Token**.

Tips on Setting Login Restrictions

Consider the following when setting login restrictions:

- When a user's password is changed, the security token is reset. Login via the API or a client can be blocked until the user adds the automatically generated security token to the end of the password.
- Partner Portal and Customer Portal users aren't required to activate their browser to log in.
- For more information on API login faults, see the Core Data Types Used in API Calls topic in the [SOAP API Developer's Guide](#).
- If single sign-on is enabled for your org, API and desktop client users can log in to Salesforce unless their profile has IP address restrictions set, and they try to log in from outside of the range defined. Furthermore, the single sign-on authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However, if the security token is enabled for your org, then your org's login lockout settings determine how many times users can attempt to log in with an invalid security token before being locked out of Salesforce.
- These events count toward the number of times users can attempt to log in with an invalid password before being locked out of Salesforce, as defined in your org's login lockout settings:
 - Each time users are prompted to verify identity
 - Each time users incorrectly add the security token or verification code to the end of their password to log in to Salesforce via the API or a client

[Set Trusted IP Ranges for Your Organization](#)

Trusted IP Ranges define a list of IP addresses from which users can log in without receiving a login challenge for verification of their identity, such as a code sent to their mobile phone.

Restrict Login IP Ranges in the Enhanced Profile User Interface

Control login access at the user level by specifying a range of allowed IP addresses on a user's profile. When you define IP address restrictions for a profile, a login from any other IP address is denied.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, click **Login IP Ranges**.
4. Specify allowed IP addresses for the profile.
 - To add a range of IP addresses from which users can log in, click **Add IP Ranges**. Enter a valid IP address in the **IP Start Address** and a higher-numbered IP address in the **IP End Address** field. To allow logins from only a single IP address, enter the same address in both fields.
 - To edit or remove ranges, click **Edit** or **Delete** for that range.

Important:

- The IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses both inside and outside of the IPv4-mapped IPv6 address space. Ranges like `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` aren't allowed.
 - Partner User profiles are limited to five IP addresses. To increase this limit, contact Salesforce.
 - The Salesforce Classic Mobile app can bypass IP ranges that are defined for profiles. Salesforce Classic Mobile initiates a secure connection to Salesforce over the mobile carrier's network. However, the mobile carrier's IP addresses can be outside of the IP ranges allowed for the user's profile. To prevent bypassing IP definitions on a profile, [disable Salesforce Classic Mobile](#) on page 1048 for that user.
5. Optionally enter a description for the range. If you maintain multiple ranges, use the **Description** field to provide details, like which part of your network corresponds to this range.
-  **Note:** You can further restrict access to Salesforce to only those IPs in Login IP Ranges. To enable this option, in Setup, enter *Session Settings* in the **Quick Find** box, then select **Session Settings** and select **Enforce login IP ranges on every request**. This option affects all user profiles that have login IP restrictions.

Restrict Login IP Addresses in the Original Profile User Interface

Control login access at the user level by specifying a range of allowed IP addresses on a user's profile. When you define IP address restrictions for a profile, a login from any other IP address is denied.

- How you restrict the range of valid IP addresses on a profile depends on your Salesforce edition.
 - If you're using an Enterprise, Unlimited, Performance, or Developer edition, from Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**, and select a profile.
 - If you're using a Professional, Group, or Personal edition, from Setup, enter *Session Settings* in the **Quick Find** box, then select **Session Settings**.
- Click **New** in the Login IP Ranges related list.
- Enter a valid IP address in the **IP Start Address** field and a higher-numbered IP address in the **IP End Address** field.

The start and end addresses define the range of allowable IP addresses from which users can log in. To allow logins from a single IP address, enter the same address in both fields.

- The IP addresses in a range must be either IPv4 or IPv6. In ranges, IPv4 addresses exist in the IPv4-mapped IPv6 address space `::ffff:0:0` to `::ffff:ffff:ffff`, where `::ffff:0:0` is `0.0.0.0` and `::ffff:ffff:ffff` is `255.255.255.255`. A range can't include IP addresses both inside and outside of the IPv4-mapped IPv6 address space. Ranges like `255.255.255.255` to `::1:0:0:0` or `::` to `::1:0:0:0` aren't allowed.
 - Partner User profiles are limited to five IP addresses. To increase this limit, contact Salesforce.
 - The Salesforce Classic Mobile app can bypass IP ranges that are defined for profiles. Salesforce Classic Mobile initiates a secure connection to Salesforce over the mobile carrier's network. However, the mobile carrier's IP addresses can be outside of the IP ranges allowed for the user's profile. To prevent bypassing IP definitions on a profile, [disable Salesforce Classic Mobile](#) on page 1048 for that user.
- Optionally enter a description for the range. If you maintain multiple ranges, use the Description field to provide details, such as which part of your network corresponds to this range.
 - Click **Save**.
 -  **Note:** Cache settings on static resources are set to private when accessed via a Force.com site whose guest user's profile has restrictions based on IP range or login hours. Sites with guest user profile restrictions cache static resources only within the browser. Also, if a previously unrestricted site becomes restricted, it can take up to 45 days for the static resources to expire from the Salesforce cache and any intermediate caches.
 -  **Note:** You can further restrict access to Salesforce to only those IPs in Login IP Ranges. To enable this option, in Setup, enter *Session Settings* in the **Quick Find** box, then select **Session Settings** and select **Enforce login IP ranges on every request**. This option affects all user profiles that have login IP restrictions.

View and Edit Login Hours in the Enhanced Profile User Interface

For each profile, you can specify the hours when users can log in.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Select a profile and click its name.
3. In the profile overview page, scroll down to Login Hours and click **Edit**.
4. Set the days and hours when users with this profile can log in to the organization.

To allow users to log in at any time, click **Clear all times**. To prohibit users from using the system on a specific day, set the start and end times to the same value.

If users are logged in when their login hours end, they can continue to view their current page, but they can't take any further action.

-  **Note:** The first time login hours are set for a profile, the hours are based on the organization's **Default Time Zone** as specified on the Company Information page in Setup. After that, any changes to the organization's **Default Time Zone** won't change the time zone for the profile's login hours. As a result, the login hours are always applied at those exact times even if a user is in a different time zone or if the organization's default time zone is changed.

Depending on whether you're viewing or editing login hours, the hours may appear differently. On the Login Hours edit page, hours are shown in your specified time zone. On the profile overview page, they appear in the organization's original default time zone.

[Work in the Original Profile Interface](#)

[Restrict Login IP Addresses in the Original Profile User Interface](#)

Set Trusted IP Ranges for Your Organization

Trusted IP Ranges define a list of IP addresses from which users can log in without receiving a login challenge for verification of their identity, such as a code sent to their mobile phone.

 **Note:**  [Who Sees What: Organization Access](#)

Watch how you can restrict login through IP ranges and login hours.

To help protect your organization's data from unauthorized access, you can specify a list of IP addresses from which users can log in without receiving a login challenge. However, this does not restrict access, entirely, for users outside of the Trusted IP Range. After these users complete the login challenge (usually by entering a code sent to their mobile device or email address), they can log in.

1. From Setup, enter `Network Access` in the `Quick Find` box, then select **Network Access**.
2. Click **New**.
3. Enter a valid IP address in the `Start IP Address` field and a higher IP address in the `End IP Address` field.

The start and end addresses define the range of allowable IP addresses from which users can log in, including the start and end values. If you want to allow logins from a single IP address, enter the same address in both fields.

The start and end IP addresses must be in an IPv4 range and include no more than 33,554,432 addresses (2^{25} , a /7 CIDR block).

4. Optionally, enter a description for the range. For example, if you maintain multiple ranges, enter details about the part of your network that corresponds to this range.
5. Click **Save**.

 **Note:** For organizations that were activated before December 2007, Salesforce automatically populated your organization's trusted IP address list in December 2007, when this feature was introduced. The IP addresses from which trusted users had already accessed Salesforce during the past six months were added.

Set Password Policies

Improve your Salesforce org security with password protection. You can set password history, length, and complexity requirements along with other values. In addition, you can specify what to do if a user forgets their password.

For your organization's security, you can set various password and login policies.

 **Note:** User passwords cannot exceed 16,000 bytes.

Logins are limited to 3,600 per hour per user. This limit applies to organizations created after Summer '08.

1. From Setup, enter *Password Policies* in the Quick Find box, then select **Password Policies**.
2. Customize the password settings.

Field	Description
User passwords expire in	<p>The length of time until user passwords expire and must be changed. The default is 90 days. This setting isn't available for Self-Service portals. This setting doesn't apply to users with the "Password Never Expires" permission.</p> <p>If you change the <code>User passwords expire in</code> setting, the change affects a user's password expiration date if that user's new expiration date is earlier than the old expiration date or if you remove an expiration by selecting <code>Never expires</code>.</p>
Enforce password history	<p>Save users' previous passwords so that they must always reset their password to a new, unique password. Password history is not saved until you set this value. The default is <code>3 passwords remembered</code>. You cannot select <code>No passwords remembered</code> unless you select <code>Never expires</code> for the <code>User passwords expire in</code> field. This setting isn't available for Self-Service portals.</p>
Minimum password length	<p>The minimum number of characters required for a password. When you set this value, existing users aren't affected until the next time they change their passwords. The default is <code>8 characters</code>.</p>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To set password policies:

- "Manage Password Policies"

Field	Description
Password complexity requirement	<p>The requirement for which types of characters must be used in a user's password.</p> <p>Complexity levels:</p> <ul style="list-style-type: none"> • No restriction—allows any password value and is the least secure option. • Must mix alpha and numeric characters—requires at least one alphabetic character and one number, which is the default. • Must mix alpha, numeric, and special characters—requires at least one alphabetic character, one number, and one of the following characters: ! # \$ % - _ = + < >. • Must mix numbers and uppercase and lowercase letters—requires at least one number, one uppercase letter, and one lowercase letter. • Must mix numbers, uppercase and lowercase letters, and special characters—requires at least one number, one uppercase letter, and one lowercase letter, and one of the following characters: ! # \$ % - _ = + < >.
Password question requirement	<p>The values are <code>Cannot contain password</code>, meaning that the answer to the password hint question cannot contain the password itself; or <code>None</code>, the default, for no restrictions on the answer. The user's answer to the password hint question is required. This setting is not available for Self-Service portals, Customer Portals, or partner portals.</p>
Maximum invalid login attempts	<p>The number of login failures allowed for a user before they become locked out. This setting isn't available for Self-Service portals.</p>
Lockout effective period	<p>The duration of the login lockout. The default is 15 minutes. This setting isn't available for Self-Service portals.</p> <p> Note: If users are locked out, they must wait until the lockout period expires. Alternatively, a user with the "Reset User Passwords and Unlock Users" permission can unlock them from Setup with the following procedure:</p> <ol style="list-style-type: none"> Enter <code>Users</code> in the <code>Quick Find</code> box. Select Users. Selecting the user. Click Unlock. <p>This button is only available when a user is locked out.</p>

Field	Description
Obscure secret answer for password resets	<p>This feature hides answers to security questions as you type. The default is to show the answer in plain text.</p> <p> Note: If your organization uses the Microsoft Input Method Editor (IME) with the input mode set to Hiragana, when you type ASCII characters they're converted into Japanese characters in normal text fields. However, the IME does not work properly in fields with obscured text. If your organization's users cannot properly enter their passwords or other values after enabling this feature, disable the feature.</p>
Require a minimum 1 day password lifetime	When you select this option, a password can't be changed more than once in a 24-hour period.

3. Customize the forgotten password and locked account assistance information.

 **Note:** This setting is not available for Self-Service portals, Customer Portals, or partner portals.

Field	Description
Message	<p>If set, this message appears in the “We can't reset your password” email. Users receive this email when they lock themselves out by trying to reset their password too many times. The text also appears at the bottom of the Answer Your Security Question page when users reset their passwords.</p> <p>You can tailor the text to your organization by adding the name of your internal help desk or a system administrator. For the email, the message appears only for accounts that need an administrator to reset them. Lockouts due to time restrictions get a different system email message.</p>
Help link	<p>If set, this link displays with the text defined in the <code>Message</code> field. In the “We can't reset your password” email, the URL displays exactly as typed in the <code>Help link</code> field, so the user can see where the link goes. This URL display format is a security feature, because the user is not within a Salesforce organization.</p> <p>On the Answer Your Security Question page, the <code>Help link</code> URL combines with the text in the <code>Message</code> field to make a clickable link. Security isn't an issue, because the user is in a Salesforce organization when changing passwords.</p> <p>Valid protocols:</p> <ul style="list-style-type: none"> • http • https • mailto

4. Specify an alternative home page for users with the “API Only User” permission. After completing user management tasks such as resetting a password, API-only users are redirected to the URL specified here, rather than to the login page.
5. Click **Save**.

SEE ALSO:

[View and Edit Password Policies in Profiles Passwords](#)

Expire Passwords for All Users

As an administrator, you can expire passwords for all users any time you want to enforce extra security for your organization. After expiring passwords, all users are prompted to reset their password the next time they log in.

To expire passwords for all users, except those users with the “Password Never Expires” permission:

1. From Setup, enter *Expire All Passwords* in the Quick Find box, then select **Expire All Passwords**.
2. Select **Expire all user passwords**.
3. Click **Save**.

The next time users log in, they are prompted to reset their password.

Considerations When Expiring Passwords

- Users might need to activate their computers to log in to Salesforce.
- *Expire all user passwords* doesn't affect Self-Service portal users, because they aren't direct Salesforce users.

[Passwords](#)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To expire all passwords:

- “Manage Internal Users”

Modify Session Security Settings

You can modify session security settings to specify session connection type, timeout settings, and IP address ranges to protect against malicious attacks and more.

1. From Setup, enter *Session Settings* in the **Quick Find** box, then select **Session Settings**.
2. Customize the session security settings.

Field	Description
Timeout value	<p>Length of time after which the system logs out inactive users. For Portal users, the timeout is between 10 minutes and 12 hours even though you can only set it as low as 15 minutes. Select a value between 15 minutes and 12 hours. Choose a shorter timeout period if your org has sensitive information and you want to enforce stricter security.</p> <p> Note: The last active session time value isn't updated until halfway through the timeout period. So if you have a 30-minute timeout, the system doesn't check for activity until 15 minutes have passed. For example, if you update a record after 10 minutes, the last active session time value isn't updated because there was no activity after 15 minutes. You're logged out in 20 more minutes (30 minutes total), because the last active session time wasn't updated. Suppose that you update a record after 20 minutes. That's 5 minutes after the last active session time is checked. Your timeout resets, and you have another 30 minutes before being logged out, for a total of 50 minutes.</p>
Disable session timeout warning popup	Determines whether the system prompts inactive users with a timeout warning message. Users are prompted 30 seconds before timeout as specified by the Timeout value .
Force logout on session timeout	<p>Requires that when sessions time out for inactive users, current sessions become invalid. The browser refreshes and returns to the login page. To access the org, the user must log in again.</p> <p> Note: Do <i>not</i> select Disable session timeout warning popup when using this setting.</p>
Lock sessions to the IP address from which they originated	Determines whether user sessions are locked to the IP address from which the user logged in, helping to

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

The **Lock sessions to the IP address from which they originated** setting is available in: **Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

All other settings available in: **Personal, Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To modify session security settings:

- "Customize Application"

Field	Description
	<p>prevent unauthorized persons from hijacking a valid session.</p> <p> Note: This setting can inhibit various applications and mobile devices.</p>
Lock sessions to the domain in which they were first used	<p>Associates a current UI session for a user, such as a community user, with a specific domain. The setting helps prevent unauthorized use of the session ID in another domain. This setting is enabled by default for orgs created with the Spring '15 release or later.</p>
Require secure connections (HTTPS)	<p>Determines whether HTTPS is required to log in to or access Salesforce, apart from Force.com sites, which can be accessed using HTTP.</p> <p>This setting is enabled by default for security reasons.</p> <p> Note: The Reset Passwords for Your Users page can only be accessed using HTTPS.</p>
Force relogin after Login-As-User	<p>Determines whether an administrator who is logged in as another user is returned to their previous session after logging out as the secondary user.</p> <p>If the setting is enabled, an administrator must log in again to continue using Salesforce after logging out as the user. Otherwise, the administrator is returned to the original session after logging out as the user. This setting is enabled by default for new orgs beginning with the Summer '14 release.</p>
Require HttpOnly attribute	<p>Restricts session ID cookie access. A cookie with the HttpOnly attribute is not accessible via non-HTTP methods, such as calls from JavaScript.</p> <p> Note: If you have a custom or packaged application that uses JavaScript to access session ID cookies, selecting <code>Require HttpOnly attribute</code> breaks your application. It denies the application access to the cookie. If <code>Require HttpOnly attribute</code> is selected, the AJAX Toolkit debugging window isn't available.</p>
Use POST requests for cross-domain sessions	<p>Sets the org to send session information using a POST request, instead of a GET request, for cross-domain exchanges. An example of a cross-domain exchange is when a user is using a Visualforce page. In this context, POST requests are more secure than GET requests because POST requests keep the session information in the body of the request. However, if you enable this setting, embedded content from another domain, such as:</p> <pre data-bbox="716 1581 1446 1627" style="border: 1px solid #ccc; padding: 5px;"></pre> <p>sometimes doesn't display.</p>
Enforce login IP ranges on every request	<p>Restricts the IP addresses from which users can access Salesforce to only the IP addresses defined in <code>Login IP Ranges</code>. If this setting is enabled, login IP ranges are enforced on each page request, including requests from client applications. If this setting isn't enabled, login IP ranges are enforced only</p>

Field	Description
	when a user logs in. This setting affects all user profiles that have login IP restrictions.
Enable caching and autocomplete on login page	<p>Allows the user's browser to store usernames. If enabled, after initial login, usernames are auto-filled into the <code>Username</code> field on the login page. If the user selected Remember me on the login page, the username persists after the session expires or the user logs out. The username also appears on the User Switcher. This setting is selected by default for all organizations.</p> <p> Note: If you disable this setting, the Remember me option doesn't appear on your org's login page or from the User Switcher.</p>
Enable secure and persistent browser caching to improve performance	Enables secure data caching in the browser to improve page reload performance by avoiding extra round trips to the server. This setting is selected by default for all organizations. We don't recommend disabling this setting, but if your company's policy doesn't allow browser caching even if the data is encrypted, you can disable it.
Enable user switching	Determines whether the User Switcher appears when your org's users select their profile picture. This setting is selected by default for all organizations. The <code>Enable caching and autocomplete on login page</code> setting must also be enabled. Deselect the <code>Enable user switching</code> setting to prevent your org from appearing in User Switchers on other orgs. It also prevents your org users from seeing the User Switcher when they select their profile picture.
Remember until logout	<p>Normally, usernames are cached only while a session is active or if a user selects Remember Me. For SSO sessions, the remember option isn't available. So, once the session expires, the username disappears from the login page and the User Switcher. By enabling <code>Remember me until logout</code>, the cached usernames are deleted only if the user explicitly logs out. If the session times out, they appear on the User Switcher as inactive. This way, if the users are on their own computer and allow a session to timeout, they can select the username to reauthenticate. If they're on a shared computer, the username is deleted immediately when the user logs out.</p> <p>This setting applies to all your org's users. This option isn't enabled by default. However, we encourage you to enable it as a convenience to your users. Keep this setting disabled if your org doesn't expose all your SSO or authentication providers on your login page.</p>
Enable the SMS method of identity confirmation	Allows users to receive a one-time PIN delivered via SMS. If this setting is selected, administrators or users must verify their mobile phone number before taking advantage of this feature. This setting is selected by default for all organizations.
Require security tokens for API logins from callouts (API version 31.0 and earlier)	In API version 31.0 and earlier, requires the use of security tokens for API logins from callouts. Examples are Apex callouts or callouts using the AJAX proxy. In API version 32.0 and later, security tokens are required by default.

Field	Description
Login IP Ranges (for Contact Manager, Group, and Professional Editions)	<p>Specifies a range of IP addresses users must log in from (inclusive), or the login fails.</p> <p>To specify a range, click New and enter a Start IP Address and End IP Address to define the range, which includes the start and end values.</p> <p>This field is not available in Enterprise, Unlimited, Performance, and Developer Editions. In those editions, you can specify a valid Login IP Range in the user profile settings.</p>
Enable clickjack protection for Setup pages	Protects against clickjack attacks on setup Salesforce pages. Clickjacking is also known as a user interface redress attack. (Setup pages are available from the Setup menu.)
Enable clickjack protection for non-Setup Salesforce pages	Protects against clickjack attacks on non-setup Salesforce pages. Clickjacking is also known as a user interface redress attack. Setup pages already include protection against clickjack attacks. (Setup pages are available from the Setup menu.) This setting is selected by default for all organizations.
Enable clickjack protection for customer Visualforce pages with standard headers	<p>Protects against clickjack attacks on your Visualforce pages with headers enabled. Clickjacking is also known as a user interface redress attack.</p> <p> Warning: If you use custom Visualforce pages within a frame or iframe, you sometimes see a blank page or the page displays without the frame. For example, Visualforce pages in a page layout don't function when clickjack protection is on.</p>
Enable clickjack protection for customer Visualforce pages with headers disabled	<p>Protects against clickjack attacks on your Visualforce pages with headers disabled when setting <code>showHeader="false"</code> on the page. Clickjacking is also known as a user interface redress attack.</p> <p> Warning: If you use custom Visualforce pages within a frame or iframe, you sometimes see a blank page or the page displays without the frame. For example, Visualforce pages in a page layout don't function when clickjack protection is on.</p>
Enable CSRF protection on GET requests on non-setup pages	Protects against Cross Site Request Forgery (CSRF) attacks by modifying non-Setup pages. Non-Setup pages include a random string of characters in the URL parameters or as a hidden form field. With every GET and POST request, the application checks the validity of this string of characters. The application doesn't execute the command unless the value found matches the expected value. This setting is selected by default for all organizations.
Enable CSRF protection on POST requests on non-setup pages	
Logout URL	Redirects users to a specific page after they log out of Salesforce, such as an authentication provider's page or a custom-branded page. This URL is used only if no logout URL is specified in the identity provider, SAML single sign-on, or external authentication provider settings. If no value is specified for Logout URL, the default is <code>https://login.salesforce.com</code> , unless MyDomain is enabled. If My Domain is enabled, the default is <code>https://customdomain.my.salesforce.com</code> .

3. Click **Save**.

Session Security Levels

You can restrict access to certain types of resources based on the level of security associated with the authentication (login) method for the user's current session. By default, each login method has one of two security levels: Standard or High Assurance. You can change the session security level and define policies so specified resources are only available to users with a High Assurance level.

The different authentication methods are assigned these security levels, by default.

- Username and Password — Standard
- Delegated Authentication — Standard
- Activation — Standard
- Two-Factor Authentication — High Assurance
- Authentication Provider — Standard
- SAML — Standard

Note: The security level for a SAML session can also be specified using the `SessionLevel` attribute of the SAML assertion sent by the identity provider. The attribute can take one of two values, `STANDARD` or `HIGH_ASSURANCE`.

To change the security level associated with a login method:

1. From Setup, enter *Session Settings* in the Quick Find box, then select **Session Settings**.
2. Under Session Security Levels, select the login method.
3. To move the method to the proper category, click the **Add** or **Remove** arrow.

Currently, the only features that use session-level security are reports and dashboards in Salesforce and connected apps. You can set policies requiring High Assurance on these types of resources. You can also specify an action to take if the session used to access the resource is not High Assurance. The supported actions are:

- Block — Blocks access to the resource by showing an insufficient privileges error.
- Raise session level — Prompts users to complete two-factor authentication. When users authenticate successfully, they can access the resource. For reports and dashboards, you can apply this action when users access reports or dashboards, or just when they export and print them.

Warning: Raising the session level to high assurance by redirecting the user to complete two-factor authentication is not a supported action in Lightning Experience. If your org has Lightning Experience enabled, and you set a policy that requires a high assurance session to access reports and dashboards, Lightning Experience users with a standard assurance session are blocked from reports and dashboards. Also, they don't see the icons for these resources in the navigation menu. As a workaround, users with a standard assurance session can log out and log in again using an authentication method that is defined as high assurance by their org. Then they have access to reports and dashboards. Or, they can switch to Salesforce Classic, where they're prompted to raise the session level when they attempt to access reports and dashboards.

To set a High Assurance required policy for accessing a connected app:

1. From Setup, enter *Connected Apps* in the Quick Find box, then select the option for managing connected apps.
2. Click **Edit** next to the connected app.
3. Select **High Assurance session required**.
4. Select one of the actions presented.
5. Click **Save**.

To set a High Assurance required policy for accessing reports and dashboards:

1. From Setup, enter *Access Policies* in the **Quick Find** box, then select **Access Policies**.
2. Select **High Assurance session required**.
3. Select one of the actions presented.
4. Click **Save**.

Session levels have no impact on resources in the app other than connected apps, reports, and dashboards for which explicit security policies have been defined.

[Identity Verification History](#)

Create a Login Flow

Use the Cloud Flow Designer to build a login flow process, then associate the finished flow with a profile.

When a user's profile is associated with a login flow, the user is directed to the flow as part of the authentication process. The login flow screens are embedded in the standard Salesforce login page. During the authentication process, these users have restricted access to the login flow screens. At the end of a successful authentication and completion of the login flow, the user is redirected to the organization. Otherwise, an explicit action can be defined within the flow to deny access.

For example, an administrator can create a login flow that implements a custom two-factor authentication process to add a desired security layer. A flow like this uses Apex methods to get the session context, extract the user's IP address, and verify if the request is coming from a Trusted IP Range. (To find or set the Trusted IP Range, from Setup, enter *Network Access* in the **Quick Find** box, then select **Network Access**.) If the request is coming from within a Trusted IP Range address, Salesforce skips the flow and logs the user into the organization. Otherwise, Salesforce invokes the flow providing one of three options.

1. Direct the user to log in with additional credentials, such as a time-based one-time password (TOTP).
2. Force the user to log out.
3. Direct the user to a page with more options.

You can also build login flows that direct users to customized pages, such as forms to gather more information, or pages providing users with additional information.

Build Your Own Login Flow

Use the following process to build your own login flow.

1. Create a new flow using the Flow Designer and Apex.

For example, you can design a custom IP-based two-factor authentication flow that requires a second factor of authentication only if the user is logging in from outside of the corporate Trusted IP Range. (To find or set the Trusted IP Range, from Setup, enter *Network Access* in the **Quick Find** box, then select **Network Access**.)

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

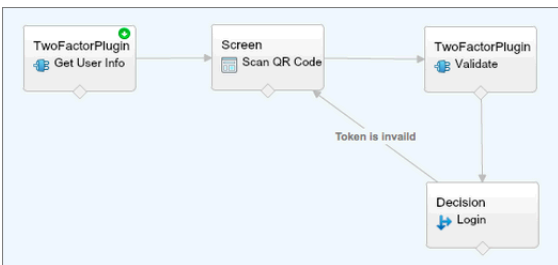

To open, edit, or create a flow in the Cloud Flow Designer:

- "Manage Force.com Flow"

 **Note:** Do not set the Login IP Ranges directly in the user profile. The Login IP Ranges set directly in a profile restrict access to the organization for users of that profile who are outside that range, entirely, and those users cannot enter the login flow process.

The flow should contain the following.

- a. A new Apex class defining an Apex plugin that implements from the (`Process.Plugin`) and uses the `Auth.SessionManagement` class to access the time-based one-time password (TOTP) methods and services. The new Apex class for the plugin generates a time-based key with a quick response (QR) code to validate the TOTP provided by the user against the TOTP generated by Salesforce.
- b. A screen element to scan a QR code.
- c. A decision element to handle when the token is valid and when the token is invalid.

Within the flow, you can set input variables. If you use the following specified names, these values will be populated for the flow when it starts.

Name	Value Description
<code>LoginFlow_LoginType</code>	The user type, such as Chatter Community external user
<code>LoginFlow_IpAddress</code>	The user's current IP address
<code>LoginFlow_LoginIpAddress</code>	The user's IP address used during login, which can change after authentication
<code>LoginFlow_UserAgent</code>	The user agent string provided by the user's browser
<code>LoginFlow_Platform</code>	The operating system for the user
<code>LoginFlow_Application</code>	Application used to request authentication
<code>LoginFlow_Community</code>	Current Community, if this login flow applies to a Community
<code>LoginFlow_SessionLevel</code>	The current session security level, Standard or High Assurance
<code>LoginFlow_UserId</code>	The user's 18-character ID.

During the flow, you can assign the following, pre-defined variables values for specific behavior.

 **Note:** The flow loads these values only *after* a UI screen is refreshed (a user clicking a button does not load the values, a new screen must be added to the flow for the values to be loaded).

Name	Value Description
<code>LoginFlow_FinishLocation</code>	A Text value. Provide a string that defines where the user goes after completing the login flow. The string should be a valid Salesforce URL (the user cannot leave the organization and stay in the flow) or relative path.
<code>LoginFlow_ForceLogout</code>	A Boolean value. Set this variable to <code>true</code> to log the user out, immediately, and force the user to exit the flow.

2. Save the flow.
3. Activate the flow.
4. Connect the login flow to a profile.

SEE ALSO:

[Custom Login Flows](#)

<https://developer.salesforce.com/page/Login-Flows>

[Connect a Login Flow to a Profile](#)

[Cloud Flow Designer](#)

Connect a Login Flow to a Profile

After you create a login flow in Flow Designer and activate the flow, you associate it with a profile in your organization. Users with that profile are then directed to the login flow.

1. From Setup, enter *Login Flows* in the **Quick Find** box, then select **Login Flows**.
2. Click **New**.
3. Enter a name to reference the login flow association when you edit or delete it. The name doesn't need to be unique.
4. Select the login flow for the profile. The drop-down list includes all the available flows saved in the Flow Designer. Only active flows of type Flow are supported.
5. Select a user license for the profile to which you want to connect the flow. The profile list then shows profiles with that license.
6. Select the profile to connect to the login flow.
7. Click **Save**.

Users of the profile are now directed to the login flow.

After you associate the login flow, you can edit or delete the flows listed on this login flows page.

You can associate a login flow with one or more profiles. However, a profile can't be connected to more than one login flow.

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Set Up Two-Factor Authentication

Admins enable two-factor authentication through permissions or profile settings. Users add the mobile authenticator app through their own personal settings.

You can customize two-factor authentication in the following ways.

- Require it for every login. Set the two-factor login requirement for every time the user logs in to Salesforce. You can also enable this feature for API logins, which includes the use of client applications like the Data Loader. For more information, see [Set Two-Factor Authentication Login Requirements](#) or [Set Two-Factor Authentication Login Requirements for API Access](#).

[Walk Through It: Secure Logins with Two-Factor Authentication](#)

- Use “stepped up” authentication (also known as “high assurance” authentication). Sometimes you don’t need two-factor authentication for every user’s login, but you want to secure certain resources. If the user tries to use a connected app or reports, Salesforce prompts the user to verify identity. For more information, see [Session Security Levels](#).
 - Use profile policies and session settings. First, in the user profile, set the `Session security level required at login` field to **High Assurance**. Then set session security levels in your org’s session settings to apply the policy for particular login methods. In your org’s session settings, check the session security levels to make sure that Two-Factor Authentication is in the High Assurance column. For more information, see [Set Two-Factor Authentication Login Requirements for Single Sign-On, Social Sign-On, and Communities](#).
-  **Warning:** If Two-Factor Authentication is in the Standard column, users get an error when they log in with a method that grants standard-level security.
- Use login flows. Use the Flow Designer and profiles to build post-authentication requirements as the user logs in, including custom two-factor authentication processes. For more information, see the following examples.
 - [Login Flows](#)
 - [Implementing SMS-Based Two-Factor Authentication](#)
 - [Enhancing Security with Two-Factor Authentication](#)

[Set Two-Factor Authentication Login Requirements](#)

As a Salesforce admin, you can require your users to use a second factor of authentication when they log in.

[Set Two-Factor Authentication Login Requirements for Single Sign-On, Social Sign-On, and Communities](#)

Use profile policies and session settings to set two-factor authentication login requirements for users. All Salesforce user interface authentication methods, including username and password, delegated authentication, SAML single sign-on, and social sign-on through a third-party authentication provider, are supported. You can apply the two-factor authentication requirement to users in Salesforce orgs and Communities.

[Set Two-Factor Authentication Login Requirements for API Access](#)

Salesforce admins can set the “Two-Factor Authentication for API Logins” permission to allow using a second authentication challenge for API access to Salesforce. API access includes the use of applications like the Data Loader and developer tools for customizing an organization or building client applications.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

[Connect Salesforce Authenticator \(Version 2 or Later\) to Your Account for Identity Verification](#)

You can connect version 2 or later of the Salesforce Authenticator mobile app to your account. Use the app whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in or access reports or dashboards, use the app to verify your account activity. If you're required to use two-factor authentication before you have the app connected, you're prompted to connect it the next time you log in to Salesforce. If you don't yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

[Connect a One-Time Password Generator App or Device for Identity Verification](#)

You can connect a one-time password generator app, such as Salesforce Authenticator or Google Authenticator, to your account. Use a verification code generated by the app, sometimes called a "time-based one-time password," whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in, access connected apps, or access reports or dashboards, use a code from the app. If you're required to use two-factor authentication before you have an app connected, you're prompted to connect one the next time you log in to Salesforce. If you don't yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

[Disconnect Salesforce Authenticator \(Version 2 or Later\) from a User's Account](#)

Only one Salesforce Authenticator (version 2 or later) mobile app can be connected to a user's account at a time. If your user loses access to the app by replacing or losing the mobile device, disconnect the app from the user's account. The next time the user logs in with two-factor authentication, Salesforce prompts the user to connect a new authenticator app.

[Disconnect a User's One-Time Password Generator App](#)

Only one mobile authenticator app that generates verification codes (one-time passwords) can be connected to a user's account at a time. If your user loses access to the app by replacing or losing the mobile device, disconnect the app from your user's account. The next time your user logs in with two-factor authentication, Salesforce prompts the user to connect a new authenticator app.

[Generate a Temporary Identity Verification Code](#)

Generate a temporary verification code for users who can't access the device they usually use for two-factor authentication. You set when the code expires, from 1 to 24 hours after you generate it. The code can be used multiple times until it expires.

[Expire a Temporary Verification Code](#)

Expire a user's temporary verification code when the user no longer needs it for two-factor authentication

[See How Your Users Are Verifying Their Identity](#)

Customize a list view of users or check the Identity Verification Methods report to find out who's using which methods to verify identity. Create custom reports to spot patterns in identity verification behavior for your org or community.

[Delegate Two-Factor Authentication Management Tasks](#)

Let users who aren't Salesforce admins provide support for two-factor authentication in your org. For example, suppose you want your company's Help Desk staff to generate temporary verification codes for users who lost or forgot the device they usually use for two-factor authentication. Assign Help Desk staff members the "Manage Two-Factor Authentication in User Interface" permission so that they can generate codes and support end users with other two-factor authentication tasks.

SEE ALSO:

[Two-Factor Authentication](#)

Set Two-Factor Authentication Login Requirements

As a Salesforce admin, you can require your users to use a second factor of authentication when they log in.

You can require two-factor authentication each time a user logs in with a username and password to Salesforce, including orgs with custom domains created using My Domain. To set the requirement, select the “Two-Factor Authentication for User Interface Logins” permission in the user profile (for cloned profiles only) or permission set.

See how to set up a two-factor authentication requirement for your org and how your users can use the Salesforce Authenticator app. [Salesforce Authenticator: Set Up a Two-Factor Authentication Requirement](#)

Walk Through It: Secure Logins with Two-Factor Authentication

Users with the “Two-Factor Authentication for User Interface Logins” permission have to use a mobile authenticator app each time they log in to Salesforce.

You can also use a profile-based policy to set a two-factor authentication requirement for users assigned to a particular profile. Use the profile policy when you want to require two-factor authentication for users of the following authentication methods:

- SAML for single sign-on
- Social sign-on in to Salesforce orgs or Communities
- Username and password authentication into Communities

All Salesforce user interface authentication methods, including username and password, delegated authentication, SAML single sign-on, and social sign-on through an authentication provider, are supported. In the user profile, set the `Session security level required at login` field to **High Assurance**. Then set session security levels in your org’s session settings to apply the policy for particular login methods. Also in your org’s session settings, check the session security levels to make sure that Two-Factor Authentication is in the High Assurance column.

Warning: If Two-Factor Authentication is in the Standard column, users get an error when they log in with a method that grants standard-level security.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit profiles and permission sets:

- “Manage Profiles and Permission Sets”

Set Two-Factor Authentication Login Requirements for Single Sign-On, Social Sign-On, and Communities

Use profile policies and session settings to set two-factor authentication login requirements for users. All Salesforce user interface authentication methods, including username and password, delegated authentication, SAML single sign-on, and social sign-on through a third-party authentication provider, are supported. You can apply the two-factor authentication requirement to users in Salesforce orgs and Communities.

To require two-factor authentication for users assigned to a particular profile, edit the `Session security level required at login` profile setting. Then set session security levels in your org's session settings to apply the policy for particular login methods.

By default, the session security requirement at login for all profiles is `None`. You can edit a profile's Session Settings to change the requirement to `High Assurance`. When profile users with this requirement use a login method that grants standard-level security instead of high assurance, such as username and password, they're prompted to verify their identity with two-factor authentication. After users authenticate successfully, they're logged in to Salesforce.

You can edit the security level assigned to a login method in your org's Session Settings.

Users with mobile devices can use the Salesforce Authenticator mobile app or another authenticator app for two-factor authentication. Internal users can connect the app to their account in the Advanced User Details page of their personal settings. If you set the `High Assurance` requirement on a profile, any profile user who doesn't already have Salesforce Authenticator or another authenticator app connected to their account is prompted to connect the app before they can log in. After they connect the app, they're prompted to use the app to verify their identity.

Community members with the `High Assurance` profile requirement are prompted to connect an authenticator app during login.

1. From Setup, enter `Profiles` in the `Quick Find` box, then select **Profiles**.
2. Select a profile.
3. Scroll to Session Settings and find the `Session security level required at login` setting.
4. Click **Edit**.
5. For `Session security level required at login`, select **High Assurance**.
6. Click **Save**.
7. From Setup, enter `Session Settings` in the `Quick Find` box, then select **Session Settings**.
8. In Session Security Levels, make sure that Two-Factor Authentication is in the High Assurance column. If Two-Factor Authentication is in the Standard column, users get an error when they log in with a method that grants standard-level security.
9.  **Note:** Consider moving Activation to the High Assurance column. With this setting, users who verify their identity from an unrecognized browser or app establish a high-assurance session. When Activation is in the High Assurance column, profile users who verify their identity at login aren't challenged to verify their identity again to satisfy the high-assurance session security requirement.

Save your changes.

 **Example:** You've configured Facebook and LinkedIn as authentication providers in your community. Many of your community members use social sign-on to log in using the username and password from their Facebook or LinkedIn accounts. You want to increase security by requiring Customer Community users to use two-factor authentication when they log in with their Facebook account, but not with their LinkedIn account. You edit the Customer Community User profile and set the `Session security level required at login` to **High Assurance**. In your org's Session Settings, you edit the Session Security Levels. You

USER PERMISSIONS

To edit profiles and permission sets:

- "Manage Profiles and Permission Sets"

To generate a temporary verification code

- "Manage Two-Factor Authentication in User Interface"

place Facebook in the Standard column. In the High Assurance column, you place Two-Factor Authentication. You also place LinkedIn in the High Assurance column.

 **Note:** You can also use login flows to change the user's session security level to initiate identity verification under specific conditions. Login flows let you build a custom post-authentication process that meets your business requirements.

If users lose or forget the mobile device they usually use for two-factor authentication, you can generate a temporary verification code for them. You set when the code expires, from 1 to 24 hours after you generate it. Your user can use the code multiple times until it expires. A user can have only one temporary code at a time. If a user needs a new code while the old code is still valid, you can expire the old code, then generate a new one. Users can expire their own valid codes in their personal settings.

 **Note:** The `High Assurance` profile requirement applies to user interface logins. OAuth token exchanges aren't subject to the requirement. OAuth refresh tokens that were obtained before a `High Assurance` requirement is set for a profile can still be exchanged for access tokens that are valid for the API. Tokens are valid even if they were obtained with a standard-assurance session. To require users to establish a high-assurance session before accessing the API with an external application, first revoke existing OAuth tokens for users with that profile. Then set a `High Assurance` requirement for the profile. Users have to log in with two-factor authentication and reauthorize the application. See [Revoking OAuth Tokens](#).

Set Two-Factor Authentication Login Requirements for API Access

Salesforce admins can set the “Two-Factor Authentication for API Logins” permission to allow using a second authentication challenge for API access to Salesforce. API access includes the use of applications like the Data Loader and developer tools for customizing an organization or building client applications.

The “Two-Factor Authentication for User Interface Logins” permission is a prerequisite for the “Two-Factor Authentication for API Logins” permission. Users who have these permissions enabled have to complete two-factor authentication when they log in to Salesforce through the user interface. Users must download and install an authenticator app on their mobile device and connect the app to their Salesforce account. Then they can use verification codes (time-based one-time passwords, or TOTP) from the app for two-factor authentication.

Connect Salesforce Authenticator (Version 2 or Later) to Your Account for Identity Verification

You can connect version 2 or later of the Salesforce Authenticator mobile app to your account. Use the app whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in or access reports or dashboards, use the app to verify your account activity. If you’re required to use two-factor authentication before you have the app connected, you’re prompted to connect it the next time you log in to Salesforce. If you don’t yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

The Salesforce Authenticator (version 2 or later) app on your mobile device is the second “factor” of authentication. Using the app adds an extra level of security to your account. Once you connect the app, you get a notification on your mobile device whenever you do something that requires identity verification. When you get the notification, open the app on your mobile device, check the activity details, and respond on your mobile device to verify. If you get a notification about activity you don’t recognize, use the app to block the activity. You can flag the blocked activity for your Salesforce admin. The app also provides a verification code you can use as an alternate method of identity verification.

1. Download and install version 2 or later of the Salesforce Authenticator app for the type of mobile device you use. For iPhone, get the app from the [App Store](#). For Android devices, get the app from [Google Play](#).

If you previously installed version 1 of Salesforce Authenticator on your mobile device, you can update the app to version 2 through the App Store or Google Play. The update preserves any connected accounts you already have in the app. These accounts are code-only accounts that generate verification codes but don’t receive push notifications or allow location-based automated verifications. Code-only accounts appear on your Connected Accounts list without a > at the far right of the account name row, and there’s no account detail page. If you have a code-only account for the username you used for your current login to Salesforce, swipe left in the app to remove that username before proceeding. In the following steps, you connect the account for that username again.

USER PERMISSIONS

To edit system permissions in profiles:

- “Manage Profiles and Permission Sets”

To enable this feature:

- “Two-Factor Authentication for User Interface Logins”

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited, Developer, and Contact Manager** Editions

The new connected account gives you full Salesforce Authenticator version 2 functionality: push notifications, location-based automated verifications, and verification codes.

2. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
3. Find **App Registration: Salesforce Authenticator** and click **Connect**.
4. For security purposes, you're prompted to log in to your account.
5. Open the Salesforce Authenticator app on your mobile device.
If you're opening the app for the first time, you see a tour of the app's features. Take the tour, or go straight to adding your Salesforce account to the app.
6. In the app, tap **+** to add your account.
The app generates a unique two-word phrase.
7. Back in your browser, enter the phrase in the **Two-Word Phrase** field.
8. Click **Connect**.
If you previously connected an authenticator app that generates verification codes to your account, you sometimes see an alert. Connecting version 2 or later of the Salesforce Authenticator mobile app invalidates the codes from your old app. When you need a verification code, get it from Salesforce Authenticator from now on.
9. In the Salesforce Authenticator app on your mobile device, you see details about the account you're connecting. To complete the account connection, tap **Connect** in the app.

To help keep your account secure, we send you an email notification whenever a new identity verification method is added to your Salesforce account. You get the email whether you add the method or your Salesforce admin adds it on your behalf.

SEE ALSO:

[Personalize Your Salesforce Experience](#)

Connect a One-Time Password Generator App or Device for Identity Verification

You can connect a one-time password generator app, such as Salesforce Authenticator or Google Authenticator, to your account. Use a verification code generated by the app, sometimes called a "time-based one-time password," whenever Salesforce has to verify your identity. If your administrator requires two-factor authentication for increased security when you log in, access connected apps, or access reports or dashboards, use a code from the app. If you're required to use two-factor authentication before you have an app connected, you're prompted to connect one the next time you log in to Salesforce. If you don't yet have the two-factor authentication requirement, you can still connect the app to your account through your personal settings.

1. Download the supported authenticator app for your device type. You can use any authenticator app that supports the time-based one-time password (TOTP) algorithm ([IETF RFC 6238](#)), such as [Salesforce Authenticator for iOS](#), [Salesforce Authenticator for Android](#), or Google Authenticator.
2. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
3. Find **App Registration: One-Time Password Generator** and click **Connect**.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in all editions

4. For security purposes, you're prompted to log in to your account.
5. Using the authenticator app on your mobile device, scan the QR code.
Alternatively, you can click **I Can't Scan the QR Code** in your browser. The browser displays a security key. In the authenticator app, enter your username and the key displayed.
6. In Salesforce, enter the code generated by the authenticator app in the **Verification Code** field.
The authenticator app generates a new verification code periodically. Enter the current code.
7. Click **Connect**.

To help keep your account secure, we send you an email notification whenever a new identity verification method is added to your Salesforce account. You get the email whether you add the method or your Salesforce admin adds it on your behalf.

[Personalize Your Salesforce Experience](#)

Disconnect Salesforce Authenticator (Version 2 or Later) from a User's Account

Only one Salesforce Authenticator (version 2 or later) mobile app can be connected to a user's account at a time. If your user loses access to the app by replacing or losing the mobile device, disconnect the app from the user's account. The next time the user logs in with two-factor authentication, Salesforce prompts the user to connect a new authenticator app.

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Click the user's name.
3. On the user's detail page, click **Disconnect** next to the *App Registration: Salesforce Authenticator* field.
4. Click **Disconnect** next to the *App Registration: One-Time Password Generator* field.

 **Note:** If you don't click **Disconnect** for this field, the inaccessible app still generates valid verification codes for the account.

Users can disconnect the app from their own account on the Advanced User Details page. In personal settings, the user clicks **Disconnect** next to both the *App Registration: Salesforce Authenticator* and *App Registration: One-Time Password Generator* fields.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To disconnect a user's Salesforce Authenticator app:

- "Manage Two-Factor Authentication in User Interface"

Disconnect a User's One-Time Password Generator App

Only one mobile authenticator app that generates verification codes (one-time passwords) can be connected to a user's account at a time. If your user loses access to the app by replacing or losing the mobile device, disconnect the app from your user's account. The next time your user logs in with two-factor authentication, Salesforce prompts the user to connect a new authenticator app.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click the user's name.
3. On the user's detail page, click **Disconnect** next to the **App Registration: One-Time Password Generator** field.

Your users can disconnect the app from their own account. In personal settings, they go to the **Advanced User Details** page and click **Disconnect** next to the **App Registration: One-Time Password Generator** field.

Generate a Temporary Identity Verification Code

Generate a temporary verification code for users who can't access the device they usually use for two-factor authentication. You set when the code expires, from 1 to 24 hours after you generate it. The code can be used multiple times until it expires.

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
2. Click the name of the user who needs a temporary verification code.
You can't generate a code for an inactive user.
3. Find **Temporary Verification Code**, then click **Generate**.
If you don't already have a session with a high-assurance security level, Salesforce prompts you to verify your identity.
4. Set when the code expires, and click **Generate Code**.
5. Give the code to your user, then click **Done**.
After you click **Done**, you can't return to view the code again, and the code isn't displayed anywhere in the user interface.

Your user can use the temporary verification code multiple times until it expires. Each user can have only one temporary verification code at a time. If a user forgets or loses the code before it expires, you can manually expire the old code and generate a new one. You can generate up to six codes per hour for each user.

See How Your Users Are Verifying Their Identity

Customize a list view of users or check the Identity Verification Methods report to find out who's using which methods to verify identity. Create custom reports to spot patterns in identity verification behavior for your org or community.

To see registered identity verification methods in a Users list view, create or edit a view and add one or more of the following fields.

Has Verified Mobile Number

Indicates whether the user has verified a mobile phone number. Salesforce can text a verification code to the user at that number.

Has One-Time Password App

Indicates whether the user has connected an authenticator app that generates verification codes, also known as time-based one-time passwords. The user can verify identity by entering a code generated by the app.

Has Salesforce Authenticator

Indicates whether the user has connected the Salesforce Authenticator mobile app. The user can verify identity by approving a notification sent to the app.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To expire a user's temporary verification code:

- "Manage Two-Factor Authentication in User Interface"

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To monitor user identity verification methods:

- "Manage Two-Factor Authentication in User Interface"

Has Temporary Code

Indicates whether the user has a temporary verification code. Admins or non-admin users with the “Manage Two-Factor Authentication in User Interface” permission generate temporary codes and set when the code expires.

You can perform some two-factor authentication support tasks right in the list view. For example, you can generate or expire a temporary verification code or disconnect a mobile authenticator app when the user loses access to the mobile device.

To view and customize the Identity Verification Methods report, users with the “Manage Two-Factor Authentication in User Interface” permission can click the link on the Identity Verification History page in Setup.

Users with the “View Setup and Configuration” permission can also access the report from the Administrative Reports folder in Reports.

Users with the “Manage Two-Factor Authentication in API” permission can create custom reports and dashboards for even deeper insight into identity verification history in your org or community. For example, create a report that shows identity verification method registration by profile. Or create a dashboard with charts that show method registration and verification challenges by the org policy that triggered them.

SEE ALSO:

[Two-Factor Authentication](#)

[Delegate Two-Factor Authentication Management Tasks](#)

Delegate Two-Factor Authentication Management Tasks

Let users who aren't Salesforce admins provide support for two-factor authentication in your org. For example, suppose you want your company's Help Desk staff to generate temporary verification codes for users who lost or forgot the device they usually use for two-factor authentication. Assign Help Desk staff members the “Manage Two-Factor Authentication in User Interface” permission so that they can generate codes and support end users with other two-factor authentication tasks.

To assign the permission, select “Manage Two-Factor Authentication in User Interface” in the user profile (for cloned profiles only) or permission set. Users with the permission can perform the following tasks.

- Generate a temporary verification code for a user who can't access the device normally used for two-factor authentication.
- Disconnect identity verification methods from a user's account when the user loses or replaces a device.
- View user identity verification activity on the Identity Verification History page.
- View the Identity Verification Methods report by clicking a link on the Identity Verification History page.
- Create user list views that show which identity verification methods users have registered.

EDITIONS

Available in: Both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To edit profiles and permission sets:

- “Manage Profiles and Permission Sets”

 **Note:** Although non-admin users with the permission can view the Identity Verification Methods report, they can't create custom reports that include data restricted to users with the "Manage Users" permission.

Transaction Security

Transaction Security is a framework that intercepts real-time Salesforce events and applies appropriate actions and notifications based on security policies you create. Transaction Security monitors events according to the policies that you set up. These policies are applied against events in your org and specify actions to take when certain event combinations occur. When a policy is triggered, you can have an action taken and receive an optional notification.

[Transaction Security Policies](#)

Policies evaluate activity using events you specify. For each policy, you define real-time actions, such as notify, block, force two-factor authentication, or choose a session to end.

[Set up Transaction Security](#)

Activate and configure transaction security on your org before creating your own custom policies. Only an active user assigned the System Administrator profile can use this feature.

[Create Custom Transaction Security Policies](#)

Create your own custom policies, triggered by specific events. Only an active user assigned the System Administrator profile can use this feature.

[Apex Policies for Transaction Security Notifications](#)

Every Transaction Security policy must implement the Apex `TxnSecurity.PolicyCondition` interface. Here are several examples.

[Manage Transaction Security Policies](#)

Use Transaction Security policies to define, enable, and generate Apex code to implement your policies. Specify how to be notified when a policy is triggered, and then select the policies to enable. Only an active user assigned the System Administrator profile can use this feature.

[Receiving Transaction Security Notifications](#)

You receive the notifications you've selected when an enabled policy is triggered. The notifications are formatted for easy recognition.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Requires purchasing Salesforce Shield or Salesforce Shield Event Monitoring add-on subscriptions.

Transaction Security Policies

Policies evaluate activity using events you specify. For each policy, you define real-time actions, such as notify, block, force two-factor authentication, or choose a session to end.

When you enable Transaction Security for your org, two policies are created:

- Concurrent Sessions Limiting policy to limit concurrent login sessions
- Lead Data Export policy to block excessive data downloads of Leads

The policies' corresponding Apex classes are also created in the org. An administrator can enable the policies immediately or edit their Apex classes to customize them.

For example, suppose that you activate the Concurrent Sessions Limiting policy to limit the number of concurrent sessions per user. In addition, you change the policy to notify you via email when the policy is triggered. You also update the policy's Apex implementation to limit users to three sessions instead of the default five sessions. (That's easier than it sounds.) Later, someone with three login sessions tries to create a fourth. The policy prevents that and requires ending one of the existing sessions before proceeding with the new session. At the same time, you are notified that the policy was triggered.

The Transaction Security architecture uses the Security Policy Engine to analyze events and determine the necessary actions.

A transaction security policy consists of events, notifications, and actions.

- Policies to apply to the organization, made up of events. Available event types are:
 - Data Export for Account, Contact, Lead, and Opportunity objects
 - Entity for authentication providers and sessions, client browsers, and login IP
 - Logins
 - Resource Access for connected apps and reports and dashboards
- Available policy notifications—You can be notified via email, by an in-app notification, or both.
- Actions to take if the policy is triggered:
 - Block the operation
 - Require a higher level of assurance using two-factor authentication

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Requires purchasing Salesforce Shield or Salesforce Shield Event Monitoring add-on subscriptions.

- End a current session

You can also take no action and only receive a notification. The actions available depend on the event type selected.

Set up Transaction Security

Activate and configure transaction security on your org before creating your own custom policies. Only an active user assigned the System Administrator profile can use this feature.

1. Enable transaction security policies to make them available for use.
 - a. From Setup, enter *Transaction Security* in the *Quick Find* box, then select **Transaction Security**.

- b. Select **Enable custom transaction security policies** at the top of the page.

The `ConcurrentSessionsLimitingPolicy` limits concurrent sessions and is triggered in two ways:

- When a user with five current sessions tries to log in for a sixth session
- When an administrator that's already logged in tries to log in a second time

You can adjust the number of sessions allowed by changing the Apex policy implementation `ConcurrentSessionsPolicyCondition`.

The Lead Data Export policy blocks excessive data downloads of leads. It's triggered when a download either:

- Retrieves more than 2,000 lead records
- Takes more than one second to complete

You can change these values by modifying the `DataLoaderLeadExportCondition` policy implementation.

2. After Transaction Security is enabled, set the preferences for your org.
 - a. Click **Default Preferences** on the Transaction Security Policies page.
 - b. Select the preference **When users exceed the maximum number of Salesforce sessions allowed, close the oldest session**.

Login policies affect programmatic access and access from Salesforce Classic and Lightning Experience. When you create a policy that limits the number of concurrent user sessions, all sessions count toward that limit. Regular logins with a username and password, logins by web applications, logins using Authentication Providers, and all other login types are considered.

The session limit isn't a problem in Salesforce Classic or Lightning Experience because you're prompted to select which session or sessions to end. That choice isn't available from within a program, so the program receives a Transaction Security exception that the session limit has been reached.

To prevent this problem, select **When users exceed the maximum number of Salesforce sessions allowed, close the oldest session**. Then when a programmatic request is made that exceeds the number of sessions allowed, older sessions are ended until the session count is below the limit. The setting also works for logins from the UI. Instead of being asked to select a session to end, the oldest session is automatically ended, and the new login proceeds for the new session. Here's how the OAuth flows handle login policies with and without the preference being set.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions.

Requires purchasing Salesforce Shield or Salesforce Shield Event Monitoring add-on subscriptions.

USER PERMISSIONS

To create, edit, and manage transaction security policies:

- "Author Apex"
- AND
- "Customize Application"

Flow Type	Action If Preference Is Selected	Action If Preference Is Not Selected
OAuth 2.0 web server	Authorization Code and Access Token granted Older sessions are ended until you're within policy compliance.	Authorization Code granted, but Access Token not granted Older sessions are ended until you're within policy compliance.
OAuth 2.0 user-agent	Access Token granted Older sessions are ended until you're within policy compliance.	Access Token granted Older sessions are ended until you're within policy compliance.
OAuth 2.0 refresh token flow	Access Token granted Older sessions are ended until you're within policy compliance.	TXN_SECURITY_END_SESSION exception
OAuth 2.0 JWT bearer token	Access Token granted Older sessions are ended until you're within policy compliance.	TXN_SECURITY_END_SESSION exception
OAuth 2.0 SAML bearer assertion	Access granted Older sessions are ended until you're within policy compliance.	TXN_SECURITY_END_SESSION exception
OAuth 2.0 username and password	Access granted Older sessions are ended until you're within policy compliance.	Access denied due to more than the number of sessions allowed by the policy
SAML assertion	Not applicable	Not applicable

For more information on authentication flows, see [Authenticating Apps with OAuth](#) in the Salesforce help.

Create Custom Transaction Security Policies

Create your own custom policies, triggered by specific events. Only an active user assigned the System Administrator profile can use this feature.

- From Setup, enter *Transaction Security* in the **Quick Find** box, select **Transaction Security**, and then click **New** in Custom Transaction Security Policies.
 - Enter the basic information fields for your new policy.
 - For clarity and easier maintenance, use similar names for the API and the policy. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.
 - Event Type**—Determines the available actions. It can be one of the following:
 - Login**—A user login. Login lets you set any combination of notifications, plus these actions:
 - Block access completely
 - Continue, but require two-factor authentication
 - Continue, but require the end of a current login session
 - Entity**—An object type. Select a specific resource and the type of notifications desired.
 - Data Export**—Notifies you if the selected object type has been exported using the Data Loader API client.
 - AccessResource**—Notifies you when the selected resource has been accessed. You can block access or require two-factor authentication before access is allowed.
 - Notifications**—You can select all, some, or no notification methods for each policy.
 - Recipient**—Must be an active user assigned the System Administrator profile.
 - Real-time Actions**—Specifies what to do when the policy is triggered. The actions available vary depending on the event type. Email and In-App notifications are always available. For login and resource events, you can also block the action or require a higher level of access control with two-factor authentication. For login events, you can require ending an existing session before continuing with the current session. You can set the default action for ending a session to always close the oldest session.
-  **Note:** Two-factor authentication is not available in Salesforce1 or Lightning Experience for the AccessResource event type. The Block action is used instead.
-  **Important:** If you create a policy requiring the two-factor authentication action, provide your users a way to get a time-based, one-time password. This password is their second authentication factor. Otherwise, if your users encounter a situation that requires a second authentication factor, they can't finish their task, such as logging in or running a report.
- You can use an existing class for `Apex Policy` or select **Generate Apex** to have a default policy class created that implements the `TxnSecurity.PolicyCondition` interface. You can also write your own policy to take advantage of any customizations you've made to your org.
 - The user selected for `Execute Policy As` must have the System Administrator profile.
- You can optionally create a condition for a specific property as part of the policy. For example, you can create a policy that's triggered when a report or dashboard is accessed from a specific source IP. The source IP is the property you're checking.
 - The available properties depend on the event type selected.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Requires purchasing Salesforce Shield or Salesforce Shield Event Monitoring add-on subscriptions.

USER PERMISSIONS

To create, edit, and manage transaction security policies:

- "Author Apex"
- AND
- "Customize Application"

- For example, with Login events, property changes that occurred within a given number of days or an exact match to a property value are available.

4. To enable a policy, select the policy's checkbox. You can enable and disable policies according to your requirements.

5. Click **Save**.

After saving your selection, you're shown the editing page for your new policy. You can modify your policy here and review its Apex class.

If you didn't specify a condition value before you generated the Apex interface for a policy, you can add the condition later. If you want to change the condition, you can edit it. Edit the Apex code to include a condition before you activate your policy. If you never include a condition, your policy is never triggered. See [Apex Policies for Transaction Security Notifications](#) for examples.

You can create multiple policies for the same type of event, but we recommend that your policies and their actions don't overlap. All the policies for a given event execute when the event occurs, but their order of execution is indeterminate. For example, if you have two policies enabled for an exported contact, you can't be sure which policy is triggered first. If one policy copies the contact and the other policy deletes the contact, the copy operation fails if the deletion is done first.

Apex Policies for Transaction Security Notifications

Every Transaction Security policy must implement the Apex `TxnSecurity.PolicyCondition` interface. Here are several examples.

If you didn't specify a condition value before you generated the Apex interface for a policy, you can add the condition later. If you want to change the condition, you can edit it. Edit the Apex code to include a condition before you activate your policy. If you never include a condition, your policy is never triggered. See the following examples for how to write up the condition.

When you delete a transaction security policy, your `TxnSecurity.PolicyCondition` implementation isn't deleted. You can reuse your Apex code in other policies.

This Apex policy example implements a policy that is triggered when someone logs in from multiple IP addresses in the past 24 hours.

Example:

```
global class LoginPolicyCondition implements
TxnSecurity.PolicyCondition {
    public boolean evaluate(TxnSecurity.Event e) {
        AggregateResult[] results = [SELECT SourceIp
                                    FROM LoginHistory
                                    WHERE UserId = :e.userId
                                    AND LoginTime =
LAST_N_DAYS:1
                                    GROUP BY SourceIp];
        if(!results.isEmpty() && results.size() > 1) {
            return true;
        }
        return false;
    }
}
```

This Apex policy example implements a policy that is triggered when a session is created from a specific IP address.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Requires purchasing Salesforce Shield or Salesforce Shield Event Monitoring add-on subscriptions.

 **Example:**

```
global class SessionPolicyCondition implements TxnSecurity.PolicyCondition {
    public boolean evaluate(TxnSecurity.Event e) {
        AuthSession eObj = [SELECT SourceIp FROM AuthSession WHERE Id = :e.entityId];
        if(eObj.SourceIp == '1.1.1.1' ){
            return true;
        }
        return false;
    }
}
```

This DataExport policy implements a policy that is triggered when someone exports data via the Data Loader.

 **Example:**

```
global class DataExportPolicyCondition implements TxnSecurity.PolicyCondition {
    public boolean evaluate(TxnSecurity.Event e) {
        if(e.data.get('SourceIp') == '1.1.1.1' ){
            return true;
        }
        return false;
    }
}
```

This Apex policy is triggered when someone accesses reports.

 **Example:**

```
global class ReportsPolicyCondition implements TxnSecurity.PolicyCondition {
    public boolean evaluate(TxnSecurity.Event e) {
        if(e.data.get('SessionLevel') == 'STANDARD' ){
            return true;
        }
        return false;
    }
}
```

This Apex policy is triggered when someone accesses a Connected App.

 **Example:**

```
global class ConnectedAppsPolicyCondition implements TxnSecurity.PolicyCondition {
    public boolean evaluate(TxnSecurity.Event e) {
        if(e.data.get('SessionLevel') == 'STANDARD' && (e.entityId == '0CiD00000004Cce')){

            return true;
        }
        return false;
    }
}
```

SEE ALSO:

[Additional PolicyCondition Example Implementations](#)

Manage Transaction Security Policies

Use Transaction Security policies to define, enable, and generate Apex code to implement your policies. Specify how to be notified when a policy is triggered, and then select the policies to enable. Only an active user assigned the System Administrator profile can use this feature.

1. From Setup, enter *Transaction Security* in the **Quick Find** box, then select **Transaction Security**.
2. From the Transaction Security Policies page, you can
 - Edit a view
 - Create a view
 - Edit a policy
 - Create a policy
 - Edit the `TxnSecurity.PolicyCondition` Apex class for a policy
 - Delete a policy
 - Set the transaction security default preferences

You can change the transaction security default preferences at any time.

Receiving Transaction Security Notifications

You receive the notifications you've selected when an enabled policy is triggered. The notifications are formatted for easy recognition.

Email Notifications

Email notifications are sent from Transaction Security with subject "Transaction Security Alert!" The body of the message contains the policy that was triggered and the event or events that occurred to trigger the policy. The times listed are when the policy was triggered in the recipient's locale and time zone. For example, a policy is triggered at 6:46 PM in the Eastern Standard Time zone. The administrator receiving the notification is in the Pacific Standard Time zone, so the times are shown as PST. Here's an example.

Example:

```
From: Transaction Security <noreply@salesforce.com>
To: Admin@company.com
Sent: Friday, November 12, 2014, 5:35 PM
Subject: Transaction Security Alert!
```

```
This is a transaction security policy alert.
```

```
Policy: An administrator created a new user.
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Requires purchasing Salesforce Shield or Salesforce Shield Event Monitoring add-on subscriptions.

USER PERMISSIONS

To create, edit, and manage transaction security policies:

- "Author Apex"
- AND
- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions.

Requires purchasing Salesforce Shield or Salesforce Shield Event Monitoring add-on subscriptions.

```
Event(s) responsible for triggering this policy:
1. Created new user Lisa Johnson at 11/12/2014 5:35:09 PM PST
```

In-App Notifications

In-app notifications are available only if you're a Salesforce1 user. The notification lists the policy that was triggered. Here's an example.

Example:

```
Transaction Security Alert:
Policy New Encrypted Custom Field was triggered.
```

Single Sign-On

Single sign-on allows users to access all authorized network resources without having to log in separately to each resource. You validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

Salesforce offers the following ways to use single sign-on:

- Federated authentication using Security Assertion Markup Language (SAML) allows you to send authentication and authorization data between affiliated but unrelated Web services. This enables you to sign on to Salesforce from a client application. Federated authentication using SAML is enabled by default for your organization.
- Delegated authentication single sign-on enables you to integrate Salesforce with an authentication method that you choose. This enables you to integrate authentication with your LDAP (Lightweight Directory Access Protocol) server, or perform single sign-on by authenticating using a token instead of a password. You manage delegated authentication at the permission level, allowing some users to use delegated authentication, while other users continue to use their Salesforce-managed password. Delegated authentication is set by permissions, not by organization.

The primary reasons for using delegated authentication include:

- Using a stronger type of user authentication, such as integration with a secure identity provider
- Making your login page private and accessible only behind a corporate firewall
- Differentiating your organization from all other companies that use Salesforce in order to reduce phishing attacks

You must request that this feature be enabled by Salesforce. Contact Salesforce to enable delegated authentication single sign-on for your organization.

- Authentication providers let your users log in to your Salesforce organization using their login credentials from an external service provider. Salesforce supports the OpenID Connect protocol that allows users to log in from any OpenID provider such as Google, PayPal, LinkedIn and other services supporting OpenID Connect. When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from the external service provider to establish authentication credentials.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

AND

"Modify All Data"

When you have an external identity provider, and configure single sign-on for your Salesforce organization, Salesforce is then acting as a *service provider*. You can also enable Salesforce as an [identity provider](#), and use single sign-on to connect to a different service provider. Only the service provider needs to configure single sign-on.

The Single Sign-On Settings page displays which version of single sign-on is available for your organization. To learn more about the single sign-on settings, see [Configuring SAML Settings for Single Sign-On](#). For more information about SAML and Salesforce security, see the [Security Implementation Guide](#).

Benefits of Single Sign-On

Implementing single sign-on can offer the following advantages to your organization:

- **Reduced Administrative Costs:** With single sign-on, users only need to memorize a single password to access both network resources or external applications and Salesforce. When accessing Salesforce from inside the corporate network, users are logged in seamlessly, without being prompted to enter a username or password. When accessing Salesforce from outside the corporate network, the users' corporate network login works to log them in. With fewer passwords to manage, system administrators receive fewer requests to reset forgotten passwords.
- **Leverage Existing Investment:** Many companies use a central LDAP database to manage user identities. By delegating Salesforce authentication to this system, when a user is removed from the LDAP system, they can no longer access Salesforce. Consequently, users who leave the company automatically lose access to company data after their departure.
- **Time Savings:** On average, a user takes five to 20 seconds to log in to an online application; longer if they mistype their username or password and are prompted to reenter them. With single sign-on in place, the need to manually log in to Salesforce is avoided. These saved seconds add up to increased productivity.
- **Increased User Adoption:** Due to the convenience of not having to log in, users are more likely to use Salesforce on a regular basis. For example, users can send email messages that contain links to information in Salesforce such as records and reports. When the recipients of the email message click the links, the corresponding Salesforce page opens automatically.
- **Increased Security:** Any password policies that you have established for your corporate network will also be in effect for Salesforce. In addition, sending an authentication credential that is only valid for a single use can increase security for users who have access to sensitive data.

[Using Frontdoor.jsp to Log Into Salesforce](#)

You can use frontdoor.jsp to give users access to Salesforce from a custom Web interface, such as a remote access Force.com site or other API integration, using their existing session ID and the server URL.

[Using Request Parameters with Client Configuration URLs](#)

You can add functionality to your authentication provider by using additional request parameters.

Identity Providers and Service Providers

An *identity provider* is a trusted provider that lets you use single sign-on to access other websites. A *service provider* is a website that hosts applications. You can enable Salesforce as an identity provider and define one or more service providers. Your users can then access other applications directly from Salesforce using single sign-on. Single sign-on can be a great help to your users: instead of having to remember many passwords, they only have to remember one. Plus, the applications can be added as tabs to your Salesforce organization, which means users don't have to switch between programs.

Configuring Remote Settings

Named Credentials

A named credential specifies the URL of a callout endpoint and its required authentication parameters in one definition. To simplify the setup of authenticated callouts, specify a named credential as the callout endpoint. If you instead specify a URL as the callout endpoint, you must register that URL in your org's remote site settings and handle the authentication yourself. For example, for an Apex callout, your code would need to handle authentication, which can be less secure and especially complicated for OAuth implementations.

About Identity Connect

Identity Connect provides Active Directory integration.

Best Practices for Implementing Single Sign-On

Salesforce offers the following ways to use single sign-on:

- Federated authentication using Security Assertion Markup Language (SAML) allows you to send authentication and authorization data between affiliated but unrelated Web services. This enables you to sign on to Salesforce from a client application. Federated authentication using SAML is enabled by default for your organization.
- Delegated authentication single sign-on enables you to integrate Salesforce with an authentication method that you choose. This enables you to integrate authentication with your LDAP (Lightweight Directory Access Protocol) server, or perform single sign-on by authenticating using a token instead of a password. You manage delegated authentication at the permission level, allowing some users to use delegated authentication, while other users continue to use their Salesforce-managed password. Delegated authentication is set by permissions, not by organization.

The primary reasons for using delegated authentication include:

- Using a stronger type of user authentication, such as integration with a secure identity provider
- Making your login page private and accessible only behind a corporate firewall
- Differentiating your organization from all other companies that use Salesforce in order to reduce phishing attacks

You must request that this feature be enabled by Salesforce. Contact Salesforce to enable delegated authentication single sign-on for your organization.

- Authentication providers let your users log in to your Salesforce organization using their login credentials from an external service provider. Salesforce supports the OpenID Connect protocol that allows users to log in from any OpenID provider such as Google, PayPal, LinkedIn and other services supporting OpenID Connect. When authentication providers are enabled, Salesforce does not validate a user's password. Instead, Salesforce uses the user's login credentials from the external service provider to establish authentication credentials.

In addition, you can also configure SAML for use with portals as well as for Sites.

Delegated Authentication Best Practices

Consider the following best practices when implementing delegated authentication single sign-on for your organization.

- Your organization's implementation of the Web service must be accessible by Salesforce servers. This means you must deploy the Web service on a server in your DMZ. Remember to use your server's external DNS name when entering the `Delegated Gateway URL` in the Delegated authentication section in Salesforce (from Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**).
- If Salesforce and your system cannot connect, or the request takes longer than 10 seconds to process, the login attempt fails. An error is reported to the user indicating that his or her corporate authentication service is down.
- Namespaces, element names, and capitalization must be exact in SOAP requests. Wherever possible, generate your server stub from the WSDL to ensure accuracy.
- For security reasons, you should make your Web service available by TLS. You must use a certificate from a trusted provider, such as Verisign or Thawte. For a full list of trusted providers, contact Salesforce.
- The IP address that originated the login request is `sourceIp`. Use this information to restrict access based on the user's location. Note that the Salesforce feature that validates login IP ranges continues to be in effect for single sign-on users. For more information, see [Restrict Where and When Users Can Log In to Salesforce](#) on page 811.
- You may need to map your organization's internal usernames and Salesforce usernames. If your organization does not follow a standard mapping, you may be able to extend your user database schema (for example, Active Directory) to include the Salesforce username as an attribute of a user account. Your authentication service can then use this attribute to map back to a user account.
- We recommend that you do not enable single sign-on for system administrators. If your system administrators are single sign-on users and your single sign-on server has an outage, they have no way to log in to Salesforce. System administrators should always be able to log in to Salesforce so they can disable single sign-on in the event of a problem.
- We recommend that you use a Developer Edition account or a sandbox when developing a single sign-on solution before implementing it in your organization. To sign up for a free Developer Edition account, go to developer.salesforce.com.
- Make sure to test your implementation with Salesforce clients such as Salesforce for Outlook, Connect for Office, and Connect Offline. For more information, see [Single Sign-On for Salesforce clients](#).

Federated Authentication using SAML Best Practices

Consider the following best practices when implementing federated single sign-on with SAML for your organization.

- Obtain the `Salesforce Login URL` value from the Single Sign On Settings configuration page and put it in the corresponding configuration parameter of your Identity Provider (sometimes called the "Recipient URL").
- Salesforce allows a maximum of three minutes for clock skew with your IDP server; make sure your server's clock is up-to-date.
- If you are unable to log in with SAML assertion, always check the login history and note the error message. Use the SAML Assertion Validator on the Single Sign On Settings configuration page to troubleshoot.
- You need to map your organization's internal usernames and Salesforce usernames. You have two choices to do this: add a unique identifier to the `FederationIdentifier` field of each Salesforce user, or extend your user database schema (for example, Active Directory) to include the Salesforce username as an attribute of a user account. Choose the corresponding option for the `SAML User ID Type` field and configure your authentication service to send the identifier in SAML assertions.
- Before allowing users to log in with SAML assertions, enable the SAML organization preference and provide all the necessary configurations.
- Use the My Domain feature to prevent users from logging in to Salesforce directly, and gives administrators more control over login policies. You can use the URL parameters provided in the `Salesforce Login URL` value from the Single Sign-On Settings configuration page with your custom domain.

For example, if the `Salesforce Login URL` is `https://login.salesforce.com/?saml=02HKiP...`

you can use `https://yourDomain.my.salesforce.com/?saml=02HKiP...`

- We recommend that you use Developer Edition account or a sandbox when testing a SAML single sign-on solution. To sign up for a free Developer Edition account, go to developer.salesforce.com.
- Sandbox copies are made with federated authentication with SAML disabled. Any configuration information is preserved, except the value for `Salesforce Login URL`. The `Salesforce Login URL` is updated to match your sandbox URL, for example `https://yourInstance.salesforce.com/`, after you re-enable SAML. To enable SAML in the sandbox, from Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**; then click **Edit**, and select `SAML Enabled`.
- Your identity provider must allow you to set the service provider's audience URL. The value must match the `Entity ID` value in the single sign-on configuration. The default value is `https://saml.salesforce.com`.

Single Sign-On for Portals Best Practices

Customer Portals and partner portals are not available for new organizations in the Summer '13 release or later. Use Communities instead. For more information about single sign-on and SAML for Communities, see "Configuring SAML for Communities" in [Getting Started With Communities](#). If you continue to use portals, note the following information.

- Only SAML version 2.0 can be used with portals.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- Both the `portal_id` and `organization_id` attributes are required for single sign-on for portals. If only one is specified, the user receives an error.
- If both the `portal_id` and `organization_id` attributes are populated in the SAML assertion, the user is directed to that portal login. If neither is populated, the user is directed to the regular SAML Salesforce login.
- More than one portal can be used with a single organization.

Single Sign-On for Sites Best Practices

- Only SAML version 2.0 can be used with Sites.
- Only Customer Portals and partner portals are supported.
- Service provider initiated login is not supported.
- The `portal_id`, `organization_id` and `siteUrl` attributes are required for single sign-on for Sites. If only one is specified, the user receives an error.
- If all three of the `portal_id`, `organization_id` and `siteUrl` attributes are populated in the SAML assertion, the user is directed to that Sites login. If the `siteUrl` isn't populated and the other two are, the user is directed to that portal login.
- More than one portal can be used with a single organization.

[Single Sign-On Implementation Guide](#)

Understanding Delegated Authentication Single Sign-On

Salesforce uses the following process for authenticating users using delegated authentication single sign-on:

1. When a user tries to log in—either online or using the API—Salesforce validates the username and checks the user’s permissions and access settings.
2. If the user has the “Is Single Sign-On Enabled” user permission, then Salesforce does not validate the username and password. Instead, a Web services call is made to the user’s organization, asking it to validate the username and password.

 **Note:** Salesforce doesn’t store, log, or view the password in any way. It is disposed of immediately once the process is complete.

3. The Web services call passes the `username`, `password`, and `sourceIp` to your Web service. (`sourceIp` is the IP address that originated the login request. You must create and deploy an implementation of the Web service that can be accessed by Salesforce servers.)
4. Your implementation of the Web service validates the passed information and returns either `true` or `false`.
5. If the response is `true`, then the login process continues, a new session is generated, and the user proceeds to the application. If `false` is returned, then the user is informed that his or her username and password combination is invalid.

 **Note:** There may be a momentary delay before a user can log in after being given delegated authentication due to the time required for the user account to become available in the organization.

Configuring Salesforce for Delegated Authentication

To enable delegated authentication single sign-on (SSO) for your organization:

1. Contact Salesforce to enable delegated authentication single sign-on for your organization.
2. Build your single sign-on Web service:

- a. In Salesforce, download the Web Services Description Language (WSDL) file `AuthenticationService.wsdl` from Setup by entering *Download Delegated Authentication WSDL* in the **Quick Find** box, then selecting **Download Delegated Authentication WSDL**. The WSDL describes the delegated authentication single sign-on service and can be used to automatically generate a server-side stub to which you can add your specific implementation. For example, in the WSDL2Java tool from Apache Axis, you can use the `--server-side` switch. In the wsdl.exe tool from .NET, you can use the `/server` switch.

For a sample request and response, see [Sample SOAP Message for Delegated Authentication](#) on page 876.

- b. Add a link to your corporate intranet or other internally-accessible site that takes the authenticated user's credentials and passes them through an HTTP POST to the Salesforce login page.

Because Salesforce does not use the `password` field other than to pass it back to you, you do not need to send a password in this field. Instead, you could pass another authentication token, such as a Kerberos Ticket so that your actual corporate passwords are not passed to or from Salesforce.

You can configure the Salesforce delegated authentication authority to allow only tokens or to accept either tokens or passwords. If the authority only accepts tokens, a Salesforce user cannot log in to Salesforce directly, because they cannot create a valid token. However, many companies choose to allow both tokens and passwords. In this environment, a user could still log in to Salesforce through the login page.

When the Salesforce server passes these credentials back to you in the `Authenticate` message, verify them, and the user will gain access to the application.

3. In Salesforce, specify your organization's single sign-on gateway URL from Setup by entering *Single Sign-On* in the **Quick Find** box, selecting **Single Sign-On Settings**, then clicking **Edit**. Enter the URL in the **Delegated Gateway URL** text box.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

4. Optionally, check the **Force Delegated Authentication Callout** box.

 **Note:** When this box is unchecked, a call is not made to the SSO endpoint if the login attempt first fails because of login restrictions within the Salesforce organization. If you must record every login attempt, then check this box to force a callout to the SSO endpoint regardless of login restriction failures.

5. Enable the "Is Single Sign-On Enabled" permission.

 **Important:** If single sign-on is enabled for your org, API and desktop client users can log in to Salesforce unless their profile has IP address restrictions set, and they try to log in from outside of the range defined. Furthermore, the single sign-on authority usually handles login lockout policies for users with the "Is Single Sign-On Enabled" permission. However, if the security token is enabled

for your org, then your org's login lockout settings determine how many times users can attempt to log in with an invalid security token before being locked out of Salesforce.

Control Individual API Client Access to Your Salesforce Organization

With API Client Whitelisting, restrict all API client applications, such as the Data Loader, to require administrator approval, unless the user's profile or permission set has the "Use Any API Client" permission.

Administrators may grant some users API access through the "API Enabled" permission. After it's given, this permission allows the user API access through any client (such as the Data Loader, Salesforce1, Salesforce for Outlook, or the Force.com Migration Tool). For finer control over which applications the user can use for API access, you can implement API Client Whitelisting. This feature leverages the existing authorization capabilities of connected apps. With API Client Whitelisting, an administrator can approve or block individual client application access for each associated connected app. All client applications that are not configured as connected apps are denied access. If you are not using connected apps, you can relax this restriction for individual users by assigning them a profile or permission set with "Use Any API Client" enabled.

 **Note:** Contact Salesforce to enable API Client Whitelisting. After it's enabled, all client access is restricted until explicitly allowed by the administrator. This restriction might block access to applications that your users are already using. Before you enable this feature, you should configure and approve connected apps for any client applications you want users to continue using, or give the users a profile or permission set with "Use Any API Client" enabled.

To configure API Client Whitelisting, do the following.

1. Contact Salesforce to get the feature enabled for your organization.
2. From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.
3. In the App Access Settings, click **Edit**.
4. Select **Limit API access to installed connected apps with the "Admin approved users are pre-authorized" policy**.

Optionally, select **Allow Visualforce pages to bypass this restriction** so that any Visualforce pages that use the API continue to be authorized to access objects in the organization. If you enable API Client Whitelisting without selecting this option, only approved connected apps are authorized, and Visualforce pages might not behave as expected. Also, if unchecked, client applications that call `getSessionId()` are denied access. Apps that make API calls to Salesforce using a session obtained in a Visualforce context are denied access unless you select this checkbox.

5. Click **Save**.

After you select this feature, all client applications need explicit approval by an administrator to be authorized for the organization, unless the user has a profile or permission set with "Use Any API Client" enabled.

Some components for commonly used apps are automatically installed as connected apps in organizations. These components support apps such as the Data Loader, Salesforce1, Workbench and more. After you select this feature, these components will also require approval, unless the user has a profile or permission set with "Use Any API Client" enabled. See [Managing a Connected App](#) for more information about these components.

[Single Sign-On](#)

About SAML

Security Assertion Markup Language (SAML) is an XML-based standard that allows you to communicate authentication decisions between one service and another. It underlies many Web single sign-on solutions. Salesforce supports SAML for single sign-on into Salesforce from a corporate portal or identity provider.

Much of the work to set up single sign-on using SAML occurs with your identity provider:

1. Establish a SAML identity provider and [gather information](#) about how they will connect to Salesforce. This is the provider that will send single sign-on requests to Salesforce.
2. Provide information to your identity provider, such as the [URLs for the start and logout pages](#).
3. Configure Salesforce using the instructions in [Configuring SAML Settings for Single Sign-On](#). This is the only step that takes place in Salesforce.

Your identity provider should send SAML assertions to Salesforce using the SAML Web Single Sign-on Browser POST profile. Salesforce sends SAML responses to the `Identity Provider Login URL` specified under Setup, by entering *Single Sign-On* in the **Quick Find** box, then selecting **Single Sign-On Settings**. Salesforce receives the assertion, verifies it against your Salesforce configuration, and allows single sign-on if the assertion is true.

If you have problems with the SAML assertion after you configure Salesforce for SAML, use the SAML Assertion Validator to [validate the SAML assertion](#). You may need to obtain a SAML assertion from your identity provider.

If your users are having problems using SAML to login, you can [review the SAML login history](#) to determine why they were not able to log in and share that information with your identity provider.

If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization or community.

Working With Your Identity Provider

1. You must gather the following information from your identity provider before configuring Salesforce for SAML.

- The version of SAML the identity provider uses (1.1 or 2.0)
- The entity ID of the identity provider (also known as the issuer)
- An authentication certificate.

 **Tip:** Be sure to store the certificate where you can access it from your browser. This will be uploaded to Salesforce in a later step.

- The following SAML assertion parameters, as appropriate:
 - The SAML user ID type
 - The SAML user ID location
 - Attribute Name
 - Attribute URI
 - Name ID format

 **Note:** Attribute Name, Attribute URI, and Name ID format are only necessary if the [SAML User ID Location](#) is in an Attribute element, and not the name identifier element of a Subject statement.

 **Tip:** To set up single sign-on quickly, you can import SAML 2.0 settings from an XML file (or a URL pointing to the file) on the Single Sign-On Settings page. Obtain the XML from your identity provider.

You may also want to share [more information](#) about these values with your identity provider.

 **Tip:** Enable Salesforce for SAML and take a screenshot of the page for your identity provider. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**, click **Edit**, then select **SAML Enabled**.

2. Work with your identity provider to setup the [start, login, and logout pages](#).
3. Share the [example SAML assertions](#) with your identity provider so they can determine the format Salesforce requires for successful single sign-on.

Configuring SAML Settings for Single Sign-On

From this page, you can configure your organization to use single sign-on. You can also set up just-in-time provisioning. Work with your identity provider to properly configure these settings. For more information about single sign-on, see [Single Sign-On](#). For more information about just-in-time provisioning, see [About Just-In-Time Provisioning](#).

To configure SAML settings for single sign-on from your corporate identity provider to Salesforce:

1. [Gather information from your identity provider.](#)
2. [Provide information to your identity provider.](#)
3. [Set up single sign-on.](#)
4. [Set up an identity provider to encrypt SAML assertions \(optional\).](#)
5. [Enable Just-in-Time user provisioning \(optional\).](#)
6. [Edit the SAML JIT handler](#) if you selected `Custom SAML JIT with Apex Handler` for Just-in-Time provisioning.
7. [Test the single sign-on connection.](#)

Set up single sign-on

1. In Salesforce, from Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**, and click **Edit**.
2. Select `SAML Enabled`. You must enable SAML to view the SAML single sign-on settings.
3. Specify the SAML version used by your identity provider.
4. Click **Save**.
5. In SAML Single Sign-On Settings, click the appropriate button to create a new configuration, as follows.
 - **New** - Specify all settings manually.
 - **New from Metadata File** - Import SAML 2.0 settings from a XML file from your identity provider. This option reads the XML file and uses it to complete as many of the settings as possible.

 **Note:** If your XML file contains information for more than one configuration, the first configuration that occurs in the XML file is used.
 - **New from Metadata URL** - Import SAML 2.0 settings from a public URL. This option reads the XML file located at a public URL and uses it to complete as many of the settings as possible. The URL must be added to Remote Site Settings to access it from your Salesforce org.
6. Give this setting a **Name** for reference within your organization.

Salesforce inserts the corresponding **API Name** value, which you can customize if necessary.
7. Enter the `Issuer`. This is often referred to as the entity ID for the identity provider.
8. If your Salesforce organization has [domains](#) deployed, specify whether you want to use the base domain (`https://saml.salesforce.com`) or the custom domain for the **Entity ID**. You must share this information with your identity provider.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

Authentication Providers are available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

 **Tip:** Generally, use the custom domain as the entity ID. If you already have single sign-on configured before deploying a domain, the base domain is the entity ID. If you are providing Salesforce to Salesforce services, you must specify the custom domain.

9. For the `Identity Provider Certificate`, use the **Browse** button to locate and upload the authentication certificate issued by your identity provider.
10. For the `Request Signing Certificate`, select the certificate you want from the ones saved in your **Certificate and Key Management** settings.
11. For the `Request Signature Method`, select the hashing algorithm for encrypted requests, either `RSA-SHA1` or `RSA-SHA256`.
12. Optionally, if the identity provider encrypts SAML assertions, select the `Assertion Decryption Certificate` they're using from the ones saved in your **Certificate and Key Management** settings. This field is available only if your organization supports multiple single sign-on configurations. For more information, see [Set up an identity provider to encrypt SAML assertions](#).
13. For the `SAML Identity Type`, `SAML Identity Location`, and other fields described in [Identity Provider Values](#), specify the values provided by your identity provider as appropriate.
14. For the `Service Provider Initiated Request Binding`, select the appropriate value based on the information provided by your identity provider.
15. For SAML 2.0, if your identity provider has specific login or logout pages, specify them in **Identity Provider Login URL** and **Identity Provider Logout URL**, respectively.

 **Note:** These fields appear in Developer Edition and sandbox organizations by default and in production organizations only if My Domain is enabled. The fields do not appear in trial organizations or sandboxes linked to trial organizations.

16. For the `Custom Error URL`, specify the URL of the page users should be directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.
17. Optionally, set up Just-in-Time user provisioning. For more information, see [Enable Just-in-Time user provisioning](#) and [About Just-in-Time Provisioning for SAML](#).
18. Click **Save**.

If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization or community.

Set up an identity provider to encrypt SAML assertions

When Salesforce is the service provider for inbound SAML assertions, you can pick a saved certificate to decrypt inbound assertions from third party identity providers. You need to provide a copy of this certificate to the identity provider.

1. In the Single Sign-On Settings page in Setup, add a new SAML configuration.
2. In the `Assertion Decryption Certificate` field, specify the certificate for encryption from the ones saved in your **Certificate and Key Management** settings.

 **Note:** If you don't see the `Assertion Decryption Certificate` field you need to enable multiple single sign-on for your organization (this applies to organizations created before the Summer '13 release that are not using SAML 1.1). To enable multiple single sign-on configurations, select **Enable Multiple Confgs** on the **Single Sign-On Settings** page. If this setting has already been enabled, the field appears, and you won't see the **Enable Multiple Confgs** button.

3. Set the `SAML Identity Location` to the element where your identifier is located.

4. When you save the new SAML configuration, your organization's SAML settings value for the `Salesforce Login URL` (also known as the "Salesforce ACS URL") changes. Get the new value (from the Single Sign-On Settings page in Setup), and click the name of the new SAML configuration. The value is in the `Salesforce Login URL` field.
5. The identity provider must use the `Salesforce Login URL` value.
6. You also need to provide the identity provider with a copy of the certificate selected in the `Assertion Decryption Certificate` field to use for encrypting assertions.

Enable Just-in-Time user provisioning

1. In SAML Single Sign-On Settings, select `User Provisioning Enabled`.
 - `Standard` - This option allows you to provision users automatically using attributes in the assertion.
 - `Custom SAML JIT with Apex handler` - This option provisions users based on logic in an Apex class.
2. If you selected `Standard`, click **Save** and [test the single sign-on connection](#). If you selected `Custom SAML JIT with Apex handler`, proceed to the next step.
3. In the `SAML JIT Handler` field, select an existing Apex class as the SAML JIT handler class. This class must implement the [SamlJitHandler interface](#). If you do not have an Apex class, you can generate one by clicking `Automatically create a SAML JIT handler template`. You must edit this class and modify the default content before using it. For more information, see [Edit the SAML JIT handler](#).
4. In the `Execute Handler As` field, select the user that runs the Apex class. The user must have "Manage Users" permission.
5. Just-in-time provisioning requires a Federation ID in the user type. In `SAML Identity Type`, select `Assertion contains the Federation ID from the User object`. If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.
6. Click **Save**.

Edit the SAML JIT handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the generated Apex SAML JIT handler to map fields between SAML and Salesforce. In addition, you can modify the generated code to support the following:
 - Custom fields
 - Fuzzy profile matching
 - Fuzzy role matching
 - Contact lookup by email
 - Account lookup by account number
 - Standard user provisioning into a community
 - Standard user login into a community
 - Default profile ID usage for portal Just-in-Time provisioning
 - Default portal role usage for portal Just-in-Time provisioning
 - Username generation for portal Just-in-Time provisioning

For example, to support custom fields in the generated handler code, find the "Handle custom fields here" comment in the generated code. After that code comment, insert your custom field code. For more information and examples, see the [SamlJitHandler Interface documentation](#).

 **Note:** If your identity provider sends JIT attributes for the Contact or Account object with the User object in the same assertion, the generated handler may be unable to make updates. For a list of User fields that cannot be updated at the same time as the Contact or Account fields, see [sObjects That Cannot Be Used Together in DML Operations](#).

Test the single sign-on connection

After you have configured and saved your SAML settings, test them by trying to access the identity provider's application. Your identity provider directs the user's browser to POST a form containing SAML assertions to the Salesforce login page. Each assertion is verified, and if successful, single sign-on is allowed.

If you have difficulty signing on using single sign-on after you have configured and saved your SAML settings, use the [SAML Assertion Validator](#). You may have to obtain a SAML assertion from your identity provider first.

If your users are having problems using SAML to login, you can [review the SAML login history](#) to determine why they were not able to log in and share that information with your identity provider.

If you are using SAML version 2.0, after you've finished configuring SAML, the OAuth 2.0 Token Endpoint field is populated. Use this with the Web single sign-on authentication flow for OAuth 2.0.

Viewing Single Sign-On Settings

After you have configured your Salesforce organization to use SAML, you can view the single sign-on settings. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**.

This page lists the details of your SAML configuration. Most of these fields are the same as the fields on the page where you [configured SAML](#). The following fields contain information automatically generated by completing the configuration. The available fields depend on your configuration.

Field	Description
Salesforce Login URL	For SAML 2.0 only. If you select "Assertion contains User's Salesforce username" for SAML User ID Type and "User ID is in the NameIdentifier element of the Subject statement" for SAML User ID Location, this URL is the URL associated with login for the Web single sign-on OAuth assertion flow.
Salesforce Logout URL	For SAML 2.0. Displays the Salesforce logout URL that the user is directed to after he or she logs off. This URL is only used if no value is specified for Identity Provider Logout URL.
OAuth 2.0 Token Endpoint	For SAML 2.0 only: The ACS URL used with enabling Salesforce as an identity provider in the Web single sign-on OAuth assertion flow.

From this page you can do any of the following:

- Click **Edit** to change the existing SAML configuration.
- Click **SAML Assertion Validator** to validate the SAML settings for your organization using a SAML assertion provided by your identity provider.
- If your identity provider supports metadata, and if you've configured SAML using version 2.0, you can click **Download Metadata** to download an XML configuration file to send them, which they can then upload to automatically configure their settings for connecting to your Salesforce organization or community.

Identity Provider Values

Before you can configure Salesforce for SAML, you must receive information from your identity provider. This information must be used on the [single sign-on page](#).

The following information might be useful for your identity provider.

Field	Description
SAML Version	The version of SAML your identity provider uses. Salesforce currently supports version 1.1 and 2.0. The SAML specifications for the various versions are linked below: <ul style="list-style-type: none"> • SAML 1.1 • SAML 2.0
Issuer	The Entity ID—a URL that uniquely identifies your SAML identity provider. SAML assertions sent to Salesforce must match this value exactly in the <code><saml:Issuer></code> attribute of SAML assertions.
Entity ID	The issuer in SAML requests generated by Salesforce, and is also the expected audience of any inbound SAML Responses. If you don't have domains deployed, this value is always <code>https://saml.salesforce.com</code> . If you have domains deployed, Salesforce recommends that you use your custom domain name. You can find the value on the Single Sign-On Settings page. From Setup, enter <i>Single Sign-On Settings</i> in the Quick Find box, then select Single Sign-On Settings .
Identity Provider Certificate	The authentication certificate issued by your identity provider.
Request Signing Certificate	The certificate (saved in the Certificate and Key Management page in Setup) used to generate the signature on a SAML request to the identity provider when Salesforce is the service provider for a service provider-initiated SAML login. If a certificate has not been saved in the Certificate and Key Management page in Setup, Salesforce uses the global proxy certificate by default. Using a saved signing certificate provides more control over events, such as certificate expiration, than using the global proxy certificate.
Request Signature Method	The hashing algorithm for encrypted requests, either RSA-SHA1 or RSA-SHA256.
SAML Identity Type	The element in a SAML assertion that contains the string that identifies a Salesforce user. Values are: <p>Assertion contains User's Salesforce username Use this option if your identity provider passes the Salesforce username in SAML assertions.</p>

EDITIONS

- AND
- "Modify All Data"

Field	Description
	<p>Assertion contains the Federation ID from the User object Use this option if your identity provider passes an external user identifier, for example an employee ID, in the SAML assertion to identify the user.</p> <p>Assertion contains the User ID from the User object Use this option if your identity provider passes an internal user identifier, for example a user ID from your Salesforce organization, in the SAML assertion to identify the user.</p>
SAML Identity Location	<p>The location in the assertion where a user should be identified. Values are:</p> <p>Identity is in the NameIdentifier element of the Subject statement The Salesforce Username or FederationIdentifier is located in the <Subject> statement of the assertion.</p> <p>Identity is in an Attribute element The Salesforce Username or FederationIdentifier is specified in an <AttributeValue>, located in the <Attribute> of the assertion.</p>
Attribute Name	If “Identity is in an Attribute element” is selected, this contains the value of the AttributeName that is specified in <Attribute> that contains the User ID.
Attribute URI	If SAML 1.1 is the specified SAML version and “Identity is in an Attribute element” is selected, this contains the value of the AttributeNamespace that is specified in <Attribute>.
Name ID Format	If SAML 2.0 is the specified SAML version and “Identity is in an Attribute element” is selected, this contains the value for the nameid-format. Possible values include unspecified, emailAddress or persistent. All legal values can be found in the “Name Identifier Format Identifiers” section of the Assertions and Protocols SAML 2.0 specification .
Service Provider Initiated Request Binding	<p>If you’re using My Domain, chose the binding mechanism your identity provider requests for your SAML messages. Values are:</p> <p>HTTP POST HTTP POST binding sends SAML messages using base64-encoded HTML forms.</p> <p>HTTP Redirect HTTP Redirect binding sends base64-encoded and URL-encoded SAML messages within URL parameters.</p> <p>No matter what request binding is selected, the SAML Response will always use HTTP POST binding.</p>
Identity Provider Login URL	<p>For SAML 2.0 only: The URL where Salesforce sends a SAML request to start the login sequence.</p> <p>If you have domains deployed and a value specified for this field, login requests are usually sent to the address specified by this field. However, if you need to bypass this value (for example, your identity provider is down) add the login parameter to the query string for the login page. For example: <code>http://mydomain.my.salesforce.com?login</code>.</p> <p> Note: This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.</p>

Field	Description
Identity Provider Logout URL	For SAML 2.0 only: The URL to direct the user to when they click the Logout link in Salesforce. The default is <code>http://www.salesforce.com</code> .  Note: This field appears in Developer Edition production and sandbox organizations by default and in production organizations only if My Domain is enabled. This field does not appear in trial organizations or sandboxes linked to trial organizations.
Salesforce Login URL	The URL associated with logging in for the Web browser single sign-on flow.
OAuth 2.0 Token Endpoint	For SAML 2.0 only: The ACS URL used with the API when enabling Salesforce as an identity provider in the Web single sign-on OAuth assertion flow.
Custom Error URL	The URL of the page users should be directed to if there's an error during SAML login. It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative.

Start, Login, and Logout URL Values

In addition to the information used during the single sign-on, your identity provider can also set the start, login, and logout pages. You can also specify these pages yourself when you [configure single sign-on](#).

The following information might be useful to your identity provider if they are setting these pages.

- The SAML specification supports an HTML form that is used to pass the SAML assertion via HTTPS POST.
- For SAML 1.1, the SAML identity provider can embed name-value pairs in the `TARGET` field to pass this additional information to Salesforce prepended with a specially formatted URL that contains URL-encoded parameters.
- The URL for SAML 1.1 to include in the `TARGET` field is as follows: `https://saml.salesforce.com/?`
- For SAML 2.0, instead of using the `TARGET` field, the identity providers uses the `<AttributeStatement>` in the SAML assertion to specify the additional information.
- Salesforce supports the following parameters:

-  **Note:** For SAML 1.1 these parameters must be URL-encoded. This allows the URLs, passed as values that include their own parameters, to be handled correctly. For SAML 2.0, these parameters are part of the `<AttributeStatement>`.
 - `ssoStartPage` is the page to which the user should be redirected when trying to log in with SAML. The user is directed to this page when requesting a protected resource in Salesforce, without an active session. The `ssoStartPage` should be the SAML identity provider's login page.
 - `startURL` is the URL where you want the user to be directed when sign-on completes successfully. This URL can be absolute, such as `https://yourInstance.salesforce.com/001/o` or it can be relative, such as `/001/o`. This parameter is only used in SAML 1.1. In SAML 2.0, the start URL is the page the user attempted to access before they were authenticated.
 - `logoutURL` is the URL where you want the user to be directed when they click the **Logout** link in Salesforce. The default is `http://www.salesforce.com`.

The following sample `TARGET` field is for SAML 1.1, and includes properly-encoded parameters. It passes a customized start page, as well as start and logout URLs embedded as parameter values in the query string.

```
https://saml.salesforce.com/?ssoStartPage=https%3A%2F%2Fwww.customer.org%2Flogin%2F&startURL=%2F001%2Fo&logoutURL=http%3A%2F%2Fwww.salesforce.com
```

The following is an example of an <AttributeStatement> for SAML 2.0 that contains both ssoStartPage and logoutURL:

```
<saml:AttributeStatement>
  <saml:Attribute Name="ssoStartPage"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:anyType">
    http://www.customer.org
  </saml:AttributeValue>
</saml:Attribute>

  <saml:Attribute Name="logoutURL"
NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:uri">
  <saml:AttributeValue xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:type="xs:string">
    https://www.salesforce.com
  </saml:AttributeValue>
</saml:Attribute>
</saml:AttributeStatement>
```

SEE ALSO:

[About SAML](#)

Customize SAML Start, Error, Login, and Logout Pages

You can customize the start, error, login, and logout pages for single sign-on users using SAML 1.1 or 2.0. As part of your configuration, decide the following:

- If your identity provider uses SAML 1.1, the URL to direct the user to when single sign-on successfully completes (known as the start page). This URL can be absolute, such as `https://yourInstance.salesforce.com/001/o` or it can be relative, such as `/001/o`. This URL must be an endpoint that accepts SAML authentication requests.
In SAML 2.0, the start page is the page the user attempted to access before they were authenticated. The SAML 2.0 start page must support Sp-init single sign-on.
If you are using SAML 2.0, you can also use the `RelayState` parameter to control where users get redirected after a successful login.
- The single sign-on start page where Salesforce sends a SAML request to start the login sequence.
We recommend that if you specify a single sign-on start page that you also specify a logout page. When you specify a logout page, when a user clicks logout or if a user's session expires, the user is redirected to that page. If you don't specify a logout page, the user is redirected to the general Salesforce login page.
- The URL to direct the user to when they click the Logout link in Salesforce (known as the logout page). The default is `https://login.salesforce.com`, unless MyDomain is enabled. If My Domain is enabled, the default is `https://customdomain.my.salesforce.com`.

For SAML 2.0, these values can be set either during the single sign-on configuration, or by your identity provider in the login URL or SAML assertion. The order of precedence is:

1. Session cookie—if you've already logged in to Salesforce and a cookie still exists, the login and logout pages specified by the session cookie are used.
2. Values passed in from the identity provider.
3. Values from the single sign-on configuration page.

If you decide not to add these values to the single sign-on configuration, share them with your identity provider. The identity provider must [use these values](#) either in the login URL or the assertion.

You can also decide if you want users to be directed to a custom error page if there's an error during SAML login: It must be a publicly accessible page, such as a public site Visualforce page. The URL can be absolute or relative. Use this value when you [configure SAML](#).

Example SAML Assertions

Share the example SAML assertions with your identity provider so they can determine the format of the information Salesforce requires for successful single-sign on. The assertion must be signed according to the [XML Signature specification](#), using RSA and either SHA-1 or SHA-256.

In addition to the general single sign-on examples for both SAML 1.1 and SAML 2.0, use the following samples for the specific feature:

- [assertions for portals](#)
- [assertions for Sites](#)
- [SOAP message for delegated authentication](#)
- [assertion for just-in-time provisioning](#)

SAML User ID type is the Salesforce username, and SAML User ID location is the <NameIdentifier> element in the <Subject> element

SAML 1.1:

```
<Subject>
  <NameIdentifier>user101@salesforce.com</NameIdentifier>
</Subject>
```

SAML 2.0:

```
<saml:Subject>
  <saml:NameID
Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified">user101@salesforce.com</saml:NameID>

  <saml:SubjectConfirmation Method="urn:oasis:names:tc:SAML:2.0:cm:bearer">
    <saml:SubjectConfirmationData NotOnOrAfter="2008-06-26T02:44:24.173Z"
Recipient="http://localhost:9000"/>
  </saml:SubjectConfirmation>
</saml:Subject>

Sample SAML Assertions for Portals

The following shows the `portal_id` and `organization_id` attributes in a SAML assertion statement:

```

<saml:AttributeStatement>
    <saml:Attribute Name="portal_id">
        <saml:AttributeValue xsi:type="xs:anyType">060D00000000SHZ</saml:AttributeValue>
    </saml:Attribute>

    <saml:Attribute Name="organization_id">
        <saml:AttributeValue xsi:type="xs:anyType">00DD00000000F7P5</saml:AttributeValue>

    </saml:Attribute>
</saml:AttributeStatement>

```

The following is a complete SAML assertion statement that can be used for single sign-on for portals. The organization is using federated sign-on, which is included in an attribute (see the `<saml:AttributeStatement>` in bold text in the assertion), not in the subject.

  </saml:Attribute>
</saml:AttributeStatement>

```

Sample SOAP Message for Delegated Authentication

As part of the delegated authentication single sign-on process, a Salesforce server makes a SOAP 1.1 request to authenticate the user who is passing in the credentials. Here is an example of this type of request. Your single sign-on Web service needs to accept this request, process it, and return a `true` or `false` response.

Sample Request

```

<?xml version="1.0" encoding="UTF-8" ?>
<soapenv:Envelope
  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Body>
    <Authenticate xmlns="urn:authentication.soap.sforce.com">
      <username>sampleuser@sample.org</username>
      <password>myPassword99</password>
      <sourceIp>1.2.3.4</sourceIp>
    </Authenticate>
  </soapenv:Body>
</soapenv:Envelope>

```

```

    </Authenticate>
  </soapenv:Body>
</soapenv:Envelope>

```

Sample Response Message

```

<?xml version="1.0" encoding="UTF-8"?>
<soapenv:Envelope
  xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
  <soapenv:Body>
    <AuthenticateResult xmlns="urn:authentication.soap.sforce.com">
      <Authenticated>false</Authenticated>
    </AuthenticateResult>
  </soapenv:Body>
</soapenv:Envelope>

```

Sample SAML Assertion for Just-In-Time Provisioning

The following is a sample SAML assertion for just in time provisioning.

```

<saml:AttributeStatement>

  <saml:Attribute Name="User.Username"
    NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">

SEE ALSO:

[About SAML](#)

Reviewing the SAML Login History

When a user logs in to Salesforce from another application using single sign-on, SAML assertions are sent to the Salesforce login page. The assertions are checked against assertions in the authentication certificate that are specified on the Single Sign-On Settings page in Setup. If a user fails to log in, a message is written to the login history log that indicates why the login failed. In addition, the [SAML Assertion Validator](#) may be automatically populated with the invalid assertion.

To view the login history, from Setup, enter *Login History* in the *Quick Find* box, then select **Login History**. After viewing the login history, you may want to share the information with your identity provider.

The following are the possible failures:

Assertion Expired

An assertion's [timestamp](#) is more than five minutes old.

Note: Salesforce does make an allowance of three minutes for clock skew. This means, in practice, that an assertion can be as much as eight minutes after the timestamp time, or three minutes before it. This amount of time may be less if the assertion's validity period is less than five minutes.

Assertion Invalid

An assertion is not valid. For example, the `<Subject>` element of an assertion might be missing.

Audience Invalid

The value specified in `<Audience>` must be `https://saml.salesforce.com`.

Configuration Error/Perm Disabled

Something is wrong with the SAML configuration in Salesforce. For example, the uploaded certificate might be corrupted, or the organization preference might have been turned off. To check your configuration, from Setup, enter *Single Sign-On Settings* in the *Quick Find* box, then select **Single Sign-On Settings**. Next, get a sample SAML assertion from your identity provider, and then click [SAML Assertion Validator](#).

Issuer Mismatched

The issuer or entity ID specified in an assertion does not match the issuer specified in your Salesforce configuration.

Recipient Mismatched

The recipient specified in an assertion does not match the recipient specified in your Salesforce configuration.

Replay Detected

The same assertion ID was used more than once. [Assertion IDs](#) must be unique within an organization.

Signature Invalid

The signature in an assertion cannot be validated by the certificate in your Salesforce configuration.

Subject Confirmation Error

The `<Subject>` specified in the assertion does not match the SAML configuration in Salesforce.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Federated Authentication is available in: **All Editions**

Delegated Authentication is available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com Editions**

Authentication Providers are available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

Validating SAML Settings for Single Sign-On

If your users have difficulty logging into Salesforce after you [configure Salesforce for single sign-on](#), use the SAML Assertion Validator and the [login history](#) to validate the SAML assertions sent by your identity provider.

1. Obtain a SAML assertion from your identity provider. The assertion can be either in plain XML format or base64 encoded.
If a user tries to log in to Salesforce and fails, the invalid SAML assertion is used to automatically populate the SAML Assertion Validator if possible.
2. From Setup, enter *Single Sign-On Settings* in the Quick Find box, then select **Single Sign-On Settings**, then click **SAML Assertion Validator**.
3. Enter the SAML assertion into the text box, and click **Validate**.
4. Share the results of the [validation errors](#) with your identity provider.

SAML Assertion Validation Errors

Salesforce imposes the following validity requirements on assertions:

Authentication Statement

The identity provider must include an `<AuthenticationStatement>` in the assertion.

Conditions Statement

If the assertion contains a `<Conditions>` statement, it must contain a valid timestamp.

Timestamps

The validity period specified in an assertion is honored. In addition, an assertion's timestamp must be less than five minutes old, plus or minus three minutes, regardless of the assertion's validity period setting. This allows for differences between machines. The `NotBefore` and `NotOnOrAfter` constraints must also be defined and valid.

Attribute

If your Salesforce configuration is set to `Identity is in an Attribute` element, the assertion from the identity provider must contain an `<AttributeStatement>`.

If you are using SAML 1.1, both `<AttributeName>` and `<AttributeNamespace>` are required as part of the `<AttributeStatement>`.

If you are using SAML 2.0, only `<AttributeName>` is required.

Format

The `Format` attribute of an `<Issuer>` statement must be set to `"urn:oasis:names:tc:SAML:2.0:nameid-format:entity"` or not set at all.

For example:

```
<saml:Issuer
  Format="urn:oasis:names:tc:SAML:2.0:nameid-format:entity">https://www.salesforce.com</saml:Issuer>
```

The following example is also valid:

```
<saml:Issuer >https://www.salesforce.com</saml:Issuer>
```

Issuer

The issuer specified in an assertion must match the issuer specified in Salesforce.

Subject

The subject of the assertion must be resolved to be either the Salesforce username or the Federation ID of the user.

Audience

The `<Audience>` value is required and must match the `Entity ID` from the single sign-on configuration. The default value is `https://saml.salesforce.com`.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Federated Authentication is available in: **All** Editions

Delegated Authentication is available in: **Professional, Enterprise, Performance, Unlimited, Developer, and Database.com** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Modify All Data"

Recipient

The recipient specified in an assertion must match either the Salesforce login URL specified in the Salesforce configuration or the OAuth 2.0 token endpoint. This is a required portion of the assertion and is always verified.

Signature

A valid signature must be included in the assertion. The signature must be created using the private key associated with the certificate that was provided in the SAML configuration.

Recipient

Verifies that the recipient and organization ID received in the assertion matches the expected recipient and organization ID, as specified in the single sign-on configuration. This is an optional portion of the assertion and is only verified if it's present. For example:

```
Recipient that we found in the assertion: http://aalbert-salesforce.com:8081/
?sam1=02HKiPoin4zeKLPYxfj3twkPsNSJF3fxsH0Jnq4vVeQr3xNkIWmZC_IVk3
Recipient that we expected based on the Single Sign-On Settings page:
http://asmith.salesforce.com:8081/
?sam1=EK03Almz90Cik_ig0L97.0BRme6mT4o6nzi0t_JROL6HLbdR1WVP5aQO5w
Organization Id that we expected: 00Dx0000000BQ1I
Organization Id that we found based on your assertion: 00D000000000062
```

Site URL Attribute

Verifies if a valid Sites URL is provided. Values are:

- Not Provided
- Checked
- Site URL is invalid
- HTTPS is required for Site URL
- The specified Site is inactive or has exceeded its page limit

[About SAML](#)

About Just-in-Time Provisioning for SAML

With Just-in-Time provisioning, you can use a SAML assertion to create regular and portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. For example, if you recently added an employee to your organization, you don't need to manually create the user in Salesforce. When they log in with single sign-on, their account is automatically created for them, eliminating the time and effort with on-boarding the account. Just-in-Time provisioning works with your SAML identity provider to pass the correct user information to Salesforce in a SAML 2.0 assertion. You can both create and modify accounts this way. Because Just-in-Time provisioning uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Benefits of Just-in-Time Provisioning

Implementing Just-in-Time provisioning can offer the following advantages to your organization.

- **Reduced Administrative Costs:** Provisioning over SAML allows customers to create accounts on-demand, as part of the single sign-on process. This greatly simplifies the integration work required in scenarios where users need to be dynamically provisioned, by combining the provisioning and single sign-on processes into a single message.

- **Increased User Adoption:** Users only need to memorize a single password to access both their main site and Salesforce. Users are more likely to use your Salesforce application on a regular basis.
- **Increased Security:** Any password policies that you have established for your corporate network are also in effect for Salesforce. In addition, sending an authentication credential that is only valid for a single use can increase security for users who have access to sensitive data.

[Example SAML Assertions](#)

[Single Sign-On](#)

Just-in-Time Provisioning Requirements

Just-in-Time provisioning requires the creation of a SAML assertion. Consider the following when creating your SAML assertion.

- `ProvisionVersion` is supported as an optional attribute. If it isn't specified, the default is 1.0. For example:

```
<saml:Attribute Name="ProvisionVersion" NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">1.0</saml:AttributeValue>
</saml:Attribute>
```

- ProfileIDs change per organization, even for standard profiles. To make it easier to find the profile name, Salesforce allows you to do a profile name lookup by passing the `ProfileName` into the `ProfileId` field.

Field Requirements for the SAML Assertion

To correctly identify which object to create in Salesforce, you must use the `User.` prefix for all fields passed in the SAML assertion. In this example, the `User.` prefix has been added to the `Username` field name.

```
<saml:Attribute
  Name="User.Username"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

The following standard fields are supported.

Fields	Required	Comments
AboutMe		
Alias		If not present, a default is derived from FirstName and LastName.
CallCenter		
City		
CommunityNickname		If not present, a default is derived from the UserName.
CompanyName		
Country		
DefaultCurrencyIsoCode		Derived from organization settings.
DelegatedApproverId		
Department		
Division		
Email	Y	For example, User.Email=test2@salesforce.com
EmailEncodingKey		If not present, a default is derived from the organization settings.
EmployeeNumber		
Extension		
Fax		
FederationIdentifier (insert only)		If present, it must match the SAML subject, or the SAML subject is taken instead. Can't be updated with SAML.
FirstName		
ForecastEnabled		
IsActive		
LastName	Y	
LanguageLocaleKey		
LocaleSidKey		If not present, a default is derived from the organization settings.
Manager		
MobilePhone		
Phone		
ProfileId	Y	For example, User.ProfileId=Standard User
ReceivesAdminInfoEmails		
ReceivesInfoEmails		
State		

Fields	Required	Comments
Street		
TimeZoneSidKey		If not present, a default is derived from the organization settings.
Title		
Username (insert only)	Y	For example, <code>User.Username=test2@test.com</code> . Can't update using SAML.
UserRoleId		Defaults to "no role" if blank.
Zip		

Other field requirements:

- Only text type custom fields are supported.
- Only the `insert` and `update` functions are supported for custom fields.
- When using the API for user creation, you can pass the new username into the `User.Username` field. You can also specify the `User.FederationIdentifier` if it is present. However, the `Username` and `FederationIdentifier` fields can't be updated with API.

SEE ALSO:

[About Just-in-Time Provisioning for SAML](#)

[Just-in-Time Provisioning for Portals](#)

[Just-in-Time Provisioning for Communities](#)

[salesforce_communities_implementation.pdf](#)

Just-in-Time Provisioning for Portals

With Just-in-Time (JIT) provisioning for portals, you can use a SAML assertion to create customer and partner portal users on the fly the first time they try to log in. This eliminates the need to create user accounts in advance. Because JIT uses SAML to communicate, your organization must have SAML-based single sign-on enabled.

-  **Note:** Starting with Summer '13, Customer Portals and partner portals are no longer available for new organizations. Existing organizations continue to have access to these portals. If you don't have a portal, but want to easily share information with your customers or partners, try Communities.

Existing organizations using Customer Portals and partner portals may continue to use their portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Creating Portal Users

The `Portal ID` and `Organization ID` must be specified as part of the SAML assertion. You can find both of these on the company information page for the organization or portal. Because you can also provision regular users, the `Portal ID` is used to distinguish between a regular and portal JIT provisioning request. If no `Portal ID` is specified, then the request is treated as a JIT request for regular platform user. Here are the requirements for a creating a portal user.

- You must specify a `Federation ID`. If the ID belongs to an existing user account, the user account is updated. In case of an inactive user account, the user account is updated, but left inactive unless `User.IsActive` in the JIT assertion is set to true. If there is no user account with that `Federation ID`, the system creates a new user.
- If the portal isn't self-registration enabled and a default new user profile and role aren't specified, the `User.ProfileId` field must contain a valid profile name or ID associated with the portal. In addition, the `User.PortalRole` field must contain a valid portal role name or ID.

 **Note:** The `User.Role` must be null.

Creating and Modifying Accounts

Create or modify an account by specifying a valid `Account ID` or both the `Account.AccountNumber` and `Account.Name`.

- Matching is based on `Account.AccountNumber`. If multiple accounts are found, an error is displayed. Otherwise, the account is updated.
- If no matching account is found, one is created.
- You must specify the `Account.Owner` in the SAML assertion and ensure that the field level security for the `Account.AccountNumber` field is set to visible for this owner's profile.

Creating and Modifying Contacts

Create or modify a contact by specifying a valid `Contact ID` in `User.Contact` or both the `Contact.Email` and `Contact.LastName`.

- Matching is based on `Contact.Email`. If multiple contacts are found, an error is displayed. Otherwise, the contact is updated.
- If no matching contact is found, one is created.

Supported Fields for the Portal SAML Assertion

To correctly identify which object to create in Salesforce, you must use a prefix. In the SAML assertion, use the `Account` prefix for all fields in the Account schema (for example `Account.AccountId`) and `Contact` prefix for all fields in the Contact schema. In this example, the `Contact` prefix has been added to the `Email` field name.

```
<saml:Attribute
  Name="Contact.Email"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for accounts.

Fields	Required	Comments
Billing		Street City State PostalCode Country
AnnualRevenue		
Description		
Fax		
FederationIdentifier (insert only)	Y	If present, it must match the SAML subject or the SAML subject is taken instead. Can't be updated using SAML.

Fields	Required	Comments

- [Just-in-Time Provisioning Requirements](#)
- [Just-in-Time Provisioning for Communities](#)
- [salesforce_communities_implementation.pdf](#)

Just-in-Time Provisioning for Communities

With Just-in-Time (JIT) provisioning for Communities, you can use a SAML assertion to create customer and partner community users on the fly the first time they try to log in from an identity provider. This eliminates the need to create user accounts in advance. Because JIT uses SAML to communicate, your organization must have SAML-based single sign-on enabled. Then, you can work with the identity provider to generate the necessary SAML assertions for JIT.

SAML Single Sign-on Settings

Follow the instructions for [Configuring SAML Settings for Single Sign-On](#) with `SAML Enabled`. Set the values for your configuration, as needed, and also include the following values specific to your community for JIT provisioning.

1. Check `User Provisioning Enabled`.

Note:

- Just-in-time provisioning requires a Federation ID in the user type. In `SAML User ID Type`, select `Assertion contains the Federation ID from the User object`.
- If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.

2. The **Entity ID** should be unique across your organization and begin with `https`. You can't have two SAML configurations with the same **Entity ID** in one organization. Specify whether you want to use the base domain (`https://saml.salesforce.com`) or the community URL (such as `https://acme.force.com/customers`) for the **Entity ID**. You must share this information with your identity provider.

Tip: Generally, use the community URL as the entity ID. If you are providing Salesforce to Salesforce services, you must specify the community URL.

3. In `SAML User ID Type`, select `Assertion contains the Federation ID from the User object`. If your identity provider previously used the Salesforce username, communicate to them that they must use the Federation ID.

Creating and Modifying Community Users

The SAML assertion needs the following.

- A `Recipient` URL. This is the Community Login URL from the SAML Single Sign-On Settings detail page in your organization. The URL is in the following form.

```
https://<community_URL>/login?so=<orgID>
```

For example, `Recipient="https://acme.force.com/customers/login?so=00DD000000JsCM"` where `acme.force.com/customers` is the community home page and `00DD000000JsCM` is the `Organization ID`.

If an Assertion Decryption Certificate has been uploaded to the organization's SAML Single Sign-On Settings, include the certificate ID in the URL using the `sc` parameter, such as

```
Recipient="https://acme.force.com/customers/login?so=00DD000000JsCM&sc=0LE000000Dp"
```

where `0LE000000Dp` is the certificate ID.

- Salesforce attempts to match the `Federation ID` in the subject of the SAML assertion (or in an attribute element, depending upon how the SAML Identity Location is defined in the SAML Single Sign-On Settings) to the `FederationIdentifier` field of an existing user record.
 1. If a matching user record is found, Salesforce uses the attributes in the SAML assertion to update the specified fields.
 2. If a user with a matching user record isn't found, then Salesforce searches the contacts under the specified `Account ID` (`Contact.Account` or `Account.AccountNumber`) for a match based on the Contact ID (`User.ContactId`) or email (`Contact.Email`).
 - i. If a matching contact record is found, Salesforce uses the attributes in the SAML assertion to update the specified contact fields, and then inserts a new user record.
 - ii. If a matching contact record isn't found, then Salesforce searches the accounts for a match based on the `Contact.Account` or both the `Account.AccountNumber` and `Account.Name` specified in the SAML assertion, or updates the existing contact and user records for the account if a match is found.
 - i. If a matching account record is found, Salesforce inserts a new user record and updates the account records based the attributes provided in the SAML assertion.
 - ii. If a matching account record isn't found, Salesforce inserts a new account record, inserts a new contact record, and inserts a new user record based on the attributes provided in the SAML assertion.

In the case of an inactive user account, the user account is updated, but left inactive unless `User.IsActive` in the JIT assertion is set to true. If there is no user account with that `Federation ID`, the system creates a new user.

- If the community doesn't have self-registration enabled, and a default new user profile and role aren't specified, the `User.ProfileId` field must contain a valid profile name or ID associated with the community.

Salesforce attempts to match the `Federation ID` in the subject of the SAML assertion to the `FederationIdentifier` field of an existing user record.

-  **Note:** Salesforce also supports custom fields on the User object in the SAML assertion. Any attribute in the assertion that starts with `User` is parsed as a custom field. For example, the attribute `User.NumberOfProductsBought__c` in the assertion is placed into the field `NumberOfProductsBought` for the provisioned user. Custom fields are not supported for Accounts or Contacts.

Supported Fields for the Community SAML Assertion

To correctly identify which object to create in Salesforce, you must use a prefix. In the SAML assertion, use the `Account` prefix for all fields in the Account schema (for example `Account.AccountId`) and `Contact` prefix for all fields in the Contact schema. In this example, the `Contact` prefix has been added to the `Email` field name.

```
<saml:Attribute
  Name="Contact.Email"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue xsi:type="xs:anyType">testuser@123.org</saml:AttributeValue>
</saml:Attribute>
```

In addition to the standard fields supported for regular SAML JIT users, these fields are supported for accounts.

Fields	Required	Comments

Just-in-Time Provisioning Errors

Following are the error codes and descriptions for Just-in-Time provisioning for SAML.

SAML errors are returned in the URL parameter, for example:

```
http://login.salesforce.com/identity/jit/saml-error.jsp?
ErrorCode=5&ErrorDescription=Unable+to+create+user&ErrorDetails=
INVALID_OR_NULL_FOR_RESTRICTED_PICKLIST+TimeZoneSidKey
```

 **Note:** Salesforce redirects the user to a custom error URL if one is specified in your SAML configuration.

Error Messages

Code	Description	Error Details
1	Missing Federation Identifier	MISSING_FEDERATION_ID
2	Mis-matched Federation Identifier	MISMATCH_FEDERATION_ID
3	Invalid organization ID	INVALID_ORG_ID
4	Unable to acquire lock	USER_CREATION_FAILED_ON_UROG
5	Unable to create user	USER_CREATION_API_ERROR
6	Unable to establish admin context	ADMIN_CONTEXT_NOT_ESTABLISHED
8	Unrecognized custom field	UNRECOGNIZED_CUSTOM_FIELD
9	Unrecognized standard field	UNRECOGNIZED_STANDARD_FIELD
11	License limit exceeded	LICENSE_LIMIT_EXCEEDED
12	Federation ID and username do not match	MISMATCH_FEDERATION_ID_AND_USERNAME_ATTRS
13	Unsupported provision API version	UNSUPPORTED_VERSION
14	Username change isn't allowed	USER_NAME_CHANGE_NOT_ALLOWED
15	Custom field type isn't supported	UNSUPPORTED_CUSTOM_FIELD_TYPE
16	Unable to map a unique profile ID for the given profile name	PROFILE_NAME_LOOKUP_ERROR
17	Unable to map a unique role ID for the given role name	ROLE_NAME_LOOKUP_ERROR
18	Invalid account	INVALID_ACCOUNT_ID
19	Missing account name	MISSING_ACCOUNT_NAME
20	Missing account number	MISSING_ACCOUNT_NUMBER
22	Unable to create account	ACCOUNT_CREATION_API_ERROR
23	Invalid contact	INVALID_CONTACT
24	Missing contact email	MISSING_CONTACT_EMAIL
25	Missing contact last name	MISSING_CONTACT_LAST_NAME
26	Unable to create contact	CONTACT_CREATION_API_ERROR
27	Multiple matching contacts found	MULTIPLE_CONTACTS_FOUND
28	Multiple matching accounts found	MULTIPLE_ACCOUNTS_FOUND
30	Invalid account owner	INVALID_ACCOUNT_OWNER
31	Invalid portal profile	INVALID_PORTAL_PROFILE
32	Account change is not allowed	ACCOUNT_CHANGE_NOT_ALLOWED

Code	Description	Error Details
33	Unable to update account	ACCOUNT_UPDATE_FAILED

[About Just-in-Time Provisioning for SAML](#)

[Just-in-Time Provisioning for Portals](#)

About External Authentication Providers

You can enable users to log into your Salesforce organization using their login credentials from an external service provider such as Facebook[®] or Janrain[®].

 **Note:**  [Social Sign-On](#) (11:33 minutes)

Learn how to configure single sign-on and OAuth-based API access to Salesforce from other sources of user identity.

Do the following to successfully set up an authentication provider for single sign-on.

- Correctly configure the service provider website.
- Create a registration handler using Apex.
- Define the authentication provider in your organization.

When set up is complete, the authentication provider flow is as follows.

1. The user tries to login to Salesforce using a third party identity.
2. The login request is redirected to the third party authentication provider.
3. The user follows the third party login process and approves access.
4. The third party authentication provider redirects the user to Salesforce with credentials.
5. The user is signed into Salesforce.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Manage Auth. Providers"

 **Note:** If a user has an existing Salesforce session, after authentication with the third party they are automatically redirected to the page where they can approve the link to their Salesforce account.

Defining Your Authentication Provider

We support the following providers:

- [Facebook](#)
- [Google](#)
- [Janrain](#)
- [LinkedIn](#)
- [Microsoft Access Control Service](#)
- [Salesforce](#)
- [Twitter](#)
- [Any service provider who implements the OpenID Connect protocol](#)

Adding Functionality to Your Authentication Provider

You can add functionality to your authentication provider by using additional request parameters.

- [Scope](#) – Customizes the permissions requested from the third party
- [Site](#) – Enables the provider to be used with a site
- [StartURL](#) – Sends the user to a specified location after authentication
- [Community](#) – Sends the user to a specific community after authentication
- [Authorization Endpoint](#) on page 927 – Sends the user to a specific endpoint for authentication (Salesforce authentication providers, only)

Creating an Apex Registration Handler

A registration handler class is required to use Authentication Providers for the single sign-on flow. The Apex registration handler class must implement the `Auth.RegistrationHandler` interface, which defines two methods. Salesforce invokes the appropriate method on callback, depending on whether the user has used this provider before or not. When you create the authentication provider, you can automatically create an Apex template class for testing purposes. For more information, see [RegistrationHandler](#) in the *Force.com Apex Code Developer's Guide*.

[Configuring a Facebook Authentication Provider](#)

[Configure a Google Authentication Provider](#)

Let users log in to a Salesforce organization using their Google accounts.

[Configure a Janrain Authentication Provider](#)

[Configure a Salesforce Authentication Provider](#)

You can use a connected app as an authentication provider.

[Configure an OpenID Connect Authentication Provider](#)

You can use any third-party Web application that implements the server side of the OpenID Connect protocol, such as Amazon, Google, and PayPal, as an authentication provider.

[Configure a Microsoft® Access Control Service Authentication Provider](#)

You can use Microsoft Access Control Service as an authentication provider, using the OAuth protocol. Authorization is typically done by a Microsoft Office 365 service like SharePoint® Online.

[Configure a LinkedIn Authentication Provider](#)

Let users log in to a Salesforce organization using their LinkedIn account.

[Configure a Twitter Authentication Provider](#)

Let users log in to a Salesforce organization with their Twitter accounts.

[Using Salesforce-Managed Values in Auth. Provider Setup](#)

You can choose to let Salesforce automatically create key values when setting up a Facebook, Salesforce, LinkedIn, Twitter, or Google Auth. Provider. This allows you to skip the step of creating your own third-party application.

[Create a Custom External Authentication Provider](#)

Create a single sign-on (SSO) authentication provider to let admins and users use their non-Salesforce SSO credentials for your Salesforce orgs.

Configuring a Facebook Authentication Provider

To use Facebook as an authentication provider:
