1. [Set up](#) a Facebook application, making Salesforce the application domain.
2. [Define](#) a Facebook authentication provider in your Salesforce organization.
3. [Update](#) your Facebook application to use the `callback URL` generated by Salesforce as the `Facebook website site URL`.
4. [Test](#) the connection.

Setting up a Facebook Application

Before you can configure Facebook for your Salesforce organization, you must set up an application in Facebook:

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. Go to the [Facebook website](#) and create a new application.
2. Modify the application settings and set the Application Domain to Salesforce.
3. Note the Application ID and the Application Secret.

Defining a Facebook Provider in your Salesforce Organization

You need the Facebook Application ID and Application Secret to set up a Facebook provider in your Salesforce organization.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Facebook for the `Provider Type`.
4. Enter a `Name` for the provider.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- “View Setup and Configuration”

To edit the settings:

- “Customize Application”
- AND
- “Manage Auth. Providers”

5. Enter the `URL_Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyFacebookProvider", your single sign-on URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx0000000001/MyFacebookProvider`.
6. Use the Application ID from Facebook for the `Consumer_Key` field.
7. Use the Application Secret from Facebook for the `Consumer_Secret` field.
8. Optionally, set the following fields.
 - a. Enter the base URL from Facebook for the `Authorize_Endpoint_URL`. For example, `https://www.facebook.com/v2.2/dialog/oauth`. If you leave this field blank, Salesforce uses the version of the Facebook API that your application uses.

 **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`. In this example, the additional `approval_prompt` parameter is necessary to ask the user to accept the refresh action, so that Google continues to provide refresh tokens after the first one.
 - b. Enter the `Token_Endpoint_URL` from Facebook. For example, `https://www.facebook.com/v2.2/dialog/oauth`. If you leave this field blank, Salesforce uses the version of the Facebook API that your application uses.
 - c. Enter the `User_Info_Endpoint_URL` to change the values requested from Facebook's profile API. See https://developers.facebook.com/docs/facebook-login/permissions/v2.0#reference-public_profile for more information on fields. The requested fields must correspond to requested scopes. If you leave this field blank, Salesforce uses the version of the Facebook API that your application uses.
 - d. `Default_Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used (see [Facebook's developer documentation](#) for these defaults).
 For more information, see [Using the Scope Parameter](#)
 - e. `Custom_Error_URL` for the provider to use to report any errors.
 - f. `Custom_Logout_URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - g. Select an already existing Apex class as the `Registration_Handler` class or click `Automatically create a registration handler template` to create an Apex class template for the registration handler. You must edit this class and modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to generate the `Single_Sign-On_Initialization_URL`.
 - h. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.
 - i. To use a portal with your provider, select the portal from the Portal drop-down list.
 - j. Use the `Icon_URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.
 You can specify a path to your own image, or copy the URL for one of our sample icons into the field.
9. Click **Save**.

Be sure to note the generated `Auth.ProviderId` value. You must use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Updating Your Facebook Application

After defining the Facebook authentication provider in your Salesforce organization, go back to Facebook and update your application to use the `Callback URL` as the `Facebook Website Site URL`.

Testing the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the `Auth.Provider` detail page. It should redirect you to Facebook and ask you to sign in. Upon doing so, you are asked to authorize your application. After you authorize, you are redirected back to Salesforce.

SEE ALSO:

[Using Request Parameters with Client Configuration URLs](#)

[About External Authentication Providers](#)

Configure a Google Authentication Provider

Let users log in to a Salesforce organization using their Google accounts.

To use Google as an authentication provider:

1. [Set up](#) a Google application, making Salesforce the application domain.
2. [Define](#) a Google authentication provider in your Salesforce organization.
3. [Update](#) your Google application to use the `Callback URL` generated by Salesforce as the `Google Website Site URL`.
4. [Test](#) the connection.

Set Up a Google Application

Before you can configure Google for your Salesforce organization, you must set up an application in Google:

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. Go to the [Google website](#) and create a new application.
2. Modify the application settings and set the Application Domain to Salesforce.
3. Note the Application ID and the Application Secret.

Define a Google Provider in Your Salesforce Organization

You need the Google Application ID and Application Secret to set up a Google provider in your Salesforce organization.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Google for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`, which is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyGoogleProvider", your single sign-on URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx0000000001/MyGoogleProvider`.
6. Use the Application ID from Google for the `Consumer Key` field.
7. Use the Application Secret from Google for the `Consumer Secret` field.
8. Optionally, set the following fields.
 - a. `Authorize Endpoint URL` to specify the base authorization URL from Google. For example, `https://accounts.google.com/o/oauth2/authorize`. The URL must start with `https://accounts.google.com/o/oauth2`.

 **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use
`https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`.

AND

"Manage Auth. Providers"

The `approval_prompt` parameter is necessary to ask the user to accept the refresh action so that Google continues to provide refresh tokens after the first one.

- b.** `Token Endpoint URL` to specify the OAuth token URL from Google. For example, `https://accounts.google.com/o/oauth2/accessToken`. The URL must start with `https://accounts.google.com/o/oauth2`.
- c.** `User Info Endpoint URL` to change the values requested from Google's profile API. The URL must start with `https://www.googleapis.com/oauth2/`.
- d.** `Default Scopes` to send with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used. For the defaults, see [Google's developer documentation](#).

For more information, see [Using the Scope Parameter](#).

- e.** `Custom Error URL` to specify a URL for the provider to report errors.
- f.** `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
- g.** To create an Apex class template for the registration handler, select an existing Apex class as the `Registration Handler` class or click `Automatically create a registration handler template`. Edit this class and modify the default content before using it.

Note: Specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

- h.** Select the user that runs the Apex handler class for **Execute Registration As**. The user must have "Manage Users" permission. You must specify a user if you selected a registration handler class or are automatically creating one.
- i.** To use a portal with your provider, select the portal from the `Portal` list.
- j.** Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Note the generated `Auth.Provider Id` value. You use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure that the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser and signs in to the third party. The third party then either creates a user or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider redirects to the `Callback URL` with information for each client configuration URL.

The client configuration URLs support other request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from a third party, or go to a location after authenticating.

Update Your Google Application

After defining the Google authentication provider in your Salesforce organization, go back to Google and update your application to use the `Callback URL` as the `Google Website Site URL`.

Test the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It redirects you to Google and asks you to sign in. You're then asked to authorize your application. After you authorize, you're redirected to Salesforce.

Configure a Janrain Authentication Provider

Setting up a Janrain authentication provider is slightly different from setting up other providers. You don't use the Single Sign-On Initialization URL that you obtain after registering your provider with Salesforce to start the flow. Instead you use Janrain's login widget that's deployed on your site.

To set up your Janrain provider:

1. [Register](#) your application with Janrain and get an `apiKey`.
2. [Define](#) the Janrain authentication provider in your Salesforce organization.
3. [Get](#) the login widget code from Janrain.
4. [Set up](#) a site that calls the login widget code in your Salesforce organization.

Register Your Application

You must sign up for a Janrain account from the [Janrain website](#). Once you have your Janrain account, you need the `apiKey`.

1. Click **Deployment > Sign-in for Web > Handle Tokens**.
2. Copy the `apiKey`. You need this when creating the Janrain provider in your Salesforce organization.
3. Add `Salesforce` to the Janrain domain whitelist in your Janrain account at **Deployment > Application Settings > Domain Whitelist**.

Define the Janrain Provider in your Salesforce Organization

You need the Janrain `apiKey` to create a Janrain provider in your Salesforce organization.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Janrain for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the `Callback URL`. For example, if the URL suffix of your provider is "MyJanrainProvider", your `Callback URL` is similar to `https://login.salesforce.com/services/authcallback/00D300000007CvvEAE/MyJanrainProvider`.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Manage Auth. Providers"

6. Use the Janrain `apiKey` value for the `Consumer Secret`.
7. Optionally enter a `Custom Error URL` for the provider to use to report any errors.
8. Optionally, enter a `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
9. Select an already existing Apex class as the `Registration Handler` class or click `Automatically create a registration handler template` to create the Apex class template for the registration handler. You must edit this class to modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to use single sign-on.

10. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have “Manage Users” permission. A user is required if you selected a registration handler class or are automatically creating one.
11. To use a portal with your provider, select the portal from the Portal drop-down list.
12. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

13. Click **Save**.

Note the value of the generated `Callback URL`. You need it to complete the Janrain setup.

Several client configuration parameters are available after configuring Janrain as the authentication provider. Use these for the `flowtype` value in the `Callback URL` with your Janrain login widget:

- `test`: Use this parameter to make sure the third-party provider is set up correctly. The administrator configures a Janrain widget to use `flowtype=test`, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `link`: Use this parameter to link existing Salesforce users to a third-party account. The end user goes to a page with a Janrain widget configured to use `flowtype=link`, signs in to the third party, signs in to Salesforce, and approves the link.
- `sso`: Use this parameter to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user goes to a page with a Janrain widget configured to use `flowtype=sso`, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Get the Login Widget Code from Janrain

You need to get the login widget code from Janrain for your Salesforce organization.

1. From your Janrain account, click **Application > Sign-in for Web > Get the Code**.
2. Enter the `Callback URL` value from your Janrain provider information in your Salesforce organization along with the query parameter `flowtype=sso` as the token URL. For example,

```
https://login.salesforce.com/services/authcallback/00DD#####/JanrainApp?flowtype=sso
```

For a custom domain created with My Domain, replace `login.salesforce.com` with your My Domain name.

For a community, add the `community` parameter and pass it to the login widget as the token URL. For example,

```
janrain.settings.tokenUrl='https://login.salesforce.com/services/authcallback/00DD#####/JanrainApp'+
'?flowtype=sso&community='+encodeURIComponent('https://acme.force.com/customers');
```

Create a Site to Call the Login Widget

1. Enable Sites.
2. Create a page and copy the login widget code to the page.
3. Create a new site and specify the page you just created as the home page for the site.

[salesforce_communities_implementation.pdf](#)

Configure a Salesforce Authentication Provider

You can use a connected app as an authentication provider.

1. [Define a Connected App](#).
2. [Define the Salesforce authentication provider in your organization](#).
3. [Test the connection](#).

Define a Connected App

Before you can configure a Salesforce provider for your Salesforce organization, you must define a connected app that uses single sign-on. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**.

After you finish defining a connected app, save the values from the `Consumer Key` and `Consumer Secret` fields.

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

Define the Salesforce Authentication Provider in Your Org

To set up the authentication provider in your org, you need the values from the `Consumer Key` and `Consumer Secret` fields of the connected app definition.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Salesforce for the `Provider Type`.
4. Enter a `Name` for the provider.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- “View Setup and Configuration”

To edit the settings:

- “Customize Application”

AND

“Manage Auth. Providers”

5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MySFDCProvider", your single sign-on URL is similar to `https://login.salesforce.com/auth/sso/00Dx0000000001/MySFDCProvider`.
6. Paste the value of `Consumer Key` from the connected app definition into the `Consumer Key` field.
7. Paste the value of `Consumer Secret` from the connected app definition into the `Consumer Secret` field.
8. Optionally, set the following fields.

- a. `Authorize Endpoint URL` to specify an OAuth authorization URL.

For the `Authorize Endpoint URL`, the host name can include a sandbox or custom domain name (created using My Domain), but the URL must end in `.salesforce.com`, and the path must end in `/services/oauth2/authorize`. For example, `https://login.salesforce.com/services/oauth2/authorize`.

- b. `Token Endpoint URL` to specify an OAuth token URL.

For the `Token Endpoint URL`, the host name can include a sandbox or custom domain name (created using My Domain), but the URL must end in `.salesforce.com`, and the path must end in `/services/oauth2/token`. For example, `https://login.salesforce.com/services/oauth2/token`.

- c. `Default Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded default is used. For more information, see [Using the Scope Parameter](#).

 **Note:** When editing the settings for an existing Salesforce authentication provider, you might have the option to select a checkbox to include the organization ID for third-party account links. For Salesforce authentication providers set up in the Summer '14 release and earlier, the user identity provided by an organization does not include the organization ID. So, the destination organization can't differentiate between users with the same user ID from two sources (such as two sandboxes). Select this checkbox if you have an existing organization with two users (one from each sandbox) mapped to the same user in the destination organization, and you want to keep the identities separate. Otherwise, leave this checkbox unselected. After enabling this feature, your users need to re-approve the linkage to all of their third-party links. These links are listed in the Third-Party Account Links section of a user's detail page. Salesforce authentication providers created in the Winter '15 release and later have this setting enabled by default and do not display the checkbox.

- d. `Custom Error URL` for the provider to use to report any errors.
 - e. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
9. Select an already existing Apex class as the `Registration Handler` class or click `Automatically create a registration handler template` to create the Apex class template for the registration handler. You must edit this template class to modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

10. Select the user that runs the Apex handler class for `Execute Registration As`. The user must have "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.
11. To use a portal with your provider, select the portal from the Portal drop-down list.
12. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

13. Click `Save`.

Note the value of the Client Configuration URLs. You need the `Callback URL` to complete the last step, and you use the `Test-Only Initialization URL` to check your configuration. Also be sure to note the `Auth. Provider Id` value because you must use it with the `Auth.AuthToken` Apex class.

14. Return to the connected app definition that you created earlier (on the Apps page in Setup, click the connected app name) and paste the value of `Callback URL` from the authentication provider into the `Callback URL` field.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Test the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page.

SEE ALSO:

[Using Request Parameters with Client Configuration URLs](#)

[About External Authentication Providers](#)

Configure an OpenID Connect Authentication Provider

You can use any third-party Web application that implements the server side of the OpenID Connect protocol, such as Amazon, Google, and PayPal, as an authentication provider.

You must complete these steps to configure an OpenID authentication provider:

1. [Register](#) your application, making Salesforce the application domain.
2. [Define](#) an OpenID Connect authentication provider in your Salesforce organization.
3. [Update](#) your application to use the `Callback URL` generated by Salesforce as the callback URL.
4. [Test](#) the connection.

Register an OpenID Connect Application

Before you can configure a Web application for your Salesforce organization, you must register it with your service provider. The process varies depending on the service provider. For example, to register a Google app, [Create an OAuth 2.0 Client ID](#).

1. Register your application on your service provider's website.
2. Modify the application settings and set the application domain (or `Home Page URL`) to Salesforce.
3. Note the Client ID and Client Secret, as well as the Authorize Endpoint URL, Token Endpoint URL, and User Info Endpoint URL, which should be available in the provider's documentation. Here are some common OpenID Connect service providers:
 - [Amazon](#)
 - [Google](#)
 - [PayPal](#)

Define an OpenID Connect Provider in Your Salesforce Organization

You need some information from your provider (the Client ID and Client Secret, as well as the Authorize Endpoint URL, Token Endpoint URL, and User Info Endpoint URL) to configure your application in your Salesforce organization.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select OpenID Connect for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyOpenIDConnectProvider," your single sign-on URL is similar to:
`https://login.salesforce.com/auth/sso/00Dx0000000001/MyOpenIDConnectProvider`.
6. Use the Client ID from your provider for the `Consumer Key` field.
7. Use the Client Secret from your provider for the `Consumer Secret` field.
8. Enter the base URL from your provider for the `Authorize Endpoint URL`.

Tip: You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use

`https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

In this specific case, the additional `approval_prompt` parameter is necessary to ask the user to accept the refresh action, so Google will continue to provide refresh tokens after the first one.

9. Enter the `Token Endpoint URL` from your provider.

10. Optionally, set the following fields.

- a. `User Info Endpoint URL` from your provider.
- b. `Token Issuer`. This value identifies the source of the authentication token in the form `https: URL`. If this value is specified, the provider must include an `id_token` value in the response to a token request. The `id_token` value is not required for a refresh token flow (but will be validated by Salesforce if provided).
- c. `Default Scopes` to send along with the request to the authorization endpoint. Otherwise, the hardcoded defaults for the provider type are used (see the [OpenID Connect developer documentation](#) for these defaults).

For more information, see [Using the Scope Parameter](#).

11. You can select `Send access token in header` to have the token sent in a header instead of a query string.

12. Optionally, set the following fields.

- a. `Custom Error URL` for the provider to use to report any errors.
- b. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
- c. Select an existing Apex class as the `Registration Handler class` or click `Automatically create a registration handler template` to create an Apex class template for the registration handler. You must edit this class and modify the default content before using it.

Note: You must specify a registration handler class for Salesforce to generate the `Single Sign-On Initialization URL`.

- d. Select the user that runs the Apex handler class for **Execute Registration As**. The user must have the “Manage Users” permission. A user is required if you selected a registration handler class or are automatically creating one.
- e. To use a portal with your provider, select the portal from the Portal drop-down list.
- f. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

13. Click **Save**.

Be sure to note the generated `Auth. Provider Id` value. You must use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.

- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Update Your OpenID Connect Application

After defining the authentication provider in your Salesforce organization, go back to your provider and update your application's `Callback URL` (also called the `Authorized Redirect URI` for Google applications and `Return URL` for PayPal).

Test the Single Sign-On Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to your provider's service and ask you to sign in. Upon doing so, you're asked to authorize your application. After you authorize, you're redirected back to Salesforce.

Configure a Microsoft® Access Control Service Authentication Provider

You can use Microsoft Access Control Service as an authentication provider, using the OAuth protocol. Authorization is typically done by a Microsoft Office 365 service like SharePoint® Online.

Salesforce supports authentication from a Microsoft Access Control Service using only OAuth. Single sign-on authentication from a Microsoft authentication provider is not supported.

You must complete these steps to configure a Microsoft Access Control Service authentication provider:

1. [Define](#) a Microsoft Access Control Service authentication provider in your Salesforce organization.
2. [Register](#) your application with Microsoft, making Salesforce the application domain.
3. [Edit](#) your Microsoft Access Control Service authentication provider details in Salesforce to use the `Consumer Key` and `Consumer Secret` generated when you registered your application with Microsoft.
4. [Test](#) the connection.

Define a Microsoft Access Control Service Authentication Provider in Your Salesforce Organization

Before you can register an application in SharePoint Online or the Microsoft Seller Dashboard, you need the callback URL that will be used to redirect the authorized user to Salesforce.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select Microsoft Access Control Service for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyMicrosoftACSPProvider," your callback URL is similar to:

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

`https://login.salesforce.com/services/authcallback/00Dx0000000001/MyMicrosoftACSPProvider`

6. Enter a placeholder value for the `Consumer Key` field (you'll edit this value after your application is registered with Microsoft).
7. Enter a placeholder value for the `Consumer Secret` field (you'll edit this value after your application is registered with Microsoft).
8. Enter the base URL from your provider for the `Authorize Endpoint URL`. For example, SharePoint Online uses the following form:

`https://<sharepoint online host name>/_layouts/15/OAuthAuthorize.aspx`

9. Enter the `Token Endpoint URL` in the following form.

`https://accounts.accesscontrol.windows.net/<tenant>/tokens/OAuth/2?resource=<sender ID>/<sharepoint online host name>&<tenant>`

- `<tenant>` is the Office 365 tenant name ending with `.onmicrosoft.com` or the corresponding tenant globally unique identifier (GUID).
- `<sender ID>` is the identifier for the sender of the token. For example, SharePoint uses `00000003-0000-0ff1-ce00-000000000000`

10. Optionally, set the following fields.

- `Default Scopes` to send along with the request to the authorization endpoint. See <http://msdn.microsoft.com/en-us/library/jj687470.aspx#Scope> for more information about scopes for SharePoint Online. Or [Using the Scope Parameter](#) for more information about using scopes with Salesforce.
- `Custom Error URL` for the provider to use to report any errors.
- `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
- To use a portal with your provider, select the portal from the `Portal` drop-down list. If you have a portal set up for your organization, this option can redirect the login request to the portal login page. Otherwise, leave as `None`.
- Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

11. Click **Save**.

Be sure to note the generated `Auth. Provider Id` value. You can use it with the [Auth.AuthToken Apex class](#).

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Oauth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Register Your Application with Microsoft

Before you can configure an application for your Salesforce organization, you must get an application identity using one of the options provided by Microsoft. For example see [Guidelines for registering apps for SharePoint 2013](#) for details about registering a remote application for SharePoint.

1. Register your application using one of the options provided by Microsoft.
2. Modify the application settings and set the redirect URI to the authentication provider's `Callback URL`.
3. Note the `Client ID` and `Client Secret`.
4. Click **Save**.

Edit Your Microsoft Access Control Service Authentication Provider Details

After registering your application with Microsoft, go back to your Microsoft Access Control Service authentication provider details, and update the `Consumer Key` and `Consumer Secret` with the values provided by Microsoft.

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **Edit** next to the name of your Microsoft Access Control Service authentication provider.
3. Enter the `Client ID` value provided by Microsoft in the `Consumer Key` field.
4. Enter the `Client Secret` value provided by Microsoft in the `Consumer Secret` field.

Test the Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to your provider's service and ask you to sign in. Upon doing so, you're asked to authorize your application. After you authorize, you're redirected back to Salesforce.

Configure a LinkedIn Authentication Provider

Let users log in to a Salesforce organization using their LinkedIn account.

Complete these steps to configure LinkedIn as an authentication provider.

1. [Decide which scopes \(user details\) to get from LinkedIn.](#)
2. [Set up a LinkedIn application.](#)
3. [Define a LinkedIn Provider in your Salesforce organization](#) and establish a registration handler.
4. [Edit the registration handler.](#)
5. [Update your LinkedIn application](#) to use the Callback URL generated by Salesforce as an entry in the LinkedIn OAuth 2.0 Redirect URLs.
6. [Test the single sign-on connection.](#)

Decide which scopes (user details) to get from LinkedIn

Scopes determine the information you get from LinkedIn about a user during the authorization process. You can request some basic information, such as username and a photo URL, or you can get more specific information, such as an address, phone number, contact list, and more. The user approves the exchange of information before it is given.

When you set up LinkedIn as an Auth. Provider, you can set the scopes in three different places: in the LinkedIn application settings, in the Salesforce Auth. Provider settings, or in a query to LinkedIn's user info endpoint using field selectors. Consider the following as you decide where to specify the scopes, and the values to use.

- You can leave this value blank in the LinkedIn and Salesforce settings. The default value is `r_basicprofile`, which provides only the most basic user information as defined by LinkedIn.
- Salesforce requires the email address for users.
- Refer to the [LinkedIn Authentication documentation](#) for a list of supported values and their meaning, or the [LinkedIn Field Selectors page](#) for information about requesting scopes using a URL.
- If you set the Default Scopes in the Salesforce Auth. Provider settings, that value overrides the value in the LinkedIn Application settings.
- Separate multiple scope values in the LinkedIn Application settings or the Salesforce Auth. Provider settings with a space, only, such as `r_basicprofile r_emailaddress`.
- If you use LinkedIn Field Selectors with a URL, separate multiple values with a comma, only, such as `https://api.linkedin.com/v1/people/~:(id,formatted-name,first-name,last-name,public-profile-url,email-address)`.

Set up a LinkedIn application

Before you can configure LinkedIn for your Salesforce organization, set up an application in LinkedIn.

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. Sign in to your developer account for the [LinkedIn website](#).
2. Click the username at the top and select **API Keys**.
3. Click **Add New Application**.
4. Enter the application settings.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

5. Note the API Key and Secret Key of the new application. You need these later in Salesforce.
6. Optionally, enter a LinkedIn supported scope value or several space-separated values.
For more information about using scopes with LinkedIn, see [Decide which scopes \(user details\) to get from LinkedIn](#).

Define a LinkedIn Provider in your Salesforce organization

You need the LinkedIn `API Key` and `Secret Key` to set up a LinkedIn provider in your Salesforce organization.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.
2. Click **New**.
3. Select LinkedIn for the `Provider Type`.
4. Enter a `Name` for the provider.
5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyLinkedInProvider," your single sign-on URL is similar to:
`https://login.salesforce.com/services/sso/00Dx0000000001/MyLinkedInProvider`
6. Use the `API Key` from LinkedIn for the `Consumer Key` field.
7. Use the `Secret Key` from LinkedIn for the `Consumer Secret` field.
8. Optionally, set the following fields.
 - a. `Authorize Endpoint URL` to enter the base authorization URL from LinkedIn. For example, `https://www.linkedin.com/uas/oauth2/authorization/auth`. The URL must start with `https://www.linkedin.com/uas/oauth2/authorization`.

 **Tip:** You can add query string parameters to the base URL, if necessary. For example, to get a refresh token from Google for offline access, use `https://accounts.google.com/o/oauth2/auth?access_type=offline&approval_prompt=force`. The `approval_prompt` parameter is necessary to ask the user to accept the refresh action so that Google continues to provide refresh tokens after the first one.
 - b. `Token Endpoint URL` to enter the OAuth token URL from LinkedIn. For example, `https://www.linkedin.com/uas/oauth2/accessToken/token`. The URL must start with `https://www.linkedin.com/uas/oauth2/accessToken`.
 - c. `User Info Endpoint URL` to change the values requested from LinkedIn's profile API. For more information, see <https://developer.linkedin.com/documents/profile-fields>. The URL must start with `https://api.linkedin.com/v1/people/~`, and the requested fields must correspond to requested scopes.
 - d. `Default Scopes` to enter a supported value or several space-separated values that represent the information you get from LinkedIn. For more information, see [Decide which scopes \(user details\) to get from LinkedIn](#).
 - e. `Custom Error URL` for the provider to use to report any errors.
 - f. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.
 - g. Click **Automatically create a registration handler template** to create an Apex class template for the [registration handler](#), unless you already have one. Edit this class later, and modify the default content before using it.

 **Note:** Specify a registration handler class for Salesforce to generate the Single Sign-On Initialization URL.

- h. Select the user that runs the Apex handler class for `Execute Registration As`. The user must have the “Manage Users” permission. A user is required if you selected a registration handler class or are automatically creating one.
 - i. To use a portal for LinkedIn users, select the portal from the Portal drop-down list.
9. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

10. Click **Save**.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.
- `Existing User Linking URL`: Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`: Use this URL to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token; this flow does not provide for future single sign-on functionality.
- `Callback URL`: Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Edit the Registration Handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the auto-created Apex registration handler (or the existing registration handler if you had one) to map fields between LinkedIn and Salesforce

 **Note:** The default profile query for LinkedIn only retrieves the following fields: first-name, last-name, headline, profile URL. The default registration handler requires email. Either remove the email requirement from the registration handler or change the desired scopes in [Decide which scopes \(user details\) to get from LinkedIn](#) to include the email address, and any other fields you want in the registration handler.

The following is an example Apex registration handler specifically for a LinkedIn application as the Auth. Provider. This registration handler assumes the requested scopes include `r_basicprofile` and `r_emailaddress`. It also assumes the users are logging in to a customer portal.

```
//TODO:This auto-generated class includes the basics for a Registration
//Handler class. You will need to customize it to ensure it meets your needs and
//the data provided by the third party.
global class LinkedInRegHandler implements Auth.RegistrationHandler {
    //Creates a Standard salesforce or a community user
    global User createUser(Id portalId, Auth.UserData data) {
        if (data.attributeMap.containsKey('sfdc_networkid')) {
```

```

//We have a community id, so create a user with community access
//TODO: Get an actual account
Account a =[SELECT Id FROM account WHERE name = 'LinkedIn Account'];
Contact c = new Contact();
c.accountId = a.Id;
c.email = data.email;
c.firstName = data.firstName;
c.lastName = data.lastName;
insert(c);
//TODO: Customize the username and profile. Also check that the username
//doesn't already exist and possibly ensure there are enough org licenses
//to create a user. Must be 80 characters or less.
User u = new User();
Profile p =[SELECT Id FROM profile WHERE name = 'Customer Portal Manager'];

u.username = data.firstName + '@sfdc.linkedin.com';
u.email = data.email;
u.lastName = data.lastName;
u.firstName = data.firstName;
String alias = data.firstName;
//Alias must be 8 characters or less
if (alias.length() > 8) {
    alias = alias.substring(0, 8);
}
u.alias = alias;
u.languageLocaleKey = UserInfo.getLocale();
u.localesidkey = UserInfo.getLocale();
u.emailEncodingKey = 'UTF-8';
u.timeZoneSidKey = 'America/Los_Angeles';
u.profileId = p.Id;
u.contactId = c.Id;
return u;
} else {
//This is not a community, so create a regular standard user
User u = new User();
Profile p =[SELECT Id FROM profile WHERE name = 'Standard User'];
//TODO: Customize the username. Also check that the username doesn't
//already exist and possibly ensure there are enough org licenses
//to create a user. Must be 80 characters or less
u.username = data.firstName + '@salesforce.com';
u.email = data.email;
u.lastName = data.lastName;
u.firstName = data.firstName;
String alias = data.firstName;
//Alias must be 8 characters or less
if (alias.length() > 8) {
    alias = alias.substring(0, 8);
}
u.alias = alias;
u.languageLocaleKey = UserInfo.getLocale();
u.localesidkey = UserInfo.getLocale();
u.emailEncodingKey = 'UTF-8';
u.timeZoneSidKey = 'America/Los_Angeles';
u.profileId = p.Id;

```

```

        return u;
    }
}
//Updates the user's first and last name
global void updateUser(Id userId, Id portalId, Auth.UserData data) {
    User u = new User(id = userId);
    u.lastName = data.lastName;
    u.firstName = data.firstName;
    update(u);
}
}

```

See the [RegistrationHandler Interface documentation](#) for more information and examples.

Update Your LinkedIn Application

After you define the LinkedIn authentication provider in your Salesforce organization, go back to LinkedIn and update your application to use the Salesforce-generated `Callback URL` as the LinkedIn OAuth 2.0 `Redirect URLs` value.

Test the Single Sign-on Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to LinkedIn and ask you to sign in. Upon doing so, you are asked to authorize your application. After you authorize, you are redirected back to Salesforce.

Configure a Twitter Authentication Provider

Let users log in to a Salesforce organization with their Twitter accounts.

Complete these steps to configure Twitter as an authentication provider.

1. [Set up a Twitter application.](#)
2. [Define a Twitter Provider in your Salesforce organization](#) and establish a registration handler.
3. [Edit the registration handler.](#)
4. [Update your Twitter application](#) to use the Callback URL generated by Salesforce as an entry in the Twitter application settings.
5. [Test the single sign-on connection.](#)

Set up a Twitter Application

Before you can configure Twitter for your Salesforce organization, you must set up an application in Twitter.

 **Note:** You can skip this step by allowing Salesforce to use its own default application. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. Sign in to your developer account for the [Twitter website](#).
2. Click on the user icon at the top and select **My Applications** (or go to apps.twitter.com).
3. Click **Create New App**.
4. Enter the application settings.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"

AND

"Manage Auth. Providers"

5. In the API Keys, note the `API key` and `API secret` of the new application, you'll need these later in Salesforce.

Define a Twitter Provider in your Salesforce organization

You need the Twitter `API key` and `API Secret` from your Twitter application to set up a Twitter provider in your Salesforce organization.

 **Note:** You can skip specifying these key values in the provider setup by allowing Salesforce to manage the values for you. For more information, see [Using Salesforce-Managed Values in Auth. Provider Setup](#).

1. From Setup, enter `Auth. Providers` in the `Quick Find` box, then select **Auth. Providers**.

2. Click **New**.

3. Select Twitter for the `Provider Type`.

4. Enter a `Name` for the provider.

5. Enter the `URL Suffix`. This is used in the client configuration URLs. For example, if the URL suffix of your provider is "MyTwitterProvider," your single sign-on URL is similar to:

```
https://login.salesforce.com/services/sso/00Dx0000000001/MyTwitterProvider
```

6. Use the `API key` from Twitter for the `Consumer Key` field.

7. Use the `API secret` from Twitter for the `Consumer Secret` field.

8. Optionally, set the following fields

- a. `Custom Error URL` for the provider to use to report any errors.

- b. `Custom Logout URL` to provide a specific destination for users after they log out, if they authenticated using the single sign-on flow. Use this field to direct users to a branded logout page or destination other than the default Salesforce logout page. The URL must be fully qualified with an `http` or `https` prefix, such as `https://acme.my.salesforce.com`.

- c. Click **Automatically create a registration handler template** to create an Apex class template for the [registration handler](#), unless you already have one. You must edit this class, later, and modify the default content before using it.

 **Note:** You must specify a registration handler class for Salesforce to generate the Single Sign-On Initialization URL.

- d. Select the user that runs the Apex handler class for `Execute Registration As`. The user must have the "Manage Users" permission. A user is required if you selected a registration handler class or are automatically creating one.

- e. To use a portal for Twitter users, select the portal from the Portal drop-down list.

- f. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

9. Click **Save**.

Several client configuration URLs are generated after defining the authentication provider:

- `Test-Only Initialization URL`: Administrators use this URL to ensure the third-party provider is set up correctly. The administrator opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`: Use this URL to perform single sign-on into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser, and signs in to the third party. This then either creates a new user for them, or updates an existing user, and then signs them into Salesforce as that user.

- **Existing User Linking URL:** Use this URL to link existing Salesforce users to a third-party account. The end user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- **Callback URL:** Use the callback URL for the endpoint that the authentication provider calls back to for configuration. The authentication provider has to redirect to the `Callback URL` with information for each of the above client configuration URLs.

The client configuration URLs support additional request parameters that enable you to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Edit the Registration Handler

1. From Setup, enter `Apex Classes` in the `Quick Find` box, then select **Apex Classes**.
2. Edit the auto-created Apex registration handler (or the existing registration handler if you had one) to map fields between Twitter and Salesforce.

The following is an example Apex registration handler specifically for a Twitter application as the Auth. Provider.

```
global class MyTwitterRegHandler implements Auth.RegistrationHandler{

global User createUser(Id portalId, Auth.UserData data)
{
    if(data.attributeMap.containsKey('sfdc_networkid'))
    {
        // Create communities user
        Account a = [SELECT Id FROM account WHERE name='Twitter Account']; // Make sure
this account exists

        Contact c = new Contact();
        c.accountId = a.Id;
        c.email = 'temp@CHANGE-ME.com';
        c.firstName = data.fullname.split(' ')[0];
        c.lastName = data.fullname.split(' ')[1];
        insert(c);

        User u = new User();
        Profile p = [SELECT Id FROM profile WHERE name='Customer Portal Manager'];
        u.username = data.username + '@sfdc-portal-twitter.com';
        u.email = 'temp@CHANGE-ME.com';
        u.firstName = data.fullname.split(' ')[0];
        u.lastName = data.fullname.split(' ')[1];
        String alias = data.fullname;

        //Alias must be 8 characters or less
        if(alias.length() > 8) {
            alias = alias.substring(0, 8);
        }

        u.alias = alias;
        u.languageLocaleKey = 'en_US';
        u.localesidkey = 'en_US';
        u.emailEncodingKey = 'UTF-8';
        u.timeZoneSidKey = 'America/Los_Angeles';
        u.profileId = p.Id;
        u.contactId = c.Id;
        return u;
    }
}
```

```

} else {
    // Create Standard SFDC user
    User u = new User();
    Profile p = [SELECT Id FROM profile WHERE name='Standard User'];
    u.username = data.username + '@sfdc-twitter.com';
    u.email = 'temp@CHANGE-ME.com';
    u.firstName = data.fullname.split(' ')[0];
    u.lastName = data.fullname.split(' ')[1];
    String alias = data.fullname;
    if(alias.length() > 8)
        alias = alias.substring(0, 8);

    u.alias = alias;
    u.languageLocaleKey = 'en_US';
    u.localesidkey = 'en_US';
    u.emailEncodingKey = 'UTF-8';
    u.timeZoneSidKey = 'America/Los_Angeles';
    u.profileId = p.Id;
    return u;
}
}

global void updateUser(Id userId, Id portalId, Auth.UserData data)
{
    User u = new User(id=userId);
    u.firstName = data.fullname.split(' ')[0];
    u.lastName = data.fullname.split(' ')[1];
    String alias = data.fullname;
    if(alias.length() > 8)
        alias = alias.substring(0, 8);

    u.alias = alias;
    update(u);
}
}

```

See the [RegistrationHandler Interface documentation](#) for more information and examples.

Update Your Twitter Application

After you define the Twitter authentication provider in your Salesforce organization, go back to Twitter and update your application to use the Salesforce-generated `Callback URL` as the `Callback URL` value in your Twitter application settings.

 **Note:** In your Twitter application, make sure that you select **Allow this application to be used to Sign In with Twitter**.

Test the Single Sign-on Connection

In a browser, open the `Test-Only Initialization URL` on the Auth. Provider detail page. It should redirect you to Twitter and ask you to sign in. Upon doing so, you are asked to authorize your application. After you authorize, you are redirected back to Salesforce.

Using Salesforce-Managed Values in Auth. Provider Setup

You can choose to let Salesforce automatically create key values when setting up a Facebook, Salesforce, LinkedIn, Twitter, or Google Auth. Provider. This allows you to skip the step of creating your own third-party application.

When you choose to use Salesforce-managed values in your Auth. Provider setup, Salesforce uses its own default application in the background from which it generates the values, eliminating the need for you to create your own application.

To use Salesforce-managed values, leave all of the following fields blank if they display in your Auth. Provider setup.

- `Consumer Key`
- `Consumer Secret`
- `Authorize Endpoint URL`
- `Token Endpoint URL`
- `User Info Endpoint URL`
- `Default Scopes`

If you specify a value for one of the preceding fields, then that indicates that you are using your own third-party application or connected app and you must specify values for the `Consumer Key` and `Consumer Secret`.

 **Example:** Suppose you want to set up single sign-on using a LinkedIn authentication provider to enable login to Salesforce with LinkedIn credentials. You can skip creating a LinkedIn application, since you choose to use Salesforce-created values in Auth. Provider setup. Next, you define the LinkedIn authentication provider in your organization and test the connection using the procedure in [Configure a LinkedIn Authentication Provider](#).

Create a Custom External Authentication Provider

Create a single sign-on (SSO) authentication provider to let admins and users use their non-Salesforce SSO credentials for your Salesforce orgs.

1. **Set up** an account with your chosen provider.
2. **Create** your custom metadata types, and select the custom fields that you want your admins to populate during setup.
3. **Build** the matching Apex classes and methods for your chosen metadata types, and use these classes to implement the `Auth.AuthProviderPlugin` interface.
4. **Configure** your new metadata through the Auth Provider Setup page.
5. **Update** your application to use the Callback URL generated by Salesforce.
6. **Test** the connection.

Set up Your Account

Before you can configure the auth provider plug-in for your Salesforce org, set up an account with your chosen external auth provider.

1. Go to your provider's site and create an application.
2. Modify the application settings, and set the Application Domain to Salesforce.
3. Note the application ID and application secret, if required by your external auth provider.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view the settings:

- "View Setup and Configuration"

To edit the settings:

- "Customize Application"
- AND
- "Manage Auth. Providers"

EDITIONS

Available in: Available in **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Create Your Custom Metadata Types

When you have an account, create the custom metadata types for your Salesforce org required by your external auth provider.

1. From Setup, enter *metadata* in the **Quick Find** box, then select **Custom Metadata Types**.
2. Click **New Custom Metadata Type**.
3. Enter a label name and plural label name for your custom metadata, and click **Save**.
4. Under the Custom Fields section, click **New** and select the custom fields you and your auth provider require. For example, if the auth provider requires an application ID or application secret, you can create fields with labels like “Consumer Key” or “Consumer Secret.”

 **Note:** You are prompted to enter details for each field type, such as label, description, and Help text. You can choose to make these fields required.

Build Your Apex Classes and Methods

To create a custom auth provider for SSO, create a class that implements the `Auth.AuthProviderPlugin` interface. This interface allows you to store the custom configuration for your auth provider and handle its authentication protocols. It also creates the name for your external auth provider, and displays this name in the list of available auth providers.

1. From Setup, enter *apex classes* in the search field, and select **Apex Classes**.
2. Click **New**.
3. In the field provided, create an Apex class and method.
 - a. Implement the `Auth.AuthProviderPlugin` interface.
 - b. Enter the API Name listed on your newly created custom metadata for the `return` string for the `getCustomMetadataType` method.

 **Note:** For information about the classes and methods that this plug-in requires, see the [Auth Namespace](#) section of the Force.com [Apex Code Developer's Guide](#).

Configure Your Auth Provider

You need your auth provider's application ID and application secret to set up your custom provider in your Salesforce org.

1. From Setup, enter *Auth. Providers* in the **Quick Find** box, then select **Auth. Providers**.
2. Click **New**.
3. For the provider type, select your custom provider.
4. Enter a name for the provider.
5. Enter the URL suffix, which is used in the client configuration URL. For example, if your provider's URL is `MyAwesomeProvider`, your SSO URL is similar to `https://login.salesforce.com/auth/sso/00Dx0000000001/MyAwesomeProvider`.
6. Enter your information in the custom fields you created.
7. To create an Apex class template for the [registration handler](#), click **Automatically create a registration handler template**. Edit the class template later, and modify the default content before using it.

 **Note:** Specify a registration handler class for Salesforce to generate the Single Sign-On Initialization URL.

8. In the `Execute Registration As` field, select a user to run the Apex handler class. The user must have the “Manage Users” permission. This field is required for all custom auth providers.

9. Use the `Icon URL` field to add a path to an icon to display as a button on the login page for a community. This icon applies to a community only, and does not appear on the login page for your Salesforce organization or custom domain created with My Domain. Users click the button to log in with the associated authentication provider for the community.

You can specify a path to your own image, or copy the URL for one of our sample icons into the field.

10. Click **Save**.

Note the generated Auth Provider Id value. You use it with the `Auth.AuthToken` Apex class.

Several client configuration URLs are generated after defining the auth provider.

- `Test-Only Initialization URL`—Use to ensure that the third-party provider is set up correctly. The admin opens this URL in a browser, signs in to the third party, and is redirected back to Salesforce with a map of attributes.
- `Single Sign-On Initialization URL`—Use to initialize SSO into Salesforce from a third party (using third-party credentials). The end user opens this URL in a browser and signs in to the third party. The third party then either creates a user or updates an existing user, and then signs that user into Salesforce.
- `Existing User Linking URL`—Use to link existing Salesforce users to a third-party account. The user opens this URL in a browser, signs in to the third party, signs in to Salesforce, and approves the link.
- `OAuth-Only Initialization URL`—Use to obtain OAuth access tokens for a third party. Users must authenticate with Salesforce for the third-party service to get a token. This flow doesn't provide for future SSO functionality.
- `Callback URL`—Use as the endpoint that the authentication provider calls back to for configuration. The authentication provider redirects to the `Callback URL` with information for each client configuration URL.

The client configuration URLs support other request parameters that enable you to direct users to log in to specific sites, obtain customized permissions from a third party, or go to a location after authenticating.

Updating Your External Auth Provider

After defining your authentication provider in your Salesforce org, go back to your external authentication provider's site and update your application to use the `Callback URL` as your custom auth provider's `Website Site URL`.

Test the SSO Connection

In a browser, open the `Test-Only Initialization URL` on the Auth Provider detail page. It redirects you to your provider's site and asks you to sign in. You're then asked to authorize your application. After you authorize, you're redirected to Salesforce.

Using Frontdoor.jsp to Log Into Salesforce

You can use `frontdoor.jsp` to give users access to Salesforce from a custom Web interface, such as a remote access Force.com site or other API integration, using their existing session ID and the server URL.

To authenticate users with `frontdoor.jsp`, you must pass the server URL and full session ID (not just the 15 or 18 character ID) to `frontdoor.jsp`.

The best way to pass the values is through a form that uses a `POST` request. For example, the following form posts the current session ID to `frontdoor.jsp`.

```
<form method="POST" action="https://instance.salesforce.com/secure/frontdoor.jsp">
<input type="hidden" name="sid"
  value="full_sessionID_value"
  />
<input type="submit" name="login" value="Log In" /></form>
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

You can also send the values as URL parameters, but this approach is not as secure as a POST request because it exposes the session ID in the URL.

```
https://instance.salesforce.com/secr/frontdoor.jsp?sid=full_sessionID_value
&retURL=optional_relative_url_to_open
```

For organizations that use a custom domain created using My Domain, you must pass the domain name in the server URL.

The following form posts the current session ID to frontdoor.jsp for a custom domain.

```
<form method="POST" action="https://domain_name.my.salesforce.com/secr/frontdoor.jsp">
<input type="hidden" name="sid"
  value="full_sessionID_value"
  />
<input type="submit" name="login" value="Log In" /></form>
```

The following example sends the values as URL parameters.

```
https://domain_name.my.salesforce.com/secr/frontdoor.jsp?sid=full_sessionID_value
&retURL=optional_relative_url_to_open
```

Instance

You must know the instance of the user's organization. For example, if the `serverUrl` returned when you log in via the API is `https://yourInstance.salesforce.com/`, `yourInstance` is the instance. The rest of the server address (the `salesforce.com` domain name) remains the same.

If you're building an integration for a single Salesforce organization, you can hard code this value. If you're building an integration for multiple organizations, parse the instance from the `serverUrl` of the returned `LoginResult` from the SOAP API `login()` call.

Full Session ID

You can obtain the full session ID from:

- The `access_token` from an OAuth authentication
 - 💡 **Tip:** One of the scopes specified when you create a connected app must be web or full.
- The `LoginResult` returned from a SOAP API `login()` call
- The `Apex UserInfo.getSessionId()`

The session ID returned using the Visualforce `{!GETSESSIONID()}` can't be used on `frontdoor.jsp`.

- 📌 **Note:** Not all session types are supported with `frontdoor.jsp`, such as community API sessions. For these sessions, consider using SAML for single sign-on, instead.

Relative URL to Open

You can optionally include a URL-encoded relative path to redirect users to the Salesforce user interface or a particular record, object, report, or Visualforce page (for example, `/apex/MyVisualforcePage`).

Using Request Parameters with Client Configuration URLs

You can add functionality to your authentication provider by using additional request parameters.

Authentication providers support additional request parameters you can use to direct users to log into specific sites, obtain customized permissions from the third party, or go to a specific location after authenticating.

Add the request parameters to the following client configuration URLs. These were generated after you defined your authentication provider:

- Test-Only Initialization URL
- Single Sign-On Initialization URL
- Existing User Linking URL
- Callback URL

Append any of these parameters to your URL as needed. For Janrain providers, append them to the appropriate callback URL.

- [Scope](#) – Customizes the permissions requested from the third party
- [Site](#) – Enables the provider to be used with a site
- [StartURL](#) – Sends the user to a specified location after authentication
- [Community](#) – Sends the user to a specific community after authentication
- [Authorization Endpoint](#) on page 927 – Sends the user to a specific endpoint for authentication (Salesforce authentication providers, only)

[Using the Scope Parameter](#)

Customizes the permissions requested from the third party like Facebook or Janrain so that the returned access token has additional permissions.

[Using the Site Parameter](#)

Use your authentication provider to log into a site or link to a sites user.

[Using the StartURL Parameter](#)

Send your user to a specific location after authenticating or linking.

[Using the Community URL Parameter](#)

Send your user to a specific Community after authenticating.

[Using the Authorization Endpoint Parameter](#)

Send your user to a specific authorization endpoint.

EDITIONS

Available in: Lightning Experience and Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view the settings:

- “View Setup and Configuration”

To edit the settings:

- “Customize Application”

AND

“Manage Auth. Providers”

Using the Scope Parameter

Customizes the permissions requested from the third party like Facebook or Janrain so that the returned access token has additional permissions.

You can customize requests to a third party to receive access tokens with additional permissions. Then you use `Auth.AuthToken` methods to retrieve the access token that was granted so you can use those permissions with the third party.

The default scopes vary depending on the third party, but usually do not allow access to much more than basic user information. Every provider type (Open ID Connect, Facebook, Salesforce, and others), has a set of default scopes it sends along with the request to the authorization endpoint. For example, Salesforce's default scope is `id`.

You can send scopes in a space-delimited string. The space-delimited string of requested scopes is sent as-is to the third party, and overrides the default permissions requested by authentication providers.

Janrain does not use this parameter; additional permissions must be configured within Janrain.

 **Example:** The following is an example of a `scope` parameter requesting the Salesforce scopes `api` and `web`, added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/sso/orgID/URLsuffix?scope=id%20api%20web`

Valid scopes vary depending on the third party; refer to your individual third-party documentation. For example, Salesforce scopes are:

Value	Description
<code>api</code>	Allows access to the current, logged-in user's account using APIs, such as REST API and Bulk API. This value also includes <code>chatter_api</code> , which allows access to Chatter REST API resources.
<code>chatter_api</code>	Allows access to Chatter REST API resources only.
<code>custom_permissions</code>	Allows access to the custom permissions in an organization associated with the connected app, and shows whether the current user has each permission enabled.
<code>full</code>	Allows access to all data accessible by the logged-in user, and encompasses all other scopes. <code>full</code> does not return a refresh token. You must explicitly request the <code>refresh_token</code> scope to get a refresh token.
<code>id</code>	Allows access to the identity URL service. You can request <code>profile</code> , <code>email</code> , <code>address</code> , or <code>phone</code> , individually to get the same result as using <code>id</code> ; they are all synonymous.
<code>openid</code>	Allows access to the current, logged in user's unique identifier for OpenID Connect apps. The <code>openid</code> scope can be used in the OAuth 2.0 user-agent flow and the OAuth 2.0 Web server authentication flow to get back a signed ID token conforming to the OpenID Connect specifications in addition to the access token.
<code>refresh_token</code>	Allows a refresh token to be returned if you are eligible to receive one. This lets the app interact with the user's data while the user is offline, and is synonymous with requesting <code>offline_access</code> .

Value	Description
visualforce	Allows access to Visualforce pages.
web	Allows the ability to use the <code>access_token</code> on the Web. This also includes <code>visualforce</code> , allowing access to Visualforce pages.

SEE ALSO:

[Using Request Parameters with Client Configuration URLs](#)

Using the Site Parameter

Use your authentication provider to log into a site or link to a sites user.

To use your provider with a site, you need to do the following:

- Enable the provider to be used with a site
- Ensure the site is configured to use the same portal
- Add the site-specific login URL information to the appropriate client configuration URL, such as the `Single Sign-On Initialization URL`, using the `site` parameter

Example: You create the site login Visualforce page, or specify the default page, when you create the site. An example site login URL is:

```
https%3A%2F%2Fmysite.force.com%2FSiteLogin.
```

The following is an example of a site-login URL added to the `Single Sign-On Initialization URL`, using the `site` parameter, where:

- `orgID` is your Auth. Provider ID
- `URLsuffix` is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/ss/orgID/URLsuffix?site=https%3A%2F%2Fmysite.force.com%2FSiteLogin
```

If you don't specify a `site` parameter, the user proceeds either to a standard portal (if set up for a portal) or the standard application (if not).

"Manage Auth. Providers"

Using the StartURL Parameter

Send your user to a specific location after authenticating or linking.

To direct your users to a specific location after authenticating, you need to specify a URL with the `startURL` request parameter. This URL must be a relative URL; passing an absolute URL results in an error. If you don't add `startURL`, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

 **Example:** For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the “Continue to Salesforce” link on the confirmation page leads to this page.

The following is an example of a `startURL` parameter added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/ss/ORGID/URLsuffix?startURL=%2F05%0000000001%3Fredirect%3D`

SEE ALSO:

[Using Request Parameters with Client Configuration URLs](#)

Using the Community URL Parameter

Send your user to a specific Community after authenticating.

To direct your users to a specific community after authenticating, you need to specify a URL with the `community` request parameter. If you don't add the parameter, the user is sent to either `/home/home.jsp` (for a portal or standard application) or to the default sites page (for a site) after authentication completes.

 **Example:** For example, with a `Single Sign-On Initialization URL`, the user is sent to this location after being logged in. For an `Existing User Linking URL`, the “Continue to Salesforce” link on the confirmation page leads to this page.

The following is an example of a `community` parameter added to the `Single Sign-On Initialization URL`, where:

- `orgID` is your Auth. Provider ID
 - `URLsuffix` is the value you specified when you defined the authentication provider
- `https://login.salesforce.com/services/auth/ss/ORGID/URLsuffix?community=https://eme.force.com/support`

“Manage Auth. Providers”

Using the Authorization Endpoint Parameter

Send your user to a specific authorization endpoint.

You can add a `provAuthorizeEndpointHost` parameter to a Salesforce authentication provider URL to direct users to an authorization endpoint for a provided domain, such as a custom domain created using My Domain. Providing an authorization endpoint lets you take advantage of features like session discovery during authorization. This parameter is only available for Salesforce authentication providers, and cannot be used to send users to an authorization page outside of a Salesforce domain.

To direct your users to a specific Salesforce authorization endpoint, you need to specify a URL with the `provAuthorizeEndpointHost` request parameter and a valid `https` host. Query strings appended to the host URL are ignored. However, you can specify a community path.

Example: The following is an example of a `provAuthorizeEndpointHost` parameter added to the authentication provider URL:

- `orgID` is your Auth. Provider ID
- `URLsuffix` is the value you specified when you defined the authentication provider

```
https://login.salesforce.com/services/auth/sso/orgID/  
URLsuffix?provAuthorizeEndpointHost=https%3A%2F%2Fmydomain.my.salesforce.com
```

The following is an example of a `provAuthorizeEndpointHost` directed to a community URL

```
https://login.salesforce.com/services/auth/sso/orgID/  
URLsuffix?provAuthorizeEndpointHost=https%3A%2F%2Fmycommunity.force.com%2Fbilling
```

If an authorization endpoint is not provided, Salesforce uses the default authorization endpoint for the authorization provider. If no default is set for the authorization provider, Salesforce uses the endpoint for `login.salesforce.com`.

The authorization endpoint does not change the token endpoint, which continues to be the configured or default host. For example, if the authorization endpoint is a sandbox instance, and your provider is set to use a production token endpoint, the flow fails, because authorization was granted by the sandbox instance, only.

"Manage Auth. Providers"

Identity Providers and Service Providers

An *identity provider* is a trusted provider that lets you use single sign-on to access other websites. A *service provider* is a website that hosts applications. You can enable Salesforce as an identity provider and define one or more service providers. Your users can then access other applications directly from Salesforce using single sign-on. Single sign-on can be a great help to your users: instead of having to remember many passwords, they only have to remember one. Plus, the applications can be added as tabs to your Salesforce organization, which means users don't have to switch between programs.

Before you can enable Salesforce as an identity provider, you have to [set up a domain](#).

Enabling Salesforce as an identity provider requires a [Salesforce certificate and key pair that is signed by an external certificate authority \(CA-signed\) or self-signed](#). If you haven't generated a Salesforce certificate and key pair, one is automatically created for you when you enable Salesforce as an identity provider. You also have the option of picking an already generated certificate, or creating one yourself.

Salesforce uses the SAML 2.0 standard for single sign-on and generates SAML assertions when configured as an identity provider.

Use the [identity provider event log](#) if your users have errors when trying to log in to your service provider's apps.

Using Identity Providers and Service Providers

Salesforce supports the following:

- Identity-provider-initiated login—when Salesforce logs in to a service provider at the initiation of the end user
- Service-provider-initiated login—when the service provider requests Salesforce to authenticate a user, at the initiation of the end user

The following is the general flow when Salesforce as an identity provider logs in to a service provider.

EDITIONS

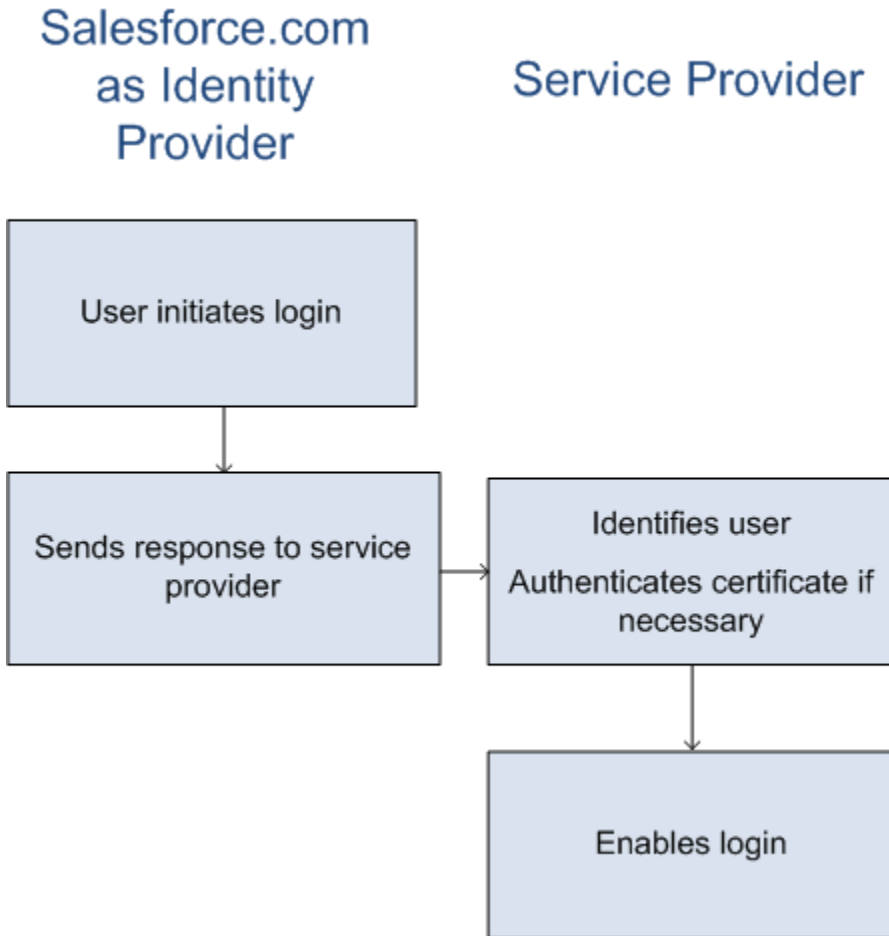

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

Define and modify identity providers and service providers:

- "Customize Application"

1. The user tries to access a service provider already defined in Salesforce.
2. Salesforce sends a [SAML response](#) to the service provider.
3. The service provider identifies the user and authenticates the certificate.
4. If the user is identified, they are logged in to the service provider.

The following is the general flow when a service provider initiates login and uses Salesforce to identify the user.

1. The service provider sends a valid SAML request. The endpoint is automatically generated when the service provider is defined—the SP-Initiated POST Endpoint.
2. Salesforce identifies the user included in the SAML request.

```

<samlp:AuthnRequest ID="bndkmeemcaamihajeloilkagfdliilbhjjnmlmfo" Version="2.0"
  IssueInstant="2010-05-24T22:57:19Z"
  ProtocolBinding="urn:oasis:names:tc:SAML:2.0:bindings:HTTP-POST"
  ProviderName="google.com" IsPassive="false"
  AssertionConsumerServiceURL="https://www.google.com/a/resp.info/acs">
  <saml:Issuer>google.com</saml:Issuer>
  <samlp:NameIDPolicy AllowCreate="true"
    Format="urn:oasis:names:tc:SAML:1.1:nameid-format:unspecified"/>
</samlp:AuthnRequest>
  
```

If a certificate was included as part of the definition, Salesforce authenticates the certificate.

 **Note:** If a certificate is included in the service provider definition, and the SAML request does not contain a certificate, the request fails. The user is not logged in using Salesforce. If the definition does not include a certificate, and the request includes a signature, the request succeeds if the user is identified correctly.

3. If the user isn't already logged in to Salesforce, they are prompted to do so.

4. Salesforce sends a [SAML response](#) to the service provider.
5. The service provider authenticates the SAML response sent by Salesforce. If the user has been authenticated, they are logged in to the service provider. The user is also logged in to Salesforce.

⚠ Important: Salesforce doesn't provide any mechanism for automatically logging the user out of Salesforce when they log out of the service provider.

The following is an example of the SAML response from Salesforce. Share this information with your service provider.

```

Enable Salesforce as an Identity Provider

To enable Salesforce as an identity provider:

1. [Set up a domain using My Domain](#), and deploy it to all users.
2. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**, and then click **Enable Identity Provider**.
3. By default, a Salesforce identity provider uses a self-signed certificate generated automatically with the SHA-256 signature algorithm. If you've already created self-signed certificates, select the certificate to use when securely communicating with other services.

If you want to use a CA-signed certificate instead of self-signed certificate, following these steps.

- a. Create and import a new CA-signed certificate. For instructions, see [Certificates and Keys](#).
- b. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**.
- c. Click **Edit**, and then select the CA-signed certificate.
- d. Click **Save**.

After you enable Salesforce as an identity provider, you can define service providers by creating connected apps (From Setup, enter *Apps* in the **Quick Find** box, then select **Apps**).

Define and modify identity providers and service providers:

- "Customize Application"

View Your Identity Provider Details

After you enable an identity provider for your organization, you can view the details from Setup by entering *Identity Provider* in the **Quick Find** box, then selecting **Identity Provider**. You might need to share this information, such as *Issuer*, with your service provider.

From this page you can click:

- **Edit** to change the certificate associated with your identity provider.
 -  **Warning:** Changing the certificate can disable access to external applications. You might need to update all external applications to validate the new certificate information.
- **Disable** to disable your identity provider.
 -  **Warning:** If you disable your identity provider, users can no longer access any external applications.
- **Download Certificate** to download the certificate associated with your identity provider. Your service provider can use this information for connecting to Salesforce.
- **Download Metadata** to download the metadata associated with your identity provider. Your service provider can use this information for connecting to Salesforce.
- In the SAML Metadata Discovery Endpoints section, you can access URLs for the SAML identity provider information for your custom domain and each community. Your service provider can use these URLs to configure single sign-on to connect to Salesforce.
 - Salesforce Identity—URL of identity provider metadata for your custom domain in My Domain.
 - *Community Name* Community Identity—URL of identity provider metadata for the named community.
- In the service providers section, next to the name of an existing service provider, click **Edit** to change its definition, click **Profiles** to add or remove user profiles that have access to this service provider, or click **Del** to delete it.
 -  **Note:** To define a new service provider, from Setup, enter *Apps* in the **Quick Find** box, then select **Apps** and then create a new SAML-enabled connected app.

[Identity Providers and Service Providers](#)

Prerequisites for Defining Service Providers

Before you define a service provider in Salesforce, follow these steps to define an identity provider and exchange configuration information with your provider.

1. [Enable Salesforce as an identity provider.](#)
2. Give your service provider information about your configuration of Salesforce as an identity provider. This information is available as metadata that you can download and give to your service provider. To obtain this metadata, from Setup, enter *Identity Provider* in the **Quick Find** box, select **Identity Provider**, then click **Download Metadata**.

If your service provider doesn't support metadata, but supports certificates instead, you can download the certificate. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**, then click **Download Certificate**.

3. Get the following information from your service provider:
 - Assertion consumer service (ACS) URL
 - Entity ID
 - Subject type—Specifies if the subject for the SAML response from Salesforce (as an identity provider) is a Salesforce user name or a federation ID
 - Security certificate—Only required when the service provider is initiating login to Salesforce and signing their SAML requests

SEE ALSO:

[Identity Providers and Service Providers](#)

Defining Service Providers as SAML-Enabled Connected Apps

1. Complete the [prerequisites](#).
2. From Setup, enter *Apps* in the **Quick Find** box, then select **Apps**.
3. Under Connected Apps, click **New**.
4. Specify the required fields under Basic Information.
5. Under Web App Settings, select **Enable SAML** and then provide the following:

Entity Id

This value comes from the service provider. Each entity ID in an organization must be unique. If you're accessing multiple apps from your service provider, you only need to define the service provider once, and then use the `RelayState` parameter to append the URL values to direct the user to the correct app after signing in.

ACS URL

The ACS, or assertion consumer service, URL comes from the SAML service provider.

Subject Type

Specifies which field defines the user's identity for the app. Options include the user's username, federation ID, user ID, a custom attribute, or an algorithmically calculated persistent ID. A custom attribute can be any custom field added to the User object in the organization, as long as it is one of the following data types: Email, Text, URL, or Formula (with Text Return Type). After you select `Custom Attribute` for the **Subject Type**, Salesforce displays a **Custom Attribute** field with a list of the available User object custom fields in the organization.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

Define and modify identity providers and service providers:

- "Customize Application"

Name ID Format

Specifies the format attribute sent in SAML messages. "Unspecified" is selected by default. Depending on your SAML service provider, you may want to set this to email address, persistent, or transient.

Issuer

By default, the standard issuer for your identity provider is used (your organization's My Domain). If your SAML service provider requires a different value, specify it here.

6. Optionally specify the following:

Start URL

Directs users to a specific location when they run the application. The Start URL can be an absolute URL, such as `https://na1.salesforce.com/001/o`, or it can be the link for the application name, such as `https://customer.goodApp.com` for GoodApp. Specifying a Start URL makes the application available in the Force.com app menu and in App Launcher.

Verify Request Signatures

Select `Verify Request Signatures` if the service provider gave you a security certificate. Browse your system for the certificate. This is only necessary if you plan to initiate logging into Salesforce from the service provider and the service provider signs their SAML requests.

 **Important:** If you upload a certificate, all SAML requests must be signed. If no certificate is uploaded, all SAML requests are accepted.

Encrypt SAML Response

Select `Encrypt SAML Response` to upload a certificate and select an encryption method for encrypting the assertion. Valid encryption algorithm values are `AES-128` (128-bit key), `AES-256` (256-bit key), and `Triple-DES` (Triple Data Encryption Algorithm).

7. Click **Save**.

To authorize users for this SAML application:

1. From Setup, enter *Connected Apps* in the `Quick Find` box, then select the option for managing connected apps.
2. Click the name of the application.
3. Select the profiles and/or permission sets that can access the application.

SEE ALSO:

[Identity Providers and Service Providers](#)

[Custom Fields](#)

Map Salesforce Users to App Users

If the `Subject Type` for the service provider definition is `Federation ID`, you must map the Salesforce user to the username used to sign into the service provider.

To map a Salesforce user to the app user:

1. From Setup, enter `Users` in the `Quick Find` box, then select **Users**, then click **Edit** for every user who needs to be mapped.
2. In `Federation ID`, under Single Sign On Information, enter the username to be used to log into the service provider.
3. Click **Save**.

Tip: Use SOAP API if you have a large number of user profiles or permission sets to update. See the [SOAP API Developer's Guide](#).

SEE ALSO:

[Identity Providers and Service Providers](#)

View Your Service Provider Details

After you define a service provider for your organization by creating a SAML-enabled connected app, you can view the details from Setup by entering `Connected Apps` in the `Quick Find` box, then selecting **Connected Apps**, and then selecting the name of the app. You might need to share this information, such as `SP-Initiated POST Endpoint` or `SP-Initiated Redirect Endpoint`, with your service providers.

From this page you can click:

- **Edit** to change the values of the service provider definition.
- **Delete** to delete a service provider definition.
 -  **Warning:** If you delete a service provider definition, your users will no longer have access to that service provider.
- **Profile Access** to change which profiles have access to this service provider.

Enabling Identity Providers and Defining Service Providers for Portals and Sites

When enabling identity providers and defining service providers for Force.com Sites, Customer Portals and partner portals, note the following:

- When [defining a service provider](#), if the `Subject Type` is `Username`, the Salesforce organization ID is prepended to the user name in the SAML assertion. For example, if the user is `jDeoint@WFC.com`, the subject for the SAML assertion contains `00DE0000000FFLT@jDeoint@WFC.com`. If the `Subject Type` is `Federation ID`, the exact federation ID is used.
- The attribute `is_portal_user` included in the SAML assertion generated by Salesforce contains values. You might want to share the following example with your service provider.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Developer**, **Enterprise**, **Performance**, and **Unlimited** Editions

USER PERMISSIONS

Define and modify identity providers and service providers:

- “Customize Application”

```
<saml:Attribute Name="is_portal_user"
  NameFormat="urn:oasis:names:tc:SAML:2.0:attrname-format:unspecified">
  <saml:AttributeValue
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:type="xs:anyType">true
  </saml:AttributeValue>
</saml:Attribute>
```

SEE ALSO:

[Identity Providers and Service Providers](#)

Using the Identity Provider Event Log

The identity provider event log records both problems and successes with inbound SAML authentication requests from another app provider, and outbound SAML responses when Salesforce is acting as an identity provider. To view the identity provider event log, from Setup, enter *Identity Provider Event Log* in the Quick Find box, then select **Identity Provider Event Log**. You can show successes, failures, or both in the log. You can view the 50 most recent events in the UI; you can view more by creating a report.

Examples Using Identity Providers and Service Providers

This section contains two examples of setting up Salesforce as an identity provider, then setting up two different service providers:

- [Google Apps](#) —shows service-provider initiated login.
- [Salesforce](#)—shows identity-provider initiated login.

Setting up Single Sign-on to Google Apps Example

This example shows how to set up single sign-on from Salesforce to Google Apps. In this example, Google is the service provider, and Google Apps is the app provided by the service provider.

For this example to work:

- You must already have a Premier Edition Google Apps account
- Your Salesforce organization must be set up for single sign-on using SAML 2.0

The general steps are as follows, with more specifics on each step below.

1. [Generate a domain name and enable an identity provider](#) in your Salesforce organization.
2. [Define the service provider in Salesforce](#).
3. [Enable the Salesforce user and profile](#).
4. [Setup Google Apps](#).
5. [Test your implementation](#).

EDITIONS

USER PERMISSIONS

Define and modify identity providers and service providers:

- “Customize Application”

Generating a Domain Name and Enabling an Identity Provider

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log in to Salesforce.
2. Generate a domain name for your organization:

- a. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**, enter a new subdomain name, and click **Check Availability**.
- b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.

 **Important:** You must deploy your domain name before you can enable Salesforce as an identity provider.

3. Enable Salesforce as an identity provider:
 - a. From Setup, enter *Identity Provider* in the **Quick Find** box, then select **Identity Provider**.
 - b. Click **Enable**.
 - c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

Defining a Service Provider

To define the service provider:

1. Log in to Salesforce.
2. From Setup, enter *Apps* in the **Quick Find** box, then select **Apps**.
3. Click **New** in the **Connected Apps** section and for **Connected App Name**, enter *Google Apps*.
4. In the **Web App Settings** area, select **Enable SAML** and then enter the following information:

Field	Value
ACS URL	The URL for your Google App account, such as <code>https://www.google.com/a/respond.info</code>
Entity ID	google.com
Subject Type	Federation ID

5. Click **Save**.
6. To authorize access to this app, enter *Connected Apps* in the **Quick Find** box, select the option for managing connected apps, and then click the name of the application. Then select the current user's profile.
7. Copy the value in the **SP-Initiated Redirect Endpoint** field. You will use this value later.

Mapping the Salesforce user to the Google Apps user

1. From your personal settings, enter *Advanced User Details* in the **Quick Find** box, then select **Advanced User Details**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. Click **Edit**.
3. For **Federation ID**, enter the username you use to sign into Google Apps, for example, `JSmith@TGroup.com`.
4. Click **Save**.

Setting up Google Apps

1. Log in to your Google Apps account.

2. Click the **Advanced tools** tab, then the **Set up single sign-on (SSO)** link.
3. Check the `Enable Single Sign-on` checkbox.
4. For `Sign-in page URL`, enter the URL copied from the `SP-Initiated Redirect Endpoint` field, from [defining a service provider](#).
5. For `Sign-out page URL`, specify the URL where you want your users to go after they log out of Google Apps, such as, `http://www.mydomain.salesforce.com`.
6. For `Change password URL`, use the following URL:
`https://mydomain.salesforce.com/_ui/system/security/ChangePassword`, where *mydomain* is the name you specified for your custom domain when you generated your domain.
7. For `Verification certificate`, upload the certificate you downloaded from [enabling an identity provider](#).
8. Click **Save Changes**.

Testing Your Implementation

To verify that your Salesforce organization can use single sign-on to Google Apps:

1. Log out of Google Apps and Salesforce.
2. Try to access a Google app page, such as `http://docs.google.com/a/respond.info/` or `http://mail.google.com/a/respond.info/`.
3. You are redirected to a Salesforce sign-on page. After you login, you are at the specified Google app page.

An alternate test is to add the Google App to a web tab in your Salesforce organization.

1. Log in to Salesforce.
2. From Setup, enter `Tabs` in the `Quick Find` box, then select **Tabs**, then click **New** in the `Web Tabs` section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the `Tab Style` lookup icon to display the `Tab Style Selector`. Select an icon. Keep all other defaults.
7. Click **Next**.
8. In the `Button or Link URL` text box, enter a Google App page, such as `docs.google.com/a/respond.info/` or `mail.google.com/a/respond.info/`, then click **Next**.

 **Note:** This has to be an absolute URL, that is, it must contain either `http://` or `https://`.

9. Click **Next** and **Save**.
10. Click the new tab at the top of your page. You are automatically logged into the specified Google app page.

Setting up Single Sign-on from Salesforce to Salesforce

This example shows how to set up a Salesforce app to initiate single sign-on from one Salesforce organization to another.

The initiating Salesforce organization, that is, the organization that you want to initially log into, acts as the *identity provider*. The Salesforce organization that you want to access using an app acts as the *service provider*. For example, suppose you have two Salesforce organizations: a sales organization and an ideas organization. You can set up single sign-on between the two organizations so your users only have to log into and remember the password for one.

For this example to work, your initiating Salesforce organization must be set up for single sign-on using SAML 2.0. The general steps are as follows, with more specifics on each of these steps.

1. [Generate a domain name and enable an identity provider](#) in the Salesforce organization that is acting as an identity provider.
2. [Set up the Salesforce organization](#) that is acting as a service provider.
3. [Define the service provider app](#) in the Salesforce organization that is acting as an identity provider.
4. [Test your implementation](#).

Generating a Domain Name and Enabling an Identity Provider

All the work in the following steps is done on the Salesforce organization that is acting as the identity provider.

To prepare your Salesforce organization for this example, generate a domain name and enable Salesforce as an identity provider:

1. Log in to Salesforce.
2. Generate a domain name for your organization:
 - a. From Setup, enter *My Domain* in the `Quick Find` box, then select **My Domain**, enter a new subdomain name, and click **Check Availability**.
 - b. If the name is available, click the **Terms and Conditions** check box, then click **Register Domain**.

 **Important:** You must deploy your domain name before you can enable Salesforce as an identity provider.
3. Enable Salesforce as an identity provider:
 - a. From Setup, enter *Identity Provider* in the `Quick Find` box, then select **Identity Provider**.
 - b. Click **Enable**.
 - c. Click **Download Certificate**. Remember where you save the certificate, as you will upload it later.

Setting up a Salesforce Organization as Service Provider

To configure a second Salesforce organization as the service provider:

1. Log in to the Salesforce organization that acts as the service provider.
2. Enable and configure SAML:
 - a. From Setup, enter *Single Sign-On Settings* in the `Quick Find` box, then select **Single Sign-On Settings**, then click **Edit**.
 - b. Select the `SAML Enabled` check box.
 - c. Use the following settings:

Field	Value
SAML Version	2.0
Issuer	The identity provider issuer URL, created when the identity provider is set up. For example, <code>https://mycustomdomain.salesforce.com</code> .
Identity Provider Certificate	Browse for the certificate you downloaded in enabling an identity provider .

Field	Value
SAML User ID Type	Select <code>Assertion</code> contains the Federation ID from the User object
SAML User ID Location	Select <code>User ID</code> is in the <code>NameIdentifier</code> element of the Subject statement

- d. Click **Save**.
 - e. Copy and save the values from the fields `Salesforce Login URL` and `Entity ID`. You need these values later, when defining the Salesforce service provider.
3. Link your user in the service provider organization to the user in the identity provider organization:
 - a. From your personal settings, enter *Advanced User Detail* in the `Quick Find` box, then select **Advanced User Detail**. No results? Enter *Personal Information* in the `Quick Find` box, then select **Personal Information**.
 - b. Click **Edit**.
 - c. For `Federation ID`, enter the username used to sign into the Salesforce identity provider organization, for example, `IDP_org@TGroup.com`.
 - d. Click **Save**.

Defining the Service Provider in the Identity Provider Organization

To define the service provider, you create a SAML enabled Web App as a connected app:

1. Log in to the Salesforce organization that acts as the identity provider.
2. From Setup, enter `Apps` in the `Quick Find` box, then select **Apps**, then in the `Connected Apps` section, click **New**.
3. Specify the following information:

Field	Value
Connected App Name	Salesforce Service Provider
Contact Email	Contact Salesforce should use for contacting you or your support team.
Enable SAML	Select this option to enter service provider details.
Entity Id	Use the Entity ID from setting up the service provider
ACS URL	Use the Salesforce Login URL from setting up the service provider
Subject Type	Select <code>Username</code>

4. Click **Save**.
5. Select the profiles allowed to access this service provider. You must select the current user's profile for this example to work.
6. Click **Save**.
7. Copy down the value of the `IdP-Initiated Login URL` field. You will use this value later, in testing.

Testing Your Implementation

To verify that your Salesforce organizations can use single sign-on to connect, create a web tab:

1. Log in to the Salesforce organization that is acting like a service provider.
2. From Setup, enter *Tabs* in the *Quick Find* box, then select **Tabs**, then click **New** in the *Web Tabs* section.
3. Choose a tab layout and click **Next**.
4. Enter a label to display on the tab.
5. Use the default name. This is the same as the label.
6. Click the *Tab Style* lookup icon to display the Tab Style Selector. Select an icon.
7. Click **Next**.
8. In the *Button or Link URL* text box, enter the value of the *IdP-Initiated Login URL* field from [defining the service provider](#), then click **Next**.

 **Note:** This has to be an absolute URL, that is, it must contain either `http://` or `https://`.

9. Click **Next**, then **Save**.
10. Click the new tab at the top of your page. If you have logged out of the Salesforce organization that acts as the identity provider, you are prompted to log in. Once you are logged in, you should see the Salesforce organization that acts as the identity provider in the tab.

Configuring Remote Settings

Before any Visualforce page, Apex callout, or JavaScript code using XMLHttpRequest in an s-control or custom button can call an external site, that site must be registered in the Remote Site Settings page, or the call will fail.

To access the page, from Setup, enter *Remote Site Settings* in the *Quick Find* box, then select **Remote Site Settings**. This page displays a list of any remote sites already registered and provides additional information about each site, including remote site name and URL.

For security reasons, Salesforce restricts the outbound ports you may specify to one of the following:

- 80: This port only accepts HTTP connections.
- 443: This port only accepts HTTPS connections.
- 1024–66535 (inclusive): These ports accept HTTP or HTTPS connections.

To register a new site:

1. Click **New Remote Site**.
2. Enter a descriptive term for the *Remote Site Name*.
3. Enter the URL for the remote site.
4. To allow access to the remote site regardless of whether the user's connection is over HTTP or HTTPS, select the *Disable Protocol Security* checkbox. When selected, Salesforce

EDITIONS

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Visualforce and S-controls are not available in **Database.com**

USER PERMISSIONS

To configure remote settings:

- “Modify All Data”

can pass data from an HTTPS session to an HTTP session, and vice versa. Only select this checkbox if you understand the security implications.

5. Optionally, enter a description of the site.
6. Click **Save** to finish, or click **Save & New** to save your work and begin registering an additional site.

Named Credentials

A named credential specifies the URL of a callout endpoint and its required authentication parameters in one definition. To simplify the setup of authenticated callouts, specify a named credential as the callout endpoint. If you instead specify a URL as the callout endpoint, you must register that URL in your org's remote site settings and handle the authentication yourself. For example, for an Apex callout, your code would need to handle authentication, which can be less secure and especially complicated for OAuth implementations.

Salesforce manages all authentication for callouts that specify a named credential as the callout endpoint so that you don't have to. You can also skip remote site settings, which are otherwise required for callouts to external sites, for the site defined in the named credential.

Named credentials are supported in these types of callout definitions:

- Apex callouts
- External data sources of these types:
 - Salesforce Connect: OData 2.0
 - Salesforce Connect: OData 4.0
 - Salesforce Connect: Custom (developed with the Apex Connector Framework)

By separating the endpoint URL and authentication from the callout definition, named credentials make callouts easier to maintain. For example, if an endpoint URL changes, you update only the named credential. All callouts that reference the named credential simply continue to work.

If you have multiple orgs, you can create a named credential with the same name but with a different endpoint URL in each org. You can then package and deploy—on all the orgs—one callout definition that references the shared name of those named credentials. For example, the named credential in each org can have a different endpoint URL to accommodate differences in development and production environments. If an Apex callout specifies the shared name of those named credentials, the Apex class that defines the callout can be packaged and deployed on all those orgs without programmatically checking the environment.

Named credentials support basic password authentication and OAuth 2.0. You can set up each named credential to use an org-wide named principal or to use per-user authentication so that users can manage their own credentials.

To reference a named credential from a callout definition, use the named credential URL. A named credential URL contains the scheme `callout:`, the name of the named credential, and an optional path. For example:

`callout:My_Named_Credential/some_path`.

You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: `callout:My_Named_Credential/some_path?format=json`.

 **Example:** In the following Apex code, a named credential and an appended path specify the callout's endpoint.

```
HttpRequest req = new HttpRequest();
req.setEndpoint('callout:My_Named_Credential/some_path');
req.setMethod('GET');
Http http = new Http();
```

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

```

HTTPResponse res = http.send(req);
System.debug(res.getBody());

```

The referenced named credential specifies the endpoint URL and the authentication settings.

The screenshot shows the 'Named Credential: My Named Credential' configuration page. It includes a 'Back to Named Credentials' link, 'Edit' and 'Delete' buttons, and a form with the following fields:

- Label: My Named Credential
- Name: My_Named_Credential
- URL: https://my_endpoint.example.com
- Authentication:
 - Certificate: (empty)
 - Identity Type: Named Principal
 - Authentication Protocol: Password Authentication
 - Username: myname

If you use OAuth instead of password authentication, the Apex code remains the same. The authentication settings differ in the named credential, which references an authentication provider that's defined in the org.

The screenshot shows the 'Authentication' configuration page for a 'Named Principal'. It includes the following fields:

- Certificate: (empty)
- Identity Type: Named Principal
- Authentication Protocol: OAuth 2.0
- Authentication Provider: [GoogleAuth](#)
- Scope: (empty)
- Authentication Status: Pending

In contrast, let's see what the Apex code looks like without a named credential. Notice that the code becomes more complex to handle authentication, even if we stick with basic password authentication. Coding OAuth is even more complex and is an ideal use case for named credentials.

```

HttpRequest req = new HttpRequest();
req.setEndpoint('https://my_endpoint.example.com/some_path');
req.setMethod('GET');

// Because we didn't set the endpoint as a named credential,
// our code has to specify:
// - The required username and password to access the endpoint
// - The header and header information

String username = 'myname';
String password = 'mypwd';

Blob headerValue = Blob.valueOf(username + ':' + password);

```

```
String authorizationHeader = 'BASIC ' +
    EncodingUtil.base64Encode(headerValue);
req.setHeader('Authorization', authorizationHeader);

// Create a new http object to send the request object
// A response object is generated as a result of the request

Http http = new Http();
HTTPResponse res = http.send(req);
System.debug(res.getBody());
```

Define a Named Credential

Create a named credential to specify the URL of a callout endpoint and its required authentication parameters in one definition. You can then specify the named credential as a callout endpoint to let Salesforce handle all the authentication. You can also skip remote site settings, which are otherwise required for callouts to external sites, for the site defined in the named credential.

Grant Access to Authentication Settings for Named Credentials

For named credentials that use per-user authentication, grant access to users through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

SEE ALSO:

Define a Named Credential

Create a named credential to specify the URL of a callout endpoint and its required authentication parameters in one definition. You can then specify the named credential as a callout endpoint to let Salesforce handle all the authentication. You can also skip remote site settings, which are otherwise required for callouts to external sites, for the site defined in the named credential.

Named credentials are supported in these types of callout definitions:

- Apex callouts
- External data sources of these types:
 - Salesforce Connect: OData 2.0
 - Salesforce Connect: OData 4.0
 - Salesforce Connect: Custom (developed with the Apex Connector Framework)

To set up a named credential:

1. From Setup, enter *Named Credentials* in the Quick Find box, then select **Named Credentials**.
2. Click **New Named Credential**, or click **Edit** to modify an existing named credential.
3. Complete the fields.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view, create, edit, or delete named credentials:

- “Modify All Data”

Field	Description
Label	<p>A user-friendly name for the named credential that's displayed in the Salesforce user interface, such as in list views.</p> <p>If you set <code>Identity Type</code> to <code>Per User</code>, this label appears when your users view or edit their authentication settings for external systems.</p>
Name	<p>A unique identifier that's used to refer to this named credential from callout definitions and through the API.</p> <p>The name can contain only underscores and alphanumeric characters. It must be unique, begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p>
URL	<p>The URL or root URL of the callout endpoint. Must begin with <code>http://</code> or <code>https://</code>. Can include a path but not a query string. Examples:</p> <ul style="list-style-type: none"> <code>http://my_endpoint.example.com</code> <code>https://my_endpoint.example.com/secure/payroll</code> <p>You can append a specific path and a query string when you reference the named credential from the callout definition. For example, an Apex callout could reference the named credential "My_Payroll_System" as follows.</p> <pre>HttpRequest req = new HttpRequest(); req.setEndpoint('callout:My_Payroll_System/paystubs?format=json');</pre>
Certificate	<p>If you specify a certificate, your Salesforce org supplies it when establishing each two-way SSL connection with the external system. The certificate is used for digital signatures, which verify that requests are coming from your Salesforce org.</p>
Identity Type	<p>Determines whether you're using one set or multiple sets of credentials to access the external system.</p> <ul style="list-style-type: none"> Anonymous: No identity and therefore no authentication. Per User: Use separate credentials for each user who accesses the external system via callouts. Select this option if the external system restricts access on a per-user basis. <ul style="list-style-type: none"> After you grant user access through permission sets or profiles in Salesforce, users can manage their own authentication settings for external systems in their personal settings. Named Principal: Use the same set of credentials for all users who access the external system from your org. Select this option if you designate one user account on the external system for all your Salesforce org users.

4. Select the authentication protocol.

- If you select **Password Authentication**, enter the username and password for accessing the external system.
- If you select **OAuth 2.0**, complete the following fields.

Field	Description
Authentication Provider	Choose the provider. See About External Authentication Providers on page 894.
Scope	Specifies the scope of permissions to request for the access token. Your authentication provider determines the allowed values. See Using the Scope Parameter on page 924.  Note: <ul style="list-style-type: none"> – The value that you enter replaces the <code>Default Scopes</code> value that's defined in the specified authentication provider. – Whether scopes are defined can affect whether each OAuth flow prompts the user with a consent screen. – We recommend that you request a refresh token or offline access. Otherwise, when the token expires, you lose access to the external system.
Start Authentication Flow on Save	To authenticate to the external system and obtain an OAuth token, select this checkbox. This authentication process is called an OAuth flow. When you click Save , the external system prompts you to log in. After successful login, the external system grants you an OAuth token for accessing its data from this org. Redo the OAuth flow when you need a new token—for example, if the token expires—or if you edit the <code>Scope</code> or <code>Authentication Provider</code> fields.

5. If you want to use custom headers or bodies in the callouts, enable the relevant options.

Field	Description
Generate Authorization Header	By default, Salesforce generates an authorization header and applies it to each callout that references the named credential. Deselect this option only if one of the following statements applies. <ul style="list-style-type: none"> • The remote endpoint doesn't support authorization headers. • The authorization headers are provided by other means. For example, in Apex callouts, the developer can have the code construct a custom authorization header for each callout. This option is required if you reference the named credential from an external data source.
Allow Merge Fields in HTTP Header Allow Merge Fields in HTTP Body	In each Apex callout, the code specifies how the HTTP header and request body are constructed. For example, the Apex code can set the value of a cookie in an authorization header. These options enable the Apex code to use merge fields to populate the HTTP header and request body with org data when the callout is made. These options aren't available if you reference the named credential from an external data source.

To reference a named credential from a callout definition, use the named credential URL. A named credential URL contains the scheme `callout:`, the name of the named credential, and an optional path. For example:

```
callout:My_Named_Credential/some_path.
```

You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example: `callout:My_Named_Credential/some_path?format=json`.

Grant Access to Authentication Settings for Named Credentials

For named credentials that use per-user authentication, grant access to users through permission sets and profiles. Doing so lets users set up and manage their own authentication settings for accessing the external system.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets** or **Profiles**.
2. Click the name of the permission set or profile that you want to modify.
3. Do one of the following.
 - For a permission set, or for a profile in the enhanced profile user interface, click **Named Credential Access** in the Apps section. Then click **Edit**.
 - For a profile in the original profile user interface, click **Edit** in the Enabled Named Credential Access section.
4. Add the named credentials that you want to enable.
5. Click **Save**.

About Identity Connect

Identity Connect provides Active Directory integration.

Identity Connect provides Active Directory integration with Salesforce via a service which runs on either Windows or Linux platforms. This integration includes syncing Active Directory users with either Salesforce or Identity Connect acting as the Identity Service Provider (IDP) for Single Sign On (SSO) Active Directory integration when logging into Salesforce.

[About Identity Connect](#)

[Installing Identity Connect](#)

My Domain

Add a custom domain to your Salesforce org URL with the My Domain Salesforce feature. Having a custom domain lets you highlight your brand and makes your org more secure. A custom domain is convenient and allows you to personalize your login page.

Using My Domain, you define a custom domain that's part of your Salesforce domain. A custom domain is actually a subdomain of a primary domain. For example, `developer` is a subdomain of the `salesforce.com` domain. With a custom domain, you can replace the URL that Salesforce assigned you, like `https://yourInstance.salesforce.com/`, with your chosen name, like `https://somethingcool.my.salesforce.com`.

A custom domain name helps you better manage login and authentication for your org in several key ways. You can

- Highlight your business identity with your unique domain URL

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available for an additional cost in: **Enterprise**, **Performance**, and **Unlimited** Editions. **Developer** Edition includes 10 Identity Connect permission set licenses.

USER PERMISSIONS

To assign a permission set license:

- “Manage Internal Users”

To create and assign permission sets:

- “Manage Profiles and Permission Sets”

To view users that are assigned to a permission set:

- “View Setup and Configuration”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance**, **Unlimited**, **Enterprise**, **Developer**, **Professional**, and **Group** Editions.

- Brand your login screen and customize right-frame content
- Block or redirect page requests that don't use the new domain name
- Work in multiple Salesforce orgs at the same time
- Set custom login policy to determine how users are authenticated
- Let users log in using a social account, like Google and Facebook, from the login page
- Allow users to log in once to access external services

My Domain is required before you can use these Salesforce features:

- Single sign-on (SSO) with external identity providers
- Social sign-on with authentication providers, such as Google and Facebook
- Lightning components in Lightning component tabs, Lightning Pages, the Lightning App Builder, or standalone apps

 [Watch a Demo](#) (5:11 minutes)

My Domain is also available for sandbox environments.

 **Note:** My Domain is subject to additional [Terms of Use](#).

Your domain name uses standard URL format, including:

- Protocol: https://
- Subdomain prefix: your brand or term
- Domain: my.salesforce.com

Your name can include up to 40 letters, numbers, and hyphens. You can't start the domain name with root, status, or a hyphen.

You have the chance to try out names and check availability before you commit to your domain name.

Salesforce is enabled as an identity provider when a domain is created. After your domain is deployed, you can add or change identity providers and increase security for your organization by customizing your domain's login policy.

 **Important:** After you deploy your domain, it's activated immediately and requests with the original URL are redirected to your new domain. Only Salesforce Customer Support can disable or change your domain name after it's deployed.

[Set Up a Domain Name](#)

Implementing your custom domain name is quick and easy.

[Define Your Domain Name](#)

Sign up for your organization's custom domain name. You can try out names and check availability before registering the name.

[Guidelines and Best Practices for Implementing My Domain](#)

These tips help smooth the transition to a new domain name.

[Test and Deploy Your New Domain Name](#)

After you set up your domain name, test it and then roll it out to your users. Testing gives you the chance to explore your domain name. It also helps you verify addresses for pages before rolling out your domain to your users.

[My Domain URL Changes](#)

When you set up a domain name for your org, all your application URLs, including Visualforce pages, change too. Make sure that you update all application URLs before you deploy a domain name. For example, the `Email Notification URL` field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it. This table shows you the differences.

[Set the My Domain Login Policy](#)

Secure your login by customizing the login policy for your domain.

[Customize Your Login Page Branding](#)

Customize the look and feel of your login page by adding a background color, logo, and right-side content. Customizing your login page helps users recognize your page by tying it to your company's branding.

[Add Identity Providers on a Login Page](#)

Allow users to authenticate using alternate identity provider options right from your login page. If you've enabled single sign-on and configured SAML, or set up external authentication providers as Auth. Providers in Setup, you can provide links to these identity providers on your domain's login page. Users are sent to the identity provider's login screen to authenticate and then are redirected back to Salesforce.

[Get System Performance and Maintenance Information Using My Domain](#)

Salesforce customers get system performance and maintenance information from `trust.salesforce.com`.

USER PERMISSIONS

To set up a domain name:

- "Customize Application"

Define Your Domain Name

Sign up for your organization's custom domain name. You can try out names and check availability before registering the name.

Start setting up your custom domain name by finding a domain name unique to your org and signing up for it. Choose your name carefully. When you register, Salesforce updates its domain name registries with your domain name. After it's registered, only Salesforce Customer Support can disable or change your domain name.

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Enter the subdomain name you want to use within the sample URL. For example, a company called Universal Containers wants to use the subdomain `universalcontainers`. The company's login URL would be `https://universalcontainers.my.salesforce.com/`. Your name can include up to 40 letters, numbers, and hyphens.

You can't use these reserved words for subdomains:

- `www`
- `salesforce`
- `heroku`

You can't start the domain name with:

- `root`
- `status`
- a hyphen

3. Click **Check Availability**. If your name is already taken, choose a different one.
4. Click **Terms and Conditions** to review your agreement, then select the checkbox.
5. Click **Register Domain**.
6. You receive an email when your domain name is ready for testing. It can take up to 3 minutes.

Your users can use your new domain name after you test and deploy it.

USER PERMISSIONS

To define a domain name:

- "Customize Application"

Guidelines and Best Practices for Implementing My Domain

These tips help smooth the transition to a new domain name.

- Communicate the upcoming change to your users before deploying it.
- Deploy your new domain when your org receives minimal traffic, like during a weekend, so you can troubleshoot while traffic is low.
- Before deploying, first test the login policy customizations, custom UI features, Visualforce pages, and application URL changes in a sandbox environment.
- If you've customized your Salesforce UI with features such as custom buttons or Visualforce pages, make sure that you test custom elements thoroughly before deploying your domain name. Look for hard-coded references and instance-based URLs in your customizations. Use your custom domain URLs instead.
- Make sure that you update all application URLs before you deploy a domain name. For example, the `Email Notification URL` field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it.
- If your domain is registered but has not yet been deployed, URLs contain your custom domain name when you log in from the My Domain login page. However, links that originate from merge fields that are embedded in emails sent asynchronously, such as workflow emails, still use the old URLs. *After* your domain is deployed, those links show the new My Domain URLs.
- Help your users get started using your new domain name by providing links to pages they use frequently, such as your login page. Let your users know if you changed the login policy, and encourage them to update their bookmarks the first time they're redirected.
- Choose the Redirect Policy option **Redirected with a warning to the same page within the domain** to give users time to update their bookmarks with the new domain name. After a few days or weeks, change the policy to **Not redirected**. This option requires users to use your domain name when viewing your pages. It provides the greatest level of security.
- Only use `Prevent login from https://login.salesforce.com` if you're concerned that users who aren't aware of your custom domain try to use it. Otherwise, leave the option available to your users while they get used to the new domain name.
- Bookmarks don't work when the `Redirect to the same page within the domain` option is selected for partner portals. Manually change the existing bookmarks to point to the new domain URL by replacing the Salesforce instance name with your custom domain name. For example, replace `https://yourInstance.salesforce.com/` with `https://yourDomain.my.salesforce.com/` in the bookmark's URL.
- If you block application page requests that don't use the new Salesforce domain name URLs, let your users know that they must either update old bookmarks or create new ones for the login page. They must also update any tabs or links within the application. Users are required to use the new URLs immediately if you change your login redirect policy to `Not Redirected`.
- If you are using My Domain, you can identify which users are logging in with the new login URL and when. From Setup, enter `Login History` in the `Quick Find` box, then select **Login History** and view the Username and Login URL columns.
- On the `login.salesforce.com` page, users can click **Log in to a custom domain** to enter your custom domain name and log in. In this case, they must know the domain name. As a safeguard, give them a direct link to your custom domain's login page as well.

[My Domain URL Changes](#)[Test and Deploy Your New Domain Name](#)[My Domain](#)

Test and Deploy Your New Domain Name

After you set up your domain name, test it and then roll it out to your users. Testing gives you the chance to explore your domain name. It also helps you verify addresses for pages before rolling out your domain to your users.

Important: After you deploy your domain, it's activated immediately and requests with the original URL are redirected to your new domain. Only Salesforce Customer Support can disable or change your domain name after it's deployed.

1. Test your domain login. From Setup, enter *My Domain* in the `Quick Find` box, then select **My Domain**, then **Click here to login**. Or, log out of your DE org and log in to Salesforce using your custom domain name. You can click the login link in the activation email you received. You can customize your domain login page and add authentication services (like social sign-on) before you deploy the domain to your users. You can also test the domain in a sandbox environment.
2. Test the new domain name by clicking tabs and links. All pages now show your new domain name.

If you've customized your Salesforce UI with features such as custom buttons or Visualforce pages, make sure that you test custom elements thoroughly before deploying your domain name. Look for hard-coded references and instance-based URLs in your customizations. Use your custom domain URLs instead.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

My Domain URL Changes

When you set up a domain name for your org, all your application URLs, including Visualforce pages, change too. Make sure that you update all application URLs before you deploy a domain name. For example, the **Email Notification** URL field in Chatter Answers continues to send notifications with the old URLs to internal users unless you update it. This table shows you the differences.

URL Type	Old URL	New URL
Login	https://login.salesforce.com	https://<subdomain>.my.salesforce.com
Application page or tab	https://yourinstance.salesforce.com/<pageID>	https://<subdomain>.my.salesforce.com/<pageID>
Visualforce page with no namespace	https://c.visual.force.com/apex/<pagename>	https://<subdomain>--c.visual.force.com/apex/<pagename>
Visualforce page with namespace	https://<yournamespace101>.visual.force.com/apex/<pagename>	https://<subdomain>--<yournamespace>.visual.force.com/apex/<pagename>

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer, Professional,** and **Group** Editions.

-  **Note:** If you implement My Domain in a sandbox environment, the URL format is `https://<subdomain>--<sandboxname>.<instance>.my.salesforce.com`. Since you can't have namespaces in a sandbox environment, the format of all Visualforce page URLs in a sandbox is `https://<subdomain>--<sandboxname>.<instance>.my.salesforce.com/apex/<pagename>`.

Set the My Domain Login Policy

Secure your login by customizing the login policy for your domain.

Customize your login policy to add a layer of security for your org. By default, users log in from a generic Salesforce login page, bypassing the login page specific to your domain. Users are also allowed to make page requests without your domain name, such as when using old bookmarks.

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Under My Domain Settings, click **Edit**.
3. To turn off authentication for users who don't use your domain-specific login page, select the login policy. For example, selecting the policy prevents users from logging in at the generic `https://<instance>.salesforce.com/` login page, and then being redirected to your pages after login. This option enhances security by preventing login attempts by anyone who doesn't know your domain name.
4. Choose a redirect policy.
 - a. Choose **Redirect to the same page within the domain** to allow users to continue using URLs that do not include your domain name. Choosing this option does not enhance security for your org.

 **Note:** Bookmarks don't work when the **Redirect to the same page within the domain** option is selected for partner portals. Manually change the existing bookmarks to point to the new domain URL by replacing the Salesforce instance name with your custom domain name. For example, replace `https://yourInstance.salesforce.com/` with `https://yourDomain.my.salesforce.com/` in the bookmark's URL.

- b. Choose **Redirected with a warning to the same page within the domain** to remind users to use your domain name. After reading the warning, users are allowed to view the page. Selecting this option for a few days or weeks can help users transition to a new domain name, but does not enhance security for your org.
 - c. Choose **Not redirected** to require users to use your domain name when viewing your pages. This option provides the greatest level of security.
5. Click **Save**.

To set login policy for a domain:

- "Customize Application"

Customize Your Login Page Branding

Customize the look and feel of your login page by adding a background color, logo, and right-side content. Customizing your login page helps users recognize your page by tying it to your company's branding.

🕒 [Setting Up a My Domain](#) (5:10 minutes. Login page branding starts at 2:43.)

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Under Authentication Configuration, click **Edit**.
3. To customize your logo, upload an image.
Images can be .jpg, .gif, or .png files up to 100 KB. Maximum image size is 250px by 125px.
4. To customize your login page background, click the  or enter a valid hexadecimal color code.
5. Enter the URL of the file to be included in the right-side iFrame on the login page.
The content in the right-side iFrame can resize to fill about 50% of the page. Your content must be hosted at a URL that uses SSL encryption and the https:// prefix. To build your own custom right-side iFrame content page using responsive web design, use the [My Domain Sample](#) template.
Example: <https://c.salesforce.com/login-messages/promos.html>
6. Optionally, select authentication services as identity providers on the login page, such as social sign-on providers like Google and Facebook. Users can then log in with their social account credentials. Configure authentication services as Auth. Providers in Setup.
7. Click **Save**.

Add Identity Providers on a Login Page

Allow users to authenticate using alternate identity provider options right from your login page. If you've enabled single sign-on and configured SAML, or set up external authentication providers as Auth. Providers in Setup, you can provide links to these identity providers on your domain's login page. Users are sent to the identity provider's login screen to authenticate and then are redirected back to Salesforce.

 **Note:** Available authentication services include all providers configured as SAML single sign-on identify providers or external authentication providers, except Janrain. Janrain can't be used for authentication from the login page.

1. From Setup, enter *My Domain* in the **Quick Find** box, then select **My Domain**.
2. Under Authentication Configuration, click **Edit**.
3. Select one or more already configured authentication services as an identity provider.
4. Click **Save**.

Get System Performance and Maintenance Information Using My Domain

Salesforce customers get system performance and maintenance information from `trust.salesforce.com`.

Here's how to get that information using your new domain name.

1. Go to trust.salesforce.com where you can check the System Status.
2. To find the instance for your domain, click **What instance am I using?**
3. In the System Status table, look for the entry for your instance.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Performance, Unlimited, Enterprise, Developer, and Database.com** Editions. Some topics don't apply to **Database.com**.

What is My Domain?

Using My Domain, administrators can define a custom Salesforce domain name for their organization. The custom domain name appears in all org URLs and replaces the instance name (such as `na1`). URLs for organizations using My Domain use the format `https://yourDomain.my.salesforce.com/`.

My Domain is not used as a custom domain for sites, communities, or portals. The domains are defined separately.

Which Salesforce Editions is My Domain available in?

Performance, Unlimited, Enterprise, Developer, Professional, and Group editions.

What are My Domain's advantages?

My Domain allows customers to:

- Customize the login page with their own branding.
- Use Identity features for single sign-on. My Domain is required for:
 - Single sign-on into a Salesforce organization
 - Using a Salesforce organization as an identity provider for single sign-on into third-party applications or other Salesforce organizations
- Preserve deep links (such as `https://yourDomain.my.salesforce.com//001/o`) through any future organization splits and migrations.

Does My Domain work differently in different Salesforce Editions?

The only difference is that Developer Edition URLs are appended with "-developer-edition".

Does My Domain work in sandboxes?

Sandboxes and production organizations are different environments, and maintain separate domain name registries. So, you can use the same My Domain name in sandbox. In fact, during a sandbox refresh, the My Domain name of the production organization is copied into sandbox.

For example, if the production organization name is `acme.my.salesforce.com`, the sandbox name is `acme--<sandboxName>.csN.my.salesforce.com`.

You should test your custom domain in a sandbox before deploying it to find any hard-coded references to URLs in Visualforce pages, email templates, or other content.

What are the differences between the Redirect Policy options?

After you deploy your domain, you can select a redirect option for users trying to access a page in your organization without using the custom domain name.

To see the assigned policy, from Setup, enter *My Domain* in the *Quick Find* box, then select **My Domain**.

If `Redirected to the same page within the domain` is selected, users are immediately sent to the new URL, without any notification.

If `Redirected with a warning to the same page within the domain` is selected, users briefly see a standard warning message before being redirected to the new URL. The warning gives users a chance to change their bookmarks and start getting used to using the new domain name. The message can't be customized.

If `Not redirected` is selected, the user sees the page is missing. This is recommended as the most secure option, but it is a best practice to use `Redirected with a warning to the same page within the domain` for a short period of time after your custom domain is deployed so users get used to the new URLs.

How does My Domain work with single sign-on?

My Domain is required for single sign-on implementation. For inbound single sign-on requests, the custom domain enables deep linking directly to pages in the organization. No changes are required for the identity provider. The Salesforce SAML endpoint (`login.salesforce.com`) continues to work for SAML and OAUTH requests, even if your organization deploys My Domain and has `Prevent login from https://login.salesforce.com` for users selected in the My Domain Settings.

 **Note:** If you're using external Chatter groups along with single sign-on for employees, then users outside of your company are redirected to a SAML identity provider they can't access. For your implementation to work, migrate external Chatter groups to communities, or in the My Domain settings do *not* select `Prevent login from https://login.salesforce.com`. This allows users to continue to login through `login.salesforce.com`.

Is My Domain available for the API?

Yes, you can use the Salesforce APIs with your My Domain.

Is the subdomain for My Domain related to the subdomain for Sites?

No. The subdomains you use for Sites and My Domain can be the same or different.

Is there a limit on how long our subdomain can be?

Yes. You can use up to 40 characters. The protocol (`https://`) and the domain (`my.salesforce.com`) are not included in the limit.

After we set up My Domain, will we still be able to log in from `https://login.salesforce.com`?

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Will we still be able to log in from a URL that includes a Salesforce instance, like `https://yourInstance.salesforce.com/`?

Yes, unless your system administrator prevents it. If so, you'll need to log in using your new My Domain URL.

Can we still use our old Salesforce bookmarks?

Yes, if your system administrator allows it. If so, you'll be redirected to the Salesforce page using its new My Domain URL. If your system administrator prevents using old bookmarks, or you see a warning, you should update your bookmarks using the new domain name.

Will our Visualforce and content (files) page URLs change?

URLs for your Visualforce pages contain your new domain name, such as `https://<mydomain>--c.<instance>.visual.force.com`.

URLs for your content (files) also contain your new domain name, such as `https://<mydomain>--c.<instance>.content.force.com`.

Can I rename or remove my custom domain name?

You can't change your custom domain name, or reverse its deployment, once deployed. If you have a special need to change it, contact Salesforce Customer Support.

App Launcher

The App Launcher presents users with logos that link to their on-premise applications, connected apps, and Salesforce apps, all from a unified user interface. Administrators can set the default app order for their organizations.

All Lightning Experience users get the App Launcher.

Salesforce Classic users need the "Use Identity Features" permission, and the App Launcher option in their profile set to **Visible**. Users see only the apps they are authorized to see.

In Salesforce Classic, administrators using the System Administrator profile automatically have access to the App Launcher. Administrators using profiles cloned from the System Administrator profile don't.

[Enable the App Launcher with a Profile in Salesforce Classic](#)

Create a profile and assign it to users, so they can access the App Launcher.

Enable the App Launcher with a Profile in Salesforce Classic

Create a profile and assign it to users, so they can access the App Launcher.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

In Salesforce Classic, administrators using the System Administrator profile automatically have access to the App Launcher. Administrators using profiles cloned from the System Administrator profile don't.

1. From Setup, enter *Profiles* in the **Quick Find** box, then select **Profiles**.
2. Click **New Profile**.
3. Select an Existing Profile as a basis for the new profile.
For example, select **Standard User**.
4. Enter the name of the new profile.
For example, *Standard User Identity*.
5. Click **Save**.
6. In the detail page for the new profile, click **Edit**.
7. In Custom App Settings, set the App Launcher to **Visible**, if it isn't already.
Under Tab Settings, verify that the App Launcher tab is set to **Default On**.
8. Under Administrative Permissions, select **Use Identity Features**.
9. Click **Save**.
10. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
11. Click **Edit** next to each user you want to access the App Launcher.
12. In the user's Profile field, select the new profile that has "Use Identity Features" enabled.
For example, you might use the *Standard User Identity* profile.
13. Click **Save**.
When you log in as the selected user, the App Launcher appears in the drop-down app menu.

Enable the App Launcher with a Permission Set in Salesforce Classic

Create a permission set and assign it to users, so they can access the App Launcher.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

1. From Setup, enter *Permission Sets* in the **Quick Find** box, then select **Permission Sets**.
2. Click **New**.
3. Enter a Label for the new permission set.
For example, *Identity Features*.
4. Optionally, restrict the use of this permission set to a specific User License.
5. Click **Save**.
6. Click **System Permissions**.
7. Click **Edit**.
8. Select **Use Identity Features**.
9. Click **Save**.
10. From Setup, enter *Users* in the **Quick Find** box, then select **Users**.
11. Click the name of an existing user to whom you want to give access to the App Launcher.
12. In the **Permission Set Assignments** related list, click **Edit Assignments**.
13. Add the new permission set you created for identity features to Enabled Permission Sets.
14. Click **Save**.

When you log in as the selected user, the App Launcher appears in the drop-down app menu.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

 **Note:** Still not seeing the App Launcher? In the profile associated with the user, select **Visible** for the App Launcher setting.

Configure File Upload and Download Security Settings

For security reasons, your organization may want to configure the way some file types are handled during upload and download.

To manage file upload and download settings:

1. From Setup, enter *File Upload and Download Security* in the Quick Find box, then select **File Upload and Download Security**.
2. Click **Edit**.
3. To prevent users from uploading files that may pose a security risk, select `Don't allow HTML uploads as attachments or document records`.

This setting blocks upload of these MIME file types: `.html`, `.htt`, `.mht`, `.svg`, `.swf`, `.thtml`, and `.xhtml`.

 **Warning:** Keep the following in mind when selecting this option:

- If your organization uses the partner portal to give your partner users access to Salesforce, we don't recommend enabling this setting. Enabling this setting prevents your organization from customizing the appearance of your partner portal.
- HTML attachments are not permitted on solutions, regardless of whether this security setting is enabled. In addition, this setting does not affect attachments on email templates; HTML attachments on email templates are always permitted.
- After this setting is enabled, previously-uploaded HTML documents and attachments are unaffected. However, when users attempt to view an HTML attachment or

EDITIONS

document, their browser first prompts them to open the file in the browser, save it to their computer, or cancel the action.

4. Set download behavior for each file type:
 - a. **Download** (recommended): The file, regardless of file type, is always downloaded.
 - b. **Execute in Browser**: The file, regardless of file type, is displayed and executed automatically when accessed in a browser or through an HTTP request.
 - c. **Hybrid**: Salesforce Files are downloaded. Attachments and documents execute in the browser.
5. Click **Save**.

Certificates and Keys

Salesforce certificates and key pairs are used for signatures that verify a request is coming from your organization. They are used for authenticated SSL communications with an external web site, or when using your organization as an Identity Provider. You only need to generate a Salesforce certificate and key pair if you're working with an external website that wants verification that a request is coming from a Salesforce organization.

You can export all your certificates and private keys into a keystore for storage or import certificates and keys from a keystore. This allows you to move keys from one organization to another. The exported file is in the Java Keystore (JKS) format, and the imported file must also be in the JKS format. For more information about the JKS format, see [Oracle's Java KeyStore documentation](#).

API Client Certificate

The API client certificate is used by workflow outbound messages, the AJAX proxy, and delegated authentication HTTPS callouts. For security reasons, the API client certificate should be known only to your org.

Choose an API client certificate based on the remote endpoint you connect to. Some endpoint servers require a certificate chain that is trusted by a certificate authority; others are fine with directly trusting a self-signed certificate.

[Generate a Self-Signed Certificate](#)

Generate a certificate signed by Salesforce to show that communications purporting to come from your organization are really coming from there.

[Generate a Certificate Signed By a Certificate Authority](#)

A certificate authority-signed (CA-signed) certificate can be a more authoritative way to prove that your organization's data communications are genuine. You can generate this type of certificate and upload it to Salesforce.

[Set Up a Mutual Authentication Certificate](#)

To prevent security from being compromised by simple impersonation, you can require clients and servers to prove their identity to each other with a mutual authentication certificate.

[Configure Your API Client to Use Mutual Authentication](#)

Enforce SSL/TLS mutual authentication.

[Manage Master Encryption Keys](#)

Encrypted custom fields, such as `Social Security Number` or `Credit Card Number`, are encrypted with a master encryption key. This key is automatically assigned when you select fields to encrypt. You manage your own master key according to your organization's security and regulatory needs.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

Generate a Self-Signed Certificate

Generate a certificate signed by Salesforce to show that communications purporting to come from your organization are really coming from there.

1. From Setup, search for *Certificate and Key Management* in the Quick Find box.
2. Select **Create Self-Signed Certificate**.
3. Enter a descriptive label for the Salesforce certificate.

This name is used primarily by administrators when viewing certificates.

4. Enter a unique name. You can use the name that's automatically populated based on the certificate label you enter.

This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the unique name when referring to the certificate using the Force.com web services API or Apex.

5. Select a key size for your generated certificate and keys.

Certificates with 2048-bit keys last one year and are faster than certificates with 4096-bit keys. Certificates with 4096-bit keys last two years.

Note: After you save a Salesforce certificate, you can't change its type or key size.

6. Click **Save**.

Downloaded self-signed certificates have `.cert` extensions.

After you successfully save a Salesforce certificate, the certificate and corresponding keys are automatically generated.

You can have a maximum of 50 certificates.

SEE ALSO:

[Certificates and Keys](#)

[Generate a Certificate Signed By a Certificate Authority](#)

Generate a Certificate Signed By a Certificate Authority

A certificate authority-signed (CA-signed) certificate can be a more authoritative way to prove that your organization's data communications are genuine. You can generate this type of certificate and upload it to Salesforce.

1. From Setup, search for *Certificate and Key Management* in the Quick Find box.
2. Select **Create CA-Signed Certificate**.
3. Enter a descriptive label for the Salesforce certificate.

This name is used primarily by administrators when viewing certificates.

4. Enter the `Unique Name`. You can just accept the name that's automatically populated based on the certificate label you enter.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

To create, edit, and manage certificates:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. Use the `Unique Name` when referring to the certificate using the Force.com Web services API or Apex.

5. Select a `Key Size` for your certificate and keys.

We recommend that you use the default key size of 2048 for security reasons. Selecting 2048 generates a certificate using 2048-bit keys and is valid for two years. Selecting 1024 generates a certificate using 1024-bit keys and is valid for one year.

 **Note:** Once you save a Salesforce certificate, you can't change its type or key size.

6. Enter the following information.

These fields are joined together to generate a unique certificate.

Field	Description
Common Name	The fully qualified domain name of the company requesting the signed certificate. This is generally of the form: <code>http://www.mycompany.com</code> .
Email Address	The email address associated with this certificate.
Company	Either the legal name of your company, or your legal name.
Department	The branch of your company using the certificate, such as marketing or accounting.
City	The city where the company resides.
State	The state where the company resides.
Country Code	A two-letter code indicating the country where the company resides. For the United States, the value is <code>US</code> .

7. Click **Save**.

After you save a Salesforce certificate, the certificate and corresponding keys are automatically generated.

8. Find your new certificate from the certificates list, then click **Download Certificate Signing Request**.

Downloaded certificate signing requests have `.csr` extensions.

9. Send the certificate request to the certificate authority of your choice.

10. After the certificate authority sends back the signed certificate, go back to *Certificate and Key Management*, click the name of the certificate, then click **Upload Signed Certificate**.

The CA-signed certificate must match the certificate created in Salesforce. If you try to upload a different CA-signed certificate, the upload fails.

11. Click **Save** to finish the upload process.

After you upload the CA-signed certificate, the status of the certificate is changed to `Active` and you can use it.

 **Tip:** If you need to change something in a certificate you've uploaded, just upload it again; no need to start over with a new key and certificate. When you upload again, published site domains are automatically republished if they have at least one Force.com site or community. The expiration date of the certificate record is updated to the expiration date of the newly uploaded certificate.

You can have a maximum of 50 certificates.

Set Up a Mutual Authentication Certificate

To prevent security from being compromised by simple impersonation, you can require clients and servers to prove their identity to each other with a mutual authentication certificate.

1. On the Certificate and Key Management page, click **Upload Mutual Authentication Certificate**.

 **Note:** If you don't see this option on the Certificate and Key Management page, contact Salesforce to enable the feature.

2. Give your certificate a label and name and click **Choose File** to locate the certificate.
3. Click **Save** to finish the upload process.
4. Enable the "Enforce SSL/TLS Mutual Authentication" user permission for an "API Only" user. This "API Only" user configures the API client to connect on port 8443 to present the signed client certificate.

If you are using a certificate chain, the client certificate must include any intermediate certificates in the chain when contacting port 8443.

A certificate chain is a hierarchical order of certificates where one certificate issues and signs another certificate lower in the hierarchy. Upload a certificate chain as a single PEM-encoded CA-signed certificate representing the concatenated chain of certificates. The uploaded certificate chain must include the intermediate certificates in the following order.

- Start with the server or client certificate and then add its signing certificate.
- If more than one intermediate certificate exists between the server or client certificate and the root, add each certificate as the one that signed the previous certificate.
- The root certificate is optional, and generally should not be included.

Available in: **Enterprise, Performance, Personal, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

Configure Your API Client to Use Mutual Authentication

Enforce SSL/TLS mutual authentication.

1. After you've set up mutual authentication, log in to the Salesforce service using port 8443. Include your credentials and your signed certificate information. For example, your configuration using `cURL` may look something like this, where `@login.txt` contains the login Soap message with your credentials and `fullcert.pem:xxxxxx` is your certificate information:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Personal, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To create, edit, and manage certificates:

- "Customize Application"

To Enforce mutual authentication on port 8443 for standard SSL/TLS connections:

(Assign to users with the "Api Only" User permission.)

- "Enforce SSL/TLS Mutual Authentication"

To access Salesforce only through a Salesforce API:

- "Api Only User"

```
curl -k https://login.salesforce.com:8443/services/Soap/u/31.0 -H "Content-Type: text/xml; charset=UTF-8" -H "SOAPAction: login" -d @login.txt -v -E fullcert.pem:xxxxxx
```

2. Once a session ID is returned from your call, you can perform other actions, such as queries. For example:

```
curl -k https://yourInstance.salesforce.com:8443/services/Soap/u/31.0 -H "Content-Type: text/xml; charset=UTF-8" -H "SOAPAction: example" -d @accountQuery.xml -v -E fullcert.pem:xxxxxx
```

where `@accountQuery.xml` is the file name containing the query Soap message with session ID from the login response.

[Certificates and Keys](#)

[Set Up a Mutual Authentication Certificate](#)

Manage Master Encryption Keys

Encrypted custom fields, such as `social_security_number` or `credit_card_number`, are encrypted with a master encryption key. This key is automatically assigned when you select fields to encrypt. You manage your own master key according to your organization's security and regulatory needs.

With master encryption keys, you can:

- Archive the existing key and create a new key.
- Export an existing key after it's been archived.
- Delete an existing key.
- Import an existing key after it's been deleted.

Archiving and Creating New Keys

To archive your current key and create a new key, click **Archive Current Key and Create New Key** on the *Certificate and Key Management* Setup page. A new key is generated, assigned the next sequential number, and activated. All new data is encrypted using the new key.

Existing data continues to use the archived key until the data is modified and saved. Then data is encrypted using the new key.

After you archive a key, you can export or delete it.

Exporting Keys

You can export your keys to a back-up location for safe keeping. It's a good idea to export a copy of any key before deleting it.

Exporting creates a text file with the encrypted key, so you can import the key back into your organization later.

Deleting Keys

Don't delete a key unless you're absolutely certain no data is currently encrypted using the key. After you delete a key, any data encrypted with that key can no longer be accessed.

-  **Important:** Export and delete keys with care. If your tenant secrets are destroyed, you must reimport them to access your data. You are solely responsible for making sure your data and tenant secrets are backed up and stored in a safe place. Salesforce cannot help you with deleted, destroyed or misplaced tenant secrets.

Importing Keys

If you have data associated with a deleted key, you can import an exported key back into your organization. Any data that was not accessible becomes accessible again.

Click **Import** next to the key you want to import.

-  **Note:** This page is about Classic Encryption, not Shield Platform Encryption.

Monitor Your Organization

About the System Overview Page

 **Note:** The system overview page shows only the items enabled for your organization. For example, your system overview page shows workflow rules only if workflow is enabled for your organization.

The system overview page shows usage data and limits for your organization, and displays messages when you reach 95% of your limit (75% of portal roles). Click the numbers under each metric to get more details about your usage. If it's available, use Checkout to increase usage limits for your organization. For example, if your organization reaches the limit for custom objects, the system overview page notifies you with a message link. Click the link to clean up any unused objects, or visit Checkout to increase your limit for objects.

To access the system overview page, from Setup, enter *System Overview* in the **Quick Find** box, then select **System Overview**.

The system overview page displays usage for:

- [Schema](#)
- [API usage](#)
- [Business logic](#)
- [User interface](#)
- [Most used licenses](#)
- [Portal roles](#)

 **Note:** The object limit percentages are truncated, not rounded. For example, if your org uses 95.55% of the limit for a particular customization, the object limit displays 95%.

System Overview: Schema

The Schema box in the system overview page shows usage information for:

- Custom objects
 -  **Note:** Soft-deleted custom objects and their data count against your limits. We recommend that you hard delete or erase custom objects you no longer need.
- Data storage

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except **Personal** Edition

USER PERMISSIONS

To access the system overview page:

- "Customize Application"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: All Editions except **Personal** Edition

System Overview: API Usage

The API Usage box in the system overview page shows usage information for API requests in the last 24 hours.

Limits are enforced against the aggregate of all API calls made by the org in a 24 hour period. Limits are not on a per-user basis. When an org exceeds a limit, all users in the org can be temporarily blocked from making additional calls. Calls are blocked until usage for the preceding 24 hours drops below the limit.

System Overview: Business Logic

The Business Logic box in the system overview page shows usage information for:

- Rules
- Apex triggers
- Apex classes
- Code used: Total number of characters in your Apex triggers and Apex classes (excluding comments, test methods, and @isTest annotated classes).

System Overview: User Interface

The User Interface box in the system overview page shows usage information for:

- Custom apps
- Site.com sites: We only count published Site.com sites.
- Active Force.com sites
- Flows: We only count active flows.
- Custom tabs
- Visualforce pages

System Overview: Most Used Licenses

The Most Used Licenses box in the system overview page counts only active licenses, and by default shows the top three used licenses for your organization. Any license that reaches 95% usage also appears. Click **Show All** to view all the licenses for your organization.

System Overview: Portal Roles

The Portal Roles box in the system overview page shows the usage data and limit for total partner portal, Customer Portal, and Communities roles. The system overview page displays a message when your organization reaches 75% of its allotted portal roles.

-  **Note:** The maximum number of portal roles for an organization is 5000. This limit includes portal roles associated with all of the organization's customer portals, partner portals, or communities. To prevent unnecessary growth of this number, we recommend reviewing and reducing the number of roles for each of your portals and communities. Additionally, delete any unused portal roles. If you still require more portal roles, please contact Salesforce Customer Support.

Monitor Storage Resources

See your Salesforce org's storage limits and usage from the Storage Usage page in Setup.

Items That Require Storage

Storage is divided into two categories. File storage includes files in attachments, the Documents tab, the Files tab, the File field, Salesforce CRM Content, Chatter files (including user photos), and Site.com assets. Data storage includes the following.

- Accounts
- Article types (format: "[Article Type Name]")
- Article type translations (format: "[Article Type Name] Version")
- Campaigns
- Campaign Members
- Cases
- Case Teams
- Contacts
- Contracts
- Custom objects
- Email messages
- Events
- Forecast items
- Google docs
- Ideas
- Leads
- Notes
- Opportunities
- Opportunity Splits
- Orders
- Quotes
- Quote Template Rich Text Data

- Solutions
- Tags: Unique tags
- Tasks

Storage Capacity

For file storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated a per-user limit multiplied by the number of users in the org plus an additional per-org allocation. For example, a Professional Edition org with 10 users receives 11 GB of file storage, or 100 MB per user multiplied by 10 users plus an additional 10 GB. A Professional Edition org with 100 users receives 20 GB of file storage, or 100 MB per user multiplied by 100 users plus an additional 10 GB.

For data storage, Contact Manager, Group, Professional, Enterprise, Performance, and Unlimited Editions are allocated the greater of 1 GB or a per-user limit. For example, a Professional Edition org with 10 users receives 1 GB, because 10 users multiplied by 20 MB per user is 200 MB, which is less than the 1 GB minimum. A Professional Edition org with 100 users receives more than the 1 GB minimum, because 100 users multiplied by 20 MB per user is 2,000 MB.

The values in the Storage Allocation Per User License column below apply to Salesforce and Salesforce Platform user licenses.

Salesforce Edition	Data Storage Minimum per Org	Data Storage Allocation per User License	File Storage Allocation per Org	File Storage Allocation per User License
Contact Manager				
Group				612 MB
Professional	1 GB	20 MB	11 GB	
Enterprise				
Performance				2 GB
Unlimited		120 MB		
Developer	5 MB			
Personal	20 MB (approximately 10,000 records)	N/A	20 MB	N/A

If your organization uses custom user licenses, contact Salesforce to determine if these licenses provide additional storage. For a description of user licenses, see [User Licenses](#).

Viewing Storage Usage

To view your organization's current storage usage from Setup, enter *Storage Usage* in the *Quick Find* box, then select **Storage Usage**. You can view the available space for data storage and file storage, the amount of storage in use per record type, the top users according to storage utilization, and the largest files in order of size. To view what types of data a particular user is storing, click that user's name.

In all Editions except Personal Edition, administrators can view storage usage on a user-by-user basis:

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Click the name of any user.

3. Click **View** next to the `Used Data Space` or `Used File Space` fields to view that user's storage usage by record type.

Data storage and file storage are calculated asynchronously and your organization's storage usage isn't updated immediately, if you import or add a large number of records or files.

Individual users can view their own storage usage in their personal information.

Increasing Storage

When you need more storage, increase your storage limit or reduce your storage usage.

- Purchase additional storage space, or add user licenses in Professional, Enterprise, Unlimited, and Performance Editions.
- Delete outdated leads or contacts.
- Remove any unnecessary attachments.
- Delete files in Salesforce CRM Content.

Storage Considerations

When planning your storage needs, keep in mind:

- Person accounts count against both account and contact storage because each person account consists of one account as well as one contact.
- Archived activities count against storage.
- Active or archived products, price books, price book entries, and assets don't count against storage.

Monitor Login History

Administrators can monitor all login attempts for their organization and enabled portals or communities. The login history page displays the most recent 20,000 attempts. To see more records, download the information to a CSV or GZIP file.

Download Login History

You can download the past six months of user logins to your Salesforce organization to a CSV or GZIP file.

1. From Setup, enter `Login History` in the `Quick Find` box, then select **Login History**.
2. Select the file format to download.
 - **Excel csv file:** Download a CSV file of all user logins to your Salesforce organization for the past six months. This report includes logins through the API.
 - **gzipped Excel csv file:** Download a CSV file of all user logins to your Salesforce organization for the past six months. This report includes logins through the API. The file is compressed, which is the preferred option for quickest download time.
3. Select the file contents. All Logins includes API access logins.
4. Click **Download Now**.

 **Note:** Older versions of Microsoft Excel can't open files with more than 65,536 rows. If you can't open a large file in Excel, see the [Microsoft Help and Support article about handling large files](#).

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

USER PERMISSIONS

To monitor logins:

- "Manage Users"

Create List Views

You can create new list views sorted by login time and login URL. For example, you can create a view of all logins between a particular time range. Like the default view, a custom view displays the most recent 20,000 logins.

1. On the Login History page, click **Create New View**.
2. Enter the name to appear in the View drop-down list.
3. Specify the filter criteria.
4. Select the fields to display.

You can choose up to 15 fields. You can display only the fields that are available in your page layout. Text area fields display up to 255 characters.

 **Note:** Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary.

View Your Login History

You can view your personal login history.

1. From your personal settings, enter *Login History* in the **Quick Find** box, then select **Login History**. No results? Enter *Personal Information* in the **Quick Find** box, then select **Personal Information**.
2. To download a CSV file of your login history for the past six months, click **Download...**

 **Note:** For security purposes, Salesforce may require users to pass a CAPTCHA user verification test to export data from their organization. This simple text-entry test prevents malicious programs from accessing your organization's data. To pass the test, users must correctly type the two words displayed on the overlay into the overlay's text box field. Note that the words entered into the text box field must be separated by a space.

Single Sign-On with SAML

If your organization uses SAML single sign-on identity provider certificates, single sign-on logins appear in the history.

My Domain

If you are using My Domain, you can identify which users are logging in with the new login URL and when. From Setup, enter *Login History* in the **Quick Find** box, then select **Login History** and view the Username and Login URL columns.

SEE ALSO:

[Personalize Your Salesforce Experience](#)
[Identity Verification History](#)

Identity Verification History

As an admin, use Identity Verification History to monitor and audit up to 20,000 records of your org users' identity verification attempts from the past six months. For example, suppose that two-factor authentication is enabled when a user logs in. When the user successfully provides a time-based, one-time password as proof of identity, that information is recorded in Identity Verification History.

To access Identity Verification History, from Setup, enter *Verification History* in the **Quick Find** box, then select **Identity Verification History**. To view more information, such as the user's approximate geographic location at the time of verification, create a custom view and add the columns you want.

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Identity Verification Fields

The following fields are displayed by default.

Field	Description
Time	The time of the identity verification attempt. The time zone is based on GMT.
Verification Attempt	ID of the verification attempt. Verification can involve several attempts and use different verification methods. For example, in a user's session, a user enters an invalid verification code (first attempt). The user then enters the correct code and successfully verifies identity (second attempt). Both attempts are part of a single verification and, therefore, have the same ID.
Username	The username of the user challenged for identity verification.
Activity Message	The text the user sees on the screen or in Salesforce Authenticator when prompted to verify identity. For example, if identity verification is required for a user's login, the user sees "You're trying to Log In to Salesforce". In this instance, the Activity Message is "Log In to Salesforce". The exception is when the User Activity is "Apex-defined activity." In this instance, the Activity Message can be a custom description passed by the Apex method. If the user is verifying identity using version 2 or later of the Salesforce Authenticator app, the custom description displays in the app as well as in Verification History. If the custom description isn't specified, the name of the Apex method is shown in Verification History. <p> Note: If the user attempted to access a connected app, and the app was renamed or deleted after the verification attempt, this field shows the original connected app name.</p>
Triggered By	The identity verification security policy or setting. <ul style="list-style-type: none"> Apex method—Identity verification made by a verification Apex method.

Field	Description
	<ul style="list-style-type: none"> • Device activation—Identity verification required for users logging in from an unrecognized device or new IP address. This verification is part of Salesforce’s risk-based authentication. • High assurance session required—High assurance session required for resource access. This verification is triggered when the user tries to access a resource, such as a connected app, report, or dashboard that requires a high-assurance session level. • Profile session level policy—Session security level required at login. This verification is triggered by the “Session security level required at login” setting on the user’s profile. • Two-factor authentication required—Two-factor authentication required at login. This verification is triggered by the “Two-Factor Authentication for User Interface Logins” user permission assigned to a custom profile. Or, the user permission is included in a permission set that is assigned to a user.
Method	<p>The method by which the user attempted to verify identity in the verification event.</p> <ul style="list-style-type: none"> • Email message—Salesforce sent an email with a verification code to the address associated with the user’s account. • One-time password—An authenticator app generated a time-based, one-time password (TOTP) on the user’s mobile device. • Salesforce Authenticator—Salesforce Authenticator sent a notification to the user’s mobile device to verify account activity. • Temporary verification code—A Salesforce admin or a user with the “Manage Two-Factor Authentication in User Interface” permission generated a temporary verification code for the user. • Text message—Salesforce sent a text message with a verification code to the user’s mobile device.
Status	<p>The status of the identity verification attempt.</p> <ul style="list-style-type: none"> • Access denied—The user denied the approval request in the authenticator app, such as Salesforce Authenticator. • Access denied: Flagged by user—The user denied the approval request in the authenticator app, such as Salesforce Authenticator, and also flagged the approval request to report to an administrator. • Failed: General error—An error caused by something other than an invalid verification code, too many verification attempts, or authenticator app connectivity.

Field	Description
	<ul style="list-style-type: none"> Failed: Invalid verification code—The user provided an invalid verification code. Failed: Recoverable error—Salesforce can't reach the authenticator app to verify identity, but will retry. Failed: Too many attempts—The user attempted to verify identity too many times. For example, the user entered an invalid verification code repeatedly. Succeeded—The user's identity was verified. Succeeded: Automated response—Salesforce Authenticator approved the request for access because the request came from a trusted location. After users enable location services in Salesforce Authenticator, they can designate trusted locations. When a user trusts a location for a particular activity, such as logging in from a recognized device, that activity is approved from the trusted location for as long as the location is trusted. User challenged; waiting for response—Salesforce challenged the user to verify identity and is waiting for the user to respond or for Salesforce Authenticator to send an automated response.
Login Time	Time of the login attempt, in GMT time zone.
Source IP	The IP address of the machine from which the user attempted the action that requires identity verification. For example, the IP address of the machine from where the user tried to log in or access reports. If it's a non-login action that required verification, the IP address can be different from the address from where the user logged in. This address can be an IPv4 or IPv6 address.
Location	The country where the user's IP address is physically located. This value is not localized. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary.

You can display the following fields by creating a custom view. In the description, the IP address is the address of the machine from which the user attempted the action that requires identity verification. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) can vary.

Field	Description
City	The city where the user's IP address is physically located. This value is not localized.
Connected App	The name and link to the connected app the user attempted to access. If the connected app was renamed since the user's verification attempt, it shows the new name. If the connected app was deleted since the user's verification attempt, it shows "Unavailable."

Field	Description
Country	The country where the user's IP address is physically located. This value is not localized.
CountryIso	The ISO 3166 code for the country where the user's IP address is physically located. For more information, see Country Codes - ISO 3166
Latitude	The latitude where the user's IP address is physically located.
Login Type	The type of login, for example, Application, OAuth, or SAML.
Longitude	The longitude where the user's IP address is physically located.
Postal Code	The postal code where the user's IP address is physically located. This value is not localized.
Subdivision	The name of the subdivision where the user's IP address is physically located. In the U.S., this value is usually the state name (for example, Pennsylvania). This value is not localized.
User Activity	The action the user attempted that requires identity verification. <ul style="list-style-type: none"> • Access a connected app—The user attempted to access a connected app. • Access reports—The user attempted to access reports or dashboards. • Apex-defined activity—The user attempted to access a Salesforce resource with a verification Apex method. • Export and print reports—The user attempted to export or print reports or dashboards. • Log in to Salesforce—The user attempted to log in.

Monitor Login Activity with Login Forensics

Login forensics helps administrators better determine which user behavior is legitimate to prevent identity fraud in Salesforce.

Companies continue to view identity fraud as a major concern. Given the number of logins to an org on a daily—even hourly—basis, security practitioners can find it challenging to determine if a specific user account is compromised.

Login forensics helps you identify suspicious login activity. It provides you key user access data, including:

- The average number of logins per user per a specified time period
- Who logged in more than the average number of times

EDITIONS

Available in: **Enterprise**, **Performance, Unlimited**, and **Developer** Editions

- Who logged in during non-business hours
- Who logged in using suspicious IP ranges

There's some basic terminology to master before using this feature.

Event

An event refers to anything that happens in Salesforce, including user clicks, record state changes, and taking measurements of various values. Events are immutable and timestamped.

Login Event

A single instance of a user logging in to an organization. Login events are similar to login history in Salesforce. However, you can add HTTP header information to login events, which makes them extensible.

Login History

The login history that administrators can obtain by downloading the information to .csv or .gzip file and that's available through Setup and the API. This data has indexing and history limitations.

Administrators can track events using the LoginEvent object. There's no user interface for login forensics. Use the Force.com IDE, Workbench, or other development tools to interact with this feature.

 **Note:** Login forensics isn't available on government pods.

Considerations for Using Login Forensics

Before you get started with Login Forensics, keep in mind some considerations for use.

- This feature is API only. You can't view events in the user interface.
- Login events are retained for 10 years by default.
- Because login forensics uses an asynchronous queuing technology similar to @future calls in Apex, login data might be delayed when querying.

EDITIONS

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Enable Login Forensics

Perform this quick, one time setup to start collecting data about your org's login events.

You can enable login forensics from the Event Monitoring Setup page in the Setup area.

USER PERMISSIONS

To enable login forensics

- "Modify All Data"

Metrics in Login Forensics

Forensic investigations often begin with a roll-up of login events, and metrics are roll-up aggregations of login events over time.

Login forensics can be:

- A count.
- A count followed by an aggregation.

Each time-series metric contains:

- A query that uses aggregate functions.
- An hourly sampling interval.
- A frequency time frame, such as from 01-01-2015 12:00 to 01-01-2015 1:00.

EDITIONS

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

With this information, you can find anomalies by viewing summary data and then following up with more detailed queries to perform additional investigations. All metrics are generated once per hour and are accessed using the PlatformEventMetrics object.

In the following example, the total number of logins is four, but the aggregated number of logins by each user differs. The user with an ID that ends in "122" logged in once, and another user logged in three times.

Login Time	User Id
12:00	005000000000122
12:15	005000000000123
12:31	005000000000123
12:47	005000000000123

This table shows the collected metrics for the 12:00-1:00 time frame.

Metric Type	Aggregation Field Name	Aggregation Field Value	Value
NumLogins	Null	Null	4
NumLoginsByUser	UserId	005000000000122	1
NumLoginsByUser	UserId	005000000000123	3

Monitoring Training History

As an administrator, it is important to know that your team is learning how to use Salesforce effectively. The Training Class History shows you all of the Salesforce training classes your users have taken.

Administrators can view the Training Class History from Setup by entering *Training History* in the **Quick Find** box, then selecting **Training History**. After taking a live training class, users must submit the online training feedback form to have their training attendance recorded in the training history.

 **Note:** If you don't see this link under **Manage Users**, your organization has been migrated to a new system. You need to be a Help & Training Admin to access the training reports via My Cases in Help & Training. Contact Salesforce if you do not have this access.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Database.com** Editions

USER PERMISSIONS

To view training history:

- "Manage Users"

Monitor Setup Changes

The setup audit trail history tracks the recent setup changes that you and other administrators have made to your org. Audit history can be especially useful in orgs with multiple administrators.

To view the setup audit trail history, from Setup, enter *View Setup Audit Trail* in the **Quick Find** box, then select **View Setup Audit Trail**. To download your org's full setup history for the past 180 days, click the **Download** link.

The setup audit trail history shows you the 20 most recent setup changes made to your org. It lists the date of the change, who made it, and what the change was. Additionally, if a delegate (such as an administrator or customer support representative) makes a setup change on behalf of an end-user, the Delegate User column shows the delegate's username. For example, if a user grants login access to an administrator and the administrator makes a setup change, the administrator's username is listed.

The setup audit trail history tracks the following types of changes:

Setup	Changes Tracked
Administration	<ul style="list-style-type: none"> Company information, default settings such as language or locale, and company message changes Multiple currency setup changes User, portal user, role, permission set, and profile changes Email address changes for any user Deleting email attachments sent as links Creating, editing, or deleting email footers Record type changes, including creating or renaming record types and assigning record types to profiles Changes to divisions, including creating and editing divisions, transferring divisions, and changing users' default division Adding or deleting certificates Domain name changes Enabling or disabling Salesforce as an identity provider
Customization	<ul style="list-style-type: none"> Changes to user interface settings, such as collapsible sections, Quick Create, hover details, or the related list hover links Page layout, action layout, and search layout changes Changes to compact layouts Changes to the Salesforce1 navigation menu Changes made using inline editing Custom field and field-level security changes, including changes to formulas, picklist values, and custom field attributes, like the format of auto-number fields, manageability, or masking of encrypted fields Changes to lead settings, lead assignment rules, and lead queues Changes to activity settings

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

USER PERMISSIONS

To view audit trail history:

- “View Setup and Configuration”

Setup	Changes Tracked
	<ul style="list-style-type: none"> • Changes to support settings, business hours, case assignment and escalation rules, and case queues • Any changes made by Salesforce Customer Support at your request • Changes to tab names, including tabs that you reset to the original tab name • Changes to custom apps (including Salesforce console apps), custom objects, and custom tabs • Changes to contract settings • Changes to forecast settings • Enabling or disabling Email-to-Case or On-Demand Email-to-Case • Changes to custom buttons, links, and s-controls, including standard button overrides • Enabling or disabling drag-and-drop scheduling • Enabling, disabling, or customizing similar opportunities • Enabling or disabling quotes • Changes to data category groups, data categories, and category-group assignments to objects • Changes to article types • Changes to category groups and categories • Changes to Salesforce Knowledge settings • Changes to ideas settings • Changes to answers settings • Changes to field tracking in feeds • Changes to campaign influence settings • Activating or deactivating critical updates • Enabling or disabling Chatter email notifications • Enabling or disabling Chatter new user creation settings for invitations and email domains • Changes to validation rules
Security and Sharing	<ul style="list-style-type: none"> • Public groups, sharing rule changes, and org-wide sharing, including the Grant Access Using Hierarchies option • Password policy changes • Password resets • Session settings changes, such as changing the session timeout setting • Changes to delegated administration groups and the items delegated administrators can manage. Setup changes made by delegated administrators are tracked as well. • How many records a user emptied from their Recycle Bin and from the org's Recycle Bin • Changes to SAML (Security Assertion Markup Language) configuration settings • Changes to Salesforce certificates • Enabling or disabling identity providers • Changes to named credentials • Changes to service providers • Changes to Shield Platform Encryption setup.

Setup	Changes Tracked
Data Management	<ul style="list-style-type: none"> • Mass delete use, including when a mass delete exceeds the user's Recycle Bin limit of 5,000 deleted records. The oldest excess records are permanently removed from the Recycle Bin within two hours of the mass delete transaction time. • Data export requests • Mass transfer use • Changes to reporting snapshots, including defining, deleting, or changing the source report or target object on a reporting snapshot • Use of the Data Import Wizard • Sandbox deletions
Development	<ul style="list-style-type: none"> • Changes to Apex classes and triggers • Changes to Visualforce pages, custom components, or static resources • Changes to Lightning Pages • Changes to action link templates • Changes to custom settings • Changes to custom metadata types and records • Changes to remote access definitions • Changes to Force.com Sites settings

Setup**Changes Tracked**

- Enabling or disabling Customer Portal or partner portal users

SEE ALSO:

[Security Health Check](#)

Field History Tracking

You can select certain fields to track and display the field history in the History related list of an object. The field history data is retained for up to 18 months.

You can track the field history of custom objects and the following standard objects.

- Accounts
- Articles
- Assets
- Cases
- Contacts
- Contracts
- Contract line items
- Entitlements
- Leads
- Opportunities
- Orders
- Order Products
- Products
- Service Contracts
- Solutions

Modifying any of these fields adds an entry to the History related list. All entries include the date, time, nature of the change, and who made the change. Not all field types are available for historical trend reporting. Certain changes, such as case escalations, are always tracked.

 **Note:** Field history increases beyond your current limits require purchasing the Field Audit Trail add-on following the Spring '15 release. When the add-on subscription is enabled, your field history storage is changed to reflect the retention policy associated with the offering. If your org was created prior to June 2011 and your field history limits remain static, Salesforce commits to retain your field history without a limit. If your org was created after June 2011 and you decide not to purchase the add-on, field history is retained for a maximum of 18 months.

Consider the following when working with field history tracking.

- Changes to fields with more than 255 characters are tracked as edited, and their old and new values are not recorded.
- Tracked field values are not automatically translated; they display in the language in which they were made. For example, if a field is changed from *Green* to *Verde*, *Verde* is displayed no matter what a user's language is, unless the field value has been translated into other languages via the Translation Workbench. This also applies to record types and picklist values.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Standard Objects are not available in **Database.com**

- Changes to custom field labels that have been translated via the Translation Workbench are shown in the locale of the user viewing the History related list. For example, if a custom field label is `Red` and translated into Spanish as `Rojo`, then a user with a Spanish locale sees the custom field label as `Rojo`. Otherwise, the user sees the custom field label as `Red`.
- Changes to date fields, number fields, and standard fields are shown in the locale of the user viewing the History related list. For example, a date change to `August 5, 2012` shows as `8/5/2012` for a user with the English (United States) locale, and as `5/8/2012` for a user with the English (United Kingdom) locale.
- If a trigger causes a change on an object the current user doesn't have permission to edit, that change is not tracked because field history honors the permissions of the current user.

[Disable Field History Tracking](#)

Track Field History for Standard Objects

You can enable field history tracking for standard objects in the object's management settings.

If you use both business accounts and person accounts, review the following before enabling account field history tracking:

- Field history tracking for accounts affects both business accounts and person accounts.
- Enabling field history tracking on person accounts does not enable field history tracking on personal contacts.

To set up field history tracking:

1. From the management settings for the object whose field history you want to track, go to the fields area.
2. Click **Set History Tracking**.

Tip: When you enable tracking for an object, customize your page layouts to include the object's history related list.

3. For accounts, contacts, leads, and opportunities, select the `Enable Account History`, `Enable Contact History`, `Enable Lead History`, or `Enable Opportunity History` checkbox.
4. Choose the fields you want tracked.

You can select a combination of up to 20 standard and custom fields per object. This limit includes fields on business accounts and person accounts.

Certain changes, such as case escalations, are always tracked.

You can't track the following fields:

- Formula, roll-up summary, or auto-number fields
- `Created By` and `Last Modified By`
- `Expected Revenue` field on opportunities
- `Master Solution Title` or the `Master Solution Details` fields on solutions; these fields display only for translated solutions in organizations with multilingual solutions enabled.

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, Developer**, and **Database.com** Editions

Standard Objects are not available in **Database.com**

USER PERMISSIONS

To set up which fields are tracked:

- "Customize Application"

5. Click **Save**.

Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.

SEE ALSO:

[Field History Tracking](#)

Track Field History for Custom Objects

You can enable field history tracking for custom objects in the object's management settings.

1. From the management settings for the custom object, click **Edit**.**2.** Select the `Track Field History` checkbox.

Tip: When you enable tracking for an object, customize your page layouts to include the object's history related list.

3. Save your changes.**4.** Click `Set History Tracking` in the Custom Fields & Relationships section.

This section lets you set a custom object's history for both standard and custom fields.

5. Choose the fields you want tracked.

You can select up to 20 standard and custom fields per object. You can't track:

- Formula, roll-up summary, or auto-number fields
- `Created By` and `Last Modified By`

6. Click **Save**.

Salesforce tracks history from this date and time forward. Changes made prior to this date and time are not included.

USER PERMISSIONS

To set up which fields are tracked:

- "Customize Application"

Disable Field History Tracking

You can turn off field history tracking from the object's management settings.

 **Note:** You can't disable field history tracking for an object if Apex references one of its fields on the object is referenced in Apex.

1. From the management settings for the object whose field history you want to stop tracking, go to **Fields**.
2. Click **Set History Tracking**.
3. Deselect **Enable History** for the object you are working with—for example, **Enable Account History**, **Enable Contact History**, **Enable Lead History**, or **Enable Opportunity History**.

The History related list is automatically removed from the associated object's page layouts.

If you disable field history tracking on a standard object, you can still report on its history data up to the date and time that you disabled tracking. If you disable field history tracking on a custom object, you cannot report on its field history.

4. Save your changes.

Field Audit Trail

Field Audit Trail lets you define a policy to retain archived field history data up to ten years, independent of field history tracking. This feature helps you comply with industry regulations related to audit capability and data retention.

Use Salesforce Metadata API to define a retention policy for your field history. Then use REST API, SOAP API, and Tooling API to work with your archived data. For information about enabling Field Audit Trail, contact your Salesforce representative.

Field history is copied from the History related list into the `FieldHistoryArchive` object and then deleted from the History related list. You define one `HistoryRetentionPolicy` for your related history lists, such as Account History, to specify Field Audit Trail retention policies for the objects that you want to archive. You can then deploy the object by using the Metadata API (Workbench or Force Migration Tool). You can update the retention policy on an object as often as you like.

You can set field history retention policies on the following objects.

- Accounts
- Cases
- Contacts
- Leads
- Opportunities
- Assets
- Entitlements
- Service Contracts

EDITIONS

Standard Objects are not available in **Database.com**

USER PERMISSIONS

To set up which fields are tracked:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance**, and **Unlimited** Editions

USER PERMISSIONS

To specify a field history retention policy:

- "Retain Field History"

- Contract Line Items
- Solutions
- Products
- Price Books
- Custom objects with field history tracking enabled

 **Note:** The `HistoryRetentionPolicy` is automatically set on the above objects, once Field Audit Trail is enabled. By default, data is archived after 18 months in a production organization, after one month in a sandbox organization, and all archived data is stored for 10 years.

You can include field history retention policies in managed and unmanaged packages.

The following fields can't be tracked.

- Formula, roll-up summary, or auto-number fields
- Created By and Last Modified By
- Expected Revenue field on opportunities
- Master Solution Title or the Master Solution Details fields on solutions
- Long text fields
- Multi-select fields

After you define and deploy a Field Audit Trail policy, production data is migrated from related history lists such as Account History into the `FieldHistoryArchive` object. The first copy writes the field history that's defined by your policy to archive storage and sometimes takes a long time. Subsequent copies transfer only the changes since the last copy and are much faster. A bounded set of SOQL is available to query your archived data.

 **Note:** For some time after the initial GA release, data might not be automatically deleted from the History related list and may reside in both the `FieldHistoryArchive` object and in the History related list. Salesforce reserves the right to delete archived data from the History related list in accordance with the customer-defined policy in future releases.

 **Note:** If your organization has Field Audit Trail enabled, previously archived data isn't encrypted if you subsequently turn on Platform Encryption. For example, your organization uses Field Audit Trail to define a data history retention policy for an account field, such as the phone number field. After enabling Platform Encryption, you turn on encryption for that field, and phone number data in the account is encrypted. New phone number records are encrypted as they are created, and previous updates to the phone number field that are stored in the Account History related list are also encrypted. However, phone number history data that is already archived in the `FieldHistoryArchive` object continues to be stored without encryption. If your organization needs to encrypt previously archived data, contact Salesforce. We will encrypt and rearchive the stored field history data, then delete the unencrypted archive.

Examples

Set Data Retention Policy for Field History

This example demonstrates how to set a field history data retention policy by using Metadata API. You need to edit the metadata only if you want to override the default policy values (18 months of production storage and 10 years of archive storage). Setting data retention policy involves creating a metadata package and deploying it. The package consists of a `.zip` file that contains an `objects` folder with the XML that defines each object's retention policy, and a project manifest that lists the objects and the API version to use.

 **Note:** The first copy writes the entire field history that's defined by your policy to archive storage and might take a long time. Subsequent copies transfer only the changes since the last copy, and will be much faster.

1. Define a field history data retention policy for each object. The policy specifies the number of months that you want to maintain field history in Salesforce, and the number of years that you want to retain field history in the archive. The following sample file defines a policy of archiving the object after six months, and keeping the archives for five years.

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <historyRetentionPolicy>
    <archiveAfterMonths>6</archiveAfterMonths>
    <archiveRetentionYears>5</archiveRetentionYears>
    <description>My field history retention</description>
  </historyRetentionPolicy>
  <fields>
    <fullName>AccountSource</fullName>
    ...
  </CustomObject>
```

The file name determines the object to which the policy is applied. For example, to apply the above policy to the Account object, save the file as `Account.object`. For existing custom objects, this works the same way, with the file named after the custom object. For example: `myObject__c.object`.

2. Create the project manifest, which is an XML file that's called `package.xml`. The following sample file lists several objects for which data retention policy is to be applied. With this manifest file, you expect the objects folder to contain five files: `Account.object`, `Case.object`, and so on.

```
<?xml version="1.0" encoding="UTF-8"?>
<Package xmlns="http://soap.sforce.com/2006/04/metadata">
  <types>
    <members>Account</members>
    <members>Case</members>
    <members>Contact</members>
    <members>Lead</members>
    <members>Opportunity</members>
  </types>
  <version>32.0</version>
</Package>
```

3. Create the `.zip` file and use the `deploy()` function to deploy your changes to your production environment. For more information, see the [Metadata API Guide](#).

 **Note:** This pilot doesn't support deployment from sandbox to production environments.

That's it! Your field history retention policy will go into effect according to the time periods that you set.

Create a Custom Object and Set Field History Retention Policy at the Same Time

You can use Metadata API to create a custom object and set retention policy at the same time. You must specify the minimum required fields when creating a new custom object. Here's sample XML that creates an object and sets field history retention policy:

```
<?xml version="1.0" encoding="UTF-8"?>
<CustomObject xmlns="http://soap.sforce.com/2006/04/metadata">
  <deploymentStatus>Deployed</deploymentStatus>
  <enableHistory>true</enableHistory>
  <description>just a test object with one field for eclipse ide testing</description>
  <historyRetentionPolicy>
    <archiveAfterMonths>3</archiveAfterMonths>
    <archiveRetentionYears>10</archiveRetentionYears>
    <gracePeriodDays>1</gracePeriodDays>
    <description>Transaction Line History</description>
  </historyRetentionPolicy>
  <fields>
    <fullName>Comments__c</fullName>
    <description>add your comments about this object here</description>
    <inlineHelpText>This field contains comments made about this object</inlineHelpText>

    <label>Comments</label>
    <length>32000</length>
    <trackHistory>true</trackHistory>
    <type>LongTextArea</type>
    <visibleLines>30</visibleLines>
  </fields>
  <label>MyFirstObject</label>
  <nameField>
    <label>MyFirstObject Name</label>
    <type>Text</type>
  </nameField>
  <pluralLabel>MyFirstObjects</pluralLabel>
  <sharingModel>ReadWrite</sharingModel>
</CustomObject>
```

Set `trackHistory` to `true` on the fields that you want to track and `false` on the other fields.

Update Data Retention Policy for Field History

If a field history data retention policy is already defined on an object, you can update the policy by specifying a new value of `HistoryRetentionPolicy` in the metadata for that object. Once you deploy the metadata changes, the new policy overwrites the old one.

 **Note:** To check the current data retention policy for any object, retrieve its metadata using Metadata API and look up the value of `HistoryRetentionPolicy`.

Query Archived Data

You can retrieve archived data by making SOQL queries on the `FieldHistoryArchive` object. You can filter on the `FieldHistoryType`, `ParentId`, and `CreatedDate` fields, as long as you specify them in that order. For example:

```
SELECT ParentId, FieldHistoryType, Field, Id, NewValue, OldValue FROM FieldHistoryArchive
WHERE FieldHistoryType = 'Account' AND ParentId='906F000000
```

Monitor Debug Logs

When you've set your trace flags, monitor logging for users, Apex classes, and Apex triggers in the Developer Console or in Setup.

You can retain and manage the debug logs for specific users, including yourself, and for classes and triggers.

To view saved debug logs, from Setup, enter *Debug Logs* in the *Quick Find* box, then select **Debug Logs**. When you've started retaining debug logs, you can view, download, or delete your logs from this page.

SEE ALSO:

[Set Up Debug Logging](#)

[Viewing Debug Logs](#)

EDITIONS

Available in: Salesforce Classic

Available in **Enterprise, Developer, Performance, Unlimited**, and **Database.com** Editions

The Salesforce user interface and Email Services are not available in **Database.com**.

USER PERMISSIONS

To view, retain, and delete debug logs:

- "Manage Users"

Set Up Debug Logging

To activate debug logs for users, Apex classes, and Apex triggers, configure trace flags and debug levels in the Developer Console or in Setup. Each trace flag includes a debug level, start time, end time, and log type.

You can retain and manage the debug logs for specific users, including yourself, and for classes and triggers.

The following are the limits for debug logs.

- Each debug log must be 2 MB or smaller. Debug logs that are larger than 2 MB are reduced in size by removing older log lines, such as log lines for earlier `System.debug` statements. The log lines can be removed from any location, not just the start of the debug log.
- Each org can retain up to 50 MB of debug logs. Once your org has reached 50 MB of debug logs, the oldest debug logs start being overwritten.

Configure Trace Flags in the Developer Console

To configure trace flags and debug levels from the Developer Console, click **Debug > Change Log Levels**. Then complete these actions.

- To create a trace flag, click **Add**.
- To edit an existing trace flag's duration, double-click its start or end time.
- To change a trace flag's debug level, click **Add/Change** in the Debug Level Action column. You can then edit your existing debug levels, create or delete a debug level, and assign a debug level to your trace flag. Deleting a debug level deletes all trace flags that use it.

Create Trace Flags in Setup

1. From Setup, enter *Debug Logs* in the *Quick Find* box, then click **Debug Logs**.
2. Click **New**.
3. Select the entity to trace, the time period during which you want to collect logs, and a debug level.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

USER PERMISSIONS

To view, retain, and delete debug logs:

- "Manage Users"

New Trace Flag

To specify the type of information that is included in debug logs, add trace flags and debug levels. Each trace flag includes a debug level, a start time, an end time, and a log type.

Trace flags set logging levels (such as for Database, Workflow, and Validation) for a user, Apex class, or Apex trigger for up to 24 hours.

- Select Automated Process from the drop-down to set a trace flag on the automated process user. The automated process user runs background jobs, such as emailing Chatter invitations.
- Select User from the drop-down to specify a user whose debug logs you would like to monitor and retain.
- Select Apex Class or Apex Trigger from the drop-down to specify the log levels that take precedence while executing a specific Apex class or trigger. Setting class and trigger trace flags doesn't cause logs to be generated or saved. Class and trigger trace flags override other logging levels, including logging levels set by user trace flags, but they don't cause logging to occur. If logging is enabled when classes or triggers execute, logs are generated at the time of execution.

A total of 50 MB of debug logs can be retained for your org.

[Configure your Debug Levels.](#)

Traced Entity Type	Apex Class
Traced Entity Name	SampleClass
Start Date	4/14/2016 5:05 PM [4/14/2016 5:05 PM]
Expiration Date	4/14/2016 5:35 PM [4/14/2016 5:05 PM]
Debug Level	ApexCodeFinest <input type="button" value="New Debug Level"/>

View, Edit, or Delete Trace Flags in Setup

To manage trace flags from Setup, complete these actions.

1. Navigate to the appropriate Setup page.
 - For user-based trace flags, enter *Debug Logs* in the **Quick Find** box, then click **Debug Logs**.
 - For class-based trace flags, enter *Apex Classes* in the **Quick Find** box, click **Apex Classes**, click the name of a class, then click **Trace Flags**.
 - For trigger-based trace flags, enter *Apex Triggers* in the **Quick Find** box, click **Apex Triggers**, click the name of a trigger, then click **Trace Flags**.
2. From the Setup page, click an option in the Action column.
 - To delete a trace flag, click **Delete**.
 - To modify a trace flag, click **Edit**.
 - To modify a trace flag's debug level, click **Filters**.
 - To create a debug level, click **Edit**, and then click **New Debug Level**.

Configure Debug Levels in Setup

To manage your debug levels from Setup, enter *Debug Levels* in the **Quick Find** box, then click **Debug Levels**. To edit or delete a debug level, click an option in the Action column. To create a debug level, click **New**.

Debug Levels

A debug level is a set of log levels for debug log categories: Database, Workflow, Validation, and so on. You can reuse debug levels across your [trace flags](#).

Available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

To view the details of a debug log, from Setup, enter *Debug Logs* in the *Quick Find* box, select **Debug Logs**, and then click **View** next to the debug log that you want to examine. Click **Download** to download the log as an XML file.

The debug log contains information about the transaction, such as if it was successful, the size of the log (in bytes), how long the transaction took in milliseconds, and so on. The log itself contains additional information about the transaction, depending on the filters set for the user.

SEE ALSO:

[Monitor Debug Logs](#)

Monitoring Scheduled Jobs

The All Scheduled Jobs page lists all reporting snapshots, scheduled Apex jobs, and dashboards scheduled to refresh.

To view this page, from Setup, enter *Scheduled Jobs* in the *Quick Find* box, then select **Scheduled Jobs**. Depending on your permissions, you can perform some or all of the following actions.

- Click **Del** to permanently delete all instances of a scheduled job.
- View the details of a scheduled job, such as the:
 - Name of the scheduled job
 - Name of the user who submitted the scheduled job
 - Date and time at which the scheduled job was originally submitted
 - Date and time at which the scheduled job started
 - Next date and time at which the scheduled job will run
 - Type of scheduled job

Monitoring Background Jobs

You can monitor background jobs in your organization, such as when parallel sharing recalculation is running.

Parallel sharing recalculation helps larger organizations to speed up sharing recalculation of each object. If the number of impacted records from an owner-based sharing rule insert or update is less than 25,000, recalculation runs synchronously and you won't receive an email notification when it's completed. Owner-based sharing rule inserts and updates impacting less than 25,000 records are not available on the Background Jobs page.

To view any background jobs in your organization, from Setup, enter *Background Jobs* in the *Quick Find* box, then select **Background Jobs**.

The Background Jobs page shows the details of background jobs, including a percentage estimate of the recalculation progress. The **Job Type** column shows the background job that's running, such as *Organization-Wide Default Update*. The **Job Sub Type** column shows the affected object, such as *Account* or *Opportunity*.

 **Note:** You can only monitor background jobs on this page. Contact Salesforce to abort a background job.

Configure Salesforce Mobile Apps

Salesforce1

Salesforce1 Mobile App Setup Options

See the many options for customizing the Salesforce1 mobile app, to make it an effective on-the-go tool for your users' business needs.

All Salesforce1 customization options are available from the Setup menu. For your convenience, you can access many Salesforce1 settings pages more quickly from the Salesforce1 Quick Start setup page. In Salesforce Classic, from Setup, click **Salesforce1 Quick Start** (near the top of the Setup menu). In Lightning Experience, from Setup, enter *Salesforce1 Quick Start* in the `Quick Find` box, then select **Salesforce1 Quick Start**.

 **Note:** We recommend using Google Chrome for the Salesforce1 Quick Start setup page. Microsoft Internet Explorer 9 or later and Mozilla Firefox are also supported.

Here are the Salesforce1 customization options you can consider for your organization.

- Do some basic setup using the Salesforce1 Wizard. From the Salesforce1 Quick Start page, click **Launch Quick Start Wizard**.
- Define the users who can access Salesforce1.
 - For the downloadable apps, from the Salesforce1 Quick Start page, click **App Security Controls**.
 - For the mobile browser app, from the Salesforce1 Quick Start page, click **Mobile Browser Option**.
- Customize how data appears in Salesforce1. Unless otherwise specified, you can access these customizations from the management settings for the object whose data you want to customize.
 - Optimize your page layouts so they display well on mobile devices. You can modify existing page layouts or create new, mobile-friendly page layouts. From the appropriate object management settings, go to Page Layouts.
 - Add expanded lookups, components (including the Twitter component), or Visualforce pages to the Mobile Cards section of a page layout to have them display as mobile cards in Salesforce1. From the appropriate object management settings, go to Page Layouts.
 - Make sure that Visualforce pages are enabled for use in Salesforce1, so they'll display in the app. From Setup, enter *Visualforce Pages* in the `Quick Find` box, then select **Visualforce Pages**. Click **Edit** next to the name of a page, and select `Available for Salesforce mobile apps`.
 - Define the fields that show up in an object's record highlight area and in related list preview cards by creating custom compact layouts. From the appropriate object management settings, go to Compact Layouts.
 - Verify that your existing search layouts populate Salesforce1 search results with the desired fields. From the appropriate object management settings, go to Search Layouts.
- Make it easy and efficient to work in the field by creating actions that are tailored to your specific business activities and use cases.
 - Enable actions in the publisher for your organization. From Setup, enter *Chatter Settings* in the `Quick Find` box, then select **Chatter Settings**. Select the `Enable Actions in the Publisher` checkbox. (This option assumes that your organization has Chatter enabled and that you want the actions you create to display in the Chatter publisher. If your organization doesn't have Chatter enabled, you can still use actions but they only display in Salesforce1 and not in the full Salesforce site.)

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

 **Note:** If actions in the publisher aren't enabled, only standard Chatter actions (Post, File, Link, Poll, and Thanks) appear in the Chatter publisher in the full Salesforce site. When Chatter is enabled but actions in the publisher aren't, standard Chatter actions and nonstandard actions appear in the Salesforce1 action bar and in third-party apps that use action lists. Nonstandard actions include Create, Update, Log a Call, custom actions, and Mobile Smart Actions.

- Create global actions that allow users to add new object records with no automatic relationship to other records. From Setup, enter `Global Actions` in the `Quick Find` box, then select **Global Actions**. To customize the fields that are used by global actions, click **Layout** on the Global Actions page.

Then add the new actions to the Salesforce1 and Lightning Experience Actions section of the global publisher layout so that they appear in Salesforce1. From Setup, enter `Publisher Layouts` in the `Quick Find` box, then select **Publisher Layouts**.

- Create object-specific actions that allow users to add new records or update data in existing records. From the management settings for the object that you want to add an action to, go to Buttons, Links, and Actions. To customize the fields used by an object-specific action, click **Layout** on the Buttons, Links, and Actions page.

Then add the new actions to the Salesforce1 and Lightning Experience Actions section on the appropriate object page layout.

- Customize the options that are available in the Salesforce1 navigation menu, and the order in which items appear. From the Salesforce1 Quick Start page, click **Navigation Menu**.
- Help keep Salesforce1 users aware of important Salesforce activities by enabling in-app and push notifications. From the Salesforce1 Quick Start page, click **Notification Options**.
- Integrate third-party apps into the Salesforce1 navigation menu by adding Lightning Page tabs for the Lightning Pages deployed to your organization. From Setup, enter `Tabs` in the `Quick Find` box, select **Tabs**, and then click **New** on the Lightning Page Tabs related list.
- Customize Salesforce1 to match the look and feel of your company's branding. From the Salesforce1 Quick Start page, click **Salesforce1 Branding**.
- Allow the Salesforce1 downloadable apps to automatically cache frequently accessed Salesforce data to secure, persistent storage, so users can view data when their devices are offline. (This option is turned on by default.) From the Salesforce1 Quick Start page, click **Offline Cache**.

You can also check out the [Salesforce1 Mobile App Admin Guide](#), which walks you through using the Salesforce1 declarative tools in Setup to get your organization ready for the Salesforce1 mobile experience.

Set Up the Salesforce1 Mobile App with the Salesforce1 Wizard

The Salesforce1 Wizard provides an easy way to complete the essential setup tasks for Salesforce1. After you've set up Salesforce1 with this wizard, your sales reps can use Salesforce1 to run their business from their mobile devices.

 **Note:** We recommend using Google Chrome for the Salesforce1 Wizard and the Salesforce1 Setup page. Microsoft Internet Explorer 9 or later and Mozilla Firefox are also supported.

If you're using Lightning Experience:

1. From Setup, click **Launch Wizard** in the Set Up Salesforce1 tile in the quick access carousel.

If you're using Salesforce Classic:

1. From Setup, click **Salesforce1 Quick Start**.
2. On the Salesforce1 Setup page, click **Launch Quick Start Wizard**.

 **Note:** Although the Salesforce1 Wizard gets you up and running with basic setup tasks, it doesn't include all Salesforce1 setup tasks. For example, although you can rearrange global quick actions via the wizard, the Salesforce1 action bar and action menu can include other types of actions such as object-specific quick actions and standard Chatter actions, depending on the context.

After you've finished the wizard, you'll be directed to the Salesforce1 Quick Start setup page, which provides easy access to Salesforce1 setup pages and documentation. For settings that are configured on a single page, the Quick Start page includes direct links to those pages. In cases where the settings are available on multiple pages in Setup, we've provided links to relevant documentation about the setting.

SEE ALSO:

User Access and Security Policies for the Salesforce1 Downloadable Apps

The Salesforce1 downloadable apps are connected apps. As a result, you can control the users who have access to the apps, as well as other security policies. By default, all users in your organization can log in to the Salesforce1 downloadable apps.

You can control security and access policies for each of the Salesforce1 downloadable apps, using settings components that are installed from the managed Salesforce1 connected apps package. These components need to be installed in Salesforce:

- Salesforce1 for Android
- Salesforce1 for iOS

These components are automatically installed when one of your users installs a Salesforce1 downloadable app from the App Store or Google Play on a mobile device and authenticates with your organization by logging in to the mobile app.

Alternatively, you can manually install the [Salesforce1 and Chatter Apps connected apps package](#) so you can review and modify the default security and access settings before rolling out the Salesforce1 downloadable apps to your users.

When the Salesforce1 connected apps components are installed, they're added to the Connected Apps page. (From Setup, enter *Connected Apps* in the *Quick Find* box, then select the option for managing connected apps.) Here, you can view and edit the settings for each of the apps, including controlling user access with profiles, permissions, and IP range restrictions. An error message is displayed if a restricted user attempts to log in to a Salesforce1 downloadable app.

Push notifications for the Salesforce1 downloadable apps aren't managed from the Connected Apps page. To manage these settings, from Setup, enter *Notifications* in the *Quick Find* box, then select **Salesforce1 Notifications**.

Offline access is enabled by default when one of the Salesforce1 downloadable apps is installed. To manage these settings, from Setup, enter *Offline* in the *Quick Find* box, then select **Salesforce1 Offline**.

Available in Salesforce Classic in: **All** editions except Database.com

USER PERMISSIONS

To edit your Salesforce1 downloadable app settings:

- "Customize Application"

To view your Salesforce1 downloadable app settings:

- "View Setup and Configuration"

Enable the Salesforce1 Mobile Browser App

You can control whether users can access the Salesforce1 mobile browser app when they log in to Salesforce from a supported mobile browser. By default, the mobile browser app is turned on for your organization.

Important: Use of the Salesforce Classic full site in a mobile browser isn't supported. While you can disable the Salesforce1 mobile browser app for your organization, and individual users can turn off the mobile browser app for themselves, regular use of the full site in a mobile browser isn't recommended. Your users may experience problems that Salesforce Customer Support won't investigate.

It's not possible to access the Lightning Experience full site from any mobile browser.

1. From Setup, enter *Salesforce1 Settings* in the Quick Find box, then select **Salesforce1 Settings**.
2. Select **Enable the Salesforce1 mobile browser app** to allow all users in your organization to access the app. Deselect this option to turn off access to the app.
3. Click **Save**.

When this option is turned on, users who log in to Salesforce from a supported mobile browser are automatically directed to the Salesforce1 interface. Logging in from an unsupported mobile browser loads the Salesforce Classic full site, even when this option is selected.

In most cases, logging in from an unsupported mobile browser loads the Salesforce Classic full site, even if the **Enable the Salesforce1 mobile browser app** option is enabled. There are two exceptions for iPhone and iPad users, however. Users can access the mobile browser app from Google Chrome for iOS or the Gmail for iOS app's webview, but using Salesforce1 in these environments isn't supported.

Salesforce1 Mobile App Navigation Menu

Learn about the items that can appear in the Salesforce1 navigation menu. You can customize most aspects of the navigation menu for your organization.

The  icon in the Salesforce1 header opens the navigation menu.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

If the default navigation menu doesn't meet your users' needs, you can easily customize it. From Setup, enter *Navigation* in the Quick Find box, then select **Salesforce1 Navigation**.

Depending on your organization's settings, the menu can contain:

Menu Item	Description
Approval Requests	Displays a list of the user's pending approvals. Users can tap an approval item and approve or reject it from within Salesforce1. Available in the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app.
Canvas apps	Appears for organizations that have enabled a canvas app to appear in the Salesforce1 navigation menu.
Dashboards	Availability depends on edition and user permissions. If you don't add this item to the navigation menu, dashboards are automatically included in the set of Smart Search Items instead and the Dashboards item is available from the Recent section.
Events	Lists events owned by the user, that the user created for him- or herself, and that the user or a user's groups are invited to.
Feed	Appears for organizations that have Chatter enabled.

Menu Item	Description
Groups	Appears for organizations that have Chatter enabled. If you don't add this item to the navigation menu, groups are automatically included in the set of Smart Search Items instead and the Groups item is available from the Recent section.
Lightning component tabs	Only custom Lightning components that have a Lightning component tab associated with them can appear in the Salesforce1 navigation menu.
Lightning Pages	Custom app pages.
Notes	Displays the Notes app. If you don't add this item to the navigation menu, notes are automatically included in the set of Smart Search Items instead and the Notes item is available from the Recent section.
Paused Flow Interviews	Displays a list of flow interviews that the user paused. An interview is a running instance of a flow. Users can tap an interview and resume or delete it from within Salesforce1. Available in the Salesforce1 mobile browser app only.
People	Appears for organizations that have Chatter enabled. If you don't add this item to the navigation menu, profiles are automatically included in the set of Smart Search Items instead and the People item is available from the Recent section.
Reports	Availability depends on edition and user permissions. If you don't add this item to the navigation menu, reports are automatically included in the set of Smart Search Items instead and the Reports item is available from the Recent section.
Smart Search Items	<p>Adds standard and custom Salesforce objects to the Recent section in the menu. This item also adds a set of the user's recently accessed objects to the Recent section and adds the More item so users can access all the objects they have permission to use and that are supported in Salesforce1. If you don't include this item in the navigation menu, users can't access any objects on the navigation menu.</p> <p> Note: Smart Search Items is required for users to get search results in the Salesforce1 downloadable app for Android. Users of the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app are able to search for records if this option is omitted from the navigation menu.</p> <p>If your users don't yet have a history of recent objects, they initially see a set of default objects in the Recent section. It can take up to 15 days for the objects that users work with regularly in both Salesforce1 and the full Salesforce site to appear in the Recent section. To make objects appear under Recent sooner, users can pin them from the search results screen in the full site.</p>
Tasks	Lists of a user's open and closed tasks and tasks that have been delegated.
Today	An app that helps users plan for and manage their day by integrating mobile calendar events with associated Salesforce tasks, accounts, and contacts. The app also allows users to instantly join conference calls, quickly log notes about events, and more. Available in the Salesforce1 downloadable apps only.
Visualforce page tabs	Only Visualforce pages with the <code>Available for Salesforce mobile apps and Lightning Pages</code> checkbox selected will display in Salesforce1.

Things to Keep in Mind

- You can't set different menu configurations for different types of users.
- Anything represented by a tab in Salesforce—such as standard and custom objects, Visualforce pages, the Feed, People, or Groups—is visible for a user in the Salesforce1 menu, based on the user's profile settings. For example, if a user is assigned to a profile that has the Groups tab set to Tab Hidden, the user won't see the Groups menu item in Salesforce1, even though an administrator has included it in the menu.
- The navigation menu in a community isn't controlled via the Navigation Menu settings page. Instead, the tabs that are specified in Tabs & Pages in the community's administration settings determine the contents of the community's navigation menu.

[Customize the Salesforce1 Navigation Menu](#)

[Notes About the Salesforce1 Navigation Menu](#)

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

Customize the Salesforce1 Navigation Menu

Customize your users' mobile Salesforce experience by selecting the menu items, apps, Visualforce pages, or Lightning Pages to display in the Salesforce1 navigation menu.

-  **Note:** Before you can include Visualforce pages, Lightning Pages, or Lightning components in the Salesforce1 navigation menu, create tabs for them. From Setup, enter *Tabs* in the Quick Find box, then select **Tabs**.

[Walk Through It: Customize the Salesforce1 Navigation Menu](#)

1. From Setup, enter *Navigation* in the Quick Find box, then select **Salesforce1 Navigation**
2. Select items in the Available list and click **Add**.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

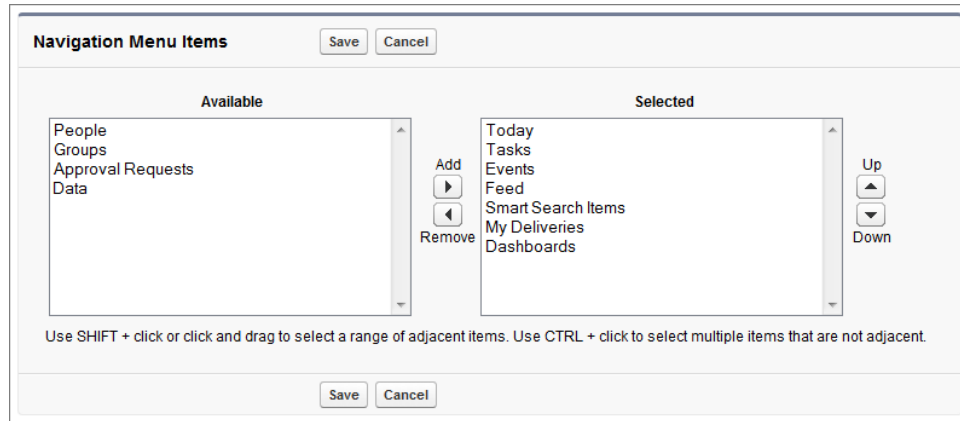

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

USER PERMISSIONS

To customize the Salesforce1 navigation menu:

- "Customize Application"

3. Sort items by selecting them and clicking **Up** or **Down**.

The order you put items in the Selected list is the order that they display in the navigation menu.

 **Note:** The first item in the Selected list becomes your users' Salesforce1 landing page.

4. Click **Save**.

Once saved, the navigation menu items and their order should be reflected in Salesforce1. You may need to refresh to see the changes.

 **Tip:** When organizing the menu items, put the items that users will use most at the top. The Smart Search Items element can expand into a set of eight or more menu items and it might end up pushing other elements below the scroll point if you put it near the top of the menu. Anything you put below the Smart Search Items element appears in the Apps section of the navigation menu.

SEE ALSO:

[Salesforce1 Mobile App Navigation Menu](#)

[Notes About the Salesforce1 Navigation Menu](#)

[Enable Visualforce Pages for the Salesforce1 Mobile App](#)

Notes About the Salesforce1 Navigation Menu

Some objects are excluded from the Recent section in the Salesforce1 navigation menu, even if you accessed them recently.

- Tasks and events
- People, groups, notes, dashboards, and reports, if these items were added directly to the navigation menu
- List views, which are shown only on object home pages, not in the navigation menu
- Objects that aren't available in Salesforce1, including any objects that don't have a tab in the full Salesforce site

About the Dashboards, Reports, Notes, Groups, and People Menu Items

If you opt to add the Dashboards, Reports, Notes, Groups, or People items to the Selected list for the Salesforce1 navigation menu, these items appear in the order you specify, just like Tasks, Today, and other individual menu items.

If you don't add these items to the navigation menu, however, they're automatically included in the Smart Search Items set of objects and show up in the Recent section of the navigation menu.

(For Reports only, this is true when using the Salesforce1 downloadable app for Android or the Salesforce1 mobile browser app. But the only way to include access to reports in the Salesforce1 downloadable app for iOS is to add the Reports item directly to the navigation menu.

Pin an Object into the Recent Section

Users can customize the objects that appear in the Recent section of the Salesforce1 navigation menu. If they search for an object in the full site, they can hover their mouse over the object name and click  to pin it to the top of the search results. The order of pinned objects in the full site determines the order of the objects that stick to the top of the Recent section of the navigation menu. However, pinning objects in this way causes the unpinned objects remaining in the Recent section to drop into the **More** element.

Smart Search Items and Search Results in Salesforce1

Smart Search Items adds standard and custom Salesforce objects to the Recent section of the navigation menu. Removing Smart Search Items from the navigation menu means Salesforce1 users can't access objects (including object home pages and list views) from the menu.

Removing Smart Search Items also impacts search options in Salesforce1. Because object home pages aren't available, it's not possible to run object-specific searches. The impact on global search depends on the Salesforce1 app.

- With the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app, users can find and access their records from global search results.
- The Salesforce1 downloadable app for Android requires Smart Search Items for global search to work. If Smart Search Items is omitted from the navigation menu, Android users can't locate records using global search.

Salesforce1 Mobile App Notifications

Notifications let your users know when certain events occur in Salesforce. For example, notifications let users know when they receive approval requests or when someone mentions them in Chatter.

Two types of notifications can appear to Salesforce1 users.

- *In-app notifications* keep users aware of relevant activity while they're using Salesforce1. By tapping , a user can view the 20 most recent notifications received within the last 90 days.

If Salesforce Communities is enabled for your organization, users see notifications from all of the communities they're members of. To help users easily identify which community a notification came from, the community name is listed after the time stamp.

- *Push notifications* are alerts that appear on a mobile device when a user has installed the Salesforce1 downloadable app but isn't using it. These alerts can consist of text, icons, and sounds, depending on the device type. If an administrator enables push notifications for your organization, users can choose individually whether to receive push notifications on their devices.

-  **Note:** Some notifications include text that your users enter in Salesforce. To ensure that sensitive information isn't distributed through a third-party service without proper authorization, push notifications include minimal content (such as a user's name) unless you enable full content in push notifications.

For example, suppose an in-app notification reads: "Allison Wheeler mentioned you: @John Smith, heads-up! New sales strategy for Acme account." By default, the equivalent push notification would be "Allison Wheeler mentioned you." However, if you enabled full content in push notifications, this push notification would include the same (full) content as the in-app notification.

EDITIONS

Salesforce1 mobile app available in: **All** editions except Database.com

Terms and Conditions for Including Full Content in Push Notifications

If you go to the Notifications Settings page on the full site and select the option to include full content in push notifications, a pop-up window displays several terms and conditions. If you click **OK** in the pop-up window, you're agreeing to these terms and conditions on behalf of your company.

Salesforce1 Mobile Push Notifications

The Salesforce1 full-content push notifications feature will provide your organization's Users (collectively, "you" or "your") with real-time updates — for example, whenever you receive an approval request or a mention in a post. The frequency of notifications sent to you will depend on the number of these actions occurring for you.

Enable or disable full-content push notifications at any time from Setup by entering *Notifications Settings* in the **Quick Find** box, selecting **Notifications Settings**, and then selecting or deselecting "Include full content in push notifications."

For Users within your organization whose mobile devices run the iOS platform, usage of the full-content push notifications feature will result in transmission of your data contained in those notifications (potentially including Customer Data and/or Confidential Information, as those terms are defined in the subscription agreement that governs your use of Salesforce products) to Apple Inc. and its affiliated entities (collectively, "Apple"). To the extent that any such data is transmitted to Apple, Salesforce is not responsible for the privacy, security, or integrity of that data.

If you are authorized by the company that has purchased the subscriptions associated with your use of the Salesforce Services to enable this functionality and agree to these terms and conditions, please confirm your acceptance by checking the box marked "OK" below. If you are not authorized by such company to accept these terms and enable this functionality, you must click "Cancel".

SEE ALSO:

[Enable Salesforce1 Mobile App Notifications](#)

Enable Salesforce1 Mobile App Notifications

Allow all users in your organization to receive mobile notifications about events in Salesforce, for example when they receive approval requests or when someone mentions them in Chatter.

1. From Setup, enter *Salesforce1 Notifications* in the **Quick Find** box, then select **Salesforce1 Notifications**.
2. Select the notifications you want your Salesforce1 users to receive.
3. If you're authorized to do so for your company, select **Include full content in push notifications**.
4. Click **Save**. If you checked the box to include full content in push notifications, a pop-up appears displaying terms and conditions. Click **OK** or **Cancel**.

By enabling this option, you're agreeing to the terms and conditions on behalf of your company. For details, see [Salesforce1 Mobile App Notifications](#) on page 1012.

A user can receive approval requests in Salesforce1 notifications only when the user receives approval requests as email notifications. You or your user can change the **Receive Approval Request Emails** user field to set this preference.

SEE ALSO:

[Salesforce1 Mobile App Notifications](#)

Salesforce1 Mobile App Offline Access

The Salesforce1 downloadable apps can cache recently accessed data so it's available when a user's device is offline or unable to connect to Salesforce. With offline access turned on, the downloadable app automatically caches many of the user's records for frequently accessed objects. (The actual set of records is determined by a user's activities in both the mobile app and the full Salesforce site, including Salesforce Classic and Lightning Experience.) In addition, the app caches much of the data that a user accesses during a Salesforce1 session. When working offline, users can view cached records. And with Salesforce1 for Android, version 9.0 or later, the Offline Edit Pilot feature allows users to create, edit, and delete records for many objects.

 **Note:** Cached data is encrypted and stored in a secure, persistent data store.

You can control offline access for the Salesforce1 downloadable apps from the Salesforce1 Offline Settings page. From Setup, enter *Offline* in the **Quick Find** box, then select **Salesforce1 Offline**.

- Viewing data while offline is automatically enabled for your org via the **Enable caching in Salesforce1** checkbox.

We strongly recommend leaving this option enabled. In addition to making cached data available offline, this setting also enables faster viewing of previously-accessed records and better overall performance. If you disable caching, the Salesforce1 downloadable apps only store the minimum data required to maintain a session. This can impact performance because the app has to refresh record details and feed items every time they're viewed.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

USER PERMISSIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

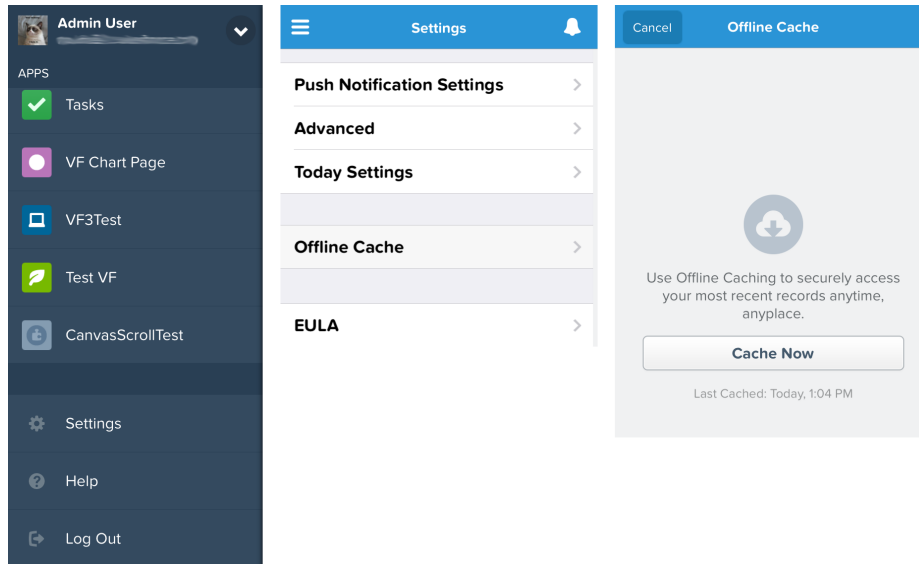

- The Offline Edit Pilot feature isn't enabled by default. Turn this feature on by selecting `Enable offline create, edit, and delete in Salesforce1`. (This checkbox isn't available if caching in Salesforce1 is disabled.)

This table lists the data and Salesforce1 elements that are available offline.

Salesforce1 Element	Available for Offline Viewing	Possible to Create, Edit, or Delete Offline (Pilot)
Navigation Menu	Yes	Not applicable
Global Search	Previous searches only	Not applicable
Notifications	Previously viewed only	Not applicable
Feeds, Groups, and People	Previously viewed only	No
Salesforce Today	Main page and mobile event records if previously viewed	Not applicable
Salesforce Events	Previously viewed only	Previously viewed only
Recent Objects	Most frequently accessed (the objects listed in the Recent section of the Salesforce1 navigation menu)	Most frequently accessed (the objects listed in the Recent section of the Salesforce1 navigation menu)
Other Objects	No	No
Record Details	Most recently accessed records only	Most recently accessed records only
Related Records	Previously viewed only	Previously viewed only
List Views	Previously viewed only	No
Tasks	Only tasks from the first page of the My Tasks list, and only if the list was previously viewed or after the user manually updates the cache	Yes Can create tasks from the My Tasks list only.
Notes	Most recently accessed only	Most recently accessed only
Dashboards (Enhanced Dashboard only)	Most recently accessed only	Most recently accessed only
Approvals (submit, approve, or reject)	No	No
Visualforce pages	No	No
Canvas Apps	No	No
Lightning Pages	No	No
Salesforce1 Settings	Yes	Yes

Cached data is refreshed when a user switches to Salesforce1. If a user switches to another app, the user's cached data is automatically refreshed if the existing data store is over one hour old.

Users can manually cache their data at any time—for example, before switching into airplane mode or entering an area with no service. From the Salesforce1 navigation menu, select **Settings > Offline Cache > Cache Now**.

 **Note:** The cache is saved for two weeks. Users can clear the cache by logging out of the Salesforce1 app.

Enable Visualforce Pages for the Salesforce1 Mobile App

You can use Visualforce to extend the Salesforce1 app and give your mobile users the functionality that they need while on the go. Before adding a Visualforce page to Salesforce1, make sure the page is enabled for mobile use or it won't be available in the mobile apps.

 **Tip:** Before exposing existing Visualforce pages in Salesforce1, consider how they'll look and function on mobile phones and tablets. Most likely, you'll want to create a new page specifically for mobile form factors.

Visualforce pages must be enabled for mobile use before they can display in these areas of the Salesforce1 user interface:

- The navigation menu, via a Visualforce tab
- The action bar, via a custom action
- Mobile cards on a record's related information page
- Overridden standard buttons, or custom buttons and links
- Embedded in record detail page layouts
- Lightning pages

To enable a Visualforce page for Salesforce1:

1. From Setup, enter *Visualforce Pages* in the Quick Find box, then select **Visualforce Pages**.
2. Click **Edit** for the desired Visualforce page.
3. Select **Available for Salesforce mobile apps and Lightning Pages** then click **Save**.

Consider these notes about Visualforce support in Salesforce1.

EDITIONS

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable the display of Visualforce in Salesforce1:

- "Customize Application"
- "Author Apex"

- Standard tabs, custom object tabs, and list views that are overridden with a Visualforce page aren't supported in Salesforce1. The Visualforce page is shown for full site users, but Salesforce1 users will see the default Salesforce1 page for the object. This restriction exists to maintain the Salesforce1 experience for objects.
- You can also enable Visualforce pages for Salesforce1 through the metadata API by editing the `isAvailableInTouch` field on the `ApexPage` object.
- The `Salesforce Classic Mobile Ready` checkbox on Visualforce Tab setup pages is for Salesforce Classic Mobile only and has no effect on Visualforce pages in the Salesforce1 apps.

[Viewing and Editing Visualforce Pages](#)

Your Org's Branding in the Salesforce1 Mobile App

You can customize the Salesforce1 mobile app to match some aspects of your company's branding, so the app is more recognizable to your mobile users. Custom branding is displayed in all of the Salesforce1 apps.

 **Note:** Images that you upload to customize the Salesforce1 app are stored in a Documents folder named Salesforce1 Branding Resources. For this reason, the Documents object must be enabled for your organization before administrators can view and modify the Salesforce1 Branding page. (The Documents tab doesn't need to be visible, however.)

For users of the Salesforce1 mobile browser app to see custom branding, Documents must be enabled for your organization. For the Salesforce1 downloadable apps, users must also have "Read" user permissions on Documents.

You can customize:

Element	Description
Brand Color	<p>The color for key user interface elements such as the header, buttons, and search bar.</p> <p>Based on the brand color you select, contrasting colors for user interface elements such as borders for the navigation menu, the notifications list, and button text are automatically defined.</p> <p>The headers on overlays, popups, and dialogs—such as edit and create windows or windows that open from actions in the action bar—aren't affected by this setting. These headers are always white, to provide a visual indicator that the user is performing an action as opposed to simply viewing information.</p>
Loading Page Color	The background color on the loading page that appears after a mobile user logs in.

EDITIONS

Setup for Salesforce1 available in: both Salesforce Classic and Lightning Experience

Available in Lightning Experience in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All** editions except Database.com

Element	Description
Loading Page Logo	The image on the loading page that appears after a mobile user logs in. We recommend using an image with the largest dimensions allowable for best results. Maximum image size is 460 pixels by 560 pixels.

Consider the following tips when customizing the branding of the Salesforce1 app:

- When creating your logo image, be sure to compress it. In many image editing programs, this process is identified as “use compression,” “optimize image,” “save for web,” or “shrink for the web.”
- Verify that your logo appears correctly in Salesforce1, using the same devices as your user base, not just a desktop monitor. Your image can render at different scales or proportions depending on the screen size and pixel density of each device.
- Salesforce1 supports .png, .gif, and .jpg image formats for custom branding elements, but we recommend using .png for the best results.
- These interface elements can’t be customized:
 - The Salesforce1 app icon that appears on the mobile device’s home screen.
 - The initial loading screen when launching the Salesforce1 downloadable app for iOS. This loading screen appears before the user is prompted by the login page.
- Your mobile users must close the app and then log in again to see any custom branding changes.

You can also customize the branding for the Salesforce1 app login page. My Domain must be enabled to modify the login page. To customize your company’s Salesforce1 login page, see [Customize Your Login Page Branding](#) on page 961.

SEE ALSO:

[Customize Branding of the Salesforce1 Mobile App](#)

Customize Branding of the Salesforce1 Mobile App

Change the Salesforce1 mobile app's appearance, including the loading page background color, loading page logo, and header background color, so the app matches your company's branding.

 **Note:** Images that you upload to customize the Salesforce1 app are stored in a Documents folder named Salesforce1 Branding Resources. For this reason, the Documents object must be enabled for your organization before administrators can view and modify the Salesforce1 Branding page. (The Documents tab doesn't need to be visible, however.)

For users of the Salesforce1 mobile browser app to see custom branding, Documents must be enabled for your organization. For the Salesforce1 downloadable apps, users must also have "Read" user permissions on Documents.

1. From Setup, enter *Branding* in the **Quick Find** box, then select **Salesforce1 Branding**, then click **Edit**.
2. To customize brand color for key user interface elements, including the header, click  or enter a valid hexadecimal color code.
3. To customize the background color of the loading page, click  or enter a valid hexadecimal color code.
4. To customize the loading page logo, click **Choose File** to upload an image. Images can be .jpg, .gif, or .png files up to 200 KB in size. The maximum image size is 460 pixels by 560 pixels.
5. Click **Save**.

Data Access and Views: What's Not Available in Salesforce1

Supported Objects and Data

These objects are available in the Salesforce1 mobile app:

- Accounts and Person Accounts
- Assets
- Campaigns
- Cases
- Contacts
- Contracts
- D&B Company (*view only, for Data.com Premium Prospector and Data.com Premium Clean customers*)
- Dashboards (*view only*)
- Events
- Leads
- Linked Articles (*view only*)
- Live Chat Transcripts
- Opportunities
- Orders (*view or edit only*)
- Reports (*view only*)
- Salesforce Knowledge Articles (*view only*)
- Tasks
- Work.com Coaching, Goals, Thanks, Rewards, and Skills (*Skills not available in the iOS downloadable app*)
- Work Orders
- Work Order Milestones (*view only*)
- Custom objects that have a tab you can access
- Salesforce Connect external objects that are searchable and have a tab you can access

Note: To be available in Salesforce1, an object must have a tab that you can access. This is true for supported standard objects and your org's custom and external objects.

Salesforce1 doesn't support the User object or provide access to user record detail pages. However, user fields are supported and appear on user profiles, in related lists, and so forth. See "Fields" for some issues with user fields in Salesforce1.

Salesforce1 doesn't support:

- Standard or custom Salesforce apps. (Instead, the navigation menu gives users access to all of the objects that are available to them in the mobile app.)
- Salesforce Console or Agent Console.
- Advanced currency management.

Fields

- While user detail pages aren't available in the Salesforce1 mobile app, user fields are supported and appear on user profiles, in related lists, and so forth.

There are some issues when the following user fields appear in related lists or mobile cards:

- The `Company Name` field is blank if an internal user is viewing a mobile card or related list entry related to another internal user. If the referenced user is an external user, the company name appears correctly.
- The `Active` field is blank unless the user is inactive.
- These fields aren't supported in Salesforce1:
 - division fields
 - territory management fields
- Support for rich text area fields varies by the version of Salesforce1 and the type of device.

Device	Salesforce1 Version	View Rich Text Area Fields	Edit Rich Text Area Fields
Android	Downloadable App	Yes	Yes
	Mobile Browser App		The rich text editor isn't available. But you can manually add HTML tags.
BlackBerry	Mobile Browser App	No	No
iOS	Downloadable App	Yes	No
iOS	Mobile Browser App	Yes	Yes The rich text editor is available.
Windows 8.1	Mobile Browser App	No	No

- Lookup fields in Salesforce Classic show record names regardless of sharing permissions, so it's possible for users to see the name of records that they can't access. In Lightning Experience and the Salesforce1 mobile app, lookup fields respect sharing permissions and only show the name of records that the user can access. The one exception is owner lookup fields, which always display the name of the record's owner, regardless of sharing permissions.
- When a user who doesn't have the "View Encrypted Data" permission clones a record, encrypted fields show masked data.

Related Lists

- Related lists in Salesforce1 display the first four fields that are defined in the Related List section on an object's page layout. The number of fields shown can't be increased.
- Some related lists aren't available in the mobile app, including:
 - Content Deliveries
 - External Sharing
 - Related Content

And see [Sales Features in Salesforce1](#), [Productivity Features in Salesforce1](#), and [Customer Service Features in Salesforce1](#) for related lists that aren't available for specific objects.

- The Notes and Attachments related list isn't fully supported in Salesforce1. There are several issues, including:
 - Attachments added in the full Salesforce site aren't guaranteed to open in Salesforce1, even if they appear in the related list. We recommend using Files instead. Documents that are uploaded to the Files tab in the full site are then viewable in Salesforce1.
 - You can't add or delete notes or attachments from the related list. (But you can create a note and relate it to a record, using the **Note** (📌) action in the Salesforce1 action bar. Depending on how your administrator has configured Notes in Salesforce1, this action may not be available for all objects.)
 - Notes and attachments on child records don't display on the parent record's related list.
- If a related list is sorted by a text area field, it doesn't display any records.

List Views

- The Search box in the List View Controls menu in Lightning Experience, which allows you to search for a specific list view, isn't available.

Sales Features: What's Not Available in Salesforce1

Accounts

- Account Insights:
 - When accessing Account Insights from Salesforce1 running on a smartphone, only one insight is displayed at a time.
 - When accessing Account Insights from Salesforce1 running on a tablet, you can't scroll through the available insights. Instead, the device's screen size determines the number of insights that are displayed.
- Social Accounts:
 - You can't access social accounts features for Facebook, Klout, or YouTube in Salesforce1.
 - If an account has been linked to a social network profile, the profile image selected for the account may display when viewing the account in Salesforce1 even when you aren't logged in to the social network. Profile images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your account share on Twitter. You can't view common connections in the full Salesforce site.
 - To view the Twitter card on accounts in Salesforce1, you must add Twitter to the page layout. Access the full Salesforce site to edit page layouts. If your organization uses person accounts, the card must be added separately for business account layouts and person account layouts.
- The **Manage External Account** button isn't available.
- You can't view the account hierarchy.
- You can't merge accounts or contacts.
- As you navigate to other records, more insights may become available. It takes longer for those insights to appear in the News app.
- Account suggestions aren't available when you type a company in the `Account Name` field.
- You can view partners, notes, and attachments, but you can't edit them.
- Accounts Home reports and tools aren't available.
- Records in the Contact Roles related list are read only.

The Roles field on the Contact Roles related list isn't available.

- You can't clean account records with Data.com Clean.

Account Teams

- You can add, edit, or delete only one account team member at a time.
- When the account owner is changed, the account team is retained.
- The **Display Access** button isn't available.

Campaigns

- The **Manage Members** and **Advanced Setup** buttons aren't available.
- Campaign Hierarchy is available only as a related list. The option to **View Hierarchy** from a link on the campaign detail page isn't available. When viewing a parent campaign, the Campaign Hierarchy related list shows only the child campaigns, while the full site displays both the parent and child campaigns.
- When viewing the Campaign Members related list, only the members' Status appears. You can, however, tap members to see more details about them.

Contacts

- Contacts to Multiple Accounts
 - Only the list item actions that are specific to the Account Contact Relationship object are available on the Related Accounts and Related Contacts related lists. Therefore, you see actions to edit or remove the account-contact relationship, but not to edit or delete the contact or account record as you do in Salesforce Classic.
 - From the Related Contacts related list, you can navigate to a contact record, but not an account record.
 - In the Related Accounts related list, the `Account Name` field appears only if the user has access to the account. If they don't have access to the account, only the Account Contact Relationship fields appear.
- Social Contacts:
 - You can't access social contacts features for Facebook, Klout, or YouTube in Salesforce1.
 - If a contact has been linked to a social network profile, the profile image selected for the contact may display when viewing the contact in Salesforce1 even when you aren't logged in to the social network. Profile images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your contact share on Twitter. You can't view common connections in the full Salesforce site.
 - To view the Twitter card on a contact in Salesforce1, you must add Twitter to the page layout for contacts. Access the full Salesforce site to edit page layouts.
- Activity logs aren't created when you use the  icon to send emails from the Salesforce1 app.
- The **Request Update**, **Manage External User**, and **Enable Customer User** buttons aren't available.
- You can't add opportunities or account users on a contact, and you can't add a contact to a campaign.
- You can't merge accounts or contacts.
- You can't add contacts from Data.com or clean contact records with Data.com Clean.

Contracts

- The **Clone**, **Activate**, and **Deactivate** buttons aren't available.
- These contracts related lists aren't available:
 - Contract History
 - Items to Approve

Leads

- Social leads:
 - You can't access social leads features for Facebook, Klout, or YouTube in Salesforce1.
 - If a lead has been linked to a social network profile, the profile image selected for the lead may display when viewing the lead in Salesforce1 even when you aren't logged in to the social network. Profile images from Facebook or Twitter may appear even if you aren't currently logged in to those networks. You can't switch to a different profile image in Salesforce1.
 - You can view Tweets, retweets, replies, or favorites for an associated Twitter user if you're using a Salesforce1 downloadable app. With the Salesforce1 mobile browser app, tap the Twitter profile to see Tweets and so forth directly in Twitter. Also, in the Salesforce1 mobile browser app, you can't see who is following a Twitter user, or who the Twitter user is following.
 - Salesforce1 lists common connections you and your lead share on Twitter. You can't view common connections in the full Salesforce site.
 - To view the Twitter card on a lead in Salesforce1, you must add Twitter to the page layout for leads. Access the full Salesforce site to edit page layouts.
- Lead conversion:
 - You can select accounts but can't create them.
 - You can create opportunities but can't select existing ones.
 - You can't select lead sources across duplicate records. The lead source defaults to the duplicate contact.
 - You can't create related tasks during the conversion, but you can create tasks from the contact record.
 - You can't automatically notify owners of converted leads.
- The **Find Duplicates** and **Unlock Record** buttons aren't available.
- The Lead History related list isn't available.
- When adding a new lead, the `Campaign` field and the `Assign using active assignment rule` checkbox aren't available. You can add values to these fields in the full Salesforce site.

Opportunities

- The **Competitors** button isn't available.
- These fields aren't available: `Opportunity Splits` amount field, `Products` subtotal field, and `Stage History` connection field.
- Records in the Contact Roles related list are read only.
The Roles field on the Contact Roles related list isn't available.
- The Campaign Influence and Similar Opportunities related lists aren't available.
- These related lists are available but the lists display record preview cards only; you can't tap to open any of the list records.
 - Competitors
 - Opportunity Splits

- Stage History
- The opportunity owner can't edit the `Probability` or `Forecast Category` fields. However, field values are automatically populated, based on the value of the `Stage Opportunities` field, when you save the record. The opportunity owner can manually edit the values for these fields in Salesforce Classic (but not from Lightning Experience).
- Before you can use Salesforce1 to add a product to an opportunity, the opportunity must already have a price book associated with it. By default, Salesforce1 doesn't include an action for associating a price book, but Salesforce admins can create a quick action that allows Salesforce1 users to add this information. Alternately, users can associate a price book with an opportunity in the full Salesforce site.
- You can't add products with revenue or quantity schedules to opportunities. If you do, the product appears on the opportunity, but the schedule is not created. You also can't re-establish a product schedule from an opportunity.
- You can't view product details, even for products that appear on the opportunity.

Opportunity Teams

- You can add, edit, or delete only one opportunity team member at a time.
- When the opportunity owner is changed, the opportunity team is retained.
- The **Clone** and **Display Access** buttons aren't available.

Orders

- The **Create**, **Clone**, **Activate**, **Deactivate**, **Reduce Order** buttons aren't available.
- You can't add, edit, or remove order products.

Quotes

- Quote PDFs appear in the related list but aren't viewable.
- You can approve or reject quotes but you can't submit quotes for approval.
- You can't perform these actions:
 - **Email Quote**
 - **Create PDF**
 - **Start Sync**
 - **Stop Sync**

Productivity Features: What's Not Available in Salesforce1

Salesforce Today

The Salesforce Today app is available in the Salesforce1 downloadable apps for Android phones and iPhone and iPad devices. It's not available in the Salesforce1 mobile browser app, nor in the full Salesforce site.

There are some issues when using Today.

- You see local events from selected calendars on your mobile device but Salesforce events aren't available in this release of Today.
- If some or all of your calendar servers don't automatically push data to your device, you need to update your calendars before you can see the most current information in Today.
- The 24-hour time format isn't supported.

- When viewing a multiday event, only the ending date and time are displayed in the highlights area.
- The wrong date and time may display for recurring multiday events.
- If your calendar doesn't display invitee names because the list is too long, Today shows a count of "1 invitee" in the Current Event and Agenda cards on the main view and doesn't show any invitees when you open the event.
- Today is unable to find a matching Salesforce record for a meeting organizer of an iCloud event because the iCloud API doesn't return an email address.
- Today uses the mobile device's time zone setting, while Salesforce events respect the user's Salesforce time zone setting. If there's a difference between these settings when a user logs a local event from Today, the `Time` field in the new Salesforce event record reflects the user's Salesforce time zone and doesn't match the time of the local event.
- On Android devices, a meeting organizer's name may not display correctly if there isn't a matching Salesforce record for the person.
- If another user makes updates to a mobile calendar event record while you're viewing the record in Today on an Android device, you don't automatically see the changes. The record is refreshed the next time you select it from the Today main view.
- Because of the way that the Android OS identifies local events, if a user accesses Today on an Android device to log a local event in Salesforce, then views the same event in Today on a different Android device or an iOS device, it may look like the event wasn't logged and it isn't possible to access the corresponding Salesforce event from Today. The logged event status and link is correct on the original Android device, however.
- Chatter Free and Chatter External users aren't able to access Today because these user license types don't have access to contacts or person accounts.

Activities (Events and Tasks)

- The `subject` field doesn't include a picklist of previously defined subjects.
- Activities can't be archived.
- You can't use Shared Activities to relate multiple contacts to an event or a task.
- Recurring activities aren't available.
- Activity reminders aren't available.
- When an activity is related to a person account using only the `Name` field, the activity doesn't appear on the person account record.

Events and Calendars

- You can't see a full calendar like you can in the full site. Nor can you create a calendar from standard or custom objects.
- You can't accept or decline an event you've been invited to.
- You can't add events to Microsoft® Outlook®.
- You can't add invitees to events or remove them from events.
- Invitee related lists display slightly different content. In Salesforce1, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner. To reproduce the full site functionality in Salesforce1, use an API query; see [EventRelation](#).
- Events reflect your Salesforce time zone and locale settings, not the time zone setting on your mobile device.
- In **Events** in the Salesforce1 navigation menu, the date bar always begins on Sunday and ends on Saturday, regardless of your device and Salesforce locale settings.
- If you view the event list while the time advances from 11:59 PM to midnight, the list isn't automatically updated to display the next day's date and time.

Tasks

- Only the **My Tasks**, **Completed Within Last 7 Days**, **Delegated**, and **Today** lists are available in Salesforce1. No other task lists, such as **Overdue**, **This Month**, or **All Open**, are available in Salesforce1.
- Group (multiuser) tasks aren't available.
- In task lists, the order of the fields in the priority picklist determines the order in which tasks are sorted.
- The more tasks that you have, and the more relationships that your tasks have to other records, the longer it can take to view tasks or use other features in the Salesforce1 app.
- When more than 1,000 overdue tasks exist, task lists in Salesforce1 don't display any overdue tasks at all. Use reports to view your overdue tasks and close them, postpone them, or delete their due dates.
- Task layouts contain a few unique elements that make tasks easier to work with. These elements don't appear in a compact layout because you can't change them, but users always see them:
 - The and icons represent the status of the `isclosed` field to users with the Edit Task permission.
 - The  icon represents a task marked high priority (including custom high priority).
 - If the due date exists and a user has permission to view it, all tasks show the due date.
 - Tasks include the primary contact and the related account or other record, when they exist.

The fields in each list can vary depending on the settings in your Salesforce org.

You control the layout of task records and tasks in the task list using compact layouts. You control related lists, as always, using the page layout editor. Adding the due date field to either layout doesn't change the appearance of tasks—that field never appears twice.

Below the built-in task elements, Salesforce1 displays up to three other fields.

- The default compact layout for tasks includes two fields: the name of a lead or contact, and an opportunity, account, or other record the task is related to.
- In an Activities related list, a task's fields depend on what record you're viewing and how you've defined the layout for that object.

For more information, see [Compact Layouts](#).

Notes

- When using Salesforce1, you can access all of your notes from the **Notes** item in the Salesforce1 navigation menu. The Salesforce Classic version of the full site doesn't include a Notes tab. Instead, Salesforce Classic users access notes from the **Files** tab.
- You can't delete notes.
- You can't share notes with other users or groups.
- In the Salesforce1 downloadable app for Android and the Salesforce1 mobile browser app, you can't add images to notes, but you can view images that were added from the full site. You can, however, add images to notes using the Salesforce1 downloadable app for iOS, version 10.0 or later.
- Some rich text options that are available in the full site, such as applying a bold or italic font or indenting a paragraph, aren't available in Salesforce1. But you can view formatting that was added from the full site.
- You can't revert to previous versions of notes, but you can view previous versions.
- Spelling errors aren't highlighted while creating or editing notes.

Integrated Email

- Salesforce1 doesn't display emails in the improved layout that's available in Lightning Experience.

Voice

The telephony features in Lightning Experience aren't available in Salesforce1.

Work.com

When using Work.com features in Salesforce1, you can't:

- Share goals and metrics
- Link metrics to reports
- Refresh metrics that are linked to reports
- Link parent goals and subgoals
- Add goal images
- Create custom badges
- Offer or request feedback
- View custom metric fields
- Create, fill out, or dismiss performance summaries
- Manage performance summary cycles

Customer Service Features: What's Not Available in Salesforce1

Cases

- Standard actions on Case Feed aren't available in Salesforce1. Instead, use quick actions provide this functionality in the mobile app. For example, to provide the Email action functionality on a case page, create a Send Email quick action and add it to the case page layout.

Standard Action Available in Salesforce Classic	Replace with Quick Action in Salesforce1
Email	Send Email
Change Case Status	Update Case
Log a Call	Log a Call

The **Portal** action isn't available.

For organizations that have the legacy "Page Layouts for Case Feed Users" enabled, users who are assigned the "Use Case Feed" permission see the standard case layout in Salesforce1.

- Some fields on Service Contract and Contact Line Item related lists aren't available.
- These case related lists aren't available:
 - Business Hours on Holiday List
 - Case Contact Role
 - Milestone List
 - Solution List
 - Team Member List
 - Team Member on Team List

- Team Template Member List

Chatter Questions

- To access the action drop-down menu for a question, tap the question.
- You don't see similar questions and knowledge articles when you ask questions.
- You can't select best answers.

Field Service Lightning

- The dispatcher console, which includes the service list, scheduling policy picker, Gantt view, and map, isn't available in Salesforce1.

Salesforce Knowledge Articles

Articles are supported in the Salesforce1 downloadable app for iOS, version 10.0 or later, the Salesforce1 downloadable app for Android, version 8.0 or later, and in the Salesforce1 mobile browser app, with these limitations:

Issue	Android Downloadable App, v8.0 or later	iOS Downloadable App, v10.0 or later	Mobile Browser App
Only published articles are available—not draft or archived articles.	■	■	■
Articles can't be created, edited, translated, or archived.	■	■	■
Articles can't be linked to cases. (But links that are set up from the full site can be viewed in Salesforce1 on the Related tab.)	■	■	■
Smart links aren't supported.	■	■	■
Article ratings aren't supported.	■	■	■
Tables are sometimes cut off on the right side when included in article rich text fields.	■		■
Compact layouts display the article type API name instead of the article type name. So users see the article type API name in the highlights area when viewing an article.	■	■	
When searching from the Articles home page, only articles in the user's language are returned and only if that language is an active Knowledge language (from Setup, Customize > Knowledge > Knowledge Settings). To see articles in another language, users can change to an active Knowledge language. From My Settings , use the Quick Find search box to locate the Language & Time Zone page.	■	■	
In global search, search results show articles in the language specified for the device, regardless of the active Knowledge language.	■		
Filtering search results by data categories, article type, validation status, or language isn't available.	■	■	■
In global search, articles don't appear in the list of recent records.	■	■	

Issue	Android Downloadable App, v8.0 or later	iOS Downloadable App, v10.0 or later	Mobile Browser App
In global search results, search highlights and snippets don't appear. These features are available in all versions of Salesforce1 when searching from the Articles home page.	■	■	
Knowledge articles aren't available when accessing communities via the Salesforce1 mobile app.	■	■	

Work Order Milestones

- The milestone tracker isn't available.
- Entitlement processes and milestones must be managed from the full Salesforce site.

Work Orders and Linked Articles

- Linked articles are view-only. You can search the Knowledge base and read attached articles, but you can't attach or detach articles. To manage linked article settings and attach or detach articles, use the full site.
- The Linked Work Orders and Linked Work Order Line Items related lists on articles aren't available.
- Linked articles can't be accessed from feed items.

Reports and Dashboards: What's Not Available in Salesforce1

Reports

Considerations When Using Reports in Salesforce1

Feature	Notes about Salesforce1 Availability
Number of Rows Displayed	Reports display a maximum of 2,000 rows, same as on the full Salesforce site.
Groupings	When you view a report with groupings, the groupings are displayed as columns at the end of the report.
Report Formats	Summary reports, matrix reports, and tabular reports are available in Salesforce1, but matrix and summary reports are shown in tabular format. Joined reports aren't available.
Conditional Highlighting	You can't view reports that show conditional highlighting in Salesforce1.
Filters	When you open a report from the Reports tab, you can't filter the report. When you tap a dashboard component to open the source report, you can filter the report by tapping a value on the chart.

Feature	Notes about Salesforce1 Availability
	If the source report is a tabular or joined report, then you can't filter it.
Custom Summary Formula Fields	Custom summary formula fields don't display in Salesforce1.

Report Features Not Available in Salesforce1

- Create, edit, or delete reports
- Export
- Print
- Feed
- Schedule report refreshes
- Subscribe
- Joined reports
- Historical trend reports
- Add to campaign
- Role hierarchy
- Conditional highlighting
- Custom summary formula fields
- Folders

Other Notes about Using Reports in Salesforce1

- You can't drill into reports that have more than three checkbox fields.
- When you view a report with more than 16 summary fields in Salesforce1, you receive an error message.
- Salesforce1 can't render reports via URLs that use dynamic parameter values. If you modify a URL to pass parameters into reports, Salesforce1 shows a blank screen (a report record with no returned results).

Dashboards

Considerations When Using Dashboards in Salesforce1

Feature	Notes about Salesforce1 Availability
Edit a Dashboard	You can't edit dashboards in Salesforce1. Dashboards are read-only.
Refresh a Dashboard	In addition to rerunning all reports in a dashboard, which can take time, you can quickly refresh the dashboard to show data from the last run.
View As	In Salesforce1, as in the full Salesforce site, you can only run dashboards as a user in your role hierarchy. However, in Salesforce1 you can choose from all users in your organization. If you select a user outside your role hierarchy, you get an error.

Feature	Notes about Salesforce1 Availability
Lightning Experience Dashboard Layout	Lightning Experience dashboards that have more than three columns display in a three-column layout on phones and tablets.

Dashboards Features Not Available in Salesforce1

- Create, edit, or delete dashboards
- Feed
- Schedule
- Link from a dashboard component to a website or email address
- Post dashboard components to Chatter
- Visualforce components on dashboards
- Folders

Other Notes about Using Dashboards in Salesforce1

In some situations, data displayed in a dashboard component can get out of sync with data in the report that's displayed on the same page. When a dashboard component's data doesn't match the report, one of these things is happening:

- The dashboard is being refreshed as the configured user or the running user, while a report is always run as the current user.
- The report was refreshed more recently than the dashboard. A report is refreshed every time you look at it (assuming you aren't working offline). But a dashboard component is refreshed only when the dashboard it belongs to is refreshed.

The same temporary mismatch can occur in the full site, but there you see reports and dashboard charts on separate pages. In Salesforce1, you see the report and the dashboard chart on the same page.

Charts

Other Notes about Using Charts in Salesforce1

- Unless you turn on **Enable Enhanced Charts in Salesforce1**, legacy Salesforce Classic charts display instead of the new Lightning Experience charts. After turning on **Enable Enhanced Charts in Salesforce1**, all users see enhanced charts regardless of whether they switch to Lightning Experience on the full Salesforce site.

Enhanced charts are similar to legacy charts, but they have the following limitations:

- Enhanced charts show only the first 100 groupings.
- You can't post enhanced charts to feeds.
- Report Charts are only available after drilling into a dashboard component's report. Report charts aren't available from the Reports tab.

Salesforce Files: What's Not Available in Salesforce1

When using Salesforce Files in the Salesforce1 mobile app, you can't:

- View file types other than these: `.doc`, `.docx`, `.pdf`, `.ppt`, `.pptx`, `.xls`, `.xlsx`, and all image files, including `.gif`, `.jpg`, and `.png` formats.
- Access Files from the Salesforce1 navigation menu if you're a high-volume portal user.
- Upload files using the Good Access secure mobile browser.

Chatter: What's Not Available in Salesforce1

Feeds

When using feeds in the Salesforce1 mobile app, you can't:

- Send or view Chatter messages.
- See Chatter activity statistics or Chatter influence status.
- Share public posts.
- Add or view Chatter favorites.
- Filter records.
- Search in feeds on user profiles and records.
- Invite coworkers to sign up for Chatter.
- Use Chatter emoticons (but you can use iOS and Android emoji keyboards to add emoticons to feeds).
- Edit feed posts or comments (but you can see feed items that were edited in the full site).
- Mute a feed item from its detail view.

Topics (Salesforce1 mobile browser app only)

Topics are available in the Salesforce1 mobile browser app only. But you can't:

- See trending topics.
- Edit topic details (name and description).
- Tag favorite topics.
- Assign topics to records.
- View records assigned to a topic.
- See these related lists: Related Topics, Related Groups, Knowledgeable on Topics, Recent Files.
- See topics in auto-complete options when searching.
- Delete topics.

People and Profiles

When using People to view profiles in the Salesforce1 mobile app, you can't:

- Edit profile information in the Salesforce1 downloadable app for iOS devices.
- Upload a profile photo using the Good Access™ secure mobile browser.
- Use custom profiles.

Groups

When using groups in the Salesforce1 mobile app, you can't:

- Invite customers to join private customer groups.
- Add records to Chatter groups with customers using the Add Record publisher action.
- Withdraw requests to join private groups
- Change email and in-app notification settings for groups in communities.
- Perform the following group owner and manager actions:

- Remove files from the group files list.
- Upload group photos from the Salesforce1 downloadable apps

Chatter Messenger

Chatter Messenger isn't available in Salesforce1.

Salesforce Communities: What's Not Available in Salesforce1

Salesforce Communities in Salesforce1 is similar to the full site, with these differences:

- The Salesforce1 navigation menu for a community doesn't include all of the items that are available to your internal organization:
 - The navigation menu shows only the tabs that the admin has included in that community via Tabs & Pages in the community's administration settings.
 - The Chatter tab that's available in Salesforce Classic is divided into three menu options in Salesforce1 (and Lightning Experience). If your community includes the Chatter tab in Salesforce Classic, you'll see Feed, People, and Groups in Salesforce1.
 - The Events and Today items aren't available and don't appear in the navigation menu.
 - Tasks are available only to users with the Edit Tasks permission.
 - The Reports item isn't available and doesn't appear in the navigation menu.
 - Salesforce Knowledge articles aren't supported in communities when using the Salesforce1 downloadable apps. The Articles item doesn't display in the navigation menu. (But articles are available if using the Salesforce1 mobile browser app.)
- There is no All Company Feed.
- Adding inline images to a post isn't available.
- The Community Management page isn't available in Salesforce1.
- Communities that use a Community Builder template, such as Koa, Kokua, or Napili, contain rich styling that doesn't display in Salesforce1. These communities are responsive and it's best to access them directly from a mobile browser using community URLs. (Communities that use a Salesforce Tabs + Visualforce template *are* supported in all the Salesforce1 apps.)
- Site.com branding is not supported.
- Community members can't flag private messages as inappropriate.
- Reputation isn't supported in Salesforce1. However, if reputation is enabled and set up in the full site, users do accrue points when using Salesforce1. For example, if the community manager set up a point system in the full site and assigned point values for writing a post and commenting on a post, then users in the community earn points with every post and comment made in Salesforce1. Users can view their points in the full site only though.
- Search is scoped by community and returns only items from the current community. The only exception is records, since they are shared across communities.
- Role-based external users can approve and reject approval requests from the Approval History related list on records, but they can't submit requests for approval.
- A user's list of notifications includes notifications from all communities the user is a member of. The name of the community in which the notification originated appears after the time stamp.
- External users accessing communities don't see a help link.
- In the Salesforce1 mobile browser app, external users' photos don't include any visual indication that the user is an external user. In the full Salesforce site and the Salesforce1 downloadable apps, the upper left corner of an external user's photo is orange.

- In the Salesforce1 mobile browser app, the People list shows the default photo () next to each user's name. Tap a user to go to their profile page where you can see their uploaded photo. In the Salesforce1 downloadable apps, photos appear next to users' names in the People list.
- The community template and your user licenses determine how you can access communities using Salesforce1. For more information, see *Access to Communities Using Salesforce1* in the Salesforce Help.
- Group members in communities can't edit their email and in-app notification settings in Salesforce1. As a workaround, users can set their group email notification preference to **Every Post** in the community from the full site. Doing this automatically enables both email notifications and in-app notifications in Salesforce1 for that group.
- Communities aren't available from Salesforce1 when the mobile device is offline.

Navigation and Actions: What's Not Available in Salesforce1

Navigation

- When used on smartphones, the Salesforce1 mobile app doesn't rotate into landscape orientation.
The Salesforce1 for iOS downloadable app is available in landscape orientation on supported iPad models. But the Salesforce1 for Android downloadable app doesn't rotate into landscape orientation on supported Android tablets.
The mobile browser app interface does rotate into landscape orientation but isn't guaranteed to work in this orientation. Only portrait orientation is supported.
- The top-down tab-key order, which allows users viewing a record detail page to move through a column of fields from top to bottom before moving focus to the top of the next column of fields, isn't supported in Salesforce1. Even if a page layout is configured for a top-down tab-key order, Salesforce1 moves from left-to-right through field columns.

Actions

- Most actions, including quick actions, productivity actions, and standard and custom buttons, are displayed in the action bar or list item actions in Salesforce1.
- If you use URL custom buttons to pass parameters to standard pages in Salesforce Classic—such as pre-populating fields when creating a record—this behavior doesn't work in Salesforce1.
- There are a few differences between the Send Email quick action in Salesforce and the standard Email action in Case Feed:
 - Users can't switch between the rich text editor and the plain text editor in a Send Email action.
 - Templates aren't supported in the Send Email action.
 - Quick Text isn't available in the Send Email action.
 - The Send Email action doesn't support attachments.
 - Users can't save messages as drafts when using the Send Email action.
 - Users can't edit or view the From field in the Send Email action.

Search: What's Not Available in Salesforce1

- In the Salesforce1 mobile browser app, you don't search across multiple objects at the same time when doing a global search. Instead, you use the search scope bar beneath the global search box to pick the object that you want to search (same as in Lightning Experience).
- In the Salesforce1 mobile browser app, the objects available in the search scope bar are the same as the items that appear in the Recent section of the Salesforce1 navigation menu. If you're new to Salesforce and don't yet have a history of recent objects, you're able to search the default set of objects: Accounts, Cases, Contacts, Files, Leads, Opportunities, and Groups and People (unless these items were added directly to the navigation menu). As you spend time working in Salesforce1 and the full Salesforce site, the objects

that you use the most eventually replace the default ones in the Recent section and become the objects that are available for global searches in Salesforce1. The Salesforce1 downloadable apps for Android and iOS don't have a search scope bar.

- When setting up the Salesforce1 navigation menu, the Smart Search Items option adds Salesforce objects to the menu. Smart Search Items is required for users to get search results in the Salesforce1 downloadable app for Android. On the other hand, users of the Salesforce1 downloadable app for iOS and the Salesforce1 mobile browser app are able to search for their records if this item is omitted from the navigation menu.
- If a desired object isn't yet available via global search in Salesforce1, you can search the object directly. From the navigation menu, tap **More** beneath the Recent section to see all objects available to you. Then tap the object to open its record search page.
- List views aren't included in Salesforce1 search results, from either a global search or an object-specific record search. To find list views, open the record search page for an object and type your search terms. As you type, the list of matching items expands to show the list views you've most recently accessed in the full Salesforce site.
- For the Salesforce1 downloadable apps for Android and iOS, search returns up to 50 of the most relevant records in the results. The Salesforce1 mobile browser app doesn't have a limit on the number of results presented.
- When searching in Salesforce1, you can't:
 - Filter search results
 - Pin frequently used items
 - Search by division

[How Is Search Different Between Lightning Experience, Salesforce Classic, and Salesforce1?](#)

Entering Data: What's Not Available in Salesforce1

There are some differences between the full Salesforce site and the Salesforce1 app when you're adding new records or updating existing data.

Category	Issue	Creating Records	Editing Records
Any Record	Inline editing isn't available.	✓	✓
	Changing a record's owner is available for accounts, campaigns, cases, contacts, leads, opportunities, work orders, and custom objects only.		✓
	You can't modify a record's record type.		✓
	Combo boxes, which combine a picklist with a text field, aren't available. Typically the text field is available but the picklist is not.	✓	✓
	If territory management is enabled, you can't assign or modify a record's territory rules.	✓	✓
Accounts and Contacts	The Copy Billing Address to Shipping Address and Copy Mailing Address to Other Address links aren't available.	✓	✓
	If territory management is enabled, the Evaluate this account against territory rules on save option isn't available when editing account records.		✓

Category	Issue	Creating Records	Editing Records
Events	An event owner can't change, add, or remove an event's invitees. If two or more contacts are related to an event, the owner can't edit them; if the event has just one related lead or contact, the owner can edit it but not add more.		✓
	Events that aren't related to a contact or object aren't displayed.	✓	✓
	You can't accept or decline an event you've been invited to.		✓
	You can't use Shared Activities to relate multiple contacts to an event.	✓	✓
	Proposed Events (the New Meeting Request button) aren't supported.	✓	✓
	The <code>Related To</code> field remains editable when the <code>Name</code> field is set to <code>Lead</code> , but you'll receive an error if the <code>Related To</code> field contains data when you save the record.	✓	✓
	You can't create recurring events or change the details of a recurring event series. (You can change the details of individual occurrences in an event series.)	✓	✓
	The <code>Subject</code> field doesn't include a picklist of previously defined subjects.	✓	✓
	The <code>Email</code> and <code>Phone</code> fields for an associated contact aren't displayed.	✓	✓
	You can't add attachments.	✓	✓
	You can't send notification emails.	✓	✓
	You can't set event reminders.	✓	✓
Leads	When you add a new lead, the <code>Campaign</code> field and the <code>Assign using active assignment rule</code> checkbox aren't available. You can add values to these fields in the full site.	✓	
Opportunities	You can't edit the <code>Probability</code> or <code>Forecast Category</code> fields. However, values are automatically added to these fields (based on the value of the <code>Stage</code> field) when you save the record. You can manually edit the values for these fields in the full site.	✓	✓
Tasks	The <code>Subject</code> field doesn't include a picklist of previously defined subjects.	✓	✓
	The <code>Related To</code> field remains editable when the <code>Name</code> field is set to <code>Lead</code> , but you'll receive an error if the <code>Related To</code> field contains data when you save the record.	✓	✓
	The <code>Email</code> and <code>Phone</code> fields for an associated contact aren't displayed.	✓	✓
	You can't use Shared Activities to relate multiple contacts to a task.	✓	✓
	You can't create recurring tasks or change the details of a recurring task series. (You can change the details of individual occurrences in a task series.)	✓	✓
	You can't add attachments.	✓	✓
	You can't send notification emails.	✓	✓
	You can't set task reminders.	✓	✓

Category	Issue	Creating Records	Editing Records
Lookup Fields	Administrator-defined dependent lookup filters aren't supported.	✓	✓
	User-defined lookup filter fields aren't supported.	✓	✓
Phone Number Fields	Phone number fields display a keypad, from which you tap out the phone number. The keypad doesn't include parentheses, hyphens, or periods, and Salesforce1 doesn't apply any phone number formatting when you save the record. To apply a specific phone number format, edit the record in the full site.	✓	✓
Picklist Fields	Controlling and dependent picklists are supported, but Salesforce1 doesn't display indicators on create and edit pages for these fields. To determine if a picklist field is dependent, and which picklist field controls it, switch to the full site.	✓	✓

Duplicate Management: What's Not Available in Salesforce1

Duplicate management in the Salesforce1 app is similar to the full site, with these differences:

- Each possible duplicate is shown on a "duplicate card." Salesforce1 shows a maximum of 30 duplicates (10 per object), even if there are more.
- A duplicate card displays three fields, which are derived from the search results format defined for the organization, not from the associated matching rule.
- You can tap a duplicate card to view the possible duplicate record's complete details, but that action erases the information you entered in the new or updated record. You must re-enter that information before you can save the record or view additional duplicate cards.
- By default, duplicate rules run when you complete fields on a record. In Salesforce Classic, duplicate rules run when you save a record.

Approvals: What's Not Available in Salesforce1

These approval-related options aren't available in the Salesforce1 mobile app:

- Recalling approval requests.
- Reassigning approval requests.
- Manually selecting the next approver. For approval requests that require this manual selection, the approver needs to log in to the full Salesforce site.

In addition:

- Salesforce1 notifications for approval requests aren't sent to queues. For each approval step involving a queue, we recommend adding individual users as assigned approvers, so at least those individuals can receive the approval request notifications in the mobile app. To have both queues and individual users as assigned approvers, select **Automatically assign to approver(s)** instead of **Automatically assign to queue** in the approval step.
- Salesforce1 notifications for approval requests are sent only to users who have access to the record being approved. Assigned approvers who don't have record access can still receive email approval notifications, but they won't be able to complete the approval request until someone grants record access.
- When responding to an approval request from Salesforce1, it is possible to include comments but the Comments field appears after approving or rejecting the record.
- When working with approvals in communities, role-based external users can see and take action from the Approval History related list, but they can't submit requests for approval.

Salesforce Customization: What's Not Available in Salesforce1

Custom Home Pages

- Salesforce1 doesn't support login redirection to Salesforce apps or custom home tabs like the full Salesforce site does. If you prefer to retain this redirection for users who log in to Salesforce from a mobile browser, turn off the Salesforce1 mobile browser app. This can be done on a user-by-user basis or for your entire organization.

Custom Actions and Buttons

- Custom buttons that are added to the Button section of a page layout and that define the content source as *URL* or *Visualforce* are supported in Salesforce1. Remember that Visualforce pages must be enabled for use in Salesforce1.

Custom links, custom buttons that are added to list views, and custom buttons that define the content source as *OnClick JavaScript* aren't available in Salesforce1.

- If you use URL custom buttons to pass parameters to standard pages in Salesforce Classic—such as pre-populating fields when creating a record—this behavior doesn't work in Salesforce1 or Lightning Experience.
- Custom images used for action icons must be less than 1 MB in size.

Visualforce Pages

- Standard tabs, custom object tabs, and list views that are overridden with a Visualforce page aren't supported in Salesforce1. The Visualforce page is shown for full site users but Salesforce1 users will see the default Salesforce1 page for the object instead. This restriction exists to maintain the Salesforce1 experience for objects.
- Embedded Visualforce pages—that is, those added to a page layout—that contain an `<apex:enhancedList>` component may cause the Salesforce1 app to crash when used on iOS devices.
- When viewing Visualforce pages on an Android device, horizontal scrolling doesn't work if the page is wider than the viewport. Redesign the page so that it's narrower than the viewport.

Lightning Pages

- You can't add more than 25 components to a Lightning Page region.

Programmatic Customizations

- These programmatic customizations to the UI aren't supported: Web tabs and S-controls.

SalesforceA

Manage users and view information for Salesforce organizations from your mobile device.

SalesforceA is a mobile app for Salesforce administrators. When you're away from your desk, you can use your phone or tablet to perform essential administration tasks like resetting passwords, freezing users, and viewing current system status.

SalesforceA is free. Download it from the Google Play Store for Android phones and tablets, and from the Apple App Store for Apple iPhone, iPod Touch, and iPad.

Overview of Your Organization

The Overview screen shows:

- Number of frozen and locked out users
- Trust status
- Recently viewed users

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

For Android users, the navigation icon is in the top left. Tap it to go to the navigation menu.

For iOS users, navigation is done through the action bar at the bottom of the screen.

User Management

From the navigation menu, tap **Users** to see a list of users or search for a user. Tap a name to:

- View or edit user details
- Freeze, deactivate, or reactivate the user
- Reset a user password

Swipe to the Related page to see:

- The user's current permission sets
- The user's login history

Additional Information

The Resources page gives you quick access to:

- Admin news and events
- Trailhead
- Salesforce trust
- Salesforce answers
- Salesforce release notes

SEE ALSO:

[Log In to SalesforceA](#)

[Log In to Multiple Organizations with SalesforceA](#)

Log In to SalesforceA

Log in to the SalesforceA mobile app to perform essential administrative tasks for your Salesforce organization.

As a Salesforce administrator, you can use SalesforceA to log in to your production organization (default), sandbox environment, or a custom host. Choose the environment or host with the host menu.

- For iOS users: open the host menu from the gear icon in the upper right corner of the login screen.
- For Android users: open the host menu from the action overflow button in the upper right corner of the login screen.

If prompted, enter a passcode as an extra layer of security for your mobile device. Manage this security setting in the Salesforce desktop browser application from **Setup** in the **Connected Apps** entry for **SalesforceA**.

Once you log in, you see the Overview screen.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

SEE ALSO:

[SalesforceA](#)

[Log In to Multiple Organizations with SalesforceA](#)

Log In to Multiple Organizations with SalesforceA

Use SalesforceA on your mobile device to log in to multiple Salesforce organizations that you administer. Once logged in, you can switch between organizations without going through the login process again.

1. Tap the navigation icon to go to the menu. For iOS users, tap **More**.
2. Tap the down arrow next to your username. A list of your accounts appears.
3. Select a previously saved username or tap **+ Add account** to add an account.
4. To choose a sandbox or custom host, tap the gear icon in the upper right (iOS users) or the action overflow button in the upper right (Android users), and switch to your desired host.

From the list of your accounts, you can:

- Switch between organizations
- See whether each organization is production or sandbox (iOS only)
- See each organization's edition (iOS only)

Tap the up arrow to close the account selector.

EDITIONS

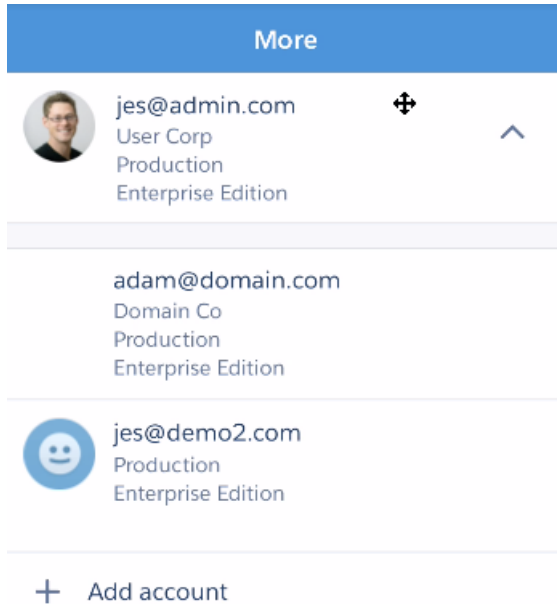

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions.

USER PERMISSIONS

To use SalesforceA:

- "Manage Users"

Salesforce Classic

Salesforce Classic Mobile Overview for Administrators

Salesforce Classic Mobile helps your teams succeed by allowing users to access their latest Salesforce data, whenever and wherever they need it, directly from Android™ and iPhone® devices. The Salesforce Classic Mobile app exchanges data with Salesforce over mobile or wireless networks, and stores a local copy of the user's data in its own database on the mobile device. Users can edit local copies of their Salesforce records when a data connection isn't available, and transmit those changes to Salesforce when a connection is available again. The app also promotes near real-time logging of critical information by prompting users to enter updates directly in Salesforce or Force.com AppExchange apps after important customer calls, emails, or appointments.

A Salesforce Classic Mobile license is required for each user to use Salesforce Classic Mobile. For organizations using Unlimited, Performance, and Developer Editions, Salesforce provides one mobile license for each Salesforce license. Organizations using Professional or Enterprise Editions must purchase mobile licenses separately.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

 **Note:** The Android and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact Salesforce to turn on Salesforce Classic Mobile for your organization.

About the Salesforce Classic Mobile Default Configuration

Mobile configurations for the Salesforce Classic Mobile app are sets of parameters that determine what data Salesforce transmits to users' mobile devices and which users receive the data on their mobile devices. A default mobile configuration is provided for Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations. Administrators can't view or edit the default mobile configuration.

Users are automatically assigned to the default mobile configuration when they activate their Salesforce account from a supported mobile device using the Salesforce Classic Mobile app.

The default mobile configuration:

- Allows users with an assigned mobile license to install and activate Salesforce Classic Mobile, even if you haven't yet assigned them to a mobile configuration.

You can [disable Salesforce Classic Mobile](#) to prevent users from activating the Salesforce Classic Mobile app.

The default configuration can mobilize the following objects:

- Accounts
- Assets
- Cases
- Contacts
- Dashboards
- Events
- Leads
- Opportunities
- Reports
- Solutions
- Tasks

 **Note:**

- Not all objects available in the Salesforce Classic Mobile app are mobilized with the default configuration.
- Assets aren't available as a tab in the Salesforce Classic Mobile app but display as a related list for accounts, cases, and contacts.

The default configuration automatically synchronizes records the user recently accessed in Salesforce on the Salesforce Classic Mobile app. Users can search for records that aren't automatically synchronized; once the user downloads a record, the record becomes a permanent part of the data set. In addition to recently accessed records, the default configuration synchronizes activities closed in the past five days and open activities due in the next 30 days.

Salesforce Classic Mobile Implementation Tips and Best Practices

Set up the Salesforce Classic Mobile app using these tips and best practices.

Building Lean Data Sets

- Keep the data sets in your mobile configurations as small as possible. Not only do lean data sets greatly improve the Salesforce Classic Mobile app's performance, but they also make the app easier to use. Pushing massive amounts of data to the device might seem like a good idea, but the important records tend to get lost among the ones that aren't relevant to users' day-to-day activities. Small data sets are powerful because the Salesforce Classic Mobile app synchronizes with Salesforce every 20 minutes, so the data is constantly refreshed with new and updated records. Even if your mobile configurations don't account for every possible record your users might need, they can search for records that aren't automatically synchronized to their devices.

To build small data sets:

- Nest the objects in the data set tree. For example, add contacts as a child data set of the account object so that the data set includes contacts related to the mobilized accounts instead of all the user's contacts.
 - Avoid setting the record ownership filter to All Records unless your organization uses a private sharing model. It's unlikely that users need to see all of an object's records on their devices. Instead of mobilizing all opportunity records, for example, mobilize just the opportunities owned by the user or the user's opportunity team.
 - Use filters that synchronize the most relevant records. For example, even if you limit the opportunities on the device to records owned by the user, you could further prune the data set by mobilizing only opportunities closing this month.
 - Set a record limit to prevent the data set from getting too large. Generally, a single data set should generate no more than 2,500 records.
- Another way to build lean data sets is to [mobilize the Salesforce recent items list](#), add the data sets, and set the record ownership filters in your data sets to None (Search Only). The user's data set is populated with records recently accessed in Salesforce, and those records in turn synchronize additional data based on the data set hierarchy. For example, let's say you create a data set with the account object at the root level and add the contact, task, and event objects as child data sets. When the Salesforce Classic Mobile app synchronizes an account from the Salesforce recent items list, it also synchronizes the contacts, tasks, and events related to that account.
 - If you're not sure which fields to use as filters for your data sets or mobile views, consider using the Last Activity Date field. For example, set up a filter that synchronizes contacts with an activity logged this week or this month. The Last Activity Date field is a better indicator of a record's relevance than the Last Modified Date field—often the main detail of a record remains unchanged even though users frequently log related tasks and events.

Mobilizing Records Users Need

- Before mobilizing a custom object, make sure the object's functionality is compatible with the Salesforce Classic Mobile app. Salesforce Classic Mobile doesn't support S-controls, mashups, merge fields, image fields, or custom links.
- To obtain a relevant set of activities, mobilize the task and event objects at the root level of the data set hierarchy and nest them under parent objects, like contacts, accounts, and opportunities. Adding tasks and events at multiple levels ensures that users will see their personal activities and activities related to the records on their devices. Avoid mobilizing too much activity history or too

EDITIONS

- "Manage Mobile Configurations"

many tasks and events not owned by the user. Generally, there are more task and event records in an organization than any other type of record, so it's easy to bloat data sets with too many activities.

- If your sales representatives frequently take orders in the field and need a comprehensive inventory list, add the product object at the root level of the data set hierarchy. Nesting the opportunity product object below the opportunity object won't mobilize all products.
- If your users need to assign tasks to other users or change the record owner, mobilize the user object so that the names of other users will be available on the device. Avoid mobilizing all user records—instead, set up filters based on the role or profile.
- Be sure that users assigned to a mobile configuration have field-level access to all the fields used in the configuration's filter criteria. If a user doesn't have access to a field in a data set's filter criteria, the Salesforce Classic Mobile app won't synchronize the records for that data set or its child data sets.
- You can sometimes use cross-object formula fields to work around limitations of the Salesforce Classic Mobile app. For example, Salesforce Classic Mobile doesn't support campaigns, so you can't add the campaign object as a data set and add the opportunity object as its child data set to get the related records. However, you can create a text formula field on the opportunity object equal to the name of the parent campaign. The field needs to be visible, but it doesn't need to be included on your page layouts. Then add the opportunity object to the data set and use the new formula field to filter opportunities related to a specific campaign.
- Although a mobile configuration might include an object at multiple levels in the data set hierarchy, users won't see duplicate tabs in the Salesforce Classic Mobile app. Only one Task tab appears on the device even if you mobilize the task object at the root level and as a child data set of three objects.

Customizing Mobile Configurations

- Clean up your mobile page layouts by excluding fields from the objects in the mobile configuration. Less data is sent to the device, and mobile users don't have to scroll through unnecessary fields.
- If you mobilize the Dashboards tab, be sure to select any other tabs that should appear in the Salesforce Classic Mobile app. Customizing the tabs for a mobile configuration overrides the default tab set—if you only mobilize the Dashboard tab, it will be the only tab sent to the device.
- Due to the small size of mobile device screens, you can only select two display columns for mobile views. If you need three columns of data, create a text formula field on the object that concatenates the three fields, then use the formula field in the mobile view criteria.
- When creating mobile views, you can filter based on the current user with the `$User.ID` global variable, but you can't enter a user's name as a value in the filter criteria. To build a view based on users, create a text formula field on the appropriate object, then use the formula field in the mobile view criteria. For example, to create a view that displays opportunities owned by an opportunity team, create a text formula field on the opportunity object that contains the opportunity owner's user ID or role, then create a view that filters on values in that field.

Testing and Deploying the Mobile Product

- It's important to test mobile configurations to make sure they're synchronizing an acceptable amount of data. Test configurations against active users who own a very large number of records. Typically, most data sets generate between 500 KB and 4 MB of data. If the data sets are over 4 MB, refine the filter criteria to limit the amount of data sent to the device.
- You can use the Salesforce Classic Mobile app in the sandbox before deploying to your organization.
- Use of the Salesforce Classic Mobile app requires a data plan. The wireless data volume for the Salesforce Classic Mobile app varies greatly between customers and even users in the same organization. It's impossible to predict your organization's data usage, but we can offer some guidelines:
 - The initial data download consists of records that match the criteria specified in the user's mobile configuration and the metadata needed to support these records when disconnected. On average, the data sizes range from 500 KB–4 MB.

- After the initial download of data, incremental update requests are initiated by the client app every 20 minutes. Each of these requests and the corresponding server response are approximately 200 bytes.
- If any new data is downloaded to the client app as a result of the update request, only the new or changed values are sent. For example, the Salesforce Classic Mobile app only downloads the new phone number in a contact record, not the entire contact record. The amount of data transmitted differs for every organization and every user.

Generally, the volume of data transmitted by the Salesforce Classic Mobile app is low compared to moderate email usage.

Best Practices

- Use the zero-administration deployment option to experiment with the Salesforce Classic Mobile app before you set up mobile configurations. You'll create better blueprints for your mobile configurations if you've tried using the Salesforce Classic Mobile app.
- Talk to users about their favorite reports, views, and dashboards to get ideas for what filter criteria to use in mobile configurations.
- After setting up mobile configurations, deploy the Salesforce Classic Mobile app on a limited basis with a select group of users. Adjust the mobile setup based on their feedback, then deploy to all of your users.

Setting Up Salesforce Classic Mobile

To deploy the Salesforce Classic Mobile app to your organization:

1. [Review the mobile implementation tips and best practices](#)
2. [Enable mobile users](#)
3. [Create one or more mobile configurations](#)
4. [Define the data sets for your mobile configurations](#)
5. [Test the mobile configurations](#)
6. [Customize mobile page layouts and adjust mobile user permissions](#) (optional)
7. [Customize mobile tabs](#) (optional)
8. [Create custom mobile views](#) (optional)
9. [Set up dashboards](#) (optional)
10. [Set up mobile reports](#) (optional)
11. [Set up Salesforce CRM Content](#) (optional)
12. [Configure access for partner users](#) (optional)
13. [Create links to Web and Visualforce Mobile pages](#) (optional)
14. [Notify users that Salesforce Classic Mobile is available for download](#)

When users download the Salesforce Classic Mobile app and activate their accounts, you can [manage their devices](#) in the Salesforce Classic Mobile Administration Console.

To change Salesforce Classic Mobile settings:

- "Manage Mobile Configurations"

Enabling Salesforce Classic Mobile Users

To enable users to access Salesforce Classic Mobile:

1. Allocate mobile licenses to users by selecting the `Salesforce Classic Mobile User` checkbox on the user record.
2. Edit each custom profile to which Salesforce Classic Mobile users are assigned to include the "API Enabled" permission. Salesforce Classic Mobile users need access to the API so their mobile devices can communicate with Salesforce. The "API Enabled" permission is enabled by default on standard profiles.

 **Note:** The Android and iPhone apps are available in English, Japanese, French, German, and Spanish. Contact Salesforce to turn on Salesforce Classic Mobile for your organization.

To prevent users from activating Salesforce Classic Mobile on their mobile devices before you're ready to deploy the app, disable the `Salesforce Classic Mobile User` checkbox for all your users.

 **Note:** If you deselect this checkbox for a user who is already assigned to a mobile configuration, Salesforce removes that user from the mobile configuration and assigns the user to the default mobile configuration.

The free version of Salesforce Classic Mobile is available only for orgs that enabled this option before Summer '16. With Summer '16, all other orgs (new and existing) don't see this option.

Create Salesforce Classic Mobile Configurations

Mobile configurations are sets of parameters that determine the data Salesforce transmits to users' mobile devices, and which users receive that data on their mobile devices. Organizations can create multiple mobile configurations to simultaneously suit the needs of different types of mobile users. For example, one mobile configuration might send leads and opportunities to the sales division, while another mobile configuration sends cases to customer support representatives.

Before creating your mobile configurations, plan which profiles and users you want to assign to each configuration. Each mobile configuration only affects the mobile devices of users assigned to the configuration.

To create a mobile configuration:

1. [Enter Basic Information](#)
2. [Assign Users and Profiles](#)
3. [Set Total Data Size Limit](#)
4. [Complete Your Mobile Configuration](#)

 **Note:** A [default mobile configuration](#) is provided for Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations. You can't view or edit the default configuration.

Enter Basic Information

1. From Setup, enter *Salesforce Classic Configurations* in the **Quick Find** box, then select **Salesforce Classic Configurations** to access the mobile configurations list page.
2. Click **New Mobile Configuration**.
3. Enter a name for the mobile configuration.
4. Select the **Active** checkbox if you want to activate the mobile configuration immediately after creating it. The mobile configuration does not work until you select this checkbox.

If you deactivate an active mobile configuration, Salesforce saves all requests from devices of the users assigned to the mobile configuration for up to one week. If you reactivate the mobile configuration, Salesforce executes those requests in the order received.

5. Optionally, enter a description for the mobile configuration.
6. Optionally, select the **Mobilize Recent Items** checkbox to mark recently used records in Salesforce for device synchronization.

Selecting this option ensures that mobile users assigned to the configuration will not have to search for and download items they recently accessed on Salesforce, even if those records do not meet the configuration's filter criteria. Only records belonging to mobilized objects can be marked for device synchronization; for example, if you do not mobilize the account object in a configuration, users assigned to that configuration cannot automatically receive recent accounts on their devices.
7. If you select the **Mobilize Recent Items** checkbox, select a value from the **Maximum Number of Recent Items** drop-down list. Set a low number if your users have minimal free space on their mobile devices.
8. Optionally, select the **Mobilize Followed Records** checkbox to automatically synchronize records users are following in Chatter to their mobile device. The device only synchronizes followed records for objects included in the mobile configuration's data set.

The **Mobilize Followed Records** checkbox is only available if Chatter is enabled for your organization.

Assign Users and Profiles

You can assign individual users and profiles to each mobile configuration. If you assign a profile to a mobile configuration, the mobile configuration applies to all Salesforce Classic Mobile users with that profile unless a specific user is assigned to another mobile configuration.

 **Tip:** For ease of administration, we recommend that you assign mobile configurations to profiles; however, you may have situations in which you need to assign a configuration directly to individual users.

To assign users and profiles to a mobile configuration:

1. In the Search drop-down list, select the type of member to add: users or profiles. This drop-down list is not available if you have not enabled the `Mobile User` checkbox on any user records, or if all users are already assigned to a mobile configuration; in that case, you can only assign profiles to this mobile configuration.
2. If you do not immediately see the member you want to add, enter keywords in the search box and click **Find**.
3. Select users and profiles from the `Available Members` box, and click the **Add** arrow to add them to the mobile configuration. You can assign each user and profile to only one mobile configuration.

The `Available Members` box only displays users who have the `Mobile User` checkbox enabled.

4. If there are users or profiles in the `Assigned Members` box you do not want to assign to this mobile configuration, select those users and click the **Remove** arrow.

 **Warning:** Removing a user from an active mobile configuration deletes the Salesforce-related data on the user's mobile device but does not delete the client application.

Set Total Data Size Limit

Different types of mobile devices offer different memory capacities, and some devices experience serious problems if all of the flash memory is used. To avoid overloading mobile devices, optionally specify a total data size limit for each mobile configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration.

To set the total data size limit, use the `Don't sync if data size exceeds` drop-down list to specify the amount of memory that is consistently available on the mobile devices of users who are assigned to this mobile configuration. If the combined size of all the data sets exceeds this limit, users assigned to this profile receive an error message on their mobile devices, and Salesforce will not synchronize any data sets in this mobile configuration. [Test your mobile configuration](#) to make sure the data sets do not exceed the total data size limit.

 **Tip:** To reduce the size of your data, do one or more of the following:

- Delete a data set.
- Reduce the scope of your data sets.
- Refine the filter criteria of your data sets.

Complete Your Mobile Configuration

Click **Save**. Note that your mobile configuration is not active until you select the `Active` checkbox.

[Define Data Sets](#)

[Setting Up Salesforce Classic Mobile](#)

Define Data Sets

Accessing Salesforce from a mobile device is very different than accessing it from your computer. This is because mobile devices generally have less memory and screen size than computers, and they do not maintain a constant network connection. To work with these limitations, each mobile configuration only transfers data sets, which are subsets of the records users access in the Salesforce online user interface. Mobile devices store data sets in on-board databases, allowing users to access their most important records and work offline when no network connection is available. Salesforce automatically synchronizes the on-board databases when the mobile device reestablishes a network connection.

Each data set can contain records related to a single object and is classified by the name of that object. For example, the Accounts data set only includes account records.

Data sets can have child data sets, which are data sets that contain records associated with a top-level (parent) data set. For example, if the first level of your hierarchy has an Accounts data set, you can add a Contacts child data set that includes all contact records related to the account records. Child data sets appear as related lists on mobile devices.

A single mobile configuration can have multiple data sets for the same object and at different levels. For example, you can have an Events parent data set and an Events child data set under Leads.

 **Tip:** Review the [sample data sets](#) to see how you might define data sets for common groups of Salesforce users.

After [creating a mobile configuration](#), you must define its data sets. To access the data sets for a mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of the mobile configuration that you want to modify.
2. In the Data Sets related list, click **Edit**.
3. From the Data Sets page, you can:
 - [Add a data set](#).
 - Remove a data set by selecting the data set you want to remove and clicking **Remove**.
 - Edit a data set by selecting the data set you want to edit in the hierarchy. The right pane displays the filters for that data set.
 - [Test your mobile configuration](#).

As you define and modify the data sets, Salesforce automatically saves your changes.

4. Click **Done** when you are finished.

Adding Data Sets

To add a data set:

1. In the hierarchy, select **Data Sets** to create a parent data set, or select an existing data set to create a child data set.
2. Click **Add...**
3. In the popup window, select the object for the records you want the data set to include. Salesforce lets you create parent data sets for all custom objects and the following standard objects:
 - Accounts
 - Assets

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To view mobile data sets:

- “View Setup and Configuration”

To create, change, or delete mobile data sets:

- “Manage Mobile Configurations”

- Attachments
- Cases
- Contacts
- Content
- Events
- Leads
- Notes
- Opportunities
- Price Books
- Products
- Solutions
- Tasks
- Users

**Note:**

- Although attachments are available as a data set, they're only supported in Salesforce Classic Mobile for Android.
- Salesforce Classic Mobile supports default field values only for picklists and multiselect picklists. Default field values for other types of fields, such as checkboxes and numeric fields, do not appear in Salesforce Classic Mobile.

When adding to an existing data set, the popup window displays any object with a relationship to the selected object. This includes child objects, and also parent objects with a master-detail or lookup relationship to the selected object.

For example, assume you created an account field called Primary Contact with a lookup relationship to the contact object. If you add Account as a top-level data set in a mobile configuration, you see two sets of contacts when you add Contact below Account:

- **Contact:** Represents the standard relationship between the account and contact objects.
- **Contact (Referenced by Account):** Represents any object that is the parent in a lookup or master-detail relationship for the selected object. In this case, the contact object is referenced by the Primary Contact field on the account object.

Because Salesforce distinguishes between these two types of relationships, you could, for example, mobilize just the contacts referenced by a custom account field without sending any child contact records to the device.

4. Click **OK**. The data set you created appears in the hierarchy.
5. Optionally, use filters to restrict the records that a parent or child data set includes:
 - a. Use the Filter by Record Ownership options to configure Salesforce to automatically synchronize records based on the owner of the record. The possible options are:
 - **All Records:** Salesforce automatically synchronizes all records the user can access. The **All Records** option is not available for tasks and events when they are parent data sets in a mobile configuration. This helps prevent failed data synchronization due to activity filter queries that take too long to run.
 - **User's Records:** Salesforce automatically synchronizes all records the user owns.
 - **User's Team's Records:** Salesforce automatically synchronizes all records owned by the user and the user's subordinates in the role hierarchy.
 - **User's Account Team's Records:** Salesforce automatically synchronizes accounts for which the user is an account team member, but does not include accounts owned by the user.
 - **User's Opportunity Team's Records:** Salesforce automatically synchronizes opportunities for which the user is an opportunity team member, but does not include opportunities owned by the user.

- **None (Search Only)**: Salesforce does not automatically synchronize any records for this data set; however, users can use their mobile devices to search all of the records they can access.

Salesforce only displays options that relate to the selected data set. For example, selecting an account data set displays the **User's Account Team's Records** option, while selecting an opportunity data set displays the **User's Opportunity Team's Records** option.

If your mobile needs for an object require a combination of the available record ownership filters, you can add the same object data set up to four times on the same hierarchy level. For example, a sales manager might want to synchronize his opportunities, opportunities owned by his subordinates, and opportunities for which he is an opportunity team member. In this case, you would add an opportunity data set and select **User's Team's Records**, then add a second opportunity data set at the same level in the hierarchy and select **User's Opportunity Team's Records**. Note that objects with only one ownership filter option, such as Case Comment, cannot be added multiple times at the same level of the hierarchy.

- b.** Set the filter criteria to automatically synchronize only records that meet specific criteria in addition to the Filter by Record Ownership option you selected. For example, you can set the filter to only include opportunity records with amounts greater than \$50,000, or contact records with the title "Buyer."
- c.** To prevent a single data set from consuming all the memory on a mobile device, select the second radio button under Set Max Record Limit and enter the maximum number of records this data set can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the [data size limit](#) is exceeded.

If the limit is reached, Salesforce updates the records currently on the mobile device approximately every 20 minutes, and replaces the records approximately every 24 hours in accordance with the Order By and Sort settings. For example, if the settings are Last Modified Date and Descending, Salesforce transfers the most recently modified records to mobile devices and removes the same number of records that were least recently modified.

If you selected the **None (Search Only)** Filter by Record Ownership option, the limit you set does not apply because no records are automatically synchronized.

 **Tip:** Do not use Set Max Record Limit in place of filters. Only use Set Max Record Limit as a safety mechanism, and use filters as the primary means of limiting the number of records on a mobile device. This ensures that your mobile users receive the correct records on their devices.

Because of the memory restrictions of mobile devices, Salesforce prevents a single query from returning more than 2,500 records.

- 6.** Be sure to [test your mobile configuration](#) to make sure the data does not exceed the total data size limit.
- 7.** Click **Done**.

[Setting Up Salesforce Classic Mobile](#)

Merge Fields for Mobile Filter Criteria

Some of the \$User merge fields are available when defining filters for mobile configurations and mobile custom views. In mobile configurations, you can use these merge fields to synchronize records where the user is linked to a record but is not the record owner. For example, you can send cases created by the current user to the mobile device, or you can send records to the device where the current user is referenced in a custom field. In mobile views, you can use the merge fields to define view based on the record owner; for example, you might create a view that displays the current user's accounts with a rating of "Hot".

The following table describes the available user merge fields:

Merge Field	Description
<code>\$User.ID</code>	References the ID of the current user. This merge field can be applied to fields that contain a user lookup. The valid operators for this merge field are Equals and Not Equal To. When creating mobile view filters that reference an owner field, you can only use the <code>\$User.ID</code> merge field.
<code>\$User.Username</code>	References the username of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Firstname</code>	References the first name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Lastname</code>	References the last name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or Equal, Contains, Does Not Contain, and Starts With.
<code>\$User.Fullname</code>	References the first and last name of the current user. This merge field can be applied to any text or lookup field, except picklists. The valid operators for this merge field are Equals, Not Equal To, Greater Than or Equal, Less Than or

- [Define Data Sets](#)

Sample Data Sets

Many administrators create mobile configurations based on the functional groups in their organization because users in the same group usually have similar mobile requirements for data. Below are sample data sets for common Salesforce groups. Your mobile users have unique needs, but you can use the examples as a reference to help you get started with mobile configurations.

Sales Manager

Sales managers usually need to see records they own and also the records of their subordinates. They also tend to closely monitor large deals in the pipeline.

This mobile configuration allows sales managers to see:

- The opportunities they own.
- The opportunities owned by users who report to them in the role hierarchy.
- All opportunities scheduled to close in the current quarter with an amount greater than \$100,000.
- All accounts related to the opportunities.
- A subset of their contact and activity records.

Sample Mobile Configuration for Sales Managers

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Team's Records	(Close Date equals THIS QUARTER) AND (Amount greater than "100,000")	No Limit	
Account	All Records		No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Sales Engineer

The sales engineer mobile configuration retrieves opportunities owned by the other members of the user's opportunity team, but does not include the user's records. The configuration is opportunity-based because all accounts and contacts sent to the device are related to the opportunities. The sales engineers would see activity history related to the opportunities on the device and also their own activities.

Sample Mobile Configuration for Sales Engineers

Object	Ownership Filter	Field Filter	Max Records	Order By
Opportunity	User's Sales Team's Records	Closed equals False	No Limit	
↳ Account	All Records		No Limit	
↳ Contact	All Records		No Limit	
↳ Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
↳ Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Account Executive

This account executive mobile configuration is account-based, which means the device pulls down the user's accounts and opportunities related to those accounts. The opportunities are filtered so that only open opportunities scheduled to close in the current quarter appear on the device. The Task and Event child data sets retrieve all activities related to those opportunities, not just the user's activities. Only open tasks and events from a two-month window are sent to the device. The Task and Event parent data sets pull down just the user's activities and restrict the activities to open tasks and events scheduled for the next 30 days. The Contact data set delivers the user's contact records, but limits the record count to the 500 most recently active contacts.

Sample Mobile Configuration for Account Executives

Object	Ownership Filter	Field Filter	Max Records	Order By
Account	User's Records		No Limit	
↳ Opportunity	User's Records	(Closed equals False) AND (Close Date equals THIS QUARTER)	No Limit	
↳ Event	All Records	(Date equals LAST 30 DAYS) AND (Date equals NEXT 30 DAYS)	No Limit	
↳ Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Contact	User's Records		500	Last Activity (Decending)
Task	User's Records	Closed equals False	No Limit	
Event	User's Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	

Customer Support Representative

Customer support representatives are focused primarily on cases and solutions. This mobile configuration delivers all open cases to the user's device, along with related accounts, contacts, case comments, case history, tasks, and events. The Case Solution child data set sends all solutions related to the cases, and the Solution data set lets the user search for solutions from the Solutions tab on the device. The support representatives also have access to a subset of their activity records.

Sample Mobile Configuration for Customer Support Representatives

Object	Ownership Filter	Field Filter	Max Records	Order By
Task	All Records	Closed equals False	No Limit	
Event	All Records	Date equals TODAY OR Date equals NEXT 30 DAYS	No Limit	
Case	User's Records	Closed equals False	No Limit	
Task	All Records	Due Date equals LAST 30 DAYS OR Due Date equals NEXT 30 DAYS	No Limit	
Case Comment	All Records		No Limit	
Event	All Records	Date equals LAST 30 DAYS OR Date equals NEXT 30 DAYS	No Limit	
Account	All Records		No Limit	
Contact	All Records		No Limit	
Case History	All Records		No Limit	
Case Solution	All Records		No Limit	
Solution	None (Search Only)		No Limit

Test Salesforce Classic Mobile Configurations

When you [create a Salesforce Classic Mobile configuration](#), you specify a total data size limit for the configuration. The total data size limit prevents Salesforce from sending too much data to the mobile devices of users assigned to the mobile configuration. After [defining the data sets](#), it's important to test the mobile configuration to make sure the total data size limit isn't exceeded.

To estimate the size of the data set that the mobile configuration will deliver to a user's device:

1. From Setup, enter *Salesforce Classic Configurations* in the **Quick Find** box, then select **Salesforce Classic Configurations**. Then click the name of the mobile configuration that you want to test.
2. In the Data Sets related list, click **Edit**.
3. In the Test Data Size section, click the lookup icon next to the **Select a user** field to choose the user you want to test. While users must be mobile-enabled in order to assign them to mobile configurations, you can test the configuration's data size against any user account.

The **Select a user** field defaults to the name of the user currently logged in; however, it is important to test a mobile configuration with the accounts of users who will actually be assigned to the configuration, particularly users who own a large number of records.

4. Select the **Include metadata** checkbox to include metadata in the estimate. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.

Warning: It might take a while for Salesforce to calculate the metadata size in addition to the data size. Even if you choose to hide the metadata in your test results, the metadata is still factored into the total data size when the mobile device synchronizes with Salesforce.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To view Salesforce Classic Mobile data sets:

- "View Setup and Configuration"

To test Salesforce Classic Mobile configurations:

- "Manage Mobile Configurations"

5. Click **Estimate Data Size**.

The size of each data set is calculated. Results display in the hierarchy tree, which is the left pane of the data set region at the top of the page. Additional results appear in the Test Data Size section below the hierarchy.

- In the hierarchy tree, two numbers appear next to each data set. The first represents the number of records generated by the data set, and the second represents the total size of the data set in bytes or kilobytes. This breakdown is useful for identifying which data sets might require additional filtering criteria to reduce the size.
 - The Test Data Size section provides an estimate of the data that the current mobile configuration would deliver to the selected user's device, including:
 - The size and number of records in each object's data set.
 - The total size and number of records, which includes records in the data set and marked records. A marked record is a record that is not part of a user's mobile configuration. There are two ways marked records can become part of the data set:
 - The user downloads records to his or her device through online searches, and the records are flagged so that they get sent to the user's device every time the device synchronizes with Salesforce.
 - Records in the user's data set contain lookup fields to records that do not match the mobile configuration's filter criteria. Salesforce synchronizes the records referenced in the lookup fields so that users do not encounter broken links in the mobile app.
-  **Tip:** For an accurate count of the marked records, synchronize the data in the mobile app before estimating the data size. To synchronize the data:
- On an Android device, tap **Application Info** > **Sync Now** > **Refresh All Data**.
 - On an iPhone device, tap **More**, then tap **App Info**. Tap **Sync Now**, then tap **Refresh All Data**.
- The size of the metadata that would be sent to the device for the user, if you selected the **Include metadata** checkbox.
 - The total mobilized data set, which is the sum of all the records.
- Reports are not included in the data size estimate.

- ## 6. Compare the test results to the total data size limit that was set for the configuration; the limit is located in the top of the Test Data Size section. Click the size limit to increase or decrease the value on the Edit Mobile Configuration page.
- If the total data size is below the limit, the selected user can safely be assigned to the mobile configuration. However, keep in mind that the test results are an estimate because different devices have different storage algorithms.
 - If the total data size exceeds the limit, reduce the size of the data by reducing the scope of your [data set](#), refining the filter criteria of your data sets, deleting a data set, or [removing fields from the mobile page layout](#). Repeat the testing process until the data is below the total limit.

 **Note:** The data size estimate in the Test Data Size section does not automatically refresh if you edit the data sets. Click **Refresh Data Size** to update the test results.

[Salesforce Classic Mobile Overview for Administrators](#)

[Manage Salesforce Classic Mobile Configurations](#)

[Manage Salesforce Classic Mobile Devices](#)

[Setting Up Salesforce Classic Mobile](#)

Edit Object Properties for Salesforce Classic Mobile

You can change the properties of standard and custom objects in the Salesforce Classic Mobile app. For example, you can restrict the permissions of Salesforce Classic Mobile users, or you can exclude unnecessary fields from the object's mobile page layout.

Salesforce Classic Mobile object properties are customized per mobile configuration. To edit mobile object properties:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**.
2. Click the name of the mobile configuration you want to modify.
3. In the Mobile Object Properties related list, click **Edit** next to an object name.

Only objects you mobilized in the configuration's data set appear in the related list. You can't change the properties of the user object.

4. From the Edit Mobile Configuration page, you can:
 - [Remove Mobile Permissions](#)
 - [Customize Salesforce Classic Mobile Page Layouts](#)
5. Click **Save**.

Remove Mobile Permissions

The Salesforce Classic Mobile app inherits the user's permissions from Salesforce. Some administrators want to further restrict the permissions of users when they access Salesforce data in Salesforce Classic Mobile, usually due to limitations of the app or the possibility of user error. For example, users can inadvertently delete a record because they don't realize that deleting a record in Salesforce Classic Mobile also deletes the record in Salesforce. If this is a concern, administrators can prevent users from deleting records in the mobile application, regardless of their standard and custom object permissions in Salesforce. Also, Salesforce Classic Mobile doesn't support all Salesforce features, such as S-controls and Apex. If your business process for an object is unsupported by Salesforce Classic Mobile, you might choose to prevent mobile users from updating those records in the app.

In the Permissions section, select which permissions to remove from mobile users for this object. Use the **Deny Create**, **Deny Edit**, or **Deny Delete** checkboxes to prevent users from creating, editing, or deleting records in Salesforce Classic Mobile.

 **Note:** Currently, you can't block mobile permissions for the content object.

Customize Salesforce Classic Mobile Page Layouts

The Salesforce Classic Mobile app inherits the user's page layouts from Salesforce. Administrators may want to exclude some fields from each object's mobile page layout because unnecessary fields consume memory and make it harder for users to scroll through pages on the mobile device.

In the Excluded Fields section, select which fields to display on the mobile device for this object. To add or remove fields, select a field name, and click the **Add** or **Remove** arrow.

- Administrators can view all available fields per object, regardless of field-level security.
- Certain fields are required in order for Salesforce Classic Mobile to communicate with Salesforce. Those fields don't display in the Available Fields box because they are mandatory and can't be excluded from mobile page layouts.
- Fields used in custom mobile views can't be excluded from mobile page layouts.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To edit Salesforce Classic Mobile object properties:

- "Manage Mobile Configurations"

- If you mobilize the content object, all of the content object's fields display in the Available Fields box; however, the layout of the content detail page in the Salesforce Classic Mobile app is hard-coded to show only a few fields. Excluding fields for the content object doesn't affect the page layout in the app.

SEE ALSO:

[Salesforce Classic Mobile Overview for Administrators](#)

[Manage Salesforce Classic Mobile Configurations](#)

[Manage Salesforce Classic Mobile Tabs](#)

[Create Links to Web and Visualforce Mobile Pages for Salesforce Classic Mobile](#)

[Setting Up Salesforce Classic Mobile](#)

Assign Tabs to a Salesforce Classic Mobile Configuration

For each mobile configuration, you can select the tabs that appear in the Salesforce Classic Mobile app and define the order of the tabs. The available tabs for a mobile configuration include:

- Standard object tabs
- Custom object tabs
- Visualforce and web tabs that have been enabled for Salesforce Classic Mobile

Warning: Not all websites and Visualforce features are supported on mobile devices. Carefully review the [best practices](#) for creating mobile-friendly pages before enabling Visualforce or web tabs for the Salesforce Classic Mobile app.

By default, tabs work the same in the Salesforce Classic Mobile app as in the full Salesforce site—if an object's tab is hidden in Salesforce, it's hidden in Salesforce Classic Mobile as well.

Note: If you customize mobile tabs, the tabs you select for the mobile configuration are sent to users' mobile devices even if the tabs have not been added to a configuration. Although the tabs are sent to the device, they only display in the Salesforce Classic Mobile app if users have permission to view the tab.

There are several reasons you might want to hide an object's tab in Salesforce Classic Mobile even though the object records are sent to the device. The Salesforce Classic Mobile app has much less screen space to display a row of tabs, so occasionally you might choose to reduce the number of tabs on the device. Also, sometimes a custom object has a relationship to a standard object, and users access the custom object record from the parent object record. In that case, you could mobilize the custom object but hide the tab.

To assign tabs to a mobile configuration:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration.
2. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you have already set up the mobile tabs, click **Edit**.
3. Select tabs from the Available Tabs list, and click the **Add** arrow to add them to the mobile configuration.
4. In the Selected Tabs list, choose tabs and click the **Up** and **Down** arrows to arrange the tabs in the order they should appear in the Salesforce Classic Mobile app.
5. Click **Save**.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional and Enterprise** Editions

USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To customize Salesforce Classic Mobile tabs:

- "Manage Mobile Configurations"

-  **Note:** iPhone users can customize the order of their tabs in the Salesforce Classic Mobile app. If the user customizes their tab order, any administrator changes to the tab order in the mobile configuration are ignored by the app, and any newly mobilized tabs are added below the user's existing tabs.

SEE ALSO:

- [Manage Salesforce Classic Mobile Tabs](#)
- [Enabling Web and Visualforce Tabs for Salesforce Classic Mobile](#)
- [Salesforce Classic Mobile Overview for Administrators](#)
- [Manage Salesforce Classic Mobile Configurations](#)

Enabling Web and Visualforce Tabs for Salesforce Classic Mobile

You can make web and Visualforce tabs available in the Salesforce Classic Mobile app. When you build the web tab or Visualforce tab, edit the tab properties and select the `Salesforce Classic Mobile Ready` checkbox to ensure that the web page or Visualforce page displays and functions properly on a mobile device. Selecting the checkbox adds the tab to the list of available tabs for your Salesforce Classic Mobile mobile configurations.

It is important to note that most mobile browsers have technical limitations concerning display size, scripts, processor speed, and network latency. Review the following considerations before mobilizing your web and Visualforce pages to ensure that they are compatible with mobile browsers.

Mobile Web Tab Considerations

Consider the following when defining a web tab that will be used in the Salesforce Classic Mobile app:

- The ability to mobilize web tabs is only available for iPhone devices. If you mobilize a web tab, keep in mind that Android users can't view the tab in Salesforce Classic Mobile.
- The tab type must be URL. The mobile application can't run S-controls.
- Some web pages contain JavaScript and Flash, but not all mobile browsers support them:
 - Apple's Safari browser supports JavaScript, but not Flash.
- Before mobilizing a web tab, navigate to the target URL on one of your organization's mobile devices to verify that it works as expected in a mobile browser. In the event that your organization's device inventory includes phones with different operating systems—for example, iPhone devices—be sure to test on each type of device. If users can't accomplish the necessary tasks on the web page from a mobile browser, do not mobilize the web tab.

Visualforce Mobile Tab Considerations

Consider the following when defining a mobile Visualforce tab:

- Visualforce Mobile is only available for iPhone. If you mobilize a Visualforce tab, keep in mind that Android users can't view the tab in Salesforce Classic Mobile.
- Because the display size is limited on mobile browsers, we recommend redesigning the Visualforce page to optimize it for mobile users:
 - Set the `sidebar` and `showHeader` attributes on the `<apex:page>` tag to `false`. Phones have small screens and limited processing power, so it is essential that the page suppresses the tab header and sidebar.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

- Set the `standardStylesheets` attribute on the `<apex:page>` tag to `false`. The standard Salesforce style sheet causes pages to load slowly on the device. The best approach to adding a style sheet to your page is to include a `<style>` section just below the `<apex:page>` component.
- Set the `columns` attribute on the `<apex:pageBlockSection>` component to `1`. There is not enough room on a mobile device's screen to display two columns, so specifying a one-column layout prevents fields from wrapping awkwardly on the page.
- Splash pages don't display in the Salesforce Classic Mobile app.
- In the Salesforce Classic Mobile app, the Visualforce page is embedded in a tab, so you should avoid using tabs for navigation in mobile Visualforce pages.
- Even if you know that the mobile browser supports the JavaScript in your Visualforce page, keep your use of JavaScript to a minimum. Mobile devices generally have slow network connections, and too many scripts running on a page creates a poor user experience. To minimize the amount of JavaScript on your mobile Visualforce pages, try to build them using mostly HTML.
- All Visualforce pages contain JavaScript, even if you don't create pages that use JavaScript code.
- User agent inspection can be executed in a custom controller to support multiple devices. You can do this by inspecting the appropriate result of the `getHeaders()` method on the current page reference.

Create List Views for Salesforce Classic Mobile

You can create custom list views for Salesforce Classic Mobile users. Custom list views for Salesforce Classic Mobile, also called mobile views, are different from Salesforce custom views in these ways:

- Administrators set up mobile views for each mobile configuration. The views are available to all users assigned to the configuration, and administrators can't restrict visibility to certain groups of users within the configuration. Each mobilized object in a mobile configuration can have up to 10 custom views.
- Users can't filter mobile views by All Records or My Records. The views apply to all records stored locally on the device regardless of ownership; however, ownership filters can be applied using the additional fields in the search criteria.
- Mobile views don't support filter logic.
- Mobile views are limited to a two-column display.
- Users can sort mobile views in ascending or descending order by up to two fields.

For each mobile configuration, you can define up to 10 custom views per object. These views are then pushed to the devices of users assigned to the affected configurations. To create a custom view for Salesforce Classic Mobile:

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration. You might need to [create a mobile configuration](#) if you haven't already.
2. Scroll down to the Mobile Views related list.
3. Choose an object type from the Select an object drop-down list, and then click **New Mobile View**. Only objects included in the mobile configuration's data set appear in the drop-down list. You can't create mobile views for the user object.
4. Enter the view name.

Because display space on mobile devices is limited, the maximum length of a mobile view name is 30 characters.

5. In the Specify Filter Criteria section, enter conditions that the selected items must match; for example, *Amount is greater than \$100,000*.
 - a. Choose a field from the first drop-down list.

 **Note:** You can't create views based on fields you [excluded from mobile page layouts](#) or fields that are [hidden for all profiles and permission sets](#).

- b. Choose a filter operator.
- c. In the third field, enter the value to match.

 **Warning:** Note the following about filter criteria values for mobile views:

- You can use the `!User.ID merge field` as a value in your filter criteria to reference the current user. You can't enter user names in your filter criteria.
- You can only enter special date values in your filter criteria, not actual dates.
- You can't use FISCAL special date values in the filter criteria.

- d. Select **Match All** if items in the mobile view should match all the criteria you entered. Select **Match Any** if items in the mobile view should match any of the criteria you entered. Mobile custom views do not support advanced filtering options.
6. In the Select Fields to Display section, select the fields to use as display columns.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited, and Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To view Salesforce Classic Mobile devices and users:

- "View Setup and Configuration"

To manage Salesforce Classic Mobile custom views:

- "Manage Mobile Configurations"

The default fields are automatically selected. You can choose up to two different columns of data fields to display in your mobile custom view.

7. In the Define Sort Order section, optionally set a primary and secondary sort order for the view.
 - a. Select a field in the Order By drop-down list. You can sort by fields that have been excluded from the object's mobile page layout.
 - b. Set the sort order to Ascending or Descending.
8. Click **Save**.

Set Up The Mobile Dashboards for iPad App

 **Important:** As of Summer '15, the Mobile Dashboards for iPad app is no longer supported. You can continue to use the app, but Salesforce no longer provides support in the form of bug fixes or enhancements for any issues you may encounter. Talk to your Salesforce administrator about migrating to the Salesforce1 app, the new Salesforce mobile experience.

You can make the Dashboards tab available in Salesforce Classic Mobile by adding it to the tabs for a [mobile configuration](#). Mobile dashboards allow field users to keep up with corporate metrics and key performance indicators even when they are away from their desks.

Note the following about mobile dashboards:

- The Dashboards tab in the mobile application launches an embedded browser to display the dashboards.
- Due to screen size limitations, mobile dashboards display in a single column.
- Links to custom report details are disabled in mobile dashboards.
- The first time a user visits the Dashboards tab in Salesforce Classic Mobile, the mobile application requests the last dashboard the user viewed in Salesforce. Depending on the strength of the cellular or WiFi signal, it could take several minutes before the dashboard displays on the page.
- Dashboards do not automatically refresh in the mobile application. Users can request a dashboard refresh by clicking the **Refresh** button.
- Users are able to work offline in the mobile application. Without a wireless connection, users can see the last viewed dashboard, but they cannot refresh the dashboard or select a different one.
- The minimum BlackBerry operating system requirement for mobile dashboards is 4.5. Mobile dashboards are compatible with version 4.3, but tables in the dashboards might not display properly.
- BlackBerry administrators should be aware that the download size setting on the BlackBerry Enterprise Server affects how much dashboard data can be pushed to the device. Check that the download size setting is appropriate, and be sure to test your dashboards before deploying them to your mobile users.

 **Note:** Currently, dashboards are only available in the BlackBerry and iPhone mobile client applications.

To enable mobile dashboards:

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view mobile configurations:

- "View Setup and Configuration"

To mobilize dashboards:

- "Manage Mobile Configurations"

1. From Setup, enter *Mobile Dashboards* in the `Quick Find` box, then select **Mobile Dashboard Settings**. Then click the name of a mobile configuration.
2. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you have already set up the mobile tabs, click **Edit**.
3. Select **Dashboards** from the Available Tabs list, and click the **Add** arrow to add it to the mobile configuration. The Available Tabs list includes standard object tabs and custom object tabs. It can also include web and Visualforce tabs.
 -  **Warning:** If you have not yet customized tabs in the mobile configuration, you must select all the tabs that should appear in the mobile application, not just the Dashboards tab.
4. In the Selected Tabs list, choose the Dashboards tab and click the **Up** and **Down** arrows to define where the Dashboards tab should appear in the mobile application.
5. Click **Save**.

SEE ALSO:

[Setting Up Salesforce Classic Mobile](#)

Enable Reports in Salesforce Classic Mobile

To enable reports in the Salesforce Classic Mobile app:

1. Create a Mobile Reports folder in Salesforce. From the reports home page in the full site, click **Create New Folder**.
2. In the `Report Folder` field, enter: *Mobile Reports*.

The server won't load reports on mobile devices unless this folder is named `Mobile Reports`. Be sure to check for any typos in the name before saving the folder. Additionally, Salesforce doesn't require folder names to be unique. Salesforce Classic Mobile users can see any report stored in all folders named `Mobile Reports` unless you restrict access with the folder visibility option.
3. Choose a `Public Folder Access` option. This option doesn't affect the ability of mobile users to run reports.
4. Optionally, select any unfiled reports and click **Add** to store them in the `Mobile Reports` folder. You can also add reports to the folder after saving the folder.
5. Choose a folder visibility option.
 - `This folder is accessible by all users` gives every user in your organization the ability to see the list of mobile reports from their devices.
 - `This folder is accessible only by the following users` lets you grant access to a desired set of users.

Don't make the `Mobile Reports` folder private unless you want to hide mobile reports from all users, including yourself.
6. Click **Save**.
7. Add reports to the `Mobile Reports` folder. Click the report name on the reports home page, then click **Save As** and save the report in the `Mobile Reports` folder.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To create, edit, and delete public report folders:

- "Manage Public Reports"

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

After saving the report, you can edit the options to make the report easier to view on a mobile device. For example, you might reduce the number of columns or enter additional filtering criteria.

8. Add the Reports tab to your mobile configurations. From Setup, enter *Salesforce Classic Configurations* in the **Quick Find** box, then select **Salesforce Classic Configurations**. Then click the name of a mobile configuration.
9. In the Mobile Tabs related list, click **Customize Tabs** to define mobile tabs for the first time. If you've already set up the mobile tabs, click **Edit**.
10. Select **Reports** from the Available Tabs list, then click the **Add** arrow to add it to the mobile configuration. The Available Tabs list includes standard object tabs and custom object tabs. It can also include web and Visualforce tabs.

Warning: If you have not yet customized tabs in the mobile configuration, you must select all the tabs that should appear in the Salesforce Classic Mobile, not just the Reports tab.

11. In the Selected Tabs list, choose the Reports tab and click the **Up** and **Down** arrows to define where the Reports tab should appear in the Salesforce Classic Mobile app.
12. Click **Save**.

Note: Currently, reports in Salesforce Classic Mobile aren't available on Android or iPhone devices.

[Setting Up Salesforce Classic Mobile](#)

Setting Up Salesforce CRM Content for Salesforce Classic Mobile

Note the following about how Salesforce CRM Content is implemented in Salesforce Classic Mobile:

- Content record information is synchronized to the device; however, the files associated with the content records are not. This allows users to deliver content from the app even when a file is too large to be downloaded to a mobile device.
- Users can't search for a specific piece of content in the app. They can only share the content available on the Content tab, which is automatically synchronized to their device based on the filters in their assigned mobile configuration.
- Users can't view a list of their subscribed content in the app. They also can't filter the list of records on the Content tab based on a particular library.
- While users can preview and share content from the app, they can't update the file associated with a content record. If they have the required permissions, they can edit the fields on the content detail page.
- Users must have a data connection to preview and deliver content. Without a data connection, they can only view the content detail page.
- Content in Salesforce Classic Mobile is only supported on iPhone devices.
- You can't block mobile permissions for the content object. Currently, the content object in Salesforce Classic Mobile is read-only.
- You can't edit the mobile page layout for the content object. The content detail page in the app is hard-coded to display only a few fields.

To set up Content for a Salesforce Classic Mobile configuration:

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in:

Performance, Unlimited, and Developer Editions, and for an extra cost in: **Professional and Enterprise** Editions

USER PERMISSIONS

To view Salesforce Classic Mobile configurations:

- "View Setup and Configuration"

To create, change, or delete Salesforce Classic Mobile data sets:

- "Manage Mobile Configurations"

1. From Setup, enter *Salesforce Classic Configurations* in the Quick Find box, then select **Salesforce Classic Configurations**, and then click the name of a mobile configuration.
2. In the Data Sets related list, click **Edit**.
3. Click **Add...**
4. In the popup window, select Content, then click **OK**.
5. Use field filters to specify which content records are synchronized.

Because users can't search for content in the Salesforce Classic Mobile app, it's essential to set up filters that make important content available on the device. You can't create filters based on libraries or subscriptions, but here are a few options for setting up useful filter conditions:

- **Date:** Filter on the `Last Modified Date`, `Content Modified Date`, or `Created Date` fields. Use special date values like LAST 90 DAYS or LAST 180 DAYS to ensure that recently updated content records are synchronized.
 - **Owner:** Filter on the author if certain people in your organization are responsible for publishing content.
 - **File Type:** Filter on certain types of documents. For example, your opportunity team might generally be interested in presentations or PDF documents.
 - **Custom Fields:** If you created custom content fields that help you categorize your content, filter on the custom fields. For example, if you built a `Functional Use` field with picklist values, you could set up a filter condition where `Functional Use` equals *Sales*.
6. Optionally, prevent content records from consuming all the memory on a mobile device by selecting the second radio button under Set Max Record Limit and entering the maximum number of content records this configuration can transfer to mobile devices. Use the Order By and Sort drop-down lists to specify which records are synchronized if the data size limit for your mobile configuration is exceeded.
 7. Click **Done**.

Configuring Salesforce Classic Mobile Access for Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can allow partner users to access partner portal data on mobile devices using the Salesforce Classic Mobile app.

Tips for setting up Salesforce Classic Mobile access for partner users:

- Before setting up Salesforce Classic Mobile for partner users, you must configure partner user accounts and purchase mobile licenses for each partner portal user that will be using Salesforce Classic Mobile. Partner user profiles must be assigned to at least one active partner portal before partner users can use Salesforce Classic Mobile. If a user profile is assigned to multiple partner portals, only the first assigned partner portal will be accessible using Salesforce Classic Mobile.
- Custom mobile list views don't affect list views in the partner portal.
- If you make User data sets available in the Salesforce Classic Mobile app, partners can assign objects to their partner account users and all internal users. If you don't make User data sets available, partners can only assign objects to internal or partner account users who are associated with records that you've made available on the mobile device.

- "Manage Mobile Configurations"

Create Links to Web and Visualforce Mobile Pages for Salesforce Classic Mobile

To improve the integration between the Salesforce Classic Mobile app, Visualforce Mobile, and external websites, you can optionally create links from native Salesforce records to Visualforce Mobile pages or external websites. To create the links, build text formula fields on a standard or custom object. The field must be visible on the page layout to appear in the Salesforce Classic Mobile app. The best practice is to include all embedded links in a separate section labeled "Mobile Links" at the bottom of the page layout. There is currently no way to hide these links in Salesforce, but users can collapse the section to keep the links out of the way.

1. Navigate to the fields area of the appropriate object.
2. Click **New** in the fields section of the page.
3. Select **Formula**, and then click **Next**.
4. Enter the field label.

The field name is automatically populated based on the field label you enter.

5. Select **Text**, then click **Next**.
6. In the formula editor, create the link to the custom Visualforce page or external website:

- To create a Visualforce link, type `"visualforce:///apex/PageName"`, and replace `PageName` with the name of your Visualforce page. You can append parameters to the string, such as `?contactid=" & Id"`, in order to pass information from the record in the client application to the Visualforce page.
- To create a Web link, type `"weblink:"`, followed by the URL to which you want the link to point, such as `"weblink:http://www.salesforce.com"`. You can append parameters to the string in order to pass information from the record in the client application to the Web page. For example, the following Web link launches a social networking site from a contact record and performs a search for the contact:

```
"weblink:http://m.linkedin.com/members?search_term=" &FirstName& "+" &LastName&
"&filter=name&commit=Search"
```

 **Note:** The client application passes the Visualforce or Web link with all parameters to the embedded browser. It is up to the website or Visualforce Mobile page to interpret any parameters. Be sure to construct your Visualforce Mobile page to consume any parameters passed in the link.

7. Click **Next**.
8. Set the field-level security to determine whether the field should be visible or read only for specific profiles, and click **Next**.
9. Choose the page layouts that should display the field. In the next step, you will customize the layout to change the location of the field on the page.
10. Save your changes.
11. Edit the object's page layout. From the management settings for the object whose page layout you want to change, go to Page Layouts.
12. Drag a Section element from the palette to the page layout and drop it below the existing sections.
13. In the **Section Name** field, type `Mobile Links`.
14. Deselect the **Edit Page** option.
15. Select the 1-column layout, then click **OK**.
16. Drag the new text formula field from its current location into the new Mobile Links section.

Notifying Users about Salesforce Classic Mobile Availability

When you're ready to deploy the Salesforce Classic Mobile app to your users, send them an email to notify them about the availability of the app and provide installation instructions. You can send the email using your corporate email application, like Outlook, or you can send mass email from Salesforce. Either way, include the URL that launches the download.

- For Android users, the download URL is `mobile.salesforce.com`. The link is the same for the initial download and for subsequent upgrades.
- You can obtain the iPhone download URL from iTunes. Open iTunes, click **iTunes Store**, then search for Salesforce Classic Mobile. Click the app icon to view details about the app. At the top of the iTunes window is a bread crumb path representing the application's location in the App Store: **App Store > Business > Salesforce Classic Mobile**. Drag-and-drop the path into a text editor or word processing program to display the app's download URL.

To send mass email to Salesforce Classic Mobile users from Salesforce:

1. Create an email template that informs users about the availability of Salesforce Classic Mobile. From your personal settings, enter *Templates* in the *Quick Find* box, and select either **My Templates** or **Email Templates**—whichever one appears. Optionally, you can also create a separate email template for upgrade notifications. Include the download link in the templates.
2. Create a custom view on the Mass Email page that shows your Salesforce Classic Mobile users only.
3. Send mass email to your Salesforce Classic Mobile users, using the custom view that you created. From Setup, enter *Mass Email Users* in the *Quick Find* box, then select **Mass Email Users**.

Salesforce Classic Mobile FAQ for Administrators

- [Is the Salesforce Classic Mobile app secure?](#)

Is the Salesforce Classic Mobile app secure?

All data transmitted between Salesforce and Salesforce Classic Mobile is fully encrypted and secured over the air.

The mobile application has multiple layers of security at the device level. Device vendors provide the ability to set password or passcode access restrictions. Users must be required to use the device protection in accordance with your organization's security policy. If the device is locked by password, it is difficult for unauthorized persons to obtain sensitive data.

Additionally, a user must have valid Salesforce credentials to activate the mobile application on the device. When a user registers a new wireless device, the Salesforce data on their old wireless device is automatically erased—users can only activate one mobile device at a time. Users are also warned when a new device is activated using their Salesforce account. If a logged in user exceeds the administrator-configured inactivity period on the mobile device, the mobile session is terminated and the password or passcode is required to reestablish the session.

Administrators can also remotely [delete data](#) from any lost or stolen devices.

Is there an easy way to deploy Salesforce Classic Mobile to all of my BlackBerry users?

If your organization manages BlackBerry smartphones using the BlackBerry Enterprise Server (BES), you can use Application Push. Application Push is an administrator-initiated delivery technology on the BlackBerry Enterprise Server that installs applications on BlackBerry smartphones remotely. This technology is not developed or supported by Salesforce, but BlackBerry Enterprise Server administrators can use it to install Salesforce Classic Mobile on their BlackBerry users' mobile devices.

For instructions on how to configure the BlackBerry Enterprise Server v4.1 to push Salesforce Classic Mobile to your BlackBerry users, see "BlackBerry Enterprise Server Application Push" in the [Salesforce Classic Mobile Implementation Guide](#).

You can find detailed information about Application Push in the official *BlackBerry Enterprise Server Administrator Guide* from Research In Motion in the sections "Making additional BlackBerry device software and applications available to users" and "Creating software configurations." If you have any technical issues with Application Push, contact [Research in Motion Support](#).

Salesforce Classic Mobile Permissions

A mobile license is required for each user who will access the Salesforce Classic Mobile app. You allocate mobile licenses using the `Mobile User` checkbox on the user record.

For organizations using Unlimited, Performance, and Developer Editions, Salesforce provides a mobile license for each Salesforce license and the `Mobile User` checkbox is enabled by default for all users. Organizations using Professional or Enterprise Editions must purchase mobile licenses separately and allocate them manually.

 **Note:** The `Mobile User` checkbox is disabled by default for new Performance Edition users.

To prevent users from activating Salesforce Classic Mobile on their mobile devices before you're ready to deploy the app, disable the `Mobile User` checkbox for all your users.

Salesforce Classic Mobile Usage Data in Custom Report Types

You can create custom report types with data that shows how your organization uses Salesforce Classic Mobile. For example, the reports can show how often users access Salesforce Classic Mobile, which mobile device models they use, and so forth.

To create a custom report type with Salesforce Classic Mobile usage data, select the Mobile Session `Primary Object` when defining a custom report type. When you select the fields for the custom report type, choose from the following Salesforce Classic Mobile-specific fields.

Mobile Usage Data Point	Definition
Brand	Wireless carrier
Data Size (Bytes)	Total size of records on device
Device Address	Unique physical address of device (UDID for iOS)
Device Application Version	Installed version of Salesforce Classic Mobile
Device Model	Model of device
Device Operating System Version	Version of operating system installed on device
Duration	Duration of the mobile session in seconds
Last Registration Date	Date of last registration or activation
Last Status Date	Date of last communication received from device
Manufacturer	Manufacturer of device
Metadata Size (Bytes)	Size of metadata (page layouts, picklist values, and so forth) on the device
Owner: Full Name	Name of the device user
Session Start Date	Date the mobile session started
Status	Indicator that the user's data set exceeds the maximum allowed size by the mobile configuration

Note:

- Mobile sessions are similar to Web-based sessions in login history reports; however, mobile sessions have a fixed timeout value of 20 minutes. Salesforce creates a new Mobile Session when a user logs into or launches Salesforce Classic Mobile after 20 minutes of inactivity in the app or on the device in general.
- Mobile session reports only have usage data for the Salesforce Classic Mobile app and not other Salesforce mobile apps, such as the Salesforce1 apps.
- Some devices do not provide every physical attribute. For example, Apple devices do not provide brand.

Manage Salesforce Classic Mobile Devices

After a user installs the Salesforce Classic Mobile app on a mobile device and logs in for the first time, Salesforce collects information about the device and associates it with the user's record. The device information is read only.

Although the device entry is created automatically, you can still view and manage all the mobile users and devices in your organization from Setup by entering *Users and Devices* in the **Quick Find** box, then selecting **Users and Devices**.

From the All Mobile Users and Devices page, you can:

- View the list of users in your organization who have been enabled to use Salesforce Classic Mobile.
- Create custom list views to see different subsets of your mobile users. For example, create a view that shows the users who have never logged in to Salesforce from the Salesforce Classic Mobile app to evaluate the effectiveness of your organization's Salesforce Classic Mobile deployment efforts.
- [View details about a mobile device](#) by clicking the device address.
- View details about a specific user by clicking the username.
- View details about a mobile configuration by clicking the mobile configuration name.
- Perform these actions on multiple users at the same time:
 - [Adjust the mobile session timeout value](#)
 - [Erase the Salesforce data from a user's mobile device](#)
 - [Delete a mobile device from a user's record](#)
- Find out why a user's device isn't synchronizing by hovering your mouse over the red error icon in the Status column. Additional information about the synchronization errors appears on the device's detail page.

 **Note:** You can also manage mobile users from the Assigned Mobile Devices related list on the user detail page.

[Permanently Link Salesforce Classic Mobile Users to a Mobile Device](#)

You can prevent mobile users from registering any mobile device other than the one they used for their initial Salesforce Classic Mobile activation.

- "Manage Mobile Configurations"

Permanently Link Salesforce Classic Mobile Users to a Mobile Device

You can prevent mobile users from registering any mobile device other than the one they used for their initial Salesforce Classic Mobile activation.

By default, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so administrators don't need to update the device record to assign the device to another user. While this behavior makes it easy to switch devices between users in your organization, some administrators prefer that users are permanently linked to the devices they were originally assigned. This helps administrators of organizations with highly sensitive data ensure that their users do not access corporate data from personal devices.

To permanently link a user to a mobile device:

1. From Setup, enter *Salesforce Classic Settings* in the Quick Find box, then select **Salesforce Classic Settings**.
2. Click **Edit**.
3. Select **Permanently Link User to Mobile Device**.
4. Click **Save**.

 **Warning:** Enabling the **Permanently Link User to Mobile Device** setting requires administrative action when users need to switch devices. You must manually [delete the existing device](#) from a user's record in order for the user to register a different device. If you don't delete the device, the user won't be able to access the Salesforce Classic Mobile app.

USER PERMISSIONS

To view Salesforce Classic Mobile settings:

- "View Setup and Configuration"

To change Salesforce Classic Mobile settings:

- "Manage Mobile Configurations"

Viewing Salesforce Classic Mobile Device Information

Salesforce collects information about a mobile user's device the first time the user logs in to the Salesforce Classic Mobile app. There are two ways to access the device details.

- From Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. Then click a device address in the list view.
- From Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click **Edit** next to a user's name, and then click the device address in the Assigned Mobile Devices related list.

From the Mobile Device page, you can:

- Review device information
- [Adjust the mobile session timeout value](#)
- [Erase the Salesforce data from a user's device](#)
- [Delete a device from a user's record](#)

Below is a description of the fields in alphabetical order that are stored for each mobile device in your organization.

Field	Description
Brand	The brand of the mobile device, if available.
Carrier	The name of the carrier providing service for the mobile device, if available.
Connected Since	The date and time the device established a connection to the mobile server. The device loses a connection when the battery dies or when the session is closed because the server has not received data from the device for a long period of time.
Connection Status	The state of the device connection. Possible values for this field are Connected, Not Connected, and Not Available.
Created By	The name of the first user who registered the mobile device and the time and date the registration occurred.
Data Size	The size of the Salesforce data currently stored on the user's mobile device. The mobile device periodically sends this information to Salesforce, which is helpful when troubleshooting synchronization errors resulting from an exceeded data limit .
Device Address	The unique identifier of the user's mobile device.
Device Model	The model of the mobile device.
Is Simulator?	A flag indicating whether the device is a simulator or a mobile device. A simulator is a

USER PERMISSIONS

To view Salesforce Classic Mobile devices and users:

- "View Setup and Configuration"

To manage Salesforce Classic Mobile devices:

- "Manage Mobile Configurations"

Field	Description
	software application that emulates the behavior of a mobile device.
Last Activated	The last time a full data set was downloaded to the mobile device. If a user's data set exceeds the limit defined in the assigned mobile configuration, the device can be registered but not activated.
Last Data Received	The last time data was received from the device. This information is helpful for troubleshooting connection issues.
Last Registration	The last time a user registered the mobile device. The registration process creates the device record in Salesforce and associates it with the user who registered it.
Last Status Date	The last time the mobile device notified Salesforce that the device is no longer synchronizing data due to an error. The Last Status Date field is only visible when an error is present.
Manufacturer	The manufacturer of the mobile device.
Metadata Size	The size of the Salesforce metadata currently stored on the user's mobile device. Metadata consists of page layout and schema information, and the amount of metadata sent to a device can be very high depending on the size of your organization and the complexity of its setup.
Modified By	The name of the last user who registered the mobile device and the time and date the registration occurred.
Number of Pending Outgoing Messages	The number of messages queued on the mobile server waiting to be sent to the device.
Operating System	The type of operating system installed on the mobile device: Android or iPhone.
Operating System Version	The version number of the operating system installed on the mobile device.
Phone Number	The phone number associated with the mobile device.
Salesforce Classic Mobile Version	The version number and build number of the mobile client application installed on the device.
Size of Pending Outgoing Messages (Bytes)	The total data size of the messages queued on the device waiting to be sent to the mobile server. Because the server processes messages almost instantaneously, this value is usually 0.
Size of Outgoing Messages (Bytes)	The total data size of the outbound message queue on the mobile server.
Status	Indicates whether any synchronization errors exist between the device and Salesforce. The Status field is only visible when an error is present. The two error statuses are Data Limit Exceeded and Unknown Error.

Field	Description
Username	The Salesforce username of the user who is associated with the mobile device.

 **Note:** If Salesforce detects the selected device was registered by a user in another organization, an error displays on the device detail page. This can happen when a device was registered to a user in your sandbox organization and then later activated by a user in your production organization. To remove the old device record from your organization, simply [delete the device](#).

Set Salesforce Classic Mobile Session Timeout Values

For security reasons, the Salesforce Classic Mobile app is set to lock out users after 10 minutes of inactivity. Administrators can adjust or disable this setting on a device-by-device basis. For example, you might disable the Salesforce Classic Mobile timeout setting if a mobile device's operating system has its own locking mechanism.

To change the Salesforce Classic Mobile session timeout value:

- Navigate to one of these pages.
 - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
 - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
- Click **Set Mobile Session Timeout**.
- Choose the new timeout value in minutes. You can also choose **Never Expire** if users shouldn't be locked out of the app.
- Click **Save**.
Salesforce attempts to send a message containing the new session timeout setting to the selected mobile devices.
- A confirmation page [summarizes the results](#) for each mobile device you selected.

Mobile Session Timeout Results

After Salesforce sends the new session timeout session to the selected mobile devices, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Classic Mobile server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Classic Mobile server prevented the message from being sent. Try again later.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To set Salesforce Classic Mobile session timeout values:

- "Manage Mobile Configurations"

Result	Description
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

Erasing Data in Salesforce Classic Mobile

When a user accesses the Salesforce Classic Mobile app, the user's mobile device contains both the mobile app and a set of the user's Salesforce data. An administrator can remove the data from a device without uninstalling the mobile app. This is an effective security tool when a user misplaces his or her device. You also must erase a device's data if you plan to give it to another user.

To erase the Salesforce data on one or more mobile devices:

- Navigate to one of these pages.
 - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
 - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
- Click **Erase Data**, then click **OK**.
Salesforce attempts to send a message to the mobile devices to erase the data.

Erase Data Results

After Salesforce sends the message to the mobile devices to erase data, a results page provides information about the status of each message. The table below describes the three possible outcomes:

Result	Description
Message successfully queued	The Salesforce Classic Mobile server has sent the message to the device. Salesforce can't detect if the message was received by the device.
Unable to send message	A temporary communication problem between Salesforce and the Salesforce Classic Mobile server prevented the message from being sent. Try again later.
User has no mobile device	The selected mobile user never registered a device, so therefore the message could not be sent.

EDITIONS

Salesforce Classic Mobile setup available in: both Salesforce Classic and Lightning Experience

Mobile app available in: **Performance, Unlimited,** and **Developer** Editions, and for an extra cost in: **Professional** and **Enterprise** Editions

USER PERMISSIONS

To delete the Salesforce data on a device running Salesforce Classic Mobile:

- "Manage Mobile Configurations"

Deleting Mobile Devices

There are two instances when you would delete a mobile device from a user's record:

- Your organization's mobile settings permanently link mobile users to their devices, and you need to assign a device to a different user. If you did not enable this setting, Salesforce automatically associates a device record with the mobile user who most recently activated the device, so it is unnecessary to delete a device to assign it to another user.
- You want to move a device from your sandbox organization to your production organization.

To delete a mobile device:

1. Navigate to one of these pages.
 - To deal with multiple devices at the same time, from Setup, enter *Users and Devices* in the **Quick Find** box, then select **Users and Devices**. In the list view on the Mobile Users and Devices page, select the desired devices.
 - To deal with a specific device, from Setup, enter *Users* in the **Quick Find** box, then select **Users**. Click a user's name, then click the device address in the Assigned Mobile Devices related list to see the Mobile Device page.
2. On the Mobile Devices and Users page, select one or more devices, then click **Delete Device**. On the Mobile Device page, click **Delete**.
3. Click **OK**.
Salesforce attempts to delete the selected device(s).
4. A confirmation page [summarizes the results](#) for each mobile device you selected.

Delete Device Results

After Salesforce sends the message to the mobile server to delete the devices, a results page provides information about the status of each device. The table below describes the three possible outcomes:

Result	Description
Device deleted.	Salesforce removed the device record from your organization.
Device cannot be deleted at this time. Please try again later.	A temporary communication problem between Salesforce and the mobile server prevented the device from being deleted. Try again later.
User has no mobile device.	The selected mobile user never registered a device, so therefore the message could not be sent.

Salesforce Classic Mobile App Limits

Mobile Device Limits

Apple iPhone and iPod Touch devices

- Third parties (including, but not limited to, Apple Inc. and your network connectivity provider) may at any time restrict, interrupt or prevent use of Salesforce Classic Mobile for the iPhone and iPod touch devices, or delete the Salesforce Classic Mobile app from iPhone or iPod touch devices, or require Salesforce to do any of the foregoing, without entitling the customer to any refund, credit or other compensation from such third-party or Salesforce.
- Service level agreements don't apply to the Salesforce Classic Mobile for iPhone product. Additional limitations are described in the Order Form Supplement for Salesforce Classic Mobile for iPhone, which users are required to accept upon download or installation of the Salesforce Classic Mobile for iPhone product.

Dashboards Limits

When working with dashboards in Salesforce Classic Mobile, these limitations exist:

- You can't create or edit dashboards.
- Links to custom report details are disabled.

View a Mobile User's Push Registration Information

With the Mobile Push Registrations Page, you can view any user's push registration information for general troubleshooting.

To view a user's device push registration information:

1. From Setup, enter `users` in the `Quick Find` box, then select **Users**.
2. Select a user.
3. On the user detail page next to `Mobile Push Registrations`, click **View**.

Install Packages and Manage Apps

Installed Packages

You can install packages into your Salesforce organization, and then configure and manage them. To view the packages you've installed, from Setup, enter "Installed" in the Quick Find box, and then select **Installed Packages**.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Install a Package

Install a managed or unmanaged package in your Salesforce org to add new functionality to your org. Choose a custom installation to modify the default package settings, including limiting access to the package.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Pre-Installation Steps

1. In a browser, go to the installation URL provided by the package developer, or, if you're installing a package from the AppExchange, click **Get It Now** from the application information page.

 **Note:** If you're installing into a sandbox, replace the www.salesforce.com portion of the installation link with test.salesforce.com. The package is removed from your sandbox organization whenever you create a new sandbox copy.

2. Enter your username and password for the Salesforce organization in which you want to install the package, and then click the login button.
3. If the package is password-protected, enter the password you received from the publisher.
4. Optionally, if you're installing an unmanaged package, select **Rename conflicting components in package**. When you select this option, Salesforce changes the name of a component in the package if its name conflicts with an existing component name.

USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

Default Installation

Click **Install**. You'll see a message that describes the progress and a confirmation message after the installation is complete.

Custom Installation

Follow these steps if you need to modify the default settings as an administrator.

1. Choose one or more of these options, as appropriate.
 - Click **View Components**. You'll see an overlay with a list of components in the package. For managed packages, the screen also contains a list of connected apps (trusted applications that are granted access to a user's Salesforce data after the user and

the application are verified). Review the list to confirm that the components and any connected apps shown are acceptable, and then close the overlay.

 **Note:** Some package items, such as validation rules, record types, or custom settings might not appear in the Package Components list but are included in the package and installed with the other items. If there are no items in the Package Components list, the package might contain only minor changes.

- If the package contains a remote site setting, you must approve access to websites outside of Salesforce. The dialog box lists all the websites that the package communicates with. We recommend that a website uses SSL (secure sockets layer) for transmitting data. After you verify that the websites are safe, select **Yes, grant access to these third-party websites** and click **Continue**, or click **Cancel** to cancel the installation of the package.

 **Warning:** By installing remote site settings, you're allowing the package to transmit data to and from a third-party website. Before using the package, contact the publisher to understand what data is transmitted and how it's used. If you have an internal security contact, ask the contact to review the application so that you understand its impact before use.

- Click **API Access**. You'll see an overlay with a list of the API access settings that package components have been granted. Review the settings to verify they're acceptable, and then close the overlay to return to the installer screen.
- In Enterprise, Performance, Unlimited, and Developer Editions, choose one of the following security options.

 **Note:** Depending on the type of installation, you might not see this option. For example, in Group and Professional Editions, or if the package doesn't contain a custom object, Salesforce skips this option, which gives all users full access.

Install for Admins Only

Specifies the following settings on the installing administrator's profile and any profile with the "Customize Application" permission.

- Object permissions—"Read," "Create," "Edit," "Delete," "View All," and "Modify All" enabled
- Field-level security—set to visible and editable for all fields
- Apex classes—enabled
- Visualforce pages—enabled
- App settings—enabled
- Tab settings—determined by the package creator
- Page layout settings—determined by the package creator
- Record Type settings—determined by the package creator

After installation, if you have Enterprise, Performance, Unlimited, or Developer Edition, set the appropriate user and object permissions on custom profiles as needed.

Install for All Users

Specifies the following settings on all internal custom profiles.

- Object permissions—"Read," "Create," "Edit," "Delete," "View All," and "Modify All" enabled
- Field-level security—set to visible and editable for all fields
- Apex classes—enabled
- Visualforce pages—enabled
- App settings—enabled
- Tab settings—determined by the package creator
- Page layout settings—determined by the package creator
- Record Type settings—determined by the package creator

 **Note:** The Customer Portal User, Customer Portal Manager, High Volume Customer Portal, Authenticated Website, Partner User, and standard profiles receive no access.

Install for Specific Profiles...

Enables you to choose the usage access for all custom profiles in your organization. You can set each profile to have full access or no access for the new package and all its components.

- Full Access—Specifies the following settings for each profile.
 - Object permissions—“Read,” “Create,” “Edit,” “Delete,” “View All,” and “Modify All” enabled
 - Field-level security—set to visible and editable for all fields
 - Apex classes—enabled
 - Visualforce pages—enabled
 - App settings—enabled
 - Tab settings—determined by the package creator
 - Page layout settings—determined by the package creator
 - Record Type settings—determined by the package creator
- No Access—Specifies the same settings as Full Access, *except* all object permissions are disabled.

You might see other options if the publisher has included settings for custom profiles. You can incorporate the settings of the publisher’s custom profiles into your profiles without affecting your settings. Choose the name of the profile settings in the drop-down list next to the profile that you need to apply them to. The current settings in that profile remain intact.

Alternatively, click **Set All** next to an access level to give this setting to all user profiles.

2. Click **Install**. You’ll see a message that describes the progress and a confirmation message after the installation is complete.
 - During installation, Salesforce checks and verifies dependencies. An installer’s organization must meet all dependency requirements listed on the Show Dependencies page or else the installation will fail. For example, the installer’s organization must have divisions enabled to install a package that references divisions.
 - When you install a component that contains Apex, all unit tests for your organization are run, including the unit tests contained in the new package. If a unit test relies on a component that is initially installed as inactive, such as a workflow rule, this unit test might fail. You can select to install regardless of unit test failures.
 - If your installation fails, see [Why did my installation or upgrade fail?](#) on page 1103.

Post-Installation Steps

If the package includes post-installation instructions, they’re displayed after the installation is completed. Review and follow the instructions provided. In addition, before you deploy the package to your users, make any necessary changes for your implementation. Depending on the contents of the package, you might need to perform some of the following customization steps.

- If the package includes permission sets, assign the included permission sets to your users who need them. In managed packages, you can’t make changes to permission sets that are included in the package, but subsequent upgrades happen automatically. If you clone a permission set that comes with a managed package or create your own, you can make changes to the permission set, but subsequent upgrades won’t affect it.
- If you’re re-installing a package and need to re-import the package data by using the export file that you received after uninstalling, see [Importing Package Data](#) on page 1096.
- If you installed a managed package, click **Manage Licenses** to assign licenses to users.

 **Note:** You can’t assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.

- Configure components in the package as required. For more information, see [Configuring Installed Packages](#) on page 1088.

SEE ALSO:

[Upgrading Packages](#)

[Installation Guide: Installing Apps from Force.com AppExchange](#)

[Installed Packages](#)

Configuring Installed Packages

Many components have an **Is Deployed** attribute that controls whether they are available for end users. After installation, all components are immediately available if they were available in the developer's organization. Before making the package available to your users, make any necessary changes for your implementation. Depending on the contents of the package, you might need to customize the following items:

Configure Option

If the publisher included a link to an external website with information about configuration, AppExchange Downloads page displays a **Configure** option next to the package in Setup when you click **Installed Packages**. Click **Configure** to view the publisher's suggested configurations.

Custom Fields and Custom Links

Add any necessary custom fields or links to the new custom objects.

Custom Object

Enable tracking on objects that aren't in this package, but that have fields that are tracked in Chatter. For example, if you want to track a custom field on Account, you must make sure the Account standard object is enabled for tracking.

Custom Report Types

If the `Report Type Name` of a custom report type matches one used within your organization, change the `Report Type Name` after you install the package to avoid any confusion between the two report types.

Dashboard Running User

The `Running User` for any dashboards are set to the user installing the package. You can edit the properties of the dashboard and change the `Running User` to a user that has the security settings you want applied to the dashboard.

Folders

When apps contain documents, email templates, reports, or dashboards, Salesforce creates new folders in the installer's organization using the publisher's folder names. Make sure these folder names are unique in your organization.

All users can see new folders. Configure folder settings before you deploy if you want them to have limited visibility.

Home Page Layouts

Custom home page layouts included in the package are not assigned to any users. To make them available to your users, assign them to the appropriate profiles.

List Views

List views included in apps are visible to all users. Change the visibility of these list views if necessary.

Page Layouts

All users are assigned the default page layout for any custom objects included in the package. Administrators of Enterprise, Unlimited, Performance, and Developer Edition organizations can configure the page layout for the appropriate users.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To install packages:

- "Download AppExchange Packages"

To configure installed packages:

- "Customize Application"

If a custom object in the package includes any relationships to standard objects, add them as related lists on the appropriate page layouts.

If the package includes any custom links, add them to the appropriate page layouts.

If your organization has advanced currency management enabled, currency roll-up summary fields are invalid if they are on accounts and summarizing opportunity values, or on opportunities and summarizing custom object values. Remove these fields from any page layouts.

Permission Sets

Assign permission sets included in a package to the users who need access to the package.

You can't edit permission sets that are included in a managed package. If you clone a permission set that comes with the package or create your own, you can make changes to the permission set, but subsequent upgrades won't affect it.

Translation Workbench

Translated values for installed package components are also installed for any language that the developer has included. Any package components the developer has customized within setup, such as a custom field or record type, display in the installer's setup pages in the developer's language (the language used when defining these components). Users in the installer's organization automatically see translated values if their personal language is included in the package. Additionally, installers can activate additional languages as long as the Translation Workbench is enabled.

Workflow Alerts

If the recipient of a workflow alert is a user, Salesforce replaces that user with the user installing the package. You can change the recipients of any installed workflow alerts.

Workflow Field Updates

If a field update is designed to change a record owner field to a specific user, Salesforce replaces that user with the user installing the package. You can change the field value of any installed field updates.

Workflow Outbound Messages

Salesforce replaces the user in the `User to send as` field of an outbound message with the user installing the package. You can change this value after installation.

Workflow Rules

Workflow rules are installed without any time-based triggers that the developer might have created. Set up time-based triggers as necessary.

Workflow Tasks

Salesforce replaces the user in the `Assigned To` field with the user installing the package. You can change this value after installation.

Make any more customizations that are necessary for your implementation.

Note: Anything you add to a custom app after installation will be removed with the custom app if you ever uninstall it.

SEE ALSO:

[Installed Packages](#)

[Tradeoffs and Limitations of Shield Platform Encryption](#)

Uninstalling a Package

You can remove any installed package, including all of its components and all data in the package. Additionally, any custom fields, links, or anything else you added to the custom app after installation are also removed.

To remove a package:

1. From Setup, enter *Installed* in the **Quick Find** box, then select **Installed Packages**.
2. Click **Uninstall** next to the package that you want to remove.
3. Select *Yes, I want to uninstall...* and click **Uninstall**.
4. After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it's only available for a limited period of time after the uninstall completes.

Tip: If you reinstall the package later and want to reimport the package data, see [Importing Package Data](#) on page 1096.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

Notes on Uninstalling Packages

- If you're uninstalling a package that includes a custom object, all components on that custom object are also deleted. This includes custom fields, validation rules, s-controls, custom buttons and links, as well as workflow rules and approval processes.
- You can't uninstall a package whenever any component in the package is referenced by a component that will not get included in the uninstall. For example:
 - When an installed package includes any component on a standard object that another component references, Salesforce prevents you from uninstalling the package. This means that you can install a package that includes a custom user field and build a workflow rule that gets triggered when the value of that field is a specific value. Uninstalling the package would prevent your workflow from working.
 - When you have installed two unrelated packages that each include a custom object and one custom object component references a component in the other, Salesforce prevents you from uninstalling the package. This means that you can install an expense report app that includes a custom user field and create a validation rule on another installed custom object that references that custom user field. However, uninstalling the expense report app prevents the validation rule from working.
 - When an installed folder contains components you added after installation, Salesforce prevents you from uninstalling the package.
 - When an installed letterhead is used for an email template you added after installation, Salesforce prevents you from uninstalling the package.
- You can't uninstall a package if a field added by the package is being updated by a background job, such as an update to a roll-up summary field. Wait until the background job finishes, and try again.
- Uninstall export files contain custom app data for your package, excluding some components, such as documents and formula field values.

Manage Installed Packages

Manage packages installed in your Salesforce org, including assigning licenses to users, uninstalling packages, and exporting package data.

 **Note:** Salesforce only lists license information for managed packages. For unmanaged packages, the license-related fields, such as **Allowed Licenses**, **Used Licenses**, and **Expiration Date**, displays the value "N/A."

Using this list, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
- Click **Manage Licenses** to assign available licenses to users in your organization. You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.
-  **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.
- Click **Configure** if the publisher has included a link to an external website with information about configuring the package.
- Click the package name to view details about this package.
- View the publisher of the package.
- View the status of the licenses for this package. Available values include:
 - Trial
 - Active
 - Suspended
 - Expired
 - Free

This field is only displayed if the package is managed and licensed.

- Track the number of licenses available (**Allowed Licenses**) and the number of licenses that are assigned to users (**Used Licenses**).
- View the date your licenses for this package are scheduled to expire.
- View the date your licenses were installed.
- View the number of custom apps, tabs, and objects this package contains.
- See whether the custom apps, tabs, and objects count toward your organization's limits. If they do, the box in the **Limits** column is checked.

 **Note:** If you have not installed a licensed managed package, the **Publisher**, **Status**, **Allowed Licenses**, **Used Licenses**, and **Expiration Date** fields do not appear.

After an uninstall, Salesforce automatically creates an export file containing the package data, as well as any associated notes and attachments. When the uninstall is complete, Salesforce sends an email containing a link to the export file to the user performing the uninstall. The export file and related notes and attachments are listed below the list of installed packages. We recommend storing the file elsewhere because it's only available for a limited period of time after the uninstall completes. Using this list, you can:

- Click **Download** to open or store the export file.
- Click **Del** to delete the export file.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

To assign licenses for a managed package:

- "Manage Package Licenses"

To download or delete the export file for an uninstalled package:

- "Download AppExchange Packages"

Expired Managed Packages and Sharing Rules

If a criteria-based sharing rule references a field from a licensed managed package whose license has expired, (`expired`) is appended to the label of the field. The field label is displayed in the field drop-down list on the rule's definition page in Setup. Criteria-based sharing rules that reference expired fields aren't recalculated, and new records aren't shared based on those rules. However, the sharing of existing records prior to the package's expiration is preserved.

SEE ALSO:

[Importing Package Data](#)

View Installed Package Details

View key details about a package installed from the AppExchange, such as the number of custom apps, tabs, and objects it uses. You can also assign licenses to users, uninstall the package, and purchase the package.

To access the package detail page, from Setup, enter *Installed Packages* in the **Quick Find** box, select **Installed Packages**, and then click the name of the package that you want to view.

From this page, you can:

- Click **Uninstall** to remove the package and all its components from your Salesforce organization.
- Click **Manage Licenses** to assign available licenses to users in your organization. You can't assign licenses in Lightning Experience. If you need to assign a license, switch to Salesforce Classic.

 **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.

- Optionally, click **View Dependencies** and review a list of components that rely on other components, permissions, or preferences within the package.

Viewing Installed Packages

The installed package page lists the following package attributes (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Uninstall • Manage Licenses
Allowed Licenses	The total number of licenses you purchased for this package. The value is "Unlimited" if you have a site license for this package. This field is only displayed if the package is managed and licensed.
Apps	The number of custom apps in the package.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To uninstall packages:

- "Download AppExchange Packages"

To manage user licenses for an AppExchange package:

- "Manage Package Licenses"

Attribute	Description
Connected Apps	A list of the connected apps that can have access to a user's Salesforce data after the user and the application have been verified.
Description	A detailed description of the package.
Expiration Date	The date that this license expires, based on your terms and conditions. The expiration date is "Does Not Expire" if the package never expires. This field is only displayed if the package is managed and licensed.
Installed Date	The date of the package installation.
Limits	If checked, the package's custom apps, tabs, and objects count toward your organization's limits.
Namespace	The 1- to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
Objects	The number of custom objects in the package.
Package Name	The name of the package, given by the publisher.
Publisher	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
Status	<p>The state of a package. Available values include:</p> <ul style="list-style-type: none"> • Trial • Active • Suspended • Expired • Free <p>This field is only displayed if the package is managed and licensed.</p>
Tabs	The number of custom tabs in the package.
Used Licenses	The total number of licenses that are already assigned to users. This field is only displayed if the package is managed and licensed.
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the Version Number.

Viewing Installed Package Details

The installed package detail page lists the following package attributes (in alphabetical order):

Attribute	Description
Apps	The number of custom apps in the package.
Description	A detailed description of the package.
First Installed Version Number	The first installed version of the package in your organization. This field is only displayed for managed packages. You can reference this version and any subsequent package versions that you have installed. If you ever report an issue with a managed package, include the version number in this field when communicating with the publisher.
Installed By	The name of the user that installed this package in your organization.
Limits	If checked, the package's custom apps, tabs, and objects count toward your organization's limits.
Modified By	The name of the last user to modify this package, including the date and time.
Namespace	The 1- to 15-character alphanumeric identifier that distinguishes a package and its contents from packages of other developers on AppExchange.
Objects	The number of custom objects in the package.
Package Name	The name of the package, given by the publisher.
Package Type	Indicates whether the package is managed or unmanaged.
Post Install Instructions	A link to information on configuring the package after it's installed. As a best practice, the link points to an external URL, so you can update the information independently of the package.
Publisher	The publisher of an AppExchange listing is the Salesforce user or organization that published the listing. This field is only displayed if the package is managed and licensed.
Release Notes	A link to release notes for the package. As a best practice, link to an external URL, so you can make the information available before the release and update it independently of the package.
Tabs	The number of custom tabs in the package.
Version Name	The version name for this package version. The version name is the marketing name for a specific release of a package. It is more descriptive than the <code>Version Number</code> .
Version Number	The version number for the latest installed package version. The format is <code>majorNumber.minorNumber.patchNumber</code> , such as 2.1.3. The version number represents a release of a package. The <code>Version Name</code> is a more descriptive name for the release. The <code>patchNumber</code> is generated only when you create a patch. If there is no <code>patchNumber</code> , it is assumed to be zero (0).

Unused Components

You can see a list of components deleted by the developer in the current version of the package. If this field is part of a managed package, it's no longer in use and is safe to delete unless you've used it in custom integrations. Before deleting a custom field, you can keep a record of the data from Setup by entering *Data Export* in the **Quick Find** box, then selecting **Data Export**. After you've deleted an unused component, it appears in this list for 15 days. During that time, you can either undelete it to restore the field and all data stored in it, or delete the field permanently. When you undelete a field, some properties on the field are lost or changed. After 15 days, the field and its data are permanently deleted.

The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Undelete • Delete
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Package Components

You can see a list of the components included in the installed package. The following component information is displayed (in alphabetical order):

Attribute	Description
Action	Can be one of two options: <ul style="list-style-type: none"> • Undelete • Delete
Name	Displays the name of the component.
Parent Object	Displays the name of the parent object a component is associated with. For example, a custom object is the parent of a custom field.
Type	Displays the type of the component.

Importing Package Data

When you uninstall an AppExchange package, Salesforce automatically creates an export file containing the package data as well as any associated notes and attachments. If you choose to install the package again, you can import this data.

To import your AppExchange package data, use one of the following tools that is available for your Edition:

- For Group Edition, use the appropriate import wizard.
- For Professional Edition, use the appropriate import wizard or any compatible Salesforce ISV Partner integration tool.
- For Enterprise, Developer, Performance, and Unlimited Edition, use the Data Loader.

Notes on Importing AppExchange Package Data

- Salesforce converts date fields into date/time fields upon export. Convert the appropriate fields into date fields before you import.
- Salesforce exports all date/time fields in Greenwich Mean Time (GMT). Before importing these fields, convert them to the appropriate time zone.
- The value of auto number fields may be different when you import. To retain the old values, create a new custom auto number field on a custom object before importing the data.
- Salesforce updates system fields such as `Created Date` and `Last Modified Date` when you import. To retain the old values for these fields, contact Salesforce support.
- Relationships are not included in the export file. Recreate any master-detail or lookup relationships after importing your data.
- Record type IDs are exported but not the record type name.
- Field history is not exported.
- Recreate any customizations that you made to the package after installation.

USER PERMISSIONS

To import Force.com AppExchange package data:

- The permissions required to use the import tool you choose, such as the import wizard or Data Loader.

Managing Licenses for Installed Packages

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

 **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.

1. From Setup, enter *Installed Packages* in the Quick Find box, then select **Installed Packages**.
2. Click **Manage Licenses** next to the package.

 **Note:** To assign licenses for a package, you must have access to the package and at least one available license.

- To assign licenses to more users, click **Add Users**.
- To remove a license from a user, click **Remove** next to the user's name. To remove licenses from multiple users, click **Remove Multiple Users**.
- Click any column heading to sort the users in ascending order using the data in that column. Click the heading again to sort in descending order.
- If available, select **fewer** or **more** to view a shorter or longer display list.

USER PERMISSIONS

To manage licenses for a AppExchange package:

- "Manage Package Licenses"

Assigning Licenses for Managed Packages

When you install a licensed managed package in your organization from AppExchange, you purchase a certain number of licenses from the package developer or publisher. You can assign each license to a user within your organization. If you assign all available licenses, but would like to grant licenses to additional users, you can reassign a license or purchase more. To get more licenses, contact the publisher of the managed package.

The Managed Packages related list on the user detail page lists all managed packages that user is assigned. Assigning a license for a managed package makes the package available to the user within Salesforce.

Unmanaged packages will not appear on this list, as you cannot assign licenses for them.

To assign a user to a license for one of the available managed packages:

1. From Setup, enter *Users* in the *Quick Find* box, then select **Users**.
2. Click **Assign Licenses** from the Managed Packages list.
3. Select the package you want to assign to the user. All available managed packages are listed in the Unassigned Packages list. After selecting a package, Salesforce automatically moves it to the Selected Packages list.

The Unassigned Packages list displays all packages that this user could access if assigned a license. Packages will not appear on this list if they are unmanaged, uninstalled, in use, or not available.

- Click a letter to view the packages that begin with that letter or click **All** to display all available managed packages.
- Click **select shown** to select all packages displayed in the Unassigned Packages list on the current page, adding them to the Selected Packages list below.
- Click **deselect shown** or **deselect all** to move packages from the Selected Packages area to the Unassigned Packages area.

4. Click **Add**.

To revoke a license from this user, click the *Remove* link next to the appropriate package name.

Assigning Licenses for Installed Packages

To assign licenses to Force.com AppExchange users:

-  **Note:** If you purchased a site license or if the managed package is not licensed, Salesforce assigns licenses to all your users and you can't manage licenses. Your users can use the package as long as they have the appropriate permissions.
1. From Setup, enter *Installed Packages* in the **Quick Find** box, then select **Installed Packages** to find the installed package that has available licenses.
 2. Click the **Manage Licenses** link next to the package name.
 3. Click **Add Users**.
 4. Choose a view from the drop-down list, or click **Create New View** to build a new custom view.
 5. Click a letter to filter the users with a last name that corresponds with that letter or click **All** to display all users who match the criteria of the current view.
 6. Select users.
 - To select individual users, use the checkboxes. Selected users are listed in the Selected list. When the list includes all users to which you want to assign licenses, click **Add**.
 - To select all users for the current view, click **Add All Users** then click **OK**.

 **Note:** You can also add a single user from the user's detail page.

SEE ALSO:

[Managing Licenses for Installed Packages](#)

Removing Licenses for Installed Packages

To remove licenses for an AppExchange package from multiple users:

1. From Setup, enter *Installed Packages* in the **Quick Find** box, then select **Installed Packages**.
2. Click **Manage Licenses** next to the package name.
3. Click **Remove Multiple Users**.
4. To show a filtered list of items, select a predefined list from the **View** drop-down list, or click **Create New View** to define your own custom views.
5. Click a letter to filter the users with a last name that corresponds with that letter or click **All** to display all users who match the criteria of the current view.
6. Select users.
 - To select individual users, use the checkboxes. Selected users appear in the Selected for Removal list. When the list includes all users for which you want to remove licenses, click **Remove**.
 - To select all users in the current view, click **Remove All Users**, then click **OK**.

You can also remove licenses for an AppExchange package from a single user using the following options:

1. From Setup, enter *Users* in the **Quick Find** box, then select **Users** and click **Remove** next to the package in the managed packages list.

Responding to License Manager Requests

A license manager is a Salesforce organization that tracks all Salesforce subscribers installing a particular AppExchange package. Salesforce administrators can choose to designate another organization as the license manager for one of their packages. The license manager does not need to be the same organization as the one from which the package is managed. To choose another organization as the license manager, all you need is an email address (not a Salesforce username). If a Salesforce administrator selects to have a third-party license manager and enters your email address, you will receive a license management request in email.

To respond to a registration request:

- Click the link in the license management request email. This displays the registration request in the requestor's Developer Edition organization.
- Click **Accept** to complete the registration process. Alternatively, click **Reject** to decline the request and close the browser; this prevents you from using the link again.

 **Note:** If you accept this request, you authorize Salesforce to automatically create records in your Salesforce organization to track information about this package. Choosing a license manager organization is permanent and cannot be changed.

- Enter the username and password for the Salesforce organization you want to use to manage licenses for this package. A license manager can be any Salesforce organization that has installed the free License Management Application (LMA) from Force.com AppExchange.
- Click **Confirm**.

Assigning Licenses Using the API

Administrators can use the API to assign or revoke licenses for any managed package installed in their organization. License information for a package is stored in two objects, PackageLicense and UserPackageLicense, which were previously accessible only from the Manage Licenses page under Setup. These are now accessible as standard objects, so an administrator can assign licenses to specific users via API calls. This makes managing package licenses in a subscriber organization faster and easier, especially for large-scale deployments.

For example, suppose an administrator installs an app for use by all 200 salespeople in the company. Assigning a license to each salesperson from the UI is inefficient and time-consuming. Using the API, the administrator can assign licenses to all salespeople, based on their profile, in one step.

Here are some common licensing tasks that administrators can use the API to do.

- Determine the number of package licenses in use and available.
- Verify if a specific user has a license for the package.
- Get a list of all users who have a license for the package.
- Assign a package license to a user or group of users.
- Revoke a package license that was previously assigned to a user.

For details of the PackageLicense and UserPackageLicense objects and a code sample, see the [Object Reference for Salesforce and Force.com](#).

Upgrading Packages

Salesforce supports upgrades for managed packages only. Publishers can publish an upgrade for a managed package and notify installers that the new version is available. Installers of a managed package can then install the upgrade as follows:

1. Before you install an upgrade, determine if the app you installed was from a managed package. Look for the  Managed - Installed icon on the detail pages for each component and on the list of packages installed.
If the app you installed is not from a managed package, upgrades for it are not available.
2. Then, install the upgrade in the same way you would install any other package from the AppExchange. If the publisher provided a link to the new version, follow the link to the package posting and install it in your organization. The first page of the install wizard lists the current version you have installed, the version you're about to install, and a list of additional components included in the new version.

Notes on Upgrading Managed Packages

Consider the following when upgrading a managed package:

- All existing custom objects that were previously deployed will still be deployed. Salesforce prompts you to deploy any new custom objects or previously undeployed custom objects.
- Profile settings for components in a package are editable by the customer but not upgradeable by the package developer. If the developer makes changes to any profile settings after releasing the package, those changes won't be included in an upgrade. Customers will need to manually update the profile settings after upgrading the package. In contrast, permission sets in a package are upgradeable by the developer, so any changes the developer makes will be reflected in the customer organization after upgrading the package.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To manage licenses for an AppExchange app:

- "Manage Package Licenses"

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To upload packages:

- "Upload AppExchange Packages"

To install and uninstall packages:

- "Download AppExchange Packages"

- If the developer chooses to add universally required custom fields, the fields will have default values.
- Translation Workbench values for components that are “editable but not upgradeable” are excluded from upgrades.
- If an installed package has `Restricted` API access, upgrades will be successful only if the upgraded version does not contain any s-controls. If s-controls are present in the upgraded version, you must change the currently installed package to `Unrestricted` API access.
- When you upgrade a package, changes to the API access are ignored even if the developer specified them. This ensures that the administrator installing the upgrade has full control. Installers should carefully examine the changes in package access in each upgrade during installation and note all acceptable changes. Then, because those changes are ignored, the administrator should manually apply any acceptable changes after installing an upgrade.

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Can I uninstall packages that I installed from AppExchange?

Yes. All your installed packages are listed in the Installed Packages page. You can remove any package by clicking the **Uninstall** link next to the package name.

SEE ALSO:

[Uninstalling a Package](#)

[Importing Package Data](#)

Why did my uninstall fail?

Salesforce prevents you from uninstalling a package if it causes any remaining components to malfunction.

SEE ALSO:

[Uninstalling a Package](#)

Who can use AppExchange?

Anyone can browse and test drive AppExchange listings. Salesforce administrators and users with the “Download AppExchange packages” permission can install AppExchange apps. To publish an app on the AppExchange, a user must have both “Create AppExchange packages” and “Upload AppExchange packages” permissions.

Why did my installation or upgrade fail?

An installation can fail for several reasons:

- The package includes custom objects that will cause your organization to exceed its limit of custom objects.
- The package includes custom tabs that will cause your organization to exceed its limit of custom tabs.
- The developer of the package has uploaded a more recent version of the package and has deprecated the version associated with this installation URL. Contact the publisher of the package to get the most recent installation URL.
- You’re trying to install an extension to a package, and you don’t have the base package installed.
- The package requires that certain components are enabled in your organization, or that required features are enabled in your edition.
- The package contains Apex code and you are not authorized to run Apex in your organization.
- The package you’re installing has a failing Apex test.

Can I customize AppExchange packages?

Yes, all packages are customizable. However, to ensure compatibility with future versions, some aspects of managed packages can’t be changed.

For a list of components that are editable in a managed package, see [ISVforce Guide](#).

Who can use AppExchange packages?

If you use an Enterprise, Unlimited, Performance, or Developer Edition organization, you can choose which user profiles have access to the package as part of the installation process. Packages installed in Professional and Group Edition organizations are installed with “Full Access” to all user profiles. However, regardless of Edition, all custom objects are installed in “In Development” mode which hides them from all standard users. Users must have the “Customize Application” permission to view custom objects in “In Development” mode. When you are ready to roll out the package to other users, change the custom object status to “Deployed.”

How can I upgrade an installed package?

Managed packages are completely upgradeable. Before installing a package, contact the publisher to determine if it’s managed.

How secure are the components I install?

Salesforce performs periodic security reviews of all publicly listed applications on AppExchange. When installing third party applications with access to data, these applications may have access to other data within the organization where the package was installed. Private listings do not go through a security review and administrators should inspect the application carefully before determining whether it should be installed within their organization.

What happens to my namespace prefix when I install a package?

A namespace prefix is a globally unique identifier that you can request if you plan to create a managed package. All the components from a managed package that you install from another developer contain the developer’s namespace prefix in your organization.

However, unmanaged packages can also have a namespace prefix if they originated from an organization that contained a managed package. When you install an unmanaged package that contains a namespace prefix, Salesforce replaces the developer's namespace prefix with yours.

Can I reinstall an AppExchange package after uninstalling it?

Yes. You can reinstall a package in the same manner that you installed it.

SEE ALSO:

[Install a Package](#)

[Importing Package Data](#)

When I install a package that's listed on the AppExchange, do custom objects, tabs, and apps in that package count against the limits of my Salesforce Edition?

No. If you install a package from the AppExchange, its custom objects, tabs, and apps don't count against the limits of your Salesforce edition. However, if the package uses other types of custom components, such as custom fields, they count against the relevant limits of your Salesforce edition.

Note: These rules apply only to managed packages that are listed on the AppExchange. If you install an unmanaged package or a managed package that's not publicly listed on the AppExchange, its custom objects, tabs, and apps count against the limits of your Salesforce edition.

Printable Resources for Administrators

In addition to online help, Salesforce publishes printable documentation to help you successfully administer Salesforce.

These documents include tip sheets, user guides, implementation guides, and other resources that describe the features and capabilities of Salesforce. These documents are available as Adobe® PDF files. Adobe Reader® is required to open PDF files; to download the latest version of Reader, go to www.adobe.com/products/acrobat/readstep2.html.

Managing the People and Organizations You Sell To

Establishing Your Customers, Competitors, and Partners

Accounts

Use Salesforce accounts to store information about your customers or the entities you are working with, such as companies, schools, government agencies, or individuals.

Think of an account as a file folder in which you store every bit of information you know about a customer. For example, if you're storing information about a company, you include its name, location, a contact person, past or current orders, and other related information. You could also keep a log of phone calls or service requests.

In Salesforce, information about the company itself—its name, location, website, and so on—is stored as an *account record*. Information related to the account, such as a contact person, notes, and orders, is stored in other types of records. Salesforce makes it easy to find all the records related to each account by listing them on the account record's home page. You can locate, create, delete, sort, and filter your accounts from the Accounts tab. Select an account to view its record home page, to edit the account, and access other records related to that account.

There are a few things to know about accounts.

Salesforce Offers Two Types of Accounts

Salesforce accounts are *business accounts* by default. Business accounts are used to store information about companies or other entities. Salesforce administrators can also choose to set up *person accounts*, which are used to store information about individual people. For example, person accounts fit your customers best if they are online shoppers, gym members, vacation travelers, or other individual consumers. Depending on who your company sells to, you might have just one type of account available, or both.

Note: In the Salesforce Help and other documentation, the word *account* by itself always refers to both business accounts and person accounts. We use the terms *business accounts* and *person accounts* when there are differences between the two types of accounts.

The Accounts Feature Can Be Renamed

Your Salesforce administrator can change the name of accounts to something that works better for your business, such as *Clients* or *Patients*. However, we will always refer to them as *accounts* in the Salesforce Help.

Users Can Access Accounts on Mobile Devices

Your accounts are accessible to you from the full Salesforce site or the Salesforce1 mobile application, if your Salesforce administrator has turned on Salesforce1 access.

What Is a Person Account?

Person accounts store information about individual consumers.

 **Note:** This release contains a beta version of person accounts in Lightning Experience that is production quality but has known limitations. For information on enabling person accounts for your organization, see [Enable Person Accounts](#) on page 1670.

Salesforce accounts are *business accounts* by default. Business accounts are used to store information about companies or other entities. Salesforce administrators can also choose to set up *person accounts*, which are used to store information about individual people. For example, person accounts fit your customers best if they are online shoppers, gym members, vacation travelers, or other individual consumers. Depending on who your company sells to, you might have just one type of account available, or both.

Person accounts work differently than business accounts. For example, person accounts can't have contacts. Instead, the person account record stores the information you'd typically save for business contacts, such as first name and last name. You can usually treat a person account like a contact. For example, you can invite a person account to a meeting or associate it with a campaign. For differences between person accounts and business accounts, see [Person Account Behaviors](#).

 **Note:** In the Salesforce Help and other documentation, the word *account* by itself always refers to both business accounts and person accounts. We use the terms *business accounts* and *person accounts* when there are differences between the two types of accounts.

Considerations for Using Merge Fields for Person Accounts

A merge field is a field you can put in an email, an email template, a mail merge template, a custom link, or a formula to incorporate values from a record. You can use merge fields in the subject and body of custom HTML templates. When using merge fields, it's a good idea to understand how they work and what to expect in your merged documents and emails.

- If your organization uses person accounts, business account and person account fields are available as account merge fields. Account fields exclusive to person accounts, such as `Birthdate`, `Email`, and `Title` have "Account.Person" in their merge field names. For example, `{!Account.PersonBirthdate}`.
- You can use the merge field `{!Account.IsPersonAccount}` to determine whether you are working with a person account or a business account.
- Account fields that previously had unique names and labels may no longer be unique because some contact fields are displayed as part of the account object. These fields on the accounts page are identified by the person account icon (). Ensure that all custom account fields have field names and labels unique to your organization so that the merge field references the correct field. For more information, see [What Is a Person Account?](#) on page 1110.

Important:

- If two or more custom objects have matching names or labels, only one of the objects appears when you select from available merge fields. Make sure that all custom objects have unique names and labels so that you can select merge fields from any of the objects.

[Accounts](#)

[Validation Rules for Person Accounts](#)

Validation Rules for Person Accounts

 **Important:** Once person accounts have been enabled, they can't be turned off. Therefore, we recommend existing customers [create a sandbox](#) to preview how person accounts will affect their organization.

A merge field is a field you can put in an email template, mail merge template, custom link, or formula to incorporate values from a record. The list of available merge fields depends on the type of data that you're working with. This topic lists considerations for working with merge fields in validation rules with person accounts.

Tips

- To define a validation rule that applies only to person accounts, use the `IsPersonAccount` merge field. For example, `Account.City = "San Francisco"` verifies that a business or person account's city is San Francisco, while `IsPersonAccount (Account.City = "San Francisco")` verifies that a person account's city is San Francisco.
- You must handle person account and business account names separately in account validation rules.
 - For business accounts, use the `Name` merge field.
 - For person accounts, use the `FirstName` and `LastName` merge fields.

EDITIONS

[Considerations for Using Merge Fields for Person Accounts](#)

What is a business account and how does it differ from a person account?

A business account is a company, corporation, firm, or other business entity to which you can associate multiple contacts. Business accounts are available in all Editions and have a folder icon (📁).

In Enterprise, Unlimited, Performance, and Developer Editions, your Salesforce organization can be enabled to use person accounts (👤), which are individual consumers who function simultaneously as accounts and contacts.

SEE ALSO:

[Accounts](#)

Person Account Behaviors

Person accounts are accounts that can also be used as contacts in many situations. However, there are key areas in which person accounts differ from business accounts or have unique considerations.

- 📌 **Note:** This release contains a beta version of person accounts in Lightning Experience that is production quality but has known limitations. For information on enabling person accounts for your organization, see [Enable Person Accounts](#) on page 1670.

Salesforce Functionality	Person Account Behavior
Account Merge	Person accounts can be merged only with other person accounts. See Merge Duplicate Accounts on page 1134.
Account Quick Create	On the accounts home page, the fields in the Quick Create area are based on whether the default account record type set on your profile is a person account record type or a business account record type.
Accounts	Person accounts can't have relationships with other accounts or with contacts. They can't be included in account hierarchies.
Activities	<p>Person accounts can be associated with events or tasks using either the <code>Name</code> or <code>Related To</code> fields.</p> <p>As with contacts, person accounts can be invited to events.</p> <p>For users to request a meeting with a person account, the <code>Email</code> field must be added to the Person Accounts page layout.</p>
Campaigns	As with contacts, person accounts can be added to campaigns and have a Campaign History related list.

EDITIONS

Business accounts available in: Both Salesforce Classic and Lightning Experience

Business accounts available in: **All Editions**

Person accounts available in: Salesforce Classic and Lightning Experience

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

Salesforce Functionality	Person Account Behavior
Cases	On cases, person accounts can be entered in the <code>Account Name</code> field, the <code>Contact Name</code> field, or both.
Chatter Feed Tracking	When you follow person accounts, you follow the account fields, but not the contact fields.
Communities and Portals	As with contacts, person accounts can be enabled as users for customer communities and portals Person Accounts can't be enabled as users for partner communities and portals.
Contact Roles	As with contacts, you can associate person accounts to accounts, cases, contracts, and opportunities using the Contact Roles related list. Similarly, you can associate contacts to person accounts using the Contact Roles related list.
Contacts	Unlike business accounts, person accounts can't have relationships with contacts.
Custom Objects	Custom objects with relationships to either accounts or contacts can be added as related lists on person accounts.
Data.com	Person accounts aren't supported by Data.com products and features.
Desktop Integration	Person accounts are supported by the following Salesforce integration features. <ul style="list-style-type: none"> • Lightning for Outlook • Salesforce for Outlook • Connect Offline Person accounts aren't supported by Lightning Sync.
Duplicate Management	Person accounts aren't supported by Data.com Duplicate Management.
Email	As with contacts, you can send individual emails and mass emails to person accounts.
ExactTarget	Person accounts are supported, but more configuration is required.
Field History	Account and contact fields that appear on person account records can be tracked using the account field history settings. Person account field history is then captured in the Account History related list, the Account History report, and field audit trails.
Fields	Most standard account and contact fields and all custom account and contact fields are available for person account page layouts. Some business account fields (such as <code>Parent Account</code> and <code>View Hierarchy</code>) and some contact fields (such as <code>Reports To</code>) are not supported for person accounts. See Person Account Fields .
Icons	In Salesforce Classic, person accounts have a person icon (), while business accounts have a folder icon (). In Lightning Experience, person accounts have a person with building icon (), while business accounts have building icon ().

Salesforce Functionality	Person Account Behavior
	The person account icon can be added to search results, list views, and lookup dialogs by adding the <code>Is Person Account</code> field to the appropriate search layout or list view.
Import Wizards	Person accounts can be imported using the Data Import Wizard, as well as the individual import wizard for Person Accounts.
Lead Conversion	Leads that don't have a value in the <code>Company</code> field are converted to person accounts. Leads that do have a value in the <code>Company</code> field are converted to business account.
List Views	<p>Person accounts appear in all account and contact list views, except the Recent Contacts list on the Contacts home page.</p> <p>Quickly see which records are person accounts by adding the <code>Is Person Account</code> field to the list of fields to display. To include or exclude person accounts from a list view, add the <code>Is Person Account</code> field to the filter criteria.</p>
Mobile Configurations for Salesforce Classic	<p>Salesforce Classic Mobile Configurations that include the account object automatically deliver person accounts and business accounts to users' mobile devices.</p> <p>Person accounts can be excluded from the configuration's data set using the criteria "<code>Is Person Account equals False</code>." To mobilize only person accounts, use the criteria "<code>Is Person Account equals True</code>." If a mobile configuration includes accounts but not contacts, users assigned to that configuration will see a Contacts tab in the mobile client application, and the tab will contain person accounts.</p>
Packaging	Person accounts components and attributes can be included in managed and unmanaged packages.
Page Layouts	<p>Person accounts have their own page layouts that can include account and contact fields, account custom links, and account and contact related lists.</p> <p>Person accounts page layouts do not support the <code>Reports To</code> and <code>Parent Account</code> fields. See Person Account Fields.</p>
Pardot	Person accounts are supported, but additional configuration is required.
Partners	You can use the Partners related list to relate person accounts to each other. We recommend that you rename the Partners related list to reflect how your person accounts are connected.
Process Builder	Creating or editing a person account triggers the Process Builder, if applicable.
Record Types	Administrators can configure multiple record types for person accounts. A person account can only be changed to another person account record type.
Renamed Tabs and Standard Fields	To customize the names of tabs and fields that display on person account records, administrators need to customize the account and contact tabs and fields.
Salesforce1	For organizations that have enabled person accounts and Salesforce1, person accounts can be created, accessed, and managed within Salesforce1 for most features.
Search	<p>In Lightning Experience and Salesforce1, person accounts appear in both account and contact search results. In Salesforce Classic, person accounts appear only in account search results.</p> <p>To help users differentiate person accounts from business accounts in search results, administrators can add the <code>Is Person Account</code> field to the appropriate search layout.</p>

Salesforce Functionality	Person Account Behavior
Self-Service Portal	As with contacts, person accounts can be enabled as users for your Self-Service portal.  Note: Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.
Sharing Settings	If you have enabled person accounts, the organization-wide default sharing for contacts is set to Controlled by Parent and is not editable. If your organization has customized your contact sharing settings and you want to enable person accounts, change your organization-wide default for contacts to Controlled by Parent, which removes all your contact sharing rules and manually shared contacts.
Social Accounts, Contacts, and Leads	As with contacts, you can link person accounts to social network profiles
Stay-in-Touch Requests	As with contacts, you can send individual and mass Stay-in-Touch requests to person accounts.
Storage	Person accounts count against both account and contact storage because each person account consists of one account as well as one contact.
Visual Workflow	Creating or editing a person account triggers flows created with Visual Workflow.
Workflow Rules	Creating or editing a person account triggers account workflow rules.

Guidelines for Changing an Account's Record Type

Record types determine the business processes, picklist values, and page layouts that are available to you when creating records. Before you change an account's record type, be aware of these important details.

If your organization uses person accounts, your administrator has configured two record types for accounts—one for business accounts, and another for person accounts. From the UI, you can change an account's record type from a business account to a business account or from a person account to a person account. However, to change an account's record type from a business account to a person account, or vice versa, you must use the API.

[Select and Change Profile Images for Accounts, Contacts, and Leads](#)

Guidelines for Creating Accounts

Keep these guidelines and tips in mind when creating accounts.

- To create business accounts, you need “Create” permission on accounts. To create person accounts, you need “Create” permission on both accounts and contacts.
- If your organization uses record types, you might be prompted to choose a `Record Type` when creating an account. Different record types can have different fields and different picklist values.
- To specify that a business account is a subsidiary of another business account, fill in the `Parent Account` field. You can then view a hierarchy of account relationships. The `Parent Account` field isn’t available for person accounts.
- Use the `Account Site` field to designate different locations of the same company. For example, Acme.com may have offices in Paris and London. Create two accounts, both called Acme.com, but with `Account Site` values of Paris and London, respectively.
- If your organization uses divisions, the division of a new account is automatically set to your default division, unless you manually select a different one.
- If your organization uses territory management, account assignment rules can automatically assign newly created accounts to territories. See [Territory Management](#) on page 1296.

Understanding What Happens when You Delete Accounts

Most accounts and their associated records can be deleted in one click—but some accounts can't be deleted until associations have been removed.

 **Important:** If you can delete an account, you will see **Delete** as an option on the account's detail page and on its row on the account list page in both Salesforce Classic and Lightning Experience. If you don't see the delete option, you don't have permission to delete the account. Ask your Salesforce administrator for help.

Deleted accounts are moved to the Recycle Bin, along with these associated items.

 **Note:** You can't access the recycle bin from Lightning Experience, but deleted items still go into it. Switch to Salesforce Classic temporarily to view or restore recycle bin items.

- Contacts
- Opportunities
- Contracts (if they're not activated)
- Activities
- Notes
- Attachments
- Portal roles and groups (if all portal users in the account are disabled.)
- Partner relationships
- Relationship group members

If you restore an account from the Recycle Bin, any related items are also restored except for:

- Relationship group members in some cases. See [Removing Members from Relationship Group Members](#) on page 1254.
- Portal roles and groups. See [Using Accounts](#) on page 1116.

You can't delete an account if:

- You don't have the "Delete" permission on accounts
- You aren't the account's owner, above the account's owner in the organization role hierarchy; or an administrator
- The account is enabled as a partner account; it has associated cases, activated contracts, or related opportunities that are owned by other users; or it has associated contacts that are enabled for the Self-Service portal.

In addition, if you attempt to delete an account that has closed/won opportunities owned by you, a message displays asking you whether you want to delete the closed/won opportunities along with the account or to cancel the account deletion.

 **Note:** You don't need the "Delete" permission on any associated records that are included in the deletion.

Account Fields

Business Account Fields

A business account has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the account record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com fields are available to only organizations that use a specific Data.com product. Those fields are identified in their descriptions.

Field	Description	Allows Value from Data.com or D&B
Account Currency	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Account Division	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically inherit the account's division. Available only in organizations that use divisions to segment their data.	
Account Name	Name of company. Up to 255 characters are allowed in this field.	✔ (D&B)
Account Name (Local)	The name of the account translated into the local language.	
Account Number	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
Account Owner	Assigned owner of account. Not available in Personal Edition.	
Account Record Type	Name of the field that determines what picklist values are available for the	

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available business account fields vary according to which Salesforce Edition you have.

Person accounts available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

The available person account fields vary according to which Salesforce Edition you have.

Field	Description	Allows Value from Data.com or D&B
	record. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.	
Account Site	Information about the account's location, such as <i>single location</i> , <i>Headquarters</i> , or <i>Branch</i> . Up to 80 characters are allowed in this field.	✔ (D&B)
Account Source	The source of the account record. For example, <i>Advertisement</i> , <i>Data.com</i> , or <i>Trade Show</i> . The source is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Annual Revenue	Amount of annual reported revenue.  Note: If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in this field to change. For organizations that use non-USD currencies, we ignore the Annual Revenue field when determining a record's clean status (so the Clean Status field's value does not change). We also remove the value from the Annual Revenue field on account records and the clean comparison page.	✔ (D&B)
Billing City	City portion of billing address. Up to 40 characters are allowed in this field.	✔ (D&B)
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.	✔ (D&B)
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.	✔ (D&B)
Clean Status	<p>The record's clean status, as compared with Data.com. Values are Not Compared, In Sync, Reviewed, Different, Not Found, and Inactive. This field is available if you use Data.com Prospector or Data.com Clean.</p> <p> Note: If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in the Annual Revenue field to change. For organizations that use non-USD currencies, we ignore the Annual Revenue field when determining a record's clean status (so the Clean Status field's value does not change).</p>	✔ (Data.com)
Created By	User who created the account, including creation date and time. (Read only)	
Data.com Key	The company's ID in Data.com. When Salesforce records are compared with Data.com records (via manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
D&B Company	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the account. Use the lookup if you need to associate a different D&B Company record with the account. This field is only available to organizations that use Data.com Premium Prospector or Data.com Premium Clean.	✔ (D&B)
Description	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
D-U-N-S Number	<p>The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. This field is available if you use Data.com Prospector or Data.com Clean.</p> <p> Note: To see the entire D-U-N-S number, either</p> <ul style="list-style-type: none"> • Add the account to Salesforce if you haven't yet, or • Clean the account with Data.com if it already exists in Salesforce <p>Until you add or clean the record, its first five digits will be masked with asterisks (*).</p>	✔ (D&B)
Employees	Number of people employed by the account.	✔ (D&B)
Evaluate this account against territory rules on save	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See Territory Management on page 1296.	
Exclude from territory assignment rules	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See Territory Management on page 1296.	
Fax	Fax number. Up to 40 characters are allowed in this field.	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
Industry	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Modified By	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
NAICS Code	The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments into 20 industries, according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the U.S. business economy. This field is available if you use Data.com Prospector or Data.com Clean.	✔ (D&B)
NAICS Description	A brief description of an organization's line of business, based on its NAICS code. This field is available if you use Data.com Prospector or Data.com Clean.	✔ (D&B)
Ownership	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (D&B)
Parent Account	Parent company for companies that are subsidiaries of a larger company or organization. The parent account must be an existing account in Salesforce. You can enter the account name, or select (or optionally, create) the account using the lookup icon.	
Partner Account	Read-only field that indicates whether an account is a partner account.	
Phone	Primary phone number of account. Up to 40 characters are allowed in this field.	✔ (D&B)
Rating	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values,	

Field	Description	Allows Value from Data.com or D&B
	which are set by an administrator. Each picklist value can have up to 40 characters.	
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.	✔ (D&B)
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✔ (D&B)
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.	✔ (D&B)
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.	✔ (D&B)
SIC Code	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	✔ (D&B)
SIC Description	A brief description of an organization's line of business, based on its SIC code.	✔ (D&B)
Territories	<p>The territories to which the account has been assigned. See Territory Management on page 1296.</p> <p>For organizations that use Enterprise Territory Management, this field is not available. Enterprise Territory Management offers a related list called Assigned Territories that you can add to account page layouts.</p>	
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol. Up to 20 characters are allowed in this field.	✔ (D&B)
Tradestyle	A name, different from its legal name, that an organization may use for conducting	✔ (D&B)

Field	Description	Allows Value from Data.com or D&B
	business. Similar to "Doing business as" or "DBA". This field is available if you use Data.com Prospector or Data.com Clean.	
Type	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Custom Links	Listing of custom links for accounts as set up by your administrator.	
Website	URL of account's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	✔ (Data.com)
Year Started	The year the company was established or the year when current ownership or management assumed control of the company. If the company establishment or ownership year is unavailable, then the year the Dun & Bradstreet record was created will be used. Dun & Bradstreet does not supply this data for branch locations. This field is available if you use Data.com Prospector or Data.com Clean.	✔ (D&B)

Person Account Fields

A person account has the following standard fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable. Fields with a checkmark in the Is Contact Field column are contact fields that are supported for person accounts but not business accounts.

Note that this list does not include any custom fields that your administrator may have created. Both account and contact custom fields are available for person accounts.

Field	Description	Is Contact Field
Account Currency	The default currency for all currency amount fields in the account. Amounts display in the account currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Account Division	Division to which the account belongs. Records related to the account, such as contacts and opportunities, automatically	

Field	Description	Is Contact Field
	inherit the account's division. Available only in organizations that use divisions to segment their data.	
Account Name	The name of the individual. In person accounts, the account name cannot be edited directly. Instead, Salesforce derives it by combining the <code>First Name</code> and <code>Last Name</code> fields in the appropriate order per the user's language setting. If <code>Middle Name</code> and <code>Suffix</code> fields have been enabled for the organization, those fields are also included in the account name.	
Account Name (Local)	The name of the account translated into the local language.	
Account Number	Tracking or reference number for account. Up to 40 characters are allowed in this field.	
Account Owner	Assigned owner of account. Not available in Personal Edition.	
Account Record Type	Name of the field that determines what picklist values are available for the record. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.	
Account Site	Information about the account's location, such as <i>single location</i> , <i>Headquarters</i> , or <i>Branch</i> . Up to 80 characters are allowed in this field.	
Annual Revenue	Amount of annual reported revenue.	
Assistant	The contact's assistant. Maximum 40 characters.	✓
Asst. Phone	The assistant's phone number. Maximum 40 characters.	✓
Billing City	City portion of billing address. Up to 40 characters are allowed in this field.	
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard	

Field	Description	Is Contact Field
	values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.	
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.	
Birthdate	The contact's birthday. Click the field, and then choose a date from the calendar.	✓
Created By	User who created the account, including creation date and time. (Read only)	
Custom Links	Listing of custom links for accounts as set up by your administrator.	
Department	The associated business or organizational unit. Maximum 80 characters.	✓
Description	Description of account. Up to 32 KB of data are allowed in this field. Only the first 255 characters display in reports.	
Do Not Call	Whether the contact wants to be contacted by phone. If you use Data.com, the <code>Phone</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.	✓
Email	The contact's email address. A valid email address is required. Maximum 80 characters.	✓
Email Opt Out	Whether the contact wants to receive email. If you use Data.com, the <code>Email</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.	✓
Employees	Number of people employed by the account.	
Evaluate this account against territory rules on save	When checked, causes account assignment rules to run when the account is edited and saved. When customizing the page layout for accounts, an administrator can control whether this checkbox displays and whether it is checked by default. See Territory Management on page 1296.	

Field	Description	Is Contact Field
Exclude from territory assignment rules	When checked, shields the account from being evaluated when account assignment rules are run, preventing it from being automatically assigned to territories. Also, if the account is already assigned to territories as a result of assignment rules, checking this box removes the account from those territories. This checkbox only affects rule-based account assignments and has no effect on manual account assignments. See Territory Management on page 1296.	
Fax	Fax number. Up to 40 characters are allowed in this field.	
Fax Opt Out	Whether the contact wants to be included in broadcast faxes.	✓
First Name	The first or given name of the individual. Up to 40 characters are allowed in this field.	✓
Home Phone	The contact's home phone number. Maximum 40 characters.	✓
Industry	Primary business of account. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Last Name	The surname or family name of the individual. Up to 80 characters are allowed in this field.	✓
Last Stay-in-Touch Request Date	The date when the most recent Stay-in-Touch request was sent.	✓
Last Stay-in-Touch Save Date	The date when the most recent Stay-in-Touch request was returned and merged.	✓
Lead Source	The record source: for example, Advertisement, Partner, or Web. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters for each picklist value.	✓
Mailing City	The city in the mailing address. Maximum 40 characters.	✓
Mailing Country	The mailing country for the address. Entry is selected from a picklist of standard values,	✓

Field	Description	Is Contact Field
	or entered as text. Up to 80 characters are allowed if the field is a text field.	
Mailing State/Province	The mailing state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓
Mailing Street	The street in the mailing address. Maximum 255 characters.	✓
Mailing Zip/Postal Code	The zip or postal code in the mailing address. Maximum 20 characters.	✓
Middle Name	Middle name of the individual. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	✓
Mobile	The contact's mobile phone number. Maximum 40 characters.	✓
Modified By	User who last changed the account fields, including modification date and time. This does not track changes made to any of the related list items on the account. (Read only)	
Other City	The city in another address for the contact. Maximum 40 characters.	✓
Other Country	Another country for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓
Other Phone	Another phone number for the contact. Maximum 40 characters.	✓
Other State/Province	Another state or province for the address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	✓

Field	Description	Is Contact Field
Other Street	The street address in another address for the contact. Maximum 255 characters.	✓
Other Zip/Postal Code	The zip or postal code in another address for the contact. Maximum 20 characters.	✓
Ownership	Ownership of company, for example, public or private. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Phone	Primary phone number of account. Up to 40 characters are allowed in this field.	
Rating	Categorization of how you rate this account, for example, Hot, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Salutation	The title for addressing the contact, for example, Mr., Ms., or Dr. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters.	✓
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.	
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.	
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.	

Field	Description	Is Contact Field
SIC Code	Standard Industrial Classification code of the account's main business categorization. Up to 10 characters are allowed in this field.	
Suffix	Name suffix of the individual. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	
Territories	The territories to which the account has been assigned. See Territory Management on page 1296.	
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol. Up to 20 characters are allowed in this field.	
Title	The contact's position within the organization. Maximum 80 characters.	
Type	Type of account, for example, Customer, Competitor, or Partner. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Website	URL of account's website, for example, www.acme.com . Up to 255 characters are allowed in this field; only the first 50 are displayed.

Account History

The Account History related list of an account detail page tracks the changes to the account. Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the account, a new entry is added to the Account History related list. For person accounts, this includes any relevant contact fields that are set to be tracked. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the account are not tracked in the account history.

SEE ALSO:

[Accounts](#)

Viewing Parent Accounts

The account hierarchy shows you the accounts that are associated through the `Parent Account` field, giving you a global view of a company and its subsidiaries. In the hierarchy, accounts are indented to show that they are subsidiaries of the parent account above them.

- To view the account hierarchy, click **View Hierarchy** next to the account name on the account detail page. The Account Hierarchy page displays up to 500 child accounts. If you don't have access to certain accounts that appear on the Account Hierarchy page, the columns for those accounts won't display details.
- To list an account as a subsidiary, edit the subsidiary account and type the name of an existing account in the `Parent Account` field. Alternatively, you can click the lookup icon to search for (or optionally, create) a parent account.

The parent account must be an existing account before it can be entered and saved in this field.

For companies with multiple office locations, you can also use the `Account Site` field to distinguish among the locations.

If your organization uses divisions, accounts that are associated via the `Parent Account` field do not need to be in the same division.

The `Parent Account` field and the **View Hierarchy** link are not supported for person accounts.

Merge Duplicate Accounts

Merge multiple accounts into one so you can keep your data clean and focus on closing deals.

1. From the Accounts tab, click **Merge Accounts** in the Tools section.
2. To find the duplicate accounts, enter a search string. Then click **Find Accounts**.
3. Select up to three accounts you want to merge. Then click **Next**.
4. Select one account as the master record.
5. Select the fields that you want to retain from each record. Fields with conflicting values are highlighted.
6. Click **Merge**.

Guidelines and Considerations for Merging Duplicate Accounts

When merging account records, there are some things to know before you get started, as well as some things to understand about how other features are affected.

 [Merging Duplicate Accounts: Tips and Gotchas](#)

General

- You can merge accounts if you're an administrator, the account owner, or a user above the account owner in the role hierarchy and you have the appropriate user permissions ("Delete" on accounts and "Edit" on related objects, such as opportunities and cases).
- Items related to the original accounts become related to the newly merged account.
- For organizations that use Professional, Enterprise, Unlimited, Performance, or Developer editions, any sharing rules are applied to the newly merged account. Also, any manual sharing from the master record is applied to the merged account.

EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

- The newly merged account retains the account hierarchy from the master record.
- The original accounts are moved to the Recycle Bin.
- On the newly merged account, the `Created By` field takes the date from the oldest merged account. The `Last Modified By` field uses the date the records were merged.
- In organizations that use divisions, the newly merged account is assigned to the division from the master record, unless you select otherwise.

Team Members

- The newly merged account retains all the team members from merged accounts, even if the members are from different teams.
- To merge accounts that a team member has greater record-level access than you do, you must have the "Modify All Data" permission on accounts. For example, if you're the account owner who's merging the accounts but an account team member has more access than you on any account child records, you need the "Modify All Data" permission to merge those accounts.

For more information, see [Account Teams](#).

Person Accounts

- If your organization uses person accounts, both business accounts and person accounts are returned when you search for duplicates. However, you can't merge a person account with a business account or vice versa. Person accounts are indicated by the person account icon ().
- You can't merge person accounts that are enabled to use a Customer Portal.

For more information, see [What Is a Person Account?](#)

Portals

- You must have the "Manage Users" permission to merge accounts associated with portals.
- To merge accounts that have contacts associated with a portal, the contacts must have the same type of portal.
- When merging accounts that have contacts associated with multiple portals of the same type, a contact's access to a specific portal doesn't change. This is because a portal user's profile determines the portal he or she can access.
- When merging a partner account with a non-partner account, the partner account must be selected as the master record.
- When merging partner accounts with a non-partner account, the owner can't be changed.
- To ensure that the newly merged account includes contacts associated with a portal, select the account with portal users as the master record.

Territory Management

This information applies to the original Territory Management feature only, and not to [Enterprise Territory Management](#).

- If none of the original accounts has `Exclude from account assignment rules` selected, then account assignment rules run on the newly merged account to determine its territories. Also, any territories that were manually added to the original accounts are manually added to the new account.
- If at least one of the original accounts has `Exclude from account assignment rules` selected, then the following happens.
 - Account assignment rules don't run on the newly merged account.
 - The newly merged account inherits all of the territories from the original accounts.

- If assignment rules were used to assign territories to the original accounts, it appears as if assignment rules are also used to assign territories to the newly merged account, even if the rules don't apply to the newly merged account.
- If a territory was manually assigned to one of the original accounts, the territory is manually assigned to the newly merged account.
- If a territory was added to one account manually and to another account by rules, the territory is manually added to the newly merged account.

Enterprise Territory Management

This information applies to the Enterprise Territory Management feature only, and not to the [original Territory Management](#).

- If a territory was manually assigned to one of the original accounts (for models in all states), the territory is manually added to the newly merged account, if not already there.
- Account assignment rules run on the merged account for the active territory model only if you select *Select by default* for the *Evaluate this account against territory rules on save checkbox* on the applicable account page layout's layout properties.
- If the merged value of `Exclude from territory assignment rules = true`, then: 1) territory assignment rules are not evaluated even if the *Select by default* checkbox for the *Evaluate this account against territory rules on save checkbox* is selected on the applicable account page layout's layout properties; and 2) any existing rule based territory associations in the active model are removed from the merged account.
- For territory models in non-active states (*Planning* or *Archived*), rule-based associated territories don't change on the merged account even if the merged account field values do not match the rules.

SEE ALSO:

[Merge Duplicate Accounts](#)

[Considerations for Merging Accounts Associated with Relationship Groups](#)

Considerations for Merging Accounts Associated with Relationship Groups

Merging multiple accounts into one helps you keep your data clean so you can focus on closing deals. Here's what you need to know about merging accounts that are members of relationship groups.

- An account can't exist more than once in the same relationship group.
- The account you select as the master record retains its original relationship group memberships. For example, if the master record "Joseph Bannon" was a member of the "Bannon Family" and "Bannon Law Firm" relationship groups, it remains a member of those relationship groups.
- The master record replaces the non-master records in all other relationship groups involved in the merge. For example, if the non-master record "Joe Bannon" was a member of "Bannon Trust Beneficiaries," the master record is transferred Joe Bannon's membership in Bannon Trust Beneficiaries.
- If there is a relationship group to which the master record did not originally belong but the multiple non-master records belong, the master record is transferred the membership of the non-master account that had higher priority (primary versus secondary) or the account whose member record was most recently modified in the relationship group. For example, if the non-master records "JR Bannon" and "Joe Bannon" both were members of "Acme LLP" and JR Bannon was primary, then the master record is transferred JR Bannon's membership in Acme

EDITIONS

LLP. Alternatively, if neither JR Bannon or Joe Bannon were primary or secondary but JR Bannon's member record in the relationship group was modified more recently, then the master record would be transferred JR Bannon's membership in Acme LLP.

SEE ALSO:

[Merge Duplicate Accounts](#)

[Removing Members from Relationship Group Members](#)

Sharing Accounts

Your administrator defines your organization's sharing model as well as your organization's default account access levels for territories. However, you can extend sharing privileges for your own data on an account-by-account basis. You can use account sharing to increase access to your accounts; you cannot restrict access beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the account detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the account. On this page, you can do any of the following:

- Click **Add** to grant access to the record for other users, groups, roles, or territories.
 -  **Note:** When you share an account, Salesforce prompts you to share any related [contacts](#), [opportunities](#), or cases, up to and including your access level. Enterprise, Unlimited, Performance, and Developer Edition users can also share related records from the record detail pages. Ensure users have at least "Read" permission on shared records.

Alternatively, you can share account access by creating an [account team](#).

- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level. For accounts, you can also edit the "Owner" sharing rule.

Record Translated Names

Use local name fields to store translated names for accounts, contacts, or leads.

For example, you can store the name of an account in the default language of your organization as well as the account's or user's language. The following fields can have corresponding local names:

Standard Field	Local Name Field
Account Name	Account Name (Local)
Contact: First Name	Contact: First Name (Local)
Contact: Middle Name	Contact: Middle Name (Local)
Contact: Last Name	Contact: Last Name (Local)
Lead: Company	Lead: Company Name (Local)

EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All Editions** except **Database.com**

Person accounts available in: **Enterprise, Performance, Unlimited, and Developer Editions**

Standard Field	Local Name Field
Lead: First Name	Lead: First Name (Local)
Lead: Middle Name	Lead: Middle Name (Local)
Lead: Last Name	Lead: Last Name (Local)

Local names do not affect the user's language settings. Depending on your page layout settings, they can both be displayed on the detail or edit page.

Changing the Territories of an Account

To modify an account's manually assigned territories:

1. From the account detail page, click **Change** next to the `Territories` field.
2. At the `Rule-based territory assignments` list, view the territories that contain the account due to active account assignment rules. You cannot use this page to remove the account from these territories; to do so you must modify the account assignment rules that evaluated the account.
3. If the account has existing manual assignments to one or more territories, the names of those territories will appear in the `Selected territories` list.
4. Click **Select** and **Deselect** to move territories between the Available territories list and the Selected territories list.
5. Optionally, click **Horizontal View** or **Vertical View** in the drop-down list to place the Selected territories list either alongside or below the Available territories list.
6. When the Selected territories list contains the territories to which the account should be manually assigned, click **Save** to finish and return to the account detail page.

EDITIONS

Available in: Salesforce Classic

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in **Enterprise**, **Performance**, **Unlimited**, and **Developer** Editions

Territory management available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

USER PERMISSIONS

To change the territories of an account:

- "Manage Territories"

OR

You are a forecast manager. Forecast managers can manage territories of those users working below them in territory hierarchy.

Change a Record's Owner

You can give ownership of a record to another user as long as that user has at least "Read" permission for the type of record being transferred.

1. On the record detail page, click the link to change the owner.
If you don't see the link, you don't have permissions to change record ownership.
2. Enter or select a new owner. In organizations where the Salesforce Customer Portal or partner portal is enabled, you can filter the results that appear on the user lookup dialog by selecting either a queue or group of users from the `Owner` or `Assigned To` drop-down list.

 **Note:** You can only enter or select users who have permission to own the record. Neither the User group nor the Roles and Internal Subordinates group contains Customer Portal or partner users.

3. Select the `Send Notification Email` checkbox to notify the new owner.

The "From" email address displayed in the notification is your return email address set in your email settings.

For cases in Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, the email text is determined by the `Case Assigned Template` setting specified in the Support Settings. For other records, the email text is automatically generated and cannot be customized.

4. Depending on the type of object you are transferring and your user permissions, the following checkboxes may also appear:

Checkbox	Description	Appears For
<code>Change Division</code>	Transfers the record to the new owner's division. All records related to the account are transferred to the new division as well.	Accounts and leads in Salesforce Classic, if you can view or edit the <code>Division</code> field
<code>Transfer open opportunities not owned by the existing account owner or Transfer open opportunities not owned by you</code>	Transfers open opportunities owned by other users that are associated with the account.	Accounts in Lightning Experience Accounts in Salesforce Classic
<code>Transfer closed opportunities</code>	Transfers the closed opportunities associated with the account. This option applies only to closed opportunities owned by the account owner; closed opportunities owned by other users are not changed.	Accounts in Salesforce Classic
<code>Transfer open cases owned by the existing account owner</code>	Transfers any open cases associated with the account that are owned by the existing account owner.	Accounts in Salesforce Classic
<code>Transfer closed cases</code>	Transfers the closed cases associated with the account. This option applies only to closed cases owned by the account owner; closed cases owned by other users are not changed.	Accounts in Salesforce Classic

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To transfer single records:

- "Transfer Record"

Checkbox	Description	Appears For
Keep Account Team	Transfers all account team members on the account to the new owner.	Accounts in Salesforce Classic
Keep Opportunity Team	Preserves the opportunity team when the opportunity is transferred to the new owner. Any opportunity splits are preserved, and split percentages assigned to the previous owner transfer to the new one. If this box is unchecked, all opportunity team members and splits are deleted when the opportunity is transferred.  Note: If you transfer closed opportunities, the opportunity team and opportunity splits are maintained, regardless of this setting.	Accounts in Salesforce Classic Opportunities in Salesforce Classic

 **Note:** If you change an account owner with both `Transfer closed opportunities` and `Keep Opportunity Team` deselected, the opportunity team members' access for closed opportunities becomes Private (that is, the opportunity team members lose access to any closed opportunities).

5. Save your owner changes.

SEE ALSO:

[Transfer of Associated Items](#)

Transfer of Associated Items

When you change a record's owner, some of its associated records may also be transferred to the new owner.

 **Important:** Workflow rules that update owners *do not* also transfer associated items. To ensure transfer, click **Change** next to the owner's name in a record and make your transfer selections.

Record Type	Associated items that are also transferred
Accounts	<p>Contacts, contracts with <i>Draft</i> status, attachments, notes, open activities, and orders with <i>Draft</i> status that are either associated with a transferring contract or no contract. Depending on your selections, this can also include open opportunities not owned by the current account owner, closed opportunities, open cases owned by the existing account owner, and closed cases.</p> <p>When a partner account is transferred, partner users associated with that account are moved into the role hierarchy beneath the new owner.</p> <p>Contracts and orders with <i>Activated</i> status are not transferred to the new owner, however, the new owner has read-only access to these contracts and orders.</p>

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise Performance, Unlimited, and Developer** Editions

Record Type	Associated items that are also transferred
Contacts	Notes, attachments, and open activities
Orders	Open tasks and future events (only applies if neither the old nor new owner is a queue)
Opportunities	Notes, attachments, and open activities
Leads	Notes, attachments, and open activities. Open activities are not transferred if you change lead ownership using the <code>Assign using active assignment rule</code> checkbox.
Cases	Notes, attachments, and open activities
Campaigns	Attachments and open activities
Contracts	Notes, attachments, open activities, and orders with <code>Draft</code> status
Custom objects	Notes, attachments, and open activities

 **Note:** You can't transfer events to which you have been invited and don't own.

Business accounts available in: **All** Editions

Person accounts available in: Salesforce Classic and Lightning Experience

Person accounts available in **Enterprise, Performance, Unlimited,** and **Developer** Editions

Related lists, such as opportunities, display information related to an account.

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

- If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.
- To directly add new items, click **New** (or the equivalent button) at the top of a related list. For example, to add a task to the Open Activities related list, click **New Task**.
- To change the number of records shown for related lists, click **View More** below a related list, or click **fewer** or **more** at the bottom of the page.
- If you are unable to see related records that belong to portal users, contact your Salesforce administrator.

Viewing Related Lists

What related lists you see are determined by several things.

- The Salesforce edition you are using
- Whether you are using Salesforce Classic or Lightning Experience
- Whether you are viewing a business account or a person account
- Your personal customization
- Page layout customizations set by your Salesforce administrator
- Your permissions to view related data

[Accounts](#)

Working Together on Accounts

Account Teams

An account team is a team of users who work together on an account. For example, an account team can include an executive sponsor, dedicated support representative, and project manager. Using account teams makes it easy to track collaboration on accounts.

Account teams aren't the same as opportunity teams, although they have the same team member roles.

You can build an account team for each account that you own. When selecting an account team member, specify the role that the person plays on the account. Depending on your sharing model, you can specify each account team member's level of access to the account and any contacts, opportunities, or cases associated with that account. That way, you can give some team members read-only access and others read/write access.

You can set up a default account team that includes the people who you normally work with on your accounts. You can choose to automatically add this default account team to all your accounts.

In a custom list view, you can filter account lists by the account teams in which you are a member. When creating or editing a custom list view for accounts, select the **My Account Teams** filter. In account reports, you can filter accounts by the account teams in which you are a member.

[Add Account Team Members](#)

An account record owner or users above the owner in the role hierarchy who have read access on the account can add team members but not edit them. If they have edit access on the account, they can also edit or delete team members.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

[Considerations for Removing Account Team Members](#)

Before you delete a member from an account team, make sure you're aware of these considerations.

[Guidelines for Setting Up Default Account Teams](#)

Save time by setting up a default account team—a group of coworkers you typically work with on account. Then add the team to accounts that you own.

[Account Team Fields](#)

An account team member has the following fields, listed in alphabetical order. Your page layout and field-level security settings determine which fields are visible and editable.

SEE ALSO:

[Guidelines for Setting Up Default Account Teams](#)

[Accounts](#)

Add Account Team Members

An account record owner or users above the owner in the role hierarchy who have read access on the account can add team members but not edit them. If they have edit access on the account, they can also edit or delete team members.

A user who doesn't own the account record can add team members only if he or she has edit access on the record.

You can grant the team member a higher access to the record only if you are the owner of account record, or above the owner in your organization's role hierarchy.

To build an account team, select an account and add account team members to it. High-volume portal users can't be added to teams.

1. View the account.
2. Click **Add** in the Account Team related list.
3. Select users to add to the account team. To add your default account team to an account, click **Add Default Team** in the Account Team related list. To add all account team members to an opportunity, click **Add Account Team** from the Opportunity Team related list on the opportunity.
4. Select the type of access each member should have to the account's related records.

 **Note:** The access level cannot be less restrictive than your org's default account access level. The options available to you vary depending on your org's sharing model and whether you're using Salesforce Classic or Lightning Experience. Regardless of sharing access, account team members must also have the "Read" permission on accounts to view accounts that list them as members.

5. Select a team role for each member.
6. Click **Save**.

EDITIONS

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To add team members to an account:

- "Read" on users

AND

"Edit" on accounts

To view accounts as team members:

- "Read" on accounts

-  **Tip:** In a custom list view, you can filter account lists by the account teams in which you are a member. When creating or editing a custom list view for accounts, select the `My Account Teams` filter. In account reports, you can filter accounts by the account teams in which you are a member.

SEE ALSO:

[Account Team Fields](#)

Considerations for Removing Account Team Members

Before you delete a member from an account team, make sure you're aware of these considerations.

- For each account you own, you can remove any team member from the account team.
- Unless specified, removing a member of your account team does not remove that person from your opportunity teams.
- If a team member is on your default account team and you remove him or her from a specific account, those changes only affect that account. The setup of your default account team does not change. To remove users from your default account team, see [Guidelines for Setting Up Default Account Teams](#) on page 1145.
- If a user on an account team has Read/Write access (**Account Access**, **Contact Access**, **Opportunity Access**, and **Case Access**) and is deactivated, the access will default to Read Only if the user is reactivated.

AND

Owner of account record, or above owner in your organization's role hierarchy

Guidelines for Setting Up Default Account Teams

Save time by setting up a default account team—a group of coworkers you typically work with on account. Then add the team to accounts that you own.

Account teams aren't the same as opportunity teams, although they have the same team member roles.

- To set up a default account team, access Advanced User Details in your personal settings.
- The access levels of the records can only grant the same or wider access than your organization's default access. However, at least one of the access levels must be set to a wider access than the organization's defaults. For example, if the organization-wide defaults for your contacts, opportunities, and cases are set to Private, then at least one of them must be set to a wider access for the account team members.
- `Contact Access` is not available when the organization-wide default for contacts is set to Controlled by Parent.
- While you're defining your default opportunity team, you can choose to automatically add it to all your open opportunities. If you don't choose this option, you add the default team from the Opportunity Team related list of your opportunities.
- Clicking **Add Default Team** adds the default team of the opportunity owner, not of the user who clicks the button.
- Salesforce admins and users above you in the role hierarchy can add your default opportunity team to opportunities that you own.

Syncing Prospects, Contacts, and Leads with Pardot

Getting Started with the Salesforce Connector

Sync newly created prospects, contacts, and leads, between Pardot and Salesforce. In addition, sync Pardot emails sent to prospects as Salesforce activities.

The Salesforce connector, an AppExchange-certified solution, helps you streamline disparate marketing channels from within Pardot.

Records sync between in Pardot and Salesforce at least every 10 minutes. The sync process handles as many as 800 records every 10 minutes, and up to 4,800 every hour.

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

If you're setting up the connector for	You'll set up the connector using the instructions in
Either a production or a sandbox environment for the first time	Set Up the Connector to Sync with Either Production or Sandbox Environments
A sandbox environment in addition to an already existing connector you've already set up for your production environment	Set Up the Connector to Sync with Sandbox Environments

Prepare Salesforce for Connecting to Pardot

Install an AppExchange package to get Salesforce ready to connect and sync with Pardot.

The package you'll download from the AppExchange automatically updates Salesforce with a custom application, custom tab, and custom fields for leads and contacts. After you install the package, you'll see a custom tab for the Pardot LeadDeck application. Keep in mind that you may need to customize your view to display the custom fields for leads and contacts. This helps your sales teams share information between Pardot and Salesforce.

If you're installing the Pardot AppExchange package for a

You need to

Production environment

1. Go to the [Pardot AppExchange package](#) for production environments.
2. Click **Continue** to install the package.
3. When prompted for your username and password, enter your production username and password.
4. Review the actions and click **Deploy** to complete the installation.
5. Confirm with your Salesforce administrator you have read permissions for ObjectChangeLogs.

Sandbox environment

1. Log out of Salesforce.
2. Go to the [Pardot AppExchange package](#) for sandbox environments.
3. When prompted for your username and password, enter your sandbox username and password.
4. Click **Continue** to install the package.
5. Review the actions and click **Deploy** to complete the installation.
6. Confirm with your Salesforce administrator you have read permissions for ObjectChangeLogs.

Set Up the Connector to Sync with Either Production or Sandbox Environments

Get your Salesforce connector ready to sync between Pardot and Salesforce for either a product or a sandbox environment.

Complete this procedure only if this is the first time you're establishing your connector. You'll need administrative rights in Salesforce for this procedure.

1. From Salesforce Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.
2. Create these trusted IP ranges.

Start IP Address	End IP Address
67.228.95.145	67.228.95.145

Start IP Address	End IP Address
67.228.168.139	67.228.168.141
67.228.223.106	67.228.223.107

Add the Connector to Pardot

Add and manage connector settings directly in Pardot.

Complete this procedure only if this is the first time you're establishing your connector and you have administrative rights in Salesforce.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. Click **+ Add Connector**.
3. Select Salesforce.
4. Type a name for the connector.
Use a name that makes it easy for you to identify your connector.
Example: Salesforce Connector)
5. Type your Salesforce username and password.
Keem in mind that when your Salesforce password changes, you'll need to update the Salesforce password for your connector.

Options for Customizing the Connector

Customize the connector based on your preferences.

Select any of these options to customize your connector.

The option	Which
Automatically create prospects in Pardot if they're created in Salesforce	<p>Enables a trigger to set any newly created leads or contacts in Salesforce to sync to Pardot. This won't happen for historical leads or contacts—only for those created after installing the Pardot AppExchange package in Salesforce, and will work only for leads and contacts created with an email address.</p> <p>If this feature is enabled later on, any leads and contacts with email addresses that were created after the Pardot package was installed in Salesforce will be pushed down to Pardot. Select a default campaign from the dropdown for any prospect created with this option.</p>
Automatically change emails in Pardot to reflect changes in Salesforce	<p>Automatically updates email addresses for Pardot prospects if an email address of a lead or contact is updated in Salesforce.</p> <p>Learn more about keeping email address updates in sync in About Email Address Updates Between Salesforce and Pardot.</p>

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To create records:

- "Create," "Update," and "Read" on contacts and leads

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

The option	Which
Automatically match Salesforce users to Pardot users	Lets you send emails from any user fields, including, for example, support contacts and account managers. Learn how to set up this functionality is Send Emails from Salesforce .
Exclude Salesforce Partner and Customer Portal users from Prospect assignment	Prevents Salesforce Partner and Customer Portal users from displaying in the “CRM Username” dropdown when you edit a user in Pardot.
Allow editing of Prospect lists within the CRM	Lets users add and remove Pardot prospects from within Salesforce. If you check this box, you must add the Visualforce elements to your Leads and Contacts page layouts.
Connect to a Salesforce sandbox account	Let’s you connect to a sandbox environment.
Sync emails with the CRM	Automatically logs an activity for every email sent to a prospect (list, drip, autoresponder and 1-to-1 prospect emails).  Note: This can quickly fill up your activity views, especially on an account object. Disabling Email Logging in Pardot is not retroactive. If the email logging may interfere with your workflow in Salesforce, we recommended that you do not enable this option.
Sync plugin emails with the CRM	Logs an activity for emails you send through Pardot for Microsoft® Outlook®, our Thunderbird extension, our Apple Mail plug-in, or our add-in for Gmail.
Enable Salesforce emails for task creation	Lets you send a notification email to users when a task is created.
Enable Salesforce emails for assignment rules	Lets Salesforce send a notification email to users when assignment rules run.
Enable Salesforce emails for user and queue assignments	Lets Salesforce send a notification email to users when an assignment takes place for a user or queue.

Set Up the Connector to Sync with Sandbox Environments

Get your Salesforce connector ready to sync between Pardot and your Salesforce sandbox.

Complete this procedure only if you already have a Salesforce connector set up for your production environment, but want the connector to point to your sandbox environment instead.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. In the row for your Salesforce connector, click , then **Edit**.
3. In the `Username` field, append `.NSPARDOT` to your username.
(Example: christina.wills@pardot.com.NSPARDOT)
4. If your sandbox password differs from your password in production, enter your sandbox one in the `Password` field.
5. Select the option `Connect to a Salesforce sandbox account`.

Because your sandbox is a copy of your production Salesforce organization, you’ll see the connector for your sandbox, too.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Whitelist Pardot IP Addresses in Salesforce

Set up Pardot IP addresses in Salesforce so that Pardot can communicate with Salesforce.

Complete this procedure only if this is the first time you're establishing your connector. You'll need administrative rights in Salesforce for this procedure.

1. From Salesforce Setup, enter *Network Access* in the *Quick Find* box, then select **Network Access**.
2. Create these trusted IP ranges.

Start IP Address	End IP Address
67.228.95.145	67.228.95.145
67.228.168.139	67.228.168.141
67.228.223.106	67.228.223.107

Turn On the Connector

Complete a simple task to turn on the Salesforce connector so that you can begin syncing between Pardot and Salesforce.

1. In Pardot, hover over **Admin**, then click **Connectors**.
2. In the row for your Salesforce connector, click **verify now**.

If Pardot is able to send data to and receive data from Salesforce, the status will change to .

Map Custom Leads Fields to Contacts Fields

Get the most out of contacts created from converted leads when you map custom fields between the two record types.

The connector creates leads in Salesforce from prospects in Pardot. But when you convert those Salesforce leads to contacts, only standard fields from the contacts appear for the newly converted contacts. Mapping custom fields between leads and contacts ensures you see all the information that helps you with your marketing and sales efforts.

1. From the object management settings for leads, go to the fields area, and then click **Map Lead Fields**.
2. For each custom lead field, choose a custom account, contact, or opportunity field into which you want the information inserted when you convert a lead.
3. Click **Save**.

Setting Up Pardot Custom Fields in Salesforce

Get your custom Pardot fields to appear in Salesforce.

The AppExchange package you installed to get Salesforce ready to connect and sync with Pardot sets up the custom fields for you, but the fields do not appear in Salesforce automatically. You need to complete a procedure to have these custom fields appear in Salesforce.

Add Sections to Leads and Contacts Page Layouts

Complete a procedure for getting Pardot fields to appear in leads and contacts page layouts.

1. In Salesforce, from the object management settings for leads, go to Page Layouts. A drag-and-drop box including your field options appears at the top of the page.
2. Drag a Section field to your Leads page layout.
3. In the pop-up window, enter section name *Pardot*.
4. For the number of columns, select **2 (Double)**.
5. Select the option for showing the section heading, and then click **OK**.
6. Return to the Fields section of the drag-and-drop editor and scroll right to locate the Pardot custom fields.
7. Drag all the Pardot fields into your new section.
8. Add another section using the drag-and-drop editor, but for the number of columns, select **1 (Single)**.
9. Select the option for showing the section heading, and then click **OK**.
10. Select **Visualforce Pages tab** and drag **Pardot Lead Activities** and **Pardot Lead List Membership** into your new section.

Set Up Salesforce to Add Campaign Prospects to Pardot

Set up Salesforce to quickly get prospects from your Salesforce campaigns into Pardot.

1. From the object management settings for campaigns in Salesforce Setup, go to Page Layouts.
2. Edit the layout, and select **Buttons**.
3. Drag the **Add to Pardot List** button to your row of custom buttons at the top of the Campaign view.
4. Save the layout.

Set Up Salesforce for Adding Leads and Campaigns to Pardot

Easily add buttons in Salesforce that make it easy to add leads and campaigns to Pardot, as well as send Pardot-tracked email from Salesforce.

If you want to add Salesforce leads and campaigns to Pardot, set up and use the **Send to Pardot** button. If email address associated with the Salesforce records:

- Don't yet exist in Pardot, the Send to Pardot feature creates new records for you in Pardot.
- Already exist in Pardot, no harm done—you won't get duplicate records in Pardot.

If you want to send Pardot-tracked email from Salesforce set up and use the **Send Pardot Email** button. You can send free-form tracked email, or use a marketing approved Pardot email template to send email to a lead or contact.

1. Log in to Salesforce as an administrator.
2. From the object management settings for leads, go to Page Layouts.
A drag-and-drop box including your field options appears at the top of the page.
3. In the Lead Layout box, select **Buttons**.
4. Select the **Send to Pardot** button and drag it into the Lead Detail section.
5. Select the **Send Pardot Email** button and drag it into the Lead Detail section.
6. Save the layout.
7. Repeat Steps 2 through 6 for Contacts.

Assign Your Salesforce Username to the Connector

Make sure that any actions you take with the connector are associated with you.

1. In Pardot, hover over **Admin**, then click **User Management > Users**.
2. In the row for your user profile, click , then **Edit**.
3. Scroll to the bottom of the Edit User box.
4. Select your Salesforce username from the drop-down menu.
5. Click **Save user**.
6. When you're in your Pardot user profile, you'll see your Salesforce username in the **CRM Username** field. Click **Verify**, and enter your Salesforce password.

Set Up Single Sign-On for Salesforce and Pardot

Avoid having to sign on to your two separate Salesforce and Pardot systems.

1. Log in to Pardot.
2. Hover over your email address, and then click **My Settings**.
3. Verify that your Salesforce username is correct. If it's correct, click **Verify**. If you need to change or add it, click **Edit My User Information** to change or add it.
4. When prompted, enter your Salesforce password, and then click **Verify**.
You'll receive a message letting you know whether the validation was successful.
5. If the validation was successful, log in to Salesforce and select the Pardot tab.
You should be able to see the contents of the tab without having to log in to Pardot separately.

Send Emails from Salesforce

Send emails from any user field, including support contacts, account managers, or anyone who is attached to a Pardot prospect.

Setting up your users and the necessary custom fields in Pardot lets you take advantage of this feature, and send emails to prospects that could appear to come from any user in Salesforce.

In	Do this
Salesforce	<ol style="list-style-type: none"> 1. Create the field you'd like to use to contain your CRM User Value, e.g. Relationship Manager, on the lead or contact record in Salesforce. This field should be the type "Lookup Field." If you already have the field created, make sure that it's a "Lookup Field" and that it's successfully populated. 2. Populate the lookup field with the user.
Pardot	<ol style="list-style-type: none"> 1. Create matching user seats for any Salesforce users. 2. On the user record, map the Pardot user seat to the Salesforce user. This lets Pardot to infer information about the user for variable tags when sending the email. 3. Create a custom field in Pardot with the designated type "CRM User" to hold the field values on the prospect record. This field is a read-only field in Pardot. 4. Map the custom field to the corresponding salesforce.com field.

About Email Address Updates Between Salesforce and Pardot

Learn how email address updates for your Salesforce contacts and leads automatically sync to your corresponding prospects in Pardot.

When you update email addresses either manually or with Data.com for your Salesforce contacts and leads, the following sync cycle updates the email addresses for corresponding Pardot prospects. Also, if you merge Salesforce contacts or leads and the email addresses for your primary records differ from the corresponding Pardot prospects, the following sync cycle updates email addresses for your prospects.

What Syncs when Email Addresses are Missing in Salesforce or Pardot

If you have Salesforce contacts or leads that don't include email addresses, but then subsequently add them, the sync cycle will not create new prospects in Pardot. If, however, prospects with matching email addresses already exists in Pardot, the sync cycle will update email addresses for the matching Salesforce leads or contacts.

Understand Sync Options for Pardot Accounts and Salesforce Person Accounts

Easily sync leads between the two systems after you assign your Pardot prospects to users.

Consider these options before you sync Pardot accounts and Salesforce person accounts.

If you want Pardot to

Create leads in Salesforce and sync with person accounts

By default, the connector creates Salesforce records as leads. But when leads are converted to person accounts, Pardot is unable to recognize person accounts. Pardot can't sync with person accounts. Instead, Pardot recreates leads to sync with.

If you use person accounts in Salesforce, you'll want to change this default behavior. By enabling person account syncing with lead creation, Pardot still creates records in Salesforce as leads, but when the leads are converted into person accounts, Pardot syncs with the person account and no additional Salesforce leads will be created for that prospect.

With this syncing, a Salesforce person account will sync to a Pardot prospect record that is associated with an Account in Pardot, which will not merge the two records into one view as in Salesforce. The field mapping will remain the same—contact fields will map to prospect fields and salesforce.com account level fields will map to Pardot account fields. This means that the Account Owner of a person account will sync to the Assigned User field on the account level in Pardot.

Create and sync person accounts only

Assigned prospects that have updated default field values (including the assigned owner) in Salesforce sync roughly every ten minutes, pushing the updates back to the Pardot record (because Salesforce wins in the event of a conflict in data). Updates to custom fields also sync with Salesforce, pushing those back to the Pardot record unless the option to have the Pardot value override the Salesforce value is enabled for that custom field.

Unassigned prospects in Pardot that have activities or updated records also sync if records in Salesforce use the same email address. Keep in mind that assigned prospects take higher priority for syncing than those that are unassigned in Pardot. If there are no matching email addresses in Salesforce, the prospect in Pardot will not sync until it's assigned to a user. This means that the connector will not create new records in Salesforce until the prospect is assigned in Pardot.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Sync Leads between Pardot and Salesforce

Easily sync leads between the two systems after you assign your Pardot prospects to users.

If you already have leads in Salesforce, the connector will sync those leads to Pardot, merging the Pardot prospects and Salesforce leads between the two systems. If data in common fields between Salesforce and Pardot conflicts, including lead owner, the data from the Salesforce fields always wins. You can take advantage of this functionality when you set up custom fields in Pardot. You can also set up Pardot to send emails to prospects that appear to come from any user in Salesforce.

Sync Method	Do this
Manual	In Pardot, when you click the link Synchronize with CRM , prospects in Pardot and leads in Salesforce sync instantly, merging the data from Pardot with that from Salesforce.
Automatic	Assigned prospects that have updated default field values (including the assigned owner) in Salesforce sync roughly every ten minutes, pushing the updates back to the Pardot record (because Salesforce wins in the event of a conflict in data). Updates to custom fields also sync with Salesforce, pushing those back to the Pardot record unless the option to have the Pardot value override the Salesforce value is enabled for that custom field. Unassigned prospects in Pardot that have activities or updated records also sync if records in Salesforce use the same email address. Keep in mind that assigned prospects take higher priority for syncing than those that are unassigned in Pardot. If there are no matching email addresses in Salesforce, the prospect in Pardot will not sync until it's assigned to a user. This means that the connector will not create new records in Salesforce until the prospect is assigned in Pardot.

Tracking Prospects as Salesforce Contacts

Automatically create contacts in Salesforce from your Pardot prospects.

By default, the Salesforce connector creates Salesforce leads from your prospects in Pardot. If you don't want to track your prospects as leads in Salesforce, you can have a Pardot Services member adjust the default setting so that Pardot creates contacts in Salesforce instead of leads.

If this feature is enabled on your account, Pardot will look first at your Salesforce leads to see whether there's an existing lead record with the same email address with which Pardot can sync. If there's no existing lead record, Pardot looks for an existing contact record with the same email address. If no Salesforce lead or contact exists with the same email address, Pardot will create a new Salesforce contact record.

Tracking the Products Your Customers Buy

What Are Assets?

While products represent the items that your company sells, assets represent the specific products your customers have purchased. Assets have a serial number, date of purchase, and other information related to an individual sale. Depending on how your organization uses assets, they can represent a competitor product that your customer has or versions of your products.

Use assets to store specific information about the products your customers have. You can view assets on the Assets tab. Depending on your page layouts, you also can view asset related lists on your account, contact, and product page layouts.

You can introduce hierarchy to assets in your org to represent more complex products. An asset can have up to 2,000 child assets, and a hierarchy of assets can have up to 50 levels. Define relationships between assets using the `Parent Asset` field on assets.

If your admin has set up entitlements, your customers may be eligible for support based on an asset they've purchased.

[Viewing Asset Lists](#)

Getting Started with Assets

If your organization has enabled products, assets are automatically enabled for your organization. However, admins still need to customize their org before users can begin using assets.

To implement assets for your organization:

- Add the Assets tab to your home page.

Note: By default, the Assets tab is hidden in organizations created before Spring '15. You can make the Assets tab visible to your users by changing the user profiles.

- Add the Assets related list to account, contact, and product page layouts. Users can create new assets from these related lists.
- If you want to be able to make one asset a child of another asset, add the `Parent Asset` field and Child Assets related list to asset page layouts. If you'd like to give users more context, you can also add the read-only `Root Asset` field, which represents the top-level asset in an asset hierarchy.
- Add the Cases related list to the appropriate product and asset page layouts.
- Add the `Asset` field to your case page layouts. Consider changing the field-level security for the `Asset` field so that it displays or is required if necessary for your business.
- By default, your users have "Read," "Create," "Edit," and "Delete" permissions on assets. If necessary, revise these permissions for your users. Without the "Read" permission on assets, users will not see any assets or asset related lists in Salesforce.

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- Optionally, customize asset fields and page layouts from Setup by entering *Assets* in the **Quick Find** box, then selecting **Assets**.

SEE ALSO:

[What Are Assets?](#)

Displaying the Assets Tab

The Assets tab is where you can view and work with assets. The Asset tab is visible in organizations created after Spring '15.

By default, the Asset tab is hidden for organizations created before Spring '15, so it doesn't appear in the All Tabs page. Update the user profile to change the tab visibility.

- From Setup, click **Administer | Manage Users | Profiles**.
- Click **Edit** next to the user profile that you want to update.
- In the Tab Settings list, change the setting for Assets to *Default On*.
- Click **Save**.

Now users with the updated profile can see the Asset tab in the All Tabs page and can add the Assets tab to their home pages.

Viewing Asset Lists

You can display a list of assets by opening the Assets tab. You also can display a list of assets by going to the Products tab and clicking a view from the Asset Views section.

To show a filtered list of items, select a predefined list from the View drop-down list, or click **Create New View** to define your own Custom view. To edit or delete any view you created, select it from the View drop-down list and click **Edit**.

- Click an asset name to view the detail. Click **Edit** or **Del** to [edit or delete the asset](#). For information on deleting assets, see [Deleting Assets](#) on page 1160.
- If Chatter is enabled, click **+** or **x** to follow or stop following an asset in your Chatter feed.

Displaying and Editing Assets

You can display an asset from the Products tab or a related account or contact.

Displaying Assets

Once you have located an asset from a related list, or the products home or list pages, click the name to display detailed information. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

Viewing Asset Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the asset.

Editing Assets

- Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.
- To display the page in edit mode, click **Edit**, make your changes, and click **Save**.

Asset Related Lists

Below the asset detail are related lists that include information about associated cases, entitlements, activities, or notes and attachments. The related lists you see are determined by your personal customization and any customization your administrator has made to page layouts. Click on individual items to display additional information about them. Click **more** at the bottom of the page or **View More** below a related list to display more items.

 **Note:** Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

Printing Assets

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

To return to the last list page you viewed, click **Back to list** at the top of the asset detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

 **Note:** Users can view an asset if they can view the account or contact listed on the asset. However, sharing settings may prevent users from viewing the account associated with the contact on the asset.

USER PERMISSIONS

To view assets:

- "Read" on assets

To change assets:

- "Edit" on assets

Creating Assets

1. Click **New** on the Assets home page or on the Assets related list of an account, contact, or product. This action automatically inserts the account name, contact name, or product name, depending on the record you selected when you clicked **New**.
2. To associate the asset with a product, enter the exact product name. If the product name is unique, Salesforce automatically inserts this name in the `Asset Name` field.

If you do not know the name of the product:

- a. Click the `Product` lookup icon if the asset is based on a product.
- b. Enter a search filter to find a current product, and click **Go!**
- c. Select the appropriate product. Salesforce automatically inserts the selected product name in the `Asset Name` field.

3. Enter a name for the asset.

4. Choose the account or contact for the customer who has purchased the asset.

If necessary, you can choose both an account and a contact that are not related. The asset displays on the contact selected on the asset as well as the account selected on the asset. However, it doesn't display on the account of the contact. If you only choose a contact, the asset displays on both the contact and the contact's account.

5. Optionally, select a parent asset. This field is useful if the asset you are creating is a component of another asset. For example, a "tent" asset could be the parent of a "rain fly" asset and a "tent pole set" asset. Creating hierarchical relationships between assets lets you track when an asset component was last replaced, link work order line items to child assets, and more.

Note:

- An asset can have up to 2,000 child assets, and a hierarchy of assets can have up to 50 levels.
- Depending on how assets are set up in your org, the `Parent Asset` field may need to be added to the asset page layout.

6. To create an asset for a competitor's product, check `Competitor Asset`.

7. Click **Save**.

You can enter person accounts in either the `Account` or `Contact` fields of an asset. The Assets related list on a person account includes all assets related to the person account, including those where the person account is in the `Contact` field.

Use the **Clone** button on an asset to quickly create a new asset with the same information as the selected asset. To clone an asset for your organization:

1. Click **Clone** on an existing asset.
2. Enter or change any information for the new asset.
3. Click **Save**.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

SEE ALSO:

[Asset Fields](#)

Deleting Assets

Since assets are related to account and contact records, you can delete them from those records or individually using the Products tab. Before you delete an asset, review the following scenarios:

- **Is the asset associated with a case?**

Assets associated with cases cannot be deleted. This includes deleting an account or contact record that is associated with an asset listed on a case.

- **Is the asset associated with a product?**

When an asset is based on a product, deleting the product does not delete the asset.

- **Is the asset associated with an account or contact?**

If you delete an account or contact, all associated assets are also deleted and moved to the Recycle Bin.

Note that if you delete an account with a related contact that is associated with an asset, all three records are deleted. To restore all three records, restore the account record.

- **Does the asset have a parent asset and child assets?**

If you delete an asset with both a parent asset and child assets, keep in mind that its parent and children will no longer be linked in an asset hierarchy.

 **Note:** You can delete an asset individually without deleting any related record. However, if you later delete the related record, you cannot recover the asset from the Recycle Bin.

To delete an asset:

1. Locate the asset on the Assets related list of an account or contact, or on an asset list view from the Products tab.
2. Click **Del** next to the asset you want to delete.

Asset Fields

An asset has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Asset Division	Division to which the asset belongs. This value is automatically inherited from the related account if any. Otherwise the value is inherited from the related contact. Available only in organizations that use divisions to segment their data.
Asset Name	Identifying name for the asset. If you select a product from the product lookup, this name is automatically populated with the product name.
Account	Account associated with the asset. Each asset must be associated with an account or contact.
Contact	Contact associated with the asset. Each asset must be associated with an account or contact. If you choose both an account and contact, they do not need to be related to each other. Contacts that are not associated with an account cannot be linked to assets.
Competitor Asset	Checkbox to indicate if the asset represents a competitor's product. Use assets to track what customers have your competitor's products using this checkbox.
Description	Text that distinguishes this asset from others.
Install Date	Date the customer installed the asset.
Owner	Individual user to which the asset is assigned. By default, the asset owner is the user who created the asset record.
Parent Asset	The asset's parent asset.
	 Tip: View, create, and delete an asset's child assets in the Child Assets related list.
Price	Amount the customer paid for the asset.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Product	The product on which the asset is based.
Purchase Date	Date the customer bought the asset.
Quantity	The number of assets purchased.
Root Asset	Read Only. The top-level asset in an asset hierarchy. Depending on where an asset lies in the hierarchy, its root might be the same as its parent.
Serial Number	The model number on the asset.
Status	State of the asset.
Usage End Date	The date the asset expires or the last date it is under warranty. Use this field to store whatever date is appropriate for your business.

Set Field History Tracking on Assets

Track changes to asset records by enabling field history tracking.

Use field history tracking to see information about:

- The date and time when the field was changed
- What changed
- Who made the change

To enable tracking on asset fields, from the object management settings for assets, go to the fields section and click **Set History Tracking**. See also [Tracking Field History](#) on page 990.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, Developer** Editions

Specify the Asset Owner for Assets

Asset records have an `Asset Owner` field, which is used to set hierarchy and sharing-based access controls. By default, the asset owner is the user who creates the asset record.

Beginning Spring '15, the `Asset Owner` field is used for access control when the Assets object's sharing setting is *Private*, *Public Read-Only*, or *Public Read/Write*. If the Asset object's sharing setting is *Controlled by Parent*, the asset owner field has no effect on access control. That's because the parent account's settings control access to the asset.

If you activated Salesforce before Spring '15, you can automatically update the asset owner field on asset records when you enable the Asset object sharing preference. The sharing preference sets the value of the asset owner field to equal either:

- The user who created the asset
- The user who is the owner of the parent account

By default, the `Asset Owner` field doesn't appear on the page layout. To add the `Asset Owner` field to the page layout, from the object management settings for assets, go to Page Layouts.

1. From Setup, enter *Asset Settings* in the *Quick Find* box, then select **Asset Settings**.
2. Select the option *Enable Asset Sharing*.
The options for setting the default `Asset Owner` field appear for newly created asset records.
3. Set the `Asset Owner` to be either:
 - Creator of the asset
 - Owner of the parent account
4. Save your changes.

To change the asset owner of an asset record, click the Assets tab and select an asset record. Or, open the asset record from the Assets Related List on the Accounts, Contacts, or Products tabs. In the Asset Detail section, click **Change** next to the `Asset Owner` field and select a different user.

- "Customize Application"

Searching for Assets

1. Enter your search terms in the sidebar or header search box.
2. Click **Search**.
3. From the search results, click an item to open it or click **Edit**, if available.

You can also create an asset list view from the Products tab to find assets that match specific criteria.

Enabling Sharing Rules for Assets

Sharing rules allow you to make automatic exceptions to your organization-wide sharing settings for defined sets of users. If your organization was created before Spring '15, you must enable the sharing preference so you can create and apply sharing rules on assets in your organization.

Previously, the asset object was a child object of the Accounts object, so the asset object's visibility was based on the parent object's settings. In Spring '15, the asset object was redesigned to be an individual standard object, not a child object. As a result, you can create sharing rules and apply them to asset records.

 **Note:** Sharing is enabled by default in organizations created after Spring '15, so you can skip these steps. For organizations created before Spring '15, sharing is disabled by default. If you want to use sharing rules, then you must enable the sharing preference.

1. From Setup, enter *Asset Settings* in the Quick Find box, then select **Asset Settings**.
2. Select the checkbox next to **Enable Asset Sharing**.
3. Click **Save**.

Now you can create and apply sharing rules on assets.

After you've enabled asset sharing, specify how the system should populate the `Owner` field.

- "Manage Sharing"

Sharing Assets

To view and manage sharing details for assets, click **Sharing** on the asset detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the asset.

Your administrator defines the default sharing model for your entire organization. You can change this model to extend sharing to more users than the default set by your administrator. However, you cannot change the sharing model to make it more restrictive than the default.

On the Sharing Detail page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
 -  **Note:** To share an asset with another user, that user must have access to the account associated with the asset and the "Read" permission on assets.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Creating Asset Sharing Rules

Asset sharing rules can be based on the record owner or on other criteria, including record type and certain field values.

You can define up to 300 asset sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
 2. From Setup, enter *Sharing Settings* in the `Quick Find` box, then select **Sharing Settings**.
 3. In the Asset Sharing Rules related list, click **New**.
 4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
 5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
 6. Select a rule type.
 7. Depending on the rule type you selected, do the following:
 - **Based on record owner**—In the `owned by members of` line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
 - **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.
-  **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.

To create sharing rules:

- "Manage Sharing"

8. In the `Share with` line, specify the users who should have access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
9. Select a setting for `Asset Access`.
10. In the remaining fields, select the access settings for the records associated with the shared assets.

Access Setting	Description
Controlled by Parent	Users can view, edit, or delete an asset based on whether he or she can perform that same action on the parent object associated with the Asset object. Controlled by Parent is the default access setting.
Private (available for associated contacts, opportunities, and cases only)	Users can't view or update records, unless access is granted outside of this sharing rule.
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

 **Note:** Asset Access is not available when the organization-wide default for assets is set to Controlled by Parent.

11. Click **Save**.

Tracking the People You Work With

Contacts

A contact is someone who's associated with one of your accounts or other records such as opportunities. Contacts are typically employees of the businesses that you sell to. Contact details provide the information that you need to work your deals effectively, such as name, mobile phone number, and job title.

[Considerations for Creating Contacts](#)

Before you create contacts, consider a few key points.

[Guidelines for Viewing and Managing Contacts](#)

Use the Contacts home page to view and manage your contacts.

[Contact Roles Concepts](#)

Define contact roles to specify the part that a contact or person account plays in an account, case, contract, or opportunity. When contact roles are defined, your sales team has more information for determining who to contact and when.

[Update Contacts Via Stay-in-Touch Requests](#)

To quickly and easily request updated contact information from a contact or person account, send a Stay-in-Touch request.

[Considerations for Changing the Account for Contacts](#)

Consider key points before changing the account that's associated with a contact.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

[Merge Duplicate Contacts](#)

If duplicate contacts are associated with the same account, you can merge them. That way, your data is streamlined and up-to-date.

[Display and View a Contact's Org Chart](#)

Find out who's who at your contacts' companies. Salesforce can display an org chart with contact hierarchy for each of your contacts. That way, you have even more information for planning your sales strategy.

[Considerations for Deleting Contacts](#)

Most contacts can be deleted with one click. However, before you delete a contact, be aware of who can delete contacts and what happens to records that are associated with deleted contacts.

SEE ALSO:

[What Is a Person Account?](#)[Social Accounts, Contacts, and Leads](#)[Manage Email and Templates in Lightning Experience](#)[Manage Work and View Past Activity in Lightning Experience](#)

Considerations for Creating Contacts

Before you create contacts, consider a few key points.

- You can create a contact from several places in Salesforce.
 - Create a contact on an account's detail page.
 - [Import a contact](#) from a mobile device using the Salesforce1 app.
 - Create a contact in the Contacts area.
-  **Note:** When using this method, if you don't add an account, the new contact is private.
- To create a contact that's automatically associated with an account, create the contact in the account's detail page.
 - If your Salesforce org uses record types, you're sometimes prompted to choose a `Record Type` when creating a contact. Different record types can have different fields and picklist values.
 - If your Salesforce org uses divisions, the division of a new contact is automatically set to the division of the related account.
 - Always associate a contact with an account, unless you have a specific reason not to. Contacts without accounts are hidden from all users except their owner and system administrators, which makes them hard to find and easy to forget.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

SEE ALSO:

[Contacts](#)[Create Records](#)[Import Contacts from Mobile Device Contact Lists into Salesforce](#)[Contact Fields](#)[Share Contacts](#)

Guidelines for Viewing and Managing Contacts

Use the Contacts home page to view and manage your contacts.

- Person accounts don't appear in the Recently Viewed list on the Contacts home page.
- If you're using Salesforce Classic, a printable view of the contacts list is available. You can save the printable view as a PDF.
- When you select a person account from a contact list view, the corresponding person account appears on the Accounts page.
- To view a filtered list of contacts, select a predefined view from the drop-down list. Admins of Professional, Enterprise, Unlimited, Performance, and Developer Edition orgs can grant access to contacts beyond what the sharing model allows. See [Share Contacts](#).
If you're using Salesforce Classic:
 - To define your own custom view, click **Create New View**.
 - To edit or delete a view that you created, select it from the **View** drop-down list, and then click **Edit**.
- To make person accounts easy to find, create a custom list view, adding the **Is Person Account** icon as a column.
- If you're using Salesforce Classic, to [add contacts to a campaign](#), select the checkbox next to one or more contacts, and then click **Add to Campaign**. To select all displayed records, select the checkbox in the column header.

Contact Roles Concepts

Define contact roles to specify the part that a contact or person account plays in an account, case, contract, or opportunity. When contact roles are defined, your sales team has more information for determining who to contact and when.

Here's an example of how contact roles work. At AW Computing, Mary Smith evaluates all proposals and then forwards them to Tom Jones for a final decision. In the opportunity record for AW Computing, you designate Mary Smith as the Evaluator and Tom Jones as the Decision Maker. Now your sales team knows who to contact first!

When you add contact roles to a business or person account, case, contract, or opportunity, the Contact Roles related list includes the roles for each contact or person account. When you add contact roles to a person account, the Opportunity Contact Roles related list includes opportunities that have the person account listed in the **Account Name** field.

A single contact or person account can have a different contact role on different records.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To view contacts:

- "Read" on contacts

To create contacts:

- "Create" on contacts

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

User permissions and sharing access are required to view the contact information for any person who's listed in the appropriate Contact Roles related lists.

SEE ALSO:

[Add and Manage Contact Roles](#)

Update Contacts Via Stay-in-Touch Requests

To quickly and easily request updated contact information from a contact or person account, send a Stay-in-Touch request.

 **Note:** Stay-in-Touch Requests is scheduled for retirement in all Salesforce orgs as of Summer '17. For more information, see, [Stay-in-Touch Request Retirement](#).

If the contact or person account has a valid email address, you can request updates from:

- Contacts that you own
 - Contacts that are associated with accounts that you own
 - Contacts that you can edit because of a sharing rule or manual record sharing
 - Person accounts that you own
1. On the detail page of a contact or person account, click **Request Update**.
An outgoing email is created according to your personal Stay-in-Touch settings.
 2. Edit the details of the email.
 3. Click **Send**. You can send individual Stay-in-Touch requests regardless of the recipient's `Email Opt Out` setting.

The recipient receives the email and clicks a link to provide updates or to confirm that no changes are necessary. You receive an email notification.

4. To update, review, and accept or reject the new information, click the link in the email.

Display and View a Contact's Org Chart

Find out who's who at your contacts' companies. Salesforce can display an org chart with contact hierarchy for each of your contacts. That way, you have even more information for planning your sales strategy.

1. To display a contact's org chart, enter the name of the contact's manager in the `Reports To` field in the contact's record.
2. Save your changes.
3. To view the contact's org chart, click **[View Org Chart]** in the contact's record.

 **Note:** To maintain a complete org chart, make sure that every contact in an account contains another contact in the `Reports To` field. (The contact at the top of the org chart is an exception.) If your contact doesn't report to anyone, the org chart shows only a single person, regardless of how many other contacts are assigned to the same account.

[Update Contacts Via Stay-in-Touch Requests](#)

Considerations for Deleting Contacts

Most contacts can be deleted with one click. However, before you delete a contact, be aware of who can delete contacts and what happens to records that are associated with deleted contacts.

 **Tip:** We recommend deactivating a contact unless it's necessary to delete it. That way you retain an accurate historical record.

- You can delete a contact if you're an administrator, the contact owner, or a user above the contact owner in the organization role hierarchy, *and* if you have the "Delete" permission on the Contact object. If you meet these requirements, you'll see **Delete** as an option on the contact's detail page and on its row on the contact list page in.
- If you delete a contact, these associated records are also deleted. You don't need the "Delete" permission on the associated records.
 - Assets (without cases)
 - Attachments
 - Campaign history
 - Events
 - Notes
 - Tasks

Accounts, entitlements, and opportunities that are associated with the contact aren't deleted.

- The deleted contact is moved to the Recycle Bin. If you undelete the contact, any associated records are restored, including any inactive Self-Service usernames.
- If you delete or remove an activity's primary contact, another contact becomes the primary contact in its place. You can edit the activity to manually select another primary contact.
- You can't delete contacts that have these records associated with them.
 - Assets (with cases)
 - Cases

[Delete Records](#)

Share Contacts

Share contacts with other users to make it easier to collaborate within your sales team.

To share contact records with other users, those users must have Read permission for Contacts. When you share a contact record that has an associated account, the account is also shared only if you have permission to share account records.

1. On a contact's detail page, click **Sharing**.

The sharing detail page lists the users, groups, roles, and territories that have sharing access to the contact.

2. On the sharing detail page, do any of the following.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views.
- To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Expand List** to view all users that have access to the record.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

3. Save your changes.

Considerations for Sharing and Accessing Contacts

Here's some things to know about sharing and accessing contact records.

- Contact sharing isn't available for organizations that have territory management or person accounts.
- You can't restrict access to contacts beyond your organization's default access levels.
- You need at least read access to the contacts and leads that you invite to an event. You need at least "Add Events" on a resource to invite it to an event.
- A contact that isn't linked to an account is always private, regardless of your organization's sharing model. Only the owner of the contact and administrators can view it. Sharing rules and workflow rules don't apply to private contacts. If your organization uses divisions, private contacts always belong to the global division.
- If a recipient doesn't have access to the account, you can't share the contact unless you also have permission to share the account.
- If your organization-wide default for contacts is set to Controlled by Parent, the `Contact Access` options aren't available when you share related records such as accounts. Instead, all access to contacts is determined by the user's access to the contact's account.
- If your organization-wide default for contacts is Controlled by Parent and your organization-wide default for accounts is Private, you can't view contacts for accounts that you don't own, even if you have the View All permission on the account object. However, if you own a contact on an account, you can view other contacts on the same account. (Access to a parent account gives you access to the associated child records.)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Contact Fields

Contacts have the following fields, listed in alphabetical order. Availability of fields depends on how your admin set up Salesforce.

Field	Description
Account Name	The account that the contact is linked to. Enter the account name, select the account from a list, or create an account. Private contacts don't have an account.
Allow Customer Portal Self-Registration	If you allow access to a customer portal, when selected, allows contacts to self-register for it.
Assistant	The contact's assistant. Maximum 40 characters.
Asst. Phone	The assistant's phone number. Maximum 40 characters.
Birthdate	The contact's birthday. Click the field, and then choose a date from the calendar.
Contact Currency	The default currency for all currency amount fields in the contact. Amounts are displayed in the contact currency and converted to the user's personal currency. Available when multiple currencies are used.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Field	Description
Contact Division	The division that the contact belongs to. This value is inherited from the related account. Available when divisions are used to segment data.
Contact Owner	The contact's assigned owner. Not available in Personal Edition.
Contact Record Type	The name of the field that determines what picklist values are available for the record. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.
Created By	The user who created the contact. Includes creation date and time. Read only.
Custom Links	A list of custom links for contacts, as set up by your administrator.
Department	The associated business or organizational unit. Maximum 80 characters.
Description	The contact's description. Maximum 32 KB of data. The first 255 characters appear in reports.
Email	The contact's email address. A valid email address is required. Maximum 80 characters. Click the email address in this field to send an email using your personal email application. This action isn't logged as an activity on the contact record. If the Gmail Buttons and Links feature is enabled, click the Gmail link next to the field to send an email from your Gmail account.
Fax	The contact's fax number. Maximum 40 characters.
First Name	The contact's first name, as displayed on the contact edit page. Maximum 40 characters.
First Name (Local)	The contact's first name, translated into the local language.
Home Phone	The contact's home phone number. Maximum 40 characters.
Last Modified By	The user who last changed the contact fields, including modification date and time. This field doesn't track changes that were made to any of the related list items on the contact. Read only.
Last Name	The contact's last name as displayed on the contact edit page. Maximum 80 characters.
Last Name (Local)	The contact's last name, translated into the local language.
Last Stay-in-Touch Request Date	The date when the most recent Stay-in-Touch request was sent.
Last Stay-in-Touch Save Date	The date when the most recent Stay-in-Touch request was returned and merged.

Field	Description
Lead Source	The record source: for example, Advertisement, Partner, or Web. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters for each picklist value.
Mailing City	The city in the mailing address. Maximum 40 characters.
Mailing Country	The country in the mailing address. Maximum 80 characters.
Mailing State/Province	The state or province in the mailing address. Maximum 80 characters.
Mailing Street	The street in the mailing address. Maximum 255 characters.
Mailing Zip/Postal Code	The zip or postal code in the mailing address. Maximum 20 characters.
Middle Name	The contact's middle name, as displayed on the contact edit page. Maximum 40 characters. To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Middle Names for Person Names .
Middle Name (Local)	The contact's middle name, translated into the local language. To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Middle Names for Person Names .
Mobile	The contact's mobile phone number. Maximum 40 characters.
Name	The contact's combined first name, middle name, last name, and suffix, as displayed on the contact detail page.
Other City	The city in another address for the contact. Maximum 40 characters.
Other Country	The country in another address for the contact. The entry is selected from a picklist of standard values or entered as text. If the field is a text field, maximum 80 characters.
Other State/Province	The state or province in another address for the contact. The entry is selected from a picklist of standard values or entered as text. If the field is a text field, maximum 80 characters.
Other Street	The street address in another address for the contact. Maximum 255 characters.
Other Zip/Postal Code	The zip or postal code in another address for the contact. Maximum 20 characters.
Other Phone	Another phone number for the contact. Maximum 40 characters.
Phone	The contact's primary phone number. Maximum 40 characters.

Field	Description
Reports To	The name of the contact's manager. Enter a contact name, or select a contact from the list.
Salutation	The title for addressing the contact, for example, Mr., Ms., or Dr. The entry is selected from a picklist of available values, which the administrator sets. Maximum 40 characters.
Suffix	The suffix in the contact's name, as displayed on the contact edit page. Maximum 40 characters. To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select <code>Enable Middle Names for Person Names</code> .
Title	The contact's position within the organization. Maximum 80 characters.
Username	For Self-Service contacts only. The <code>Username</code> defaults to the <code>Email</code> . Contacts enter their usernames when logging in to the Self-Service portal.  Note: Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

Contact Role Fields

Contact Roles define the role that a contact or person account plays in an account, case, contract, or opportunity. A contact role has the following fields. Lightning Experience also includes an Opportunities field.

Field	Description
Contact	The name of the contact or person account. Select an existing contact or create a new one.
Primary	When selected, identifies the person as the primary contact for the record. The <code>Primary</code> option isn't available for cases. Instead, the contact listed in the <code>Contact Name</code> field on the case record is automatically the primary contact.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Field	Description
Role	The role of the contact for the record. Your administrator can customize the selections for this picklist.

Add and Manage Contact Roles

Specify the part that each contact or person account plays in your business process.

[Add and Manage Contact Roles in Lightning Experience](#)

To specify the part that each contact plays in your business process, add contact roles to opportunities and person accounts.

[Add and Manage Contact Roles in Salesforce Classic](#)

To specify the part that each contact plays in your business process, add contact roles to accounts, cases, contracts, and opportunities.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Add and Manage Contact Roles in Lightning Experience

To specify the part that each contact plays in your business process, add contact roles to opportunities and person accounts.

 **Note:** Adding person accounts to contact roles on accounts is available but not recommended. Instead, use the Partners related list to associate person accounts with other accounts.

1. Click **Add Contact Role** in the Contact Roles related list of a record.
2. Click the contact field to select a listed contact or person account. Optionally click **New Contact** to create a new contact.

When you click the contact field, up to 50 contacts that are associated with the record's account are displayed.

3. Select a role for the contact. If you don't select a role, the contact is still added to the Contact Role related list and can be edited later.
4. Optionally, select `Primary` to set the contact or person account as the primary contact for the record.
5. Save your changes.
6. Keep the record's contact roles up-to-date by editing and deleting them as needed.

EDITIONS

Available in: Lightning Experience

Available in all editions

USER PERMISSIONS

To add or edit contact roles:

- "Edit" on the related object, such as accounts or opportunities

AND

"Read" on contacts

To view contact roles:

- "Read" on the related object, such as accounts or opportunities

Add and Manage Contact Roles in Salesforce Classic

To specify the part that each contact plays in your business process, add contact roles to accounts, cases, contracts, and opportunities.

 **Note:** Adding person accounts to contact roles on accounts is available but not recommended. Instead, use the Partners related list to associate person accounts to other accounts.

1. Click **New** in the Contact Roles related list of an account, case, contract, or opportunity. Up to 50 contacts that are associated with the record's account are displayed.
2. Use the lookup icon to select a contact or person account. Optionally, click **New** to create a contact.
3. Select a role for the contact.
4. Optionally, designate a primary contact for the record.
5. Save your changes.
6. Keep the record's contact roles up-to-date by editing and deleting them as needed.

 **Tip:** To create an opportunity related to a person account, click **New** in the Opportunity Contact Roles related list on a person account.

Contacts to Multiple Accounts

People often work with more than one company. A business owner might own more than one company or a consultant might work on behalf of multiple organizations. Relate a single contact to multiple accounts so you can easily track the relationships between people and businesses without creating duplicate records.

When you use Contacts to Multiple Accounts, each contact still needs to have a primary account (the account in the `Account Name` field). The contact and its primary account have a *direct* relationship. But you can add other accounts to the contact. These secondary account-contact relationships are *indirect*.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To add or edit contact roles:

- "Edit" on the related object, such as accounts, cases, contracts, or opportunities

AND

"Read" on contacts

To view contact roles:

- "Read" on accounts, cases, contracts, or opportunities

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

 **Example:** John Smith is president of Acme Corporations, and Acme is the account on his contact record. But John is also involved with the nonprofit media organization Greendot Media. By adding Greendot Media as a related account on John's contact record, you can track this other relationship. John is considered a *direct* contact to Acme because Acme is the account on his contact record. And he's considered an *indirect* contact to Greendot Media and any other accounts that he becomes related to. John also appears on the Related Contacts related list for Greendot Media and any other accounts that he's indirectly related to.

[Considerations for Relating a Contact to Multiple Accounts](#)

Create and Edit Relationships Between Contacts and Accounts

To easily track the relationships between people and the businesses they work with, relate a single contact record to multiple account records.

▶ [Watch a Demo](#) (2:12 minutes)

1. From an account record, use the Related Contacts related list to create or edit relationships between accounts and contacts. Create a relationship by clicking **Add Relationship**. Edit an existing relationship by clicking **Edit Rel** (in Salesforce Classic) or **Edit Relationship** (in Lightning Experience).
2. Fill in the account contact relationship information.
3. Save your changes.

To create and edit account and contact relationships from a contact record, use the Related Accounts related list.

SEE ALSO:

[Contacts to Multiple Accounts](#)

[Considerations for Relating a Contact to Multiple Accounts](#)

[Account Contact Relationship Fields](#)

Considerations for Relating a Contact to Multiple Accounts

Get familiar with potential gotchas before you relate a single contact to multiple accounts.

General

- Contacts can have relationships with business accounts, but not with person accounts.
- The account that's in the `Account Name` field on a contact record is the contact's *primary* account. The relationship between the contact and its primary account is a *direct* relationship. All other accounts that are related to the contact are *indirect* relationships.
- To remove a direct relationship between a contact and an account, change the contact's primary account or delete the contact.
- You can import account-contact relationships with the Data Loader, but not the Data Import Wizard.

Account Contact Relationships

- All direct contacts are automatically included in the account record's Related Contacts related list, so your admin may have removed the Contacts related list from your page layouts.
- When you have access to a particular account, the related contacts that you have Read access to appear in the Related Contacts related lists. When you have access to a particular contact, all related accounts appear in the Related Accounts related list, but you can open only the accounts you have Read access to.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, or delete relationships between account and contacts

- "Read" on accounts and "Edit" on contacts

To view relationships between account and contacts

- "Read" on accounts and contacts

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

- When creating indirect relationships between accounts and contacts, the contact must have a primary account—it can't be a private contact.
- In Lightning Experience, when you create a contact from the Account Contact Relationship detail and you give the new contact the same account as the record you're on, the account-contact relationship is created when you save the new contact. Ignore the error you see when you save the account-contact relationship.
- In Salesforce Classic, when you create a contact from the Account Contact Relationship detail, you can't give the contact a primary account. Because a contact must have a primary account before it can be related to other accounts, you can't save the relationship.
- If changing a contact's primary account triggers a workflow rule that changes the primary account to something else, the relationship between the contact and the account you had selected is saved as an indirect relationship. This is true *only* if your admin has configured the settings to save previous relationships,

Microsoft Integration

- When syncing contacts between Salesforce and Microsoft Outlook, only the primary account relationship is synced.
- If you remove the account name from a contact in Outlook, the contact will not sync to Salesforce successfully if the contact has relationships to other accounts in Salesforce.

Admin Settings

- When you try to delete an account that has direct contacts that are related to other accounts, what happens depends on what your admin specified in the account settings. You're either blocked from deleting the account or allowed to delete the account. If you're allowed to delete the account, all direct contacts will be automatically deleted, regardless of whether they have relationships to other accounts.
- When you change a contact's primary account, what happens to the previous account relationship depends on what your admin specified in the account settings. The relationship between the contact and previous primary account will be deleted or saved as an indirect relationship.
- Whether activities roll up to a contact's parent account depends on what your admin specified in the activity settings.

Account Contact Relationship Fields

Contacts to Multiple Accounts lets you associate a single contact to multiple accounts through the Account Contact Relationship object. Your page layout and field-level security settings determine which fields are visible and editable.

Field	Description
Account	The name of the company the contact is related to.
Active	Indicates whether the contact is actively involved with the company.
Contact	The name of the person that's related to the account.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Field	Description
Direct	Indicates whether the account associated with the contact is the contact's primary account. This read-only field is based on the <code>Account Name</code> field on the contact record. For example, on the Acme account record, the Related Contacts related list automatically includes all contacts that have Acme in the <code>Account Name</code> field and marks them as direct contacts.
End Date	The date a relationship between a contact and account ended. Use with the <code>Start Date</code> field to keep a history of the relationship.
Roles	The contact's participating role in the account; for example, Buyer, Decision Maker, or Evaluator. You can select multiple roles for a contact.
Start Date	The date a relationship between a contact and account began. Use with the <code>End Date</code> field to keep a history of the relationship.

Use Stay-in-Touch Responses to Update Contact Details

Use a contact's Stay-in-Touch email reply to update a contact record.

 **Note:** Stay-in-Touch Requests is scheduled for retirement in all Salesforce orgs as of Summer '17. For more information, see, [Stay-in-Touch Request Retirement](#).

1. From the Stay-in-Touch email response that you receive, click the **Update Now** link.
2. Review the new and original values.
3. Click **Accept Changes** to save the new data or **Reject Changes** to ignore the updates and retain the original values.

 **Note:** Changes to contact records that are made with the Stay-in-Touch tool don't trigger workflow rules.

SEE ALSO:

[Update Contacts Via Stay-in-Touch Requests](#)

[Edit Stay-in-Touch Settings](#)

[Use Mass Stay-in-Touch to Request Updated Contact Information from Multiple People](#)

EDITIONS

Available in: Salesforce Classic

Available in all editions

Use Mass Stay-in-Touch to Request Updated Contact Information from Multiple People

To request updated information from more than one contact or person account at a time, use the Mass Stay-in-Touch wizard.

 **Note:** Stay-in-Touch Requests is scheduled for retirement in all Salesforce orgs as of Summer '17. For more information, see, [Stay-in-Touch Request Retirement](#).

1. On the contacts home page, under Tools, click **Mass Stay-in-Touch**. If your Salesforce org uses person accounts, the link also appears on the accounts home page.
2. Select a list view of contacts and person accounts from whom you're requesting updated information. You can also edit list views and create list views from here.
3. Click **Go**.
4. Select the individuals to whom the request will be sent.
Only records with email addresses can be selected. Records that have the `Email Opt Out` option selected don't appear in the list view, because you can't send mass emails to them.
5. Click **Next**.
6. Review the email text. If needed, edit your Stay-in-Touch settings.
7. Click **Send**.

When recipients reply with their latest information, use the link in their reply to make updates to their contact record.

SEE ALSO:

- [Update Contacts Via Stay-in-Touch Requests](#)
- [Use Stay-in-Touch Responses to Update Contact Details](#)
- [Edit Stay-in-Touch Settings](#)

Considerations for Changing Accounts on Contacts That Are Enabled for Portals

Consider key points before you change the account on contacts that are enabled for portals.

- External users can access their own cases and opportunities from their previous accounts.
- You can transfer contacts that are enabled for a partner portal only to [accounts that are enabled for a partner portal](#).
- Contacts' portal roles are automatically updated to match the name of the account that they're transferred to (unless they're high-volume customer users, which don't have roles). For example, the portal role "Account A Customer User" becomes "Account B Customer User" (because a portal role's name includes the name of the account that it's associated with). Portal roles are unique to each account and are located under the account owner's role in your Salesforce org's [role hierarchy](#).
- When you transfer portal users between accounts, the portal users' roles are updated, so when you transfer a partner user to another account:
 - Opportunities on each account are recalculated through your Salesforce org's [forecast hierarchy](#).
 - Opportunities that the partner user owns remain in the previous account.

EDITIONS

Available in: Salesforce Classic

Available in all editions

USER PERMISSIONS

To send mass Stay-in-Touch updates:

- "Send Email"

AND

"Send Stay-in-Touch Requests"

- [Delegated partner user administrators](#) and [delegated customer user administrators](#) can update portal users on accounts that they're transferred to.

SEE ALSO:

[Enable the Customer Portal for Contacts and Person Accounts](#)

[Enable Self-Service for Contacts and Person Accounts](#)

Considerations for Merging Duplicate Contacts

Consider key points before you merge duplicate contacts.

- Some items related to the discarded duplicate contacts become related to the newly merged contact. Examples include campaign history, cases, case teams, attachments, notes, and opportunities. Chatter feeds from the discarded records are not kept.
- Some settings and related information are taken from the master record and are applied to the newly merged record. Examples include sharing settings, meeting invites, account divisions, the `Reports To` field value, and Read-only and hidden fields. (Administrators and users with the "Edit Read Only Fields" permission can manually select which read-only fields to retain.)
- The discarded duplicate contacts are moved to the Recycle Bin.
- On the newly merged contact, the `Created By` field takes the date from the oldest merged contact. The `Last Modified By` field uses the date the records were merged.
- If the duplicate contacts are members of different campaigns, the date in the `Member Status Updated` field is retained for each contact and associated with the newly merged contact.
- There can be only one active self-service user, so deactivate any additional Self-Service users before merging contacts. The merged contact adopts the active Self-Service username.

SEE ALSO:

[Merge Duplicate Contacts](#)

[Considerations for Merging Contacts That Are Associated with Portal Users](#)

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

Customer Portal is available in: **Enterprise, Performance, Unlimited, and Developer Editions**

Partner Portal is available in: **Enterprise, Performance, and Unlimited Editions**

Considerations for Merging Contacts That Are Associated with Portal Users

Consider key points before you merge contacts that are associated with portal users.

- You can merge a portal contact with another portal contact. For example, you can merge contacts that are enabled to use the following.
 - A partner portal *with* contacts that are enabled to use a customer portal or vice versa
 - A partner portal or customer portal with contacts that are *not* enabled to use a portal
- Before you merge contacts that include partner users *and* customer users, decide which type of portal user to retain. The user that you don't retain is [disabled](#). However, after the contacts are merged, you can enable the contact for access to the portal from which it was removed during the merge process.
- Portal users who are disabled during the merge process retain ownership of any records that they own. For example, if a portal user owns a case, and the portal user is disabled, he or she remains the owner of the case until the case is updated with a new owner.
- You can merge contacts that are associated with various accounts by [transferring the contacts that you want to merge into one account](#) and then [merging the contacts that are associated with the common account](#).

Import Contacts from Mobile Device Contact Lists into Salesforce

Sales reps can save time and eliminate typos by using the Salesforce1 app to import contacts from mobile device contact lists into Salesforce. This feature is available only in the Salesforce1 downloadable apps.

1. In Salesforce1, navigate to where you create contacts.
2. Tap **Import from Device** to open the device's contact list.
3. Select a contact.
4. To associate the contact with an account in Salesforce, go to the contact record in Salesforce and add an account.

When importing contacts from a mobile device, these fields are mapped from your device's contact to the Salesforce contact.

- Email
- Home Phone
- Mailing City
- Mailing Country
- Mailing Postal Code
- Mailing State
- Mailing Street
- Mobile
- Other Phone
- Phone

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

 **Note:** In some situations, mappings from the local device don't map as expected to the Salesforce1 contact record.

SEE ALSO:

[Considerations for Importing Contacts from a Mobile Device](#)

Considerations for Importing Contacts from a Mobile Device

When importing contacts into Salesforce from a mobile device's contact lists, there are a few things to be aware of.

- When importing contacts from an Android or iOS device using Salesforce1 into a Salesforce org that has State and Country picklist fields enabled, the `State` field isn't populated.
- If you have multiple mobile phone fields in your mobile device's contact, and the `Phone` field in Salesforce is empty:
 - The first mobile phone field maps to the `Phone` field in Salesforce.
 - The second mobile phone field maps to the `Mobile` field in Salesforce.
- When you select emails from the mobile device, Salesforce1 typically pulls the second email address location. If labels are created on the device, the integration tries to map from the local work email address to the standard contact email address in Salesforce.

Get High Quality Data When You Need It Right In Salesforce

High quality data is key to business success. When data quality is high, it means your records are complete and up-to-date; it means you have the right connections at the companies that interest you; and it means you have the information you need to close deals and expand your business. In short, high quality data lets you understand, adapt, focus, and execute with surgical precision. Data.com offers a suite of products to give your business the high quality data it needs when it needs it. That way, you spend less time entering and updating data and more time growing your business.

The free version of Data.com is available to all Salesforce organizations and includes the following functionality.

- For organizations with Professional Edition and above, administrators can use Duplicate Management tools to control whether and when users can create duplicate records inside Salesforce. Administrators can customize the logic that's used to identify duplicates and can create reports on the duplicates that they allow users to save.
- All users can search across the complete Data.com database of accounts and contacts. However, free version users can't see phone and email information for contacts, see account cards or D&B data on account records, add records to Salesforce, or clean records. To take full advantage of Data.com's data, purchase Data.com licenses and set up the feature.

The Data.com product suite includes Data.com Prospector, Data.com Clean.

 **Note:** For organizations with Performance Edition, users automatically get Data.com Corporate Prospector and Data.com Corporate Clean. For an additional cost, you can upgrade to Data.com Premium Prospector and Data.com Premium Clean.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Data.com Prospector license available in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Data.com Clean license available in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Data.com Social Key available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

[Data.com Prospector](#)

Use Data.com Prospector to search valuable company information from Dun & Bradstreet and millions of crowd-sourced contacts to find the records your business needs. Add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. It's a great way to get the data you need to plan your sales territories, segment campaigns, find new accounts to engage, and expand your sales network.

[Data.com Clean](#)

Data.com Clean provides a number of ways to keep your Salesforce CRM records up to date by leveraging company information from D&B and millions of crowd-sourced contacts. There are two versions of the Data.com Clean product: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records.

[Data.com Social Key](#)

Data.com Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to learn more about your contacts and leads in Salesforce or on social network sites. Your organization must have Data.com Clean enabled to use Social Key.

Data.com Prospector

Use Data.com Prospector to search valuable company information from Dun & Bradstreet and millions of crowd-sourced contacts to find the records your business needs. Add these records to Salesforce as new accounts, contacts, and leads, or export them to use in other apps. It's a great way to get the data you need to plan your sales territories, segment campaigns, find new accounts to engage, and expand your sales network.

All Salesforce users can search Data.com for accounts and contacts. Users with a Data.com Prospector license can:

- Add accounts and contacts to Salesforce, and add contacts as leads.
- Add contacts for an account directly from the account record.
- Export accounts and contacts from Data.com.
- Manually clean Salesforce account, contact, and lead records, regardless of whether they were added from Data.com.
- Get prospecting insights into accounts' business, financial, competitive, and industry details.
- Get company hierarchical views of parent-child relationships and account information, such as the annual revenue, ownership, and number of employees. (Available to Data.com Premium Prospector users as a beta feature.)

There are two versions of Data.com Prospector: Corporate Prospector and Premium Prospector. They differ based on the Dun & Bradstreet fields that are included when you add or manually clean account or lead records. Premium Prospector users also have access to the Company Hierarchy page.

Contact Manager (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in:
Professional, **Enterprise**, **Performance**, and **Unlimited** Editions

Considerations for Prospecting for Companies, Contacts, and Leads in Salesforce

There are several important limitations to note for users who are searching and adding records from Data.com.

- The subindustries under Government in the Data.com Industry Categories classification system are currently unavailable due to mapping limitations between the Data.com Industry Categories and the SIC system.
- By default, each user assigned a Data.com Prospector user license has a monthly record addition limit of 300. This number can be adjusted based on your agreement. Record additions expire at midnight on the last day of each month, as determined by your organization's default time zone.
- A single Data.com Prospector license is assigned every time you enable a user for Data.com Prospector.
- If your organization purchased only Data.com Prospector, only users with licenses can clean records.
- When adding records from Data.com, annual revenue is only available in US dollars. If `USDOLLAR` is not an active currency for your organization, records added from Data.com do not include annual revenue information.

Prospect for Companies in the Same Corporate Hierarchy (Beta)

Data.com Company Hierarchy uses Dun & Bradstreet company data in Data.com to display a hierarchical view of companies. It shows parent-child relationships and account information, such as the annual revenue, ownership, and number of employees.

Data.com Company Hierarchy uses Dun & Bradstreet data to create a hierarchical view of an account displaying its relationship with related companies. To add an account to your Salesforce organization, click the **Add Account** button next to the account.

Company Hierarchy is available as a standard feature for Data.com Premium Prospector customers. Company Hierarchy is built using Dun & Bradstreet company data. In addition to showing the relationships between corporate entities, you can see the associated annual revenue and number of employees at different entities in the hierarchy. Information from your Salesforce organization is also included to provide more context, such as whether an entity exists as an account record, along with the listed account owner. Using this information, sales reps can identify relevant prospective customers, and then add them as accounts to your Salesforce organization with the click of a button directly from the hierarchy view.

This release contains a beta version of Data.com Company Hierarchy that is production quality. You can provide feedback and suggestions for Company Hierarchy on the [IdeaExchange](#). For information on enabling this feature for your organization, contact Salesforce.

The Data.com Company Hierarchy shows you different company types and how they are related.

Company Type	Description
Global Headquarters	The highest organizational entity in a corporate hierarchical structure that oversees domestic or international companies and subsidiaries.

Company Type	Description
Domestic Headquarters	The highest level member in a corporate hierarchy within a single country. A DHQ typically reports to a GHQ.
Headquarters	A company that owns branches, divisions, or subsidiaries and has financial responsibility for the companies that report to it.
Branch	A secondary location of a headquarters.
Single Location	A company with no branches or subsidiaries.
Unmarketable	This company is unmarketable, and record details are intentionally hidden. You can't add this record from the hierarchy, but you can view or add active, linked accounts.

[View the Company Hierarchy for Accounts](#)

Data.com Company Hierarchy displays a hierarchical relationship of accounts with important account details. View parent-child relationships and account information, such as the annual revenue, ownership, and number of employees.

[Find New Accounts Using the Global Ultimate D-U-N-S Number](#)

If you use Data.com Premium Prospector, it's a cinch to find new companies to do business with that are in the company hierarchy of existing accounts. Just do a search by Global Ultimate D-U-N-S Number right from a D&B Company record. You'll be able to see other companies within the same corporate structure and add those companies to Salesforce as new accounts.

[Guidelines for Adding Accounts in the Same Company Hierarchy to Salesforce](#)

Data.com Company Hierarchy searches Data.com for Dun & Bradstreet company records and displays company linkages in a hierarchical view. From the Company Hierarchy, you can add account records to Salesforce. Here are some guidelines to follow when you add Data.com records to Salesforce from Company Hierarchy.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited Editions**

Find New Accounts Using the Global Ultimate D-U-N-S Number

If you use Data.com Premium Prospector, it's a cinch to find new companies to do business with that are in the company hierarchy of existing accounts. Just do a search by Global Ultimate D-U-N-S Number right from a D&B Company record. You'll be able to see other companies within the same corporate structure and add those companies to Salesforce as new accounts.

The Global Ultimate is the highest entity within an organization and is identified by a nine-digit Global Ultimate D-U-N-S Number. All companies that are part of the same corporate structure as the Global Ultimate are identified by the same Global Ultimate D-U-N-S Number.

 **Note:** Before you can search by Global Ultimate D-U-N-S Number, the `Search Global Ultimate D-U-N-S` button must be [added to the D&B Company page layout](#).

1. Go to the detail page of the D&B Company record you want to find accounts with the same Global Ultimate D-U-N-S Number for.
2. Click **Search Global Ultimate D-U-N-S**.
The Data.com tab opens and displays a list of accounts that match the Global Ultimate D-U-N-S Number of the D&B Company record.
3. If the results list is long, you can sort the results by any table heading. The **Location Type** heading, for example, sorts results by headquarters, single location, and branch.
4. If you don't see what you're looking for, use filters to narrow your results.
5. For more information about a particular account, such as its account site, click the account name to see its account card.
6. Add all accounts or a selection to Salesforce.
7. From the confirmation message, click **Go to Accounts** to view the list of new records on the Accounts home page.

Here are some things to keep in mind when searching by Global Ultimate D-U-N-S Number.

- Global Ultimate D-U-N-S Number search results *only* include accounts that are in Data.com, so you may not get *complete* Global Ultimate D-U-N-S results if some members of the corporate structure are not in Data.com.
- You can use filters to narrow down your Global Ultimate D-U-N-S Number search results.
- You can export records from your Global Ultimate D-U-N-S Number search results.
- You can't save the search.

- "Create" on accounts

Guidelines for Adding Accounts in the Same Company Hierarchy to Salesforce

Data.com Company Hierarchy searches Data.com for Dun & Bradstreet company records and displays company linkages in a hierarchical view. From the Company Hierarchy, you can add account records to Salesforce. Here are some guidelines to follow when you add Data.com records to Salesforce from Company Hierarchy.

- A green dot (●) appears in the search results next to records already in Salesforce. These records can't be added again unless they have first been deleted from Salesforce, or your organization allows duplicates.

 **Tip:** If a record is already in Salesforce, hover over the green dot and click the link to go directly to the record.

- You can add only one record at a time from Company Hierarchy.
- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. When a duplicate record is added, it isn't counted against your record addition balance.
- If you can't add a record to Salesforce because of errors, we'll notify you and provide the error details in a .csv file.

Guidelines for Prospecting for Companies, Contacts, and Leads in Salesforce

Check out some guidelines to follow when prospecting for new companies and contacts with Data.com Prospector.

- A green dot (●) appears in the search results next to records already in Salesforce. These records can't be added again unless they have first been deleted from Salesforce, or your organization allows duplicates.

 **Tip:** If a record is already in Salesforce, hover over the green dot and click the link to go directly to the record.

- A blue checkmark (✓) appears in search results next to records you've already purchased (added or exported) from Data.com. When you add Data.com contacts or accounts, each one counts against your record addition balance. If you add records you've already exported from Data.com, the added records don't count against your record addition balance.
- Regardless of your record addition limit or your record addition balance, you can't manually select more than 1,000 records at a time.
- Regardless of your record addition limit or your record addition balance, you can't add more than 100,000 records at a time.
- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. This includes records that were added from Data.com as both contacts and leads. When a duplicate record is added, it will *not* be counted against your record addition balance.
- If you can't add one or more records to Salesforce because of errors, we'll notify you and provide the error details in a .csv file.
- If your search produces a large number of results, you won't see any data past page 10. If this happens, you can refine your search to get the results you want. See [How can I see complete, relevant information for Data.com search results?](#)
- If you export Data.com contacts or accounts *instead of* adding them to Salesforce, each exported record counts against your record addition balance. If you export records you've already added to Salesforce or re-export records you previously exported, the exported records don't count against your record addition balance.
- If you export a group of Data.com contacts, you can still add those contacts back into Salesforce as contacts or leads without affecting your record addition balance.
- Regardless of your addition limit or the number of records you have left to add, you can't export more than 100,000 records at a time. Records will be exported in batches of 50,000. If two batches are needed, the records will be sent in a .zip file.

- If numeric values, such as phone numbers, are cut off in the .csv file, change the format of the field's column in the .csv file to *General* or *Text*, or open the file in a text editor such as WordPad.
- You can import a list of exported records back into Salesforce using Data Loader. Unless your Data.com preferences are set to allow duplicate records, the import process checks for duplicates using the Data.com ID number from the `Data.com Key` field.

These records won't be imported from Data Loader.

- Any record that has the same Data.com ID (from the `Data.com Key` field) as another record within the .csv file.
- Any record that has the same Data.com ID (from the `Data.com Key` field) as a record already in Salesforce.

Understand Data.com Searches

Learn how the Data.com search features work, what fields are searched, and how to refine your search results using filters and location criteria so you can easily find the records most valuable to your business.

Searching Data.com for CRM records is simple. Start your search by entering search criteria in the fields on the Data.com tab. You can also [use search modifiers to target and narrow your search results](#). Depending on your entries and selections, you may end up with a large list of accounts or contacts. To find out how many, check the results list's header or footer. Click the **Reset Search** link if you need to clear all your entries and selections. You'll see your search results until you start a new search or refresh your browser page.

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For example, if you want to find Sun Microsystems and you enter either *Sun Microsystems* or *sun.com* in the `Company or Website` field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems.

Also, account searches are based on both the `Account Name` field and the `Tradestyle` field. So, for example, if you are looking for United Parcel Services, you can search on its tradestyle, *UPS*, and still see *United Parcel Services, Inc.* in your search results.

Once you have a set of records, you can narrow your list by using filters if you need to. Just look for the filter categories at the left of the page, and select the checkboxes for the filters you need. Some searches generate filter options that are specific to your results. For example, if you want leads in `Healthcare, Pharmaceuticals & Biotech` industry—specifically `Doctors & Health Care Practitioners`—the list of filters in the `Title` category might include `Doctor, Chiropractor, Dentist, and Office Manager`. For searches that generate a large list of results for `Title, Company Name, and Website Domain Type` filters, we show the 25 filters with the most search results. To see a shorter list of filters, narrow your initial search.

Some filter categories are expanded automatically when you run a search, but you can click the links at the top of the `Filters` panel to expand or collapse them all. As you select filters, the search results list is updated automatically.

For example, if you search for contacts from your IBM account detail page, the Data.com tab will open and automatically enter IBM's URL, *www.ibm.com*, in the `Company or Website` field on the `Find Contacts` subtab. The search will generate a list of thousands of IBM contacts all over the world. That's probably more than you need, so you can either:

- Refine your initial search by selecting location criteria (such as *Australia* or *United States*) or industry options (like *Computers & Electronics* or *Financial Services*)
- Narrow your search results list by selecting filters such as *Human Resources, C-Level, or Program Manager* or
- Select *IBM* in the `Company Name` filter category.

By refining your search criteria and filtering your results, you can narrow your list from more than 30,000 contacts to the 25 or so you want to call or email.

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Understand Data.com Search Modifiers

When searching for Data.com accounts and contacts, you can use modifiers to target and narrow your search results. Here's how modifiers work, field by field.

Company or Website

- To search for or exclude multiple companies, separate them with commas: *,*. For example, *salesforce.com,Apple* returns results for both salesforce.com and Apple (for example, Apple Computer, Inc. and Apple Inc.), or either one, depending on Data.com data.
- To search for the exact name of a company, type the name within quotation marks: *" "*. For example, *"Apple, Inc."* returns only results with the exact company name Apple, Inc.
- To exclude a company from your results, before the company name, type a minus sign: *-*. For example, *-Oracle* returns a list of results that excludes Oracle. For company names with more than one word, after the minus sign, type the first part of the name. For example, *-Adobe* returns a list of results that excludes Adobe Systems.
- You can also use mixed search modifiers. For example, *salesforce, -Microsoft, "GE Healthcare"* returns all results including salesforce (for example, salesforce and salesforce.com, inc.); it excludes all results containing Microsoft; and it finds GE Healthcare but not GE Health Care.

Title

- To exclude a title, before the title, type a minus sign: *-*. For example: *-buyer*.
- To search for exact titles, type them within quotation marks: *" "*. For example: *"Managing Director"*.
- To search for multiple titles, separate them with commas: *,*. For example: *CEO,-Dr,"managing director"*.

Name or Email

- To search for results for an individual element in this field—just Name or just Email—type that element followed by a colon (*:*) and a space, then type the name, or email you're looking for. For example, *Name: Marc Benioff* returns results with only the name Marc Benioff. *Email: marcbenioff@salesforce.com* returns results with only the email address marcbenioff@salesforce.com.
- Modifiers will not work if you don't include *"name: "* or *"email: "*, and you can't mix and match these modifiers (for example, using *"name: "* and *"email: "* in the same search).
- To search for multiple names or emails, separate them with commas: *,*.
- To search for exact titles, names, or emails, type them within quotation marks: *" "*.
- To exclude a title, name, or email from your results, before the element, type a minus sign: *-*.

Location | City

- To search for multiple cities, separate them with commas: *,*. For example, *San Francisco, San Jose* returns results for both San Francisco and San Jose, or either one, depending on Data.com data.
- To search for exact cities, type them within quotation marks: *" "*. For example, *"San Francisco"*, won't return results for South San Francisco. Similarly, *"South San Francisco"* won't return any results for San Francisco.

Location | Postal/ZIP Code

- To search for multiple postal or ZIP codes, separate them with commas: *,*. For example, *94105, 94122* returns results for both 94105 and 94122, or either one, depending on Data.com data.
- To exclude a postal or ZIP code from your results, before the code, type a minus sign: *-*. For example, *-94122* returns a list of results that excludes 94122.

Location | Area Code

USER PERMISSIONS

To search Data.com for accounts:

- No permissions required

To search Data.com for contacts:

- No permissions required

- To search for multiple area codes, separate them with commas: ,. For example, *312, 708* returns results for both 312 and 708, or either one, depending on Data.com data.
- To exclude an area code from your results, before the area code , type a minus sign: -. For example, *-708* returns a list of results that excludes 708.

[Understand Data.com Searches](#)

How Is Industry Determined for Records in Data.com?

We use the primary SIC (Standard Industry Classification) code to determine the value of the `Industry` field on account cards and account records in Data.com. By using only the primary SIC code for this industry mapping, we're able to provide a more consistent and accurate value in the `Industry` field, which leads to more relevant search results, regardless of the industry classification system you use in your search query.

A limited number of Data.com accounts show `Data.com - Jigsaw` as the value of the `Source` field on their account card. These accounts do not have a value for the SIC code, and so their `Industry` value is determined using a different system. Contact Salesforce Customer Support for details.

 **Example:** You're searching Data.com for accounts with a SIC industry value of *Computer Peripheral Equipment*, which maps to `Electronics` in Data.com. Your Data.com search results will include all accounts with a value of `Electronics` in the `Industry` field. If you use the Data.com Industry Categories classification system and select the *Computers and Electronic* industry, which also maps to `Electronics`, your results will again include all accounts with a value of `Electronics` in the `Industry` field.

Data.com Industry Selector

When searching for accounts and contacts in Data.com, use the industry selector to add industries and subindustries to your search criteria.

Here's how it works.

EDITIONS

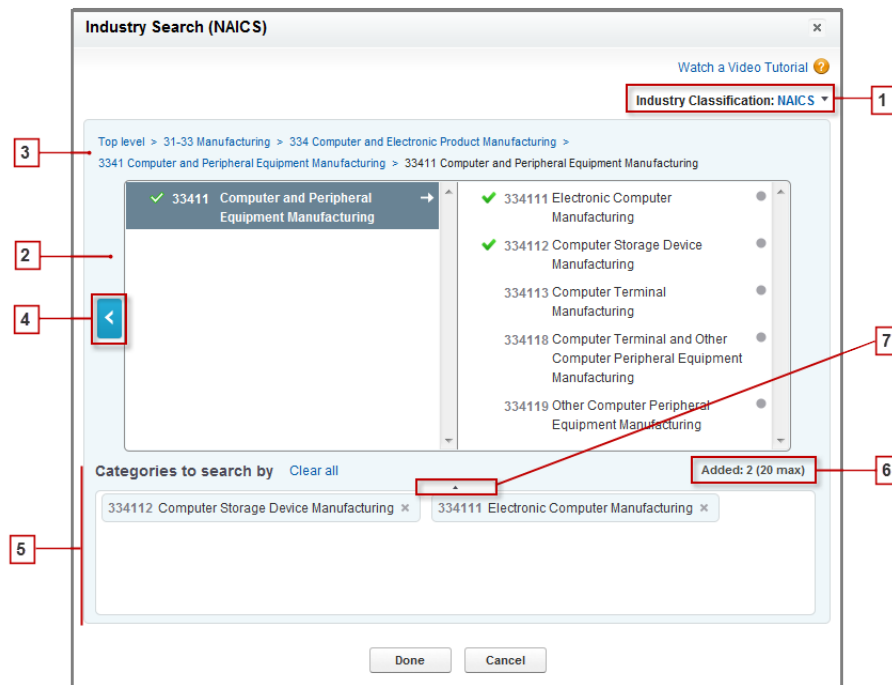

Available in: Salesforce Classic

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:
Contact Manager (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

1. Select the industry classification system your organization uses.
 - *NAICS* (North American Industry Classification System): Used by business and government to classify North American business establishments according to the type of economic activity. This system includes 20 industry sectors, each with multiple levels of subindustries. Industries and subindustries are identified by numeric code, up to six digits.
 - *SIC* (Standard Industry Classification): Used by the United States government to classify business establishments according to the type of economic activity. This system includes 10 industry sectors, each with multiple levels of subindustries. Industries and subindustries are identified by numeric code, up to four digits.
 - *Data.com Industry Categories*: The Data.com system of classifying business establishments by industry and subindustry.

You can select a different industry classification system at any time, but doing so will clear your selections.

2. Use the selection panels to explore industries and their subindustries and add them to your search. If an industry has a numeric classification code, you'll see it here. When you hover over an industry name, you'll get two options.
 - Click the industry name to view its subindustries, if any, in the right panel. If an industry has any available subindustries, you'll see an arrow → to the right of the industry name.
 - Click **Add** to add the industry (including all its subindustries) to the **Categories to search by** (Categories) box.

When you click an industry name in the right panel, it moves to the left panel and its subindustries appear in the right panel. You can continue moving through the industry levels in this manner, adding any industries and subindustries you want to search on as you go. A circle ● to the right of a subindustry name means you have reached the final level of subindustries. When you add an industry to your search criteria, it appears in the Categories box and all of its subindustries are automatically included. You'll also see a solid green checkmark ✓ next to its name. Only the industry, however, appears in the Categories box.

To remove industries from the Categories box, hover over the industry name and click the ✕. If you remove any subindustries from the selection panel, the industry is removed from the Categories box, and its remaining subindustries appear instead. (This

partial selection is denoted by an outlined green checkmark  next to the industry name.) Keep in mind that if you select some but not all subindustries within an industry, the number of selections in the Categories box increases.

3. Use the navigation links at the top of the page to keep track of where you are within the industry levels. Click any link to return to that industry level in the selection panels.
4. Click the **Back** arrow to move up one industry level.
5. All industries and subindustries that you add to your search appear in the **Categories to search by** box. You can remove individual selections by clicking the  next to the industry or subindustry name. Clicking **Clear all** removes *all* your selections.
6. There's a limit on how many industries and subindustries you can add to one search. If you exceed the limit, you'll need to remove selections in order to continue your search.
7. If the **Categories to search by** box includes a long list of industries, you may need to click the arrow to expand the box to view them all.

Here's an example of how the industry selector works. John is looking for companies that manufacture computers. He decides to use the North American Industry Classification System (NAICS) and begins by clicking the **Manufacturing** industry to reveal its subindustries, which include **Food Manufacturing**, **Machinery Manufacturing**, and lots more. He finds **Computer and Electronic Product Manufacturing**, and clicks it, moving it to the left panel to reveal its subindustries in the right panel. He continues to navigate deeper in to the industry levels in this manner, clicking through subindustries until he ultimately finds what he's looking for: **Computer and Peripheral Equipment Manufacturing**. John clicks **Add** to add two subindustries, **Electronic Computer Manufacturing** and **Computer Storage Device Manufacturing**, to the **Categories to search by** box. Those selections remain in the Categories box even if he navigates to other levels in the selection panel and adds other industries. When he is finished adding industries to the Categories box, he does a last review of his selections, then happily clicks **Done** to return to the Data.com tab to complete his search.

Why do some leads have a blank or zero (0) value in the Annual Revenue and Number of Employees fields after I use the Data.com Clean auto-fill feature?

When I use the Employees or Revenue filter to refine my account or contact search results, I get far fewer results than I expect. Why?

Why do some account and D&B Company records have identical D-U-N-S Numbers?

What is the difference between the Account Site and Location Type fields?

Why did I receive a message that says, You have limited access to data, so you can't completely clean this record?

Why did I receive a message that says, You can't clean this record because you have limited data access, as set by your administrator?

SEE ALSO:

[Understand Data.com Searches](#)

How can I see complete, relevant information for Data.com search results?

We've limited the number of details available for search results that exceed ten pages, to ensure data security.

To see complete, relevant account information in search results:

- Narrow your search using the search filters on the left of the page. Filtering out results that aren't the focus of your search gives fewer, more targeted results. For example, selecting Director-level accounts in a company's Sales department reduces the results from 50 pages to 4, listing only the accounts you're looking for.
- Sort your search results so that the target of your search appears in the first few pages. For example, sorting the Updated column lists the most recently updated accounts first.

Once you've identified the accounts you're looking for, purchase the accounts by adding or exporting them to Salesforce from Data.com. You see full details of the accounts and contacts you purchase and add to your organization.

Which Data.com user type am I?

It's easy to find out. From your personal settings, enter *Advanced User Details* in the Quick Find box, then select **Advanced User Details**. No results? Enter *Personal Information* in the Quick Find box, then select **Personal Information**. The `Data.com User Type` field identifies you as either a Data.com User or a Data.com List User. If the field is blank, you do not have a Data.com user license.

For a quick definition of your Data.com user type, just click the info icon () next to the field.

[Personalize Your Salesforce Experience](#)

How can I improve my Data.com search results?

It's easy. Just use [search modifiers](#). To see examples, just click the info icon () above each Data.com search field. It's also helpful to save searches you use frequently.

SEE ALSO:

[Understand Data.com Searches](#)

Why do I see companies I didn't search for in my Data.com search results?

For account searches, the Data.com search results you get are based on the company name, the website of the parent company, and the websites of the parent company's subsidiaries and branch locations, if any, so your results may include companies that you didn't actually search for. For example, if you want to find Sun Microsystems and you enter either *Sun Microsystems* or *sun.com* in the `Company` or `Website` field, the results will also include Oracle Corporation because Oracle is the parent company of Sun Microsystems..

SEE ALSO:

[Understand Data.com Searches](#)

[Using Data.com FAQ](#)

What's the limit of Data.com records I can add to Salesforce?

From Setup, enter `Users` in the `Quick Find` box, then select **Prospector Users**. In the Data.com Users section, find your name and see what your monthly limit is and how many records you've already added or exported during the month. Your administrator sets the monthly allowance, which expires at the end of each month, regardless of whether you've met your limit.

If you're a Data.com List User, your name also appears in the Data.com List User section of the page. After you've used your monthly record additions, you'll share record additions from a pool with all other List Users in your organization. Your organization's pool has a limit, so if one Data.com List User reaches the limit, other Data.com List Users can't add records. List pools expire one year after purchase.

If adding a set of records causes you to exceed your addition limit, you'll see a message that tells you how many additions you have remaining. If you still need to add more records, contact your administrator.

[Using Data.com FAQ](#)

When I add CRM records from Data.com, how do I know which field values have Data.com data?

Just check the help topics that define the fields on those records. All fields that are enabled for Data.com data are identified.

- [Account Fields](#)
- [Contact Fields](#)
- [Lead Fields](#)

SEE ALSO:

[Using Data.com FAQ](#)

What does the `Account Site` field value on an Account record mean?

`Headquarters/Parent` indicates that a company is a legal entity with other locations.

`Single location` indicates that a company is a headquarters with no other locations, and that it may or may not be a distinct legal entity.

`Branch` indicates that a company is not a distinct entity. Rather, a branch is a location of a headquarters or parent company.

SEE ALSO:

[What is the difference between the Account Site and Location Type fields?](#)

[Using Data.com FAQ](#)

Why does the `Ownership` field have a value of `Private` for companies I know are public?

Dun & Bradstreet (D&B), who provides this data, only tracks ownership information for headquarters or parent companies. If a publicly traded headquarters or parent company has any subsidiaries, such as branch locations, those subsidiaries show a value of `Private` unless they are traded independently. The value will also be `Private` if the ownership type is unknown.

SEE ALSO:

[What does the Account Site field value on an Account record mean?](#)

[Using Data.com FAQ](#)

I'm seeing a discrepancy between the numbers in the `Employees` and `Contacts` fields on an Account record. Why?

There are a number of possible reasons.

- The number of employees is only available on records that have a value of `Headquarters/Parent` in the `Account Site` field. This means that a branch location may show a value of zero in the `Employees` field but still have a number of contacts.
- The `Employees` field on Account records shows the total number of employees within a company, including all subsidiary and branch locations. The number of contacts, however, reflects only the contacts at that specific location. So a headquarters location that has 5,000 employees throughout its various locations may only have 3,000 contacts at the headquarters location.
- *Employee* totals come from Dun & Bradstreet (D&B) and usually *do not* include contract employees. *Contact* totals and related data come from the Data.com community and often *do* include contract employees as long as they have a valid company email address.

SEE ALSO:

[Using Data.com FAQ](#)

I use Data.com and I'm seeing a blank or zero (0) value in the Employee and Revenue fields. Why?

Dun & Bradstreet (D&B) collects revenue data for headquarters and single locations only, so records associated with branch locations won't have a value for the `Annual Revenue` field on account and leads records or the `Annual Sales Volume` field on D&B Company records.

Similarly, D&B doesn't always have confirmed employee counts for branches and single locations, so there might not be a value for the `Number of Employees` field on lead records, the `Employee` field on account records, or the `Number of Employee-Total` field on D&B Company records.

SEE ALSO:

[Using Data.com FAQ](#)

Why do some leads have a blank or zero (0) value in the Annual Revenue and Number of Employees fields after I use the Data.com Clean auto-fill feature?

Data.com Clean has improved its location-based matching and, as a result, contacts are now associated with their actual location, rather than the organization's headquarters location. Because Dun & Bradstreet (D&B) only collects revenue data for headquarters locations, leads associated with a branch location or single location won't have a value for the `Annual Revenue` field. Similarly, D&B doesn't always have confirmed employee counts for branch and single locations, so there might not be a value for the `Number of Employees` field on lead records.

If you want to map the revenue and employee data from the headquarters location to the branch or single location records, contact your Salesforce administrator.

SEE ALSO:

[Using Data.com FAQ](#)

When I use the Employees or Revenue filter to refine my account or contact search results, I get far fewer results than I expect. Why?

Dun & Bradstreet (D&B) doesn't collect revenue data for branch locations and doesn't always have confirmed employee counts for branches or single locations. Therefore, if you enter `1` as your minimum range in the Revenue filter, your search results will exclude all records that have a zero (0) Revenue value. Similarly, if you enter `0` as your minimum range in the Revenue filter, your search results will exclude all records that have a blank Revenue value. The Employee filter works the same way.

If you want all records with a zero (0) or blank Revenue or Employee value included in your filtered search results, be sure to leave the `Min` field blank.

SEE ALSO:

[What does the Account Site field value on an Account record mean?](#)

[Using Data.com FAQ](#)

Why do some account and D&B Company records have identical D-U-N-S Numbers?

If a company operates within a single country, its Global Ultimate (highest entity within an organization) and Domestic Ultimate (highest entity within an organization in a country) are the same entity, and therefore the values in their `D-U-N-S Number` fields are the same. For definitions of all the D&B fields, see [D&B Company Fields](#).

SEE ALSO:

[Using Data.com FAQ](#)

What is the difference between the Account Site and Location Type fields?

`Account Site` is the field found on account records and the Data.com account card. `Location Type` is the field found on D&B Company records. (D&B Company records are available to organizations that have purchased Data.com Premium Prospector.) Both fields contain the same values: `Single location`, `Headquarters/Parent`, and `Branch`.

SEE ALSO:

[Using Data.com FAQ](#)

Why did I receive a message that says, You have limited access to data, so you can't completely clean this record?

If you can't edit one or more fields on an account, contact, or lead record, you'll see this message when you use Data.com Clean to manually clean the record. You'll still be able to clean the fields that you can edit.

Ask your administrator to make sure you can edit the [Salesforce fields affected when cleaning records](#), including D&B fields. How your administrator does this depends on which edition of Salesforce your company uses.

- For Contact Manager and Group editions, make sure the fields are on the appropriate page layout.
- For Professional, Enterprise, Performance, and Unlimited editions, make sure field-level security is set to `Visible` for the fields.

SEE ALSO:

[What Salesforce Fields Are Affected by Data.com Clean?](#)

[Using Data.com FAQ](#)

Why did I receive a message that says, You can't clean this record because you have limited data access, as set by your administrator?

If you don't have appropriate access to the `D&B Company` object, you'll see this message when you use Data.com Clean to manually clean an account.

Ask your administrator to make sure you have read access to the `D&B Company` object.

Get Critical Industry, Financial, and Competitive Insights for Your Accounts

Need detailed information about account businesses? Click the `Prospecting Insights` button on the account detail page to get data about your prospects' businesses and financials, as well as competitive and industry details—directly from Data.com in real time.

Prospecting Insights is available with Data.com Corporate Prospector and Data.com Premium Prospector licenses. Insights data is available for accounts that were imported from, or cleaned by, Data.com.

Before you begin, make sure that your administrator has added the `Prospecting Insights` button to the Account page layout.

1. Open the account detail page for a prospect.
2. Click **Prospecting Insights**.

If you click **Prospecting Insights** for an account that hasn't been imported from or cleaned by Data.com, a message recommends that you first clean the account.

Data.com Clean

Data.com Clean provides a number of ways to keep your Salesforce CRM records up to date by leveraging company information from D&B and millions of crowd-sourced contacts. There are two versions of the Data.com Clean product: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records.

Clean compares your Salesforce account, contact, and lead records with records from Data.com and creates a link between your Salesforce record and its matching Data.com record. Clean also provides [clean status information for Salesforce accounts, contacts, and leads](#) on page 1222.

Users with a Clean license can:

- Manually compare individual Salesforce records side by side with matched Data.com records, and update Salesforce records field by field.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:
Professional, Enterprise, Performance, and Unlimited Editions

- Select account, contact, and lead records from a list, and clean them all at once.
- Manually refresh D&B Company records linked to accounts (Premium Clean only).

Your organization can also:

- Configure and run automated Clean jobs to flag field value differences on Salesforce records, fill blank fields, overwrite field values.
- Use the [Data.com Match API](#) to create a custom solution for specific business purposes like cleaning leads as they are created and cleaning custom objects.

Data.com Clean does not support person accounts.

There are two versions of Data.com Clean: Corporate Clean and Premium Clean. They differ based on the D&B fields that are available when you clean account or lead records, either manually or via automated jobs.

Data.com Clean Version	D&B Fields
Data.com Corporate Clean	Basic set of D&B fields.
Data.com Premium Clean	Basic set of D&B fields, plus the <code>D&B Company</code> field. This field links to an associated D&B Company record with over 70 more D&B fields that are accessible on the D&B Companies tab. If the Salesforce records's <code>D&B Company</code> field is blank, a link is created, if available, when the record is cleaned.

 **Note:**

- Prospector or Clean Corporate licenses can't be purchased for organizations that already have Prospector or Clean Premium licenses. If you want to purchase Corporate licenses, you'll need to convert your Premium licenses.
- Prospector or Clean Premium licenses can't be purchased for organizations that already have Prospector or Clean Corporate licenses. If you want to purchase Premium licenses, you'll need to convert your Corporate licenses.
- Data.com Clean must be purchased 1:1 for Sales Cloud and Service Cloud seats.

When you clean a record, you're comparing your Salesforce data with information in Data.com. There are a few important concepts to understand about this process, including how to select matching records and how to mark Data.com records as incorrect.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:

Professional, Enterprise, Performance, and Unlimited Editions

Clean Individual Salesforce Records

Use Data.com Clean to manually update your account, contact, and lead records. Manual clean lets users compare a single Salesforce record side by side with its matched Data.com record and update the Salesforce record field by field.

Data.com Clean offers a number of ways to clean records. Users can clean individual records manually or clean groups of records from a list view. Your organization can also clean batches of records using automated Clean jobs. Manual clean works for *all* the account, contact, and lead records you have access to in Salesforce—not just those you previously added from Data.com. Manual clean is available to organizations that have purchased Data.com Clean, and to any Salesforce user with a Data.com Prospector license.

 **Note:** If you clean your account records with Data.com Prospector or Data.com Clean, Data.com converts non-USD currencies to USD every month, which may cause the values in the `Annual Revenue` field to change. For organizations that use non-USD currencies, we ignore the `Annual Revenue` field when determining a record's clean status (so the `Clean Status` field's value does not change). We also remove the value from the `Annual Revenue` field on account records and the clean comparison page.

1. Open the record and check its `Clean Status` field. Even if its status is `In Sync`, you can manually clean the record. And if your organization uses D&B's DUNSRight matching service, you may be able to match your record to a different one from Data.com.

 **Tip:** From the `Clean Status` field, you can also get additional status information (such as which fields have different data in Data.com) and then clean the record. Just click the status icon () and the popup will guide you.

2. Click **Clean** to open the comparison page and compare the Salesforce record with Data.com's.
3. Compare the two records side by side. You'll see a check mark next to any Data.com field value that matches the corresponding value in your Salesforce record.
4. Select the checkbox next to any Data.com value you want to accept.
5. If you use DUNSRight Matching and want to look for a different match from Data.com, click **Wrong Match?**
6. Click **Save** when you're satisfied that the record is accurate, even if you don't accept any data from Data.com. The `Clean Status` field reflects the record's current status and its time stamp is updated to reflect your activity.

 **Note:** If you click **Cancel**, your Salesforce record's data won't be updated, but if Data.com finds a better match for the record, the values in its `Clean Status` and `Data.com Key` fields may change. These two fields always reflect the best match from Data.com as of the most recent clean process, regardless of the method used to clean the record.

If your organization uses Data.com Premium Clean or Data.com Premium Prospector and you've manually cleaned an account or lead record that doesn't yet have a D&B Company record linked to it, Salesforce will create a D&B Company record (if available) and link it to the account or lead record when you click **Save**. The next time you open the comparison page, the linked record will be identified by its D-U-N-S Number in the `D&B Company Record Linked` field.

With Data.com Clean, you can select account, contact, and lead records from a list, and clean them all at one time. A Data.com Clean license is required to clean records from a list.

Data.com Clean offers a number of ways to clean records. Users can clean individual records manually or clean groups of records from a list view. Your organization can also clean batches of records using automated Clean jobs.

Cleaning from a list works for all the account, contact, and lead records you have access to in Salesforce—not just those you previously added from Data.com. When you click the Accounts, Contacts, or Leads tab, you can select a view to see a list of the records you're allowed to view. The results you see are called a *list view*. From the list view, simply select the records you want to clean and Data.com Clean does the rest.

 **Note:** If you're cleaning records from a standard list view, make sure your system administrator has added the `Clean Status` field to the view. If you're cleaning records from a custom list view you've created, you'll need to add the `Clean Status` field yourself. If you use Data.com Social Key together with Social Accounts and Contacts, you or your administrator can also add the fields for the applicable social networks (LinkedIn, Twitter, or Facebook) to your contact list views.

1. Click the tab (Accounts, Contacts, or Leads) for the object whose records you want to clean from your list.
2. Select a view from the drop-down and click **Edit**.
3. From the list, select the records you want to clean, and click **Clean**.
4. Select one of these Clean options.
 - `Update Clean Status` will update each record's `Clean Status` field. If you use Social Key, social handles will be added to the record, if available.
 - `Update Clean Status and Fill Blank Fields` will update each record's `Clean Status` field and fill blank fields with Data.com data. If you use Social Key, social handles will be added to the record, if available.
5. Click **Update**.
We'll provide a confirmation message telling you how many records were matched, updated, and whether any errors occurred. If your organization uses Social Key with contacts and leads, we'll also let you know if we were able to supply social handles.
6. Review the changes to your records.

If you selected the option to update only the `Clean Status` field and now find records with a clean status of `Different`, you can manually clean each record from its detail page.

What Salesforce Fields Are Affected by Data.com Clean?

 **Note:**

- These fields may be different if your organization uses customized Data.com-to-Salesforce field mappings.
- If you can't edit one or more fields on an account, contact, or lead record, you may receive a message that says, `You have limited access to data, so you can not completely clean this record` or `You have limited access to account fields, so you can not update all the fields shown here`. If this happens, ask your administrator for help.

When you use Data.com Clean to clean a Salesforce record, either manually or with automated jobs, the record's fields are updated with Data.com data. Here's a list of the fields that are updated.

Account Fields

Account Name	Industry
Account Site	NAICS Code
Annual Revenue	NAICS Description
Billing Address	Ownership
Clean Status	Phone
D&B Company (Premium Prospector and Clean only)	SIC Code
Data.com Key	SIC Description
D-U-N-S Number	Ticker Symbol
Description	Tradestyle
Employees	Website
Fax	Year Started

Contact Fields

Clean Status	Mailing Address

What Does the Clean Status Tell Me About a Record?

The Clean Status field on account, contact, and lead records indicates how the record's data compares with data from Data.com. If you click the icon next to the status, you'll get more status details, plus options for refreshing the status. Depending on the status, you can also clean some records right from the Clean Status field.

Here's an example that shows some of your options.

1. This record's status is *Different* because when it was last compared, one week before, the records in Salesforce and Data.com had different values for some or all of their fields. The user who compared the records previously may have:

- Decided not to accept any of the Data.com values.
- Accepted some values from Data.com and kept some Salesforce values.
- Clicked **Cancel** on the comparison page.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Click the icon to view the popup, which provides additional information and Clean options.

2. This line tells you about the Salesforce record's most recent comparison activity.

In this case, a user compared the Salesforce account record with Data.com's version one week ago.

3. This section provides more details about the comparison. In this case, Data.com had *different* Email, Phone, and Mailing Address values for the contact.
4. You can click the **Clean...** link to compare the Salesforce and Data.com records yourself.

If you click **Cancel**, the record's clean status will remain *Different*. If you click **Save**, even if you haven't accepted any Data.com values, the record's clean status will be *Reviewed*.

How Are Salesforce and Data.com Records Matched?

If you clean your Salesforce account, contact, and lead data with Data.com, it's important to understand how your Salesforce records are compared and matched with records from Data.com.

 **Tip:** For complete details about how the Data.com matching service works, including a graphic overview and extensive examples, please see our white paper, [Data.com Record Matching in Salesforce](#).

Watch a Demo:  [Understanding Matching Rules](#)

Salesforce and Data.com records can be compared and matched in two ways.

- Manually, when a user clicks **Clean** on an individual account, contact, or lead record.
- Via Clean jobs, which automatically attempt to match all your account, contact, or lead records.

Automated clean jobs are only available to organizations that purchase Data.com Clean. *Manual* clean is available to all licensed Data.com Prospector users.

The first time a Salesforce record is cleaned—either manually or via automated job—the matching service searches Data.com for similar records. It examines the field values in each record and looks for enough identical or similar information to indicate that the two records represent the same entity (that is—the same account, contact, or lead). If Data.com finds a match, the two records are linked by a numeric value in the `Data.com Key` field. For contact and lead records, every time the Salesforce record is cleaned, the matching service is used to match the record. For account records, every time the Salesforce record is cleaned, the `D-U-N-S Number` field is used to match (or look up) the record. If the `D-U-N-S Number` field is blank, the matching service will be used to find a match. If the Salesforce record changes substantially, the next time it is cleaned, the matching service may look for a better match from other Data.com records.

 **Note:**

- If you prefer to rematch account records with the matching service, regardless of whether a D-U-N-S Number is present, please contact Salesforce Customer Support. Doing so, however, may cause some account records to have the Data.com Clean *Not Found* status.
- If you've remapped or skipped mapping for the `D-U-N-S Number` field, or if you're organization purchased Data.com prior to December 16, 2011, the matching service will automatically be used to rematch account records.

For contacts and leads, the important fields are:

- Name
- Email

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Ideally, use a direct email address rather than a group address like info@org.com. (Identical Email values will almost always trigger a match unless other values in the record conflict.) **Note:** Data.com does not store emails that may be personal contact information, such as those from Gmail or Yahoo.

- Account Name for contacts; Company for leads.
- Title
- Phone

For accounts, the important fields are:

- Account Name
 - Make sure the account name doesn't contain any unrelated artifacts, such as numbers (1002), special characters (!#@#), or unrelated words. (These symbols are acceptable if they are part of the company's name.)
 - Try to avoid country and state names as values unless they are part of the company's name.
 - If the account name contains more than one word, like *DSGI Business (PC World Business)* try both of them.
 - If an account name is also a Website (like *salesforce.com*), try leaving off the subdomain (.com and the like).
- Billing Address
 - Use a full address, if possible.
 - Try to specify a value for the Country field. This will optimize your match rates.
 - Try to specify a value for the State or ZIP code field.
 - If you know the account's street name but not its street number, use the street name only. A street name without a street number is better than no value.
- Website
- Phone

Data.com Clean Statuses

If you have Data.com Prospector or Data.com Clean, the Clean Status field on your Salesforce accounts, contacts, and leads indicates the record's clean status as compared with Data.com.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in:
Contact Manager (no Lead object), **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

Available with a Data.com Clean license in:
Professional, Enterprise, Performance, and **Unlimited** Editions

Clean Status	Definition	API Value	Notes
 Not Compared	<p>The current version of the Salesforce record has not been compared with Data.com. This status may occur because:</p> <ul style="list-style-type: none"> The record was <i>created manually</i> in Salesforce (not <i>added from Data.com</i>) and has not yet been compared with Data.com. The Salesforce record was previously compared with Data.com but later edited by a user and not compared again. The Salesforce record was previously compared with Data.com but later updated by a workflow or other automated process (such as lead conversion) and not compared with Data.com again. You map Data.com fields to Salesforce fields and one or more newly mapped Data.com fields has no value. 	Pending	<p>Records you add from Data.com are always <code>In Sync</code> until the data changes in one or both of the records.</p> <p>After you clean the record and a match is found in Data.com, the record's <code>Clean Status</code> changes to <code>Reviewed</code> until one of these conditions is met.</p> <ul style="list-style-type: none"> The two records are identical (<code>In Sync</code> status). The record is updated in Salesforce or Data.com (<code>Different</code> status). The record becomes inactive in Data.com (<code>Inactive</code> status).
 In Sync	<p>When your Salesforce record was last compared with the Data.com record, the two were identical. Records with <code>In Sync</code> status are considered to be clean.</p>	Matched	<p>Records in <code>In Sync</code> status are considered to be clean, but you can repeat the clean process.</p> <p>Click the icon in the <code>Clean Status</code> field and check the time stamp to see when the record was last compared.</p>
 Reviewed	<p>When your Salesforce record was last compared with the Data.com record, the user who compared them:</p> <ul style="list-style-type: none"> Kept one or more values from the Salesforce record. May have also flagged a field value as <i>wrong</i> to Data.com. Marked a record as <i>Inactive</i>. <p>or</p> <ul style="list-style-type: none"> Your Clean jobs are set to overwrite values for one or more fields, and one or more values were overwritten during the most recent job. 	Acknowledged	<p>Records in <code>Reviewed</code> status are considered to be clean, but you can repeat the clean process.</p> <p>After you clean the record and a match is found in Data.com, the record's <code>Clean Status</code> remains in <code>Reviewed</code> status until one of these conditions is met.</p> <ul style="list-style-type: none"> The two records are identical (<code>In Sync</code> status). The record is updated in Salesforce or Data.com (<code>Different</code> status).

Clean Status	Definition	API Value	Notes
			<ul style="list-style-type: none"> The record becomes inactive in Data.com (<code>Inactive</code> status). Any fields previously flagged as <i>wrong</i> to Data.com have been reflagged as <i>right</i>.
 Different	<p>The Salesforce record has different data from the corresponding Data.com record.</p> <p> Note: It's important to remember that a record's clean status can change from <code>In Sync</code> or <code>Reviewed</code> to <code>Different</code> when values change in the matched Data.com record. This may happen regularly as updated information from Data.com and D&B is made available.</p>	<code>Different</code>	<p>After you clean the record and a match is found in Data.com, the record's <code>Clean Status</code> remains in <code>Different</code> status until one of these conditions is met.</p> <ul style="list-style-type: none"> The two records are identical (<code>In Sync</code> status). A user reviews the two records and keeps one or more values from the Salesforce record (<code>Reviewed</code> status). The record becomes inactive in Data.com (<code>Inactive</code> status).
 Select Match	Data.com does not have a record qualified for an <i>automatic</i> match but does have one or more potential matches. You can select one from up to five (5) match candidates.	<code>SelectMatch</code>	This status is available with the Data.com Clean product and D&B DUNSRight matching service only.
 Not Found	The Salesforce record has no similar records in Data.com record.	<code>NotFound</code>	The record can't be cleaned in Salesforce because Data.com could not find a record to match it with.
 Inactive	The Data.com record corresponding to the Salesforce record has been reported as inactive by either Data.com or a user in your organization. A contact record may be inactive if it contains out-of-date or inaccurate information. An account record is inactive if D&B has marked it as out of business.	<code>Inactive</code>	<p><code>Inactive</code> records are hidden from Data.com Prospector search results by default, but you can use filters to show them.</p> <p>If clean the record and report it as <code>Active</code> to Data.com, the record's clean status changes to <i>Reviewed</i>.</p>
 Skipped	<p>Either:</p> <ul style="list-style-type: none"> The Salesforce record encountered an error related to a validation rule or trigger when it was last saved, causing 	<code>Skipped</code>	<p>Work with your administrator to either:</p> <ul style="list-style-type: none"> Modify the trigger, validation rule, or API customization that

Clean Status	Definition	API Value	Notes
	<p>the next incremental sync Clean job to set the record's status to <code>Skipped</code>.</p> <p>or</p> <ul style="list-style-type: none"> The record's clean status was set to <code>Skipped</code> via the API. <p><i>Incremental sync</i> Clean jobs <i>do not</i> process records with <code>Skipped</code> clean status.</p> <p><i>Full sync</i> Clean jobs process records with <i>any</i> clean status that encountered errors related to validation rules, triggers, or other customizations when last saved, but those records' <code>Clean Status</code> field values do not change until the errors are resolved.</p>		<p>caused the error and the <code>Skipped</code> status, and then clean the record again manually or with Clean jobs.</p> <p>or</p> <ul style="list-style-type: none"> Ask your administrator to consider selecting the <code>Skipped Records Clean Job Bypass</code> preference, which causes <i>both incremental and full sync jobs</i> to skip processing for records in <code>Skipped</code> clean status.

When you clean a record, you're comparing your Salesforce data with information in Data.com. There are a few important concepts to understand about this process, including how to select matching records and how to mark Data.com records as incorrect.

[Report an Account, Contact, or Lead as Inactive or Active to Data.com](#)

When you use Data.com Clean to clean a Salesforce record, if you know the related account, contact, or lead is either out of business or not active at a company, you can report that information to Data.com. If an account, contact, or lead has been reported as `Inactive` to Data.com, we'll let you know. If you believe the account, contact, or lead is `Active`, you can tell us that, too.

[Guidelines for Selecting an Account Matching Service](#)

If you use Data.com Prospector or Data.com Clean, you can select the matching service your organization uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

Report an Account, Contact, or Lead as Inactive or Active to Data.com

When you use Data.com Clean to clean a Salesforce record, if you know the related account, contact, or lead is either out of business or not active at a company, you can report that information to Data.com. If an account, contact, or lead has been reported as *Inactive* to Data.com, we'll let you know. If you believe the account, contact, or lead is *Active*, you can tell us that, too.

An account, contact, or lead may be designated as *Active* or *Inactive* by either Data.com or a Data.com Clean user. For accounts, *Inactive* means out of business, and for contacts or leads, it means the associated person no longer works at the company.

If a record is *Inactive*, we'll let you know the source of that status, and if the source is Data.com, we'll tell you why. For example, we'll tell you if an account is out of business, a contact is no longer employed at the company, or a contact or lead's phone or email is invalid.

1. From the account, contact, or lead record, click **Clean** to open the comparison page.
2. If the account, contact, or lead is inactive, click **Report as Inactive**.
3. Click **Save**.
The record's `Clean Status` field now shows that it's *Inactive*.
4. If an account has been reported as inactive, but the company remains in business, or a contact or lead has been reported as inactive, but the person still works at the company, you can clean its record again. On the comparison page, you'll see a message telling you the record's current reported status—*out of business* for accounts or *Inactive* for contacts and leads—and who reported it: Data.com or a user.
5. Click **Report as Active**.
The record's `Clean Status` field reverts to the value it had before the record was reported as *Inactive*. For example, if a contact's `Clean Status` is *Reviewed*, and then the contact is reported as *Inactive*, its clean status will change to *Inactive*. If the contact is later reported as *Active*, its clean status reverts to *Reviewed*.

Guidelines for Selecting an Account Matching Service

If you use Data.com Prospector or Data.com Clean, you can select the matching service your organization uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

The available matching services are:

Data.com matching

Data.com's own matching technology, which matches on the `Account Name`, `Billing Address`, `Website`, and `Phone` fields.

The Data.com matching service is always used when cleaning accounts that have a valid `D-U-N-S Number`, even if the DUNSRight matching service is selected.

D&B DUNSRight™ matching

D&B's proprietary data-quality technology, which uses a rigorous process to normalize data and match D&B company records to your account records. The process also employs the D&B Confidence Code, which ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). D&B also provides letter-coded match grades for individual fields. For details about how D&B DUNSRight matching works, see [D&B Entity Matching](#).

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Attribute	Data.com matching	DUNSRight™ matching
Default matching service	✓	
Includes D&B's Confidence Code		✓
Supports broad international matching ¹		✓
Supports non-English speaking countries		✓
Requires default mapping for <code>D-U-N-S Number</code>		✓

¹D&B DUNSRight matching provides matching records for over 200 more countries than Data.com matching. DUNSRight matching *does not* support these countries and regions: Admiralty Islands; Åland Islands; Antarctica; Ascension Island; Bonaire; Bouvet Island; British Indian Ocean Territory; Caroline Islands; Cocos (Keeling) Islands; Cuba; Curaçao; French Southern Territories; Guernsey; Heard Island and McDonald Islands; Isle of Man; Jersey; Korea, Democratic People's Republic of; Mayotte; Micronesia, Federated States of; Midway Islands; Mongolia; Niue; Palau; Palestinian Territory Occupied; Pitcairn; Saint Barthélemy; Saint Eustatius and Saba; Saint Martin (French part); Sint Maarten (Dutch part); South Georgia; South Sandwich Islands; Svalbard and Jan Mayen; Timor Leste; Turkish Cyprus; United States Minor Outlying Islands; Wake Island; Wallis and Futuna; Western Sahara.

Data.com Social Key

Data.com Social Key works with Social Accounts and Contacts and Data.com Clean to make it easier to learn more about your contacts and leads in Salesforce or on social network sites. Your organization must have Data.com Clean enabled to use Social Key.

Important: As of Summer '16, Data.com Social Key and the Data.com Social Profile Match API are no longer available. At that time, social profile handles, such as those from LinkedIn®, aren't added to records that are cleaned with Data.com. And, you can't use the Data.com Social Profile Match API to search for social profile handles.

When Clean jobs are run or records are cleaned from a list, Social Key finds and associates social handles for your contacts and leads. Social Key currently provides social handles for LinkedIn®, Twitter®, and Facebook® for contacts and leads in the United States only. Your administrator selects the social networks you want.

Users log in to a social network from a contact or lead's detail page and view the associated profile from within the Social Accounts and Contacts viewer or on the social network site. There's no manual search required.

Note: Depending on contacts' and leads' privacy settings, as well as the permissions set by their friends or connections and the site's terms of use, users might not see as much information as they would if logged in to their social network accounts directly.

Data.com Clean must be enabled to use Social Key.

Stay Up to Date with Social Networks and News

Account Insights

Give your users instant access to relevant, timely news about customers, partners, and competitors with Account Insights.

Account Insights provides up to 20 relevant, timely news items (including articles and Twitter posts, which are collectively known as insights) that are selected to help you stay up-to-date with your accounts, industries you work with, and more. Salesforce pre-processes all insights to ensure relevance and to filter out spam and inappropriate content. It's not possible to add or change news sources.

Account Insights is available in English only from US news sources, and only in the Salesforce1 mobile app and Salesforce Lightning Experience.

Accounts Insights provides different insights depending on where you access it.

- On account and opportunity record detail pages, insights are selected based on the account, its executives, and its industry.
- In Salesforce Today and the News app, insights are selected based on recently viewed accounts and opportunities, and on tasks and events for those accounts. In Salesforce1, insights might also be related to the accounts that are associated with attendees on your upcoming mobile calendar events.

Insights are divided into four categories.

Account News

Insights related to an account, based on the Account Name entered in Salesforce.

Industry News

Insights based on the selected value in the Industry field for each account.

EDITIONS

Available in: both Lightning Experience and Salesforce1

Available in: **Group, Professional, Enterprise, Performance, Unlimited Editions**

Executive News

Insights about individuals who hold executive roles at an account. You don't have to list executives as contacts on the account to get executive news.

Trending at My Company

Insights that other users in your Salesforce org are reading.

Account Insights is curated using technology provided by Data.com and third parties. You don't have to be a Data.com customer to use Account Insights.

 **Note:**

- When enabled, some of your organization's data may be saved and/or processed by third-party services and other Salesforce technologies, each that may offer different privacy and security protections than the Salesforce Services. When data (such as the name or website of an account that's being queried) is shared or transferred, we make efforts to exclude your name and your organization's name. Salesforce is not responsible for the privacy and security of data that is shared with third parties when you use this feature.
- For most accounts, Salesforce provides insights from our own news processing platform, which collects news from RSS feeds and Twitter content of news providers. On occasion, if a match isn't found in our database, we may search a third-party provider for news specific to your account, using the account name you've listed in Salesforce. In either event, Salesforce is not responsible for the content of insights that are provided by third parties. Queries performed by Salesforce are performed using secure protocols and are not linked to individual Salesforce users.

YouTube videos	<p>YouTube helps you find and view videos related to your accounts, contacts, and leads.</p>	<p>Accounts Contacts Leads</p>		

After you or another user in your organization associate a social network profile with an account, a contact, or a lead, Salesforce always displays current information about it. Which details each Salesforce user can see depend on how they're connected with the account, contact, or lead on the social network, as well as the privacy settings for the profile. If you aren't signed in to the social network through Salesforce, you see only information the social network user has made publically available.

Important: The Social Accounts, Contacts, and Leads feature uses Facebook, Klout, Twitter, and YouTube public APIs to display social information in Salesforce. Because these social networks have the option of modifying or terminating access to their APIs at any time, salesforce.com can't guarantee the future availability of this feature or any of its functionality, including access to the data that is currently provided or to any particular social network as a whole. As of the Winter '16 release, LinkedIn is no longer available through this feature.

Get Started in Salesforce1 or the Full Salesforce Site

To get started, simply go to any account, contact, or lead detail page and sign in to your social network accounts. Signing in creates private connections between Salesforce and your social network accounts, allowing you to see external social profiles in Salesforce.

SEE ALSO:

[Enable Social Accounts, Contacts, and Leads](#)

[Configure Social Accounts, Contacts, and Leads](#)

Security and Privacy When Using Social Accounts, Contacts, and Leads

The Social Accounts, Contacts, and Leads feature is built to provide security and privacy for you and your data.

- Salesforce uses the trusted OAuth protocol when you sign in to your Facebook, Twitter, or Klout accounts. Your login credentials aren't exposed to Salesforce, and we never store your passwords.
 - Salesforce doesn't import or store social information. Each time you select a social profile or a YouTube video, Salesforce retrieves the information that you want to see directly from the social network. You'll always see current social information for your accounts, contacts, and leads.
 - Associating a Salesforce record with a social network account doesn't cause any activity on the social network. For example, when you associate a contact with a Twitter account, you don't become a Follower of that account on Twitter.
 - Salesforce never posts anything about your or your activities to your social network accounts.
 - Your accounts, contacts, and leads aren't notified when you use Salesforce to view their social network profiles. And your interaction with social networks through Salesforce is read-only as long as you're using the Social Viewer.
- Note:** If you leave the Social Viewer, for example by clicking a link that opens a new Web browser tab, you're leaving Salesforce and interacting directly with the social network. Actions you perform outside of the Salesforce Social Accounts, Contacts, and Leads viewer may be recorded on the social network.
- Your view of a Facebook or Twitter profile is unique to you and depends on how you're connected with each account, contact, or lead on each social network, as well as on the privacy settings currently in use by the account, contact, or lead. Other Salesforce users must sign in to their own social network accounts, and they'll only see what's permitted to them based on their own connection level. For example, if your Twitter profile is connected to your lead's Twitter profile,

Select and Change Profile Images for Accounts, Contacts, and Leads

When you or another user have associated records for accounts, contacts, and leads to social networks profiles, the records display images from Twitter or Facebook profiles. For some networks, profile images appear in Salesforce even when you aren't logged in to the network.

By default, the profile image for an account, a contact, or a lead is the profile image from the first social network linked to the record. If your org has enabled Account Logos, profile images that you've manually added to accounts might be replaced with a fresher, more up-to-date image in Lightning Experience.

 **Note:** Profile images from Facebook are visible in Salesforce Classic only.

1. On an account, contact, or lead detail page, click any social network icon (   ).
2. In the Social Viewer, select the tab for the social network that has the image you want to use.
3. Click **Show Photo in Salesforce**.

Cultivating High Net Worth Customers for Financial Services

Salesforce for Wealth Management Overview

What Is Salesforce for Wealth Management?

Salesforce for Wealth Management is an industry solution that is designed and customized for the wealth management industry.

Who Should Use Salesforce for Wealth Management?

Salesforce for Wealth Management is intended for wealth management professionals who advise high net worth clients. It allows you to build deeper customer relationships, integrate key systems to drive user adoption, and effectively support compliance processes.

How Do I Obtain Salesforce for Wealth Management?

Salesforce for Wealth Management is available for free on AppExchange for Enterprise, Unlimited, and Performance Editions. It includes all generally available Enterprise, Unlimited, and Performance Edition features such as Outlook integration, workflow, and the Force.com API. As a prerequisite, it requires [person accounts](#), which are enhanced account records designed for business-to-consumer industries such as financial services.

What Does Salesforce for Wealth Management Include?

Salesforce for Wealth Management contains the following components that set it apart from standard Salesforce functionality:

- Easy-to-use tabs with client-oriented fields
- Comprehensive client information including financial accounts, investment preferences, addresses, and personal interests
- Comprehensive “Know Your Client” suitability forms with an automated approval process
- Reports and dashboards specific to the wealth management process
- Relationship groups (also known as households)

SEE ALSO:

[Get Started With Salesforce for Wealth Management](#)

[Navigating the Salesforce for Wealth Management App](#)

Get Started With Salesforce for Wealth Management

As an administrator, perform the following tasks to set up Salesforce for Wealth Management for your organization:

Verify the Contents of the Salesforce for Wealth Management App

Verify that the Salesforce for Wealth Management custom app contains the correct tabs:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. In the list, click *Salesforce for Wealth Management*.
3. Verify that the following tabs are present in the Included Tabs list:
 - Home

USER PERMISSIONS

To view the setup options for custom apps:

- “View Setup and Configuration”

To manage custom apps:

- “Customize Application”

- Accounts
- Financial Accounts
- Holdings
- WM Assets
- Client Interests
- Know Your Clients
- Reports
- Dashboards
- Documents
- Console

4. If necessary, click **Edit** and choose the appropriate tabs to add or remove.

Configure Users' App Choices

In addition to the main Salesforce for Wealth Management custom app, the following custom apps are also available in the Force.com app menu:

- Salesforce Financial Accounts & Holdings
- Salesforce Clients and Interests
- Salesforce Know Your Client

Optionally, you can hide these apps from users in the Force.com app menu, because all appropriate tabs are already consolidated in the main Salesforce for Wealth Management custom app. To hide these apps:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps**.
2. Click **Edit** next to the appropriate app name.
3. In the *Assign to Profiles* area, deselect the checkboxes in the *Visible* column that correspond to end users' profiles. Select only the checkboxes that correspond to administrator profiles.
4. Click **Save**.
5. Repeat this procedure as necessary for the remaining custom apps listed above.

Verify Record Types

From the object management settings for person accounts, go to Record Types to verify that the following record types are available for person accounts (clients).

Individual

This record type is for clients and prospective clients. It should be assigned to the *Individual* page layout.

Professional Relationship

This record type is for lawyers, accountants, and other professional relationships. It should be assigned to the *Professional Relationship* page layout.

Configure Users' Page Layouts

Ensure that the following components are included in users' page layouts, which can be configured from the management settings for each object by going to Page Layouts.

Home Tab Page Layouts

The home page layout for financial advisors, titled FA Home Page, should include the following components:

- Items To Approve
- Tasks
- Calendar
- Dashboard Snapshot
- Search
- Create New
- Recent Items
- Messages & Alerts
- Custom Links

Person Accounts Page Layout

The page layouts for person accounts (clients) should include the following related lists:

- Financial Accounts
- Holdings
- Client Interests
- Know Your Client
- Open Activities
- Activity History
- Partners
- Account Team
- Notes & Attachments

Verifying the Know Your Client Approval Process

Salesforce for Wealth Management includes an approval process that routes Know Your Client forms to the appropriate Salesforce users for approval.

SEE ALSO:

[Salesforce for Wealth Management Overview](#)

Managing the Know Your Client Approval Process

About the Know Your Client Approval Process

An approval process automates how records are approved in Salesforce. An approval process specifies each step of approval, including who to request approval from and what to do at each point of the process.

The Know Your Client approval process is included in Salesforce for Wealth Management and has the following general definition:

USER PERMISSIONS

To create, edit, delete, or clone approval processes:

- “Customize Application”

To view approval processes:

- “View Setup and Configuration”

1. A financial advisor creates a new Know Your Client record.

Note: Data from a saved Know Your Client record can be merged into a printable Microsoft Word document using the provided mail merge template.

2. A financial advisor submits the Know Your Client record for approval, which sets the following actions in motion:
 - The Know Your Client record is locked and cannot be edited
 - `KYC Approval Status` becomes "Pending Approval"
 - `Date Know Your Client Submitted` becomes today
 - Know Your Client record type becomes "KYC Submitted"
 - An approval request is routed to the appropriate Salesforce user for review, and he or she is also sent an email notification using the appropriate email template
3. The lead financial advisor approves or rejects the approval request, which causes the following actions:
 - The record continues to be locked and cannot be edited
 - `KYC Approval Status` becomes "Approved" or "Rejected"
 - `Date KYC Approved/Rejected` becomes today
 - If the record was approved, a follow-up task is scheduled for the financial advisor to review the Know Your Client form in six months

Activating the Know Your Client Approval Process

To activate the Know Your client approval process:

1. From Setup, enter `Approval Processes` in the `Quick Find` box, then select **Approval Processes**.
2. In the `Manage Approval Processes For` drop-down list, select "Know Your Client."
3. Click **Activate** next to the approval process name.

SEE ALSO:

[Salesforce for Wealth Management Overview](#)

[Managing Wealth Management Clients](#)

Navigating the Salesforce for Wealth Management App

To access the Salesforce for Wealth Management app, go to the Force.com app menu in the top right corner of any Salesforce page and select Salesforce for Wealth Management. To get started on any task, just click the tab you want.

SEE ALSO:

[Salesforce for Wealth Management Overview](#)

[Managing Wealth Management Clients](#)

Managing Wealth Management Clients

Clients are exclusively available in Salesforce for Wealth Management. A client is a person who you advise or do business with, a prospect who you potentially will do business with, or a professional relationship such as an accountant or lawyer. You can manage your clients on the Clients tab. In standard Salesforce terminology, clients are called “accounts.” However, Salesforce for Wealth Management uses the term “clients.”

Clients have all of the standard capabilities of account records.

In addition, the special capabilities of clients are as follows:

Client Record Types

Record types are categories that allow you to organize your records. You can assign client records to the following record types:

- “Business” specifies a corporate entity or trust
- “Individual” specifies an existing or prospective client
- “Professional Relationship” specifies an accountant, lawyer, or other professional relationship

Client List Views

On the Clients tab, you can use [list views](#) to conveniently access different sets of clients. For example, select “My A Clients” to view a list of your clients who have an “A” rating.

Client Details

The client detail page includes groups of fields tailored to wealth management clients. For example, one section tracks a client's preferences in several categories — you can specify that a client is interested in vacation homes, mid-cap stocks, the retail and entertainment sectors, golf, and US politics.

Financial Accounts Related List

The Financial Accounts related list provides an overview of the client's financial accounts, such as account names, account numbers, and current values. This information comes from the records on the Financial Accounts tab.

Holdings Related List

The Holdings related list provides an overview of the client's owned assets such as funds, stocks, and bonds. For each holding you can see values such as market value, last price, purchase price, and number of shares. This information comes from the records on the Holdings tab. Note that each holding is associated with a financial account record.

Client Interests Related List

The Client Interests related list provides an overview of the securities that the client is interested in buying or selling. This information comes from the records on the Client Interests tab.

Know Your Clients Related List

The Know Your Clients related list provides an overview of the Know Your Client forms that are associated with the client. This information comes from the records on the Know Your Clients tab.

Relationships Related List

A relationship refers to a client who has a role in the life of another client, such as a spouse, child, accountant, or attorney. Relationships are tracked in the Relationships related list on the client detail page, which is available as an option. In standard Salesforce terminology, relationships are called “[partners](#).” However, Salesforce for Wealth Management uses the term “relationships.”

Client Team Related List

The Client Team related list tracks the financial advisors and other Salesforce users who are involved in the management of a particular client. In standard Salesforce terminology, client teams are called “[account teams](#).” However, Salesforce for Wealth Management uses the term “client teams.”

USER PERMISSIONS

To view the Clients tab:

- “Read” on accounts

To view clients:

- “Read” on accounts

To create clients:

- “Create” on accounts and contacts

Relationship Group Members Related List

The Relationship Group Members related list displays the relationship groups of which the client is a member. It is available as an option and is called "Household Members" in some organizations.

Salesforce for Wealth Management Reports and Dashboards

Salesforce for Wealth Management Reports

Salesforce for Wealth Management offers industry-specific reports, which are grouped in the following folders on the Reports tab:

- Client Reports
- Client Interest Reports
- Financial Account Reports
- Holdings and WM Asset Reports
- Know Your Client Reports

To access these reports, select the appropriate folder from the drop-down list on the Reports tab, then click the appropriate report name.

Salesforce for Wealth Management Dashboards

Salesforce for Wealth Management offers industry-specific dashboards, such as a dashboard of financial accounts that allows you to analyze your book of business. To access these dashboards, go to the Dashboards tab and select the appropriate dashboard name from the drop-down list.

 **Note:** You can see a dashboard snapshot on the Home tab.

Establishing Relationship Groups of Your Customers

Relationship Groups Overview

What Are Relationship Groups?

Relationship groups are custom object records used to store collections of [accounts](#). For example, you can use relationship groups to manage the following:

- A household of people who reside at the same address
- An extended family consisting of multiple generations of relatives
- A professional group such as a medical practice or a law firm
- The trustees and beneficiaries of a trust

The accounts that you add to relationship groups are called *relationship group members*. For more information, see [Relationship Group Members](#) on page 1244.

Who Can Use Relationship Groups?

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

Your organization must have implemented [person accounts](#) before you can use relationship groups.

Your administrator can enable relationship groups by installing the Relationship Groups custom app.

What Are the Benefits of Relationship Groups?

Relationship groups allow you to:

- Track the familial and professional roles of different relationship group members
- Assign primary and secondary designations to the two most important members of a relationship group
- View roll-up related lists of all [activities](#) for the members of a relationship group
- View roll-up related lists of the custom objects that are related to the accounts in a relationship group

USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups

AND

“Create” and “Edit” on relationship group members

AND

“Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

Relationship Group Fields

A relationship group custom object has the following default fields, listed in alphabetical order.

Name	Description
Description	A text description of the relationship group. Up to 255 characters are allowed.
Primary Name	The name of the primary relationship group member .
Secondary Name	The name of the secondary relationship group member .
Total Members	The total number of members in the relationship group.

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

To add custom fields to relationship groups, from the object management settings for relationship groups, go to the fields area, then click **New** in the Custom Fields & Relationships section.

SEE ALSO:

[Relationship Groups Overview](#)

[Using Relationship Groups](#)

Relationship Group Members

Relationship groups let you group closely related accounts together so you can manage them easier. The accounts that you add to the group are the members. For example, a relationship group might be medical practice or a law firm, while the individual doctors or lawyers would be the group members.

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

What Are Relationship Group Members?

The accounts that you add to relationship groups are called *relationship group members*. Like relationship groups, relationship group members are custom objects. Each relationship group member record represents an association between an account and a relationship group. For example, if you add the account “Mary Smith” to the relationship group “Smith Family,” a relationship group member record is created that links Mary Smith to the Smith Family.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. When discussing these master-detail relationships, accounts and relationship groups are sometimes referred to as the “parents” of relationship group members.

What Are the Limits on Relationship Group Members?

You can add a given account to up to 200 relationship groups. For example, an account “Joseph Brown” who is an attorney may be a member of several relationship groups—in some cases as an attorney, in other cases as a family member.

You can add up to 20 accounts to a particular relationship group. For example, a relationship group that represents a large extended family including grandparents, children, and grandchildren cannot have more than 20 relationship group members.

In a particular relationship group, you can specify only one relationship group member as primary, and only one relationship group member as secondary. In addition, you cannot add the same account more than once to a particular relationship group.

Where Can I View Relationship Group Members?

The Relationship Group Members related list displays on both the relationship group detail page and the account detail page. On the relationship group detail page, the related list summarizes the accounts that are members of the given relationship group. On the account detail page, the related list summarizes the relationship groups of which the given account is a member.

Relationship Group Member Fields

Relationship group members have the following fields.

Field Name	Description
Account	The name of the account.

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

USER PERMISSIONS

To create or edit relationship groups and relationship group members via the wizard:

- “Create” and “Edit” on relationship groups
- AND
- “Create” and “Edit” on relationship group members
- AND
- “Read” on accounts

To delete relationship groups:

- “Delete” on relationship groups

To remove relationship group members:

- “Delete” on relationship group members

Field Name	Description
Role	The familial, professional, or other role that an account has in a relationship group - for example, Client, Spouse, Child, Attorney, or Accountant. Your administrator defines the available values in this picklist.
Primary	Designates an account as the most important member of the relationship group. Only one relationship group member can be specified as primary.
Secondary	Designates an account as the second-most important member of the relationship group. Only one relationship group member can be specified as secondary.
Include in Roll-up	Specifies whether the activities and custom objects of an account display in related lists on the relationship group detail page.
Priority	Does not display in the relationship group wizard, but is available as a column in the Relationship Group Members related list on account and relationship group detail pages. This column displays the primary (👤) or secondary (👥) icon as appropriate next to account names.
Unique Key	This is a system field that prevents duplicate records. It does not display to users in Salesforce but is visible in the Force.com API. This field should be treated as read only; attempts to modify it through the API will be ignored.

SEE ALSO:

[Relationship Groups Overview](#)

[Relationship Group Considerations](#)

Relationship Group Considerations

To make the most of relationship groups and relationship group members, review the notable behaviors and limitations below.

Relationship Group Considerations

Relationship groups:

- Support roll-up related lists for activities and custom objects only.
- Are completely separate from the Partners related list on accounts.
- Do not have directly associated activities, notes, or attachments.
- Only support required custom fields that are configured with a default value. Such custom fields will display on relationship group detail and edit pages, but not in the relationship groups wizard.
- Only support validation rules on custom fields that were added after the Relationship Group managed package was installed.
- Cannot be renamed to a different name than “relationship group,” because they are a custom object in a managed package.

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

- Can be created and edited through the relationship group wizard regardless of field-level security settings on the `Description` field.

Relationship Group Member Considerations

Relationship group members:

- Are limited to a maximum of 20 per relationship group.
- Cannot be imported via the import wizard for custom objects.
- Do not support tagging.
- Have the division of the parent relationship group.
- Are owned by both the parent relationship group and the parent account.
- Do not support validation rules.
- Do not support universally required fields.
- Cannot be renamed to a different name than “relationship group member,” because they are a custom object in a managed package.
- Can have the fields `Primary`, `Secondary`, and `Include in Roll-Up` edited through the relationship group wizard even when the field-level security on those fields is “read-only.”
- Cannot be included in workflow rules or approval processes.
- Cannot be used in Salesforce to Salesforce.
- Are not supported in Connect Offline.
- Are only supported in API version 11.0 and later. In the API, using the `upsert` call on relationship group members is not supported.

Creating Relationship Groups

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. To create a new relationship group:

1. On the Relationship Groups home page, click **New** next to `Recent Relationship Groups`.
2. Enter the name and description of the relationship group:
 - a. Enter a name for the relationship group.
 - b. Optionally, enter a description for the relationship group.
 - c. Click **Next** to continue.
3. Define the members of the relationship group:
 - a. Use the lookup fields to select the appropriate records.
 - b. In the `Role` drop-down list, specify the appropriate role for each person in the relationship group.
 - c. Designate one of the records as primary.
 - d. Designate another record as secondary.
 - e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
 - f. Select `Include in Roll-up` for the accounts whose related activities and custom objects should display on the relationship group detail page.
 - g. Click **Save** to finish.
4. After completing the wizard, the detail page of the new relationship group displays so you can review your work.

 **Note:** You can also add an account to a new or existing relationship group. To add an account, go to the Relationship Group Members related list and click **New**.

Adding Accounts to Relationship Groups

Salesforce provides an easy wizard so you can quickly create and edit relationship groups. On the Accounts tab, you can add an account to a new or existing relationship group:

1. Open the detail page for the account you want to add to a relationship group.
2. On the Relationship Group Members related list, click **New**.
3. Choose whether to add the account to an existing relationship group or a new relationship group:
 - If you are adding the account to an existing relationship group, click the lookup icon to find the appropriate relationship group.
 - If you are adding the account to a new relationship group, enter a name and optionally a description for the new relationship group.
4. Click **Next**.
5. Define the members of the relationship group:
 - a. Use the lookup fields to select the appropriate records.
 - b. In the **Role** drop-down list, specify the appropriate role for each person in the relationship group.
 - c. Designate one of the records as primary.
 - d. Designate another record as secondary.
 - e. Optionally, click **Add Member** as needed to include additional members. You can add a maximum of 20 records to a relationship group.
 - f. Select **Include in Roll-up** for the accounts whose related activities and custom objects should display on the relationship group detail page.
 - g. Click **Save** to finish.
6. After completing the wizard, the detail page of the new relationship group displays so you can review your work.

Displaying and Editing Relationship Groups

 **Note:** Relationship groups are only available upon request to [Salesforce for Wealth Management](#) customers. Note that the Relationship Groups tab may be named “Households” in Salesforce for Wealth Management organizations. To enable relationship groups, contact your Salesforce representative.

The following sections describe how to display and edit relationship groups:

- [Accessing the Relationship Groups Tab](#)
- [Viewing Relationship Group Lists](#)
- [Displaying Relationship Group Records](#)
- [Editing Relationship Group Records](#)

Accessing the Relationship Groups Tab

The Relationship Groups tab is available by default in the Relationship Groups app. To switch to the Relationship Groups app, select Relationship Groups from the Force.com app menu in the top right corner of every Salesforce page.

Note that your administrator may have customized your profile to also display the Relationship Groups tab in other apps.

Viewing Relationship Group Lists

You can work with relationship group list views as you would any other custom object. .

Displaying Relationship Group Records

To open an individual relationship group record, click a relationship group name on the relationship groups home page or a relationship groups list view.

Note the following when viewing related lists on the relationship group detail page:

- The Relationship Group Members related list summarizes the accounts that are members of the relationship group. In the `PRIORITY` column, the icons ( and ) show which accounts are defined as primary or secondary for the relationship group. For more information on relationship group members, see [Relationship Group Members](#) on page 1244.
- The Activity History and Open Activities related lists on a relationship group are roll-ups of activities for the relationship group members; relationship groups themselves do not have their own tasks and events.
- If accounts have a relationship with a custom object, a related list for that custom object can display on the relationship group detail page. This requires that `Include in Roll-Up` is selected on an associated relationship group member record. For example, in the following theoretical scenario, the vehicles associated with members of the Stone family display in a Vehicles related list on both the account detail page and the relationship group detail page:
 - The account Sam Stone has a Toyota Prius car tracked in the Vehicles custom object related list on the account detail page
 - The account Chris Stone has a Ford Mustang car tracked in the same related list
 - Sam and Chris Stone are members of the Stone Family relationship group
 - Both associated relationship group member records have `Include in Roll-Up` selected

[Relationship Groups Overview](#)

Deleting Relationship Groups

Relationship groups are custom object records that you can delete as you would any other record.

A relationship group is the master object in a master-detail relationship with relationship group members. Consequently, when you delete a relationship group, all relationship group members on that relationship group are also deleted. Restoring a relationship group from the Recycle Bin also restores the associated relationship group members that were deleted. However, if you delete a relationship group that contains the same relationship group member as a deleted account, the shared relationship group member cannot be restored from the Recycle Bin.

Removing Members from Relationship Group Members

To remove an individual relationship group member, go to the Relationship Group Members related list on an account or relationship group detail page and click **Del** next to the appropriate relationship group member record.

Relationship group members are unique because they have two master-detail relationships: one with accounts and another with relationship groups. Also, there are rules that govern the number of relationship group members a relationship group can have, as well as prevent more than one relationship group member from being specified as either primary or secondary on a given relationship group. The following considerations apply to deleting relationship group members:

Deleting Accounts with Relationship Group Members

When you delete an account, its associated relationship group members are also deleted. However, you cannot restore an account from the Recycle Bin if restoring the account's deleted relationship group members would violate rules such as the maximum of 20 relationship group members per relationship group. Also, if you delete an account that shares a relationship group member with a deleted relationship group, the shared relationship group member is automatically purged from the Recycle Bin.

Deleting Relationship Groups with Relationship Group Members

See [Deleting Relationship Groups](#) on page 1253.

Restoring Individual Relationship Group Members

You cannot restore an individual relationship group member from the Recycle Bin in the following scenarios:

- Restoring the record would violate rules such as the maximum of 20 relationship group members per relationship group
- The deleted relationship group member was deleted during an account merge

Relationship group members are automatically and irrecoverably removed from the Recycle Bin in the following scenarios:

- If both parents (the relationship group and the account) of a relationship group member are deleted, the relationship group member is removed
- If a relationship group member is deleted individually and then one of its parents is deleted, the relationship group member is removed

[Five Steps for Managing Campaigns](#)

Campaigns Home

Clicking on the Campaigns tab displays the campaigns home page. Any user can access the campaigns home page.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- In the **Recent Campaigns** section, select an item from the drop-down list to display a brief list of the top campaigns matching that criteria. From the list, you can click any campaign name to go directly to the campaign detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Campaigns Tab" search layout defined by your administrator and by your field-level security settings (available in Professional, Enterprise, Unlimited, Performance, and Developer Editions). The Recent Campaigns choices are:

Recent Campaigns Choice	Description
Recently Viewed	The last ten or twenty-five campaigns you viewed, with the most recently viewed campaign listed first. This list is derived from your recent items and includes records owned by you and other users.
My Active Campaigns	The most recent ten or twenty-five campaigns marked as Active, with the most recently created campaign listed first. This list only includes records owned by you.

- In the **Recent Campaigns** section, click **New** to create a new campaign.

[Campaigns](#)

[Manage Campaigns](#)

Manage Campaigns

We recommend that you follow these steps to make your marketing programs and post-campaign analysis more effective.

See the [Campaign Management Implementation Guide](#) for additional information.

1. Create the campaign

After determining your marketing strategy, create a campaign to track your efforts.

2. Create your target list

Next define who you want to target with your campaign. The method used to create a target list depends on who you are targeting:

- **Rented or Purchased Lists** - Simply use the list of names as your target list. We recommend that you do not import the names into the system yet.
- **Existing Contacts, Leads, or Person Account** - Run a contact, lead, or person account report in Salesforce. Then use the **Add to Campaign** button to associate those records with your campaign. Alternatively, go to a list view of contacts or leads and use the **Add to Campaign** button to associate those records with your campaign. Note that person accounts are included in contact list views and can be added to campaigns from them. See [Managing Campaign Members](#) on page 1266.

3. Execute the campaign

All campaign execution occurs outside of Salesforce. It can be online or offline. For example:

- **Online** - Send email using an email execution vendor.
- **Offline** - Plan and host a conference; run print or radio advertisements; send direct mail pieces; or host a Web seminar.

4. Track responses

The possible types of campaign responses can be divided into the following groups based on the response tracking mechanism:

- **Website Response** - Prospects respond by filling in a form on your website. Use Web-to-Lead to set up a jump page or microsite for the campaign. All responses are created as leads, and if the Web form includes the `Campaign` field value, the leads are directly associated to the campaign. You can also include the `Member Status` field in the form to automatically mark all submissions with a particular member status.
- **Manual Update** - Customers and prospects respond via phone or mail. A sales or marketing team member can manually update the Campaign History for the lead, contact, or person account.
- **Mass Update/Offline Response** - The third type of response is any response that you track in an offline list, for example, trade show attendance or email responses from your email vendor. In Salesforce, use the Manage Members page to update the member status of leads, contacts, or person accounts that have been associated with your campaign. See [Editing Multiple](#)

To change campaigns:

- "Edit" on campaigns

AND

Marketing User checked in your user information

[Campaign Members](#) on page 1268. Alternatively, import the offline list into Salesforce via the Data Import Wizard. See [Update Campaign Member Statuses with the Data Import Wizard](#).

5. Analyze campaign effectiveness

The final step is to analyze the effectiveness of the campaign using reports and campaign statistics. See [Displaying and Editing Campaigns](#) on page 1258 for information on calculating statistics.

SEE ALSO:

[Campaigns FAQ](#)

[Who can import campaign members?](#)

Viewing Campaign Hierarchies

A campaign hierarchy allows you to group campaigns together within a specific marketing program or initiative, which enables you to analyze related marketing efforts more efficiently.

To view the hierarchy for a campaign, click **View Hierarchy** next to the `Campaign Name` field on the campaign detail page. If a campaign is not part of a hierarchy, its corresponding Campaign Hierarchy page shows only the campaign you selected.

A campaign hierarchy shows campaigns that are associated with one another via the `Parent Campaign` field. A hierarchy illustrates a relationship between campaigns, such as a grouping of campaigns within a specific marketing tactic. Each campaign can have only one parent campaign but an unlimited number of sibling campaigns, and a campaign hierarchy can contain a maximum of five levels or generations. In other words, a campaign hierarchy has a maximum depth of five levels but an unlimited breadth on each level. Campaign members, such as contacts and leads, can be included on any level.

On the Campaign Hierarchy page, campaigns are indented to show that they are related to the campaigns above them. Campaigns are listed in descending order based on their hierarchy level. Click any campaign name to open the detail page for that campaign.

Statistics for an individual campaign are in the Campaign Statistics section of the campaign detail page. Aggregate statistics for parent and child campaigns are in the Campaign Hierarchy related list.

 **Note:** To ensure accurate reporting, all campaigns in a hierarchy must use the same currency.

[Set Up Campaign Hierarchies](#)

[Viewing Campaign Hierarchy Statistics](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view campaigns:

- "Read" on campaigns

Viewing Campaign Hierarchy Statistics

Campaign detail pages include a Campaign Hierarchy related list, which displays a parent campaign and all the campaigns directly below the parent campaign in the campaign hierarchy. You can create a campaign hierarchy by associating campaigns with one another using the `Parent Campaign` lookup field on the campaign detail page. Click any campaign in the related list to open the detail page for that campaign.

The Campaign Hierarchy related list provides statistics fields for each campaign in the list as well as the total value for the parent campaign and all the campaigns below it in the campaign hierarchy. Statistics fields are not visible in the related list until campaign hierarchies are enabled for your organization. For more information and a list of fields, see [Set Up Campaign Hierarchies](#) on page 1262.

The Campaign Hierarchy related list shows a maximum of two hierarchy levels: the parent campaign and its child campaigns. If a child campaign has children, those children do not appear in the related list but their data is included in the campaign hierarchy statistic field values. The campaign hierarchy statistic fields provide aggregate data regardless of whether you have sharing rights to view individual campaigns within the hierarchy. However, if you do not have access to a campaign that appears in the related list, you cannot view its detail page from the link on the related list. To view all the levels in a campaign hierarchy, click the **View Hierarchy** link next to the `Campaign Name` on the campaign detail page.

Displaying and Editing Campaigns

Displaying Campaigns

Once you have located a campaign on the campaigns home or list pages, click the campaign name to display detailed information. You can also select a campaign name from the Campaign History related list of an associated lead, contact, or person account. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

Editing Campaigns

To update a campaign, click **Edit**, and then change the fields you want to update. When you have finished, click **Save**. You can also click **Save & New** to save the current campaign and create another.

Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.

Note: To edit a campaign that is a child of another campaign, you must have at least "Read" access on the parent.

Creating Campaign Hierarchies

When creating or editing a campaign you can use the `Parent Campaign` lookup field to assign a parent to your campaign. In the lookup dialog you can search for an existing campaign or create a new parent campaign. For more information on configuring campaign hierarchies for your organization, see [Set Up Campaign Hierarchies](#) on page 1262.

Calculating Campaign Statistics

The campaign detail includes campaign statistic fields, which are updated automatically and include values from all associated records regardless of whether you have read access to those records. If you have campaign hierarchies enabled, the Campaign Hierarchy related list contains aggregate statistics for a parent campaign and all the campaigns below it in the campaign hierarchy.

Note: The campaign statistics calculation process runs every two minutes and processes one campaign's statistics at a time. If there are a large number of campaigns or campaigns with large numbers of campaign members pending, there may be a delay of 10 minutes or more.

Linking Contacts, Leads, or Person Account to Campaigns

Select an option from the **Manage Members** drop-down button on the campaign detail page.

Advanced Setup

Click **Advanced Setup** to customize the `Member Status` values for a campaign. The `Member Status` values are the possible responses that a member can have to the campaign, for example, "Sent," "Responded," "Attended." See [Customizing Campaign Setup](#) on page 1261.

Campaign Related Lists

- Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.
- The lower portion of the display provides information related to the campaign including activities, attachments, campaign members, campaign hierarchies, and the opportunities that resulted from the campaign. The related lists you see are determined by your personal customization, and by any customization your administrator has made to page layouts or your permissions to view related data. You can click individual items to display additional detail. Click **More** at the bottom of the page or **View More** below a related list to display more items.

Printing Campaigns

To view a printable display of all information for the campaign, click **Printable View** on the campaign detail page. Use your browser's Print function to print the display.

Sharing

To share a campaign with other users, groups, or roles, click **Sharing**. See [Sharing Campaigns](#) on page 1289.

To return to the last list page you viewed, click **Back to list** at the top of the campaign detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

Add Individual Members to Campaigns

Hand-pick individual campaign members from contact, lead, or person account detail pages.

1. From a contact, lead, or person account detail page, click **Add to Campaign**.
2. Specify the campaign.
3. On the Campaign Member Edit page, specify the campaign member status.
4. Save your work.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To add or clone a campaign member:

- "Read" on campaigns
AND
"Edit" on leads and contacts

To edit individual campaign members:

- "Read" on campaigns
AND
"Read" or "Edit" on leads or contacts

Customizing Campaign Setup

For each campaign, Marketing Users must define campaign `Member Status` values that a lead, contact, or person account has for a campaign. For example, you could define values of “Planned,” “Sent Invitation,” “RSVP,” and “Attended” for a conference. Not available in Lightning Experience.

User Privileges for Customizing Campaign Setup

- Anyone can view a campaign's advanced setup. You can *edit* advanced setup if:
 - The `Marketing User` checkbox is selected in your user information
 - You have the “Edit” permission on campaigns
 - You have at least create sharing access on the campaign record
 - You are working in Salesforce Classic
- If you [replace member status values](#), all campaign records are updated regardless of your sharing access to the related contacts or leads.

Defining Member Status Values

New campaigns have two default member status values: “Sent” and “Responded”. You can edit or create them.

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Edit**.
3. Update the existing entries or add new values.
4. Click **Add More** to add entries. You can add up to 50 entries.
5. Select one entry as the “Default” value.
6. Choose which values count as “Responded.” Members with “Responded” values are tallied in the `Total Responses` field on the campaign.

 **Note:** Modifying the Responded checkbox has broad effects. When you select or deselect the Responded checkbox, [campaign statistics](#) and campaign member details change accordingly. Specifically, the fields `Responded`, `Last Responded Date`, and `Last Modified` change on the campaign member record. For example, if you're working with a status called “Attended” and you select the `Responded` checkbox, existing campaign members whose status is “Attended” are counted as responses in campaign statistics and the date fields updated.

Replacing Member Status Values

You can globally replace the `Member Status` values for each campaign member. For example, you decide that “Attended” is a more appropriate value than “Showed Up.”

1. Click **Advanced Setup** on a campaign detail page.
2. Click **Replace** in the Member Status Values related list.
3. Enter the value you want to change, and select the new value.
4. Click **Save**.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view campaigns:

- “Read” on campaigns

To customize member status values:

- “Edit” on campaigns

AND

`Marketing User` checked in your user information

 **Note:** Replacing the campaign member status doesn't recalculate roll-up summary fields or fire workflow, triggers, or validation rules.

[Managing Campaign Members](#)

Set Up Campaign Hierarchies

Analyze and report on the health of your related campaigns. By associating campaigns with one another using a lookup relationship, you can group campaigns within a specific marketing program or initiative.

Hierarchies contain up to five levels. Each campaign can have one parent campaign, but an unlimited number of sibling campaigns.

To set up campaign hierarchies, add the `Parent Campaign` field to your campaign page layout and enable the campaign hierarchy statistics fields.

Use field-level security to make the fields visible. As you make each field visible, Salesforce displays the field's value in the **Hierarchy Total** section of the Campaign Hierarchy related list.

 **Note:** The campaign hierarchy fields provide aggregate data for a parent campaign and all the campaigns below it in the campaign hierarchy, regardless of whether a user has sharing rights to a particular campaign within the campaign hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy fields. If you do not want users to see aggregate hierarchy data that includes campaigns to which the users do not have access, you can choose to remove any or all of the campaign hierarchy fields from the Campaign Hierarchy related list. If you do not add the campaign hierarchy fields to the related list or page layout, you can still access these fields on reports.

Once campaign hierarchies are set up, users can create and assign parent campaigns using `Parent Campaign` and then view details about the hierarchy on the Campaign Hierarchy page or the Campaign Hierarchy related list.

 **Note:** All campaigns within a hierarchy must use the same currency.

The Campaign Hierarchy page, accessible from the **[view hierarchy]** link next to the **Campaign Name** on the campaign record, shows all the levels in a hierarchy and the campaigns included in each level. For more information, see [Viewing Campaign Hierarchies](#) on page 1257. The Campaign Hierarchy related list provides aggregate data for the parent campaign and all the campaigns below it in the hierarchy. For more information see [Viewing Campaign Hierarchy Statistics](#) on page 1258.

Associating Influential Campaigns to Opportunities

Add Influential Campaigns to an Opportunity

Associate multiple influential campaigns to a single opportunity.

If enabled, automatic association will add influential campaigns to opportunities when the campaign is related to a contact that is assigned a contact role on the opportunity prior to the opportunity close date. You can specify additional automatic association criteria, including a campaign influence time frame that limits the amount of time a campaign can influence a new opportunity after the campaign first associated date and before the opportunity created date. Influential campaigns can also be added to opportunities manually by clicking the **Add Campaign** button in the Campaign Influence related list.

1. From the object management settings for Opportunities, go to Page Layouts.
2. Add the [Campaign Influence related list](#) to the opportunities page layout.
3. [Set up campaign influence.](#)

SEE ALSO:

[Campaign Fields](#)

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To set up campaign influence:

- "Customize application"

To view the campaign influence related list:

- "Read" on campaigns

AND

"Read" on opportunities

To manually add influential campaigns:

- "Read" on campaigns

AND

"Edit" on opportunities

Configure Campaign Influence

Setting up Campaign Influence

You can configure influential campaigns to be automatically added to opportunities. When automatic association is enabled, influential campaigns are added to opportunities when a campaign is related to a contact that is assigned a contact role on an opportunity prior to the close date of the opportunity. For example, if you have an email campaign with a member who is assigned a contact role on an open opportunity, the email campaign will be added to the Campaign Influence related list for that opportunity.

You can set a Campaign Influence Time Frame that specifies the maximum number of days between the campaign first associated date and the opportunity created date, during which a campaign is considered influential. For example, if you specify a Campaign Influence Time Frame of 15 days and one of your contacts becomes a member of a campaign on June 1, the campaign is considered influential to any opportunity that is created and associated with the contact by June 15. Use the association rules to configure additional criteria that campaigns must meet to be automatically associated to an opportunity.

When automatic association is disabled, users must manually add influential campaigns to opportunities using the [Campaign Influence related list](#).

To set up automatic association for campaign influence:

1. From Setup, enter *Campaign Influence* in the Quick Find box, then select **Campaign Influence**.
2. Select **Enabled**.
3. In the **Campaign Influence Time Frame** field, optionally specify the maximum number of days between the campaign first associated date and the opportunity created date.

 **Note:** Campaigns associated to a contact prior to this time frame will not be considered influential. The maximum campaign influence time frame is 9,999 days. If you do not want to specify a campaign influence time frame, leave the **Campaign Influence Time Frame** field blank.

4. Optionally, define additional filter criteria that must be met in order for a campaign to be automatically associated.
5. Click **Save**.

Campaigns will be automatically added to the Campaign Influence related list on opportunities when they meet the criteria you specified.

To disable automatic association for campaign influence:

1. From Setup, enter *Campaign Influence* in the Quick Find box, then select **Campaign Influence**.
2. Select **Disabled**.
3. Click **Save**.

Adding Influential Campaigns to Opportunities

Manage lists of campaigns that influence your opportunities directly on opportunity detail pages.

Consider these details before adding influential campaigns to your opportunities.

- Though multiple campaigns can be influential, you can designate only one campaign as the primary campaign source on the opportunity.
- The campaign you designate as the primary campaign source will always appear in the Campaign Influence related list.
- The opportunities fields of the campaign statistics section on a campaign detail page will populate for only the campaign you designate as the primary campaign source. For example, you have an email campaign and a telemarketing campaign that both influence the same opportunity, and you designate the email campaign as the primary campaign source. The campaign statistics opportunities fields will populate for only the email campaign.
- When you select `Primary Campaign Source`, the `Primary Campaign Source` field on the opportunity detail page updates with the name of the primary campaign. It's possible that workflow and Apex rules on opportunities can be triggered by this change.
- When you add campaigns using **Add Campaign** in the Campaign Influence related list, campaign member details don't appear in the related list.

Let's now add influential campaigns from the Campaign Influence related list.

1. View the detail page of an opportunity.
2. Click **Add Campaign** in the Campaign Influence related list.
3. Enter a campaign name in the `Campaign name` field or click  to search for a campaign.
4. If you want to designate the campaign as the primary campaign, select `Primary Campaign Source`.
5. Click **Save**.

You can also [configure filter criteria](#) that, when met, will automatically add influential campaigns to opportunities. For example, you can configure a filter to add only email and telemarketing campaigns.

Managing Campaign Members

Managing Campaign Members

Campaign members are created from lead, contact, or person account records. Salesforce provides a variety of ways in which you can manage your campaign members. You can search for and add or edit multiple leads and contacts from the Manage Members page. You can add members to a campaign one at a time from contact or lead detail pages. With the Data Import Wizard, you can add up to 50,000 leads, contacts, or person accounts at a time to a campaign. You can also use the Data Import Wizard to update the statuses of up to 50,000 campaign members at a time.

Adding Campaign Members

You can [add new members to a campaign](#):

- Individually from the Campaign History related list on a contact, lead, or person account detail page
- By searching for contacts and leads from the [Manage Members page](#)
- [From a campaign, contact, person account, or lead report](#)
- [From a list view of existing contacts or leads](#)
- [From a CSV import file of existing leads](#)
- [From a CSV import file of existing contacts](#)
- [From a CSV import file of existing person accounts](#)
- [From a CSV import file of new leads](#)
- [From a CSV import file of new contacts](#)

Editing Campaign Members

You can edit the details of existing campaign members:

- Campaign History related list on a contact, lead, or person account detail page
- [From the Campaign Members related list](#) on a campaign detail page
- [From the Manage Members page](#)

Updating the Status of Existing Campaign Members

You can update the status of existing campaign members:

- From the Campaign History related list on a contact, lead, or person account detail page
- [From the Manage Members page](#)
- [From a campaign, contact, person account, or lead report](#)
- [From a CSV import file of existing members](#)

Removing Campaign Members

You can remove members of a campaign:

- From the Campaign History related list on a contact, lead, or person account detail page
- [From the Campaign Members related list](#) on a campaign detail page

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- [From the Manage Members page](#)

Example Uses

- **Create follow-up campaigns**—Search for a custom list view of contacts or leads that is restricted to an earlier campaign and a certain member status, such as “Attended”. Then add items from the generated list to a follow-up campaign. See [Adding Contacts or Leads from a List View to a Campaign](#) on page 1272.
- **Leverage reporting functionality**—Customize a standard report or build a new custom report that returns a list of contacts, person account, or leads that you want to target. With the click of a button, you can add the entire list to a campaign. See [Add Campaign Members from Reports](#) on page 1271.

Editing Multiple Campaign Members

Editing Campaign Members from the Manage Members Page

 **Note:** Before using the Manage Members page, verify that you are using a supported browser.

To update the campaign member status, edit campaign member details, or remove campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Edit Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list on a campaign detail page.
2. On the Existing Members subtab, optionally enter filter criteria to find existing members and click **Go!**.

 **Note:** For campaigns with campaign members created from both leads and contacts, you must have “Read” permission on leads and contacts to see all members. If you only have “Read” on leads, you will only see campaign members created from leads; if you only have “Read” on contacts, you will only see campaign members created from contacts.

3. Select the checkboxes next to the records you want to edit. To select all records on the current page, select the checkbox in the header row.
4. Optionally perform the following actions:
 - To change the campaign member status, select a status from the **Update Status** drop-down list.
 - To remove a member from a campaign, click **Remove**.
 - To edit the details of a campaign member, click **Edit**.
 - To [view, edit, delete, clone, a campaign member](#), click the campaign member's name in the Name column.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still [add contacts or leads to a campaign](#), [update campaign members](#), and [remove campaign members](#) using the campaign member wizards.

Adding Multiple Campaign Members

Adding Campaign Members from the Manage Members Page

You can add leads and contacts as members of a campaign from the Manage Members page. To add contacts to a campaign, the [Add to Campaign checkbox must be enabled](#).

 **Note:** Before using the Manage Members page, verify that you are using a supported browser.

To add campaign members from the Manage Members page:

1. Click **Manage Members** and choose **Add Members - Search** from the drop-down button on a campaign detail page or the Campaign Members related list.
2. On the Add Members subtab, select the **Leads** or **Contacts** radio button to add leads or contacts, respectively.
3. Search for leads or contacts:
 - You can specify search filters and click **Go!**
 - Alternatively, you can select an existing view, such as all open leads, from the Use Existing View drop-down list. Your results will display automatically. If you select an existing view, you can modify its criteria by adding or changing filters, and clicking **Go!**

 **Note:** You cannot modify filter criteria if you selected a view that uses advanced options or that uses more than five filters. Filter criteria will be reflected in your search results for these views, though not all filter criteria will display.

4. Select the checkboxes next to the records you want to add. To select all records on the current page, select the checkbox in the header row.
5. Select a status from the **Add with Status** drop-down list.

A confirmation message will display and you will see the members you added on the Existing Members subtab.

 **Note:** If you are unable to add contacts, enable the [Add to Campaign checkbox](#):

1. From the object management settings for contacts, go to Search Layouts.
2. Click **Edit** next to Contacts List View.
3. Select [Add to Campaign](#).
4. Click **Save**.

The latest Manage Members page is not available in accessibility mode. In accessibility mode, you can still [add contacts or leads to a campaign](#), [update campaign members](#), and [remove campaign members](#) using the campaign member wizards.

- "Edit" on campaigns
- AND
- "Read" on contacts
- AND
- "Read" on reports

To add campaign members from a lead report:

- Marketing User checked in your user information
- AND
- "Edit" on campaigns
- AND
- "Read" on leads
- AND
- "Read" on reports

To add campaign members from a person account report:

- Marketing User checked in your user information
- AND
- "Edit" on campaigns
- AND
- "Read" on contacts
- AND
- "Read" on reports

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

To add leads, contacts, or person accounts from a report to a campaign:

1. Click **Add to Campaign** from a campaign, contact, lead, or person account report that returns lead, contact, or person account records.

 **Tip:** You must have sharing access to view the lead or contact you are adding.

If your report returns more than 50,000 records, the button will be disabled. You can modify your report to return fewer records.

2. Use the lookup icon to choose a campaign to which the report results will be added.
3. Choose a member status for the contacts, leads, or person accounts you are adding to the campaign.
4. Choose whether or not to override the member status of members who already exist in the campaign.

If you choose to override the status of existing campaign members, you will be updating their member statuses to whatever value you selected in the previous step.

5. Click **Add to Campaign**.
6. Review the confirmation screen.
7. Click **Done** to return to the report.

 **Note:** You can add campaign members directly from a tabular, summary, or matrix report, but not from a joined report.

Consider the following additional tips when adding campaign members from a report:

- Campaign members are added in batches, so in the event that the process is interrupted, for example, by clicking **Cancel**, some members will still be added.
- If lead or contact records are edited after you click **Add to Campaign** but before they are actually added, they will not be added to the campaign.
- You cannot add converted leads to campaigns. If any converted leads are included in a report, they will be ignored during the add to campaign process.

Adding Contacts or Leads from a List View to a Campaign

USER PERMISSIONS

To add multiple existing contacts to a campaign:

Marketing User checked in your user information
AND
"Edit" on campaigns
AND
"Edit" on contacts

To add multiple existing leads to a campaign:

Marketing User checked in your user information
AND
"Edit" on campaigns
AND
"Edit" on leads

To add multiple person accounts to a campaign:

Marketing User checked in your user information
AND
"Edit" on campaigns
AND
"Edit" on contacts

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

To add existing contacts, leads, or person accounts to a campaign from a list view:

1. Navigate to a list view of contacts or leads, such as the “My Contacts” list view. You can create custom list views that restrict results according to campaign name and optionally also by campaign member status.

 **Tip:** You must have sharing access to view the lead or contact you are adding.

Note that person accounts are included in contact list views and can be added to campaigns from them.

2. Check the boxes next to the records you want to select. Optionally, check the box in the column header to select all currently displayed items. Up to 250 records can display on the page at a time.
3. Click **Add to Campaign**.
4. In the first step of the wizard, enter the name of the campaign you want to update, or click the lookup icon to search for and select an existing campaign.
5. Choose whether or not to override the member status of members who already exist in the campaign.
If you choose to override the status of existing campaign members, you will be updating their member statuses to whatever value you selected in the previous step.
6. Click **Add to Campaign**.
7. In the second step of the wizard, review confirmation messages about the members you selected. If a selected member already existed in the campaign, then its member status value will have been updated.
8. Click **Done** to exit the wizard and return to the list view.

SEE ALSO:

[Managing Campaign Members](#)

Displaying and Editing a Campaign Member

From the campaign member detail page, you can edit, delete, or clone a campaign member record. Additionally, if the campaign member is based on a lead, you can convert the lead; if the campaign member is based on a contact, you can create an opportunity.

To view the campaign member detail page, click the campaign member's name in the Name, First Name, or Last Name columns on the Campaign Members related list on a campaign detail page or on the Existing Members tab.

 **Note:** To view a campaign member, you must have permissions on the campaign and the lead or contact. For example, to view a campaign member created from a lead, you must be able to view both the campaign and the lead.

To edit the campaign member detail page layout, from the object management settings for campaign members, go to Page Layouts, and then click **Edit** next to the page layout name.

Editing a Campaign Member

To edit a campaign member, click **Edit** on the campaign member detail page, change the fields you want to update, then click **Save**. Fields derived from the contact or lead can only be edited from the lead or contact detail pages.

 **Note:** If your administrator has enabled inline editing for your organization, you cannot use inline editing on the `STATUS` drop-down list on the campaign member detail page. Instead, click **Edit** on the campaign detail page to edit the `STATUS` drop-down list.

Cloning a Campaign Member

To clone a campaign member, click **Clone** on the campaign member detail page, then select a campaign and a contact or lead. Change the fields you want to clone for the new campaign member, then click **Save**.

Deleting a Campaign Member

To delete a campaign member, click **Delete** on the campaign member detail page.

 **Note:** Deleting a campaign member record is permanent; the record is not recoverable from the recycle bin. However, the original lead or contact record is not deleted.

Converting a Lead

If the campaign member was created from a lead, you can click **Convert Lead** on the campaign member detail page to convert the lead. When you convert a lead, the campaign member is still a part of the campaign, but its type changes from lead to contact.

Creating an Opportunity

If the campaign member was created from a contact, you can click **Create Opportunity** on the campaign member detail page to create an opportunity. When you create an opportunity, the campaign member is still a part of the campaign.

Campaign Member Fields

These are the fields (in alphabetical order) that make up a campaign member. Most campaign member fields are derived from the lead or contact record from which the campaign member was created and must be edited from the corresponding lead or contact record. Some of these fields may not be visible or editable depending on your page layout and field-level security settings.

Field	Description
Campaign	The campaign to which the lead or contact belongs.
Campaign Member Currency	The default currency for currency amount fields on the campaign member. Amounts display in the campaign member currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
Campaign Member Type	The record type of the campaign member, which determines the page layout available for the campaign member. (Read only)
City	City portion of the lead or contact's address.
Company (Account)	The company, if the campaign member is based on a lead, or the account, if the campaign member is based on a contact.
Contact	The name of the contact, if the campaign member is based on a contact.
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Created By	User who created the campaign member. (Read only)
Created Date	Date the campaign member was created. (Read only)
Description	Description of the lead or contact.
Do Not Call	Whether the contact wants to be contacted by phone. If you use Data.com, the <code>Phone</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.
Email	Email address of the lead or contact.
Email Opt Out	Whether the contact wants to receive email. If you use Data.com, the <code>Email</code> field value is hidden from search results and on the Contact Card, and it's blank in <code>.csv</code> files that are created when you export records.
Fax	Fax number of the lead or contact.
Fax Opt Out	Whether the contact wants to be included in broadcast faxes.
First Name	First name of the lead or contact.
First Responded Date	Date the campaign member first responded. (Read only)

EDITIONS

Available in: Salesforce Classic

The available fields vary according to which Salesforce Edition you have.

Field	Description
Last Modified By	User who last changed the campaign member record. (Read only)
Last Modified Date	Date the campaign member record was last modified. (Read only)
Last Name	Last name of the lead or contact.
Lead	The name of the lead, if the campaign member is based on a lead.
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Mobile	Mobile phone number for the lead or contact.
Phone	Phone number for the lead or contact.
Responded	Indicates if the campaign member has responded.
Salutation	The salutation for addressing the person, for example, Mr., Ms., Dr., or Prof.
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Status	The status of the campaign member, for example, sent or responded.
Street	Street portion of the lead or contact's address.
Title	The title of the lead or contact, for example, President.
Zip/Postal Code	Zip or postal code portion of the lead or contact's address.

Importing Campaign Members

Add contacts, leads, and person accounts to campaigns via the Data Import Wizard.

With the Data Import Wizard, a designated marketing user can use a CSV (comma-separated values) file to import contacts, leads, or person accounts and track their responses at each stage of a campaign.

For example, you can mark each contact, lead, or person account as "Planned" at the beginning of the campaign. Then mark them as "Responded" after they respond. These responses are referred to as the member statuses.

[Update Campaign Member Statuses with the Data Import Wizard](#)

To update the status of many campaign members at once, launch the Data Import Wizard from the campaign detail page.

Update Campaign Member Statuses with the Data Import Wizard

To update the status of many campaign members at once, launch the Data Import Wizard from the campaign detail page.

Before you begin, make sure that your import file is in CSV format and contains values for these fields.

- Salesforce ID of the campaign member
- Status of the campaign member

 **Tip:** To obtain Salesforce IDs or other values from your org, run reports and then export the report data.

1. From the campaign detail page, select **Manage Members > Update Members - Import File**. The Data Import Wizard appears.
2. Select **Campaign Member Status**, then select **Update existing records**.
3. Select the CSV file that contains your import data, and click **Next**.
4. Map column headers from your CSV file to these fields.
 - Salesforce ID of the campaign member
 - Status of the campaign member
5. Click **Next**.
6. Review the import settings, and then click **Start Import**.

When we finish importing your data, we notify you by email. Review the results and resolve any errors that occurred.

Add Existing Contacts to a Campaign with the Data Import Wizard

USER PERMISSIONS

To add contacts that you own to a campaign via the Data Import Wizard:

Marketing User selected in your user information

AND

“Create” on accounts

AND

“Read” on contacts

AND

“Edit” on accounts and campaigns

AND

“Import Personal Contacts”

To add contacts owned by others to a campaign via the Data Import Wizard:

Marketing User selected in your user information

AND

“Create” on accounts

AND

“Read” on contacts

AND

“Edit” on accounts, contacts, and campaigns

AND

“Modify All Data”

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

To add multiple contacts as members of a campaign, launch the Data Import Wizard from the campaign detail page.

Before you begin, make sure that your import file is in CSV format and contains values for these fields.

- Account: Salesforce ID
- Contact: Salesforce ID
- Contact: Last Name

 **Tip:** To obtain Salesforce IDs or other values from your org, run reports and then export the report data.

These steps describe one recommended method of importing data. You can import data into Salesforce fields that aren't listed here. You can also customize your import by using other options that appear in the Data Import Wizard.

1. From the campaign detail page, select **Manage Members > Add Members - Import File**. The Data Import Wizard appears.
2. Select **Accounts and Contacts**, then select **Update existing records**.
3. Set Match Contact by to **Salesforce.com ID**.
4. Set Match Account by to **Salesforce.com ID**.

5. Select the CSV file that contains your import data, and click **Next**.
6. Select **Assign contacts to campaigns**.
7. Map column headers from your CSV file to these fields.
 - Account: Salesforce ID
 - Contact: Salesforce ID
 - Contact: Last Name
8. Click **Next**.
9. Review the import settings, and then click **Start Import**.

When we finish importing your data, we notify you by email. Review the results and resolve any errors that occurred.

Campaign Fields

A campaign has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Active	Checkbox to mark whether the campaign is active or not.
Actual Cost	Amount of money spent to run the campaign.
Budgeted Cost	Amount of money budgeted for the campaign.
Campaign Currency	The default currency for currency amount fields in the campaign. Amounts display in the campaign currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.
Campaign Member Type	Record type for campaign members; determines the page layout of the members of the campaign.
Campaign Name	Identifying name for the campaign.
Campaign Owner	Assigned owner of the campaign.
Campaign Record Type	Record type for the campaign; determines the picklist values available for the campaign.
Converted Leads	Number of leads that were converted to accounts due to the marketing efforts in the campaign. Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. For more information on converting leads, see Convert Qualified Leads on page 1313. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional**, **Enterprise**, **Performance**, **Unlimited**, and **Developer Editions**

Field	Description
Created By	User who created the campaign including creation date and time. (Read only)
Custom Links	Listing of custom links for campaigns as set up by your administrator.
Description	Description of the campaign. Up to 32KB of data are allowed in this field. Only the first 255 characters display in reports.
End Date	Ending date for the campaign. Responses received after this date are still counted.
Expected Response (%)	Percentage of responses you expect to receive for the campaign.
Expected Revenue	Amount of money you expect to generate from the campaign.
Last Modified By	User who last changed the campaign fields, including modification date and time. This does not track changes made to any of the related list items on the campaign. (Read only)
Num Total Opportunities	Calculated field for number of opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Num Sent	Number of individuals targeted by the campaign. For example, the number of emails sent.
Num Won Opportunities	Calculated field for number of closed/won opportunities associated with the campaign. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.
Parent Campaign	The campaign above the selected campaign in the campaign hierarchy.
Start Date	Starting date for the campaign.
Status	Status of the campaign, for example, Planned, In Progress. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Total Actual Cost in Hierarchy	Calculated field for the total amount of money spent to run a campaign hierarchy. (Read only) Salesforce automatically calculates this amount using all associated records regardless of whether you have read access to them. This field cannot be referenced in formulas for workflow rules, validation rules, field updates, or

Field	Description
Total Budgeted Cost in Hierarchy	approval processes, but it can be referenced in custom formula fields. Updates to this field do not trigger workflow rules.

<p><code>Type</code></p>	<p>Type of campaign, for example, Direct Mail or Referral Program. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.</p>

Sharing Campaigns

Your administrator defines your organization's sharing model for campaign access. However, you can extend sharing privileges for your own campaigns individually. Use campaign sharing to *increase* access to your campaigns; you cannot restrict access beyond your organization's default access levels.

To view and manage sharing details, click **Sharing** on the campaign detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the campaign. On this page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Special Considerations

- To share a campaign, you must have Public Full Access to the campaign and have the `Marketing User` checkbox selected in your personal information.
- The **Sharing** button is available depending on your organization-wide default for campaigns.
- Make sure you are sharing records with users who have the appropriate "Read" object permission for viewing the shared records.
- Sharing a campaign does not automatically grant read access to all the campaign members. Make sure that the user you are sharing a campaign with has visibility to the associated leads or contacts.
- The campaign hierarchy statistic fields provide aggregate data for a parent campaign and all the campaigns below it in the hierarchy, regardless of whether a user has sharing rights to a particular campaign within the hierarchy. Therefore, consider your organization's campaign sharing settings when enabling campaign hierarchy statistics. If you do not want users to see aggregate hierarchy data, remove any or all of the campaign hierarchy statistic fields from the [Campaign Hierarchy](#) related list. These fields will still be available for reporting purposes.

Can I use mass email for my email campaigns?

Mass email is designed for small-scale sales and support mailings, not for marketing purposes. We recommend that you use a third-party email-execution vendor to send emails for marketing campaigns.

[Campaigns FAQ](#)

How can I add contacts and leads to my campaigns?

Your company's campaigns typically target existing customers (contacts) and prospective customers (leads). Both contacts and leads can be associated with your campaigns as campaign members. You can easily add members from a campaign member detail page by clicking the Manage Members drop-down in the campaign detail section or in the Campaign Members related list, then selecting one of the following options.

Adding Contacts to Campaigns

Contact Source	Recommended Campaign Member Tool	Maximum Number of Records
A report of existing contacts	Add Campaign Members from Reports	50,000 per report
A .csv file of existing contacts	Add Existing Contacts to a Campaign with the Data Import Wizard	50,000 per import file

[Campaigns FAQ](#)

How can I calculate the ROI for my campaigns?

The Campaign ROI Analysis Report is located on the Reports tab in the Campaign Reports folder. It calculates your campaigns' performance by return on investment (ROI) and average cost. For each campaign in the report:

- ROI, which is expressed as a percentage, is calculated as the net gain (Total Value Won Opportunities - Actual Cost) divided by the Actual Cost.
- Total Value Won Opportunities is the calculated amount of all closed or won opportunities where the campaign is the Primary Campaign Source on the opportunity.

SEE ALSO:

[Campaigns FAQ](#)

How can I track which opportunities resulted from campaigns?

One key benefit of campaigns is the ability to track how much business has been generated from each campaign. When you create an opportunity, you can fill in the `Primary Campaign Source` field to indicate that the opportunity resulted from a specific campaign.

In addition, when you convert a lead that is linked to a campaign, that campaign is automatically inserted into the opportunity `Primary Campaign Source` field.

If a lead or contact is linked to multiple campaigns, the campaign with which he or she is most recently associated is inserted into the opportunity `Primary Campaign Source` field.

The Opportunities related list on a campaign shows every opportunity that is linked to that campaign. You can also run the Campaign Revenue Report to track which opportunities are linked to your campaigns.

SEE ALSO:

[Campaigns FAQ](#)

How does Primary Campaign Source work?

Primary Campaign Source is the campaign associated with a lead prior to lead conversion. This value can be manually changed in the lead detail. Additionally, it provides 100% of the amount revenue credit to the specified campaign.

SEE ALSO:

[Campaigns FAQ](#)

How is Campaign influence different from ROI reports?

Campaign influence tracks pipeline and revenue for multiple campaigns, and ties all campaigns of a contact role to that opportunity for pipeline and ROI reporting. This is especially helpful for longer deal cycles when more than one campaign contributes to a closed deal or a converted lead.

SEE ALSO:

[Campaigns FAQ](#)

Who has access to campaigns?

Depending on your sharing settings, users in your org can view campaigns, view the advanced campaign setup, or run campaign reports. However, only designated marketing users with the appropriate user permissions can create, edit, and delete campaigns and configure advanced campaign setup. An administrator must select the `Marketing User` option on a user's personal information to designate that user as a marketing user.

In addition, marketing users with the appropriate user permissions can use the Data Import Wizard to add contacts, leads, and person accounts as campaign members. They can also use the Data Import Wizard to update the statuses of campaign members.

Explore Your Salesforce Org's Territory Model

A territory model includes a hierarchy and a list view of parent and child territories. If you manage, administer, or belong to a sales territory, you should explore your territory model to understand how Sales efforts are organized. Drill down to get important details on individual territories, including assigned accounts.

 **Note:** This information applies to Enterprise Territory Management only, not to previous versions of Territory Management.

1. From Setup, enter *Territory Models* in the `Quick Find` box, then select **Territory Models**. The list view displays your org's active territory model. Click the model's label if you want to view its detail page. Along with other details, this page tells you the last time account assignment rules were run to realign the territory.
2. From the list view, click the model's **View Hierarchy** link.
3. Click **Tree View** to expand and explore the hierarchy tree.
4. Within the hierarchy, click a territory label to view its detail page, where you can identify its territory type, assigned users and their access levels, assignment rules, and more.
5. From the top of the page, navigate back to the model's territory hierarchy and check out its other territories.

Managing Accounts by Territory

Territory Management

Territory management is an account sharing system that grants access to accounts based on the characteristics of the accounts. It enables your company to structure your Salesforce data and users the same way you structure your sales territories.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Developer and Performance** Editions and in **Enterprise and Unlimited** Editions with the Sales Cloud

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management. Original Territory Management is available only with [Customizable Forecasts](#) and is not supported with [Collaborative Forecasts](#). If original Territory Management is enabled, you can no longer use Collaborative Forecasts. The newer Enterprise Territory Management can't be used with [Customizable Forecasts](#). Enterprise Territory Management and Collaborative Forecasts can both be enabled and used at the same time in your Salesforce organization, but the two features are not currently integrated to work together.

Particularly if your organization has a private sharing model, you may need to grant users access to accounts based on criteria such as postal code, industry, revenue, or a custom field that is relevant to your business. You may also need to generate forecasts for these diverse categories of accounts. Territory management solves these business needs and provides a powerful solution for structuring your users, accounts, and their associated contacts, opportunities, and cases.

 **Note:** Account ownership and its effect on record sharing remains valid and unchanged when territory management is in use.

Key benefits of territory management include:

- The ability to use account criteria to expand a private sharing model.
- Support for complex and frequently changed sales organization structures.
- Support for transferring users between territories, with the option to retain opportunities.
- Multiple forecasts per user, based on territory membership.
- Territory-based sales reports.

 **Note:** Territory management only affects accounts and the standard objects that have a master-detail relationship to accounts. For example, opportunities are included in territory management but leads are not.

What Is a Territory?

A territory is a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the account. By configuring territory settings, users in a territory can be granted read, read/write, or owner-like access (that is, the ability to view, edit, transfer, and delete records) to the accounts in that territory. Both accounts and users can exist in multiple territories. You can manually add accounts to territories, or you can define account assignment rules that assign accounts to territories for you.

You can also control users' access to the opportunities and cases associated with the accounts in the territory, regardless of who owns the records.

What Is a Territory Hierarchy?

Territories exist in a hierarchy which you can set up with as many nested levels as you wish. For example, you could create a top-level territory named "Worldwide Sales" that has the child territories "North America," "Europe/Middle East," "Latin America," "Africa," and "Asia/Australia." "North America" might have the child territories "Canada" and "United States." "United States" might have the child

territories “Western,” “Central,” “Southern,” and “Eastern.” Finally, “Western” might have the child territories “California,” “Oregon,” “Washington,” “Nevada,” “Arizona,” and “Utah.”

Territory hierarchies do not have to be focused on geography; they can be defined however you like.

How Do Territories Affect Forecasting?

When you enable territory management for your organization, the territory hierarchy also becomes the forecast hierarchy. Your forecast data is derived from the opportunities that are associated with the accounts in your territories. Users have a different forecast for each territory to which they are assigned. For example, if you are assigned to both “California” and “Arizona,” you have a separate forecast for the opportunities you have in each of these territories.” See [Viewing Customizable Forecasts](#) on page 1505.

[Territory Management FAQ](#)

Managing Territories

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Managing your organization’s territories involves the following tasks:

- Organize territories into hierarchies that represent your organization’s forecasting requirements and how users work in your organization.
- Configure organization-wide settings for territory management.
- Create new territories and edit existing territories.
- Assign users to territories.
- Define account assignment rules that evaluate accounts and assign them to territories.
- Select accounts from lists and manually assign them to territories.

USER PERMISSIONS

To manage territories:

- “Manage Territories”

OR

You are a forecast manager. Forecast managers can manage territories of those users working below them in territory hierarchy.

Assigning Opportunities to Territories

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

An opportunity can be assigned to a territory when the opportunity is created—either manually or during lead conversion—or when account assignment rules run that affect existing opportunities. This topic includes the following sections:

- [Territory Assignment for Manually Created Opportunities](#)
- [Territory Assignment for Converted Leads](#)
- [Notes About Territory Assignment for Opportunities](#)

Territory Assignment for Manually Created Opportunities

When an opportunity is created from the Opportunities tab or from the Quick Create area on the sidebar, Salesforce compares the territories associated with the opportunity's account to the territories that the opportunity owner is a member of:

- If there is a single territory that both the account and the opportunity owner belong to, the opportunity is assigned to that territory if "Evaluate this account against territory rules on save" is selected.
- If more than one territory is common to both the account and the opportunity owner, the opportunity is not automatically assigned to any territory. The opportunity owner must manually assign a territory to the opportunity.
- If no territory is common to both the account and the opportunity owner, the opportunity owner cannot assign the opportunity to a territory.

Territory Assignment for Converted Leads

When a lead is converted to an opportunity, that opportunity's territory assignment depends on several factors, including:

- Whether the account associated with the opportunity is assigned to one or more territories
- Whether the lead owner is a member of the same territory as the account
- The number of users assigned to a territory
- Whether a forecast manager is assigned to the territory

If the account associated with the opportunity is assigned to only one territory, use the following table to determine how the opportunity's territory is assigned:

Lead Owner Belongs to Same Territory as Account	Number of Users Assigned to Territory	A Forecast Manager is Assigned to the Territory	Results
Yes	1	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	1	N/A	The opportunity is assigned to the same territory as the account and the opportunity owner is the sole member of the territory.

EDITIONS

Available in: Salesforce Classic

Available in: **Developer** and **Performance** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

USER PERMISSIONS

To create opportunities:

- "Create" on Opportunities

Lead Owner Belongs to Same Territory as Account	Number of Users Assigned to Territory	A Forecast Manager is Assigned to the Territory	Results
No	0	N/A	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.
Yes	>1	Yes	The opportunity is assigned to the same territory as the account and the forecast manager becomes the opportunity owner.
Yes	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner.
No	>1	Yes	The opportunity is assigned to the forecast manager of the territory.
No	>1	No	The opportunity is assigned to the same territory as the account and the lead owner becomes the opportunity owner. The lead owner is added as an inactive member of the territory.

If the account associated with the opportunity is assigned to more than one territory, use the following table to determine how the opportunity's territory is assigned:

Lead Owner's Territory Membership	Results
Lead owner has one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to the account's territory.
Lead owner has more than one territory in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner can assign the opportunity to any territory that he or she has in common with the account.
Lead owner has no territories in common with the account	The opportunity is not assigned to any territories and the lead owner becomes the opportunity owner. The opportunity owner cannot assign the opportunity to any territories.

Notes About Territory Assignment for Opportunities

- The following actions do not change an opportunity's territory:
 - Manually assigning the opportunity's account to a territory

- Changing which account is associated with the opportunity
- Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
- Transferring the opportunity to a new owner
- Territory assignment rules do not update an opportunity if the opportunity's `Close Date` is before the current date and the opportunity's `Stage` is `Closed Won` or `Closed Lost`.
- When an opportunity is not automatically assigned to a territory, we recommend that users be notified if the opportunity is not assigned to a territory manually within one day. You can set up time-based workflow to notify users about unassigned opportunities.
- Restoring an account or opportunity from the Recycle Bin restores the territory assignment, but it does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are inconsistent with the new rules.
- When opportunities are transferred from one user to another, whether individually or as a group, the territory assignment on the opportunities is unaffected. However, if the opportunities are assigned to a user who is not already a member of the opportunity's territory, that user is added as an inactive member of the territory.
- When users are removed from a territory, you can specify who should receive their open opportunities. Also, when users are transferred from one territory to another, you can specify which opportunities the users should continue to own and select a recipient for any remaining opportunities. If you do not specify a recipient:
 - If the parent territory has a forecast manager, the forecast manager takes ownership of the user's open opportunities. The forecast manager is assigned to the territory and `Active in Territory` is unchecked.
 - If the parent territory does not have a forecast manager, the user remains in the territory and `Active in Territory` is unchecked.

How does Salesforce handle territory management?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

In Developer and Performance Edition orgs, and in Enterprise and Unlimited Edition orgs with the Sales Cloud, you can enable Territory Management to organize your users into territories and provide access to accounts and their related opportunities and cases.

In Professional Edition orgs, Salesforce's role hierarchy allows you to manage the roll-up of information among your company's territories. The hierarchy structure is not based on traditional titles, but rather on a hierarchy of roles. Multiple people with different titles can be assigned to the same role. Users always have access to the data that is owned by or shared with users assigned to roles below them in the hierarchy. A user's role also determines which data is accessible to him or her in forecasts.

A typical org may have three levels of roles, for example:

- The top role may include your VPs of sales, marketing, and client services, and your CFO. These users will be able to view all information at lower levels and perform roll-ups on that information.
- The middle level may include various vice president or regional managers. These roles can access the data owned by or shared with all users below them in the hierarchy. For example, the Western VP role can view and perform roll-ups of the information owned by users in the Western Reps role.
- Since no roles are below the various Reps roles, the users in those roles cannot perform any roll-ups or view anyone's information except their own.

 **Note:** Your role hierarchy interacts with your org's sharing model to determine exactly what information a user can see, given the sharing setting is selected to use hierarchies. For forecasts, a user's role always determines which information he or she can view, regardless of the sharing model. Likewise, in a Private sharing model, a user's role determines his or her access to other users' data. However, in a Public Read/Write or Public Read Only org, users can view (and edit, for Public Read/Write) information of all other users, in addition to having access to the data of users below them in the hierarchy.

SEE ALSO:

[Territory Management FAQ](#)

[Territory Management](#)

Are opportunities transferred to different users when account assignment rules are run?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

When account assignment rules cause an opportunity to be reassigned to a territory to which you already belong, you automatically become the owner of that opportunity when you meet any of the following criteria:

- You are the only member of the territory.
- You are the only forecast manager in the territory.
- You are the only territory member enabled for forecasting.

If none of these criteria are met, the original opportunity owner is added to the territory as an inactive member.

SEE ALSO:

[Territory Management FAQ](#)

Are the territory hierarchy and the role hierarchy different?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Yes. The territory hierarchy and the role hierarchy are independent. See the following comparison:

Territory Hierarchy	Role Hierarchy
Is available by contacting Salesforce	Is available by default
Determines forecasts	Has no impact on forecasting when territory management is enabled
Supports assigning a user to multiple territories	Supports assigning a user to only one role
Affects account and opportunity reports	Affects all other reports
Grants access to records regardless of ownership. Users receive whatever access is most permissive across both hierarchies.	Grants access to records based on ownership. Users receive whatever access is most permissive across both hierarchies.

SEE ALSO:

[Territory Management FAQ](#)

How are opportunities assigned to territories?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Opportunities are automatically assigned to territories based on the following actions.

- Creating a new opportunity
- Running account assignment rules

When account assignment rules are run, opportunities are automatically assigned to the same territory as the account when:

- An opportunity does not have a territory and its account is added to a territory.
- An account moves from one territory to another. However, if an account assignment rule prohibits opportunities from moving outside a given part of the territory hierarchy, the opportunities do not move and no longer belong to any territories.

Opportunities are not automatically assigned to the same territory as the account when:

- An account is removed from a territory and not reassigned to a new territory in the same operation. The account's opportunities from the original territory no longer belong to any territories.

- An account is reassigned to multiple territories in one operation. The account's opportunities from the original territory no longer belong to any territories, unless the `Confine Opportunity Assignment` checkbox is checked.

 **Note:** If the opportunity owner is not part of the new territory, he or she is added as an inactive member of the territory.

The following actions do not change an opportunity's territory.

- Manually assigning the opportunity's account to a territory
- Changing which account is associated with the opportunity
- Changing the account's territory as a result of account assignment rules if the opportunity and its account are in different territories
- Transferring the opportunity to a new owner.

SEE ALSO:

[Territory Management FAQ](#)

How do manually assigned accounts differ from those assigned by account assignment rules?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Manually assigned accounts are not evaluated when running account assignment rules. After they have been manually assigned to a territory, they remain there until they are manually removed from the territory.

SEE ALSO:

[Territory Management FAQ](#)

How does opportunity confinement work?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

If the `Confine Opportunity Assignment` checkbox is selected for a territory, the territory's opportunities remain in the territory or its child territories when you run account assignment rules. The following exceptions apply:

- If an opportunity's account moves to only one of the territory's children, then the opportunity follows the account and is reassigned to the account's new territory. This includes when an account moves to multiple territories and only one of the new territories is a child of the original territory.
- If an opportunity's account moves to more than one of the territory's children, then the opportunity's territory field is set to blank.
- If an opportunity's account moves completely out of the territory and its children, then the opportunity's territory field is set to blank.

SEE ALSO:

[Territory Management FAQ](#)

Must I be assigned to the same territories as the opportunities I own?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

When an open opportunity is assigned to you and you do not belong to that opportunity's territory, you are assigned to the territory with `Active in Territory` unchecked in the Assigned Users related list of the territory.

SEE ALSO:

[Territory Management FAQ](#)

What happens when I undelete an account or opportunity that was assigned to a territory?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Undeleting an account or opportunity restores the territory assignment, but does not trigger the evaluation of account assignment rules. If account assignment rules changed while the record was in the Recycle Bin, the restored record may have territories that are not consistent with the new rules.

SEE ALSO:

[Territory Management FAQ](#)

What kinds of records have territories?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Accounts, opportunities, and users have territory fields. Accounts and users can be associated with multiple territories. An opportunity can be associated with only one territory.

SEE ALSO:

[Territory Management FAQ](#)

When do account assignment rules evaluate accounts?

 **Note:** This information applies to the original Territory Management feature only, and not to Enterprise Territory Management.

Active account assignment rules automatically evaluate accounts and assign them to territories when:

- An account is created using the Salesforce user interface, the Force.com API, or a client such as Connect Offline.
- An account is imported using an import wizard.
- An account is created by the conversion of a lead.
- An account is edited and saved if the `Select by default` checkbox is selected for the "Evaluate this account against territory rules on save" checkbox option under **Layout Properties**. If the account assignment rule initiates an opportunity ownership change, you must have transfer access on the opportunity.
- An account is edited and saved via the Force.com API.
- **Run Rules** is clicked on a territory detail page, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.
- **Save & Run Rules** is clicked on the manage account assignment rules page for a territory, provided the `Exclude from territory assignment rules` checkbox on the account is deselected.

- Duplicate accounts are merged.

[Territory Management FAQ](#)

Tracking Potential Opportunities as Leads

Leads

Track prospects apart from your contacts and opportunities with Salesforce lead records. After you've qualified your lead records, convert them to contacts and create accounts for them (if you don't already have the accounts in Salesforce). And hopefully, create opportunities to bolster your pipeline.

Regardless of whether you're working in Lightning Experience or Salesforce Classic, you work with a list of leads. From the list, you quickly create, locate, and work with the leads you're focusing on at the moment.

Associate relevant events and tasks with those leads. And convert your qualified leads to contacts that have opportunities associated to them. For any lead records that you mark Unqualified, plan to revisit them later to see whether those prospects' needs for your products and services changed.

SEE ALSO:

[Convert Qualified Leads](#)

[Manage Email and Templates in Lightning Experience](#)

[Manage Work and View Past Activity in Lightning Experience](#)

Guidelines for Creating Leads

Get some guidance when you manually create leads to track your prospects.

- From the Leads tab in Salesforce Classic, you can automatically assign the lead using the active lead assignment rule. To do so, select **Assign using active assignment rules**. Otherwise, the lead belongs to you.

If you automatically assign the new lead, the record type of the lead can change, depending on the behavior your administrator specified for assignment rules.

- If your sales team uses divisions, the division of a new lead is automatically set to your default division, unless you manually select a different one.
- Your administrator determines the default lead status for new leads.
- The lead is marked as "Read", and doesn't appear in the My Unread Leads list view. But in Salesforce Classic, if you save the lead by clicking **Save & New**, the lead is marked as "Unread."

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Leads Home

Clicking on the Leads tab displays the leads home page.

- In the **Lead Views** section, select a list view from the drop-down list to go directly to that list page, or click **Create New View** to define your own custom view.

To view the leads in a queue, choose that queue list from the drop-down list. For every queue your administrator creates, Salesforce adds a corresponding queue list view.

-  **Note:** The organization-wide sharing model for an object determines the access users have to that object's records in queues:

Public Read/Write/Transfer

Users can view and take ownership of records from any queue.

Public Read/Write or Public Read Only

Users can view any queue but only take ownership of records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

Private

Users can only view and accept records from queues of which they are a member or, depending on sharing settings, if they are higher in the role or territory hierarchy than a queue member.

Regardless of the sharing model, users must have the "Edit" permission to take ownership of records in queues of which they are a member. Administrators, users with the "Modify All" object-level permission for Cases, and users with the "Modify All Data" permission, can view and take records from any queue regardless of the sharing model or their membership in the queue.

- In the **Recent Leads** section, select an item from the drop-down list to display a brief list of the top leads matching that criteria. From the list, you can click any lead name to go directly to the lead detail. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the "Leads Tab" search layout defined by your administrator and by your field-level security settings (available in Professional, Enterprise, Unlimited, Performance, and Developer Editions). The Recent Leads choices are:

Recent Leads Choice	Description
My Unread Leads	The last ten or twenty-five leads assigned to you which you have not yet viewed or edited. This list only includes records owned by you.
Recently Viewed	The last ten or twenty-five leads you viewed, with the most recently viewed lead listed first. This list is derived from your recent items and includes records owned by you and other users.
Recently Created	The last ten or twenty-five leads you created, with the most recently created lead listed first. This list only includes records owned by you.

- If Quick Create has been enabled by your administrator, you can add a new lead from the **Quick Create** area in the sidebar on the leads homepage. Alternatively, click **New** next to the **Recent Leads** section to create a new lead.

Lead Fields

A lead has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

If the lead record was added from Data.com, certain fields, as identified here, will be populated with the Data.com or Dun & Bradstreet (D&B) value, if a value is available. Some Data.com lead fields are available only to organizations that use a specific Data.com product.

Field	Description	Accepts Data.com or D&B Value
Address	Street address for the lead, for example, 475 Boardwalk Ave. Up to 255 characters are allowed in this field.	✓ (Data.com)
Annual Revenue	Amount of annual revenue at lead's company.	✓ (D&B)
Campaign	Name of the campaign responsible for generating the lead. Displays only when creating a new lead. Data entered in this field is stored in the Campaign History related list on the lead.	
City	City portion of the lead's address, for example, San Francisco. Up to 40 characters are allowed in this field.	✓ (Data.com)
Clean Status	The record's clean status, as compared with Data.com. Values are <i>Not Compared</i> , <i>In Sync</i> , <i>Reviewed</i> , <i>Different</i> , <i>Not Found</i> , and <i>Inactive</i> . This field is available if you use Data.com Prospector or Data.com Clean.	✓ (Data.com)
Company	Name of company with which lead is affiliated. Up to 255 characters are allowed in this field.	✓ (D&B)
Company D-U-N-S Number	Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the D&B database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking. This field is available if you use Data.com Prospector or Data.com Clean.	✓ (D&B)

 **Note:** To see the entire D-U-N-S number, either

- Add the lead to Salesforce if you haven't yet, or
- Clean the lead with Data.com if it already exists in Salesforce

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description	Accepts Data.com or D&B Value
	Until you add or clean the record, its first five digits will be masked with asterisks (*).	
Company Name (Local)	Name of the company in the local language.	
Country	Country portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Created By	User who created the lead, including creation date and time. (Read only)	
D&B Company	A link to the corresponding D&B Company record, which displays Dun & Bradstreet (D&B) fields for the lead. Use the lookup if you need to associate a different D&B Company record with the lead. This field is only available to organizations that use Data.com Premium Prospector or Data.com Premium Clean.	✔ (D&B)
Data.com Key	The company's ID in Data.com. When Salesforce records are compared with Data.com records (via manual cleaning or automated clean jobs), if Data.com finds a match, the two records are linked by this field's numeric value.	✔ (Data.com)
Description	Description of the lead. Up to 32KB of data are allowed in this field. Only the first 255 characters appear in reports.	
Do Not Call	Whether the contact wants to be contacted by phone. If you use Data.com, the Phone field value is hidden from search results and on the Contact Card, and it's blank in .csv files that are created when you export records.	
Email	Email address of lead. Must be a valid email address in the form: jsmith@acme.com. Up to 80 characters are allowed in this field. Click the email address in this field to send an email using your personal email application. If the Gmail Buttons and Links feature is enabled, you can click the Gmail link next to the field to send an email from your Gmail account. See Gmail™ in Salesforce on page 3305 for more information.	✔ (Data.com)
Email Opt Out	Whether the contact wants to receive email. If you use Data.com, the Email field value is hidden from search results and on the Contact Card, and it's blank in .csv files that are created when you export records.	
Fax	Lead's fax number. Up to 40 characters are allowed in this field.	
Fax Opt Out	Lead has not requested to be included in broadcast faxes.	
First Name	First name of the lead, as displayed on the lead edit page. Up to 40 characters are allowed in this field.	✔ (Data.com)

Field	Description	Accepts Data.com or D&B Value
First Name (Local)	First name of the lead translated into the local language.	
Industry	Primary business of lead's company. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Last Name	Last name of the lead, as displayed on the lead edit page. Up to 80 characters are allowed in this field.	✔ (Data.com)
Last Name (Local)	Last name of the lead translated into the local language.	
Last Transfer Date	The date the lead owner was last changed.	
Lead Currency	The default currency for all currency amount fields in the lead. Amounts display in the lead currency and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.	
Lead Division	Division to which the lead belongs. Available only in organizations that use divisions to segment their data.	
Lead Owner	Assigned owner of the lead.	
Lead Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a lead process. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.	
Lead Source	Source of lead, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	✔ (Data.com)
Lead Status	Status of the lead, for example, Open, Contacted, Qualified. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Middle Name	Middle name of the lead, as displayed on the lead edit page. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	
Middle Name (Local)	Middle name of the lead translated into the local language.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	

Field	Description	Accepts Data.com or D&B Value
Mobile	Cellular or mobile phone number. Up to 40 characters are allowed in this field.	
Modified By	User who last changed the lead fields, including modification date and time. This does not track changes made to any of the related list items on the lead. (Read only)	
Name	Combined first name, middle name (beta), last name, and suffix (beta) of lead, as displayed on lead detail page.	✔ (Data.com)
No. of Employees	Number of employees at the lead's company.	✔ (D&B)
Phone	Lead's primary phone number. Up to 40 characters are allowed in this field.	✔ (Data.com)
Partner Account	Read-only field that indicates the lead is owned by a partner user.	
Rating	Indicates value or prospect of the lead, for example, Hot, Warm, Cold. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
Read	Flag indicating that the lead has been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Read" do not contain a check mark in the Unread column on leads list views.	
Salutation	Title for addressing the lead, for example, Mr., Ms., Dr., or Prof. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.	
State/Province	State or province portion of user's address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.	
Suffix	Name suffix of the lead, as displayed on the lead edit page. Up to 40 characters are allowed for this field.  Note: To enable this field, contact Salesforce Customer Support. Next, from Setup, enter <i>User Interface</i> in the Quick Find box, then select User Interface . Then select Enable Name Suffixes for Person Names .	
Title	Position of lead within his or her company. Up to 80 characters are allowed in this field.	✔ (Data.com)
Unread	Flag indicating that the lead has not been viewed or edited by the lead owner. Flag is not displayed on lead edit or detail pages. Leads marked as "Unread" contain a check mark in the Unread column on leads list views.	
Custom Links	Listing of custom links for leads as set up by your administrator.	

Field	Description	Accepts Data.com or D&B Value
Website	URL of company's website, for example, www.acme.com. Up to 255 characters are allowed in this field; only the first 50 are displayed.	
ZIP	ZIP code or postal code portion of the lead's address. Up to 20 characters are allowed in this field.	✔ (Data.com)

Convert Qualified Leads

Keep the sales process moving when you qualify a lead and then convert it to a contact. Relate that contact to either an existing account in Salesforce, or an account that you create. And if the lead you're converting results in a deal that looks promising, create an opportunity record at the same time.

Keep in mind that you can't reverse lead conversion. When you convert leads to contacts, the process sometimes creates duplicate records. If so, we tell you. How these duplicate records are handled depends on how your administrator has set up Apex Lead Convert and Duplicate Management. For example, your administrator can require that you resolve the duplicates before you finish converting.

1. After you choose to convert the lead record, select an existing account or enter an account name for the one you're creating.
2. *Salesforce Classic only:* If you update a person account, select the option to overwrite the lead source in the person account with the value from the lead.
3. If you want to create an opportunity record, give it name.
4. Convert the lead.

USER PERMISSIONS

To convert leads:

- "Create" and "Edit" on leads, accounts, contacts, and opportunities

AND

"Convert Leads"

AND

"Read" on any related campaigns

To avoid creating duplicate records when converting leads:

- "Require Validation for Converted Leads"

Considerations for Converting Leads

Learn what happens to qualified leads when you convert them to accounts, contacts, and opportunities.

When you convert qualified leads, Salesforce moves any campaign members to the new contacts. The leads become read-only records, unless your administrator gives you permission to edit them. If existing accounts and contacts share the same names as those specified on the leads, you can choose to update the existing accounts and contacts. Salesforce adds information from the lead into empty fields; Salesforce does not overwrite existing account and contact data.

All open and closed activities from the leads are attached to the accounts, contacts, and opportunities. You can assign the owner of the records, and schedule follow-up tasks. When you assign new owners, only the open activities are assigned to the new owner. If you have custom lead fields, that information can be inserted into custom account, contact, or opportunity fields.

You can't view converted leads, but they appear in lead reports. Salesforce updates the `Last Modified Date` and `Last Modified By` system fields on converted leads when picklist values included on converted leads are changed.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer Editions**

<p>Campaigns</p>	<p>If the lead matches an existing contact and both records are linked to the same campaign, the campaign member status is determined by whichever is further along in the lifecycle of the campaign. For example, if the lead member status is "sent" and the contact member status is "responded," the responded value is applied to the contact.</p> <p>Related campaign information is always associated with the new contact record, regardless of the user's sharing access to the campaign.</p> <p>When more than one campaign is associated with a lead, the most recently associated campaign is applied to the <code>Primary Campaign Source</code> field on the opportunity, regardless of the user's sharing access to the campaign.</p>
<p>Chatter</p>	<p>When you convert a lead to an existing account, you don't automatically follow that account. However, when you convert the lead to a new account, you automatically follow the new account, unless you disabled feed tracking for accounts in your Chatter settings.</p>
<p>Data.com / D&B Company</p>	<p>If you use Data.com Premium, when you add a lead from Data.com, a corresponding D&B Company record (if one exists in Data.com) is automatically created in Salesforce and linked to the lead record via its <code>D&B Company</code> field. If you later convert that lead:</p> <ul style="list-style-type: none"> • And if the account is created from the conversion, the lead's <code>Company D-U-N-S Number</code> field value transfers to the account's <code>D-U-N-S Number</code> field, and the lead's <code>D&B Company</code> field value transfers to the account's <code>D&B Company</code> field. • Its <code>Data.com Key</code> field value transfers to the contact's <code>Data.com Key</code> field. <p>If you use Data.com Corporate, no D&B Company record is created, but the lead's <code>Data.com Key</code> field value transfers to the contact's <code>Data.com Key</code> field.</p>
<p>Divisions</p>	<p>The new account, contact, and opportunity are assigned to the same division as the lead. If you update an existing account during lead conversion, the account's division is not changed, and the new contact and opportunity inherit the account's division.</p>
<p>Duplicate Management</p>	<p>When you convert leads to contacts, the process sometimes creates duplicate records. If so, we tell you. How these duplicate records are handled depends on how your administrator has set up Apex Lead Convert and Duplicate Management. For example, your administrator can require that you resolve the duplicates before you finish converting.</p>

Enterprise Territory Management	Filter-based opportunity territory assignment is not triggered when an opportunity is created through lead conversion.
Existing Contact	When you update an existing contact with a lead that you are converting, lead information in multi-select picklist fields carries over to the existing contact only if the matching fields for the contact are blank.
Local Lead Names	<code>Company Name (Local)</code> on the lead automatically maps to <code>Account Name (Local)</code> , along with their associated standard name fields.
Person Accounts	<p>With person accounts enabled, you can convert leads to either person accounts or business accounts. Leads that don't have a value in the <code>Company</code> field are converted to person accounts. Leads that do have a value in the <code>Company</code> field are converted to business account.</p> <p>We recommend you use different lead record types and page layouts to differentiate leads that will convert to person accounts from those that will convert to business accounts. Specifically, remove the <code>Company</code> field from the page layouts for leads that will convert to person accounts. Then, make the <code>Company</code> field required on the page layouts for leads that will convert to business accounts.</p> <p>If you convert a lead and attach it to a person account that someone else owns, that person account owner becomes the contact owner.</p> <p>If you convert a lead that someone else owns and attach it to a person account that you own, the lead owner becomes the contact owner.</p>
Record Types	<p>If the lead has a record type, the default record type of the user converting the lead is assigned to records created during lead conversion.</p> <p>The default record type of the user converting the lead determines the lead source values available during conversion. If the desired lead source values are not available, add the values to the default record type of the user converting the lead.</p>
Salesforce to Salesforce	When you convert a lead, Salesforce to Salesforce inactivates the shared record and updates the External Sharing related list in your connection's lead record with an Inactive (converted) status. Due to inactivation of the shared record, changes to the Lead Status during conversion aren't reflected in your connection's lead record.
Standard and Custom Lead Fields	<p>The system automatically maps standard lead fields to standard account, contact, and opportunity fields.</p> <p>For custom lead fields, your administrator can specify how they map to custom account, contact, and opportunity fields.</p> <p>The system assigns the default picklist values for the account, contact, and opportunity when mapping standard lead picklist fields that are blank. If your organization uses record types, blank values are replaced with the default picklist values of the new record owner.</p>
Territory Management	If your organization uses territory management, the new account is evaluated by account assignment rules and may be assigned to one or more territories. If the rules assign the account to exactly one territory, then the opportunity will also be assigned to that territory. If the rules assign the account to multiple territories, then the opportunity is not assigned to any territory.
Triggers	<p>During lead conversion, Apex triggers are fired, and universally required custom fields and validation rules are enforced, only if validation and triggers for lead convert are enabled in your organization.</p> <p>Salesforce ignores lookup filters when converting leads if the <code>Require Validation for Converted Leads</code> checkbox on the Lead Settings page is deselected.</p>

Workflow You can't convert a lead that's associated with an active approval process or has pending workflow actions. Converting a lead to a person account won't trigger workflow rules.

When a lead is converted by someone who isn't the lead owner, all workflow tasks associated with the lead that are assigned to that user, except email alerts, are reassigned to the lead owner. Workflow tasks assigned to users other than the lead owner and lead converter aren't changed.

If validation and triggers for lead convert are enabled, then converting a lead can trigger a workflow action on a lead. For example, if there's an active workflow rule that either updates a lead field or transfers the owner of a lead, that rule can trigger when the lead is converted, even if the lead isn't visible on the Leads tab as a result of the conversion. Allow the workflow process to finish before updating lead fields, otherwise save or lead convert fails. If a workflow rule creates a new task as a result of a lead conversion, the task is assigned to the newly created contact and related to the associated account or opportunity.

Lead Sharing in Salesforce Classic

Extend sharing privileges beyond the basic sharing model for your own data on a lead-by-lead basis.

Your administrator defines the sharing model for your company. And if that sharing model for leads is Private or Public Read Only, you can use lead sharing to increase access to your leads. You cannot, however, restrict access beyond your company’s default access levels.

You can see sharing details when you click **Sharing** on the lead detail page.

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Merge Duplicate Leads

Work only the prospects that matter by merging duplicate records.

1. Select a lead record.
2. Click **Find Duplicates**.
3. Select up to three leads in the matching leads list that you want to merge.

If you want, enter a new lead name or company and click **Search** to find another lead to merge. Salesforce performs a phrase search for matches in the `Name` and `Company` fields. It also considers an implied wildcard after any entry. Search results include matches for any fields you enter. For example, you enter *Bob Jones* who works at *Acme*. Search results include anyone named *Bob Jones* at any company and any lead with *Acme* as a company.
4. Click **Merge Leads**.
5. Select one lead as the “Master Record.” Salesforce retains any data from hidden or read-only fields in the Master Record. If you have the “Edit Read Only Fields” permission, you can select which read-only fields to retain. Hidden fields don’t appear during the merge process.
6. Select the fields that you want to retain from each record.
7. Click **Merge**.
8. Click **OK**.

SEE ALSO:

- [Considerations for Merging Duplicate Leads](#)
- [Merge Duplicate Contacts](#)
- [Merge Duplicate Accounts](#)

Considerations for Merging Duplicate Leads

Familiarize yourself with the things to consider before you merge duplicate lead records.

- Salesforce associates any related items from the duplicate leads, such as campaign or activity information, with the newly merged lead.
- If you’re merging duplicate leads that are members of different campaigns, Salesforce retains the campaign `Member Status Updated` date for each lead in the newly merged lead.
- The newly merged lead displays the `Created By` date from the oldest lead you are merging, and shows the merge date as the `Modified By` date.
- The master lead replaces the duplicate leads in all the requested meetings they were invited to. Also, all meeting messages written by the duplicate leads are automatically associated with the master lead. (Meeting messages appear on the requested meeting’s Web page and are visible to all invitees.)
- The master lead replaces the duplicate leads in all the scheduled meetings that the leads were invited to. But make sure to add the new master lead to the meeting invitee list in the scheduled meeting.

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Searching for Leads

1. Enter your search terms in the sidebar or header search box.
 2. Click **Search**.
If you're using local lead names, search finds matches for standard or local lead names.
 3. From the search results, click an item to open it or click **Edit**, if available.
- You can also create a lead list view to find leads that match specific criteria.

SEE ALSO:

[Leads Home](#)

Considerations for Deleting Leads

Know what happens to the records associated with the leads you delete.

When you delete a lead, the lead record moves to the Recycle Bin. Associated notes, attachments, and activities are deleted along with the lead. If you restore the lead, any associated notes, attachments, and activities are also restored.

- [How are lead fields mapped to other fields during conversion?](#)

What is a Lead?

Leads are people who are interested in your product and service. Converting leads to loyal customers will provide success within a business. By managing your leads in a systematic and structured way, you can increase both the numbers of leads you generate and how many leads you convert.

SEE ALSO:

[Leads FAQ](#)

What are the advantages of using leads?

Using leads allows your company to maintain two separate lists - one for prospective customers and one for existing customers. You can store your prospects as leads, and then once a lead becomes qualified, you can convert it to an account, contact, and, optionally, an opportunity.

Leads are especially useful if your company has two separate teams - one that handles lead generation and mass marketing and one that handles sales. The lead generation team can concentrate their work on the Leads tab, and the opportunity team can use the Account, Contact, and Opportunity tabs.

SEE ALSO:

[Leads FAQ](#)

Can I convert existing accounts or contacts into leads?

No. As an alternative, create an opportunity for the account or contact. If you prefer to use a lead, create a report containing the accounts or contacts you want to convert into leads, export them, and then import them as leads.

SEE ALSO:

[Leads FAQ](#)

How many leads can we capture from our website?

In Professional, Enterprise, Unlimited, Performance, and Developer Edition organizations, you can capture up to 500 leads in a 24-hour period. If your organization exceeds its daily Web-to-Lead limit, the Default Lead Creator (specified in the Web-to-Lead setup page) receives an email containing the additional lead information. If your company regularly exceeds the Web-to-Lead limit, click **Help & Training** at the top of any page and select the My Cases tab to submit a request for a higher limit directly to Salesforce.

When your organization reaches the 24-hour limit, Salesforce stores additional requests in a pending request queue that contains both Web-to-Case and Web-to-Lead requests. The requests are submitted when the limit refreshes. The pending request queue has a limit of 50,000 combined requests. If your organization reaches the pending request limit, additional requests are rejected and not queued. Your administrator receives email notifications for the first five rejected submissions. Contact Salesforce Customer Support to change your organization's pending request limit.

SEE ALSO:

[Leads FAQ](#)

What if my company reaches the limit for web-generated leads?

The daily limit for Web-to-Lead requests is 500. If your company generates more leads than the maximum allowed, the Default Lead Creator (specified in the Web-to-Lead setup page) will receive an email containing the captured information. Contact Customer Support if your company would like to generate over 500 Web-to-Lead requests per day.

SEE ALSO:

[Leads FAQ](#)

How do I specify which information to capture online?

When you generate the HTML for your company's website, you can choose which standard or custom lead fields for which you want to gather information. You must create the custom lead fields prior to generating the HTML code. From Setup, enter *Web-to-Lead* in the `Quick Find` box, then select **Web-to-Lead** to set up this feature and generate the necessary HTML.

SEE ALSO:

[Leads FAQ](#)

Can I capture leads from multiple web pages?

Yes. Insert the generated HTML code into the web pages from which you want to capture leads. Whenever someone submits information on any of those web pages, a lead will be created.

SEE ALSO:

[Leads FAQ](#)

How can our webmaster test the Web-to-Lead page?

Add the following line to your Web-to-Lead page code if you want to see a debugging page when you submit the form. Don't forget to remove this line before releasing the Web-to-Lead page on your website.

```
<input type="hidden" name="debug" value="1">
```

SEE ALSO:

[Leads FAQ](#)

Who owns new web-generated leads?

Your administrator can create a lead assignment rule to determine how web leads will be automatically assigned to different users or queues. In addition, your administrator must customize the Lead Settings to specify a Default Lead Owner to whom all web leads will be assigned if the assignment rule fails to locate an owner. If you do not use assignment rules, all web leads will be assigned to the Default Lead Creator (specified in the Web-to-Lead setup).

SEE ALSO:

[Leads FAQ](#)

What status is assigned to web-generated leads?

All new web leads are marked with a status equal to the “default status” that your administrator selects when editing the `Lead Status` picklist values. In addition, web-generated leads are marked with the “Unread” flag; they have a check mark in the Unread column on the lead list views. When a user views or edits a new web lead, the lead is automatically set to “Read.” This way you can easily locate all new leads using the My Unread Leads list view.

SEE ALSO:

[Leads FAQ](#)

How can I be sure that leads won't be lost?

The daily limit for Web-to-Lead requests is 500. If your organization exceeds its daily Web-to-Lead limit, the Default Lead Creator (specified in the Web-to-Lead setup page) receives an email containing the additional lead information.

If a new lead cannot be generated due to errors in your Web-to-Lead setup, Customer Support is notified so that we can assist you in correcting it.

Salesforce ensures that your leads won't be lost if they are submitted during a scheduled Salesforce downtime.

SEE ALSO:

[Leads FAQ](#)

How can I tell which of my leads are new?

When a lead is assigned to you, either manually transferred, imported, or generated from the web, the lead is marked as “Unread,” that is, it has a check mark in the Unread column on leads list views. To view your new leads, select the My Unread Leads list view on the Leads tab. When you view or edit an “Unread” lead, it is automatically marked as “Read.”

SEE ALSO:

[Leads FAQ](#)

What happens when I convert leads?

When you convert leads, Salesforce creates new accounts, contacts, and opportunities using information from the leads you're converting. Salesforce moves any campaign members to the new contacts, and the leads become read-only records. If existing accounts and contacts share the same names as those specified on the leads, you can choose to update the existing accounts and contacts. Salesforce adds information from the lead into empty fields; Salesforce does not overwrite existing account and contact data.

All open and closed activities from the leads are attached to the accounts, contacts, and opportunities. You can assign the owner of the records, and schedule follow-up tasks. When you assign new owners, only the open activities are assigned to the new owner. If you have custom lead fields, that information can be inserted into custom account, contact, or opportunity fields. You can't view converted leads, but they appear in lead reports. Salesforce updates the `Last Modified Date` and `Last Modified By` system fields on converted leads when picklist values included on converted leads are changed.

SEE ALSO:

[Leads FAQ](#)

How are lead fields mapped to other fields during conversion?

When you convert a lead, data in standard lead fields is transferred into standard account, contact, and opportunity fields. For custom lead fields, the data is mapped to custom account, contact, and opportunity fields as specified by your administrator.

Any standard lead picklist fields that are blank automatically inherit the default picklist value for accounts, contacts, and opportunities. If your organization uses record types, all records created during lead conversion adopt the default record type for the owner of the newly-created account, contact, and opportunity.

SEE ALSO:

[Leads FAQ](#)

Can I automatically email leads that come from my website?

Yes. You can create auto-response rules that will email these prospects using templates that vary based on criteria you set up.

SEE ALSO:

[Leads FAQ](#)

Why can't I see the **Sharing** button on a record?

The **Sharing** button lets users grant other users access to a record beyond the organization-wide defaults or sharing rules. You can easily remove this access after it's no longer needed.

You have access to the **Sharing** button when your sharing model is either Private or Public Read Only for a type of record or related record. For example, the **Sharing** button may appear on an account even though your organization-wide default for accounts is Public Read/Write, if your organization-wide default for related opportunities is Public Read Only.

When the button is available on the page layout, administrators see the button on all records. Non-administrators see this button on records that only they own.

Managing Activities, Opportunities, and Products

Plan and Track Meetings and Tasks

Activities

Events and tasks are the engine of sales productivity. With Salesforce, you can be prepared for any meeting and know which task is your highest priority right now. Track meetings and tasks together in lists and reports to keep your finger on the pulse of all your leads, contacts, opportunities, accounts, and campaigns. Events and tasks also serve historical reporting purposes in Salesforce. Whether you're a manager delegating tasks, part of a sales team, or a sales rep who closes 50 deals a month, activities in Salesforce help you power through your day.

1. [Track Activities Together](#)

Activities in Salesforce are your events, your tasks, calls you've made, and emails you've sent. Salesforce gives you multiple ways to track your activities together for a more complete picture of your progress on deals and accounts.

2. [How to Track Your Next Steps and Past Activity](#)

See at a glance what just happened and what to do next on the deals and accounts that you're working on.

3. [Considerations for Using Activities](#)

Keep in mind these considerations for using activities, including the effects of enabling Shared Activities and designating primary contacts, as well as understanding how activities roll up to account records and what the Last Activity date represents.

4. [Considerations for Changing How Activities Roll Up to Accounts](#)

By default, an activity rolls up to a contact's primary account, but this behavior doesn't always make the most sense. For example, if users can relate a contact to multiple accounts, the contact's primary account isn't always relevant to the activity. You can turn off this default roll up behavior from the Activities Settings page, but be aware of the implications.

5. [Activities Reporting](#)

You can run various reports to get insight into the progress and history of your accounts and deals. If your Salesforce admin has enabled Shared Activities, you can run certain standard or custom reports. These reports display details about events, tasks, calls, and emails, and their related contacts, accounts, opportunities, and other associated records.

6. [Access to Activities](#)

Know who can view, create, and delete events and tasks, and when they have access. Calendar sharing and access are controlled separately from access to individual activities.

7. [Activity Reminders in Salesforce Classic](#)

Salesforce displays event and task reminders in a reminder window. When you're using Salesforce Classic, the reminder window opens whenever a reminder is triggered. When you log in to Salesforce Classic, a sound plays if you have reminders that have been triggered since the last time you logged in. You can customize reminders in your personal settings.

8. [Archived Activities](#)

Salesforce archives events and tasks on a schedule according to certain criteria.

[Events and Calendars](#)

[Tasks](#)

Track Activities Together

Activities in Salesforce are your events, your tasks, calls you've made, and emails you've sent. Salesforce gives you multiple ways to track your activities together for a more complete picture of your progress on deals and accounts.

1. [Track Activities Together in Lightning Experience](#)

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. Track events, tasks, calls, and emails—collectively called activities—on the Home page, on the Kanban Board, in the activity timeline, and in reports.

2. [Track Activities Together in Salesforce Classic](#)

You can track events, tasks, calls, and emails—collectively called activities—in lists, calendars, and reports. Track all activities on an account to get a complete picture of the preparation, follow-up, and other planned and completed work associated with the account. Activities share many fields, such as subject, contact name, and related record.

Track Activities Together in Lightning Experience

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. Track events, tasks, calls, and emails—collectively called activities—on the Home page, on the Kanban Board, in the activity timeline, and in reports.

- Use the Home page.
On the Home page, Upcoming Events shows the next five meetings on your calendar today, and Today's Tasks shows your next five tasks due today. Past events drop off Upcoming Events as the day progresses.
- Use the Kanban Board.
A yellow triangle on an opportunity or a lead indicates that the deal has no scheduled meetings or tasks. To get the deal moving, click the triangle and create an activity.
- Use the activity timeline.
The activity timeline displays your open tasks, upcoming meetings, and past activity (including calls logged and emails sent) on an opportunity, a lead, an account, or a contact.
- Use activities reports.
You can run various reports to get insight into the progress and history of your accounts and deals. If your Salesforce admin has enabled Shared Activities, you can run certain standard or custom reports. These reports display details about events, tasks, calls, and emails, and their related contacts, accounts, opportunities, and other associated records.

Track Activities Together in Salesforce Classic

You can track events, tasks, calls, and emails—collectively called activities—in lists, calendars, and reports. Track all activities on an account to get a complete picture of the preparation, follow-up, and other planned and completed work associated with the account. Activities share many fields, such as subject, contact name, and related record.

Activities List Views

Salesforce provides several list views of activities. You can also define your own.

All Activities

Shows events and tasks that you can view. In Personal Edition, the All Activities list view shows all your activities.

My Activities

Shows events and tasks that you own.

My Delegated Activities

Shows activities that you created but that are owned by someone else.

 **Note:** Assigning multiple Salesforce users to an event or task is like delegating that activity to those users. The My Delegated Activities list view also shows activities for all assignees, even if you still own that activity. In the list view, the invited user appears as the person assigned to the activity, but the activity's detail page shows you as the assignee.

My Team's Activities

Shows activities owned by users who report to you in the role hierarchy. For your convenience, your team's activities are converted to your time zone.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

Other Lists of Activities

Open Activities Related List

The Open Activities related list on a record displays all future events and open tasks related to a record.

Activity History Related List

The Activity History related list of a record displays all completed tasks, logged phone calls, saved interaction logs, expired events, outbound email, mass email, email added from Microsoft® Outlook®, and merged documents for the record and its associated records.

Console Tab

The Console tab lets you find, view, and edit activities and their related records on one screen.

Activities Reports

Standard and Custom Activities Reports

You can run various reports to get insight into the progress and history of your accounts and deals. If your Salesforce admin has enabled Shared Activities, you can run certain standard or custom reports. These reports display details about events, tasks, calls, and emails, and their related contacts, accounts, opportunities, and other associated records.

How to Track Your Next Steps and Past Activity

See at a glance what just happened and what to do next on the deals and accounts that you're working on.

1. [Manage Work and View Past Activity in Lightning Experience](#)

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. The Home page and the activity timeline both display your open tasks and upcoming meetings. The activity timeline also shows you past activity on an opportunity, a lead, an account, or a contact.

2. [Work on Open Activities and View Activity History in Salesforce Classic](#)

The Open Activities and Activity History related lists tell you at a glance what just happened and what to do next on the deals and accounts you're working on. Use the buttons and links to create a task, request a meeting or an update from a contact, log a call, or send an email. If you use person accounts, you can enter them in either the `Name` or `Related To` field of an event or a task.

Manage Work and View Past Activity in Lightning Experience

Always know what to do next on each deal that you're working on, and see at a glance what's already happened. The Home page and the activity timeline both display your open tasks and upcoming meetings. The activity timeline also shows you past activity on an opportunity, a lead, an account, or a contact.

- Take the next steps on a deal or account.

On the Home page, Upcoming Events shows the next five meetings on your calendar today. Today's Tasks shows your next five tasks due today.

In the activity timeline, use the Next Steps area to manage open tasks and preview upcoming meetings. Add tasks and meetings using the activity composer above the timeline. You can focus on one kind of activity at a time by choosing a view.

Activities that you add to the timeline appear automatically on the opportunity, lead, or other record that you're working with. Your activities for other related records also appear under Next Steps. If you add a task on an opportunity, the task also rolls up to the contact related to the opportunity.

EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

USER PERMISSIONS

To create tasks and log calls

- "Edit Tasks"

To create events

- "Edit Events"

To send email

- "Send Email"

 **Note:** You can remove a contact or a record on an activity without deleting the activity. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Instead of deleting the task, remove Contact B from the `Name` field.

- View past activity.

The Past Activity area shows your past meetings, calls that you've logged, and emails that you've sent. Like the items under Next Steps, items under Past Activity appear on other related records.

Work on Open Activities and View Activity History in Salesforce Classic

The Open Activities and Activity History related lists tell you at a glance what just happened and what to do next on the deals and accounts you're working on. Use the buttons and links to create a task, request a meeting or an update from a contact, log a call, or send an email. If you use person accounts, you can enter them in either the `Name` or `Related To` field of an event or a task.

Open Activities

The Open Activities related list shows you open tasks, future events, and requested meetings related to other records. For example, suppose that an upcoming meeting on your calendar is related to a contact. That event is displayed in the Open Activities related list of the contact and the account that the contact is related to.

Use Open Activities to do the following:

- Create events and tasks that are automatically related to the record
- Request a meeting with a contact ( denotes a meeting request that's emailed to a contact)
- Ask a contact for an update
- Edit, close, or delete activities on the list

You can send meeting requests and requests for updates to a contact, a lead, or a person account.

Activity History

The Activity History related list shows all completed tasks, logged phone calls, saved interaction logs, expired events, outbound email, mass email, email that's added from Microsoft® Outlook®, and merged documents for the record and its associated records. For example, suppose that you've completed a task related to a contact. That task is displayed in the Activity History related list of the contact and the account that the contact is related to.

Use Activity History to do the following:

Log a Call

Note the results of an unplanned phone call, and schedule a follow-up task. The call appears as a completed task under Activity History, and the task appears under Open Activities.

Mail Merge

Generate personalized documents by using data and Microsoft Word templates that your administrator provides. You can choose whether to show the merged document under Activity History. This button isn't available on all types of records.

Send an Email

Send an email to a contact, and relate the email to the contact and the corresponding account, opportunity, case, or custom object. If the subject is longer than 100 characters, it is truncated with ellipses (...). This button isn't available on all types of records.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

USER PERMISSIONS

To create tasks and log calls

- "Edit Tasks"

To create events

- "Edit Events"

To send email

- "Send Email"

Send Gmail

Send an email to a contact from your Gmail account. If you don't see this link, ask your Salesforce admin to enable Gmail Buttons and Links. If the Gmail to Salesforce feature is also enabled, the email that you send appears under Activity History on the contact or lead record.

Request Update

Send an email to a contact to request updated contact information. You can update your contact record when you receive the response. This email and mass Stay-in-Touch emails appear under Activity History.

View All

Display a printable view of the activity history for the record, if the record has activity history.

Choose Whether to Display Activity in Self-Service Portal

If your Salesforce admin has added the Case Activities related list to the View Cases page layout in the Self-Service portal, and you've set the field-level security to visible for the `visible in self-service` checkbox on activities, you have the following options for each activity.

- **Make Public:** Display a completed activity under Activity History on the case in the Self-Service portal.
- **Make Private:** Hide a completed activity under Activity History on the case in the Self-Service portal.

Considerations for Using Activities

Keep in mind these considerations for using activities, including the effects of enabling Shared Activities and designating primary contacts, as well as understanding how activities roll up to account records and what the Last Activity date represents.

Shared Activities

- You can relate an event or task to up to 50 contacts (but only one lead). The activity is then related to the contacts in the activity timeline, related lists, and reports.
- The detail page for each contact shows related events and tasks in the Open Activities and Activity History related lists, alongside other contact details. Conversely, on the detail page for an event or a task, you see the names of all contacts related to that activity, alongside other details. If you don't see all contacts that you've related to an activity, ask your Salesforce admin to add the Name related list to activity detail page layouts.
- You must designate one contact as the primary contact on the activity. If you delete the primary contact, the next contact on the activity's related list becomes the new primary contact. Or you can manually edit the activity to select a primary contact. Lists and reports display primary and secondary contacts differently.
- If you don't see the option to add more than one contact to an activity, ask your Salesforce admin to enable Shared Activities.

Activities Roll Up to Accounts

Regardless of whether Shared Activities is enabled, the activity's `Related To` field helps determine an activity's relationship to an account.

EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

Content of the <code>Related To</code> Field	Record That the Activity Rolls Up To
An account	That account
An opportunity	The account on that opportunity
A contract	The account on that contract
A custom object with master-detail relationship with the account object	The account on that custom object record

Content of the Related To Field	Record That the Activity Rolls Up To
Something other than the above, including empty	The contact's primary account

If Shared Activities is enabled, then an activity is also related to each contact's primary account.

 **Note:** If your admin has set up your org so that you can relate a contact to multiple accounts, roll up behavior may have been changed so that activities don't roll up to a contact's primary account. For more information, see [Considerations for Changing How Activities Roll Up to Accounts](#).

Last Activity Date

The last activity date is either the due date of the most recently logged event against the record or the most recently closed task associated with the record. The Last Activity date can show up in activities related lists and reports, as well as on record details pages (such as accounts, contacts, and leads).

Regardless of whether Shared Activities is enabled or not, the last activity date for an account record is based on all the activities that roll up to the account via the Related To field. For an account, the last activity date can represent an activity that's related to an opportunity. The last activity date for a contact or lead is based on all the activities that are related to that contact or lead via the Name field.

If Shared Activities is enabled, things change slightly. For account records, the last activity date is still based on the activities that roll up to the account via the Related To field. But if the Related To field is blank, the activities are based on the primary contact's account. The last activity date for contacts and leads is based on only the activities where the contact or lead is the primary contact on the activity.

 **Example:** Jane is a contact who is related to two tasks. Jane is *not* the primary contact for the first task, which has a due date of November 30. Jane *is* the primary contact for the other task, which has a due date of November 15. The Last Activity date on Jane's contact record is November 15.

[Considerations for Using Events and Calendars in Lightning Experience](#)

[Considerations for Using Tasks in Lightning Experience](#)

Considerations for Changing How Activities Roll Up to Accounts

By default, an activity rolls up to a contact's primary account, but this behavior doesn't always make the most sense. For example, if users can relate a contact to multiple accounts, the contact's primary account isn't always relevant to the activity. You can turn off this default roll up behavior from the Activities Settings page, but be aware of the implications.

To fully understand the default roll up behavior, see [Considerations for Using Activities](#).

Existing Activities

When you change the roll up setting, only new activities are affected. Existing activities are only affected if they're updated in a way that causes the roll up to be recalculated, such as when an activity is closed.

Roll Up to Account Records

Like the default behavior, the activity's Related To field determines which account an activity will be related to. But, unlike the default behavior, the activity doesn't roll up to the primary account of the contact that's specified in the Name field.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Last Activity Date

Like the default behavior, the activities that roll up to an account via the `Related To` field determine the last activity date. But, unlike the default behavior, the `Name` field on activities is always ignored when determining an account's last activity date.

Person Accounts

In Salesforce Classic, changing the roll up behavior doesn't affect person accounts. When an activity is related to a person account via either the `Related To` field or the `Name` field, the activity will always appear on the person account record. That's because a person account is its own primary account.

In Lightning Experience, the person account must be specified in the activity's `Related To` field in order for it to appear on the person account record. This is true when Shared Activities is *not* enabled.

Changing the roll up behavior doesn't affect person accounts. When an activity is related to a person account via either the `Related To` field or the `Name` field, the activity always appears on the person account record. That's because a person account is its own primary account.

Lead Convert

If you create an activity while converting a lead but don't create an opportunity from the lead, the activity doesn't roll up to the lead's primary account regardless of what's specified by the activity rollup setting.

Report on Sales Reps' Meetings with Customers

Get insight into how your sales teams are prioritizing their time. Create a custom report that shows which customers sales reps are spending their time with.

1. Create a custom report type.
 - a. For Primary Object, choose **Users**.
 - b. Complete the remaining required fields: label, description, and category.
 - c. Click **Next**.
2. Define a relationship between activities and users.
 - a. Relate the Activity Relationships object to the Users object.
 - b. Click **Save**.
3. Define the fields that appear in this report type.
 - a. In the Fields Available for Reports section, click **Edit Layout**.
 - b. Add the following Activity Relationships fields to the layout: *Date*, *Subject*, *Name*, *Related To*, *Relation Count*.
 - c. Change the label for the *Name* field to *Contact* and for the *Related To* field to *Opportunity*.
 - d. For each field, select the option to display the field by default.
 - e. Click **Save**.
4. Create a report.
 - a. In the Reports tab, select the report type that you created in steps 1–3.
 - b. Choose **Summary Format**, and create a grouping by Full Name.
 - c. Run and save the report.

You now have a report that you can use to help your sales teams optimize the time that they spend with customers.

Note: If Shared Activities isn't enabled, custom reports based on activity relationships don't include event organizers along with invitees, and they don't show events to which no one has been invited.

EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

USER PERMISSIONS

To create, edit, and delete reports:

- "Create and Customize Reports"
- AND
- "Report Builder"

To view activities owned by you and users below you in the role hierarchy:

- No permissions needed

To view all activities:

- "View All Data"

Access to Activities

Know who can view, create, and delete events and tasks, and when they have access. Calendar sharing and access are controlled separately from access to individual activities.

Watch a Demo: [Who Sees What: Organization-Wide Defaults](#)

Several kinds of settings affect your access to events and tasks owned by others in your Salesforce org.

Role

You have access to view and edit your own activities plus activities assigned to people below you in the role hierarchy of your Salesforce org.

Permissions

People with the “View All Data” permission can view all activities.

Sharing Model

When the activity sharing model is “Controlled By Parent,” people with “View All” permission for the type of object on the related record can view the activity.

Important:

- Suppose you relate one or more contacts to an activity that other people can view. Those people can view the activity along with the name, account name, and title of each contact you relate to the activity—regardless of whether they can otherwise view that information.
- An event with the `Private` checkbox selected is accessible only by the person assigned to the event.

Example: You can view an activity when one of the following applies:

- You’re assigned to the activity
- You’re above the user assigned to the activity in the role hierarchy
- You have at least read access to the record to which the activity is related
- You have the “View All Data” permission
- You have the “View All” object-level permission for at least one contact and the related opportunity, account or case, and Shared Activities is enabled
- You have the “View All” object-level permission for the related opportunity or account, where the sharing model applied to the record is “Controlled By Parent”, and Shared Activities isn’t enabled

You can edit or delete an activity (in Salesforce Classic only) when the following applies:

- You have the “Edit Tasks” and “Edit Events” permissions
- AND
- You’re assigned to the activity, or
 - You’re above the user assigned to the activity in the role hierarchy, or
 - You have the “Modify All” object-level permission in the related record, where the record’s sharing model is “Controlled By Parent.” (with Shared Activities enabled, you need the “Modify All” object-level permission for at least one contact and the related record), or
 - You have the “Modify All Data” permission

Available in Salesforce Classic in: **All Editions Except Database.com**

Activity Reminders in Salesforce Classic

Salesforce displays event and task reminders in a reminder window. When you're using Salesforce Classic, the reminder window opens whenever a reminder is triggered. When you log in to Salesforce Classic, a sound plays if you have reminders that have been triggered since the last time you logged in. You can customize reminders in your personal settings.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

Information in Reminder Windows

- Up to 100 of the oldest reminders that you haven't dismissed
- The type of activity—event or task
- The activity subject (click to see activity details)
- When the event is scheduled to start or the task is due
- When the reminder is due or that the reminder is overdue

Order of Reminders

Event reminders are sorted by start date and time, and task reminders are sorted by due date. If the option `Sort reminder window by due date` is *not* set, the window displays reminders in the following order:

1. The task and event reminder date and time.
2. The task due date *or* the event start date and time.
3. Ascending alphabetical order by subject.

If `Sort reminder window by due date` is set, the reminders are displayed in the following order:

1. The task due date *or* the event start date and time; if the task has no due date, then the reminder window displays it first
2. The task and event reminder date and time
3. Ascending alphabetical order by subject

Display of Dates and Times

The table shows how reminders display the event start time or task due date.

Activity Type	Due Date or Time That You Specified	Due Date or Start Time Shown in the Reminder
Event	An event time	The date and time that you selected when you created or edited the event
	An all-day event	The date that you selected and the time set for <code>Start of day</code> in your Personal Information Settings page
Task	A due date	The date that you selected when you created or edited the task
	No due date	The value <code>None</code>

Customizable Reminder Settings

Follow these steps to customize your reminder settings.

1. From your personal settings, enter `Reminders` in the `Quick Find` box, then select **Activity Reminders**.

2. Change the settings as desired.

Table 11: Reminder Settings

Setting	Result When Setting Is Enabled
Trigger alert when reminder comes due	The reminder window opens when a reminder is due.
Play a reminder sound	Salesforce plays a reminder sound when a reminder is due.
By default, set reminder on events to:	Salesforce sets a reminder on all new events. You choose the amount of time before the event start time when you want a reminder; the default is 15 minutes. You can disable the reminder or change the reminder time when you edit an event.
By default, set reminder on tasks to:	Salesforce sets a reminder on all new tasks. You choose the date and time when you want task reminders; the default is 8:00 AM the day that a task is due. You can disable the reminder or change the reminder time when you edit a task.
Sort reminder window by due date	Salesforce sorts reminders by due date first and then by the reminder date and time.

If Salesforce doesn't display reminders that you've set, make sure that your browser isn't blocking pop-ups. To test your settings, click **Does Your Browser Block Reminders?**

Snoozing Reminders

You can snooze one or more reminders at a time. The default snooze option is to remind you again in 5 minutes.

If you click **Snooze** when `Sort reminder window by due date` is not selected, the time overdue is based on the snooze time when the reminder opens again. If you close the reminder window, it opens again when you're notified of the next reminder.

Dismissing Reminders

You can dismiss one or more reminders at a time. To dismiss all reminders in the window, click **Dismiss All**. If the number of reminders exceeded 100 before you clicked **Dismiss All**, then after you click **Dismiss All**, the window displays the additional reminders.

[Personalize Your Salesforce Experience](#)

Archived Activities

Salesforce archives events and tasks on a schedule according to certain criteria.

1. [Criteria for Archiving Activities](#)

Salesforce archives certain year-old events and tasks every Saturday at approximately 5:00 AM Greenwich Mean Time (GMT).

2. [Where Archived Activities Are Displayed](#)

After Salesforce archives activities, you can view them in exported data and in certain locations in Salesforce Classic. Activities are archived regardless of whether you use Salesforce Classic, Lightning Experience, or Salesforce1. However, although you can view archived activities in exported data and in Salesforce Classic, you can't view them in Lightning Experience or Salesforce1.

3. [Considerations for Archiving Activities](#)

Salesforce doesn't delete archived activities, but you can manually delete them. When you create or refresh a sandbox, archived activities aren't copied.

Criteria for Archiving Activities

Salesforce archives certain year-old events and tasks every Saturday at approximately 5:00 AM Greenwich Mean Time (GMT).

Salesforce archives activities as follows.

- Events that ended more than 365 days ago
- Closed tasks due more than 365 days ago
- Closed tasks created more than 365 days ago, if they have no due date

Where Archived Activities Are Displayed

After Salesforce archives activities, you can view them in exported data and in certain locations in Salesforce Classic. Activities are archived regardless of whether you use Salesforce Classic, Lightning Experience, or Salesforce1. However, although you can view archived activities in exported data and in Salesforce Classic, you can't view them in Lightning Experience or Salesforce1.

You can view archived activities in these locations.

- In Salesforce Classic, by clicking **View All** in the Activity History related list
- In Salesforce Classic, in the printable view of the record in the `Name or Related To` field
- By using the URL for the activity, if you know it
- In weekly data export files

Considerations for Archiving Activities

Salesforce doesn't delete archived activities, but you can manually delete them. When you create or refresh a sandbox, archived activities aren't copied.

Events and Calendars

Use Salesforce to track meetings with customers, prospects, and colleagues. Drill down from events to related records, feeds, files, contracts, and more. You can also track events in reports.

1. [Manage Events](#)

In Salesforce, events are a powerful tool for keeping on top of customer relationships and closing deals. You can relate events to opportunities, leads, accounts, and contacts. Track them on those records, in your calendar, and in reports.

2. [Use Calendars to Track and Visualize Dates in Salesforce Objects](#)

Want an easy, visual way to track upcoming or ongoing campaigns? Support cases? Retail store events? Opportunities due to close? Create a calendar from a standard or custom object: Choose a date field that represents data you want to track, and the calendar displays data in that field as calendar items. You can customize most calendars by applying a list view. We've included a few popular examples. You can hide or show calendars, and you can edit and delete them. Some considerations apply to creating calendars.

3. [Calendar Sharing in Salesforce Classic](#)

Grant others access to view or edit your calendar in Salesforce Classic, or view a calendar that a coworker shares with you.

4. [Calendar Views](#)

Calendar views display your events in Salesforce.

5. [Considerations for Using Events and Calendars](#)

Salesforce always displays an event's date and time in the time zone you've chosen in My Settings. Working with meetings and scheduling is different in Lightning Experience and Salesforce Classic.

6. [Invitations and Scheduling in Salesforce Classic](#)

In Salesforce Classic, you can invite people to meetings, accept meeting invites, and use Cloud Scheduler to propose meeting times. You can also create a Microsoft® Outlook® appointment for an event in Salesforce.

[Tasks](#)

Manage Events

In Salesforce, events are a powerful tool for keeping on top of customer relationships and closing deals. You can relate events to opportunities, leads, accounts, and contacts. Track them on those records, in your calendar, and in reports.

1. [Manage Events in Lightning Experience](#)

Create, update, and track meetings using the Home page, your calendar or calendars you create, the Kanban Board, or the activity timeline.

EDITIONS

Available in Lightning Experience in: **Contact Manager, Personal, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Available in Salesforce Classic in: **All Editions Except Database.com**

2. [Manage Events in Salesforce Classic](#)

With your calendar in Salesforce, everyone stays informed—your sales team, your sales manager—and meeting prep is easy. You can track, create, and update your own and others' meetings and invitation responses in different locations in Salesforce. Salesforce displays events in activities list views and calendar views; Chatter feeds; and records that events are related to, such as contacts and accounts. You can also track events in reports.

Manage Events in Lightning Experience

Create, update, and track meetings using the Home page, your calendar or calendars you create, the Kanban Board, or the activity timeline.

- On the Home page, Upcoming Events shows the next five meetings on your calendar today. Past events drop off the list as the day progresses.
- In the navigation menu, choose **Calendar** to work with all your events and to create events. Plus, create other calendars from a standard or custom object: Choose the date field you want to track, and the calendar displays data in that field as calendar items.

You can't share your event calendar with others or invite others to an event, and coworkers can't subscribe to calendars you create.

- On the Kanban Board, opportunities show alerts when no open activities exist. To create an event, click the yellow triangle.
- Use the activity timeline to monitor and update upcoming and past events on an opportunity, a lead, an account, or a contact.
- Use activities reports to view events owned by people below you in the role hierarchy of your Salesforce org.

Note: You can remove a contact or a record from an event without deleting the event. For example, suppose that an event is related to Contact A and Contact B, but you want to relate it only to Contact A. Instead of deleting the event, remove Contact B from the `Name` field.

Manage Events in Salesforce Classic

With your calendar in Salesforce, everyone stays informed—your sales team, your sales manager—and meeting prep is easy. You can track, create, and update your own and others' meetings and invitation responses in different locations in Salesforce. Salesforce displays events in activities list views and calendar views; Chatter feeds; and records that events are related to, such as contacts and accounts. You can also track events in reports.

Track Events

View a Demo: [▶ How to Track Calls, Emails, and Meetings](#)

You can track events belonging to you and to others in the following locations. To see activities list views, click  on the Home tab or any calendar view, or go to the calendar day or week view.

Events That You Own

- The Home tab, in the Calendar section
- An activities list view: Choose an existing list view or customize one
- Your Chatter feed: Follow an event to track posts, comments, and updates about it

Events Owned by People Who Have Shared Their Calendars with You

Events That You've Assigned to Others

- The **My Delegated Activities** list view
- Activities reports

Events Owned by People Below You in Your Organization's Hierarchy

- The **My Team's Activities** list view
- Activities reports

Upcoming Events

- A calendar view
- The **Upcoming Events** list view
- The Open Activities related list for a record related to an event

Past Events

- A calendar view
- The **My Activities** list view
- The Activity History related list for a record related to an event

Events Related to Another Record, Such as a Contact or an Account

- The other record's detail page, in the Open Activities and Activity History related lists
- Your Chatter feed and in the Chatter feed for the other record
- Activities reports

View Event Details

In a calendar view, in an activities list view, in a related list, or on the Home tab, there are two ways to see event details:

- Hover your mouse over an event's subject.
- Click the subject.

On an event detail page, to view the details of a single event in a recurring series () , select the View Event subtab. To view the details for the series, select the View Series subtab.

 identifies events with invitees.

Create Events

On the Home Tab

On the Home tab, under Calendar, click **New Event** or **New Meeting Request**.

In a Chatter Feed

If you create an event in the feed for a record such as a contact, Salesforce automatically relates the event to the record.

In the Sidebar

In the sidebar in Salesforce, in the Create New drop-down list, select **Event**.

On the Detail Page of Another Record

On the Open Activities related list, click **New Event** or **New Meeting Request**. Salesforce automatically relates the event or meeting request to the record.

On the Detail Page of an Event with Invitees

On the detail page of an event that you've invited one or more people to, click **Clone**. You can clone an event that has at least one invitee and isn't a recurring event.

In a Calendar View

- Click **New Event**.
- In a day view, click a time, such as 9:00 AM.
- In a day or week view, double-click a time slot. You can't double-click to create a recurring event or an event that you invite people to. If double-clicking doesn't open a new event, ask your administrator to enable Click-and-Create Events.
- In a week or month view, click **+**.

In an Activity List View ()

In a list view, click **New Event**.

In a List View of Contacts, Leads, or Other Records

In a list view of contacts, leads, or other records, click  at the bottom of the page to add a weekly calendar view to the page. Create an event related to a record by dragging the record from the list view down to a time slot on the calendar. If you don't see , ask your Salesforce admin to enable Drag-and-Drop Scheduling.

-  **Note:** If you schedule meetings with people in a different time zone, your calendar shows their available and busy times in your time zone. An individual person's `Time Zone` setting (as specified on the personal information page) overrides the `Default Time Zone` set for the Salesforce org.

Update Events

Anywhere (except reports) that you can view event details, you can edit any event that you have permission to edit.

You can edit an event in several ways:

- To reschedule an event, in a calendar view, drag the event to a different time slot. For best results, place your mouse over the subject line of the event before dragging it. If the event is a recurring event (), only the single occurrence that you drag is changed, not the entire series.
- Click **Edit** next to the event in an activities list view, an Open Activities related list, or an Activity History related list. The event detail page opens.
- Go to a calendar view, an activities list view, a related list, or the Home tab. Hover your mouse over the subject of an event. A small window with editing options appears.
- Use Cloud Scheduler to collaborate with others in choosing a meeting date and time. When you confirm the meeting date and time, you convert the meeting into a Salesforce event, which you can edit or delete like any other event.

Use Calendars to Track and Visualize Dates in Salesforce Objects

Want an easy, visual way to track upcoming or ongoing campaigns? Support cases? Retail store events? Opportunities due to close? Create a calendar from a standard or custom object: Choose a date field that represents data you want to track, and the calendar displays data in that field as calendar items. You can customize most calendars by applying a list view. We've included a few popular examples. You can hide or show calendars, and you can edit and delete them. Some considerations apply to creating calendars.

1. [Create a Calendar](#)

Here's how to create a calendar based on a standard or custom object in Salesforce.

2. [Create a Calendar of Opportunity Close Dates](#)

See all your opportunities' scheduled close dates at a glance.

EDITIONS

Available in: **Enterprise**, **Unlimited**, and **Developer** Editions

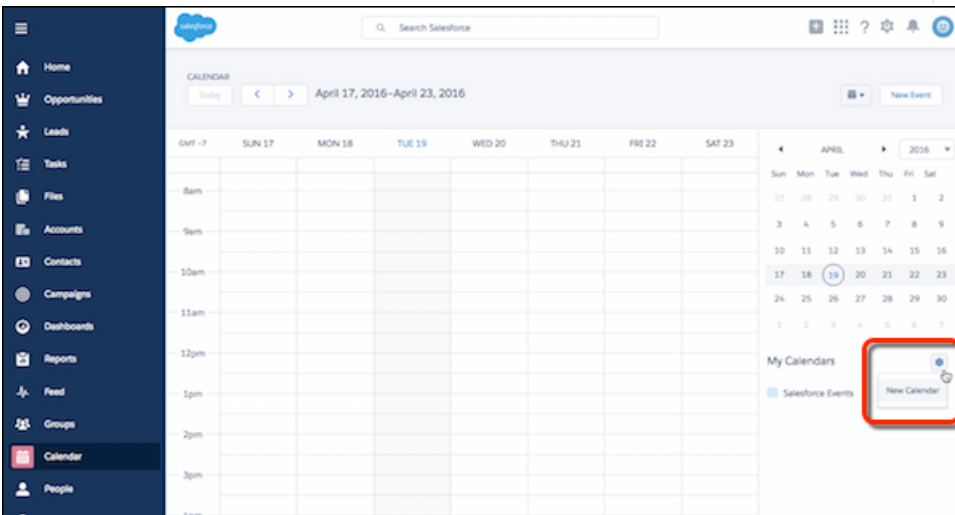

3. [Create a Calendar of Task Due Dates](#)
Make a calendar that shows when your tasks are due.
4. [Create a Calendar of Direct-Mail Campaigns](#)
Get a visual overview of all your direct-mail campaigns.
5. [Create a Calendar to View Open Cases by SLA](#)
Monitor open cases and increase compliance with your service level agreement.
6. [Considerations for Calendars Created from a Salesforce Object](#)
Considerations for calendars created from a Salesforce object include support for list view filtering, a limit on the number of items that can be displayed, no support for subscribing to calendars, and support for standard objects.

Create a Calendar

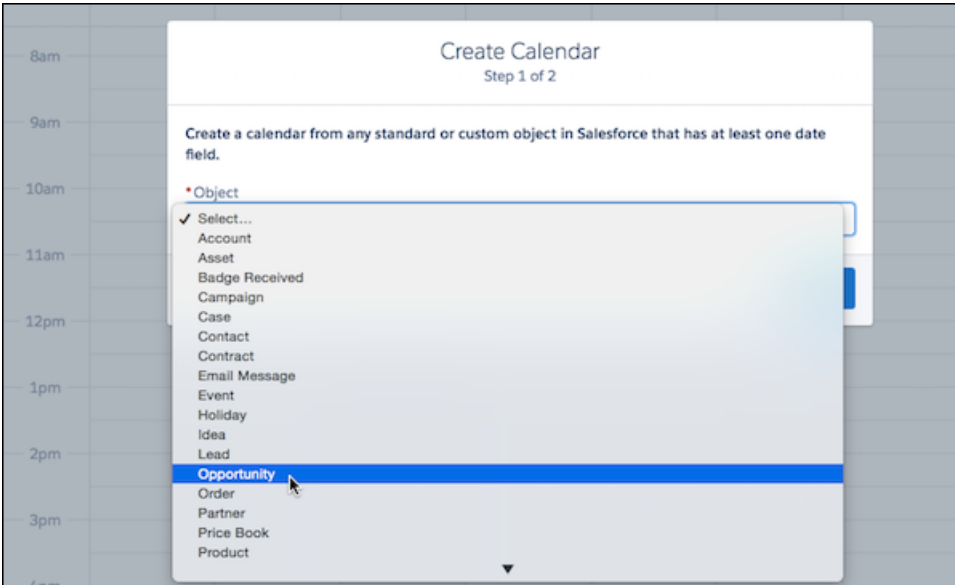

Here’s how to create a calendar based on a standard or custom object in Salesforce.

1. Start creating a calendar.

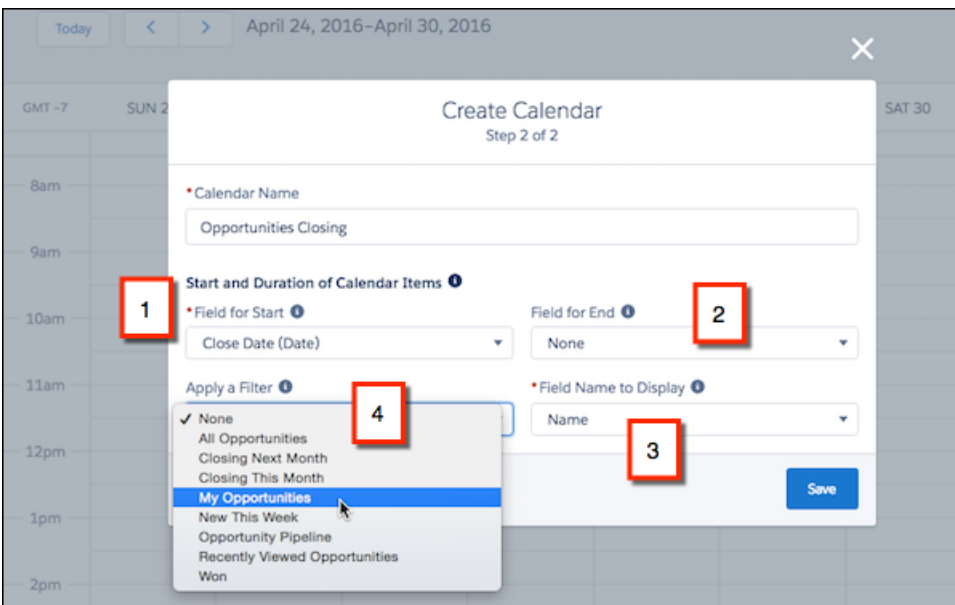

EDITIONS
Available in: **Enterprise, Unlimited, and Developer** Editions

2. Choose an object to base the calendar on.

3. Select fields that determine what the calendar displays (1, 2, 3).
If you want, filter the calendar items by selecting a list view (4).

The calendar displays items differently depending on the date fields you select.

(Date) Fields

Close Date (Date)

The names of some date fields include (Date). If you select a (Date) field, the calendar displays items across the top (as all-day items).

(Date/Time) Fields

Last Modified Date (Date/Time)

The names of other date fields include (Date/Time). If you select a (Date/Time) field in **Field for Start**, the calendar displays items in time slots. If you also select a field in **Field for End** (it's optional) and the items' duration exceeds 24 hours, the calendar displays the items across the top (as all-day items).

Selecting Start and End Fields

Start and Duration of Calendar Items ⓘ

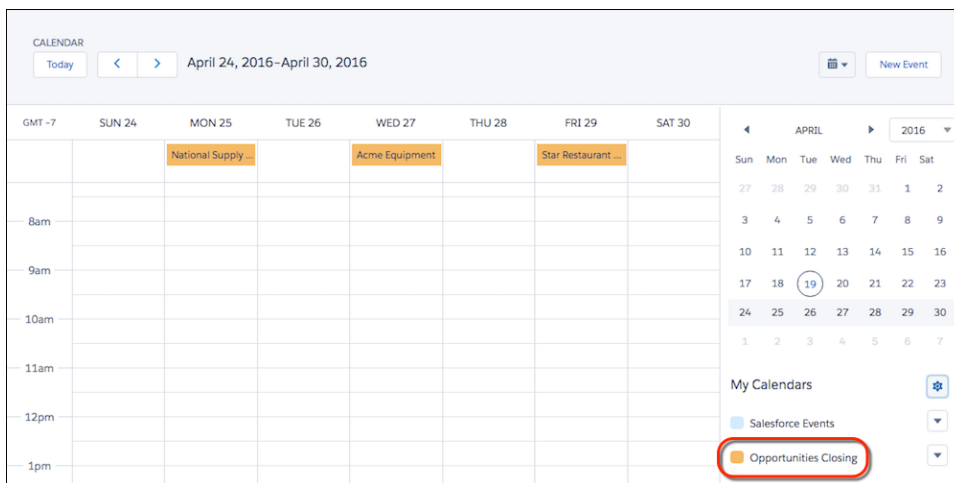

* Field for Start ⓘ Field for End ⓘ

Select... None

Field for End is optional. If you use it, you must select the same type of field as you do in **Field for Start**. For example, if you select a (Date) field in one, you can't select a (Date/Time) field in the other. If you select fields that generate dates in the wrong order (end before start), Salesforce displays an error message when you save the calendar.

The color of each calendar is the color of the object it's based on. (If a custom object has a theme, the theme determines the color of the calendar.) You can hide or show individual calendars. (You can hide the Salesforce Events calendar, too, but it's not otherwise configurable.)

Suppose that you show a calendar containing enough items to push the total items past the limit (150 items) in that view. Salesforce displays an alert and hides items on other calendars.

[Considerations for Calendars Created from a Salesforce Object](#)

Create a Calendar of Opportunity Close Dates

See all your opportunities' scheduled close dates at a glance.

Use the following selections.

Object

Opportunity

Calendar Name

Opportunities Closing

Field for Start

Close Date (Date)

Field for End

None

Apply a Filter (Optional)

My Opportunities, or another list view

Field Name to Display

Name

Now you have a calendar to remind you of close dates across all your opportunities.

SEE ALSO:

[Create a Calendar](#)

EDITIONS

Available in: **Enterprise, Unlimited, and Developer** Editions

Create a Calendar of Task Due Dates

Make a calendar that shows when your tasks are due.

First, ask your Salesforce admin to replace the Due Date field in the Task layout with a custom Date/Time field. Then use the following selections.

Object

Task

Calendar Name

Tasks Due

Field for Start

Due Date and Time (Date/Time)

Field for End

None

Apply a Filter (Optional)

My Tasks

Field Name to Display

Subject

Now you can see your task due dates alongside your Salesforce events.

EDITIONS

Available in: **Enterprise, Unlimited, and Developer** Editions

Create a Calendar of Direct-Mail Campaigns

Get a visual overview of all your direct-mail campaigns.

Use the following selections.

Object

Campaign

Calendar Name

Direct Mail

Field for Start

Start Date (Date)

Field for End

End Date (Date)

Apply a Filter (Optional)

All Active Direct-Mail Campaigns

Field Name to Display

To display the name of each campaign on the calendar: Name

To display each campaign's owner on the calendar: Owner

Now you can visually track direct-mail campaigns by name or owner.

SEE ALSO:

[Create a Calendar](#)

EDITIONS

Available in: **Enterprise, Unlimited, and Developer** Editions

Create a Calendar to View Open Cases by SLA

Monitor open cases and increase compliance with your service level agreement.

Use the following selections.

Object

Case

Calendar Name

Time Left in SLA

Field for Start

Date Opened (Date)

Field for End

Custom formula field, Opened (Date) + 36 hours: SLA Expiration

Apply a Filter (Optional)

All Open Cases, or another list view

Field Name to Display

Customer Name

Now you can see at a glance whether you're meeting your SLA.

Considerations for Calendars Created from a Salesforce Object

Considerations for calendars created from a Salesforce object include support for list view filtering, a limit on the number of items that can be displayed, no support for subscribing to calendars, and support for standard objects.

List View Filtering

No list views are available for filtering calendars based on the Events or Tasks objects. For calendars created from other objects, list views with the scope My and All are supported, but list views with the scope My Team are not.

Calendar Item Limit

You can view up to 150 calendar items total in the day or week view, including Salesforce events and the items on calendars you create. Suppose that you select a calendar containing enough items to push the total past the limit in that view. Lightning Experience displays an alert and hides items on other calendars.

Subscribing to Calendars

You can't subscribe to calendars that other people create. Each calendar can be accessed only by the person who created it.

Standard Objects Supported

Account	Endorsement	Price Book	Task
Asset	Event	Product	Topic
Badge Received	Holiday	Report	User
Campaign	Idea	Skill	User Provisioning Request
Case	Lead	Skill User	Work Badge
Contact	Opportunity	Social Persona	Work Order
Contract	Order	Social Post	Work Thanks
Email	Partner	Solution

[Access to Activities](#)

Share Your Calendar in Salesforce Classic

You can grant coworkers, personal and public groups, roles, or roles and subordinates access to view or edit your calendar in Salesforce Classic.

Watch a Demo: [Who Sees What: Organization-Wide Defaults](#)

Options vary for sharing your calendar with others, depending on the organization-wide calendar sharing level that your Salesforce admin sets. The options can make your calendar more available to others, but not less. Calendar sharing settings affect the visibility of items on a calendar, but they don't give coworkers access to event detail pages.

Events associated with a record that you own are visible to anyone above you in the role hierarchy.

1. From your personal settings, enter *Calendar Sharing* in the Quick Find box, then select **Calendar Sharing**.
2. To share your calendar with others, click **Add**. Select the users, roles, or groups whose activities you want to display in your calendar.
3. Specify how you want to share your calendar. Select one of the following:

Hide Details

Coworkers can see whether given times are available but can't see any other information about the nature of events in your calendar.

Hide Details and Add Events

Coworkers can see whether given times are available but can't see details of events. They can insert events in your calendar.

Show Details

Coworkers can see detailed information about events in your calendar.

Show Details and Add Events

Coworkers can see detailed information about events in your calendar, and they can insert events in your calendar.

Full Access

Coworkers can see detailed information about events in your calendar, insert events, and edit existing events.

SEE ALSO:

[Access to Activities](#)

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

USER PERMISSIONS

To create events

- "Edit Events"

View a Coworker's Calendar in Salesforce Classic

When coworkers share their calendars with you, you can view the calendars in Salesforce Classic.

Your access to view event details, edit events, or create events varies by calendar. Your access to a given calendar depends on how your Salesforce admin sets up your org and the calendar sharing options that your coworker has chosen.

You can view all events owned by people below you in the role hierarchy.

- In day, week, or month view, click **Change** next to the name at the top of the calendar, then select the calendar that you want to view.

Calendar Views

Calendar views display your events in Salesforce.

1. [Calendar Views in Lightning Experience](#)

Your calendar displays all events that you own in Salesforce, including events that take place outside your business hours. Calendars you create from a Salesforce object display data in date fields as calendar items. View, create, and edit your events in a day or week view.

2. [Calendar Views in Salesforce Classic](#)

Calendar views display your own calendar and coworkers' calendars along with list views of open tasks. On the Home tab, the Calendar section shows upcoming events, a date picker for the month, and links to other calendar and activity views. You can share your calendar with coworkers and print calendars and task lists.

Calendar Views in Lightning Experience

Your calendar displays all events that you own in Salesforce, including events that take place outside your business hours. Calendars you create from a Salesforce object display data in date fields as calendar items. View, create, and edit your events in a day or week view.

SEE ALSO:

On the Home tab, the Calendar section shows upcoming events, a date picker for the month, and links to other calendar and activity views. You can share your calendar with coworkers and print calendars and task lists.

Where to Select or Switch Views

You access calendar views in the following locations.

- The Calendar section at the bottom of the Home tab (if your Home tab doesn't display the Calendar section, ask your Salesforce admin to customize your home page layout)
- The Calendar shortcut in the sidebar that opens your last used calendar view (if your Salesforce admin has enabled the shortcut)
- The detail page for an event or a task

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited Editions**

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

- An activities list view

In any view, when you hover your mouse over an event that you have permission to see and edit, an overlay displays event details and actions that you can perform. Your Salesforce admin configures the content of the overlays.

Day, Week, Month, and Activity Views

Calendar views display events as follows:

- A day at a time:  or **Today**
- On a date that you choose using 
- A week at a time:  or **This Week**
- In a week view, with or without weekends
- A month at a time:  or **This Month**
- On a day that you choose: Click in the week or month view
- In a list of activities (events and tasks): 

Inside any calendar view, you can switch views by clicking the icon for a different view. In a week or month view, click a date to see that day's view.

Single-User View and Views of Other Calendars

The single-user view () displays up to 1,000 events in one month in any of the following:

- Your own calendar
- The calendar of another user (not available in Personal Edition)
- A public calendar
- A resource calendar

Click **Change** to switch users or calendars. Click **Share My Calendar** to allow other users to view your calendar. To reset your view to your own calendar, click **Back to My Calendar**.

 **Note:** Activities related to another record are visible to users above the activity owner in the role hierarchy regardless of whether your organization's sharing settings specify the use of hierarchies.

All single-user day and week views of a user's calendar display a list of the user's open tasks alongside the calendar. A drop-down list lets you choose other views, for example overdue tasks or tasks due today.

By default, your daily and weekly calendar views display the range of hours specified as *Start of Day* and *End of Day* on your Personal Information page.

If you sync events from Outlook using Salesforce for Outlook, you may see a banner at the top of your calendar that is linked to a list of your unresolved events: synced Outlook events that haven't been assigned to Salesforce records.

Multi-User View

The multi-user view () displays several users' calendars and activities together. Choose an existing list view of users from the **View** drop-down list or click **Create New View**.

The view shows each person's availability. A legend in the view shows busy and out-of-office time. If an event is set to show the time as free, then multi-user views don't display it.

Consider these limitations of the multi-user view:

- Drag-and-drop editing isn't available in the multi-user view.

- The multi-user calendar works differently in the partner portal. For example, partners can view events only on the calendars of people in their own company and their channel manager.

Printable View

After you select a view and click **Printable View**, adjust the view before printing it.

- To send the printable view to a printer, click **Print This Page**.
- To change the dates before printing, click , , **Today, This Week**, or **This Month**.
- In a day or week view, select a different task list view if you like.
- In multi-user views, in the **Sort by** drop-down list, select **Time** to include all users' events on a single calendar. Or select **User** to display a separate calendar for each user.

Considerations for Using Events and Calendars

Salesforce always displays an event's date and time in the time zone you've chosen in My Settings. Working with meetings and scheduling is different in Lightning Experience and Salesforce Classic.

1. [Considerations for Using Events and Calendars in Lightning Experience](#)

When you use events and calendars in Lightning Experience, keep in mind these considerations for creating, updating, and owning events and other calendar items.

2. [Considerations for Using Events and Calendars in Salesforce Classic](#)

Be aware of these considerations for creating, updating, owning, and inviting others to events in Salesforce Classic.

Considerations for Using Events and Calendars in Lightning Experience

When you use events and calendars in Lightning Experience, keep in mind these considerations for creating, updating, and owning events and other calendar items.

Business Hours

Your calendar doesn't indicate the business hours you've selected in your personal settings.

No Recurring Events

You can't create or edit recurring events. However, if a coworker uses Salesforce Classic to create a series of recurring events, you can view and edit the events in the series in Lightning Experience.

Outlook Appointments

You can't create a Microsoft® Outlook® appointment from a Salesforce event.

Event Invitations

You can't invite people to meetings, update events, accept or decline events, or view a list of invitees to an event. However, if someone creates a meeting in Salesforce Classic and invites you to it, it is displayed in your calendar.

Calendar Views

The calendars in Lightning Experience have no month view or print view. You can't hide weekends.

List View Filtering

No list views are available for filtering calendars based on the Events or Tasks objects. For calendars created from other objects, list views with the scope My and All are supported, but list views with the scope My Team are not.

EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

Calendar Item Limit

You can view up to 150 calendar items total in the day or week view, including Salesforce events and the items on calendars you create. Suppose that you select a calendar containing enough items to push the total past the limit in that view. Lightning Experience displays an alert and hides items on other calendars.

Calendar Sharing and Ownership

You can't share your calendar with your manager or other coworkers. Managers in the role hierarchy can use reports to view events owned by people below them in the role hierarchy, but not to edit them. Only one person can own a meeting. If you reassign a meeting to someone else, it no longer appears on your calendar.

Public Calendars and Resource Calendars

You can't create public calendars or resource calendars, and you can't view public calendars or resource calendars created in Salesforce Classic.

Cloud Scheduler

Lightning Experience doesn't support Cloud Scheduler meeting requests.

SEE ALSO:

[Considerations for Using Tasks in Lightning Experience](#)

[Considerations for Using Activities](#)

Considerations for Using Events and Calendars in Salesforce Classic

Be aware of these considerations for creating, updating, owning, and inviting others to events in Salesforce Classic.

Event Editing

Permission to Edit Other People's Events

Your org's calendar sharing model and your personal calendar sharing control permission to edit other people's events. However, regardless of these settings, managers in the role hierarchy can always edit events owned by people who report to them.

Permission to Edit Public Calendars and Resource Calendars

The calendar sharing model controls permission to edit events in public and resource calendars.

Changes to Fields in Single Events and Their Series

If you change a field in a single event and then change that field in the series, the series change overrides the change to the single event.

Event Deletion

Declining Event Invitations

If you decline an event that you've been invited to, Salesforce removes the event from your calendar. Only the event owner can delete an event with invitees.

Notification for Deleted Event Series

If an event owner deletes a series of recurring events, every invitee receives an email notification that the series of events has been canceled.

Handling of Past and Future Events in Deleted Series

If you delete a series of events, you delete only future events. Events that have already happened aren't affected.

Available in Salesforce Classic in: **All Editions Except Database.com**

Events with invitees not available in: **Personal Edition**

If a series is deleted and it contains events that occurred in the past, the series isn't moved to the Recycle Bin. As a result, the series can't be restored from the Recycle Bin.

If a series is deleted and it doesn't contain past events, Salesforce moves the series to the Recycle Bin. Individual events that were part of the series aren't moved to the Recycle Bin.

Handling of Series Restored from Recycle Bin

If you restore a series from the Recycle Bin, single events are created. Those single events contain both the details defined by the series and any changes or additions made to them individually before the series was deleted.

Deleted Public Calendars

If you delete a public calendar, Salesforce doesn't put it in the Recycle Bin.

Recurring Events

Effects of Changes to an Event Series and Single Events in a Series

Warning: Change to any fields in an event series overrides changes previously made to single events.

If you change the following settings, the status of invitees for future events is reset to Not Responded. You lose messages sent with invitees' responses and other changes to single future events. Triggers and workflows are also reset, and links to future events break.

- All-day event checkbox
- Start or end time
- Location
- Recurrence frequency
- Recurrence start or end date, if you send updates to invitees

If you don't send updates, and you only extend the recurrence end date, then future events aren't affected.

Display of Original and New Start or End Time for a Changed Series

If the organizer changes the scheduled time of an event in a recurring series, the calendar views and the Home tab's Calendar section show the updated time. However, the detail page of the single event continues to show you the original time until you accept or decline the series.

Maximum Number of Single Events in a Series

- Daily: 100
- Weekly: 53
- Monthly: 60
- Yearly: 10

Click **Calculate max end date** to enter the maximum end date allowed for the frequency that you selected.

Duration of Events

If your Salesforce admin has enabled multiday events, then you can create events up to 14 days long, except recurring events. When you create a recurring event, the maximum duration of the single events in the series is 24 hours. After you create the series, you can change the duration to up to 14 days if your Salesforce admin has enabled multiday events.

Event Reminders

If you create a recurring event and you leave the reminder checkbox selected, you receive a reminder for each single event in the series.

Attachments to Events

You can attach files to a series of recurring events. After you create a series, you can add or delete attachments to each single event in the series.

Attachments are displayed on the event detail page only, not on the detail page for other records that the event is related to. If you don't see the Attachments related list on the event detail page, ask your Salesforce admin to add it to the event page layout.

Inviting People and Scheduling Resources

Access Requirements for Inviting People and Resources

You need at least read access to the contacts and leads that you invite to an event. You need at least "Add Events" on a resource to invite it to an event.

Permission to Edit Events with Invitees

 identifies an event with one or more invitees. You can edit an event that you've invited people to only if you own the event. If the event isn't a recurring event, you can assign it to a different person.

If you want to send an email update, you can send it to all invitees or only to the people you added or deleted during editing.

Event Attendance

Declining an event removes it from your calendar. The event owner doesn't receive an email notification when an invitee accepts or declines an invitation.

Maximum Number of Invitees

The maximum number of invitees for regular events is 1,000. However, for recurring events, the maximum is 100.

Relating Events to Multiple Contacts (Shared Activities)

Maximum Number of Related Contacts

You can relate an event to up to 50 contacts (but only one lead) in the `Name` field, including one primary contact. If you don't see

 next to the `Name` field, ask your administrator to enable Shared Activities.

No Support for Recurring Events or Multiple Event Owners

You can't relate multiple contacts to a recurring event series or an event owned by multiple people.

Assigning Events to Coworkers

Default Event Owner

By default, an event is assigned to the user who creates it. To assign independent copies of a new event to multiple people, click

 next to **Assigned To**. In the window that opens, click the Multiple Users tab. The `Assigned To` field isn't available in Personal Edition.

Events in Chatter

New Events in Chatter Feeds

If a new event is related to a record like a lead, account, or custom object, the event appears in the feed for that record. On any record that you follow, you see feed items for all events, regardless of who created them.

Creating Events in Feeds

Your Salesforce admin specifies whether you can use Chatter to create events for different types of records. For example, some people can view but not create events in the feeds for accounts that they have access to.

No Recurring Events in Chatter

Your Chatter feed doesn't display recurring events, either in series or singly, and you can't follow recurring events in Chatter.

Invitations and Scheduling in Salesforce Classic

In Salesforce Classic, you can invite people to meetings, accept meeting invites, and use Cloud Scheduler to propose meeting times. You can also create a Microsoft® Outlook® appointment for an event in Salesforce.

1. [Invite People to an Event and Schedule Resources in Salesforce Classic](#)

Invite users, contacts, and leads to a meeting, and schedule meeting resources.

2. [Quickly Schedule a Meeting About an Account, a Contact, or a Lead in Salesforce Classic](#)

Drag-and-drop scheduling lets you schedule events related to accounts, contacts, and leads without leaving the list view page. You drag records from list views onto weekly calendar views and enter the details of the event in an overlay.

3. [Create an Outlook Appointment for an Event in Salesforce Classic](#)

Create an appointment in Microsoft® Outlook® from the details of an event.

4. [Create an Event in a Public Calendar in Salesforce Classic](#)

A public calendar contains a schedule of events that is available to a group of users, such as a sales events calendar for a sales department. If your Salesforce admin has set up a public calendar and you're assigned to that group, you can view the calendar. You can also add an event just as you would add an event to your own calendar.

5. [Use Cloud Scheduler to Request Meetings in Salesforce Classic](#)

Cloud Scheduler lets you request a meeting with a contact, a lead, a person account, or a coworker.

6. [Respond to Event Invitations in Salesforce Classic](#)

Accept or decline an invitation to an event. After you've accepted an invitation, you can add the event to Outlook.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

Invite People to an Event and Schedule Resources in Salesforce Classic

Invite users, contacts, and leads to a meeting, and schedule meeting resources.

1. On the Event detail page, in the Select Invitees section, click **Select**.

2. In the Select Invitees dialog box, search for the type of invitee: users, leads, contacts, or resources.

3. Enter a name or part of a name or leave the field blank to expand the search. Click **Find**.

4. Use  and  to select and deselect people or resources. To invite more people or resources, search again and select the invitees you want.

5. Click **Done**.

6. Review the calendar of each invitee and adjust the date and time of the event if necessary.

The availability of invitees is indicated in color on their calendars: busy time is blue and out-of-office time is red. If an invitee has more than one event scheduled for a particular time, all the events are shown on the calendar. To see the details of an event, hover your mouse over the event on the calendar.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

USER PERMISSIONS

To invite people to an event:

- "Edit Events"

7. To remove an invitee from an event, click **Remove** next to the invitee's name.
8. Click **Save & Send Update**.
Invited leads, contacts, and person accounts receive an email containing a link to a web page. They can accept or decline the invitation for the event or event series. You also receive an email summary of the event. If an invited resource is available at the given time, the resource automatically accepts the invitation.

Quickly Schedule a Meeting About an Account, a Contact, or a Lead in Salesforce Classic

Drag-and-drop scheduling lets you schedule events related to accounts, contacts, and leads without leaving the list view page. You drag records from list views onto weekly calendar views and enter the details of the event in an overlay.

If you don't see the  **Open Calendar** link, ask your administrator to enable drag-and-drop scheduling.

1. Click the  **Open Calendar** link at the bottom of a list view.
A weekly view of a calendar appears below view.
2. Drag a record from the list to a time slot on the calendar.
A popup window for creating an event appears. The event is already related to the record that you dragged from the list view.
 - The  **Open Calendar** link appears only at the bottom of list views for accounts, contacts, and leads.
 - Drag-and-drop scheduling isn't available for the Console tab, events that people have been invited to, recurring events, accessibility mode, or Connect Offline.
 - List views that include drag-and-drop scheduling can take slightly longer than usual to be displayed.
 - When you drag the bar in between the list and calendar to resize either one, the size is saved for all views in which you use drag-and-drop scheduling. You can resize the list and calendar at any time.

Create an Outlook Appointment for an Event in Salesforce Classic

Create an appointment in Microsoft® Outlook® from the details of an event.

1. On the detail page for an event, click **Add to Outlook**.
2. Click **Open** to immediately add the event to Outlook, or save it to your computer as a `.vcs` file. If you save it as a `.vcs` file, import the file into Outlook.

The Outlook appointment is added to the "salesforce.com" folder and tagged with the "salesforce.com" category so that duplicates aren't created during synchronization.

Consider the following when you add an event to Outlook.

- When you view the event in Outlook, the description doesn't display line breaks that you entered in the event's `Description` field. Line breaks are replaced by two spaces in the `.vcs` file.
 - You can also sync your Salesforce events to Outlook using Lightning Sync or Salesforce for Outlook.
-  **Note:** You can also use Lightning for Outlook and Salesforce for Outlook to add Microsoft® Outlook® emails to Salesforce. These email integration applications let you log an outbound or sent email as a task in Salesforce. Then you can associate this task with a contact, a lead, or another record.

Create an Event in a Public Calendar in Salesforce Classic

A public calendar contains a schedule of events that is available to a group of users, such as a sales events calendar for a sales department. If your Salesforce admin has set up a public calendar and you're assigned to that group, you can view the calendar. You can also add an event just as you would add an event to your own calendar.

1. On a calendar view, click **[Change]** to switch to a public calendar.
2. Choose the time and date of the event:
 - On the day view, click a time such as **9:00 AM** to add an event.
 - On the week or month view, click **+** to add an event on a particular date.
3. Enter the details of your event.
4. Click **Save**. Alternatively, click **Save & New Task** to save the event and begin creating a task, or **Save & New Event** to save and begin creating an event.

Use Cloud Scheduler to Request Meetings in Salesforce Classic

Cloud Scheduler lets you request a meeting with a contact, a lead, a person account, or a coworker.

1. [How Cloud Scheduler Works in Salesforce Classic](#)

When you use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker, Salesforce creates a unique Web page for your meeting that displays the proposed meeting times. When invitees visit the page, they select the times that work for them and send you a reply. Salesforce tracks all the responses so that you can pick the best time to meet when you confirm the meeting.

2. [Request a Meeting in Salesforce Classic](#)

Use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker.

3. [Tips for Proposing Meeting Times in Salesforce Classic](#)

When you request a meeting using Cloud Scheduler, you can either propose meeting times or let Salesforce propose times for you. One of the benefits of letting Salesforce propose meeting times happens when there's a long delay between the time you send the meeting request and when the first invitee views it. For example, if you request a meeting with a contact on a Monday and that contact doesn't view your request until Thursday, Salesforce proposes times from Thursday forward instead of when the meeting request was sent.

4. [Change the Invitees to a Requested Meeting in Salesforce Classic](#)

When you use Cloud Scheduler to request a meeting, you can add and remove invitees at any time.

5. [Reschedule a Requested Meeting in Salesforce Classic](#)

If you used Cloud Scheduler to request a meeting that hasn't been confirmed, you can reschedule it and propose new times. However, when you confirm a meeting, it's converted to an event, so you can't propose new times. To reschedule an event, edit the event to change its date and send an update to the invitees.

6. [Confirm a Requested Meeting in Salesforce Classic](#)

After you use Cloud Scheduler to request a meeting, wait for the invitees to reply with the times they can meet. When this happens, you receive an email notification, and the meeting in Salesforce is automatically updated with the times the invitees selected. You can then choose the best time to meet and confirm the meeting.

7. Cancel a Requested Meeting in Salesforce Classic

If you used Cloud Scheduler to request a meeting and the meeting hasn't been confirmed, you can cancel the meeting, and Salesforce automatically sends a cancellation notice to the invitees. When you confirm a meeting, then it's converted to an event, which you can delete like any other event.

How Cloud Scheduler Works in Salesforce Classic

When you use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker, Salesforce creates a unique Web page for your meeting that displays the proposed meeting times. When invitees visit the page, they select the times that work for them and send you a reply. Salesforce tracks all the responses so that you can pick the best time to meet when you confirm the meeting.

Step 1: You Request a Meeting and Propose Meeting Times

Go to either the Calendar section on the Home tab or the Open Activities related list on the detail page of the contact, lead, or person account you want to request a meeting with. Click **New Meeting Request** to open the Meeting Request page.

The screenshot shows the 'Meeting Request' interface. At the top, there is a 'To...' field containing 'Jane Smith' and 'John Doe'. Below this is a 'Subject' field with the text 'Shipping, Inc and Universal Telco'. A 'Where' field is partially visible. Below the subject field, there are two buttons: 'propose meeting times' and 'Let Salesforce propose meeting times'. A calendar view is displayed below, showing the dates from Monday, 2/22/2010 to Friday, 2/26/2010. The calendar grid shows time slots from 9:00 AM to 4:00 PM. At the bottom of the calendar, there are 'Next' and 'Close' buttons. Two red boxes with numbers 1 and 2 are overlaid on the image, pointing to the 'To...' field and the 'propose meeting times' button respectively.

1. Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
2. Click in the calendar to propose up to five meeting times, or let Salesforce propose times for you.

Step 2: Invitees Pick the Times They Can Meet

Salesforce emails a meeting request to the invitees so they can pick the times they are available.

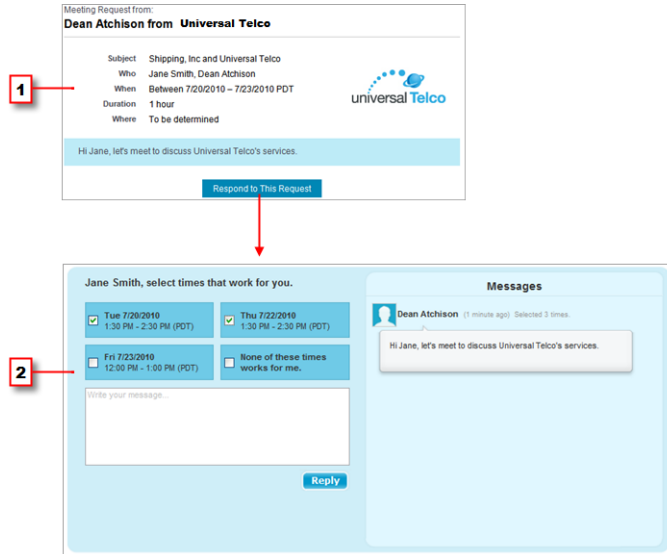

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

USER PERMISSIONS

To request a meeting:

- "Edit Events"
- AND
- "Send Email"

1. In the meeting request, invitees click **Respond to This Request** to open your meeting's Web page.
2. On the meeting Web page, invitees pick the proposed times that work for them and send you a reply.

Step 3: You Confirm the Meeting

Salesforce keeps track of all the responses so you can see when each invitee is available. You then select the best time to meet and confirm the meeting.

Request a Meeting in Salesforce Classic

Use Cloud Scheduler to request a meeting with a contact, a lead, a person account, or a coworker.

Before you use Cloud Scheduler, consider these tips:

- You must have at least read access to the contacts, leads, and person accounts that you request a meeting with.
- Each invitee must have an email address specified in their record so Salesforce can send them a meeting request.
- You can invite up to 50 people to a meeting. Invitees can consist of only contacts, leads, or person accounts, only coworkers who use Salesforce, or a combination.
- We recommend you install [Salesforce for Outlook](#) so you can sync your calendar events between Salesforce and Microsoft® Outlook®.

When proposing meeting times, it's helpful to have your Salesforce calendar up-to-date so you can see your free and busy times.

To request a meeting:

1. Go to either the Calendar section on the Home tab or the Open Activities related list on the detail page of the contact, lead, or person account you want to invite to a meeting.

2. Click **New Meeting Request**.

If this button doesn't display in the Calendar on the Home tab or on the Open Activities related list, ask your Salesforce administrator to add it.

3. Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
 - a. Select the type of invitee from the drop-down list. person accounts are returned in contact searches and can be added as invitees.
 - b. Enter a name or part of a name in the text field, or leave the field blank to expand the search.
 - c. Click **Go!**.
 - d. In the Search Results area, select the boxes next to the people you want to invite and click **Insert Selected**. To add more invitees, perform a new search and select more people as needed. If there's a warning icon (⚠️) next to a person's name, you can't invite them to the meeting because they don't have an email address specified in their record. After you add an email address to their record, you can invite them to meetings.
 - e. Click **Done**.
 - f. To remove someone you just invited, click "x" next to the person's name in the To field. You can remove all invitees unless you requested the meeting from an Open Activities related list. In that case, the first contact, lead, or person account in the To field can't be removed.

4. Enter a subject and location.

If you requested the meeting from an Open Activities related list, the default subject is a combination of the account name for the lead or contact and the company name specified in your personal information. For example, if you're meeting with a contact from the Sterling company and you work for ACME, the default subject is `Sterling and ACME`. The default location is always `To be determined`.

5. Select one of these tabs:

- **I propose meeting times**—Propose up to five meeting times by picking times in the calendar.
- **Let Salesforce propose meeting times**—Choose the duration and time frame of the meeting and let Salesforce propose up to five meeting times for you.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

USER PERMISSIONS

To request a meeting:

- "Edit Events"
- AND
- "Send Email"

6. Click **Next**.
7. Write a message to the invitees, and click **Send**.

Note the following:

- Your email signature is automatically added to your message.
- After you click **Send**, Salesforce emails a meeting request to the invitees.
- Your meeting's Web page displays all messages between you and the invitees. This includes messages that invitees write when responding to your request.
- If you requested the meeting from an Open Activities related list, the meeting appears on the detail page for that contact or lead only. It doesn't appear on the Open Activities related list for any other invitee. For example, if you requested a meeting with Jane Smith from her contact detail page and then clicked the **To** field to invite John Doe, the requested meeting only appears on the Open Activities related list for Jane Smith and not John Doe. If you requested the meeting from the Calendar section on the Home tab, the meeting doesn't appear on the Open Activities related list for either Jane Smith or John Doe.

After you send your meeting request, wait for the invitees to reply with the times they can meet. Then confirm the meeting by selecting a final meeting time.

Tips for Proposing Meeting Times in Salesforce Classic

When you request a meeting using Cloud Scheduler, you can either propose meeting times or let Salesforce propose times for you. One of the benefits of letting Salesforce propose meeting times happens when there's a long delay between the time you send the meeting request and when the first invitee views it. For example, if you request a meeting with a contact on a Monday and that contact doesn't view your request until Thursday, Salesforce proposes times from Thursday forward instead of when the meeting request was sent.

Proposing Meeting Times

When you propose meeting times:

- Proposed times aren't saved to your Salesforce calendar. The meeting only appears in your calendar after you [confirm the meeting](#).
- When the invitees view your meeting request, the proposed times are shown in your time zone. Proposed times aren't shown in the invitees' time zones.
- You can't propose a time that occurs in the past (before the black line in the calendar).
- The calendar's shaded areas show when you and the other invited coworkers are busy based on your Salesforce calendars. Darker shades show when multiple coworkers are busy at the same time.
- Use the `DURATION` field to change the length of your meeting.
- To remove a time you proposed, hover over the proposed time and click "x".

Letting Salesforce Propose Meeting Times

When Salesforce proposes meeting times:

- You won't know which times are proposed until after you send the meeting request. Once the first invitee views your request, Salesforce checks the calendars of all coworkers invited to the meeting and proposes meeting times based on their availability. Salesforce tries not to propose the same times that invitees have already selected for other unconfirmed meetings. For example, if you request a meeting for the next five business days and your invitees respond that they can meet on Tuesday and Wednesday

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

USER PERMISSIONS

To request a meeting:

- "Edit Events"
- AND
- "Send Email"

from 2:00 to 3:00 p.m., and then you request another meeting for the same time frame, Salesforce won't propose times for Tuesday and Wednesday from 2:00 to 3:00 p.m. unless your calendar is completely booked with confirmed meetings and other events.

- By default, Salesforce proposes meeting times between 9:00 a.m. and 5:00 p.m. in your time zone. However, if you have changed the `Start of day` and `End of day` fields in your Personal Information Settings page, Salesforce uses those settings instead.

 **Note:** If you don't want to meet at a specific time of day (like your lunch hour), schedule a recurring event in your Salesforce calendar to block out that time.

The following table describes the settings that control how Salesforce proposes meeting times.

Field	Description
Duration	The length of your meeting.
Time Frame	<p>How far in advance Salesforce proposes meeting times:</p> <ul style="list-style-type: none"> • Next 5 Business Days/Next 10 Business Days—Salesforce tries to spread out the proposed times over the specified time frame. For example, if your time frame is Next 5 Business Days and the first invitee views the request on a Monday, Salesforce tries to propose a time for each day of that week. If some of your days are booked, Salesforce condenses the proposed times into fewer days. Business days exclude Saturdays and Sundays. • Whenever—Salesforce tries to propose five meeting times over the next five business days, and if it can't propose enough times, it extends the range over the next 10 business days. If Salesforce still can't find five times to propose, it looks for available times over the next four weeks. When you select this option, some of the times Salesforce proposes could be seven weeks away (5 business days + 10 business days + 20 business days = 7 weeks).

Change the Invitees to a Requested Meeting in Salesforce Classic

When you use Cloud Scheduler to request a meeting, you can add and remove invitees at any time.

1. Open your meeting using one of these methods:
 - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
 - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
 - From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.
2. Do either of the following:
 - Click **To** to invite coworkers, leads, contacts, or person accounts to the meeting.
 - Click "x" next to an invitee's name to remove them from the meeting.

You can remove all invitees unless you requested the meeting from an Open Activities related list. In that case, the first contact, lead, or person account in the $\text{T}\circ$ field can't be removed.

The calendar automatically updates based on the people you added or removed from the meeting.

 **Note:** If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

3. Click **Send Update**.
4. Enter a message. For example, you might want to inform your invitees who you're adding or removing from the meeting.
5. Click one of the following:
 - **Send to All Invitees**—Sends an update to all existing and added invitees and a cancellation notice to removed invitees.
 - **Send Only to Changed Invitees**—Sends an update to added invitees and a cancellation notice to removed invitees.

Reschedule a Requested Meeting in Salesforce Classic

If you used Cloud Scheduler to request a meeting that hasn't been confirmed, you can reschedule it and propose new times. However, when you confirm a meeting, it's converted to an event, so you can't propose new times. To reschedule an event, edit the event to change its date and send an update to the invitees.

If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

1. Open your meeting using one of these methods:
 - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
 - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

USER PERMISSIONS

To add and remove invitees from a requested meeting:

- "Edit Events"
- AND
- "Send Email"

EDITIONS

Available in Salesforce Classic in: **All Editions Except Personal Edition and Database.com**

USER PERMISSIONS

To reschedule a meeting:

- "Edit Events"
- AND
- "Send Email"

- From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Click **Reschedule** and propose new times.

Once the invitees reply to your updated request, you can confirm the meeting.

Confirm a Requested Meeting in Salesforce Classic

After you use Cloud Scheduler to request a meeting, wait for the invitees to reply with the times they can meet. When this happens, you receive an email notification, and the meeting in Salesforce is automatically updated with the times the invitees selected. You can then choose the best time to meet and confirm the meeting.

The meeting confirmation page displays as read-only to coworkers without the “Edit Events” permission and coworkers without the “Edit” permission on the contact or lead record associated with a proposed meeting.

If your administrator added required fields to events, you're prompted to update those fields before the meeting is converted to an event.

1. Open your meeting using one of these methods:

- From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
- If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
- From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Select a time, and click **Confirm**.

The **Confirm** button displays after you select a meeting time. If you don't select a time, the **Send Update** button displays instead so you can send the invitees a message without confirming a meeting time.

Use the following tools to help you pick a time:

- Green check marks show when each invitee can meet.
- **Free** shows when you are available based on your Salesforce calendar.
- If none of the times work for the invitees, propose new times and reschedule the meeting.

3. Optionally, enter a message to the invitee.

4. Click **Send** to confirm the meeting.

Salesforce then:

- Emails the invitees with the final date and time of the meeting.
- Converts the requested meeting to a new multi-person event. The last message you sent to the invitees appears in the event's **Description** field, but all other messages between you and the invitees aren't saved.

This event appears in the Calendar section on the Home tab. If you requested the meeting from an Open Activities related list, the event also appears in the Open Activities related list for that contact, lead, or person account.

To confirm a meeting:

- “Edit Events”
- AND
- “Send Email”

Cancel a Requested Meeting in Salesforce Classic

If you used Cloud Scheduler to request a meeting and the meeting hasn't been confirmed, you can cancel the meeting, and Salesforce automatically sends a cancellation notice to the invitees. When you confirm a meeting, then it's converted to an event, which you can delete like any other event.

1. Open your meeting using one of these methods:
 - From the Calendar section on the Home tab, click the **Requested Meetings** subtab and then click the subject of your meeting. If the **Requested Meetings** subtab doesn't display on the Calendar section, ask your administrator to add it.
 - If you requested the meeting from the Open Activities related list for that contact, lead, or person account, click the subject of your meeting in the related list.
 - From the email notification that you received when an invitee responded to your meeting request, click **View Response and Schedule Meeting**.

2. Click **Cancel Meeting**.

You can also click **Del** next to the meeting from the Open Activities related list.

 **Note:** If **Close** is the only button on the page, you don't have permission to modify the requested meeting. Either ask the organizer to change the meeting details for you, or contact your Salesforce administrator to grant you the required permissions.

3. Click **OK** to confirm the cancellation.

Salesforce emails a meeting cancellation to all invitees. Canceled meetings are permanently removed and aren't stored in the Recycle Bin.

Respond to Event Invitations in Salesforce Classic

Accept or decline an invitation to an event. After you've accepted an invitation, you can add the event to Outlook.

When a coworker invites you to an event, you receive an email containing a link to the event. The event is also displayed on the Home tab. To accept or decline the event:

1. Click the event description.
2. Optionally, enter a response.
3. If the event is a single event, click **Accept Meeting** or **Decline Meeting**. If you have been invited to a series of events, click **Accept Series** or **Decline Series**.

 **Note:** If you want to attend some events in a series of events but decline the others, accept the series and then decline specific events.

Tasks

Keep your to-do list in Salesforce and stay right on top of your deals and accounts. Easily relate every task to records for leads, contacts, campaigns, contracts, and other information that you need. Salesforce gives you different tools to maximize productivity—quick ways to create and update tasks, prefiltered task lists, and task notification options.

1. [Manage Tasks](#)

In Salesforce, tasks are a powerful tool to help you track your work and close deals. Relate them to opportunities, leads, accounts, and contacts, and manage them on those records, in lists, and in reports.

2. [Considerations for Using Tasks](#)

Salesforce always displays a task's due date in the time zone you've chosen in My Settings. Your Salesforce admin can add conditions for closing a task, such as requiring you to enter a comment. If your Salesforce admin has set up more than one Closed or Open status for tasks, choose a status to continue. Working with tasks is different in Lightning Experience and Salesforce Classic.

3. [Repeat a Task](#)

Easily adjust the due date of a recurring task, or cut the clutter of recurring tasks in your future task list. Use repeating tasks to make a task recur a specified number of days after a trigger that you choose. The next task in the series is created only when the current task is due or marked completed. Repeating tasks are a streamlined alternative to regularly recurring tasks when you don't have to get a task done on a specific day.

4. [Assign Tasks to Multiple People in Salesforce Classic](#)

Assign up to 100 coworkers an independent copy of the same task. For example, you can create a task "Submit your expense reports" with the appropriate due date and assign it to a team of account executives.

5. [Task Notifications](#)

Set options for sending or receiving an email notification when a task is assigned.

[Events and Calendars](#)

Manage Tasks

In Salesforce, tasks are a powerful tool to help you track your work and close deals. Relate them to opportunities, leads, accounts, and contacts, and manage them on those records, in lists, and in reports.

1. [Manage Tasks in Lightning Experience](#)

Create, update, and monitor your own tasks, tasks delegated to others, and tasks on an opportunity, a lead, an account, or a contact. Use the Home page, the task list, or the activity timeline. You can also track tasks in reports.

2. [Manage Tasks in Salesforce Classic](#)

You can track, create, and update your own and others' tasks in different locations in Salesforce. Tasks are displayed in activities list views and calendar views; Chatter feeds; and records that tasks are related to, such as contacts and accounts. You can also track tasks in reports.

Manage Tasks in Lightning Experience

Create, update, and monitor your own tasks, tasks delegated to others, and tasks on an opportunity, a lead, an account, or a contact. Use the Home page, the task list, or the activity timeline. You can also track tasks in reports.

- On the Home page, Today's Tasks shows your next five tasks due today.
- On the Kanban Board, opportunities show alerts when a task is overdue or when no open activities exist. To create or update a task, click the yellow triangle.
- On an individual opportunity, lead, account, or contact, use the composer and the activity timeline to create and work with tasks, meetings, calls, and emails.
- Use the task list to work with tasks due today, all your open tasks, overdue tasks, and tasks completed in the past seven days. In the navigation menu, go to **Tasks** and choose a view. To keep recently overdue tasks (due in the past 30 days) on your radar but out of your way, **My Tasks** collapses them when they total 10 or more. **All Overdue** includes all overdue tasks. **Delegated** displays tasks that you've created and assigned to people below you in the role hierarchy of your Salesforce org.

You can also use activities reports to view tasks assigned to people below you in the role hierarchy of your Salesforce org.

-  **Note:** You can remove a contact or a record from a task without deleting the task. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Instead of deleting the task, remove Contact B from the Name field.

[Considerations for Using Tasks in Lightning Experience](#)

Manage Tasks in Salesforce Classic

You can track, create, and update your own and others' tasks in different locations in Salesforce. Tasks are displayed in activities list views and calendar views; Chatter feeds; and records that tasks are related to, such as contacts and accounts. You can also track tasks in reports.

Track Tasks

You can track tasks belonging to you and to others in the following locations. To see activities list views, click  on the Home tab or any calendar view, or go to the calendar day or week view.

Tasks Assigned to You

- The Home tab, in the My Tasks section
- An activities list view: Choose an existing list view or customize one
- Your Chatter feed: Follow a task to track posts, comments, and updates about it

Tasks Due Soon

- The **My Activities** list view
- **Today** in the Salesforce1 app for iOS or Android
- The Salesforce1 **My Tasks** list

EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional,** and **Unlimited** Editions

USER PERMISSIONS

To create tasks

- "Edit Tasks"

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

USER PERMISSIONS

To create tasks

- "Edit Tasks"

Tasks Related to Another Record, Such as a Contact or an Account

- The other record's detail page, in the Open Activities and Activity History related lists
- Your Chatter feed and in the Chatter feed for the other record
- Activities reports

Note: You can eliminate a contact or a record on a task without deleting the entire task. For example, suppose that a task is related to Contact A and Contact B, and you want to relate it only to Contact A. Rather than deleting the task, remove Contact B from the `Name` field.

Delegated Tasks (Assigned to People below You in Your Organization's Hierarchy)

- The **My Delegated Activities** list view
- Activities reports
- The Salesforce1 **Delegated Tasks** list

Overdue Tasks

- The **Overdue** activities list view
- The Salesforce1 **Overdue Tasks** list

Completed Tasks

- The **My Activities** list view
- The Salesforce1 **Completed Tasks** list

Tasks That You've Assigned to Others

- The **My Delegated Activities** list view
- Activities reports

Tasks Assigned to People below You in Your Organization's Hierarchy

- The **My Team's Activities** list view
- Activities reports

View Task Details

In a calendar, in an activities list view, in a related list, or on the Home tab, there are two ways to see task details:

- Hover your mouse over a task's subject.
- Click the subject.

On a task detail page, to view the details of a single task in a recurring series () , select the View Task subtab. To view the details for the series, select the View Series subtab.

Create Tasks

On the Home Tab

On the Home tab, under My Tasks, click **New**.

In a Chatter Feed

If you create a task in the feed for a record such as a contact, Salesforce automatically relates the task to the record.

In the Sidebar

In the sidebar in Salesforce, in the Create New drop-down list, select **Task**.

On the Detail Page of Another Record

- On the Open Activities related list, click **New Task**.
- On the Activity History related list, click **Log a Call** to add a task record with a status of Completed.

Salesforce automatically relates the task to the record.

In a Calendar Day or Week View

Under My Tasks, click **New**.

In an Activity List View ()

In a list view, click **New Task**.

Update Tasks

Anywhere (except reports) that you can view task details, you can edit any task that you have permission to edit.

Considerations for Using Tasks

Salesforce always displays a task's due date in the time zone you've chosen in My Settings. Your Salesforce admin can add conditions for closing a task, such as requiring you to enter a comment. If your Salesforce admin has set up more than one Closed or Open status for tasks, choose a status to continue. Working with tasks is different in Lightning Experience and Salesforce Classic.

1. [Considerations for Using Tasks in Lightning Experience](#)
Be aware of these considerations for owning, viewing, creating, and updating tasks.
2. [Considerations for Using Tasks in Salesforce Classic](#)
Be aware of these considerations for owning, viewing, creating, and updating tasks.

SEE ALSO:

- [Activity Reminders in Salesforce Classic](#)
- [Personalize Your Salesforce Experience](#)

Considerations for Using Tasks in Lightning Experience

Be aware of these considerations for owning, viewing, creating, and updating tasks.

Tasks Can Have One Owner at a Time

Only one person can own a task. If you reassign the task to someone else, it no longer appears in your task list, unless the person is below you in the role hierarchy. In that case, you see the task in the Delegated view in your task list.

Managers Can't Edit Others' Tasks

Anyone can reassign a task to a coworker. Managers in the role hierarchy can view tasks that they've assigned to people below them in the role hierarchy. They can also use reports to view tasks of people below them in the role hierarchy, but not to edit them.

No Recurring Tasks

You can't create recurring tasks. However, your task list and the activity timeline display each task that has been created as part of a series in Salesforce Classic. If an individual task is assigned to you, you can edit it.

EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

Limitations on Email Notifications of Task Assignments

Lightning Experience doesn't display an option to send an email when you assign a task. It also doesn't display a setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available. It depends on how your admin has set up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or created with a status of Completed.

No Task Reminders

Lightning Experience doesn't display task reminders.

SEE ALSO:

[Considerations for Using Events and Calendars in Lightning Experience](#)

[Considerations for Using Activities](#)

Considerations for Using Tasks in Salesforce Classic

Be aware of these considerations for owning, viewing, creating, and updating tasks.

Recurring Tasks ([🔗](#))

Only the Default Record Type Is Allowed

If you apply a record type other than the default, Salesforce still applies the default record type to your recurring task. Salesforce doesn't display picklist fields associated with the default record type.

No Due Date in Recurring Tasks

The `Due Date` field is disabled in recurring tasks because tasks in the series have different due dates.

Effects of Changes to a Task Series and Single Tasks in a Series

 **Warning:** Changes to a series of recurring tasks override changes to single tasks that are due in the future. (Changes to a series don't affect tasks due before the current date.) If you change either of the following settings in a series, links to tasks due in the future break. Triggers and workflows are also reset.

- Frequency
- Recurrence start or end date

Task Status

You can't change the status of a task series. You can only change the status of single tasks in a series.

Task Reminders

If you create a recurring task and you leave the reminder checkbox selected, you receive a reminder for each single task in the series.

Attachments to Tasks

You can attach files to a series of recurring tasks. After you create a series, you can add or delete attachments to each single task in the series.

Attachments are displayed on the task detail page only, not on the detail page for other records that the task is related to. If you don't see the Attachments related list on the task detail page, ask your Salesforce admin to add it to the task page layout.

EDITIONS

Available in Salesforce Classic in: **All Editions Except Database.com**

Relating Tasks to Multiple Contacts (Shared Activities)

Maximum Number of Related Contacts

You can relate a task to up to 50 contacts (but only one lead) in the `Name` field, including one primary contact. If you don't see

next to the `Name` field, ask your Salesforce admin to enable Shared Activities.

No Support for Recurring Tasks or Multiple Task Assignees

You can't relate multiple contacts to a recurring task series or a task assigned to multiple users.

Assigning Tasks

Task Is Assigned to User Who Created It

By default, a task is assigned to the person who creates it. To assign independent copies of a new task to multiple people, click  next to **Assigned To**; in the window that opens, click the Multiple Users tab. The `Assigned To` field isn't available in Personal Edition.

Task Notifications

Email Notifications

Depending on the way that your Salesforce admin has configured your Salesforce org, one of the following can happen:

- You automatically receive an email notification for every task assigned to you. You can turn off these notifications by going to the Reminders & Alerts page in your personal settings and deselecting the **Email me when someone assigns me a task** checkbox.
- You don't automatically receive an email notification for every task assigned to you. If you want an email sent to anyone you assign a task to, including yourself, select **Send Email Notification** when you create a task. (Depending on how your Salesforce admin has configured your Salesforce org, this checkbox may be unavailable.)

Mobile Task Notifications

Salesforce1 has separate settings for the task assignment notifications that you receive via your mobile device.

Tasks in Chatter

New Tasks Appear in Chatter Feeds

If a new task is related to a record like a lead, account, or custom object, the task appears in the feed for that record. On any record that you follow, you see feed items for all tasks, regardless of who created them.

Creating Tasks in Feeds

Your Salesforce admin can specify whether you can use Chatter to create tasks for different types of records. For example, some people can view but not create tasks in the feeds for accounts that they have access to.

No Recurring Tasks in Chatter

Your Chatter feed doesn't display recurring tasks, either in series or singly, and you can't follow recurring tasks in Chatter.

No Email or Call Logging in Case Feeds

On cases, feeds don't include email tasks or call logging tasks.

Email-to-Case

Viewing Associated Emails

If your organization has enabled Email-to-Case or On-Demand Email-to-Case, some tasks are associated with Email-to-Case or On-Demand Email-to-Case emails. To view the associated email, click the link at the top of the task. See [Working with Case Emails](#) on page 2133 for more information.

Salesforce for Outlook

Unresolved Items

Tasks that are emails received via Email to Salesforce or Salesforce for Outlook sometimes display a banner that links to the My Unresolved Items page. Use this page to assign any unassociated emails to related Salesforce records.

Repeat a Task

Easily adjust the due date of a recurring task, or cut the clutter of recurring tasks in your future task list. Use repeating tasks to make a task recur a specified number of days after a trigger that you choose. The next task in the series is created only when the current task is due or marked completed. Repeating tasks are a streamlined alternative to regularly recurring tasks when you don't have to get a task done on a specific day.

If you don't see the repeating tasks option when you create a task, ask your Salesforce admin to add repeating tasks to a page layout.

The screenshot shows two settings for a repeating task:

- 1 Repeat This Task:** A dropdown menu with the selected option being "After date completed".
- 2 Recurrence Interval:** A text input field containing the number "14".

1. For **Repeat This Task**, select **After due date** or **After date completed**.
2. For **Recurrence Interval**, enter the number of days after the task's due date or completed date when you want the next task to be due.

If **Repeat This Task** on an existing task is set to **(Task closed)**, it indicates that the task was closed as part of a repeating series. You can use this information to distinguish repeating tasks from other tasks for reporting purposes.

If you use Salesforce for Outlook to sync tasks, individual tasks in a repeating series are synced as they're created.

 **Note:** When tasks in a series are set to repeat after their due date, Salesforce doesn't create recurrences that would have been due in the past. Instead, Salesforce keeps adding the interval until a repeated task has a due date in the future. For example, suppose that someone sets a task to repeat three days after it's due but doesn't complete the task until five days after it's due. Instead of creating a task that's already overdue, Salesforce gives the new task a due date of tomorrow.

Assign Tasks to Multiple People in Salesforce Classic

Assign up to 100 coworkers an independent copy of the same task. For example, you can create a task "Submit your expense reports" with the appropriate due date and assign it to a team of account executives.

1. On the New Task page, click the lookup icon (🔍) next to the **Assigned To** field.
2. In the lookup window, select the **Multiple Users** tab.
3. Add up to 100 people (including members of groups) to Selected Members.

 **Tip:** Personal groups are a convenient way to organize users into groups that are meaningful to you. For details, see [Creating and Editing Groups](#).

4. Click **Done**.

EDITIONS

The New Task page displays your selections and the total number of tasks next to the `Assigned To` field.

5. Save the task.

You've now assigned copies of the task to the coworkers you selected. Coworkers can edit, reassign, or delete their individual tasks.

Task Notifications

Set options for sending or receiving an email notification when a task is assigned.

1. [Task Notifications in Lightning Experience](#)

Lightning Experience doesn't display an option to send an email when you assign a task. It also doesn't display a setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available. It depends on how your admin has set up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or created with a status of Completed. Ask your Salesforce admin for details.

2. [Task Notifications in Salesforce Classic](#)

Salesforce can send an email notification when someone creates or assigns a task, depending on how your Salesforce admin has set up your org.

Task Notifications in Lightning Experience

Lightning Experience doesn't display an option to send an email when you assign a task. It also doesn't display a setting to receive an email when someone assigns you a task. However, if you switch from Lightning Experience to Salesforce Classic, one of these options can be available. It depends on how your admin has set up your Salesforce org. If one of these options is available, you can receive emails for tasks that you assign to yourself or created with a status of Completed. Ask your Salesforce admin for details.

EDITIONS

Available in Lightning Experience in: **Developer, Enterprise, Group, Performance, Professional, and Unlimited** Editions

Task Notifications in Salesforce Classic

Salesforce can send an email notification when someone creates or assigns a task, depending on how your Salesforce admin has set up your org.

Ask your Salesforce admin which way task notifications work in your org:

- You can set your own preference for email notifications when someone assigns you a task.
- Someone who assigns you a task can determine whether to send you an email notification of the task.
- You can't receive email notifications when someone assigns you a task.

If you can set your own preference for email notifications when someone assigns you a task, then you receive email notifications by default. If you don't want to receive the email, change the setting:

- In your personal settings, go to **Reminders & Alerts > Events and Tasks** and deselect **Email me when someone assigns me a task**.

Track Your Products, Prices, and Payment Schedules

Products

Products in Salesforce represent the products and services that your company offers to customers.

[Products Concepts](#)

Before you use products in Salesforce, make sure that you understand the basics.

[Guidelines for Creating Products](#)

If you're an admin or sales operations manager, you'll create products in Salesforce to track the products and services that your company sells. After you create a product, your sales reps can add it to their quotes, opportunities, and orders. Before you get started, review a few key guidelines.

Products Concepts

Before you use products in Salesforce, make sure that you understand the basics.

Products are the items and services that you sell to customers. Each product can exist in multiple price books with different prices.

When you view the detail page of an opportunity, quote, order, or service contract, the Products related list or the Quote Line Items related list shows the associated products for that record. Use these related lists to choose a price book for the record, add or edit products, and, for opportunities, establish or edit product schedules. Use a record's detail page to associate a product with the record. For example, on a quote detail page, click **Add Line Item** on the Quote Line Items related list to select a product to list on the quote.

If products are shared with external contacts via Salesforce to Salesforce, choose one of the list views under Products from Connections to view products that your business partners have shared with you.

Guidelines for Creating Products

If you're an admin or sales operations manager, you'll create products in Salesforce to track the products and services that your company sells. After you create a product, your sales reps can add it to their quotes, opportunities, and orders. Before you get started, review a few key guidelines.

- To view and create products, you need the "Read" and "Create" permissions on products.
- To get started creating products, click **New** on the Products home page.
- You can create a product by cloning an existing product. See [Considerations for Cloning Products](#).
- To ensure fast system performance with price books, keep the number of products below 2,000,000.
- Products need a [standard active price](#) before you can add them to a price book.
- To define a payment and delivery cycle via a [product schedule](#), click **Edit** above the product detail.
- For descriptions of product fields, see [Product, Price Book, Price Book Entry, and Product Schedule Fields](#).

[Considerations for Removing Products and Price Books](#)

Review a few key points before you remove a product or a price book.

Price Books Concepts

Learn about price books and price book entries.

A *price book* is a list of products and their prices.

- The *standard price book* is the master list of all your products and their default *standard prices*. Salesforce creates the standard price book when you start creating product records. It includes all your products and their standard prices regardless of any custom price books that include those products.
- A *custom price book* is a separate list of products with custom prices, called *list prices*. Custom price books are ideal for offering products at different prices to different market segments, regions, or other subsets of your customers. Create a separate price book for each set of customers that you want to address. For example, if you have one set of prices for domestic customers and another for international customers, create a domestic price book and an international one.

A *price book entry* is a product with its price as listed in a price book. Each price book entry specifies a currency for the price.

- *Standard price book entries* are the default (standard) prices for the products and services in the standard price book. When you create a product record, Salesforce creates a standard price book entry. You can mark the standard price book entry as active or inactive, depending, for example, on whether you intend to start selling the product right away.
- *Custom price book entries* are the custom (list) prices for the products and services in your custom price books. Custom price book entries can be created only for products with active standard price book entries.
- In Lightning Experience, Product detail pages display the Standard Price related list and the Price Books related list as a single Price Books related list.
- If you customize the Price Book Entry detail page layout, no field dependencies exist for price book entry fields in the user interface. If the `Use Standard Price` checkbox is removed from the page layout, and this checkbox is selected for a price book entry, you can't edit the list price. The `List Price` field is disabled and can't be enabled on this page.

Set Product Prices in Lightning Experience

Track different types of prices for each of your products to fit the way you sell to different market segments and customers.

Tip: To access Products in Lightning Experience, click the App Launcher (), select Other Items, then select Products.

Set Standard Prices in the Standard Price Book

1. Select a product.
2. From the product page, click **Add Standard Price** from the Price Books related list. If you've already added a standard price, click **Edit** from the Show More menu to change it.
3. Enter the new standard price in the `List Price` field.
4. To make this price available to products on opportunities, quotes, or other custom price books, select `Active`.
5. Save your changes.

The standard price is automatically associated with the product in your standard price book.

Set List Prices in Custom Price Books

1. Select a product.
2. On the product page, click **Add to Price Book** from the Price Books related list.
3. Choose the price book and currency for the new list price, and then click **Next**.
4. Enter the list price. Alternatively, if you want the price in the chosen price book to match the standard price, select `Use Standard Price`.
5. To make this price available to be used when adding the product to opportunities or quotes, select `Active`.
6. Save your changes.

Edit a Price Book Entry

Click **Edit** next to a price book record in any of these locations.

- The price book detail page, in the Products related list
- The product detail page, in the Price Books related list

For information about fields, see [Product, Price Book, Price Book Entry, and Product Schedule Fields](#).

Set and Edit Product Prices in Salesforce Classic

Track different types of prices for each of your products to fit the way you sell to different market segments and customers.

Set Standard Prices

1. Select a product.
2. On the product detail page, click **Add** from the Standard Price related list.
If you've already added a standard price, click **Edit** to change it or **Edit All** to edit all standard prices in other currencies.
3. Enter the standard price.
4. Select **Active** to make this price available to products on opportunities, quotes, or other custom price books.
5. Save your changes.
The standard price is automatically associated with the product in your standard price book.

Set List Prices

1. Select a product.
2. On the product detail page, click **Edit** from the Price Books related list next to the custom price book that will contain the list price.
If you haven't already added the product to a custom price book, click **Add to Price Book** from the Price Books related list.
3. Enter the list price. Alternatively, if both prices are the same, select **Use Standard Price**.
4. Select **Active** to make this price available to products on opportunities or quotes.
5. Save your changes.

Edit a Price

Click **Edit** next to a price book entry record in any of these locations.

- The price book detail page, in the Products related list
- The product detail page, in the Standard Price related list
- The product detail page, in the Price Books related list
- The price book list view

For information about fields, see [Product](#), [Price Book](#), [Price Book Entry](#), and [Product Schedule Fields](#).

Create Custom Price Books

Create custom price books for each market segment that your sales reps sell to. Then add products to each price book with the prices that you offer each market segment. For example, if you sell to domestic and international customers at different prices, you can create two custom price books: a domestic one and an international one.

1. Review [considerations](#).
2. On the Price Books page, click **New**.
3. Enter a name for your price book.
4. If your Salesforce org uses descriptions, enter one for your price book.
5. Select **Active** to allow sales reps to begin adding the price book or its entries to opportunities or quotes.
6. If you created the custom price book from scratch, leave it empty, populate it with price book entries from another price book, or add new entries.

For information about price book fields, see [Product, Price Book, Price Book Entry, and Product Schedule Fields](#).

Guidelines for Sharing Price Books

Extend access to price books to more of your sales team members through sharing in Salesforce Classic.

If you're an admin or a user with the "Edit" permission on price books, you can extend sharing of a price book to more users. However, you can't change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click **Sharing** on the price book detail page. The sharing detail page lists the users, groups, roles, and territories that have sharing access to the price book. On this page, you can do any of the following.

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views.
- To edit or delete any view that you created, select it from the `view` drop-down list, and then click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Does your sales team want to see prices on the product detail page? If your organization-wide default for price books is "No Access," you can give your entire organization "View Only" access to your standard price book.

Considerations for Removing Price Books

To remove price books from related lists, you can archive, deactivate, or delete the price books. Each removal option has a different result. Before you remove a price book from your related lists, determine which option best fits your business needs.

- Deleting, deactivating, or archiving a custom price book doesn't affect other price books or your product lists. However, these actions can affect your opportunities and quotes. Changing associations with opportunities or quotes is sometimes required before you can remove an associated price book.
- You can deactivate the standard price book, but you can't delete or archive it.

Considerations for Deleting Price Books

- You can't delete a price book while it's in use on opportunities or quotes. If you try to, the system creates a list of the opportunities or quotes that the price book is used on.
- When you delete a price book, you delete all entries in the price book. The deleted price book and its entries are moved to the Recycle Bin. You can restore them for up to 15 days.

Considerations for Deactivating Price Books

- You can activate, deactivate, or reactivate price books at any time by changing the price book's properties.
- You can deactivate a price book even if it's used on an opportunity or quote.
- You can continue to manage entries in your price book while it's deactivated.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To share price books:

- "Edit" on price books

Considerations for Archiving Price Books

- You can archive a price book even if it's in use on an opportunity or quote.
- An archived price book is visible, but not accessible, in all associated records.
- Entries in archived price books don't appear in search results.
- You can't recover or delete an archived price book.

[Products Concepts](#)

Considerations for Removing a Product from a Price Book

Before you remove a product from a price book, consider a few key points.

- If you remove a product from a price book, all related price book entries are removed.
- If you restore the product from the Recycle Bin, any related price book entries are restored with it.
- If opportunities, quotes, service contracts, or contract line items are associated with a product, you can't remove the product.
- You can't remove a product that's used on an opportunity or quote. If you try to remove it, Salesforce displays a list of the opportunities and quotes. That way, you can remove the product from those opportunities and quotes and try again. If you don't want to remove the product from all opportunities and quotes, you can deactivate (recommended) or archive the product. See [Considerations for Removing Products and Price Books](#).

EDITIONS

---	---

Products and price books available in: Professional, Enterprise, Performance, Unlimited, and Developer Editions	Quotes available in: Performance and Developer Editions and in Professional, Enterprise, and Unlimited Editions with the Sales Cloud
---	--

Considerations for Removing Products and Price Books

Review a few key points before you remove a product or a price book.

- When you remove a product or price book, all related price book entries are removed. However, if several price books contain the same product, removing the product from one price book doesn't affect the other price books. Similarly, if you remove a price book, the products that it contained aren't removed from any other price book.
- To remove a product completely, remove it from the standard price book.
- If opportunities, quotes, service contracts, or contract line items are associated with a product, you can't remove the product.
- You can't remove a product or price book that's associated with an approval process or has a pending workflow action.
- If your product or price book is used on an opportunity, quote, or order, you have three options.
 - Deactivate it by editing it and then deselecting the `Active` field. We recommend deactivating a product or price book that's on an opportunity or quote because it will no longer be available to users. You can reactivate it later. Deactivation doesn't affect the history of an opportunity line item.
 - Remove the related product or price book from all opportunities and quotes. When you try to remove a product or price book that's used on an opportunity or quote, Salesforce displays a list of the opportunities or quotes that use it.
 - If you remove a price book, remove it from each opportunity and quote that's listed.
 - If you remove a product, remove it from each opportunity and quote that uses it.
 Then remove the price book or product.
 - Archive the product or price book and each related price book entry. Use this option with caution. Archived products and price books can't be recovered because they're not stored in the Recycle Bin. Archived products and price books still appear on any opportunities or quotes that contained them before they were archived.

If you archive a price book, it's still visible in the associated records but not accessible or retrievable.

Establish Schedules for Products on Opportunities

After you add product schedules, use them to set up payments for product sales and realized revenue on opportunities.

Product Schedules Concepts

If you're an admin or sales operations manager, you can create default schedules for products and schedules for individual product line items on opportunities. Start by learning the basics.

- A *quantity schedule* determines when a product is delivered.
- A *revenue schedule* determines when a product is paid for.
- A *default schedule* is associated with a specific product in a specific price book. Every time the product is added to an opportunity, the default schedule is used. You can override the default schedules on any opportunity.

You determine which types of schedules your Salesforce org can use and which types of schedules can be established for each individual product.

- A quantity schedule is suitable if your customers pay once but receive the product in increments, for example, as with an annual magazine subscription for a monthly magazine. A quantity schedule defines the dates, number of units, and number of installments for payments, shipping, or other use as determined by your company.
- A revenue schedule is suitable if your customers make regular payments but receive the product once, for example, if you sell customized products that are charged in installments but delivered once. A revenue schedule defines the dates, revenue amounts, and number of installments for payments, recognizing revenue, or other use.
- A revenue and quantity schedule is suitable if your customers receive their orders on a delivery schedule and pay for the products using a payment schedule, for example, a monthly product subscription that's paid for monthly.
- A default schedule is suitable if all your customers make product payments on the same timetable or you deliver products on a regular schedule. If you typically customize schedules, there's no advantage to creating default schedules.

SEE ALSO:

[Product Schedules](#)

Considerations for Using Product Schedules

Consider key points and review examples before you add product schedules or establish schedules on opportunity products.

Considerations for Using Default Product Schedules

- If you add or change a product schedule, opportunities with that product aren't updated. If a product has a default quantity schedule and a default revenue schedule, the quantity schedule is calculated first to determine the total product revenue. Then the revenue schedule is applied to that amount.
- If you have a quote line item with a discount, and the corresponding product record has a default schedule, you can't edit the `Discount` field.
- If a product has default schedules established on the product record, the schedules are automatically created when you add the product to the opportunity. The dates of the installments begin with the date that you specified when adding the product. If you didn't specify a product date, the installment dates begin with the opportunity `Close Date`.

Examples of Using Default Product Schedules

- **Default Revenue Schedule Only:** Your ASP company sells yearly contracts of product licenses at \$1,200 per license. When a customer buys licenses, the licenses are all “delivered” at one time, but you recognize the revenue monthly. In this case, set a revenue schedule of Schedule Type=Divide, Installment Period=Monthly, and Number of Installments=12.

With this default revenue schedule, a salesperson sells 200 licenses at a unit price of \$1,200 per license per year on an opportunity on March 15. The 200 licenses are all “delivered” on March 15. The total revenue for this product is the quantity of 200 multiplied by the unit price of \$1,200 per year, for a total yearly revenue of \$240,000. The revenue schedule divides the total revenue into monthly installments of \$20,000 on the 15th of every month for the next year.

- **Default Quantity Schedule Only:** Your medical supplies company sells a box of tongue depressors for \$10 per box. You normally have yearly contracts with hospitals to deliver boxes monthly. In this case, set a quantity schedule of Schedule Type=Repeat, Installment Period=Monthly, and Number of Installments=12.

With this default quantity schedule, a salesperson sells 1,000 boxes on an opportunity on January 1. The quantity schedule creates 12 monthly installments of 1,000 boxes each, for a total quantity of 12,000 boxes. The total revenue from this opportunity is calculated using the unit price and the total quantity, so \$120,000 is booked on January 1.

- **Default Quantity and Revenue Schedules:** Your manufacturing company sells widgets for \$10 each. You normally have yearly contracts to deliver widgets weekly, but your customers pay quarterly. In this case, set a quantity schedule of Schedule Type=Repeat, Installment Period=Weekly, and Number of Installments=52. Set a revenue schedule of Schedule Type=Divide, Installment Period=Quarterly, and Number of Installments=4.

With these default schedules, a salesperson sells 2,000 widgets on an opportunity on January 1. The quantity schedule is applied first, and it schedules 2,000 widgets to be delivered every week for a year, for a total quantity of 104,000. The total revenue is calculated using the unit price and the total quantity. The total revenue of \$1,040,000 is then divided into quarterly installments of \$260,000.

Guidelines for Adding Entitlement Templates to Products

If you're an admin or sales operations manager, follow key guidelines for using the Entitlement Templates related list.

Entitlement templates are predefined terms of customer support that you can quickly add to products. For example, you can create entitlement templates for Web or phone support so that users can easily add entitlements to products offered to customers.

The Entitlement Templates related list displays a product's applicable entitlement templates. Administrators determine an Entitlement Template related list's availability and content.

- To search for entitlement templates, enter a name, or part of a name, in the text entry field, and then click **Go!**.
- To add entitlement templates to a product, click **Add Entitlement Template**, select the checkboxes next to the templates that you want to add, click **Insert Selected**, and then click **Done**.
- The actions that you can perform on the entitlement template are listed under Action. For example, click **Remove** to remove an entitlement template from the product.
- The name of the template is listed under Entitlement Template. Click to view the template's details.

EDITIONS

- The user who created the entitlement template is listed under Created By.

Product, Price Book, Price Book Entry, and Product Schedule Fields

Products, price books, and product schedules have the following fields, listed in alphabetical order. Availability of fields depends on how Salesforce is set up.

Product Fields

Field	Description
Active	Whether the product is ready for use in a price book, opportunity, or quote, and whether you can find the product in searches and see the product in views.
Created By	The name of the user who created the product record, including the date and time of creation.
Custom Links	A list of custom links for products from Salesforce.
Last Modified By	The name of the user who last saved the record, including the date and time of the most recent save to the record.
Product Code	The internal code or product number that you use to identify the product.
Product Currency	In multicurrency organizations, the currency that you use for the product. If the product currency differs from the user currency, currency-related fields for opportunities, quotes, and quote line items appear in both currencies. The product's currency is converted to the user's currency, and the converted amount appears in parentheses.
Product Description	The text that distinguishes this product from other products.
Product Family	The category that you specify for the product.
Product Name	The product's name.
Quantity Scheduling Enabled	Whether the product can have a quantity schedule.
Revenue Scheduling Enabled	Whether the product can have a revenue schedule.

EDITIONS

Products and price books available in: both Salesforce Classic and Lightning Experience

Quotes and schedules available in: Salesforce Classic

Products, price books, and schedules available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Quotes available in: **Performance** and **Developer** Editions and in **Professional, Enterprise, and Unlimited** Editions with the Sales Cloud

Price Book Fields

Field	Description
Active	Whether you can add the price book to an opportunity or quote.
Created By	The name of the user who created the price book, including the date and time of creation.
Description	The text that distinguishes this price book from others.
Is Standard Price Book	Whether the price book is the standard price book. A read-only checkbox.
Last Modified By	The name of the user who last saved the record, including the date and time of the most recent save to the record.
Price Book Name	The price book's title.

Price Book Entry Fields

Field	Description
Active	Whether the price book entry (product and list price) is active and can be added to an opportunity or quote.
Created By	The name of the user who created the price book entry, including the date and time of creation.
Currency	This field is available only for Salesforce orgs with multiple currencies enabled and represents the currency to use for the price book entry (product and list price).
Last Modified By	The name of the user who last saved the price book entry record.
List Price	The price of the product within the price book, including currency.
Price Book	The price book that contains the price for this entry.
Product	The product's name.
Product Code	The internal code or product number that's used to identify the product.
Standard Price	The standard price for the product. This field is derived and doesn't exist on the underlying PricebookEntry standard object.
Use Standard Price	Whether the price book entry inherits its price from the standard price book.

Schedule Fields

Field	Description
Schedule Type	Whether the product revenue or quantity is divided into multiple installments or repeated for each installment.
Installment Period	The interval for installments; for example, Weekly or Monthly.
Number of Installments	The number of installments in the schedule.

Considerations for Cloning Products

If you're an admin or a sales operations manager, you can clone a product to quickly create another product with the same information and price book entries. Consider key points before you clone a product.

When you clone a product:

- Price book entries in price books that you don't have sharing access to aren't created.
- If you have read-only access to a field, the value of that field isn't carried over to the cloned record.

EDITIONS

Products and price books available in: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Considerations for Creating and Maintaining Price Books

Before you create a price book, consider a few key points.

- To create a custom price book by cloning an existing price book, click **Clone** on the price book detail page.
- You can delete products from custom price books without affecting the original product listing or its entries in other price books. When you delete a product from the standard price book, the product is still available and active, but its standard price is deleted and removed from all custom price books. If you delete the product from the standard price book, and it's still associated with any custom price books, click **OK** to remove it from all custom price books.
- You can add products, quote line items, or order products from a single price book only.
- To include a product on an opportunity, quote, or order, choose a price book that contains the product. The last price book that you used on an opportunity or quote is selected by default. To select a different price book, click **Choose Price Book** in the Products related list on an opportunity or the Quote Line Items related list on a quote. Choose Price Book appears when you have access to more than one price book. If you have access to more than one price book and the option isn't visible, ask your administrator to add it to your page layout.
- If you change the price book for an opportunity that has products, all products are deleted from the Products related list, but the value in the opportunity's Amount field remains.

Quotes available in: **Performance and Developer** Editions and **Professional, Enterprise, and Unlimited** Editions with the Sales Cloud

Considerations for Setting Prices

If you're an admin or a sales operations manager, consider key points before you set prices for your products in Salesforce.

- The following price types are available.
 - A *standard price* is the default price that you associate with a product. It's automatically included in your standard price book.
 - A *list price* is the custom price that you associate with a product in a custom price book. For example, you can maintain one set of prices for domestic orders and another for international orders.
 - *Sales prices* are the actual prices that sales reps specify for the products that they add to opportunities and quotes. Sales prices can be the same as the list prices from the price book that's used for the opportunity or quote, or they can include discounts or other modifications.
- Before you can add a new product to an opportunity, quote, or custom price book, add a standard price to the product, and mark it as active. This pricing is the default pricing of the product.
- Before you can assign list prices for products, create custom price books. List prices are available to use when you add products to an opportunity or quote from a custom price book.
- To represent the price, for example, \$100.00, enter *100* or *100.00*, with or without the \$ symbol.
- You can expand the format of your price fields to up to eight decimal places. To change your decimal place settings, contact Salesforce.

Considerations When Using the Salesforce Classic User Interface

- You can add standard or list prices only through the multiline add pages (the Add Standard Price page and the Add List Price page). These pages don't support custom fields. To add standard or list prices and populate custom fields, add the price book entry via the multiline add pages, navigate to the Price Book Entry Edit page for the added record, and then update the custom fields.
 - 📌 **Note:** This consideration doesn't affect price book entries that were created or edited by using Data Loader or the API.
- If the price book entry contains required custom fields, you can't create price book entries in the user interface. You can create these price book entries only by using Data Loader or the API.
- You can edit prices in either of the following locations.
 - The multiline edit pages (the Edit Standard Price page and the Edit List Price page)
 - The Price Book Entry Edit page

Building Your Pipeline with Opportunities

Opportunities

Track and manage your potential deals with Salesforce opportunities.

See key details about the deals, including which accounts you're working with, who the players are, and the amounts of the potential sales. As your deals progress toward the Proposal stage:

- Add products and attach files, such as contracts or data sheets.
- Log the calls you make.
- Use Notes to jot down things during customer meetings.
- Create tasks for key activities and calendar events for client meetings.
- Send email to the opportunity contact or other key decision-makers.

During negotiation, share sales strategies with colleagues or to ask your manager for targeted guidance using Chatter. As you drive your deal from one stage to the next, update the opportunity record with the current stage. You'll be closing deals in no time.

Move an Opportunity to the Next Stage in Salesforce Classic

Track opportunity progress as you get closer to closing your deal.

 **Note:** These steps work in Salesforce Classic. If you see a row of tabs across the top of your screen, you're in Salesforce Classic. If you see a navigation bar on the left, you're in Lightning Experience.

1. Edit the opportunity record you want to update.
2. Select the new stage.
3. Save the record.

Add and Edit Products on Opportunities

Track what's selling and in what quantity by adding products to opportunities. Then make sure that you maintain accurate records by updating the quantities and prices of the products.

1. Navigate to the opportunity that you want to edit.
2. From the Products related list, either click **Edit** next to the product you want to modify or click **Add Product** to add a new product. If you're adding the first product, choose a price book for the opportunity.
3. When adding a new product, select one or more products from the list, or search for a product.
4. Enter the attributes for each product. Admins can customize this page to include fields that are specific to your business.
5. Enter the `Sales Price` for the product. The sales price defaults to the list price that's specified in the price book that's assigned to the opportunity. Depending on your user permissions, you can override this value.
6. If the product has a discount, type the discount as a number with or without the percent sign (%) in the `Discount` field. If the `Discount` field isn't available, check with your administrator.
7. Enter the number of products at this price in the `Quantity` box.

Schedule Reminders to Update Opportunities

To ensure your team is keeping their opportunities up to date, create an automated email that contains a report of your team's open opportunities and send it to your direct reports.

For example, you can schedule a weekly report of all the opportunities for the current fiscal quarter owned by anyone on the team and have the report distributed to everyone on the team.

1. Make sure that opportunity update reminders are enabled.
2. From your personal settings, enter *Reminder* in the **Quick Find** box, then select **My Update Reminder**.
3. Check **Active** if you want reminders to start after you save the settings.
4. Enter a name and address for the sender of the reminders.
5. Choose a recipients option.
6. Enter any other recipients in the **CC** field. Separate email addresses with commas, semi-colons, spaces, or new lines.
7. Enter a subject and message to be included in the email reminders.
8. Select a schedule frequency.
9. Select **Include Past Due Opportunities** to include all open opportunities that have a closing date within 90 days before the specified **Close Date**.
 For example, suppose that your organization uses a normal fiscal year and the current quarter started on 4/1/2012. You configure update reminders for opportunities closing in the current quarter and then select **Include Past Due Opportunities**. When the update reminder is sent on 6/15, it includes all opportunities from 4/1 to 6/15. It also includes open opportunities with a closing date between 1/2 and 4/1 (there are 91 days in Q1).
10. Choose a **Close Date** to include opportunities with dates within that range.
11. Select the fields to include in the email reminders.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Field	Description
Last Login Date	Most recent login date of the opportunity owner
# of Open Opportunities	Total number of opportunities in the report
# Not Updated in Last 30 Days	Total number of opportunities that have not been updated in 30 days
Open Opportunity Amount	Total of all opportunity amounts in report
Total Closed Amount	Total closed amount for all opportunities in report. If your organization uses multiple currencies, this amount is converted to the user's currency. If your organization uses

Field	Description
	advanced currency management, the conversion is done using dated exchange rates.
Last Update Date	Most recent date the opportunity owner submitted a forecast. If your organization uses multiple currencies, this amount is converted to the user's currency. If your organization uses advanced currency management, the conversion is done using dated exchange rates.

12. Click **Save**.

When there are no records in an opportunity update reminder, Salesforce doesn't send an email. If no email is sent for three consecutive opportunity update reminders, the scheduled reminder is deactivated.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All** Editions for organizations activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions for organizations activated after Summer '09

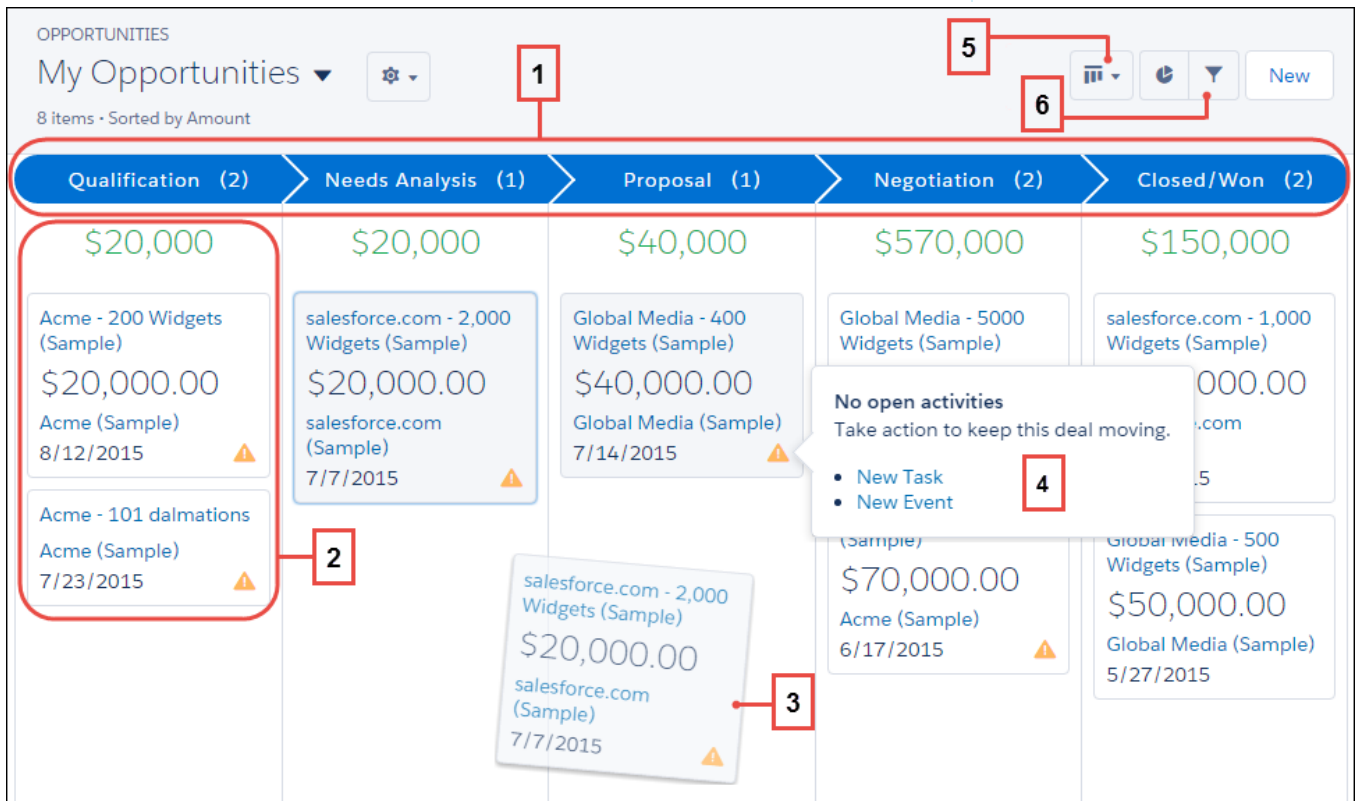

Opportunity Kanban

The Opportunity Kanban is a visual summary of all the opportunities for a particular sales path. By seeing all opportunities at once, sales managers can effectively monitor the pipeline and sales reps can keep deals moving forward.

EDITIONS

Available in: Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

The Opportunity Kanban board displays opportunities from a particular sales path (1). The opportunities are sorted by stage and include the sum of the all opportunities for that stage. The fields shown on the card are the first four fields on the corresponding list view (2). Easily move an opportunity by dragging the card to the next stage (3). Alerts tell how to keep a deal on track; for example, create a task or event on an opportunity that doesn't have any open activities (4). You can then create an activity without navigating away from this view. Easily toggle between board view and grid view (5) and quickly filter the view (6) to see a specific set of opportunities.

There are a few things to consider when using the Opportunity Kanban. For more information, see the [Lightning Experience guide](#).

Opportunity Field History

Field History lets you track the changes made to an opportunity, including changes to the stage, so you can quickly see who changed the opportunity and when.

There are two related lists that track changes to the fields on an opportunity record.

Opportunity Field History

Any time a user modifies any of the standard or custom opportunity fields that are set to be tracked, a new entry is added to the Opportunity Field History related list. All entries include details of the change and who made it. Your administrator can choose which fields to track.

Stage History

Any time a user changes the `Amount`, `Probability`, `Stage`, or `Close Date` fields, a new entry is added to the Stage History related list. All entries include details of the change and who made it. Your administrator can't choose which fields to track.

Changes to the `Amount` and `Quantity` fields are tracked even when the field is updated as the result of a change to an opportunity's products or schedules.

- "Read" on opportunities

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All** Editions for organizations activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions for organizations activated after Summer '09

Guidelines for Creating Opportunities

Many of your Salesforce org's opportunities can be generated when you convert qualified leads, but you can also create opportunities manually in both Salesforce Classic and Lightning Experience.

Contacts and Contact Roles

- To associate an opportunity with an account or contact, you must have at least read access to the account or contact.
- In Salesforce Classic, when you create an opportunity from a contact record, that contact is automatically listed as the primary contact in the Contact Roles related list of the opportunity. In Lightning Experience, when you create an opportunity from a contact record, you're prompted to assign a contact role to that contact.

Divisions

If your organization uses Divisions, the division of a new opportunity is automatically set to the division of the related account.

Forecasts

- In Professional, Enterprise, Unlimited, Performance, and Developer Editions, opportunities you create are automatically given the forecast category that corresponds to the opportunity stage you assign. Your administrator correlates opportunity stages and forecast categories when editing the `stage` picklist values.
- If the opportunity is set to close in a given month, as determined by the `Close Date`, the opportunity is automatically added to the forecast for that particular month, unless the forecast category on the opportunity is set to *Omitted*.

Multicurrency

If your organization uses multiple currencies, your opportunity amounts are initially shown in your personal currency. Change the `Opportunity Currency` picklist to track the sales revenue in another currency.

Opportunity Splits

When team selling and splits that total 100% are enabled, you're automatically added to the opportunity team and initially assigned 100% of the split.

Territory Management

If your organization uses [territory management](#), opportunities that you create are automatically assigned a territory when both of the following conditions are met.

- You belong to or have edit privileges on the same territory as the account on the opportunity.
- You have no other territories in common with that account. (Note that if you have the "Manage Territories" permission, you have access to all territories, including the parent territories of the account. In this case, you *do* have other territories in common with the account, unless the account is only assigned to a single top-level territory. No territory is assigned to the opportunity.) For example, if you are in the territories Berkeley and San Francisco and the account is in the territories Portland, San Francisco, and Seattle, the opportunity is assigned to the San Francisco territory.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Opportunity Splits available in: Salesforce Classic

Available in: **All** Editions for orgs activated before Summer '09

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions for orgs activated after Summer '09

Opportunity Splits and territory management available in: **Performance and Developer** Editions and in **Enterprise and Unlimited** Editions with the Sales Cloud

Considerations for Deleting Opportunities

Before you delete Salesforce opportunities, make sure you're familiar with these considerations.

- You can delete an opportunity if you're an administrator, the opportunity owner, or a user above the opportunity owner in the organization role hierarchy, and you have the "Delete" permission on opportunities.
- When you delete an opportunity, all related notes, attachments, quotes, quote line items, quote PDF files, events and tasks, partner relationships, competitor strengths/weaknesses, contact roles, and stage history are deleted.
- The deleted opportunity is moved to the Recycle Bin and can be restored. If you restore the opportunity, any related items are also restored.
- Associated contacts and accounts are not deleted with the opportunity.

SEE ALSO:

[Delete Records](#)

Considerations for Cloning Opportunities

Cloning an opportunity quickly creates an opportunity with the same information as the existing one. Before you clone Salesforce opportunities, make sure you're familiar with these considerations.

- If you have read-only access to a field, the value of that field isn't included in the cloned opportunity.
- If the opportunity has an associated opportunity team, the team isn't included in the cloned opportunity..
- If the opportunity has any associated products that contain unique custom fields, delete the values in the custom fields before cloning the opportunity.
- If the clone button isn't visible, you might not have permission to create opportunities, or your Salesforce admin might have removed it from the page layout. Ask your Salesforce admin for help.

 **Note:** If you have read-only access to a field, the value of that field is not carried over to the cloned record.

Considerations for Sharing Opportunities

By sharing your opportunities with other user you give visibility into your pipeline so others can provide you with important information to help you close your deals. Before you share your opportunities, make sure you're aware of these considerations.

- Your administrator determines your organization's sharing model, including the default opportunity access levels for territories.
- While you can increase access to your opportunities, you can't restrict it below your organization's default access levels.
- To share an opportunity with another user, that user must have the "Read" permission on opportunities.
- The sharing detail page lists the users, groups, roles, and territories that have sharing access to the opportunity.

SEE ALSO:

[Record Access Levels](#)

Guidelines for Finding Similar Opportunities

Close your deals faster by taking advantage of the rich information contained in successfully closed deals that are similar to yours. Here are some guidelines to help you find the opportunities that will help you close your deals.

- Use the Similar Opportunities related list on the opportunity's detail page to find Closed/Won opportunities with common information.
- The criteria used to find similar opportunities is determined by your administrator. The search finds a maximum of 10,000 opportunities with close dates in a three-month period and displays up to 300 of the records that best match the search criteria. The results are ranked by the number of matching fields.
- Results can be filtered by Close date or by matching fields.
- To see how a record in the search results is similar to your current deal, hover over the opportunity name. The matching fields are highlighted in the Match Criteria sidebar.

Considerations for Adding Products to Opportunities

If you're an admin or sales operations manager, consider key concepts before you add products to opportunities.

- The opportunity `Amount` is the sum of the products that you add to the opportunity. You can't edit the `Amount` unless you delete the products from the opportunity.
- The total price is the quantity multiplied by the sales price.
- If you're using Salesforce Classic and the product has default schedules, Salesforce creates the schedules when you add the product to the opportunity.
- For multicurrency orgs, the opportunity `Currency` is tied to the currency of the associated price book entry. You can't edit the `Currency` unless you delete the products from the opportunity.

Opportunity Fields

The fields for opportunities contain a wide variety of information to help you track your pending and potential sales. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
<code>Account Name</code>	<p>Name of account that opportunity is linked to. You can enter the account name, or select the account using the lookup icon.</p> <p>If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.</p>
<code>Amount</code>	<p>Estimated total sale amount. For organizations using multiple currencies, the amount is shown in your personal currency by default. Change the <code>Opportunity Currency</code> picklist to track the amount in another currency.</p> <p>For opportunities with products, the amount is the sum of the related products. You cannot directly edit the amount unless the opportunity has no products. To change the amount for an opportunity that contains products, edit the sales price or quantity of the related products.</p> <p>If you change the price book for an opportunity that has products, all products are deleted from the Products related list, but the value in the opportunity's <code>Amount</code> field remains.</p>
<code>Close Date</code>	<p>Date when you plan to close the opportunity. You can enter a date, or choose a date from the</p>

EDITIONS

Products and price books available in: both Salesforce Classic and Lightning Experience

Schedules available in Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
	<p>calendar that displays when you put your cursor in the field.</p> <p>Opportunities with a <code>Close Date</code> in a given month will tally in the forecast for that month, unless you assign them to the Omitted category while editing the forecast.</p> <p>When you set an open opportunity's <code>Stage</code> to a type of "Closed/Won," the <code>Close Date</code> is set to the current date in Coordinated Universal Time (UTC). At certain times of day, UTC will differ by one day from your time zone.</p>
<code>Contract</code>	Contract that the opportunity is linked to.
<code>Created By</code>	User who created the opportunity including creation date and time. (Read only)
<code>Custom Links</code>	Listing of custom links for opportunities as set up by your administrator. Available only in Salesforce Classic.
<code>Description</code>	Description of the opportunity. Up to 32KB of data are allowed. Only the first 255 characters display in reports.
<code>Expected Revenue</code>	Calculated revenue based on the <code>Amount</code> and <code>Probability</code> fields.
<code>Forecast Category</code>	Forecast category name that is displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. The setting for an opportunity is tied to its <code>Stage</code> . For more information on forecast categories, see Working with Forecast Categories on page 1503.
<code>Last Modified By</code>	User who last changed the opportunity fields, including modification date and time. This does not track changes that are made to any of the related list items on the opportunity. (Read only)
<code>Lead Source</code>	Source of the opportunity, for example, Advertisement, Partner, or Web. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
<code>Next Step</code>	Description of next task in closing opportunity. Up to 255 characters are allowed in this field.
<code>Opportunity Currency</code>	<p>The default currency for all currency amount fields in the opportunity. Amounts are displayed in the opportunity currency, and are also converted to the user's personal currency. Available only for organizations that use multiple currencies.</p> <p>For opportunities with products, the currency is tied to the currency of the associated price book. You cannot directly edit this field unless you first delete the products.</p>

Field	Description
Opportunity Division	<p>Division to which the opportunity belongs. This value is automatically inherited from the related account.</p> <p>Available only in organizations that use divisions to segment their data.</p>
Opportunity Name	Name of the opportunity, for example, Acme.com - Office Equipment Order. Up to 120 characters are allowed in this field.
Opportunity Owner	Assigned owner of opportunity. Not available in Personal Edition.
Opportunity Record Type	Name of the field that determines what picklist values are available for the record. The record type may be associated with a sales process. Available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.
Partner Account	Read-only field that indicates the opportunity is owned by a partner user.
Primary Campaign Source	<p>Name of the campaign responsible for generating the opportunity.</p> <p>For opportunities created during lead conversion, this field is automatically filled in with the campaign name from the lead. If the lead has multiple associated campaigns, the campaign with the most recently updated member status is inserted into the opportunity.</p> <p>For opportunities with multiple influential campaigns, click Edit next the primary campaign in the Campaign Influence related list on the opportunity detail page and select the <code>Primary Campaign Source</code> checkbox. The campaign will display in the <code>Primary Campaign Source</code> field on the opportunity.</p>
Private	<p>Indicates that the opportunity is private. Only the record owner, users above that role in the hierarchy, and administrators can view, edit, and report on private opportunities. Not available in Group or Personal Editions. Private opportunities do not trigger Big Deal Alerts or workflow rules. Private opportunities count towards your forecasts only if you have Customizable Forecasting or Collaborative Forecasts enabled. Users with the "View All Forecasts" permission can see private opportunities within the Forecasts tab.</p> <p> Note: When you mark opportunities <i>Private</i>, any opportunity teams, opportunity splits, and sharing are removed. (The owner of a private opportunity receives 100% of split types that total that amount.)</p>
Probability	<p>Likelihood that opportunity will close, stated as a percentage.</p> <p>The <code>Probability</code> value is always updated by a change in the <code>Stage</code> value, even if <code>Probability</code> is marked as read only</p>

Field	Description
	on your page layout. Users with access to edit this field can override the value.
Quantity	Total of all <code>Quantity</code> field values for all products in the Products related list if the opportunity has products. General use field if the opportunity does not have products.
Stage	<p>Current stage of opportunity based on selections you make from a predefined list, for example, Prospect or Proposal. Entry is selected from a picklist of up to 100 available values, which are set by an administrator. Each picklist value can have up to 40 characters.</p> <p>Your administrator correlates the values in this picklist with Forecast Category values that determine how the opportunity contributes to your forecast.</p> <p>When you set an open opportunity's <code>Stage</code> to a type of "Closed/Won," the <code>Close Date</code> is set to the current date in Coordinated Universal Time (UTC). At certain times of day, UTC will differ by one day from your time zone.</p>
Synced Quote	Quote that's synced to the opportunity. Only one quote can sync to the opportunity at a time.
Territory	Territory with which the opportunity is associated. Only available if your organization has territory management.
Type	Type of opportunity, for example, Existing Business or New Business. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.

Opportunity Product Fields

The fields for opportunity products contain information to help you track what's selling. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Active	Whether the price book entry (product and list price) is active and can be added to an opportunity or quote.
Created By	Name of the user who created the product.
Date	Close date of a particular opportunity product.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

The available fields vary according to which Salesforce Edition you have.

Field	Description
Discount	Discount for the product as a percentage.
Last Modified By	User who last changed the opportunity product fields. (Read only)
Line Description	Text to distinguish this opportunity product from another.
List Price	The price of the product within the price book, including currency.
Opportunity	Name of the opportunity for this opportunity product.
Product	Item listed in the Products related list on an opportunity.
Product	The product's name.
Quantity	Number of units for the opportunity product.
Sales Price	Price for the products in the opportunity product.
Subtotal	Difference between standard and discounted pricing. Converted currency amounts when the opportunity's currency is different from the user's currency.
Total Price	Sum of all the product amounts for this opportunity product.

Teaming Up for Sales Opportunities

Opportunity Teams

An opportunity team is a group of Salesforce users who work together on a sales opportunity.

Opportunity teams shows who's working on the opportunity and what each team member's role is. You can grant your opportunity team members special access to the opportunity and its related records, making it easier for everyone to work together.

Using opportunity teams makes it easier for you to track the work of a team, too. In opportunity reports, filter opportunities by the opportunity teams that you're a member of. When creating or editing a custom list view for opportunities in Salesforce Classic, select the My Opportunity Teams filter.

[Guidelines for Using Opportunity Teams](#)

An opportunity team is a group of Salesforce users who work together on a sales opportunity. If you're using opportunity teams, refer to these guidelines.

[Guidelines for Editing Members of an Opportunity Team](#)

Keep the details about your opportunity team members up-to-date by changing their access level, team role, and more. If you're editing team members, refer to these guidelines for information.

EDITIONS

Available in: **Salesforce Classic and Lightning Experience**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

[Considerations for Deleting Members from an Opportunity Team](#)

Keep your opportunity teams up-to-date by deleting members who are no longer part of a team. If Opportunity Splits is enabled, consider the following before you delete a team member.

[Guidelines for Setting Up and Adding a Default Opportunity Team](#)

Save time by setting up a default opportunity team—a group of coworkers who you typically work with on opportunities. Then add the team to opportunities that you own. If you're working with a default opportunity team, refer to these guidelines for additional information.

[Opportunity Team Fields](#)

Opportunity Team data is stored in these standard fields.

[Opportunity Splits](#)

Guidelines for Using Opportunity Teams

An opportunity team is a group of Salesforce users who work together on a sales opportunity. If you're using opportunity teams, refer to these guidelines.

-  **Note:** Opportunity teams aren't the same as account teams, although they share a set of available team member roles.
- Set up opportunity teams for opportunities that are owned by you or someone below you in the role hierarchy.
- Set up a default opportunity team to include the users who you normally work with on opportunities. You can choose to add your default opportunity team to all your opportunities automatically.
- When you set up an opportunity team, you:
 - Add team members.
 - Specify each member's role on the opportunity, such as Executive Sponsor.
 - Specify each team member's level of access to the opportunity: read/write access or read-only access.
- Changes that you make to the opportunity team on an opportunity don't affect your default opportunity team or the opportunity teams on your other opportunities.
- If your Salesforce admin has enabled Opportunity Splits, you can split credit for an opportunity among members of an opportunity team.
- Adding, editing, or deleting opportunity team members requires read/write access on the opportunity.
- You can't use opportunity teams for private opportunities.

SEE ALSO:

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

Guidelines for Editing Members of an Opportunity Team

Keep the details about your opportunity team members up-to-date by changing their access level, team role, and more. If you're editing team members, refer to these guidelines for information.

- If the team member that you need to update doesn't appear in the Opportunity Team related list, view the full list.
- You edit opportunity team members on the detail page of the opportunity team member that you need to update.
- When editing inactive users with assigned split percentages, you can edit only the split-related fields.
- If your Salesforce admin defined custom fields, you'll see them when you edit a team member, even if your admin didn't add them to the Add Opportunity Team Members page.
- The member's opportunity access level can't be less than your Salesforce org's default opportunity sharing access.

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

Considerations for Deleting Members from an Opportunity Team

Keep your opportunity teams up-to-date by deleting members who are no longer part of a team. If Opportunity Splits is enabled, consider the following before you delete a team member.

- If the team member that you want to delete is assigned a split percentage greater than zero, reassign the split before you delete the member.
- You can't delete the opportunity owner from the opportunity team. To remove this member from splits calculations, assign the member a split percentage of zero, or transfer ownership of the opportunity.

[Guidelines for Using Opportunity Teams](#)

Guidelines for Setting Up and Adding a Default Opportunity Team

Save time by setting up a default opportunity team—a group of coworkers who you typically work with on opportunities. Then add the team to opportunities that you own. If you're working with a default opportunity team, refer to these guidelines for additional information.

- To set up a default opportunity team, access Advanced User Details in your personal settings.
- While you're defining your default opportunity team, you can choose to automatically add it to all your open opportunities. If you don't choose this option, you add the default team from the Opportunity Team related list of your opportunities.
- Clicking **Add Default Team** adds the default team of the opportunity owner, not of the user who clicks the button.

Opportunity Team Fields

Opportunity Team data is stored in these standard fields.

Field	Description
Opportunity Access	The level of access that a team member has to the opportunity. The access level can be read/write or read only, but it can't be less than your Salesforce org's default opportunity sharing access.
Team Role	The role that the team member plays for the opportunity, such as Account Manager.
User	The user who's listed as part of the team.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

SEE ALSO:

[Opportunity Teams](#)

Opportunity Splits

Opportunity splitting lets you share revenue from an opportunity with your team members. Team members working on an opportunity can roll their individual sales credits into quota and pipeline reports for the entire team.

 [Watch a Demo](#) (1:44 minutes)

If your Salesforce admin has enabled Opportunity Splits, and you're the opportunity owner or above the owner in the organization hierarchy, you can add and adjust splits for the opportunity.

- To credit team members who are directly responsible for opportunity revenue, use *revenue* splits, which always total 100% of the opportunity amount.
- To credit supporting team members, use *overlay* splits, which can total any percentage of the opportunity amount, including percentages over 100%.

Your Salesforce org's `Split on Opportunity - Amount` field comes with one revenue split and one overlay split. If custom split types are enabled for your org, your Salesforce admin can create three more split types. Your admin decides which types of splits always total 100%. To have custom split types enabled for your org, ask your admin to contact Salesforce.

Your admin can also create custom fields for opportunity splits, allowing you to better track and store information about splits that you create for team members.

 **Note:** Splits can't be rolled up to sales territories. For information about including splits in your forecasts, see [Changing Between Revenue and Quantity Forecasts](#).

EDITIONS

If you're creating opportunity splits to share opportunity revenue with coworkers, review these guidelines for information.

[Create Opportunity Splits](#)

Add and adjust splits to share revenue from opportunities with your team members.

SEE ALSO:

[Create Opportunity Splits](#)

Considerations for Creating Opportunity Splits

If you're creating opportunity splits to share opportunity revenue with coworkers, review these guidelines for information.

- The opportunity owner is automatically included in the opportunity team and initially assigned 100% of the split types that always total 100%.
- If you can't add a team member when you're editing the opportunity split, add the member in the Opportunity Team related list on the main opportunity page. (To add members while editing splits, contact your Salesforce admin.)
- If you don't see splits on a field, ask your Salesforce admin to check your field-level security limits.
- To determine whether a split type always totals 100%, look for "must total 100%" in the description of the split.
- Split percentages are limited to two decimal places. If you enter a monetary amount that requires a split percentage with more than two, the amount is automatically rounded.

Defining Competitors

Create a picklist of competitors that your users can attach to opportunities. To add competitors to the picklist:

1. From Setup, enter *Competitors* in the **Quick Find** box, then select **Competitors**.
2. Click **New** to add competitor names to the list.
3. Enter the name of the competitor.
4. Optionally, check the default option to select this value on any new record when another value is not selected.
5. Click **Save**.

Viewing and Editing Competitors

The Competitors related list of an opportunity shows the competitors for that deal.

- To view information for a competitor, click the competitor's name.
- Click **Edit** next to a competitor's name to edit the strengths and weaknesses of the competitor for the opportunity.
- To add a competitor, click **New**. Enter the competitor's name, or click the lookup icon to select from a list of competitors defined by your administrator. It does not need to be an existing account or contact. Then specify the strengths and weaknesses of the competitor, which may be different for each opportunity.

 **Note:** To add or create a competitor on an opportunity, you must also have access to edit that opportunity.

Competitor Fields

A competitor has the following fields, listed in alphabetical order.

Field	Description
Competitor Name	Name of competitor. You can enter any name, or select from the list of all competitors defined by your administrator.
Strengths	Description of competitor's key selling points and advantages.
Weaknesses	Description of competitor's key disadvantages.

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Feedback requires a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Work.com Feedback allows you to request and offer unsolicited feedback on a person or topic, and also respond to feedback related to performance summaries.

Feedback offers, feedback requests, and feedback related to performance summaries are all managed from the Feedback tab. The Feedback tab displays the recent feedback you've viewed by default, and you can filter to see different types of feedback records. For example, select **New Feedback Requests** to see feedback records that require their input. You can also create custom list views with different filter options.

The default feedback filters include:

- All Feedback—All feedback, including one-time feedback and performance summary feedback
- Declined Feedback Requests—All the feedback you've requested that others have declined
- Feedback About Me—All the completed feedback about you
- Feedback About My Team—All the completed feedback about your team
- Feedback About Others—Completed feedback about others
- Feedback About Topics—Completed feedback about topics

- New Feedback Replies—New replies to the feedback you’ve requested
- New Feedback Requests—New feedback requests for one-time feedback and performance summaries

Goals Overview

Work.com Goals allow you to define, track, and measure your work. Access goals via the Goals tab or Chatter profile pages.

The Goals tab on a user’s profile displays the goals for that person. The top-level Goals tab is a general list view that can be configured to display different lists of goals (such as My Goals, My Team’s Goals, or Key Company Goals). The tabs and list views that appear may vary depending on how your administrator configured Work.com.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Goals requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition,** or **Developer Edition,** and is included in **Performance Edition.**

USER PERMISSIONS

To view goals:

- “Read” on Goals and Goal Links

To create goals:

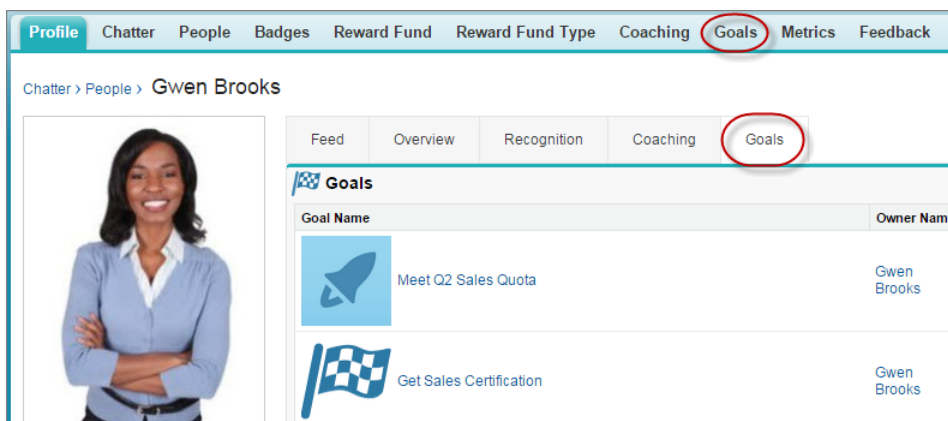

- “Create” on Goals and Goal Links

To edit goals:

- “Edit” on Goals and Goal Links

To delete goals:

- “Delete” on Goals and Goal Links

Click a goal in your list view to access the detail page.

Goals support Chatter feeds on goal records, so different users can collaborate in the feed and keep up-to-date on a goal's progress.

The goal detail page lists the metrics, tasks, events, notes, attachments, and other information related to a particular goal. Align goals with others by linking your goals with parent goals or subgoals.

Modify sharing settings to better control who can see and update your goals. For example, if goals in your organization are set to private by default, goal owners and administrators can share goals with select users or groups to increase collaboration and visibility. Choose between read-only and read/write access for more granular control over goal access.

On the Open Activities related list, click **New Task** or **New Event** to create a task or event tied to a specific goal. You can also create tasks or events for individual metrics, if desired.

Action	Metric Name	Progress	Status	Due Date	Current Value	Initial Value	Target Value	Owner Name	Comment	Weight
Edit Del	Get 5000 in Sales	66	On Track	9/1/2015	3,300.00	0.00	5,000.00	Dan Perkins		60.00
Edit Del	Get Sales Certification	0	Postponed	9/1/2015				Dan Perkins		10.00

Action	Metric Name	Progress	Status	Due Date	Current Value	Initial Value	Target Value	Owner Name	Comment	Weight
Edit Del	Finish Sales Training	100	Completed	8/1/2015				Dan Perkins		30.00

Add metrics to your goals to calculate your progress. You can also link metrics to data in your favorite reports to keep track of your work in Salesforce. Assign weights to different metrics to precisely track the completion of the goal.

Create a Goal

Define, track, and measure your work with Work.com Goals.

1. Click the top-level Goals tab.

If the Goals tab isn't displayed, select Work.com from the Force.com app drop-down menu at the top-right or click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter a name for the goal, and specify additional details.

You can adjust a goal's sharing settings after it's created. Note that all goal images are externally available.

 **Tip:** To create a key company goal, select the **Key Company Goal** field. After the goal is created, click **Sharing** on the goal's detail page and share it with the All Internal Users group. Set the Access Level to Read Only to share it with the rest of your organization, or set it to Read/Write to allow everyone to collaborate on the goal.
4. Set the goal's status:
 - Draft—The goal details are in draft state and haven't been finalized yet.
 - Published—The goal details have been finalized and the goal is in progress.
 - Completed—The goal is completed.
 - Canceled—The goal is canceled and no longer applies.
 - Not Completed—The goal is not completed.
5. Click **Save**.

You can reassign goals to other users by clicking **Change** next to Owner Name on a goal's detail page. Metrics can be owned by different users, so be sure to reassign metrics to the appropriate owner as well.

Metrics

Use metrics to track and surface your data.

Create new metrics from the Metrics tab or from a goal detail page. Users can create standalone metrics or tie them to specific goals.

The screenshot shows the 'Metrics Home' interface. At the top, there's a 'View: All' dropdown and a 'Go!' button. Below that is a 'Create New View' link. The main section is titled 'Recent Metrics' and includes a 'New' button and a 'Recently Viewed' dropdown. The table below lists three metrics:

Metric Name	Owner Name	Progress	Status	Due Date
 Get 50000 in Sales	Gwen Brooks	70	On Track	7/31/2015
 Pass Certification Test	Gwen Brooks	100	Completed	
 Finish Sales Training Course	Gwen Brooks	100	Completed	

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Metrics requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Use Progress or Completion metrics to track the status of different goals that you set for yourself or others. Anyone with read/write access can refresh metric values, and metrics can also appear in relevant coaching spaces and performance summaries.

Anyone with read/write access can refresh metric values, and metrics can also appear in relevant coaching spaces and performance summaries.

[Create a Goal](#)

Create a Metric

Track and surface your work with Work.com Metrics.

1. Click the Metrics tab.

Alternatively, you can click **New Metric** on a goal's detail page.

2. Click **New**.
3. Select a Progress or Completion record type and click **Continue**.

- Progress metrics measure achievement based on how much is finished compared to a targeted value. They're ideal for tracking hard numbers and percentages. For example, create progress metrics to *Convert 50 Leads* or *Achieve 100% Customer Satisfaction*.
- Completion metrics measure whether the metric was completed or not. They're ideal for tracking milestones or when you don't have metrics based on hard numbers. For example, create a completion metric to *Become Salesforce Certified*.

4. Enter a name for the metric and specify additional details.

5. For Progress metrics, enter a target value.

You can update the current value manually or link it to a Salesforce report. To link a metric value to a report:

- a. In the Current Value field, click **From a Salesforce report**.
- b. Select the Report Name.
- c. Select the Summary Field.

6. Set the metric's status.

7. Click **Save**.

Recognition Overview

Recognize and thank your coworkers by posting custom messages, badges, and rewards to their Chatter feed.

Work.com Recognition includes Thanks with unlimited custom badges and the ability to tie badges to tangible rewards such as gift cards. Managers can create reports and dashboards to view data on Recognition leaders. In addition to the required user permissions, your administrator must enable Thanks and Rewards for your organization. Depending on how your administrator configured Work.com, the Recognition tab and Badges tab may appear as top-level tabs. Additionally, the Recognition tab may appear as a subtab on your Chatter profile.

 **Note:** Users can create, edit, share, and give thanks badges without a Work.com license. However, users will still need a Work.com license to use badges tied to rewards. For more information about obtaining Work.com, contact Salesforce.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

Access the library of available badges from the Badges tab. Click **New** to create a badge, or click a badge to see or edit badge details. You can only view the badges you have permission to give, and your ability to create or edit badges may be limited depending on how your feature is configured.

Give thanks badges from the Chatter publisher. Users are currently limited to giving badges to one user at a time. For more information, see [Give Thanks to Your Coworkers](#).

View the badges a user has received on the Recognition tab of their Chatter profile.

Create a Badge

Create custom badges to uniquely recognize and thank your coworkers.

[Walk Through It: Create a Thanks Badge](#)

1. Click the Badges tab.
If the Badges tab isn't displayed, click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter a name and description for the badge, add a badge image, and optionally assign rewards and badge limits.

Note:

- Only users with Rewards enabled can create a Rewards badge.
- Badges can't be transferred from a sandbox organization to a production organization.
- You can limit access to badge records with the Access related list, but badge images are externally available.

Badge Field	Description
Badge Name	The name of the badge.
Active	Indicates that the badge is active and available to give. This setting is enabled by default.
Reward Fund	Select a reward fund for this badge, if applicable.
Owner Name	The name of the badge owner.
Company Badge	Select to make this badge a company badge. Only users with the Chatter moderator permission can create and edit company badges. Company badges enable all users to give the badge.
Description	A description that explains the significance of the badge.
Image URL	A visual representation of the badge. Click the image field to select a picture from a directory on your computer. Badge images are stored at 128 x 128 pixels and are externally available.
Limit Number	The number of badges that are available. This can be per user or across all users. The default value is unlimited badges.
Limit Start Date	Indicates when the system begins to count the number of badges used. The default value is the date the badge is created.

Reward Funds

Work.com Rewards allow you to tie tangible rewards to your badges. You can attach badges to tangible rewards from most digital gift codes globally.

Your administrator must enable Thanks and Rewards in your organization.

Work.com Rewards supports your choice of rewards programs or brands in addition to the default Amazon.com™ reward fund type. Reward information is stored in two objects, Reward Fund Type and Reward Fund. Here's a quick introduction to the differences between the two.

Reward Fund Type

This object holds the fixed information about a reward such as the currency type, redemption information, and CSV file upload details. Examples include Amazon.com™, iTunes™, or Starbucks™.

Reward Fund

This object holds the gifts codes and can only be tied to a single reward fund type. Each reward fund has a set value that you determine by purchasing gift codes for the specific denomination.

For example, a reward fund called Q1 US Rewards may contain codes linked to Amazon.com gift cards worth \$100 each. Another reward fund called Q1 Customer Service Rewards may contain codes linked to Amazon.com gift cards worth \$20 each. These reward funds would be related to the same reward fund type. However, a reward fund linked to Starbucks gift cards would be related to a different reward fund type.

You can create reward badges in three steps.

1. Create a reward fund type or use the default Amazon.com reward fund type.
2. Create a reward fund and upload reward codes.
3. Tie a thanks badge to a reward fund.

Create Reward Fund Types

Use reward fund types to specify general reward information, such as currency codes, redemption information, and CSV file upload details.

1. Click the Reward Fund Type tab.
If the Reward Fund Type tab isn't available, click  to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Enter the Reward Fund Type details.

Information

Field	Description
Reward Fund Type Name	The name of the reward fund type. Try to pick something descriptive, like Amazon.CA (Canada) or Starbucks (US).
Credit System	Select Gift Codes to tie your rewards to a cash reward. Select Points if the reward is not tied to cash. Reward Fund Types that use Points ignore the Currency Code field.
Active	Whether the reward fund type is active or not.
Owner Name	The owner of the reward fund type.
Currency Code	The type of currency.
Predefined	Read-only setting that indicates if a reward fund type is predefined, like the default Amazon.com type. You can't change the name, credit system, or currency code on predefined reward fund types. Predefined fund types are system-generated and can't be edited.

Redemption

Field	Description
Redemption Url	The URL where the reward is redeemed. This field is optional based on the type of reward code. For reward codes that are links, do not enter a redemption URL.
Redemption Information	The instructions for redeeming the reward, including any extra steps the user may need to take to redeem the reward.
Terms and Disclaimer	Extra legal information about the reward fund type.

Upload Configuration

Field	Description
Reward Code Column	The column in a CSV file that specifies the reward codes. The upload uses the second column by default. Enter a number to specify a different column.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Rewards features require a license to **Work.com**, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition, or Developer Edition**, and is included in **Performance Edition**.

USER PERMISSIONS

To view Reward Fund Types:

- "Read" on Reward Fund Types

- "Read" and "Create" on Reward Funds
- "Read" and "Create" on Rewards

Upload Configuration

Field	Description
Reward Value Column	The column in a CSV file that specifies the reward values. The upload uses the third column by default. Enter a number to specify a different column.

4. Click **Save**.

SEE ALSO:

- [Reward Funds](#)
- [Create Reward Funds](#)
- [Create a Badge](#)
- [Recognition Overview](#)

Create Reward Funds

Use reward funds to hold the gift codes related to a reward fund type.

Users can build reward badges from the reward funds they created. Reward funds can include Amazon.com™ gift cards purchased from one of our third-party vendors, such as TangoCard™, or different rewards programs beyond Amazon.com.

1. Click the Reward Fund tab.
If the Reward Fund tab isn't available, click **+** to the right of your current tabs and select it from the All Tabs page.
2. Click **New**.
3. Name your fund, select the Reward Fund Type, and enter the reward value.
4. Click **Save**.
5. Upload or enter your gift codes.
 - To upload gift codes through a CSV file, select **Upload CSV**, then select **Choose File**. Select a CSV file and click **Upload**.

By default, the upload uses the second column for reward codes and the third column for reward values. However, you can set these to different values on the related reward fund type. Here's an example of how you might format your CSV file:

	A	B	C
1	Sequence Number	Reward Code	Reward Value
2	1	1111-222222-3333	10
3	2	1111-222222-4444	10
4	3	1111-222222-5555	10
5	4	1111-222222-6666	10

Skills Overview

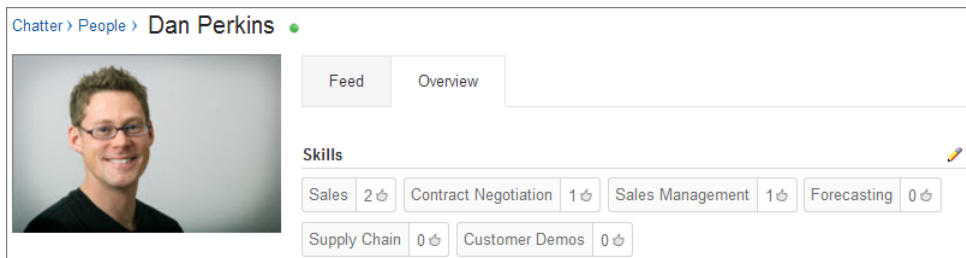

Skills allow users to share information about their professional expertise. With skills, users can discover, collaborate with, and endorse others based on their knowledge.

The Skills feature makes it easier to identify experts in different areas. Users can add or remove skills on their Chatter profile page or on record detail pages, and other users can endorse those skills. Use the global search bar to search for experts with specific skills.

Coaching Overview

With Work.com Coaching, you can privately coach or be coached by anyone in your company. You can also share coaching spaces to include additional observers and participants. Access Coaching via the Coaching tab or your profile page.

On the coaching page you can:

- View a list of your coaching spaces.
You should create your own filters (such as My Coaches, People I Coach, and Inactive Relationships) that are suitable for your organization.
- Click **New** to create a coaching space. You can have as many coaching spaces as you want.

Click a coaching space in your list view to access the detail page.

From this page you can:

- Click **Show Feed** to see the feed related to a coaching space.
Your administrator must enable Chatter feed tracking to display the feed.
- Access the goals, metrics, activities, notes, and attachments related to a particular coaching space.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

Coaching requires a **Work.com** license, which is available as an add-on license for **Professional Edition, Enterprise Edition, Unlimited Edition,** or **Developer Edition,** and is included in **Performance Edition.**

USER PERMISSIONS

To view coaching spaces:

- "Read" on Coaching

To create coaching spaces:

- "Create" on Coaching

- Set coaching spaces to inactive when they're no longer useful. This retains the record history, and the coaching space can also be reactivated anytime.
- Delete coaching spaces if you have the right access level.

Creating Quotes and Documenting Contracts

Quotes

Quotes in Salesforce represent the proposed prices of your company's products and services. You create a quote from an opportunity and its products. Each opportunity can have multiple associated quotes, and any one of them can be synced with the opportunity. When a quote and an opportunity are synced, any change to line items in the quote syncs with products on the opportunity, and vice versa.

[Create and Manage Quotes](#)

Create quotes showing your customers the prices of the products and services that you offer. You can create a set of quotes to show different combinations of products, discounts, and quantities so customers can compare prices. Then manage your quotes to keep them up-to-date.

[Sync Quotes and Opportunities](#)

Link a quote to the opportunity that it was created from. That way, updates to one record are always reflected in the other.

[Create and Email Quote PDFs](#)

Provide quotes to your customers the easy way: via PDF. Create quote PDFs from a standard template or from your company's design. Then email your quote directly from the preview page for customer approval.

[Considerations for Deleting Quotes](#)

Before you delete a quote, it's a good idea to understand how deleting affects quote-related PDFs and syncing with opportunities.

[Opportunities](#)

[Quotes Fields](#)

Create and Manage Quotes

Create quotes showing your customers the prices of the products and services that you offer. You can create a set of quotes to show different combinations of products, discounts, and quantities so customers can compare prices. Then manage your quotes to keep them up-to-date.

1. Click **New Quote** on the Quotes related list on an opportunity. The `Subtotal`, `Discount`, `Total Price`, and `Grand Total` fields show values from the opportunity.
2. Complete the fields.
3. Save your changes.
 - A unique quote number is added.
 - Products on the opportunity are copied to the quote as line items.
 - The grand total is recalculated based on the taxes and shipping information that you entered.

To add a line item to a quote:

1. Click **Add Line Item** in the Quote Line Items related list.
2. If no price book was selected on the opportunity, select a price book for the quote. Otherwise, the quote uses the opportunity's price book.
3. Enter search criteria in the lookup to locate a line item.
4. Select the products that you want to add, and then click **Select**.
5. Complete the fields. The sales price defaults to the product's list price as recorded in the price book. Depending on your permissions, you can edit the sales price.
6. Save your changes.

The line items are added to the Quote Line Items related list. The grand total in the detail section is the sum of the related line items. The discount is the average discount for the line items.

To add quote line items:

- "Edit" on Quotes

AND

"Read" on Products and Price Books

Sync Quotes and Opportunities

Link a quote to the opportunity that it was created from. That way, updates to one record are always reflected in the other.

1. Open the quote that you want to sync, and then click **Start Sync**.
2. Click **Continue, Sync**, and then **Done**.
The quote and the opportunity are now synced. The opportunity's `Synced Quote` field and Quotes related list identify the quote that's currently synced.
3. To stop syncing between a quote and an opportunity, open the synced quote, and then click **Stop Sync**.
Updates are no longer synced between the records.
4. To sync a different quote with an opportunity, follow the steps for syncing a quote.
The previously synced quote stops syncing, and the new quote starts.

[How Quote Syncing Works](#)

[Troubleshooting Quote Syncing](#)

Create and Email Quote PDFs

Provide quotes to your customers the easy way: via PDF. Create quote PDFs from a standard template or from your company's design. Then email your quote directly from the preview page for customer approval.

Create a Quote PDF from the Standard Template

If you haven't created custom templates or generated PDFs, start from the standard template.

1. On the quote detail page, click **Create PDF** to generate a preview.
2. Click **Save to Quote** to save the PDF to the Quote PDFs related list. The PDF name is the quote name plus a version number, such as `AcmeQuote_v1`.

Create a Quote PDF by Selecting a Template

If you've created a PDF, select a template from a list of templates that you've recently used. If you haven't created a PDF, or you want to use a template that's not listed, search for the one that you want.

1. On the quote detail page, click the **Create PDF** drop-down list.
2. Select your template from the Recent Templates list, or click *Choose Template* and search for the one that you want. To bypass the list of recent templates and select a different one, click **Create PDF** on the quote detail page.
3. Click **Create PDF** to generate a preview.
4. Click **Save to Quote** to save the PDF to the Quote PDFs related list. The PDF name is the quote name plus a version number, such as `AcmeQuote_v1`.

Email a Quote PDF

1. Click the email option on the PDF preview, the quote detail page, or next to the PDF in the Quote PDFs related list.

USER PERMISSIONS

To create or email quote PDFs:

- "Edit" on quotes

An email task opens with the current quote PDF attached. To email a previous version, click **Email** next to that version in the Quote PDFs related list.

2. Enter the customer's email address, a subject, and body text, and then send.

SEE ALSO:

[Considerations for Creating Quote PDFs](#)

Considerations for Deleting Quotes

Before you delete a quote, it's a good idea to understand how deleting affects quote-related PDFs and syncing with opportunities.

- If you have the appropriate permissions, and you're an admin, the quote owner, or someone above the quote owner in the organization role hierarchy, you can delete quotes.
- When you delete a quote, here's what happens. All related PDFs, notes, and attachments are deleted. If the quote is synced with an opportunity, the record is removed from the opportunity's Quotes related list. The deleted quote is moved to the Recycle Bin.
- If you undelete a previously synced quote, it's no longer synced with the opportunity.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance** and **Developer** Editions

Available in: **Professional**, **Enterprise**, and **Unlimited** Editions with the Sales Cloud

Considerations for Creating and Managing Quotes and Quote Line Items

Before you create a quote or work with quote line items, review a few key points.

-  **Note:** Your user permissions determine which tasks you can perform. See your Salesforce admin for help with any tasks that you can't perform on your own.
- Relevant price books, products, and [list prices](#) must be active in an opportunity before you can create a quote for the opportunity.
- Professional, Enterprise, Performance, Unlimited, and Developer Edition orgs can activate record types and ask you to choose a `Record Type` when creating a quote. Record types determine the picklist values and business processes that are available when you create or edit a record.
- If your Salesforce org uses divisions, the division of a new quote is automatically set to the division of the related opportunity.
- If a quote is synced with an opportunity, and you add a line item to the quote, the new line item is copied to the opportunity as a product in the Products related list.
- If an opportunity is syncing with a quote, deleting the quote line item deletes the corresponding product from the opportunity's Products related list.
- If a product has default schedules, the schedules aren't created when you add a line item to a quote. If the line item is copied from the opportunity, you can view the schedule from the opportunity. To change the schedule, edit the product record directly.
- If you have a quote line item with a discount, and the product has a default schedule on the product record or an individual schedule on the opportunity product record, you can't edit the `Discount` field of the line item.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance** and **Developer** Editions

Available in: **Professional**, **Enterprise**, and **Unlimited** Editions with the Sales Cloud

Considerations for Creating Quote PDFs

Before you create quote PDFs, consider a few key points.

- Quote PDFs don't support right-to-left languages. The text aligns to the left side of the page instead of the right.
- Text fields in a related list in a quote PDF are truncated to fewer than 256 characters. This limit occurs on rich text area fields, other types of text fields, standard fields, and custom fields.
- Your Salesforce admin determines which status is the default for new quotes and which statuses allow you to email a quote PDF. For example, your admin can prevent you from emailing a quote whose status is *In Review*.

How Quote Syncing Works

Quote syncing lets you link a quote to the opportunity that it was created from and synchronize all updates between the two records. An opportunity can have multiple quotes, but it can sync with only one quote at a time.

While a quote and an opportunity are synced, any addition or change to the list of products in one record syncs with the list of products in the other one. Adding or removing a line item from a quote updates the synced opportunity's Products related list. Adding or removing a product from the opportunity updates the synced quote's Quote Line Items related list. Product sorting also syncs between the two records. The quote and opportunity continue to sync each way until you stop syncing or delete one of the records.

You can sync quotes and opportunities that don't have any products. When you add a product to either record, it's automatically added to the record that it's synced to.

If an opportunity and a quote are synced, the opportunity identifies the synced quote in the following places.

- The `Synced Quote` field on the Opportunity detail page
- The `Syncing` checkbox in the Quotes related list

If you stop the sync between a quote and an opportunity, the link is broken and the records are no longer automatically updated with each other's changes.

Troubleshooting Quote Syncing

Errors can occur when you try to sync quotes under certain conditions. Review common error messages, and learn how to resolve them. If you don't have the appropriate permissions, contact your Salesforce admin.

This quote can't be synced because it has inactive or archived products.

- If the product isn't active, edit the product and select the `Active` checkbox.
- If the product has been archived and the opportunity isn't closed, delete the product.

This quote can't be synced because it has an inactive or archived price book.

- If the price book isn't active, edit the price book and select the `Active` checkbox.
- If the price book has been archived and the opportunity isn't closed, delete the price book.

This quote can't be synced because it has inactive or archived list prices.

- If the list price isn't active, edit the list price and select the `Active` checkbox for the list price.
- If the list price has been archived and the opportunity isn't closed, delete the list price.

This quote can't be synced because it has an inactive currency.

Activate the currency from Setup by entering *Manage Currencies* in the `Quick Find` box, then selecting **Manage Currencies**.

This quote can't be synced because one or more of the schedules for the opportunity products have changed since the quote was created.

Create a different quote and sync it, or open the product, delete the schedule, and then re-create the schedule.

This quote can't be synced because another quote that's being synced for this opportunity is locked due to a workflow approval process. Opportunities can only sync with one quote at a time.

To unlock the other quote, finish the approval process or recall the request for approval.

The SyncedQuote field is read only within a trigger.

Determine whether your Salesforce org is using an Apex trigger that's attempting to modify the `SyncedQuote` field. The `SyncedQuote` field is read only and can't be modified with a trigger. An admin can modify the trigger.

Documenting Contracts for Your Accounts

Contracts

A contract is a written agreement between two or more parties. Many companies use contracts to define the terms for doing business with other companies.

Use Salesforce to establish and document the contracts you have with your accounts. Then, track the contract through your organization's approval process and use workflow alerts to notify yourself when to initiate contract renewals.

SEE ALSO:

[Display the Contracts Home Page](#)

Display the Contracts Home Page

Click the Contracts tab to display the contracts home page.

- To show a filtered list of items, select a predefined list from the `View` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `View` drop-down list and click **Edit**.
- In the **Recent Contracts** section, select an option from the drop-down list to display a brief list of the top contracts matching that criteria. From the list, you can select any contract to go directly to the contract detail. `Contract Name` displays in this list if you have added it to your contract page layout. Toggle the **Show 25 items** and **Show 10 items** links to change the number of items that display. The fields you see are determined by the “Contracts Tab” search layout defined by your administrator and by your field-level security settings (available in Professional, Enterprise, Unlimited, Performance, and Developer Editions). The Recent Contracts options are:

Recent Contracts Choice	Description
Recently Created	The last ten or twenty-five contracts you created, with the most recently created contract listed first. This list only includes records owned by you.
Recently Modified	The last ten or twenty-five contracts you updated, with the most recently updated contract listed first. This list only includes records owned by you.
Recently Viewed	The last ten or twenty-five contracts you viewed, with the most recently viewed contract listed first. This list is derived from your recent items and includes records owned by you and other users.

- In the **Recent Contracts** section, click **New** to create a new contract.

Display and Edit Contracts

Displaying Contracts

Once you have located a contract on the contracts home or list pages, click the contract number to display detailed information. From an account, click the contract number in the Contracts related list to display the contract. All contracts associated with the account are listed in the Contracts related list. If hover details are enabled, hover over any lookup field on the detail page to view key information about a record before clicking into that record's detail page.

Viewing Contract Updates and Comments (Chatter)

Display a Chatter feed of updates, comments, and posts about the contract.

Editing Contracts

To update a contract, click **Edit**, and then change the fields that you want to update. When you have finished, click **Save**. You can also select **Save & New** to save the current contract and create another. Users with the "Edit" permission on contracts can edit contracts until they are activated. Use inline editing to edit fields directly on the detail page. If inline editing isn't enabled, contact your administrator.

Contract Related Lists

The lower portion of the display provides a snapshot of key information relating to the contract. The related lists you see are determined by your personal customization and by any customization your administrator has made to page layouts or your permissions to view related data. You can click on individual items to display additional detail. Click **more** at the bottom of the page or **View More** below a related list to display more items. Click **New** to directly add new items.

Note: Hover over the links at the top of a detail page to display the corresponding related list and its records. If Chatter is enabled, hover links display below the feed. An interactive overlay allows you to quickly view and manage the related list items. Click a hover link to jump to the content of the related list. If hover links are not enabled, contact your Salesforce administrator.

Printing Contracts

To open a printable display of the record details, in the top-right corner of the page, click **Printable View**.

To return to the last list page you viewed, click **Back to list** at the top of the contracts detail page. If your organization has enabled collapsible page sections, use the arrow icons next to the section headings to expand or collapse each section on the detail page.

Contract Fields

A contract has the following fields, listed in alphabetical order. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Account Name	Name of account associated with the contract.
Activated By	Name of the person that activated the contract.
Activated Date	Activation date of the contract.
Billing City	City portion of billing address. Up to 40 characters are allowed in this field.
Billing Country	Country portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.
Company Signed By	User at your organization who authorized the contract.
Company Signed Date	Date that the contract was authorized.
Contract Division	Division to which the contract belongs. This value is automatically inherited from the related account. Available only in organizations that use divisions to segment their data.
Contract End Date	Last day the contract is in effect. Your administrator can configure Salesforce to calculate <code>Contract End Date</code> based on <code>Contract Start Date</code> and <code>Contract Term</code> . If this field is auto-calculated, it will not display on the contracts edit page.
Contract Name	Title for the contract that distinguishes it from other contracts.
Contract Number	Unique number automatically assigned to the contract. Numbering for contracts starts at "100." (Read only) Administrators can modify the

Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.
Special Terms	Any terms that you have specifically agreed to and want to track in the contract.
Status	Indicates the stage that the contract has reached in the contract business process. Your organization can add values to this picklist within three system-defined contract status categories: <code>Draft</code> , <code>In Approval Process</code> , and <code>Activated</code> . You can use these status categories to track contracts within your business process using reports and views.

Field	Description
Custom Links	Listing of custom links for contracts set up by your administrator.

SEE ALSO:

[Display and Edit Contracts](#)

Contract History

The Contract History related list of a contract detail page tracks changes to a contract. The default is to track changes for contracts with a status of either **In Approval Process** or **Activated**. To track changes for contracts with any status, see [Customize Contract Settings](#) on page 1908.

Any time a user modifies any of the standard or custom fields whose history is set to be tracked on the contract, a new entry is added to the Contract History related list. All entries include the date, time, nature of the change, and who made the change. Modifications to the related lists on the contract are not tracked in the contract history.

You can report on activated contracts whose fields are tracked by clicking **New Report...** on the Reports tab, selecting **Contract Reports** as the Report type, and then selecting **Contract History**.

Activate Contracts

Activating a contract changes the contract status to `Activated` and makes the contract read-only. Activated contracts cannot be edited, and only users with the "Delete Activated Contracts" permission can delete an activated contract.

To activate a contract:

1. Open the contract you want to activate.
2. Click **Activate**. The status of an activated contract is `Activated`.

Managing and Tracking Your Customers' Orders

Orders

Use orders to track your customers' requests for products or services.

An *order* is an agreement between a company and a customer to provision services or deliver products with a known quantity, price, and date. Depending on your company's needs, your administrator might require orders to be added to a contract or allow them to be added directly to an account.

 **Example:** For example, an Internet service provider may require customers to commit to a year of service. That company would require contracts as a reference for every order. On the other hand, a company that sells clothing might sell products in a single transaction. That company would associate each order directly with an account.

Guidelines for Creating Orders

Each order must be associated with an account or a contract, depending on your administrator's settings.

You can create an order directly on an account or contract, through its Orders related list, to automatically associate the order with that record. You can also create an order from the Orders tab and manually add the associated account and contract, if necessary.

If you want to create an order with the same details as another order, you can clone it. If you clone with products, you can't change the new order's currency or price book.

	entered as text. Up to 80 characters are allowed if the field is a text field.
Billing State/Province	State or province portion of billing address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Billing Street	Street address used for billing. Up to 255 characters are allowed in this field.
Billing Zip/Postal Code	Zip or postal code portion of billing address. Up to 20 characters are allowed in this field.
Bill To Contact	Contact to whom the order is billed.
Company Authorized By	User at your organization who authorized the order.
Company Authorized Date	Date on which the order was authorized.
Contract End Date	Last day the contract is in effect. (Read-only)
Contract Name	Title for the parent contract that distinguishes it from other contracts. (Read-only)
Contract Number	Unique number automatically assigned to the contract. Numbering for contracts starts at "100". (Read-only for reduction orders)
Created By	User who created the order record. (Read-only)
Currency	The default currency for all currency amount fields in the order. (Read-only for reduction orders.)
Customer Authorized By	Contact on the order's account who authorized the order.
Customer Authorized Date	Date on which the contact authorized the order.
Description	Description of the order.
Last Modified By	User who most recently changed the order record
Opportunity	Opportunity that's associated with the order.
Order Amount	Total amount of the order.
Order End Date	Date on which the order ends.
Order Name	Title for the order that distinguishes it from other orders.
Order Number	Unique number automatically assigned to the order. Numbering for orders starts at "100." (Read-only)
Order Record Type	Record Type assigned to this order.
Order Reference Number	Reference number assigned to this order.
Order Start Date	Date on which the order becomes effective.

Field	Description
Order Type	Type of order. Entry is selected from a picklist of available values, which are set by an administrator. Each picklist value can have up to 40 characters.
Original Order	For reduction orders only. Pre-populated with the ID of the parent order when you create a reduction order by clicking Reduce Order .
Owner	Owner of the order. Can be either a user or a queue. Order owners have full access to their orders regardless of their account access.
PO Date	Date on which a purchase order was entered.
PO Number	Number of the purchase order.
Quote	Quote that's associated with the order.
Reduction Order	If selected, the order record represents a reduction order. Automatically selected when you create a reduction order by clicking Reduce Order . Read-only.
Shipping City	City portion of primary mailing or shipping address. Up to 40 characters are allowed in this field.
Shipping Country	Country portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Shipping State/Province	State or province portion of primary mailing or shipping address. Entry is selected from a picklist of standard values, or entered as text. Up to 80 characters are allowed if the field is a text field.
Shipping Street	Primary mailing or shipping street address of account. Up to 255 characters are allowed in this field.
Shipping Zip/Postal Code	Zip or postal code portion of primary mailing or shipping address. Up to 20 characters are allowed in this field.
Ship To Contact	Contact to whom the order is shipped.
Status	Indicates the stage that the order has reached in the order business process. Your organization can add values to this picklist within two system-defined order status categories: Draft and Activated. You can use these status categories to track orders within your business process using reports and views. Some user permissions apply

Field	Description
	specifically to draft statuses, and others apply specifically to activated statuses.

Editing and Deletion Limitations for Orders and Reduction Orders

Some fields aren't editable once an order is created. Others aren't editable once an order has been reduced.

- You can't edit the status category of an order or reduction order from *Draft* to *Activated* or vice versa. The status field is updated based on other processes.

For example, when you click **Activate**, the status category is changed from *Draft* to *Activated*. The status labels might differ, depending on your administrator's settings.

- Once an order is created, you can only change its `Account` field when the following conditions are true.
 - The order is in *Draft* status.
 - If the order has an associated contract, that contract is also associated with the new account.
- Once an order is created, you can only change its `Contract` field when the following conditions are true.
 - The order is in *Draft* status.
 - The account associated with the order is the same as the account associated with the new contract.
 - The currency associated with the order is the same as the currency associated with the new contract.
 - If the order has an associated price book, that price book is also associated with the new contract.
- Once a price book is assigned to an order, you can't change or remove the price book assignment.
- If an order has an associated reduction order, you can't edit the order's end date.
- To delete an activated order or reduction order, you must first deactivate it. To deactivate an order, you must first deactivate and delete any associated reduction orders.
- Only the order owners, account owners, contract owners, and system administrators can delete related orders.

-  **Note:** When you delete a contract, all related orders, notes, attachments, events and tasks, history, and approval requests are deleted. Associated accounts are not deleted with the contract. The deleted contract is moved to the Recycle Bin. If you undelete the contract, any related items are also restored.

Order Products

An *order product* is a product or service provided to a customer according to an associated order.

All order products in an order are associated with a price book. The Order Products related list on an order indicates in parentheses which price book the order is associated with. For example, if the Government price book is associated with your order products, the related list will be titled Order Products (Government).

A *reduction order product* is a product or service to be returned, reduced, de-provisioned, or disabled according to an associated reduction order. Each reduction order product is directly associated with an order product.

Order Product Fields

Understand the fields in order products and reduction order products.

Order products and reduction order products have the following fields. Depending on your page layout and field-level security settings, some fields may not be visible or editable.

Field	Description
Available Quantity	Number of units available to be reduced. When a reduction order is activated, an order product's Available Quantity is updated to reflect the quantity of relevant reduction order products. Value must always be greater than or equal to 0. (Read-only)
Created By	User who created the order product record. (Read-only)
End Date	End date for the order product.
Last Modified By	User who most recently changed the order record
Line Description	Description for this order product record.
List Price	Default price set by the price book on the parent order. (Read-only)
Order	Parent order for this order product.
Order Product Number	Automatically generated number that identifies the order product record. (Read-only)
Original Order Product	Number that identifies the order product being reduced. Required if the order product is reducing another order product. (Read-only)
Product	Name of the product used in this order product record. (Read-only)
Product Code	Internal code or product number used to identify the product. (Read-only)
Quantity	Quantity of units of the product.
Quote Line Item	Quote line item that's associated with the order product. The quote line item's quote must match the quote that's associated with the order product's parent order.
Start Date	Start date for the order product.
Total Price	Quantity of the order product multiplied by the unit price.

Add Products to an Order

Keep track of what you're selling to a customer by adding products to their order records.

You can add order products to draft orders.

1. Open the order you want to add products to.
2. In the Order Products related list, click **Add Products**.
3. If there isn't already a price book selected for this order, select the price book you want to use for this order and click **Save**.

 **Note:** You can only use one price book per order.

4. Select the products you want to add to your order, and then click **Select**.
5. Enter the quantity for each order product.
6. Change the unit price, if necessary.
7. Consider adding line descriptions.
8. To select more products to add, click **Save & More**.
9. To add the selected products, click **Save**.

Sharing Orders

Your administrator defines the default sharing model for your entire organization. You can change this model to extend sharing to more users than the default set by your administrator. However, you cannot change the sharing model to make it more restrictive than the default.

To view and manage sharing details, click **Sharing** on the order detail page. The Sharing Detail page lists the users, groups, roles, and territories that have sharing access to the order. The Sharing button isn't available when the organization-wide default for orders is controlled by the parent. On this page, you can take any of the following actions.

- To show a filtered list of items, select a predefined list from the *view* drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the *view* drop-down list and click **Edit**.
- Click **Add** to grant access to the record for other users, groups, roles, or territories.
 -  **Note:** To share an order with another user, that user must have "Read" permission on orders.
- Click **Expand List** to view all users that have access to the record.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

Forecasting Sales

Predicting and Planning Sales Cycles with Collaborative Forecasts

Collaborative Forecasts

Predict sales revenue and quantities from your opportunity pipeline, and incorporate product families, opportunity splits, and custom opportunity currency fields if needed.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Predict and plan the sales cycle from pipeline to closed sales, and manage sales expectations throughout the organization with Collaborative Forecasts. A forecast is an expression of expected sales revenue based on the gross rollup of a set of opportunities. The forecast amounts shown on the Forecasts tab are totals and subtotals of the opportunities in the four forecast categories—Pipeline, Best Case, Commit, and Closed. Depending on how an administrator sets up your organization, those amounts may reflect opportunities from either one or multiple forecast categories. On the Forecasts tab, users can roll over the  next to the column names to see which forecast categories roll up to the totals in each column. In the rollup table on the forecasts page, forecast amounts are organized by forecast rollup, time period, and optionally by product family. Forecasts can include adjustments made by forecast managers to their immediate subordinates' forecasts as well as adjustments made by forecast users to their own forecast amounts.

Your administrator can enable up to 4 different types of forecasts for your organization simultaneously. For example, you might want to forecast on revenue from opportunities as well as quantities by product family. You can switch between forecast types by clicking the forecast name and choosing another forecast from the pop-up menu. Each type of forecast stores its own separate quota and adjustment data.

Users can view forecast amounts and their related opportunities by forecast rollup for an individual or for everyone below them in the forecast hierarchy. For example, they can see the July Best Case forecast for all the sales managers who report to them, all the sales reps who report to any one of their managers, or just one individual. Users can also adjust their own forecasts and the forecasts of subordinates one level beneath them. The user interface makes it simple to conduct status calls with an opportunity team because users can move around it with ease.

Use the flexibility of Collaborative Forecasts to perform many tasks.

- Select and view forecasts using an interactive, expandable table.
- See forecast summary information for single months or quarters, and a multi-month or quarter range, for each forecast rollup.
- If your organization uses product families, see forecast summaries for each product family.
- If your organization uses opportunity splits, see the split percentages and the split amounts that contribute to each forecast.
- View and use the list of opportunities related to each forecast amount you select. Access opportunity details directly from this list.
- Hover and click on a column boundary and adjust the width to view data more easily.
- Make adjustments, and view adjustment details, such as the original forecast amount and who made the adjustment. If you have more than one type of forecast enabled, each forecast type maintains its own separate adjustments.
- If you're a forecast manager, move up and down through the forecasts hierarchy easily.
- View revenue- or quantity-based forecasts.
- View forecasts in multiple currencies.

Considerations for Migrating from Customizable Forecasting to Collaborative Forecasts

USER PERMISSIONS		EDITIONS
To view Forecast Setup:	“View Setup and Configuration”	Available in: Salesforce Classic
To edit Forecast Settings:	“Customize Application”	
To enable Forecasts users:	“Manage Internal Users” AND “Customize Application”	Available in: Professional (no Custom Field forecasts), Enterprise, Performance, Unlimited, and Developer Editions
To manage quotas:	“Customize Application” AND “Manage Quotas”	Territory management available in: Developer and Performance Editions and in Enterprise and Unlimited Editions with the Sales Cloud
To upload quota data to Salesforce:	“Manage Quotas” AND “View All Forecasts”	

Consider key points before migrating from Customizable Forecasting to Collaborative Forecasts.

[Collaborative Forecasts](#) includes much of the same functionality as [Customizable Forecasting](#). When migrating from Customizable Forecasts to Collaborative Forecasts, keep in mind that:

- To enable Collaborative Forecasts, Customizable Forecasting must be disabled first. Contact Salesforce for assistance with disabling Customizable Forecasting.
- When you turn off Customizable Forecasting, the Quotas related list no longer appears on User records and the Edit Personal Quota permission (API name: `PermissionsEditOwnQuota`) no longer appears in the Profile object.
- If you have the original Territory Management feature enabled, disable Customizable Forecasting and original Territory Management before migrating to Collaborative Forecasts. To disable these features, contact Salesforce. Enterprise Territory Management and Collaborative Forecasts can both be enabled and used at the same time, but the two features are not integrated to work together.
- The forecast history, overrides, reports, and sharing data from Customizable Forecasting are purged.
- Prior to migrating to Collaborative Forecasts, consider exporting forecasting report data.
- Monthly forecasts is the default Collaborative Forecasts period, however you can change your settings to quarterly. If you use custom fiscal years, your fiscal period is the default. You can also choose your custom quarters.

- The forecast hierarchy is retained. However, to reduce the chance of potential data loss, consider migrating to Collaborative Forecasts immediately after disabling Customizable Forecasts. Since the hierarchy is retained, do not enable Forecasts users again after migrating. Instead, after migration validate all hierarchies for accuracy.

Before migrating, make sure to review [What’s the difference between the Forecasting versions?](#) to determine if you can benefit from the latest improvements offered in Collaborative Forecasts.

SEE ALSO:

[What’s the difference between the Forecasting versions?](#)

Understanding the Elements of a Forecast

Learn about the items that contribute to and affect your forecasts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

The Collaborative Forecasts feature is designed to help you easily find and communicate opportunity and forecast information. This table explains what a forecast is and defines the elements that comprise a forecast.

Concept	Definition
Adjustment	<p>A layer of detail you can add to a forecast amount.</p> <p>An adjustment shows a forecasts manager or sales rep’s judgment about the final amount they expect the forecast’s opportunities to bring in at the close of the forecast period. Forecast managers may want to adjust their own or a subordinate’s forecast. For example, if they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think opportunity amounts are under or over stated. Forecast managers can adjust both forecasts that include only gross opportunity amounts or forecasts that already have adjustments made by someone else in their opportunity team. An adjustment doesn’t change the underlying gross rollup amount—it just adds a layer of detail. If you have more than one type of forecast enabled, each forecast type maintains its own separate adjustments.</p> <p>Forecast managers can adjust their own Commit and Best Case forecasts, and those of subordinates one level beneath them in the forecast hierarchy. They can view adjustments subordinates make at every level below them in the forecast hierarchy. Adjustments made to</p>

Concept	Definition
Amount Without Adjustments	their subordinates' forecasts roll up into their own forecasts. When you make an adjustment, you can choose to include a note to let others know why you made the adjustment. Adjustment notes do not appear in reports.
Amount Without Manager Adjustments	The sum of all of a person's owned revenue opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.
Corporate Currency	The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and his or her subordinates' opportunities, including adjustments made by the forecast owner on her or her own or subordinates' forecasts. <i>It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.</i>
Forecast	The currency in which your organization's corporate headquarters reports revenue. Serves as the basis for all currency conversions.
Forecast Amount	An expression of expected sales revenue based on the gross rollup of a set of opportunities. The forecast amounts shown on the Forecasts tab are totals and subtotals of the opportunities in the four forecast categories—Pipeline, Best Case, Commit, and Closed. Depending on how an administrator sets up your organization, those amounts may reflect opportunities from either one or multiple forecast categories. On the Forecasts tab, users can roll over the  next to the column names to see which forecast categories roll up to the totals in each column. In the rollup table on the forecasts page, forecast amounts are organized by forecast rollup, time period, and optionally by product family. Forecasts can include adjustments made by forecast managers to their immediate subordinates' forecasts as well as adjustments made by forecast users to their own forecast amounts. Here, users can view forecasts and related opportunities by forecast category for everyone below them in the forecast hierarchy or just one person. For example, you can see the July Best Case forecast for all the sales managers who report to you, all the sales reps who report to any one of your managers, or just one individual.
Forecast Category	The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.
Forecast Category	The category within the sales cycle that an opportunity is assigned to based on its opportunity stage. The standard forecast categories are Pipeline, Best Case, Commit, Omitted, and Closed. You can customize forecast category names for your organization.

Concept	Definition
Forecast Currency	Either the organization's corporate currency or each forecast owner's personal currency.
Forecast Display Currency	The currency that a user selects in which to display forecasts. The selection must be one of the currencies enabled for use in the organization and is made directly from the forecast page.
Forecast Hierarchy	A nested, expandable list of forecasts users. It determines how forecasts roll up within the organization, and who can view and adjust them. The forecast hierarchy is based entirely on the role hierarchy, but also specifies which users are forecast managers. When the Collaborative Forecasts feature is enabled for your organization, a forecast hierarchy is automatically generated based on your role hierarchy, but you may need to add or remove managers, sales reps, or other users.
Forecast Owner	A forecasts-enabled user who owns opportunities or is a forecast manager in the forecast hierarchy. Forecasts managers can have their own opportunities.
Forecast Quantity	The quantity forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.
Forecast Range	The date range you want displayed in your forecast. Depending on the organization settings, the range can include months or quarters.
Forecast Type	<p>A forecast configured to use a specific type of data. The opportunity <code>Amount</code> field, opportunity splits, overlay splits, custom opportunity fields, or product families can be used. Each forecast type also has its own measurement, revenue or quantity. To use both, enable a separate forecast type for each. Administrators can enable up to four forecast types in an organization. Quantity forecasts can't be used with opportunity splits or custom opportunity field forecasts.</p> <p>An opportunity-quantity forecast rolls up based on the opportunity's <code>Quantity</code> field, while opportunity-revenue forecasts roll up based on the opportunity's <code>Amount</code> field. For opportunity splits-revenue forecasts, the rollup is based on the opportunity's <code>Amount</code> field and the split % assigned to the sales rep. For custom opportunity field forecasts, the rollup is based on the custom field amount. For product families-revenue forecasts, the rollup is based on the sum of the <code>Total Price</code> field for all opportunity line items in that product family, while product family-quantity forecasts roll up based on the <code>Quantity</code> field for all opportunity line items in that product family. For opportunities without opportunity line items or with line items</p>

Concept	Definition
Gross Rollup	that don't have a product family specified, the totals roll up into the Products Not Categorized row on the Forecasts page.
Opportunity	Opportunities are the sales and pending deals that you want to track.
Opportunity Split	Opportunity splits let users share credit across an opportunity team. If your forecast data source is opportunity splits, you can see the split information on the forecast page.
Opportunity Stage	The current stage of an opportunity, such as Prospect or Proposal. Opportunity stage values correlate with forecast category values to determine how the opportunity contributes to a forecast.
Owner Only Amount	The sum of all of a person's revenue opportunities, without adjustments.
Owner Only Quantity	The sum of all of a person's quantity opportunities, without adjustments.
Personal Currency	A user's default currency for quotas, certain forecasting versions, and reports. This must be one of the active currencies for your organization. Your quota amounts display in your display currency.
Product Family	Product Families allow you to categorize your products. For example, if your company sells both hardware and software, you can create two product families: Hardware and Software.
Quantity Without Adjustments	The sum of a person's owned quantity opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.
Quantity Without Manager Adjustments	The forecast number as seen by the forecast owner. This is the sum of the owner's quantity opportunities and his or her subordinates' opportunities, including adjustments made on the subordinates' forecasts. <i>It doesn't include adjustments made by forecast managers above the owner in the forecast hierarchy.</i>
Quota	The sales goal assigned to a user on a monthly or quarterly basis. A manager's quota equals the amount the manager and team are expected to generate together. The quota rollup is done manually by users and managers, and either revenue or quantity data can be used. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate quota information.

Concept	Definition
Revenue	The total expected revenue amount from the opportunities that fit in a given category.
Rollup Table	The table at the top of a forecasts page. The Opportunities list at the bottom of the forecasts page corresponds dynamically with selections on the rollup table.
Subordinate	A Collaborative Forecasts user one or more levels beneath you in the forecast hierarchy. You can view all of your subordinates' forecasts. If your organization enables adjustments, you can view all of your subordinates' adjustment information and you can adjust the forecasts of subordinates one level beneath you in the hierarchy. Forecast amounts and adjustments roll up into the forecasts on your forecasts page.

Understanding Monthly and Quarterly Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Depending on your organization's Collaborative Forecasts period settings, you can forecast in either monthly or quarterly ranges. You can forecast up to 12 months or eight quarters in the future or past. If your forecast range includes the current month or quarter, the Forecasts page displays the current month or quarter by default. If not, then the first month or quarter of the range is selected by default. Whether your organization uses monthly or quarterly forecasts, forecast managers can still use quotas and make adjustments to their subordinates' forecasts. Quota and adjustment periods are based on the period settings.

Changing Your Forecast Date Range Display

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

The Collaborative Forecasts rollup table displays forecast amounts for individual months or quarters and a range of months or quarters, depending on your Collaborative Forecasts settings. When your administrator sets up Collaborative Forecasts for your organization, a default forecast date range display is selected. For example, your organization's default might be three months into the future. You can use this default or can change the date range displayed for your own forecast. To change your forecast date range display:

1. Click the Forecasts tab.
2. Click **Change** in the rollup table.
3. In Forecast Range, use the drop-down lists to select a beginning and ending period.
4. Click **Save**.

 **Example:** The range you select is relative to the current month or quarter. For example, in January you might select January as your beginning month and April as the ending month. In February, the date range displayed becomes February to May, and so forth. Your date range selection remains until you choose another one.

Understanding Revenue and Quantity Forecast Measurements

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Forecasts can be calculated based on revenue or quantity. An opportunity-quantity forecast rolls up based on the opportunity's `Quantity` field, while opportunity-revenue forecasts roll up based on the opportunity's `Amount` field. For opportunity splits-revenue forecasts, the rollup is based on the opportunity's `Amount` field and the split % assigned to the sales rep. For custom opportunity field forecasts, the rollup is based on the custom field amount. For product families-revenue forecasts, the rollup is based on the sum of the `Total Price` field for all opportunity line items in that product family, while product family-quantity forecasts roll up based on the `Quantity` field for all opportunity line items in that product family. For opportunities without opportunity line items or with line items that don't have a product family specified, the totals roll up into the Products Not Categorized row on the Forecasts page.

For example:

- A sales manager may need to forecast using revenue because the sales vice president sets quota amounts based on the US Dollar.
- A sales representative may need to forecast using quantity because of a sales incentive to sell 10,000 units of a promotional product.

If you want to forecast Revenue & Quantity for the same data source, such as Opportunities or Product Families, Your administrator can create a forecast type for each and you can toggle between them in the Forecasts tab.

You can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue-forecast, you'll again see your adjustment of \$90,000.

Changing Between Revenue and Quantity Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Forecasts can be calculated based on revenue or quantity. An opportunity-quantity forecast rolls up based on the opportunity's `Quantity` field, while opportunity-revenue forecasts roll up based on the opportunity's `Amount` field. For opportunity splits-revenue forecasts, the rollup is based on the opportunity's `Amount` field and the split % assigned to the sales rep. For custom opportunity field forecasts, the rollup is based on the custom field amount. For product families-revenue forecasts, the rollup is based on the sum of the `Total Price` field for all opportunity line items in that product family, while product family-quantity forecasts roll up based on the `Quantity` field for all opportunity line items in that product family. For opportunities without opportunity line items or with line items that don't have a product family specified, the totals roll up into the Products Not Categorized row on the Forecasts page.

If your organization has both kinds of forecasts enabled, you can select the type you want to use in your forecasts. To change between revenue and quantity:

1. Click  next to *Forecast Name* in *Currency Type* or Units.
2. Select `Revenue` or `Quantity (Units)`.
3. If you select Revenue and your organization has multiple currencies enabled, you can also select your display currency. Under *Currency*, click **Change currency**. A currency selection box opens for selecting a forecast display currency.

 **Note:** You can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue-forecast, you'll again see your adjustment of \$90,000.

Custom Opportunity Field Forecasts Overview

Track and predict revenue beyond the standard opportunity Amount field.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You and your sales teams can forecast on custom currency fields on opportunities. For example, your sales teams might use a custom field such as Margin, Monthly Recurring Revenue, Annual Contract Value, or any other currency field that your organization requires. Your administrator can easily set up forecasts based on any of those custom fields, which sales managers can then view in the Forecasts tab like any other forecast.

EDITIONS

EDITIONS

Available in: Salesforce Classic

Available in: **Performance**, **Unlimited**, **Enterprise**, and **Developer** Editions

If you use opportunity splits with your custom field, your forecast incorporates those splits. You can use a custom field forecast by itself or with other forecasts, such as an opportunity-revenue forecast based on the opportunity Amount field. In addition to custom currency fields, your administrator can also set up a forecast for the standard Expected Revenue field.

Note: If the forecast manager or sales rep viewing the forecast does not have access to the custom opportunity field, they can see forecast amounts but they won't be able to see any of the custom field values in the opportunity list.

Forecasting on Annual Contract Value—a Simple Custom Field Forecast

Here we see an opportunity owned by sales rep Anna Bressan. Anna's organization has a lot of multi-year deals, so they use a custom Annual Contract Value field to track the revenue received from the deal each year.

1. This is the Annual Contract Value forecast for Anna.

2. This forecast has the same name as the custom field.
3. The Forecasted Amount is the value of the Annual Contract Value field that rolls up into Anna’s forecast.
4. This is the Forecasted Amount from the Annual Contract Value field on Anna’s Acme – Premium Support opportunity.

 **Note:** To enable a custom field forecast, your administrator also has to enable opportunity splits for the custom field. However, the opportunity owner automatically receives a 100% split for the field, so if your organization doesn’t plan to use splits with the field, the rollup is the same as if there were no splits.

A Custom Field Forecast with Opportunity Splits

If you use opportunity splits on your custom field, your custom field forecast rolls up those splits. For example, here we can see that sales representative Anna owns an opportunity, which includes a custom split on the Annual Contract Value field for Kevin, a sales engineer responsible for increasing overall Annual Contract Value for the company. In this case, Kevin’s 25% split will roll up into his Annual Contract Value forecast.

The screenshot shows the Salesforce interface for an Opportunity record titled "Acme - Premium Support". The record is owned by Anna Bressan. Key details include: Opportunity Name: Acme - Premium Support; Account Name: Acme Inc.; Type: Existing Business; Stage: Negotiation/Review; Probability: 90%; Amount: USD 250,000.00; Annual Contract Value: USD 125,000.00. The Opportunity Team includes Anna Bressan (Opportunity Owner) and Kevin Bailey (Pre Sales Engineer). The Opportunity Splits table shows a 75% split for Anna Bressan and a 25% split for Kevin Bailey on the Annual Contract Value field.

Opportunity Detail	Value
Opportunity Owner	Anna Bressan
Opportunity Name	Acme - Premium Support
Account Name	Acme Inc.
Type	Existing Business
Stage	Negotiation/Review
Probability (%)	90%
Amount	USD 250,000.00
Annual Contract Value	USD 125,000.00

Opportunity Team	Member Role
Anna Bressan	Opportunity Owner
Kevin Bailey	Pre Sales Engineer

Opportunity Splits	Team Member	Opportunity Split Type	Percent (%)	Amount
Del	Anna Bressan	Annual Contract Value	75.00	USD 93,750.00
Del	Kevin Bailey	Annual Contract Value	25.00	USD 31,250.00

1. Anna owns this opportunity.
2. The opportunity contains a custom currency field called Annual Contract Value.
3. Kevin receives a 25% split on the Annual Contract Value field.

Kevin’s manager can view the Annual Contract Value forecast where he can see the deal to which Kevin is contributing, along with all of the other opportunities his sales engineer team is working on. Kevin’s manager can see that Kevin is receiving a 25% credit for all of his opportunities, which contribute to a total of \$1,026,000 revenue in his Best Case forecast. If Kevin’s manager thinks the deal will ultimately close for a higher amount, his manager can adjust the Best Case forecast amount upward. Anna’s manager can see Anna’s 75% split in her forecast.

The screenshot displays the 'Kevin Bailey Forecast' page in Salesforce. At the top, there is a navigation bar with tabs for Home, Chatter, Leads, Accounts, Contacts, Opportunities, Reports, Dashboards, Documents, Products, and Forecasts. Below the navigation bar, the user's name 'Jessica Heinz' and the forecast name 'Kevin Bailey Forecast' are visible. A dropdown menu for 'Annual Contract Value in U.S. Dollar' is highlighted with a red box labeled '1'. Below this, a summary table shows forecast data for '3 Months' across four categories: Closed, Commit, Best Case, and Pipeline. The 'Best Case' total is USD 1,026,000.00. Below the summary table, a detailed table for 'April FY 2014' is shown, listing various forecast categories and their amounts. A red box labeled '2' highlights the 'Acme - Premium Support' opportunity in this table, which has a 25.00% split and a forecasted amount of USD 31,250.00.

1. This is Kevin’s Annual Contract Value split forecast.
2. This is Kevin’s 25% split on Anna’s Acme – Premium Support opportunity.

Forecasts from the Standard Expected Revenue Field

The standard Expected Revenue field is useful for opportunities that are likely to produce more or less revenue than indicated in the Amount field. If your organization uses the Expected Revenue field, your administrator can set up a forecast for it as well. The Expected Revenue forecast then appears in the Forecast Type menu in the same way as a custom field forecast.

Overlay Splits Forecasts Overview

Track revenue from sales team members who help close opportunities, but are not directly responsible for them.

Note: This information applies to Collaborative Forecasts and not to Customizable Forecasts.

As a sales manager, you may already be using revenue splits for crediting team members who are directly responsible for opportunities. To provide more flexibility with how you assign credit for opportunities, you can use overlay splits, which help you and other team members allocate credit to overlay sales roles for working on opportunities. Overlay splits can add up to any percentage of the opportunity amount, sometimes exceeding 100%. For example, your sales team may include sales engineers, product specialists, or partners who help close deals, but are not directly responsible for them.

Overlay Forecasts let you predict revenue from overlay splits. Forecast amounts roll up through the role hierarchy based on the opportunity’s Amount field and the overlay team member’s split percentage.

EDITIONS

Available in: Salesforce Classic

Available in: **Performance, Unlimited, Enterprise, and Developer** Editions

Here we can see that sales representative Scott owns an opportunity, which includes an overlay split for sales engineer Owen, who's working with Scott to close the deal. For Scott, the opportunity Amount field will roll into his opportunity revenue forecast.

Opportunity Detail

Opportunity Name: Anaco Limited - 400K Amount: \$396,000.00

Opportunity Owner: **Scott Thompson** (Change) Profit:

Account Name: Anaco Limited Close Date: 12/27/2013

Type: New Business Stage: Needs Analysis

Forecast Category: Best Case

Probability (%): 20%

Forecasts Quotas Overview

Note: This information applies to Collaborative Forecasts and not to Customizable Forecasts.

A forecast quota is the sales goal assigned to a user on a monthly or quarterly basis. A manager's quota equals the amount the manager and team are expected to generate together. The quota rollup is done manually by users and managers, and either revenue or quantity data can be used. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate quota information.

Note: In Product Family forecasts, sales managers can't see their own quotas and quota attainment for individual product families. Only their total quota appears in the rollup table.

For example, three sales representatives might have combined quota amounts of \$75,000 and their forecasts manager might have an individual quota of \$30,000. The manager's quota in this case is \$105,000. You can only edit direct subordinates' quotas, and not your own; additionally, you must have the "Manage Quotas" permission.

If forecast quotas are enabled for your organization, quota data displays in two locations on the Forecasts tab.

- A column that contains quota amounts for a specific period. If your forecast includes product families, this column includes quotas for each product family.
- A row that contains the percentage amounts attained for a specific period in a specific forecast rollup.

If you're unsure about how to enter quota data or make updates to quotas, speak to your administrator.

Showing or Hiding Quota Information

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You can show or hide quota data on your forecast page. To show quota data:

1. Click **Display Options**.
2. Select **Show quotas column** to show your quota amount for each period.
3. Select **Show Quota % Attainment** to show your quota attainment for a specific rollup in a selected period. The percentage shown below each forecast amount indicates the proportion of the user's quota that the amount represents.

The quota information displayed can be either revenue or quantity amounts, depending on the type of forecast you are using. If your organization has more than one type of forecast enabled, each forecast type maintains its own separate quota information. To hide quota information, return to **Display Options** and deselect these options.

 **Tip:** Hover and click on a column boundary and adjust the width to view data more easily.

Forecasts Hierarchy Overview

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

The forecast hierarchy is a nested, expandable list of forecasts users. It determines how forecasts roll up within the organization, and who can view and adjust them. The forecast hierarchy is based entirely on the role hierarchy, but also specifies which users are forecast managers.

Based on your role, you can be added to or removed from the forecast hierarchy, or, your position within the hierarchy can change. For example, you might be a sales representative with no direct reports, so you can only view your own forecast. However, if your role changes and you become a sales manager, you could be added to the forecast hierarchy as a forecast manager.

Users designated as forecast managers can view the forecasts and opportunities of users, including partner portal users, below them in the forecast hierarchy. Forecast managers can also adjust the forecasts of direct reports. Only managers who made an adjustment and those above them in the hierarchy can view the adjustment.

Finding Subordinates' Forecasts with Jump to...

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You must be a forecasts manager and have forecasts users reporting to you in the forecasts hierarchy to see **Jump to...**

You might have several people whose forecasts you'd like to view or adjust, and you might need to traverse through several layers of the forecasts hierarchy if your organization is large. Finding forecasts is easy when you use **Jump to...** When you view a subordinate's forecast, you see the forecast just as they themselves would see it.

1. Click **Jump to...**
2. Begin typing up to 20 characters in the text box that appears.
3. Select a name to go to that person's forecast.
4. After you're on a forecasts page, you can expand rows by clicking them as you do in your own forecast. Hover over names to display the **Details >>** link. Navigation links with the names of forecast managers display at the top of the page as you drill down through the forecast hierarchy. Click on these links to move quickly back up the hierarchy.

Forecasts Adjustments Overview

Forecast users who anticipate differences between the current forecast and actual future results can change forecast rollup amounts. Users can add adjustments to the Best Case and Commit forecast amounts, and these adjustments can be changed or removed at any time.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To adjust forecasts, adjustments must be enabled for your organization. Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both.

An adjustment shows a forecasts manager or sales rep's judgment about the final amount they expect the forecast's opportunities to bring in at the close of the forecast period. Forecast managers may want to adjust their own or a subordinate's forecast. For example, if they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think opportunity amounts are under or over stated. Forecast managers can adjust both forecasts that include only gross opportunity amounts or forecasts that already have adjustments made by someone else in their opportunity team. An adjustment doesn't change the underlying gross rollup amount—it just adds a layer of detail. If you have more than one type of forecast enabled, each forecast type maintains its own separate adjustments.

Forecast managers can adjust their own Commit and Best Case forecasts, and those of subordinates one level beneath them in the forecast hierarchy. They can view adjustments subordinates make at every level below them in the forecast hierarchy. Adjustments made to their subordinates' forecasts roll up into their own forecasts. When you make an adjustment, you can choose to include a note to let others know why you made the adjustment. Adjustment notes do not appear in reports.

For example, let's say you're a sales manager who's adjusted the forecast of one of your sales representatives down from \$2000 to \$1500.

Your vice president, who's your forecast manager, sees \$1500 when they view your forecast, along with an  icon indicating the amount contains an adjustment. However, they might decide to adjust it to \$2000 again.

A forecasts manager's own forecasts page shows all their forecast amounts and their related opportunity details. When managers view a subordinate's forecasts page, they see the totals that the subordinate would see. Any adjustments the manager makes to subordinates' amounts from their own forecast page don't appear on the subordinate's forecasts page. Instead, they see that subordinate user's forecasts and any adjustments the subordinate has made to their own amounts or those of their own subordinates. For example, let's say you're a vice president of sales. On your own forecasts page, you see a July Best Case forecast of \$1250 (including a \$50 adjustment you made) for one of your first-level subordinates, a sales manager. However, when you view the sales manager's forecasts page by using the Jump to field, the July Best Case forecast is \$1200, because it doesn't include your adjustment. If both a manager and a subordinate adjust the same forecast amount, only the manager's adjustment rolls up the forecast hierarchy.

If your organization uses more than one type of forecast, adjustments you make are specific to each forecast type. For example, if you use both opportunity revenue and opportunity quantity forecasts, you can adjust forecast amounts in each of those forecasts. However, adjustments made in the opportunity-revenue-based forecast don't display as adjustments in any other forecast type. So, if you adjust an amount in the opportunity-revenue forecast from \$100,000 to \$90,000 and then switch your forecast view, you won't see an equivalent adjustment value in the opportunity-quantity forecast. If you change the forecast view back to the opportunity-revenue-forecast, you'll again see your adjustment of \$90,000. If your organization uses product family forecasts, you can't adjust your own product family forecast amounts.

When an opportunity moves from one forecast category to another, such as from Pipeline to Best Case, the unadjusted raw amounts change for each of those rollups. However, forecast amounts with adjustments don't change in the rollup table on the Forecasts page. We recommend updating or removing your adjustments to each forecast rollup to account for changes in the stage of opportunities.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional** (no Custom Field forecasts), **Enterprise, Performance, Unlimited, and Developer** Editions

Opportunity Splits available in: **Performance** and **Developer** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

 **Note:** While you're viewing a forecasts page, your subordinates may be adjusting forecast amounts or editing related opportunities. Or you may adjust one of your subordinates' forecasts from your own page. All these events change forecast amounts. Click **Refresh** to view the most recent forecast amounts.

This table outlines who can view and adjust your forecasts.

User	Can view your forecasts?	Can adjust your forecasts?
Your manager's manager	Yes	No
Your manager	Yes	Yes. The manager adjusts amounts from their own forecasts page.
You	Yes	Yes, if enabled by your administrator. You can only adjust forecast totals, not the subtotal for My Opportunities.
Your direct report	No	No
Your non-direct report subordinate	No	No

This table defines whose forecasts you can view and adjust.

User	Can you view forecasts?	Can you adjust forecasts?
Your manager's manager	No	No
Your manager	No	No
You	Yes	Yes, if enabled by your administrator.
Your direct report	Yes. However, if you select a direct subordinate's forecast, you see the same view as that subordinate, so your adjustments are not visible.	Yes. You adjust these amounts from your own forecasts page.
Your non-direct report subordinate	Yes. You see the same view that the subordinate sees.	No. Your direct reports can adjust their own direct reports' forecasts.

If a forecast contains adjustments, you see one or more icons next to the amount. Here's what they mean.

Icon	Definition
	You adjusted the forecast amount. You see this indicator only on your own forecasts page..
	One of your subordinates adjusted the forecast. You see this indicator on both your own and your subordinates' forecasts pages.

Icon	Definition
	Both you and one or more subordinates adjusted the forecast. You see this indicator only on your own forecasts page because when you drill down to a subordinate's page, you see the page as that user sees it.
	Save your adjustment.
	Undo your adjustment and restore the previous value of the forecast. Hover over the button to see a tool tip that tells you if the previous value includes an adjustment.
	The adjustment includes a note.
remove	Remove your adjustment and restore the previous value, which may include someone else's adjustment.

Adjustments Purges

Each forecast type maintains its own adjustment data. Adjustments can be purged when you change some forecast and custom fiscal year settings.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

An adjustment shows a forecasts manager or sales rep's judgment about the final amount they expect the forecast's opportunities to bring in at the close of the forecast period. Forecast managers may want to adjust their own or a subordinate's forecast. For example, if they know that some employees tend to be too optimistic or too conservative when assigning amounts to opportunities. Sales reps can also adjust their own forecasts if they think opportunity amounts are under or over stated. Forecast managers can adjust both forecasts that include only gross opportunity amounts or forecasts that already have adjustments made by someone else in their opportunity team. An adjustment doesn't change the underlying gross rollup amount—it just adds a layer of detail. If you have more than one type of forecast enabled, each forecast type maintains its own separate adjustments. Adjustments can be purged from forecasts; when this occurs, the underlying data on which the forecasts were based remains untouched.

Adjustment purges happen when:

- Your administrator disables Collaborative Forecasts.
- Your administrator disables manager adjustments. Only adjustments made by forecast managers to their subordinates' forecasts are purged.
- Your administrator disables owner adjustments. Only adjustments made by forecast users to their own forecasts are purged.
- You are no longer a forecast manager. Only adjustments you made to subordinates' forecast amounts are purged.
- You are removed from a role that's set as a forecast manager in the forecast hierarchy. Only adjustments you made to subordinates' forecast amounts are purged.
- Your administrator changes your forecast period setting from quarterly to monthly or monthly to quarterly.
- Your administrator disables a forecast type. Only adjustments for that forecast type are purged.
- Your administrator changes the start month of your fiscal year when the forecast period is set to quarterly. Both quotas and adjustments are purged.
- Your administrator deletes a product family. Both adjustments and quotas are purged for the deleted product family.
- Your administrator moves from cumulative forecast rollups to individual forecast category rollups, or from individual to cumulative rollups.
- Your administrator creates a custom fiscal year for the first time. All adjustments and quotas for the corresponding and following standard fiscal years are purged.
- Your administrator deletes a custom fiscal period or quarter. Forecast adjustments and quotas for that period or quarter are also deleted.

Viewing Opportunity Details from a Forecast

View or edit details of opportunities that roll up into each of your forecast amounts.

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

From your forecasts detail page or the page of any subordinate, you can view the opportunities that make up a forecast—for a month or month range, for all your subordinates or just one. If your sales team forecasts on product families, you can also view your own or a subordinate’s opportunities for each product family. When you select a cell in the rollup table, the opportunities related to that cell appear in a list at the bottom of the page. You can sort the opportunities by column header.

- **To view opportunities in all forecast categories** for a month, a quarter, or a range of months or quarters, click its table row. All opportunities in all categories appear in the opportunities list.
- **To view opportunities in any single forecast rollup** for a month, a quarter, or a range of months or quarters, click its cell within the row. The opportunities in that rollup appear in the opportunities list.

 **Tip:** Remember that the forecast rollups are dependent on the opportunity stage. To change your forecast category without updating the opportunity stage, go to the opportunity detail page. If your administrator added the `Forecast Category` field to your opportunity page layout, you can click it to open a selection box. In the box, use the Forecast Category drop-down list to update the forecast category for the opportunity.

- **To view the opportunities of a subordinate within a single month**, click the subordinate's row within that month.
- **To view a subordinate’s opportunities for a single product family**, click  next to the subordinate’s name to display the product family rows, and then click the product family name.
- **To view the splits for an opportunity**, hover over the split percent for the opportunity and then click . The Opportunity Splits detail window appears, showing splits that roll up to the selected forecast cell in bold. Other splits on the opportunity that do not roll up to the selected forecast cell appear in gray. Opportunities that contain only a single 100% split for the opportunity owner do not display split details.

Action	Opportunity Name	Account Name	Forecasted Amount	Split

Understanding Partner Portal User Opportunities in Collaborative Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Partner portal users are external to your organization but sell your products or services through indirect sales channels. Your partner portal users use a portal to log into Salesforce. Partners can create opportunities, and users can assign opportunities to them as well. Opportunities that a partner portal user creates can roll up to the forecast of the account owner; note that the account owner must be the person's forecast manager in the forecast hierarchy for the opportunities to roll up into the forecast. For example, say Gordon Johnson:

- Owns a partner account called Acme
- Has an Acme contact named Anne Smith
- Anne is a partner portal user
- Anne reports to Gordon in the forecasts hierarchy

If Anne adds opportunities in her portal, Gordon sees those opportunities in his forecast; because Gordon is Anne's forecast manager, Gordon can adjust forecast amounts based on her opportunities and see how she's tracking against her quota. However, it's important to note that partner portal users don't have access to the Collaborative Forecasts tab or any of its functionality.

Working with Multiple Currencies in Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

This information assumes that your organization uses multiple currencies.

When an administrator sets up Forecasts for an organization, they choose a forecast currency and enable one or more types of forecasts. The forecast currency is either the organization's corporate currency or each forecast owner's personal currency.

When you use Collaborative Forecasts, you also select a *display currency*, which can be any currency enabled in the organization. At the top of the Forecasts page, click  next to *Forecast Name* in *Currency Type* or Units. Under Currency, click **Change currency**. A currency selection box opens for selecting a forecast display currency.

When working with currencies in Forecasts, keep the following in mind.

- If you use revenue-based forecasts, when currency rates change, opportunities and adjustments roll up with the changed value along with values in the forecast table.
- If you use quantity-based forecasts, when currency rates change, opportunities and adjustments roll up with the changed value.
- The processing indicator () displays as changed values roll up.
- All forecast periods (historical, current, and future) are impacted by rate changes.
- Deactivating a currency that is set as a user's personal currency automatically resets the user's currency to the corporate currency.

Users can edit their personal currency settings by editing their personal information.

Refreshing Forecasts

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

While you're viewing a forecasts page, your subordinates may be editing related opportunities or adjusting the forecasts of their own subordinates. Or you might be adjusting one of your subordinates' forecasts from your own page. All of these events can change forecast amounts.

When any opportunity update or forecast adjustment occurs for a forecast you've selected in a rollup table, we let you know.

- If the selected forecast has adjustments in process (your own or your subordinate's), you'll see a processing indicator () next to the forecast.
- If any of the selected forecast's related opportunities have been updated, you'll also see the processing indicator in the header of the opportunities list.
- A message, **Processing Changes**, appears in the opportunities list header.

To see the changes, you need to click **Refresh**.

For example, while Gordon Johnson is viewing his team's opportunity revenue forecast for December, his subordinate Renee Reynolds edits an opportunity she expects to close in December. The

opportunity is currently in the Commit forecast category. Renee changes the opportunity amount from \$2500 to \$2600. This change affects her December forecast, increasing the amount by \$100.

When Gordon clicks the forecasts table cell for Renee's December commit forecast, the processing indicator appears within that cell. The indicator tells him that Renee made a change that affects the forecast. He sees the same processing indicator on the opportunities list, so he knows Renee edited an opportunity. He clicks **Refresh**. The opportunity amount changes from \$2500 to \$2600, and Renee's Commit forecast for December reflects the \$100 increase.

Using Forecasting Reports

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

To see if your organization has forecasts reports, go to the Reports tab and click **New Report...** Select the folder in which your administrator has placed the forecasting report types. If you don't see the fields or report type names described in the table, check with your administrator.

When using the reports, follow the best practices described here.

If you want to view	Do this
A forecast summary from a specific user's perspective.	Create a Forecasting Item report and add a filter using Owner: Full Name . Filter by a specific person's name.
The sum of all of a person's revenue opportunities, without adjustments.	Add Owner Only Amount to your Forecasting Item report. For example, if you own two opportunities, each worth \$10,000, the Owner Only Amount is \$20,000. To view the same information, but for quantity, add Owner Only Quantity to the report.
The sum of all of a person's owned revenue opportunities and also his or her subordinates' opportunities, without adjustments. Subordinates include everyone reporting up to a person in the forecast hierarchy.	Add Amount Without Adjustments to your Forecasting Item report. For example, if the sum of the amount of all opportunities owned by you is \$20,000 and the sum of the amount of your subordinates' opportunities is \$55,000, the Amount Without Adjustments is \$75,000. To view the same information, but for quantity, add Quantity Without Adjustments to the report.
The forecast number as seen by the forecast owner. This is the sum of the owner's revenue opportunities and his or her subordinates' opportunities, including adjustments made by the forecast owner on her or her own or subordinates' forecasts. <i>It doesn't include</i>	Add Amount Without Manager Adjustments to your Forecasting Item report. For example, say Anne has an Amount Without Adjustments of \$75,000, made up of \$20,000 of her own opportunities and \$55,000 of opportunities owned by her subordinate Ben. Additionally, she adjusted Ben's amount to \$65,000 for a total of

USER PERMISSIONS

To use Forecasts:

- "Allow Forecasting"

To view the Reports tab:

- "Run Reports"

To create, edit, and delete reports:

- "Create and Customize Reports"

AND

"Report Builder"

If you want to view

adjustments made by forecast managers above the owner in the forecast hierarchy.

Do this

\$85,000. If you adjust Anne's number from \$85,000 to \$100,000, then you see \$85,000 in **Amount Without Manager Adjustments** because this is what Anne sees (and Anne can't see your adjustments as you're her manager). To see the amount that includes *your* adjustment to \$100,000, look at **Forecast Amount**. To view the same information, but for quantity, add **Quantity Without Manager Adjustments** to the report.

The revenue forecast from the forecast manager's perspective and the sum of the owner's and subordinates' opportunities, including all forecast adjustments.

Add **Forecast Amount** to your Forecasting Item report. For example, say you're a forecast manager and have another forecast manager reporting to you who has an Amount Without Manager Adjustment totaling \$85,000. If you adjust the forecast to \$100,000, the Forecast Amount is \$100,000. To view the same information, but for quantity, add **Forecast Quantity** to the report.

Whose forecast amounts have adjustments made to them.

Add **Has Adjustment** to your Forecasting Item report. For example, if you make a manager adjustment to one of your subordinate's forecast amounts, this box is checked. If your subordinate makes an adjustment to one of his or her subordinate's amounts, this box is also checked. *However, unless you have the "View All Data" permission, if your forecast manager makes an adjustment to your forecast amount, this box remains unchecked; you don't have access to your forecast manager's adjustment information.* Also add **Has Owner Adjustment**. If a forecast user makes an adjustment to their own forecast, this box is checked.

Quota detail for your forecasts.

Create a Forecasting Quotas report. For example, depending on how your administrator set up the report type, you can include fields, such as the full name of the quota owner. You can then filter by your own name to see quotas you created and their related accounts and owners.

How forecast amounts today compare with earlier forecast amounts.

[Create a Forecasts with Historical Trending report](#) and compare the value of the `Forecast Amount` field at the beginning of the month with its value at the end of the month, sorted by owner.

View only results for your direct reports.

When creating a forecasting report, choose **My Direct Reports' <item name>** from the **Show** menu.

See which type of forecast the results are from.

Refer to the Forecasting Type field in the report results. This field is included in the default page layout for Forecasting Item and Quota reports.

 **Important:** Reports contain the latest information at the time you run the report, so if you see a difference between your report amounts and the Collaborative Forecasts pane, it may be because changes were in process while the report was running.

Keep in mind that the data you see in reports depends on what you can view in Collaborative Forecasts. For example, forecast managers can view adjustments made, but a non-forecast manager running a similar report won't see the adjusted amounts in

reports. Since a forecast amount can consist of a rollup of many users' forecast amounts, examine report results closely when using summary fields.

Forecasts Best Practices

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Consider the following best practices when using Collaborative Forecasts:

- Track important details at the opportunity level.
- Measure everything related to potential deals—activities like emails, meetings, and outreach—to determine their contributions to revenue.
- Create actionable tasks with next steps and completion dates pertaining to opportunities.
- Map your sales stages to forecast categories; adjust close probability based on historical data to increase your forecast accuracy.
- Customize your forecast category names to match your business process and terminology.
- Create dashboards for metrics of all activities related to potential sales.
- When adjusting forecasts, have conversations with your subordinates so that they understand your expectations.
- Use Chatter to share opportunity and forecast information with your team and bring attention to important details.
- Run reports to analyze trends and check performance.
- Revisit forecast adjustments weekly. Because opportunities can change frequently, this will help you avoid out-of-date adjustments.
- Be sure each sales manager with subordinates is designated as a forecast manager in your forecast hierarchy. This ensures that the forecast visibility rolls up to every level of the hierarchy.

[Forecasts FAQ](#)

Can I adjust my own forecast?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both. If only *manager adjustments* are enabled, non-forecasts managers can't adjust any forecasts. In this case, Collaborative Forecasts managers can adjust forecasts of subordinates who report to them in the hierarchy and not their own forecasts.

If *owner* adjustments are enabled, all forecast users can adjust their own forecast amounts.

SEE ALSO:

[Why can't I adjust forecasts?](#)

[Adjusting Forecasts](#)

Why can't I adjust forecasts?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both. If only manager adjustments are enabled, you must be a forecast manager to adjust forecasts. If you recently changed job functions, check the forecasts hierarchy to see if you're still a forecast manager. From Setup, enter *Forecasts Hierarchy* in the *Quick Find* box, then select **Forecasts Hierarchy**. If you're a forecast manager, your name appears next to a role that's assigned as a forecast manager.

SEE ALSO:

[Can I adjust my own forecast?](#)

[Forecasts Adjustments Overview](#)

What determines whose forecasts I can adjust?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Your administrator can enable managers to adjust subordinates' forecasts, all forecast users to adjust their own forecasts, or both.

If you are a manager and manager adjustments are enabled, the [forecasts hierarchy](#) determines whose forecasts you can see and adjust. Even if someone reports to you in the *role hierarchy*, you can't adjust that person's forecast unless he or she reports to you in the forecasts hierarchy.

If owner adjustments are enabled, all forecast users can adjust their own forecasts.

SEE ALSO:

[Can I adjust my own forecast?](#)

[Why can't I adjust forecasts?](#)

[Forecasts Adjustments Overview](#)

Why don't I see any opportunities on my forecast page?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

Try one of the following.

- **To view opportunities in all forecast categories** for a month, a quarter, or a range of months or quarters, click its table row. All opportunities in all categories appear in the opportunities list.
- **To view opportunities in any single forecast rollup** for a month, a quarter, or a range of months or quarters, click its cell within the row. The opportunities in that rollup appear in the opportunities list.
 - 💡 **Tip:** Remember that the forecast rollups are dependent on the opportunity stage. To change your forecast category without updating the opportunity stage, go to the opportunity detail page. If your administrator added the `Forecast Category` field to your opportunity page layout, you can click it to open a selection box. In the box, use the Forecast Category drop-down list to update the forecast category for the opportunity.
- **To view the opportunities of a subordinate within a single month**, click the subordinate's row within that month.
- **To sort the opportunities list**, click the header of any column. Most columns are sorted alphanumerically, but the Category column is sorted by closest to or furthest from closing.
- **To move through a list that's longer than a page**, click **Previous** and **Next** or enter a page number in the Page field.
- **To edit an opportunity** that appears in the list, click **Edit** next to its name.
- **To see any Chatter posts related to the opportunity**, click the opportunity's **Opportunity Name** link to go to its detail page. Click **Show Feed**. Click **Follow** if you want Chatter notifications about all of the opportunity's activity.

SEE ALSO:

[Viewing Opportunity Details from a Forecast](#)

How do I view and update the forecasts categories and opportunity stage mappings?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You must be an administrator to update forecasts categories and opportunity stage mappings.

1. From the management settings for opportunities, go to Fields.
2. Click `Stage`.
3. Scroll down to Opportunity Stages Picklist Values and look at the row for each stage to see what forecast category it's mapped to; click **Edit** to edit a mapping.

SEE ALSO:

[Forecasts FAQ](#)

Why don't I see the "Jump to..." link on my forecast page?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

You must be a forecasts manager and have forecasts users reporting to you in the forecasts hierarchy to see **Jump to...**

SEE ALSO:

[Forecasts FAQ](#)

How do I set up quotas for my sales reps?

 **Note:** This information applies to Collaborative Forecasts and not to [Customizable Forecasts](#).

If you have the correct permissions, you can set up quotas for your organization:

1. From Setup, enter *Forecasts Settings* in the **Quick Find** box, then select **Forecasts Settings**.
2. Under Quotas, select **Show Quotas**.
3. Click **Save**.
4. To load quota data, use either API version 25 or later, or the Data Loader.

[Forecasts FAQ](#)

Estimating Revenue and Sales with Customizable Forecasts

Customizable Forecasting Overview

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Customizable forecasting is a flexible solution for estimating how much revenue your organization can generate or how many items your organization can sell. You can set up customizable forecasting to reflect how your organization forecasts its sales. With it, you can forecast on a monthly or quarterly basis, use different dates when applying amounts to forecasts, forecast based on revenue or quantity or both, and define additional quotas based on product families.

Use customizable forecasts to review your forecast and drill down through your forecast amounts to see the opportunities included in your forecast. Override forecast amounts directly from the opportunity, or override the forecast from the Forecasts tab without notifying users below you in the forecast role hierarchy.

Clicking the Forecasts tab displays your forecast for the selected forecast period.

- Click **Submit** to submit a forecast, making a snapshot of the forecast data available in the forecast history and forecast reports. See [Submitting Customizable Forecasts](#).
- Click **Forecast History** to display the forecast data you submitted in the past. Then, click **Forecast Summary** to return to the current forecast data.
- Click **Printable View** to display the selected forecast in a simple, print-ready layout.
- Review your forecast and the forecasts of any direct reports or forecasts that are manually shared with you. See [Viewing Customizable Forecasts](#) for instructions on different viewing options.
- Click the Forecast subtab to see forecast details. See [Viewing Customizable Forecasts](#) for more information.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

- Click the Opportunities subtab to see the opportunities that are included in the displayed forecast. On the Opportunities subtab, you can choose, or create, a list view to further filter the displayed opportunities. See [Viewing Customizable Forecasts](#) for more information.
- Click the edit icon () to make changes to the adjusted forecast total, or to add an override to a particular forecast amount. For instructions on overriding forecast amounts, see [Overriding Customizable Forecasts](#).

If your forecast is not available, contact your administrator about adding you to the forecast hierarchy (or the territory hierarchy, if your organization uses territory management).

 **Note:** The Forecasts tab is unlike other tabs in that it automatically calculates data for you based on your opportunity data. You do not need to create or delete forecast records.

For information on implementing customizable forecasting for your organization, see [Setting Up Customizable Forecasting](#).

SEE ALSO:

[Do I Have Customizable Forecasting?](#)

[What's the difference between the Forecasting versions?](#)

[Do I Have Customizable Forecasting?](#)

[Managing Customizable Forecasts](#)

Do I Have Customizable Forecasting?

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Customizable forecasting may be difficult to distinguish because the tab name does not change when you convert to customizable forecasting. Here's how to tell if you have it:

Click the Forecasts tab.

- If you see either the **Introducing Customizable Forecasting** or **Request Now!** buttons, you don't have customizable forecasting.
- If you don't see either button, your organization already has customizable forecasting.

To enable customizable forecasting:

1. From Setup, enter *Forecasts (Customizable)* in the **Quick Find** box, then select **Forecasts Hierarchy**.
2. Select **Enable Customizable Forecasting**.
3. Once customizable forecasting is enabled, see [Setting Up Customizable Forecasting](#).

Setting Quotas for Customizable Forecasting

Users with the appropriate permission can set their individual quota. Administrators and users with the appropriate permission can always edit any quota, and managers can always change the quotas of users that report directly to them in the role hierarchy.

1. Do one of the following:
 - To set your personal quota, access your personal information in your personal settings.
 - To change the quota of a user that reports to you, from Setup, enter *Users* in the **Quick Find** box, then select **Users**, and click the full name of the appropriate user.
2. Click **Edit** in the Quotas related list.
3. Select the appropriate range start and range length. If available, select a territory and product family.

 **Note:** If your organization uses custom fiscal years, you cannot set quotas for a period that does not have a defined fiscal year.

4. Enter the quota amounts for revenue and/or quantity.
5. Select the appropriate currency if you work with more than one currency.
6. Click **Save** to save the quota and return to the user detail page, or click **Quick Save** to save the values and continue to edit the quota.

 **Tip:** Using **Quick Save** allows you to quickly set a different quota for each product family.

 **Note:** If these options are not available to you, you may not have customizable forecasting. To determine if your organization has enabled customizable forecasting, see [Do I Have Customizable Forecasting?](#) on page 1502. Delegated administrators won't see the quotas related list on user records.

You can also use tools like the [Data Loader](#) to do mass updates on quotas. When updating quotas, set the quota field value on the `RevenueForecast` or `QuantityForecast` objects.

SEE ALSO:

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

Working with Forecast Categories

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your forecast is a representation of your opportunity amounts, dates, and stages. Click the Forecasts tab and notice that your forecast amounts are listed in different categories. Depending on its stage, an opportunity amount can be included in the following forecast categories:

- **Best Case** includes amounts you are likely to close, closed/won opportunity amounts, and amounts in the Commit category.
- **Closed** includes amounts for closed/won opportunities.
- **Commit** includes amounts you are confident about closing and closed/won opportunity amounts.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To set your quota:

- "Edit Personal Quota"

To set any user's quota:

- "Manage Internal Users"

AND

"Modify All Data"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

- **Omitted** means the amount does not contribute to your forecast.
- **Pipeline** includes amounts from all open opportunities.

 **Note:** You can edit the forecast category field on opportunities to change the value displayed in reports, opportunity detail and edit pages, opportunity searches, and opportunity list views. For example, you can change the value of the Commit category to Won to make the category name match your business processes.

Each value in the opportunity `Stage` picklist is automatically mapped to a `Probability` and value in the `Forecast Category` picklist. Change the `Stage` of an opportunity and the `Probability` as well as the `Forecast Category` changes with it.

For example, your organization may have mapped the “Negotiation/Review” stage to the “Best Case” forecast category. This means that the amounts of your opportunities in “Negotiation/Review” are included in your “Best Case” forecast amount. Your organization may have set up different mappings but an example of how these fields map is below:

Stage	Probability	Forecast Category
Prospecting	10%	Pipeline
Qualification	10%	Pipeline
Needs Analysis	20%	Pipeline
Value Proposition	50%	Pipeline
Id Decision Makers	60%	Pipeline
Perception Analysis	70%	Pipeline
Proposal/Price Quote	75%	Pipeline
Negotiation/Review	90%	Best Case
Closed Won	100%	Commit

Regardless of whether you use customizable forecasting or not, your forecasts still rely on how your opportunity `Stage` picklist values map to values in the `Forecast Category` picklist.

SEE ALSO:

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

Managing Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your forecasts represent your opportunity amounts, dates, and stages. To make sure your forecasts are an accurate representation of your revenue potential:

1. Review your forecast amounts. See [Viewing Customizable Forecasts](#) for instructions on different viewing options.
2. Determine if you want to override any amounts.
3. Override amounts if necessary. This requires the appropriate user permission. See [Overriding Customizable Forecasts](#) on page 1507.
4. Submit your forecast to make a snapshot of your forecast data available in your forecast history and forecast reports. See [Submitting Customizable Forecasts](#).

Viewing Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

When you click the Forecasts tab, review the amounts listed and determine if they are ready to be submitted.

- Initially, your name appears in the title bar and above `Find a Forecast:`, indicating that you are viewing your own forecast. Users with the appropriate permissions can click the magnifying glass icon and select another user or role to view that person's forecast. When you are viewing a forecast other than your own, the role or username will be displayed in the title bar and above `Find a Forecast:`. In addition, your access level will be displayed above `Find a Forecast:`.

 **Note:** [User Sharing](#) does not fully support Customizable Forecasting. You'll see all users in the organization regardless of the organization-wide default for the user object.

- If your organization uses manual forecast sharing, click **Sharing** to view the forecast sharing settings or to share the forecast with other users.
- If your organization uses territories, choose an option from the `Territory` picklist to summarize the forecast by that territory. See [Territory Management](#).
- If your organization uses product families, choose an option from the `Product Family` picklist to summarize the forecast by that product family. Choosing `--All--` product families disables the **Submit**, and **Forecast History** options; choose another product family to use these options. See [Define Customizable Forecast Settings](#) for information on customizing your organization to use product families.
- If your organization forecasts on both revenue and quantity, select whether to include revenue, quantity, or revenue and quantity. This controls which information is displayed for each amount listed.
- Select a date range under `Range Start` to view another forecast period. Forecast details for opportunities that closed more than two years before you implemented Customizable Forecasting or more than 10 years in the future are not available.

EDITIONS

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see forecasts of other users:

- "View All Forecasts"

To override your forecast:

- "Override Forecasts"

-  **Note:** Organizations that implemented Customizable Forecasting prior to the Salesforce Winter '07 release can see forecasts outside of this range.
- Select a `Range Length` to view fewer or more forecast periods.
-  **Note:** If you are using custom fiscal years, periods before the first defined custom fiscal year or after the last defined fiscal year use calendar months or calendar quarters (depending on your forecast setting) for the range start and period length.
- Select an option next to `Display Units` to view forecast totals using a different unit of measurement. To display what portion each total is of your quota, choose **% Quota**.

Viewing Forecast History

When viewing a forecast from the Forecasts tab, click **Forecast History** to view snapshots of your forecast data taken when you submit it. You can also view the submitted forecasts of subordinates users. Click **Forecast Summary** to return to the previous view.

Viewing Forecast Amount Details

Select the Forecasts subtab to see forecast details. Click any forecast amount to view details of the opportunity amounts included in that forecast amount. From the details page, click any item listed to view it. Click **Edit** to override that item. See [Overriding Customizable Forecasts](#) for instructions on overriding forecast amounts from the opportunity.

If you have direct reports (users that report directly to you), their forecasts display below yours. The `Choose a view` option allows you to change the way forecast information is displayed for your direct reports. Use this option to group forecast data by subordinate or forecast period.

- **View by Period** displays a list of direct reports and their forecasts for each forecast period. Click any name to view the forecast for that user.
- **View by Direct Report** displays a list of forecast totals for each direct report. Click **View** next to any subordinate name to view the forecast for that user.
- Clicking any amount displays the opportunities and forecast overrides included in that amount.

Viewing Opportunities

Select the Opportunities subtab to see the opportunities that are included in the displayed forecast. On the Opportunities subtab, you can choose, or create, a list view to further filter the displayed opportunities. Click any opportunity to see the opportunity details. To override the opportunity, click **Edit**. For more information on overriding opportunities, see [Overriding Customizable Forecasts](#).

If you have the “View All Forecasts” permission, you can see opportunities on the Opportunities subtab regardless of their sharing settings.

-  **Note:** When a [partner portal is transferred to another account](#), the opportunities on each account are automatically recalculated through your organization's forecast hierarchy.

[Customizable Forecasting Overview](#)

[Managing Customizable Forecasts](#)

Overriding Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

You can make your forecast a more accurate assessment of your forecasted sales by overriding forecast amounts as needed. Any user can override a forecast from the opportunity by changing the `Stage` or `Forecast Category` of the opportunity. Users with the “Override Forecasts” permission can override their forecast or any direct report’s forecast at the forecast level.

When an opportunity moves from one forecast category to another, such as from Best Case to Commit, the unadjusted raw amounts change for each of those categories, but any amounts with overrides do not change. You should update or remove your overrides to each forecast category to account for changes in the stage of opportunities.

Overriding Your Forecast from the Opportunity

1. Click the Opportunities subtab on the Forecasts page.
2. Click **Edit** for the opportunity you want to override.
3. Make any changes to the details. The options available differ depending on whether you own the opportunity.
4. If products are on the opportunity and you want to change the forecast category for that product, select **Change Category**, then select the appropriate `Product Forecast Category`.
5. Click **Save**. The opportunity is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).
Click **Save & Refresh** to update the record and redisplay the totals.

Overriding Your Forecast Total

1. Click the Forecasts subtab on the Forecasts page.
2. Click the edit icon () to override the adjusted total.
3. Enter a new amount and any comment.
4. Click **Save**. The forecast is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).

Overriding the Forecast of Your Direct Reports

1. Click the Forecasts subtab on the Forecasts page.
2. Click the edit icon () to override your direct report’s forecast.
3. Choose one of the override options to control which override amounts, if any, are included in the forecast:
 - **Accept John Doe’s forecast**—Use this option to accept the forecast of your direct report, including any overrides that he or she has made.
 - **Reject any override on John Doe’s forecast, but accept forecast overrides from other subordinates**—Use this option to ignore overrides made on your direct report’s forecast, but include any overrides made on forecasts further down in the hierarchy.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see forecasts of other users:

- “View All Forecasts”

To override your forecast:

- “Override Forecasts”

- **Reject all forecast overrides**—Use this option to ignore all forecast-level overrides but include opportunity-level overrides. If you have overridden amounts at the opportunity, your own opportunity forecasts are used in this calculation. Choose this option if you want forecast amounts to be based on opportunity amounts including overrides made at the opportunity level.
 - **Override the forecast and set it to**—Use this option to enter an amount that replaces the current amount in your forecast. Your manager will see this amount in your forecast but your subordinates will not.
4. If you forecast on both revenue and quantity, choose an override option for quantity forecast.
 5. Click **Save**. The forecast is marked with the appropriate icon indicating its override status. For a description of each override icon, see [Forecast Override Indicators](#).
-  **Note:** The Forecasts tab is unlike other tabs in that it automatically calculates data for you based on your opportunity data. You do not need to create or delete forecast records.

SEE ALSO:

- [Customizable Forecasting Overview](#)

Override Customizable Forecasts from an Opportunity

A forecast override is an amount that more accurately represents your forecasted sales. You can view a list of overrides and make changes from the opportunity detail page.

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

1. From the Opportunity Forecasts related list on an opportunity record, click **Edit**.
2. Make changes to the details. See [Overriding Customizable Forecasts](#) for instructions on overriding opportunity forecast amounts.

If your organization uses territory management, the territory to which the opportunity is assigned displays in the `Territory` drop-down list.

If you are a forecast manager for multiple territories, the drop-down list shows the territories from which you can override the opportunity. Choose a value and click **Edit** to override the opportunity from the desired territory.

SEE ALSO:

- [Territory Management](#)

Forecast Override Indicators

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

An icon displays for each override to indicate the status of the override. Use the following table to determine the status of an override.

Icon	Override Status
	The opportunity has been updated since an override.
	A subordinate has overridden the forecast.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Territory management available in: **Developer** and **Performance** Editions and in **Enterprise** and **Unlimited** Editions with the Sales Cloud

USER PERMISSIONS

To view forecasts of other users:

- “View All Forecasts”

To override your forecast:

- “Override Forecasts”

Icon	Override Status
	A person that reports directly to you has overridden the forecast.
	You have overridden the forecast.
	The forecast data is not up-to-date. Refresh your browser in a few minutes.

[Overriding Customizable Forecasts](#)

Customizable Forecast Fields

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Here is a description of the fields (in alphabetical order) that make up a forecast in customizable forecasting:

Forecast Fields

Field	Description
Comments	The comments you enter when overriding your forecast.
Forecast Category	<p>Category determined by the opportunity Stage value. Options are:</p> <ul style="list-style-type: none"> • Omitted means the amount does not contribute to your forecast. • Pipeline includes amounts from all open opportunities. • Best Case includes amounts you are likely to close, closed/won opportunity amounts, and amounts in the Commit category. • Commit includes amounts you are confident about closing and closed/won opportunity amounts. • Closed includes amounts for closed/won opportunities.
Forecast Item	Record that contributes to the forecast. This displays in the detail of a forecast amount.
Revenue	The total expected revenue amount from the opportunities that fit in a given category.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Field	Description
Quantity	The total number of units that are forecasted to sell as part of the opportunities in a given category.
My Forecast Override	The amount you enter when overriding a forecast amount.
Submitted By	The user who submitted a forecast.
Type	Type of override. Options are "Opportunity" or "Forecast Override."

Opportunity Forecast Fields

Opportunity Forecast Field	Description
My Forecast Amount	The amount you enter when overriding your direct report's opportunity amount.
My Forecast Category	The category selected when you override the category of an opportunity.
My Forecast Comments	The comments you enter when overriding one of your opportunities or the opportunity of a direct report.
My Forecast Period	The period you selected when overriding a direct report's opportunity period.

[Managing Customizable Forecasts](#)

Manually Sharing a Forecast

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

Your administrator defines your organization's forecasting hierarchy, which determines which users can view the forecast data. However, your administrator can manually extend sharing privileges for forecast data, and you may be able to manually extend sharing privileges for your own forecast data as well. Manual forecast sharing can only increase access to forecast data; it cannot restrict access for users who already have access. To manually share a forecast, you must be an administrator or a forecast manager who has been given access to share your forecast data.

To see which users can view your forecast or to share your forecast data, do one of the following:

- From Setup, enter *Forecasts Hierarchy* in the **Quick Find** box, then select **Forecasts Hierarchy**, then click **Share** next to the view you want to share.
- Click **Sharing** on the forecast home page to share your own forecast data.

The User and Group Sharing list shows you all the users who currently have access to this forecast data. It also details the level of access they have, whether they can submit a forecast, and the reason they have that access. The reasons a user might have access to forecast data are:

EDITIONS

Available in: **Salesforce Classic**

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Reason	Description
Administrator	The user is an administrator, or has the “Modify All Data” permission.
Delegated Forecast Manager	A user has access to forecast data that was granted via the Sharing button on the forecast.
Forecast Manager	A user has access due to being a forecast manager in the forecast hierarchy.
Owner	The owner can always see his or her own forecast data.
View All Forecasts Permission	The user has the “View All Forecasts” permission.

On the Forecast Sharing Detail page, you can do any of the following:

- To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
- Click **Add** to grant other users or groups access to the forecast data.
 -  **Note:** Manual sharing extends to the opportunity data that makes up the forecast. If a user has permission to override forecast data, then the user also has permission to override the opportunity forecast data.
- Click **Expand List** to [view all users that have access](#) to the forecast data.
- For manual sharing rules that you created, click **Edit** or **Del** next to an item in the list to edit or delete the access level.

[Define Customizable Forecast Settings](#)

[Setting Up Customizable Forecasting](#)

Submitting Customizable Forecasts

 **Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

On the Forecasts tab, your forecast totals are always available to you and users above you in your role hierarchy. However, forecast totals are only available in forecast history and reports after you submit them. You can submit your own forecast or any forecast data that has been manually shared with you and you have permission to submit.

To submit your forecast:

1. Click **Submit** from your forecast on the Forecasts tab.
2. Click **OK** to confirm. Salesforce takes a snapshot of your forecast totals and makes them available in reports and your forecast history.

Selling Through Multiple Channels

Sharing Salesforce Information with Business Partners

Salesforce to Salesforce Overview

Salesforce to Salesforce enables business collaboration both within and across Salesforce organizations. This allows you to share [certain records](#) with your business partners that use Salesforce and get real-time updates on the shared data. For example, you can share lead and opportunity data with business partners and manage your entire pipeline and programs within Salesforce.

Salesforce to Salesforce allows you and your business partners to collaborate more easily and effectively. With Salesforce to Salesforce, you can share records with one or more connections, and each connection can accept records you share with them - even if other connections have accepted the same record.

Salesforce to Salesforce allows your business partners to:

- Access all their programs from one place
- Easily integrate your data with the data they manage in Salesforce
- Integrate their business processes with updates received from you

Salesforce to Salesforce allows you to:

- Have 100% visibility into your partner activity
- Manage your entire pipeline, both internal sales and channel sales, in one place
- Rapidly and easily share data across multitiered partnerships
- Integrate your business processes with updates received from your partners using workflow and assignment rules

If you want to connect to partners but aren't sure if they use Salesforce, you can use [connection finder](#) to find out.

If you receive an invitation to connect with a business partner using Salesforce to Salesforce, see [Accepting or Rejecting an Invitation to Join Salesforce to Salesforce](#) on page 1514.

To invite other companies to connect with you using Salesforce to Salesforce, see [Inviting Business Partners to Connect using Salesforce to Salesforce](#).

 **Note:** Salesforce to Salesforce doesn't just let you share information with business partners; it's also part of a high-availability solution called Organization Sync. For information about Organization Sync, see [Organization Sync](#).

Inviting Business Partners to Connect using Salesforce to Salesforce

Before you can start sharing data with your business partners, you need to set up a connection to them using Salesforce to Salesforce. To create that connection, you need to invite your business partner.

 **Note:** Before beginning the invitation process, you need to create an account and an associated contact for your business partner.

To invite a business partner to connect using Salesforce to Salesforce:

1. Click the Connections tab.
2. Click **New**.
3. Enter a contact name or use the lookup icon to select a contact.

 **Important:** Make sure that the email address is valid; otherwise, your invitation may be sent to the wrong person.

4. Optionally, select a related account.

 **Note:** The account associated with the connection can be changed after the invitation is sent.

5. Choose a user to manage the connection.
6. Optionally, choose a template to apply to the connection.
7. Click **Save & Send Invite**.

To invite multiple business partners to connect using Salesforce to Salesforce:

1. Click the Contacts tab.
2. Select a standard or custom list view, then click **Go!**.
3. In the list view, select the checkboxes next to the contacts you want to invite.

 **Important:** Make sure that the email addresses are valid; otherwise, your invitations may be sent to the wrong people.

4. Click **Invite to Connect**.
5. Choose a user to manage the connection.
6. Optionally, choose a template to apply to the connection.
7. Click **Save & Send Invite**.

The people you invite will receive an email invitation to connect with you using Salesforce to Salesforce. They can choose to accept or decline your invitation. You can check whether they have accepted or declined the invitation by reviewing your connections on the Connections tab. From the Connections tab, you can also resend or cancel the invitation. To learn more about connections, see [Connections Home Page](#) on page 1515.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To invite to a business partner to connect using Salesforce to Salesforce:

- "Manage Connections"

 **Note:** For information about sending an Organization Sync replication connection invitation in Salesforce to Salesforce, see [Connect the Organizations](#).

Accepting or Rejecting an Invitation to Join Salesforce to Salesforce

If a business partner sent you an invitation to connect using Salesforce to Salesforce, you can accept or reject that invitation by following these steps:

1. Click the link in the invitation email to go to the Salesforce login page.
2. Log in as the System Administrator or as a user with the “Manage Connections” permission.
3. Review the details of the invitation.
4. Click **Accept** or **Decline**.

If you aren't sure whether you want to accept or decline, click **Decide Later**. The invitation displays on the Connections tab with a connection status of Invitation Received. You can easily accept or decline it at a later date.

When you accept or reject an invitation, the company that invited you receives an email notifying them of your decision. The content of that email can be configured by changing the appropriate email template.

USER PERMISSIONS

To accept or reject an invitation to connect using Salesforce to Salesforce:

- “Manage Connections”

Connections Home Page

The Connections tab allows you to manage your Salesforce to Salesforce connections and connection templates. From the Connections tab, you can:

- Select the Connections subtab to manage connections. Connections include everyone that you have invited, whether they have accepted, declined, or have not yet responded, as well as all the invitations you have received. Recent connections are automatically displayed on the Connections subtab.
 - To view details about a connection, click the connection name.
 - To invite new connections, click **New**, then enter the connection details and click **Save & Send Invite**.
 - To deactivate a connection, click **Deactivate**.
 - For invitations to connect that have been sent but not accepted, you can click **Resend** to resend the invitation, or **Cancel Invitation** to cancel the invitation. For more information about inviting connections, see [Inviting Business Partners to Connect using Salesforce to Salesforce](#) on page 1513.
- Select the Templates subtab to manage connection templates. Templates allow you to define and publish sets of objects and fields to one or more standard Salesforce to Salesforce connections. Recent templates are automatically displayed on the Templates subtab.
 - To show a filtered list of items, select a predefined list from the `view` drop-down list, or click **Create New View** to define your own custom views. To edit or delete any view you created, select it from the `view` drop-down list and click **Edit**.
 - To view details about a template, click the template name.
 - To create a new template, click **New**.
 - To edit a template, click **Edit** next to the template you want to edit. For more information about using templates, see [Creating and Applying Connection Templates](#) on page 1517.

 **Note:** To learn about Organization Sync, a high-availability feature built on the framework of Salesforce to Salesforce, see [Organization Sync](#).

[Managing Connections](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view and manage connections for Salesforce to Salesforce:

- “Manage Connections”

To view and manage templates for Salesforce to Salesforce:

- “Manage Connections”

Managing Connections

From the Connections tab, you can view connection details and manage connections. The connection details include information on the status of the connection, the owner of the connection, information about the company, published and subscribed fields, and a connection history.

To view a connection:

1. Click the Connections tab.
2. On the Connections subtab, click the name of the connection that you want to view.

From the connection detail page, you can:

Accept an Invitation

If a business partner has sent you an invitation to connect using Salesforce to Salesforce, click **Accept** to accept the invitation. After you accept the invitation, you can subscribe to objects that the connection has published and begin sharing objects with the connection using the Published Objects and Subscribed Objects related lists on a connection detail page.

Cancel an Invitation

If an invitation you sent hasn't been accepted, you can cancel the invitation by clicking **Cancel Invitation**. If your partner hasn't received the invitation, click **Resend** to send it again.

Deactivate Connections

If you have created a connection with a business partner and you no longer wish to use the connection, click **Deactivate**. If a connection is deactivated, you can still view and update records that your connection shared with you, but updates you make won't be sent to your connection. If you sent records to your connection that they didn't accept, the records are removed from their organization, and vice versa.

Edit Connections

When displaying the connection, you can modify the connection by editing the connection details. To change the objects published to a connection, click **Publish/Unpublish**, or to use a connection template, click **Edit** and select an active template. To edit the published fields on an object, click **Edit** next to the object. To change the objects you're subscribed to, click **Subscribe/Unsubscribe**. For more information, see the following:

- [Publishing Objects in Salesforce to Salesforce](#) on page 1526
- [Subscribing to Objects in Salesforce to Salesforce](#) on page 1519
- [Publishing Fields in Salesforce to Salesforce](#) on page 1527
- [Subscribe to Fields in Salesforce to Salesforce](#) on page 1520

View Connection History

You can view a detailed history of the connection in the Connection History related list of the connection detail page. To export the connection history, select **Download connection history (csv)**. This lets you download a comma-separated values file that includes the following information:

- Connection status changes
- Changes to which account is associated with the connection
- Changes to which contact is associated with the connection
- Connection owner changes
- Changes to published fields
- Email communications sent to your business partners
- Errors related to validation rules and Apex triggers with validation rules resulting from:
 - Records manually accepted

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To manage connections:

- "Manage Connections"

- Records automatically accepted
- Records updated by Connection User

 **Note:** System errors, for example, code errors, aren't logged in the Connection History.

[Connection Templates in Salesforce to Salesforce](#)

Connection Templates in Salesforce to Salesforce

Connection templates allow you to define objects and fields that can be published to connections. Connection templates can be assigned to one or more standard Salesforce to Salesforce connections, making the process of publishing fast and easy. From the Connections tab, click the Templates subtab to view, create, and edit connection templates.

When a connection template is applied to a connection, the object and field rules are applied to that connection.

The following rules apply to connection templates:

- Objects and fields that are not already published but are published in the connection template are published.
- Objects and fields that have the same publish or unpublish status as the template are unchanged.
- Objects and fields that are already published but are not published in the connection template are unpublished.

SEE ALSO:

[Creating and Applying Connection Templates](#)

[Connections Home Page](#)

Creating and Applying Connection Templates

Creating and Editing Connection Templates

Connection templates allow you to define object and field publishing rules that can be applied to one or more standard Salesforce to Salesforce connections.

To create a connection template:

1. Select the Connections tab.
2. Select the Templates subtab.
3. Click **New**.
4. Type a name and an optional description.
5. Select the **Active** checkbox if you want to be able to assign the template to standard connections.
6. Click **Save** to save the template, or click **Save & Add Objects** to add objects to the template.

USER PERMISSIONS

To create, edit, and view connection templates:

- "Manage Connections"

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create, edit, and view connection templates:

- "Manage Connections"

7. If you clicked **Save & Add Objects**, select the checkboxes next to the objects you want to add, then click **Save**.
 -  **Note:** If you clicked **Save**, you can click **Add/Remove Objects** on the template detail page to add objects.
8. Click **Edit** next to an object you added to the Published Objects related list.
9. Select the fields you want to publish for the object, then click **Save**.
10. Repeat steps 8 and 9 for each object you added to the Published Objects related list.

To deactivate a connection template:

1. On the Templates subtab, click **Edit** next to the template you want to deactivate. Alternatively, click **Edit** on the template detail page.
2. Deselect the **Active** checkbox.
3. Click **Save**.

 **Note:** Only active connection templates can be assigned to connections. If you want to use a template that you had deactivated, you can do so by selecting the **Active** checkbox.

Assigning Connection Templates to Connections

You can assign connection templates to connections when [inviting one or more new connections](#), or you can assign connection templates to existing connections.

To assign a connection template to an existing connection:

1. Select the Connections tab.
2. Select the Connections subtab.
3. Click the name of the connection you want to assign the template to.
4. Click **Edit**.
5. In the `Template` field, type the name of the template or click the lookup icon to search for a template.
6. Click **Save**.

SEE ALSO:

[Connection Templates in Salesforce to Salesforce](#)
[Connections Home Page](#)

Sharing Records Using Salesforce to Salesforce

Once you have created a connection to another organization, you can share data with them. Your business partners do not have direct access to your record; they have a record in their organization that is connected, using Salesforce to Salesforce, to your record. Any updates to the shared information on either record is reflected on the other record. You can share records with one or more connections. Each connection has the opportunity to accept shared records, even if other connections have also accepted the same record.

 **Note:** Making records available to business partners using Salesforce to Salesforce is not the same as sharing records within your organization.

You can control the type of records you share with your business partners by selecting which objects and fields to publish.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

In addition, you can control how the information your business partner makes available to you is used in your organization by subscribing to objects and mapping the fields on those objects to fields on your own objects.

Individual records and their related records are made available to your connections by forwarding the record to one or more connections, or by assigning the record to a queue that contains connections. When you forward a record to a connection, you can select which related records to include, and you can send your connection contact an email notification that a record has been made available.

Similarly, your business partners can make records available to you. When a record has been made available to you by a business partner, you can view basic details about the record from a view on the object's home page. Then you choose whether to [accept the record](#), and its related records, or not. Additionally, when [subscribing to an object](#), you can specify that the object's records are automatically accepted when shared by your connection. This is particularly helpful if you're expecting the connection to share a large volume of records.

Once you have accepted a record, you can make it available to other connections in the same way you can make any record available using Salesforce to Salesforce. This allows you to work in a multi-tiered business network. In a multi-tiered network, changes made to the shared record in any organization updates the information in all the organizations that are sharing the record.

SEE ALSO:

[Publishing Fields in Salesforce to Salesforce](#)

[Subscribe to Fields in Salesforce to Salesforce](#)

[Tips for Using Salesforce to Salesforce](#)

Subscribing to Objects in Salesforce to Salesforce

When you are connected to a business partner using Salesforce to Salesforce, you can subscribe to objects that your business partner has published. When you subscribe to an object, you map it to an object in your organization. Standard objects must map to standard objects in your organization, but you can map custom objects to any custom object. For example, if your business partner has published a custom object named Prospects, you can map that to a custom object named Client.

To subscribe to objects for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Subscribed Objects related list, click **Subscribe/Unsubscribe**.
4. Choose the objects you want to subscribe to by selecting the object in your organization you want mapped to that object. Select `--None--` if you do not want to subscribe to a published object.
5. Select the `Auto-Accept` checkbox next to an object if you want to automatically accept records of that type when shared by your connection. The checkbox appears once you select a mapping.

Note: This checkbox is not available for:

- Child objects. Opportunity products, tasks, and public case comments are [automatically accepted](#) when the parent record is accepted. Attachments are automatically accepted if marked public and the `Share With Connections` checkbox is selected.
- Objects that have one or more master objects, such as custom junction objects or detail objects in a master-detail relationship.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To subscribe to published objects :

- "Manage Connections"

Additionally, `Auto-Accept` does not apply to any record that is shared as the child of another record, for example a case record that is the child of a case record that you already accepted.

6. Click **Save**.

 **Note:** If your business partner stops publishing an object to which you are subscribed, you are automatically unsubscribed from that object.

Once you have subscribed to an object, you can [map published fields](#) on that object to fields on your object. For example, you can map the `Description` field on leads to a custom field on leads called `Partner Description`. This would allow you to use your own field to describe the lead for users within your organization rather than using the description provided by your business partner.

Additional Considerations

- If you choose to auto-accept leads or cases, any active assignment rules in your organization run when a record is automatically accepted.
- In order to automatically accept a record shared by your connection, the connection owner for that record must be an active user.

Subscribe to Fields in Salesforce to Salesforce

When you accept an invitation from a business partner to join Salesforce to Salesforce, you can subscribe to fields that your business partner has published and map those fields to your fields. When your business partner updates the fields on a record that you're sharing, the fields will be updated on the shared record in your organization.

For example, if your business partner has published the `Description` field, you could map that field to a custom field called `Partner Description`. This would allow you to use your own field to describe the lead for users within your organization.

Before subscribing to fields, see [Best Practices for Mapping Fields in Salesforce to Salesforce](#).

To map fields on a subscribed object:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Subscribed Objects related list, click **Edit** next to an object.
4. Map your business partner's published fields to your organization's fields by choosing the appropriate field in the drop-down list.

 **Note:** Fields can only be mapped to fields with the same data type, length (for text and numeric fields) and decimal places (for numeric fields), so the drop-down list only shows fields with the correct data type. You can see the data type details of a published field by hovering your mouse over the information icon () next to the field. Select `--None--` if you don't want to populate any of your fields with the data from a published field.

5. If the field is a picklist, click **Edit Values** to map each published picklist value to a picklist value in your organization.
6. Click **Save**.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To subscribe to published fields :

- "Manage Connections"

 **Note:** Changes to field mappings and picklist values may not show up in your business partner's organization for up to 15 minutes while Salesforce refreshes the cache. This cache enables us to support larger transaction volumes and reduce the number of API calls that count against your organization's limits.

SEE ALSO:

[Managing Connections](#)

[Publishing Fields in Salesforce to Salesforce](#)

Best Practices for Mapping Fields in Salesforce to Salesforce

When you subscribe to a field in Salesforce to Salesforce, you need to map it to a field in your organization. This lets updates to that field sync for all shared records. Before you map fields, take a look at these important best practices.

 **Important:** This information applies to standard Salesforce to Salesforce connections. If you're mapping fields for a replication connection as part of Organization Sync, some of this information may not apply.

Auto-Mapping Fields

- When subscribing to fields, select **Auto-Map Fields** to automatically map your business partner's fields to your fields. After you select this option, click **Save** for your changes to take effect.
- For any unmapped field, Salesforce checks if the field's API name matches that of any of your fields. If there are no matches, Salesforce checks for matching field labels. If Salesforce still can't find a match, `--None--` is selected.
- Selecting **Auto-Map Fields** doesn't overwrite previous selections, and deselecting it doesn't affect fields that were mapped previously.
- The following standard fields are automatically mapped:
 - Account: `Account Name`, and, if you are using person accounts, `Last Name`
 - Attachment: `Body`, `Content Type`, `File Name`
 - Case: `Subject`
 - Case Comment: `Body` and `Published`
 - Contact: `Last Name`
 - Custom Object: `Name`
 - Lead: `Last Name` and `Company`
 - Opportunity: `Name`, `Closed Date`, and `Stage`
 - Product: `Product Name`
 - Task: `Subject`
 - Opportunity Product: `Quantity`, `Sales Price`

Mapping Picklist Fields

- If a picklist value is mapped to `--None--`, and your business partner enters a picklist value, your picklist field will be set to the same value. For example, if you subscribe to the Lead Status picklist, and your business partner has the value `Internal` in that picklist, your record will have a lead status of `Internal`.
- To convert a custom field to a picklist field, stop publishing the field, change the field type, then publish the field again.

EDITIONS

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Mapping Currency Fields

- If you map a currency field, and a record shared by your connection uses a currency that your organization hasn't enabled, that currency field won't be updated when your organization auto-accepts the record. If you're manually accepting the record, the currency is updated only if your organization uses the same currency as the record.

For example, suppose your connection has shared an opportunity with you. Your organization uses the Euro only. Your connection updates the opportunity amount to \$300. The opportunity amount won't update in your record because your organization doesn't support the U.S. Dollar.

- If you map a currency field and either you or your connection changes the currency on a record containing that field, updates you make to the field will no longer be propagated to the other organization, and updates your connection makes to the field won't be reflected in your organization.
- You can map roll-up summary fields to currency fields with the same currency type. For example, a roll-up summary with the currency type `U.S. Dollar` can be mapped to a currency field that uses the U.S. Dollar.

Mapping Quantity and Revenue Schedules

- If Quantity Schedules or Revenue Schedules are enabled in your connection's organization and you subscribe to the Products object from that connection, you must subscribe to the following fields and map them to matching fields in your organization.

Type of Schedule	Fields to Map
Quantity Schedule	<ul style="list-style-type: none"> - <code>Number of Quantity Installments</code> - <code>Quantity Installment Period</code> - <code>Quantity Schedule Type</code>
Revenue Schedule	<ul style="list-style-type: none"> - <code>Number of Revenue Installments</code> - <code>Revenue Installment Period</code> - <code>Revenue Schedule Type</code>

Mapping Different Field Types

- Person account fields should be mapped only to person account fields, and business account fields should be mapped only to business account fields.
- If your connection is using person accounts and you aren't, the person account field `Last Name` is used as the Account Name when your connection shares a person account record with you. If you enable person accounts, you are automatically subscribed to `Last Name`. Any changes to Last Name and Account Name are synced.
- You can't map a standard number field to a custom number field.
- You can map lookup fields to text fields that have a length of 80 or more characters. If your connection edits a lookup field that you mapped to a text field, the text field will be updated with their changes.
- You can map auto-number fields to text fields that have a length of 30 or more characters.
- You can map formula fields to fields of the same data type; for example, a formula field that has a number data type can be mapped to a field with a number data type. If a formula field is a text data type, it can be mapped to a text field with a length of 80 or more characters. Conversely, fields can't be mapped to formula fields; for example, a formula field with a currency data type can be mapped to a currency field, but a currency field cannot be mapped to a formula field. System audit fields are not supported.

Unsubscribing to Fields

- You are automatically unsubscribed from a field if:
 - Your business partner stops publishing the field
 - You delete a custom field that is mapped to a published field
 - The field type of a custom picklist or custom multi-select picklist is changed (for example, if a custom picklist is changed to a text field)

SEE ALSO:

[Subscribe to Fields in Salesforce to Salesforce](#)

Accepting Records Shared from a Connection

Salesforce to Salesforce allows you to accept records that have been made available to you by business partners with whom you have connections. When accepting a record, you can assign it to yourself, another user, a queue, or, if it is a lead or case, use your organization's assignment rules to automatically assign it. If the record is a child of another record you have accepted, you can assign it to the parent record when accepting it. Additionally, when [subscribing to an object](#), you can specify that the object's records are automatically accepted when shared by your connection.

If validation rules prevent you from accepting shared records, create a validation rule with the `Received Connection Name` field not equal to null; this will ignore validation rules for records you accept from your connections. To create this rule, use the following formula:

```
IF(OR(ISNEW(), ISNULL(Id)), if(ConnectionReceivedId =null,
TRUE, FALSE),NOT(AND(ISCHANGED(ConnectionReceivedId),
NOT(ConnectionReceivedId = null))))
```

You should also create a similar rule for any Apex trigger that has validation checks.

To accept records that have been made available to you:

 **Note:** When you manually accept a record, it takes some time for all mapped fields on the record to be updated.

If an error occurs when accepting a record, see the Connection History for details.

1. Select the tab of the record type you are accepting.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To accept shared records:

- "Read" and "Edit" on the object

To view records shared by a connection:

- "Manage Connections" or have access to the list view

2. Select a connections list view and click **Go!**. For example, on the Leads tab, in the **Leads from Connections** section, select a list view from the drop-down list and click **Go!**.
3. For accounts, contacts, and opportunities, click **Accept** next to the record you want to accept. For cases, leads and custom objects, select the checkbox next to the records to accept, then click **Accept**.

Note: If a record is a child of a record you have accepted, the name of the parent record is displayed in the Parent Record Name column. If the record is a parent record or has no parent record, this column is blank.

When you accept a record that has public attachments, the attachments are automatically accepted if you selected the `Share With Connections` checkbox on the attachment.

Accepting Opportunity Records

When you accept an opportunity, you have the option to relate the opportunity to an object and a price book, and to relate the opportunity to a new account or opportunity, or to use an existing account or opportunity. If you create a new opportunity or account, you can also set the owner of that record.

Accepting Account Records

When you accept an account, you have the option relate the account to another object and to create a new account, or to use an existing account. If you create a new account, you can also set the owner of that record.

Accepting Contact Records

When you accept a contact, you have the option relate the contact to another object and to create a new account or contact, or to use an existing account or contact. If you create a new contact or account, you can also set the owner of that record.

Accepting Case, Lead, and Custom Object Records

When you accept a case, lead or custom object, you have option to relate the case, lead or custom object to another object and to assign the lead or custom object to a new owner.

Note: If you choose to `Assign using active assignment rule` and no assignment rule criteria is met, the lead, case, or custom object is assigned to the Default Lead, Case, or Custom Object Record Owner.

Accepting Product Records

When you accept a product, you have the option to create a new product or relate the product to an existing product.

Additional Considerations

- After accepting a shared record, if you update a field that your business partner has subscribed to, the field is automatically updated on the record in your business partner's organization. Likewise, if your business partner updates a field to which you have subscribed, it is automatically updated in your organization. When your business partner updates the record, the `Last Updated By` field will be set to "Connection User".
- Once you have accepted a record, you can make it available to other connections in the same way you can make any record available using Salesforce to Salesforce. This allows you to work in a multi-tiered business network. In a multi-tiered network, changes made to the shared record in any organization updates the information in all the organizations that are sharing the record.

- When your business partner shares child records at a later time using the **Manage Connections** link in the related list of a record you have already accepted, the [child records can be automatically added](#) to your organization.

SEE ALSO:

- [Sharing Records Using Salesforce to Salesforce](#)
- [Connections Home Page](#)
- [Tips for Using Salesforce to Salesforce](#)

Automatically Accepting Related Records From a Connection

Rules for Automatically Accepting Related Records From a Connection

When you share records using Salesforce to Salesforce, you can also share child records. When you accept a record from a connection, or when your connection accepts a record from you, the child records can be automatically accepted provided that certain criteria are met. Similarly, when a child record is shared at a later time using the **Manage Connections** link in the related list, and the parent record has already been accepted, the child record can be automatically accepted.

In order for a child record to be accepted automatically, the following criteria must be met:

- The parent record must already be accepted in the organization.
- The record must be related as a child to the parent record.
- The child record cannot have two master records.
- The child record cannot have multiple relationships to the same parent object.
- The connection owner must be an active user.
- The owner of the parent record must be an active user.

 **Important:** When child records are accepted automatically, there may be a slight delay before they are visible in the related list of the parent record. Additionally, when a child record is shared using the **Manage Connections** link in the related list of a parent record, there may be a slight delay before the Sent Connection Name displays.

If a child record does not meet the criteria for automatic acceptance, it will need to be manually accepted from its object tab. For example, an opportunity record will need to be accepted from the Opportunities tab. A child record that needs to be manually accepted will display with the parent record name so that it can be properly assigned. For more information, see [Accepting Records Shared from a Connection](#) on page 1523.

USER PERMISSIONS

To accept or reject records:

- "Read" and "Edit" on the record

Publishing Objects in Salesforce to Salesforce

The objects you publish are the objects that your users can share with your business partners using Salesforce to Salesforce. If you have accepted an invitation, created new custom objects, or you have decided to share more information with your business partner, you may want to publish additional objects. Alternatively, you may find that you want to limit the objects you publish to a particular business partner.

You can publish the following objects:

- Account
- Attachment
- Case
- Case Comment
- Contact
- Lead
- Opportunity
- Opportunity Product
- Product
- Task
- Custom Object

To define published objects for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Published Objects related list, click **Publish/Unpublish**.
4. Select the objects you want to publish to your business partner. Deselect objects you no longer want to publish.
5. Click **Save**.

 **Note:** You cannot publish objects that you do not have permission to edit.

When you update your published objects, an email is sent to your business partner notifying them of the change. You can customize this email by editing the Update Connection communication template.

Your business partner is automatically unsubscribed to objects when you:

- Stop publishing an object
- Delete a custom object to which your business partner is subscribed

Once you have published an object, you can manage the fields you publish on that object. For more information on publishing fields, see [Publishing Fields in Salesforce to Salesforce](#) on page 1527.

Additional Considerations

- All custom objects in your organization appear in the list of objects, however, Salesforce to Salesforce only supports deployed custom objects. You cannot forward a record for a custom object that has not been deployed.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To publish objects:

- “Manage Connections”

- If you publish the case comment object, all public case comments will be shared with your connections. To avoid sharing a comment on a specific case, select **Make Private**.

SEE ALSO:

[Publishing Fields in Salesforce to Salesforce](#)

[Forwarding Related Records to a Connection](#)

Publishing Fields in Salesforce to Salesforce

When working with a business partner in Salesforce to Salesforce, you control which objects you share with them by publishing the objects. In addition, you can control which fields you publish on those objects. By default, the following fields are published:

- Account: `Account Name`, and, if you are using person accounts, `Last Name`
- Attachment: `Body`, `Content Type`, `File Name`
- Case: `Subject`
- Case Comment: `Body` and `Published`
- Contact: `Last Name`
- Custom Object: `Name`
- Lead: `Last Name` and `Company`
- Opportunity: `Name`, `Closed Date`, and `Stage`
- Product: `Product Name`
- Task: `Subject`
- Opportunity Product: `Quantity`, `Sales Price`

Salesforce to Salesforce displays the API label for each field.

In addition to those required fields, you may want to publish more fields, or limit the fields you are currently publishing to a particular business partner.

To define published fields for a connection:

1. Click the Connections tab.
2. Click the name of the connection you want to modify.
3. In the Published Objects related list, click **Edit** next to the published object.
4. Select the fields you want to publish to your business partner. Deselect fields you no longer want to publish.
5. Click **Save**.

 **Note:** You cannot publish fields that you do not have permission to edit.

Changes to fields may not show up in the subscribing connection for up to 15 minutes while Salesforce refreshes the cache. This cache enables us to support larger transaction volumes and reduce the number of API calls that count against your organization's limits.

You cannot publish rich text area (RTA) fields.

Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.

When you change which fields you publish, an email is sent to your business partner notifying them of the change. You can customize this email by editing the Update Connection communication template.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To publish fields:

- "Manage Connections"

Your business partner is automatically unsubscribed to fields when you:

- Stop publishing a field
- Delete a custom field to which your business partner is subscribed
- Change the type of a field to which your business partner is subscribed
- Change the size or precision of a long text area, text, percent, number, or currency field.

These fields remain published, but your business partner must re-subscribe to them.

Occasionally, new releases of the Salesforce service include new standard fields. Because Salesforce organizations around the world aren't upgraded to new releases simultaneously, you can't publish these new fields to a business partner until their organization is upgraded. Service upgrades occur during scheduled system maintenance periods. To view the system maintenance schedule, go to trust.salesforce.com.

Other Tips and Considerations

- When publishing fields, consider sending your business partner information about the fields. This helps them to create a mapping strategy that makes sense for your program.
- Translate your published custom field names into the languages your partners use. This allows them to see the field names in their own language.
- If you're using person accounts, and your connection has not enabled person accounts, the person account `Last Name` is used as the `Account Name` when you share a record. If your connection enables person accounts, they are automatically subscribed to `Last Name`. Any changes to `Last Name` and `Account Name` are synchronized.
- If you want to publish the `Middle Name`, `Informal Name`, and `Suffix` fields on contacts, the fields must be enabled in both your org and your partner's org, or your partner's org must be configured to auto-accept contacts.

[Managing Connections](#)

[Subscribe to Fields in Salesforce to Salesforce](#)

Making Records Available to a Connection

Salesforce to Salesforce allows you to share records with business partners to whom you are connected. There are two ways to share records: forward records directly to connections, or assign records to a queue of connections. You can share the same records with multiple connections. Once shared, connections must choose to accept the records.

 **Note:** Don't forward a record to the connection that originally shared it. Doing so causes errors when Apex triggers run.

Sharing a Record with Connections

You can share records with business partners to whom you are connected. You can only forward records that you or your subordinates own; System Administrators can forward all records.

 **Note:** Any lead record you are forwarding must include a populated `Company Name` field.

You cannot forward a record for a custom object that has not been deployed.

1. To forward a record and its related records:
 - View the record's detail page.
 - In the External Sharing related list, click the forward button.
2. To forward multiple records to connections:
 - Select the tab of the type of record you want to forward.
 - Select a list view from the `View` drop-down list, then click **Go!**
 - In the list view, select the checkboxes next to the records you want to forward. To select all records, select the checkbox in the column header.
 - Click **Forward to Connections**.
3. Select the connection(s) to forward the record to in the Available Connections list.
4. Click the Add arrow () to move the connection(s) to the Selected Connections list.
5. Optionally select **Send Notification Email (new invitees only)** to send email notifying the connection's representative that you forwarded the record. Only new recipients of the record receive the email; connections that you previously forwarded the record to don't receive another email.
6. Optionally select the checkboxes next to related records you want to forward. You can also [share related records separately](#).
7. Click **Save**.

The records are forwarded to the specified connections.

 **Tip:** Certain fields, like currency fields, must be mapped a certain way in Salesforce to Salesforce. For details, see [Best Practices for Mapping Fields in Salesforce to Salesforce](#).

Sharing Attachments

You can share attachments as child records of any supported object. Attachments are automatically accepted by a connection, providing the following criteria are met:

- The Attachment object type is published to your connection and your connection is subscribed to the object.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To assign records to a connection:

- "Read" and "Edit" on the record

To stop sharing a record:

- "Read" and "Edit" on the record

To forward multiple records to a connection:

- "Manage Connections"

- The parent record for the attachment is shared with the connection.
- The attachment is not marked "Private."
- The `Share With Connections` checkbox on the attachment is selected.
- The attachment is 20 MB or less.

Stop Sharing Records

To stop sharing a record:

 **Note:** You can only stop sharing records that you or your subordinates own. System Administrators can stop sharing all records.

1. View the record's detail page.
2. In the External Sharing related list, click **Stop Sharing**.

When you stop sharing the record with a connection, changes to the record in your organization are not reflected on the record in the connection's organization. The shared record is not deleted from the other organization.

SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

[External Sharing Related List](#)

External Sharing Related List

Salesforce to Salesforce allows you to share records with one or more connections; each connection has the opportunity to accept records you share with them, even if other connections have already accepted the same record. When working with a record that you have received from a connection, or a record that you have shared with a connection, the record detail page includes a header indicating the record's status. The record may also contain the External Sharing related list, which shows details on which connections this record is shared with, and the sharing status.

Externally shared records will have one of the following statuses:

Active (sent)

The record has been shared and accepted by an external organization.

Active (received)

The record has been sent to you from an external organization, and it has been accepted.

Pending (sent)

The record has been shared, but not accepted by an external organization.

Inactive

The record is no longer shared with an external organization.

Inactive (deleted)

The record was accepted by an external organization, but that organization has deleted the record.

Inactive (converted)

The record is a lead that was accepted by an external organization and converted into an opportunity by that organization. When a lead is converted, Salesforce to Salesforce inactivates the shared record so that it is no longer updated in the subscribing connection.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To see the external sharing status of a record

- "Read" on the record

To stop sharing a record:

- "Manage Connections"

 **Note:** If you change the Lead Status during conversion, it is not reflected in the subscribing connection.

SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

[Making Records Available to a Connection](#)

Forwarding Related Records to a Connection

Salesforce to Salesforce allows you to forward records that are children of records already shared with connections. You select the child record types that can be shared when you [share a parent record](#).

Child records are [automatically shared](#) with connections after the parent record has been accepted by the connection, provided certain criteria are met.

Consider the following tips when sharing related records:

- A related record will no longer be shared with a connection if the related record is edited from an unshared record.
- A maximum of 100 tasks per related record can be shared. This maximum includes open and closed tasks.

To stop sharing a related record from its parent record detail page:

1. Select the parent record's detail page.
2. In the related list of the record you want to stop sharing, click **Manage Connections** in the Sent Connection Name column. For example, to stop sharing a contact related to an account, click **Manage Connections** in the Contacts related list on the account detail page.
3. Select the connection(s) that you want to stop sharing with in the Selected Connections list.
4. Click the Remove arrow () to move the connection(s) to the Available Connections list.
5. Click **Save**.

Alternatively, to stop sharing a related record from its detail page:

1. View the record's detail page.
2. In the External Sharing related list, click **Stop Sharing**.

To stop sharing a case comment or attachment, you must make the records private.

Sharing Opportunity Products with Connections

An opportunity product is related to both opportunity and product records. For this reason, it can only be shared as a child record of a shared opportunity, provided the associated product is also shared.

If all of the following criteria are met, opportunity products are automatically shared with connections.

- The Opportunity Product object type is published to your connection, and your connection has subscribed to the object.
- The opportunity and the product associated with the opportunity product are shared with your connection.
- In the connection's organization, the opportunity is associated with an active price book during acceptance.
- In the connection's organization, the product is associated with the same active price book as the opportunity.
- In the connection's organization, the product is active.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To assign records to a connection:

- "Read" and "Edit" on the record

To forward related records to a connection:

- "Read" and "Edit" on the record

To stop sharing a record:

- "Read" and "Edit" on the record

- In both organizations, the opportunity currency is the same.

When sharing opportunity products, keep these additional rules in mind:

- If quantity or revenue schedules are enabled in the connection's organization, Quantity and Sales Price fields won't be updated in their organization.
- If the price book associated to the opportunity product is changed or deleted in one organization, the opportunity product will no longer be shared.
- If the opportunity is no longer shared, the opportunity product will no longer be shared.

 **Note:** Currently, if you edit the stage of multiple opportunity records by performing a global find and replace, that change will not be reflected in organizations that you had forwarded the records to in Salesforce to Salesforce.

For example, suppose you perform a global find and replace which causes the stage of all inactive opportunities to change from `Inactive` to `In Review`.

If any of the affected opportunities had been forwarded to a business partner in Salesforce to Salesforce, those opportunities will still be in the `Inactive` stage in your partner's Salesforce organization. For the stage change to be reflected in their organization, they would need to open each affected opportunity, click **Edit**, and click **Save**.

Sharing Case Comments with Connections

You can share a case comment as a child record of a case. Case comments are automatically accepted by a connection, providing the following criteria are met:

- The Case Comment object type is published to your connection, and your connection has subscribed to the object.
- The case to which the case comment is associated is shared with the connection.
- The case comment is not marked "Private."

SEE ALSO:

[Sharing Records Using Salesforce to Salesforce](#)

Tips for Using Salesforce to Salesforce

Managing Connections with Custom Reports

Use custom reports to keep track of Salesforce to Salesforce activity and updates. For details, see [Reporting in Salesforce to Salesforce](#).

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Managing Records

- If validation rules prevent you from accepting shared records, create a validation rule with the `Received Connection Name` field not equal to null; this will ignore validation rules for records you accept from your connections. To create this rule, use the following formula:

```
IF(OR(ISNEW(), ISNULL(Id)), if(ConnectionReceivedId =null,
TRUE, FALSE),NOT(AND(ISCHANGED(ConnectionReceivedId),
NOT(ConnectionReceivedId = null))))
```

You should also create a similar rule for any Apex trigger that has validation checks.

- To track records that you are sharing with connections, create a custom report. For example, you can create a custom report that shows all the leads that you have shared with connections that were deleted by the connection:
 - Use the Leads and Connections report type
 - Enter the filter criteria “Status equals Inactive (deleted)”
- Make your view of unaccepted records from connections more useful by creating a custom list view. For example, create a list view that hides unaccepted leads from connections that are more than a month old.

 **Note:** You must have the “Manage Connections” permission to create these list views.

- Only users with the “Manage Connections” permission can view objects shared from a connection, therefore, you should create custom list views that you can assign to people who need access to this information.
- If you are expecting to receive large volumes of records from a connection, [enable Auto-Accept for the appropriate objects](#) on page 1519. For example, if a connection shares a large number of leads with your organization on a regular basis, select the `Auto-Accept` checkbox next to Opportunity on the Add or Remove Subscribed Objects page.
- To see changes made by a connection, enable field tracking on the object and add the history related list to page layouts. Another option is to create a custom history report that includes the `Received Connection Name` field.
- To automatically assign all incoming leads or cases to a specific user, create an assignment rule that includes the following rule entries:

- *Received Connection Name contains name of connection*
- *Created By contains Connection User*

You can do the same with escalation rules.

- If you want to assign a case to a connection using an escalation rule on the case, you must assign the case to a queue where the connection is a member. For example, if you have a connection that acts as your third-party service agency and all cases meeting certain criteria should be escalated to this connection, you must:
 - Create a queue that contains the connection as a member.
 - Create an escalation rule with the appropriate criteria.
 - Add an escalation action that automatically assigns cases meeting the specified criteria to that queue

Other Tips

- If you want to connect to partners but aren't sure if they use Salesforce, you can use [connection finder](#) to find out.
- When you convert a lead, Salesforce to Salesforce inactivates the shared record and updates the External Sharing related list in your connection's lead record with an Inactive (converted) status. Due to inactivation of the shared record, changes to the Lead Status during conversion aren't reflected in your connection's lead record.

- To learn how to use workflows to automate updates to records and connections in Salesforce to Salesforce, see [Using Workflows in Salesforce to Salesforce](#).

Reporting in Salesforce to Salesforce

To track Salesforce to Salesforce activity and updates, create custom reports.

When it comes to using custom reporting to efficiently manage your Salesforce to Salesforce connections, the possibilities are endless! Here are some ways you might use custom reports in Salesforce to Salesforce:

- Create a custom report with the Connections with Accounts report type to track connection activity and other connection details. The report only displays connections that are associated with accounts.
- Create custom report types to view connection information for each of your published or subscribed objects.
- Create a custom report to view records that are shared with multiple connections. Alternatively, to view records shared with multiple connections in a list view, add the `Sent Connection Name` field to an existing or new view and verify that enhanced lists are disabled.
- Create a custom report with the Connections with Leads report type to view all leads that you shared with connections and that the connection then deleted.

Using Workflows in Salesforce to Salesforce

You can use workflow to automate updates to records and connections in Salesforce to Salesforce.

Workflow rules are only triggered for records shared in Salesforce to Salesforce when:

- You accept a parent record
- A child record is inserted
- You are subscribed to the fields that are configured to trigger the workflow rules

Some suggestions for criteria for workflow rules for Salesforce to Salesforce include:

- `Received Connection Name` field on leads, opportunities, and custom objects
- `Current User` equals `parent`
- `Last Modified By` field equals `Connection User`

For example, you can create a task for a user every time a connection updates a lead:

1. Create a workflow rule with the following criteria:
 - Evaluation criteria: `Evaluate the rule when a record is: created, and every time it's edited`
 - Run the rule when `criteria are met`.
 - Rule criteria: `"Lead: Last Modified By equals Connection User"`.

2. Add a workflow task.

You can use workflows for many Salesforce to Salesforce processes, including updating values on picklists when a connection has edited the field. When you accept a record, only the following fields trigger workflow rules:

 **Note:** If your organization is set up to automatically accept records, workflow rules are triggered by any field you subscribed to.

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

EDITIONS

Available in: Salesforce Classic

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Workflow is available in: **Enterprise, Performance, Unlimited, Developer,** and **Database.com** Editions

Object	Fields Triggering Workflows
Account	<ul style="list-style-type: none"> • Account Name • City • Country • Received Connection Name • Sent Connection Name • State • Type
Case	<ul style="list-style-type: none"> • Case Number • Priority • Status • Subject • Type
Contact	<ul style="list-style-type: none"> • Email • Last Name • Mailing Address • Phone • Title
Lead	<ul style="list-style-type: none"> • Company • Email • Industry • Lead • Lead Source • Name • No. of Employees • Phone • Received Connection Name • Sent Connection Name • State • Status • Title
Opportunity	<ul style="list-style-type: none"> • Account Name • Amount • Close Date • Name • Received Connection Name

Object	Fields Triggering Workflows
	<ul style="list-style-type: none"> • Sent Connection Name • Stage
Custom Object	<ul style="list-style-type: none"> • Connection Name • Name • Sent Date

All subsequent updates made to any fields on accepted records trigger workflow rules.

 **Note:** Sometimes it makes sense to use an Apex trigger instead of a workflow. Suppose that you have a workflow rule that updates a secondary field, **field B**, when **field A** is updated. Even if your Salesforce to Salesforce partner subscribed to fields A and B, updates to field B that are triggered by your workflow rule aren't sent to your partner's organization. This prevents a loop of updates.

If you want such secondary field updates to be sent to your Salesforce to Salesforce partners, replace the workflow with an Apex trigger that uses post-commit logic to update the secondary field.

 **Note:** In bi-directional connections, Salesforce to Salesforce updates are triggered back only on "after" triggers (for example, "after insert" or "after update"), not on "before" triggers.

Verifying Your Business Partners Use Salesforce

About Connection Finder

If your partners use Salesforce, it is beneficial to connect your Salesforce organizations so that you can share records and collaborate on relevant business processes. Before you can connect, you need to find out if your partners use Salesforce. Use Connection Finder to email your partners a link to a simple survey asking if they use Salesforce. Survey responses are recorded on the contact and account records for each partner. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

SEE ALSO:

- [Finding Out if Your Partners Use Salesforce](#)
- [Setting Up Connection Finder](#)
- [Tips and Additional Considerations for Connection Finder](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance, and Unlimited** Editions

Setting Up Connection Finder

Connection Finder allows you to email surveys to find out if your partners are Salesforce customers. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

To use connection finder, you must perform the following activities:

1. [Enable connection finder](#) in your organization.
2. [Configure connection finder settings](#).
3. Add the **Find Connections** button to the contacts list view by customizing the search layout. Add the button to the contact detail page by customizing the contacts page layout.
4. Add the `Uses Salesforce` field to the contacts page layout.
5. Add the `Salesforce Customer` field to the account page layout.

 **Note:** The `Uses Salesforce` and `Salesforce Customer` fields also appear on the contact and account records in any Customer Portal or partner portal you set up.

Enabling Connection Finder

To activate connection finder:

1. From Setup, enter *Connection Finder* in the `Quick Find` box, then select **Salesforce to Salesforce Connection Finder**.
2. Click **Edit**.
3. Select `Enabled`.
4. Click **Save**.

The connection finder settings are now available to configure. Additionally, the default email template and required related fields are created and available for use.

 **Note:** Disabling connection finder inactivates outstanding surveys and removes the **Find Connections** button. The `Uses Salesforce` and `Salesforce Customer` fields remain on contact and account records, respectively.

Configuring Connection Finder Settings

You can determine the content and look of the email you send to partners.

1. From Setup, enter *Connection Finder* in the `Quick Find` box, then select **Salesforce to Salesforce Connection Finder**.
2. Click **Edit**.
3. Select an email template.

The default connection finder template is automatically selected. You can also create custom email templates for your survey.

 **Note:** Custom email templates must contain the survey URL. `{!Contact.PartnerSurveyURL}` is available as a contact merge field when creating templates.

4. Optionally, select a logo using the lookup.

 **Note:** You must first upload your logo to the Documents tab and mark it as `Externally Available Image`.

Salesforce recommends adding a branded logo, as it appears at the top of the survey page. If no logo is selected, the logo portion of the survey page remains blank.

5. Click **Save**.

To enable Connection Finder and edit settings:

- "Modify All Data"

Finding Out if Your Partners Use Salesforce

If your partners use Salesforce, it is beneficial to connect your Salesforce organizations so that you can share records and collaborate on relevant business processes. Before you can connect, you need to find out if your partners use Salesforce. Use Connection Finder to email your partners a link to a simple survey asking if they use Salesforce. Survey responses are recorded on the contact and account records for each partner. Once you know a partner's status, you can invite them to connect using Salesforce to Salesforce.

1. In the Contact list view, select the partners you want to survey and click **Find Connections**. Alternatively, on a contact detail page, click **Find Connections**.

 **Note:** **Find Connections** doesn't appear if:

- The contact record doesn't have a valid email address
- The contact is not associated with an account

If the contact is a person account, **Find Connections** appears in the list view, but shows an error message if the user clicks the button. **Find Connections** does not appear on the contact detail page.

2. Enter a subject for the email.
3. Edit the body text, supplied by the default template, or click **Change Template** to choose a different email template.

 **Note:** The default email template is selected by your administrator. You can select a different template or edit the body text, however, you must include the survey URL: `{ !Contact . PartnerSurveyURL }`.

You cannot edit body text if you chose multiple recipients.

4. Click **Check Spelling** to spell check the body text.
5. Click **Preview** to see what your email will look like to the recipient.
6. Click **Send**.

The email is sent to the selected partners, who have 90 days to respond to the survey before the link becomes invalid. The partner's response is recorded in the `Uses Salesforce` field on the partner's contact record and the `Salesforce Customer` field on the account record. A closed activity is also added for the contact.

 **Tip:** Salesforce recommends creating a custom list view or custom report so that you can track customer responses in one convenient location.

If the partner's organization uses Salesforce, the survey displays a section asking if the recipient has administrator privileges for Salesforce. If not, the recipient can optionally provide their administrator's contact information and a new contact record is created in Salesforce for that user, unless one already exists.

 **Note:** This section doesn't appear if a contact for that partner, whose `Uses Salesforce` value is *Yes*, *admin user*, already exists in your organization.

EDITIONS

Available in: Salesforce Classic

Available in: **Group, Professional, Enterprise, Performance,** and **Unlimited** Editions

USER PERMISSIONS

To email partners asking if they use Salesforce:

- "Send Email" (single recipient)

OR

"Mass Email" (multiple recipients)

Tips and Additional Considerations for Connection Finder

- Create a custom list view or custom report to track your survey responses in one location. Add the `Uses Salesforce` field to contact list views and reports. Add the `Salesforce Customer` field to account list views and reports.
- Create translated versions of the default connection finder template to send to international partners. To do so, clone the default template, make the necessary language changes, and include the survey URL: `{ !Contact . PartnerSurveyURL }`. You can then choose the appropriate template when sending out requests to your partners.

 **Note:** The survey page is in English, but includes a `Language` drop-down so that recipients can view the survey in their native language.

- When creating validation rules for the `Uses Salesforce` field, use the API value, not the label seen in the user interface. For example:

```
CONTAINS (TEXT (UseSalesforce ), 'YesNotAdmin')
```

<code>Uses Salesforce</code> drop-down value	API value
No	No
No Response	NoResponse
Not Sure	NotSure
Yes, admin user	YesAdmin
Yes, not admin user	YesNotAdmin

- If a partner provides details for their Salesforce administrator, Salesforce checks to see if there is already a contact in your Salesforce organization with that email address. If so, the `Uses Salesforce` field on the contact record is set to *Yes, admin user*. If the field is already set to *No*, it is not updated.

 **Note:** A partner can only add an administrator if one does not already exist as a contact in your organization.

- The `Salesforce Customer` field is dependent upon the values in its contacts' `Uses Salesforce` field.

Participating in Social Networks from Within Salesforce

Salesforce for Twitter and Facebook Overview

Salesforce for Twitter and Facebook gives you an easy way to interact with customers and prospects in real-time on Twitter and Facebook, directly from within Salesforce.

Salesforce for Twitter and Facebook users can search, monitor, join, and respond to social media conversations that are relevant to your company, all from within Salesforce. Users can also:

- Find out what people are saying about your company now
- Create cases, contacts, and leads from Tweets and Facebook wall posts and comments
- Share information with Twitter and Facebook communities

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- Engage with millions of people sharing opinions, asking questions, and looking for help

You can enable Salesforce for Twitter and Facebook by downloading the free app from the [AppExchange](#). You can find more documentation from the Resources section of the app listing for Salesforce for Twitter and Facebook.

Collaborating with Partners to Increase Sales

Partners Overview

Partners are the companies with which you collaborate to close your sales deals. For each opportunity or account you create, the Partners related list allows you to store information about your partners and the roles they play in the opportunity or account. A partner must be an existing account within Salesforce.

If your organization has been enabled for partners, you can create partner accounts. Partner accounts are business accounts that a channel manager uses to manage partner organizations, partner users, and activities. They are completely separate from account partnerships that are displayed in the Partners related list on an account. For more information about partner portals, see [Partner Portal Overview](#) on page 1543.

 **Tip:** If your organization uses person accounts, you can use partner roles to relate person accounts to each other. For example, if you have individual person account records for several members of a household or family, then you can use partner roles such as “Spouse” or “Sibling” to associate those records.

Available in: **Group, Professional, Enterprise, Performance, Unlimited, and Developer** Editions for organizations activated after Summer '09

Viewing and Adding Partners

The opportunity and account detail pages include a Partners related list for viewing and adding partner relationships.

- To view account information for a specific partner, click the partner's name in the Partners related list.

If you do not have access to view and edit a partner account, the account name appears in the related list but you have no access to other information about that account.

- Click **Del** next to a partner to the partner relationship.

Note: If you change the account for an opportunity that has partners, all partners are deleted from the Partners related list.

- To add a partner to an opportunity or account:

- Click **New** in the Partners related list.
- For opportunities only, select the `Primary` option to indicate the primary partner for the opportunity, if applicable.

An opportunity can have only one primary partner. Setting a new primary partner automatically removes the "Primary" status from any existing primary partner.

Marking a partner as "Primary" allows you to report on the partner in all of the opportunity reports.

- In the `Partner` column, enter the name of an existing account by typing into the box or clicking the lookup icon to perform an account search. Alternatively, click **New** from the lookup dialog to create a new account.
- In the `Role` column, choose the role that the partner account plays in the current account or opportunity.

Note: Selecting a partner on an account or opportunity automatically creates a reverse partner relationship so that both accounts list the other as a partner. The role you select is applied to the partner account; in the current account, the reverse role is applied.

Your administrator sets the available roles and the corresponding reverse roles when editing the `Partner Role` picklist value.

Your administrator has the ability to customize the columns that display in the related list by editing the page layout. .

[Viewing and Adding Partners](#)

Sharing Information with Partners

Partner Portal Overview

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Partner relationship management allows companies to maximize the return on their channel investments and increase channel revenues by managing, tracking, and forecasting channel business alongside their direct sales business. It also helps partners sell more effectively, close more business, and achieve greater profits.

Empowering your partners with your Salesforce data can help you sell more without spending more. However, you want to control the information your partners can access, and you want your partners to work within an application that uses your company's branding. You can accomplish this by granting your partners access to a Salesforce partner portal.

A partner portal allows partner users to log in to Salesforce through a separate website than your non-partner users. Partner users can only see the data that you have made available to them. Furthermore, partner users can only manipulate data if you give them the appropriate user permissions.

You can customize the web portal to show your branding, and you can configure it to meet your functional and security needs, including enabling single sign-on for portals, so your partners have a single log in to access Salesforce. You can also have multiple portals to meet your different requirements for working with partners.

EDITIONS

Available in: **Salesforce Classic**

Available in: **Enterprise, Performance, Unlimited, and Developer** Editions

Creating Partner Accounts

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Partner accounts are Salesforce accounts that a channel manager uses to manage partner organizations, partner users, and activities when using the partner portal. Each company with which you partner should be added to Salesforce as a business account. Channel managers are associated with partner accounts by account ownership. A channel manager who owns a partner account can access all the information and manage all the activities of the partner account, including that of any partner user associated with the partner account. This allows the channel manager to easily keep up-to-date on partner activities.

 **Note:** The partner user role is a subordinate of the account owner's role, therefore, all data for the partner user role rolls up to the partner account owner's role. Keep in mind that if you disable a portal user, their partner user role becomes obsolete and their data no longer rolls up to the partner account role.

To create a partner account:

1. Create a new business account.
2. Click **Manage External Account** and then, click **Enable as Partner**.
3. A confirmation dialog will open. Select **Yes, I want to enable this account as a Partner Account**.
4. Click **Confirm**.

 **Note:** If your organization has person accounts, they cannot be used as partner accounts. Only business accounts can be used as partner accounts.

Once you have a partner account created, you can add partner users to the account as contact records. Partner users are Salesforce users with limited capabilities focused on managing leads. Partner users log in to Salesforce through the portal.

 **Note:** Partner accounts can't be deleted, but can be disabled.

SEE ALSO:

[Disabling Partner Accounts](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view accounts:

- "Read" on accounts

To create accounts:

- "Create" on accounts

To enable a partner account:

- "Manage External Users"

Disabling Partner Accounts

Disabling a partner account disables external users associated with the account. We recommend disabling a partner account only if the account was accidentally enabled for portal access.

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

You can't delete partner accounts, but you can disable them. Disabling the account permanently disables up to 15 external users associated with the account and removes them from all communities, groups, teams, permission sets, and sharing rules that they're associated with. This includes both active and inactive external users. Additionally, roles and groups associated with the account are permanently deleted and not moved to the Recycle Bin.

 **Note:** You can't disable an account if there are more than 15 active or inactive external users associated with it. You must disable the users before disabling the account.

1. Go to the Account detail page for the account you want to disable.
2. Click **Manage External Account**, then click either **Disable Partner Account**.
3. Click **OK** to confirm.

If you decide to enable the account in the future, you can re-enable individual contacts as partner portal users. Re-enabling a contact for a partner portal creates a new partner user and role that is not associated with the previous partner user and role. You can't restore deleted roles and groups.

[Creating Partner Accounts](#)

Working with Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Channel managers are associated with the partner users they manage by partner account ownership. A channel manager who owns a partner account can access all the information and manage all the activities of the partner users associated with that account.

Some common tasks when managing your partner users include:

- Creating a partner account
- Creating partner users
- Disabling and deactivating partner users
- [Assigning leads to partner users](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view accounts:

- "Read" on accounts

To create accounts:

- "Create" on accounts

To enable a partner account:

- "Manage External Users"

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- [Assigning events to partner users](#)
- [Assigning cases to partner users](#)
- Editing partner user information
- Tracking partner activity
- Giving partner users access to your knowledge base
- Enabling partner users to request meetings

In addition, here are some other ways you can work with your partner users:

Enable partner super user access

Partner super users have access to data owned by all partner users and partner super users in the same role and those below them in the portal account hierarchy, even if the organization-wide default setting is Private. Partner super user access applies to cases, leads, custom objects, and opportunities only.

Assign tasks to partner users

If your partner users have the appropriate field-level security settings, they can view and create activities related to leads or opportunities.

Add tasks to leads or opportunities to remind your partner users of particular tasks you would like them to perform. You can view the activity history for a particular lead or opportunity, or use reports to track activities assigned to partner users.

Partner users can only assign tasks to other users in their partner account or to their channel manager.

Use notes and attachments to communicate with partner users

Partner users can create, view, and edit notes and add attachments from the Notes and Attachments related list on selected detail pages, including lead, solution, and opportunity detail pages. You can use notes and attachments to share documents or information with partner users. If Chatter is enabled for your organization, feed attachments are included in the Notes and Attachments related list. Portal users can download feed attachments, but can't preview, edit, or delete them.

The size limit for an attached file is 5 MB.

Click Log in to Portal as User to troubleshoot

When you view the contact detail page for a partner user, you can click **Manage External User**, then **Log in to Portal as User**. This opens a new browser window and logs you into the portal as the partner user. Click this button to troubleshoot any issues partner users are experiencing. You may also click this button to ensure that your portal is configured appropriately. The **Log in to Portal as User** button is only available if you have the "Manage External Users" permission and one of the following: the "Modify All Data" permission or you are the partner account owner or higher in the role hierarchy. The **Log in to Portal as User** button does not display if you do not meet these requirements, or if the portal user is inactive.

Reset a partner user's password

When you view the user detail page for a partner user, you can click **Reset Password** to reset the partner user's password.

Partner users can reset their own password by clicking **Forgot Password?** on the partner portal login page.

Expose a solution in the portal

Select `Visible in Self-Service Portal` on the solution.

Add products to opportunities

If the Products related list is available to partner users on opportunities, then you can add products to the opportunities for your partners.

SEE ALSO:

[Managing Partner Users](#)

Assigning Leads to Partner Users

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

A vital piece of partner relationship management is lead assignment. Your partners can only work with leads that are assigned to them. There are two ways to handle lead assignment for partner users:

- Assign each lead to an individual partner user
- Assign leads to a lead queue and allow partner users to claim leads from the queue

In addition, you can create lead assignment rules that automatically assign leads to partner users or queues based on certain properties of those leads.

 **Note:** Assignment rules cannot be triggered by actions in the portal.

Assigning a lead to a partner user or partner lead queue is just like assigning a lead to any other user or queue.

Leads assigned directly to a user or a queue that is not part of the lead pool are shown on the portal Leads tab. The partner user can see these by selecting an appropriate list view. Until a partner user has reviewed a lead, it displays in bold, and is in the My Unread Leads list view.

If a lead is assigned to a queue that is in the lead pool, the lead displays in the [Available Leads list](#) on the Home tab of the portal.

 **Tip:** Assign partner leads to a single partner user (for example, a sales manager) in the partner account to enable that person to manage lead assignment for the partner users in that account.

Using Calendars in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

If you have added the calendar to the Home page layout for partner portal users, you can assign events to them, and partner portal users with the "Edit Events" permission can create and edit their own events. Note that the following event and calendar features are not supported in the partner portal: spell check, event updates, enhanced list views, drag-and-drop scheduling, calendar sharing, and hover details.

 **Note:** A partner user can only see calendars shared by:

- Other partner users assigned to the same account
- The channel manager for their account

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To assign leads to partners:

- "Edit" on leads

Assigning Cases in the Partner Portal

 **Note:** Starting in Summer '13, the partner portal is no longer available for organizations that aren't currently using it. Existing organizations continue to have full access. If you don't have a partner portal, but want to easily share records and information with your partners, try Communities.

Existing organizations using partner portals may continue to use their partner portals or transition to Communities. Contact your Salesforce Account Executive for more information.

Before you can assign cases to partner portal users, you must [configure cases for partner users](#). In addition to the required user permissions for this feature, you must have access to view the cases you're updating.

To assign a case to a partner user:

1. On the case detail page, click **[Change]** next to the `Case Owner` field.
2. Select Partner User from the Owner drop-down list and enter the name of the partner user.
3. Optionally, select the `Send Notification Email` checkbox to send an email to the new owner.
4. Click **Save**.

The partner user will be able to view and edit the case from the partner portal.

 **Note:** Case comments added by partner portal users are public and can be viewed by any user that can view the case.

You can also create case assignment rules and escalation rules that automatically assign cases to partner users or queues based on certain properties of those cases.

Sharing Information with Partners FAQs

Can I enable Salesforce for my Partners?

Yes, you can use Communities to connect with your partners and share appropriate Salesforce data.

You can customize communities to meet your business needs, including:

- Choosing which members from your company and which partners can join
- Selecting which Salesforce features to include
- Applying your company's branding so that the community is recognizable
- Enabling your employees and partners to collaborate on Chatter and business processes (records)
- Enabling login options based on SAML for single sign-on for people outside your company
- Enabling users to self register for a community so that the administrator isn't responsible for adding users

To get started using Communities, contact your Salesforce Account Executive.

Can I share my Salesforce data with other organizations that also use Salesforce?

Yes.

Salesforce to Salesforce enables business collaboration both within and across Salesforce organizations. For example, you can share lead and opportunity data with business partners and manage your entire pipeline and programs within Salesforce.

Using Salesforce-Integrated Email

Email Management

Salesforce offers several ways for you to manage email and increase productivity. Manage emails and templates. Relate emails to Salesforce records. To make sure that you get the information you're looking for, learn about each type, and then explore further.

EDITIONS

Available in all editions

[Manage Email and Templates in Lightning Experience](#)

If you're using Lightning Experience, you can email contacts, leads, and your own colleagues directly from account, person account, contact, lead, opportunity, campaign, and case records you have access to. Or send to any valid email address. Attach files. Automate with merge fields. Use a template if you want to: either choose from the samples we offer or create your own. Templates are shared automatically with your organization.

[Manage Email in Salesforce Classic](#)

If you're using Salesforce Classic, use Email Author to email your contacts, leads, person accounts, and coworkers directly from account, contact, lead, opportunity, case, campaign, or custom object pages.

[Experience Salesforce in Microsoft® Email Applications](#)

Relate important Microsoft emails to Salesforce records, such as contacts, leads, and opportunities. And see related Salesforce content directly in your Microsoft email applications.

[Relate Emails to Salesforce Records with Email to Salesforce](#)

Relate emails to leads, contacts, and opportunities or to other specific records in Salesforce. That way, it's easy to track your sales-related communications.

Manage Email and Templates in Lightning Experience

If you're using Lightning Experience, you can email contacts, leads, and your own colleagues directly from account, person account, contact, lead, opportunity, campaign, and case records you have access to. Or send to any valid email address. Attach files. Automate with merge fields. Use a template if you want to: either choose from the samples we offer or create your own. Templates are shared automatically with your organization.

[Access and Sharing for Email Merge Fields, Templates, and Attachments](#)

Using integrated email in Lightning Experience? It's important to understand how access and sharing work for merge fields, templates, and attachments.

[Send Email from a Record](#)

Send rich-text email, including attachments, directly from the record you're on. Send to customers, colleagues, or any valid email address. Email is available for a number of items, including accounts, person accounts, contacts, leads, opportunities, campaigns, and cases. When you send an email, Salesforce creates an email record to track the email and store its content. Find a link to the email record in the Activity feed of the record the email was sent from or on related records.

[Find Email Sent from a Salesforce Record](#)

After you send an email, Salesforce creates an email record to track the email and store its content. The activity feed includes a link to that email. If you sent email to a contact or lead, each of those records includes a link to the email. For emails that *don't* include any contacts or leads as recipients, the email and the feed item are created for the object you were on when you sent the email. If you use Automatic BCC, as defined in your email settings, you receive a copy of the email in the inbox of your specified return address.

[Send Email through Gmail or Office 365](#)

Send your Salesforce email through your Gmail or Office 365 account. Emails sent in Lightning Experience look like they were sent from your Gmail or Office 365 inbox. You can also see the emails you've sent in your Gmail or Office 365 Sent Items folder.

[Create a Template to Standardize Common Emails](#)

Create email templates to save time and standardize email sent by you or others in your organization. Use merge fields if you need them. Your page layout and field-level security settings determine which fields are available for merging. Templates you create are automatically public: they're available for use by others in your organization.

[Use a Template to Standardize Email You Send](#)

Use a template to save time and standardize email you send. You can create your own or use templates created by others in your organization. Or use one of the samples Salesforce provides. If you select a template that has attached files, you need file access to include them in emails you send from that template. If you need file access, we'll let you know.

Access and Sharing for Email Merge Fields, Templates, and Attachments

Using integrated email in Lightning Experience? It's important to understand how access and sharing work for merge fields, templates, and attachments.

Merge Fields

Merge fields are available from the Account, Contact, Opportunity, Lead, Campaign, Case, and User objects, as well as from the Person Account record type. From those items, most commonly used standard fields (and some custom fields) are available as merge fields. From that set of fields, some fields may not be available to individual users because of field-level security settings. Contact merge fields are not available for person accounts.

Templates

- Templates created in Salesforce Classic can't be used in Lightning Experience, and vice versa.
- Templates created from one object are available for that object only. For example, a template created for leads isn't available for selection from an opportunity record.
- Templates you create are automatically public: they're available for use by others in your organization.

Attachments

- Salesforce Files and Content Deliveries must be enabled before you can select and attach files from Salesforce Files. If these features are not enabled, users will be able to upload attachments only.
- Any attachment larger than 3 MB is sent as a content delivery link, not as a file. For emails with multiple attachments, if the aggregate size of all attachments is greater than 3 MB, then *all* attachments are sent as content delivery links.
- If you don't have access to a file, you can't attach it to an email or a template. We let you know if you need access, so you can ask the file's owner.
- Access becomes public, via the link, for files attached to emails from Salesforce Files. Public access allows anyone with the link to view, share, and download the file.

Send Email from a Record

Send rich-text email, including attachments, directly from the record you're on. Send to customers, colleagues, or any valid email address. Email is available for a number of items, including accounts, person accounts, contacts, leads, opportunities, campaigns, and cases. When you send an email, Salesforce creates an email record to track the email and store its content. Find a link to the email record in the Activity feed of the record the email was sent from or on related records.

 **Note:** If your company doesn't have Enhanced Email enabled, Salesforce creates a task record instead of the email record. If you're unsure whether you have Enhanced Email enabled, talk to your administrator.

To attach files to an email or use a template with attached files, you need file access. If you don't have access, we'll let you know.

1. Open the record from which you want to send the email.
2. Click the Activity tab and then click **Email**.

 **Tip:** If you prefer to compose from a window, click the arrow button to pop out your email. While the composer window is active, you can scroll the record page to view details and other information or navigate anywhere else in Salesforce.

3. Write your email. If the recipient has opted out of receiving mass email or previous emails to the address have bounced, you'll see an indicator next to their name.
4. Add attachments if you need to.
5. Preview and send.

You'll find a link to the email in the activity feed under Past Activity. You can also find a link in the activity timeline on related records. If you use Automatic BCC, as defined in your email settings, you'll receive a copy of the email in the inbox of your specified return address.

 **Example:** Jane is working a deal, or opportunity, to sell 600 widgets to Acme Corporation. The contact for Acme is John Stamos and the opportunity record is Acme 600 Widgets. Jane needs to send an email to John, including a term sheet, and she wants that email associated with the 600 widgets opportunity record. It's also handy to have the email available from John's contact record. Jane opens the Acme 600 Widgets record and writes the email, attaching the term sheet. After she sends the email, she can find a link to the email on the Acme 600 Widget opportunity record and the John Stamos contact record.

USER PERMISSIONS

To send email:

- "Send Email" permission and access to the record the email is sent from.

To attach files to email or templates:

- Access to the file you're attaching.

Find Email Sent from a Salesforce Record

After you send an email, Salesforce creates an email record to track the email and store its content. The activity feed includes a link to that email. If you sent email to a contact or lead, each of those records includes a link to the email. For emails that *don't* include any contacts or leads as recipients, the email and the feed item are created for the object you were on when you sent the email. If you use Automatic BCC, as defined in your email settings, you receive a copy of the email in the inbox of your specified return address.

 **Note:** If your company does not have Enhanced Email enabled, Salesforce saves sent emails as task records instead of email records. You find the task records the same way you would find email records. If you are unsure of whether your company uses Enhanced Email, speak with your administrator.

1. Open either the record that was originally open when you wrote the email or the record for the contact or lead you sent it to.
2. To find the email in Past Activity, click the Activity tab.
3. To open its task record, where you can view the message and related details, click the email link. And if you use Automatic BCC, you can find the sent email in your inbox.

Send Email through Gmail or Office 365

Send your Salesforce email through your Gmail or Office 365 account. Emails sent in Lightning Experience look like they were sent from your Gmail or Office 365 inbox. You can also see the emails you've sent in your Gmail or Office 365 Sent Items folder.

Emails sent through workflows and triggers are still sent through Salesforce. Also, bounce management isn't supported when you send through external email accounts.

1. From your personal settings, enter *My Email Settings* in the **Quick Find** box, and select **My Email Settings**.
2. Select how you'd like to send your email.
Your Salesforce admin can enable either Gmail or Office 365 for your org. You can't choose between the two.
3. Click **Save**.

Create a Template to Standardize Common Emails

Create email templates to save time and standardize email sent by you or others in your organization. Use merge fields if you need them. Your page layout and field-level security settings determine which fields are available for merging. Templates you create are automatically public: they're available for use by others in your organization.

Templates created from one object are available for that object only. For example, a template created for leads isn't available for use from an opportunity record.

 **Tip:** Found a great template that needs updates or modifications? Select that template, then edit and save. If you want to keep the original, save your changed version as a new template.

1. Open a record, such as an opportunity or account, that offers email.
2. Click the Activity tab, then click the Email tab.
3. Compose the email to use as your template. Templates can include all the features of other email: rich text, merge fields, and attachments. If you need to navigate the record or other Salesforce pages as you work, pop out the composer window.
4. Click the Templates icon and then save the template as new.

Use a Template to Standardize Email You Send

Use a template to save time and standardize email you send. You can create your own or use templates created by others in your organization. Or use one of the samples Salesforce provides. If you select a template that has attached files, you need file access to include them in emails you send from that template. If you need file access, we'll let you know.

1. Open the record from which you want to send email.
2. Click the Activity tab, then click the Email tab.
3. To insert a template, click the Templates icon. Select the template you want and its contents appear. Edit your email as needed, then preview and send!

- "Send Email"

Send Mass Email in Salesforce Classic

Send an email to a group of contacts, leads, person accounts, or coworkers all at the same time! Email a list of contacts, leads, or person accounts for small-scale sales or support. Mass email is intended to facilitate your business processes, not to replace your email application or handle mass-marketing campaigns.

Watch a Demo: [▶ Sending Mass Email](#)

1. Depending on who the recipients of your mass email are, do one of the following.

For contacts or person accounts

On the Contacts or Cases tab, in the Tools section at the bottom of the page, click **Mass Email Contacts**. If your Salesforce org has person accounts, the link also appears on the Accounts tab.

For leads

On the Leads tab, in the Tools section at the bottom of the page, click **Mass Email Leads**.

For coworkers (other Salesforce users)

If you have the "Manage Users" permission, from Setup, enter *Mass Email Users* in the Quick Find box, then select **Mass Email Users**.

2. Select a list view of recipients, and then click **Go!**
3. All recipients in the list view are selected by default. To remove recipients, deselect them.
4. Click **Next**.
5. Choose an email template.
6. To view the templates, click the **Preview** links.
7. Click **Next**.
8. On the confirmation page, select the processing options to use. The mass email name that you specify appears in the queue and status messages that you receive from Salesforce, not in the email that you're sending.
9. In Delivery Options, send the email, or choose a date and time zone for sending the email in the future.
10. Click **Send**, and then click **Finished**.

Considerations for Sending Email in Salesforce Classic

Before you send email, consider a few key points.

General

- You can enter only one name in the To field.
- You can include a signature in text emails only.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer Editions**

USER PERMISSIONS

To send mass emails to contacts, person accounts, or leads:

- "Mass Email"

To send mass emails to coworkers:

- "Mass Email"

AND

"Manage Users"

To send mass emails and log them in the Activity History related list:

- "Mass Email"

AND

"Edit Tasks"

EDITIONS

Available in: Salesforce Classic

Available in all editions

Email Templates

- When authoring an email, you can choose a predefined template for the message. To personalize your message, you can include merge fields that are replaced with information from the Salesforce record when the email is sent. For example, your company can use a standard template to communicate solution information to customers with cases. Your Salesforce admin can maintain company-wide templates, and you can maintain your own templates.
- Email templates give you access only to the fields that are accessible to you via your page layout and field-level security settings. (Field-level security is available in Professional, Enterprise, Unlimited, Performance, and Developer Editions.)
- If your template contains a merge field for which no data exists in a particular record, that field doesn't appear in the email that you send. To find such blank fields, modify your recipient list view to search for the merge fields that you're using in your template. Then enter the criterion "<field> equals," leaving the third field blank. Edit those records that have blank fields before you send email.
- If you modify an email template, your changes affect the HTML version of the template.
- You can't modify custom email templates.

Tracking Email

To track email that you sent, use HTML formatting when authoring. Also make sure that your Salesforce admin has added the HTML Email Status related list to your contact, lead, and person account pages.

Guidelines for Sending Email in Salesforce Classic

Review additional information about sending email, including general functions, tracking email, and adding attachments.

EDITIONS

Available in: Salesforce Classic

Available in all editions

General

Who Can Send

Anyone with access to view or edit a record can send email related to the record.

Addresses

For contacts and leads that have multiple email fields, you can select an email address.

Use a semicolon, comma, space, or line to separate multiple email addresses in the **Additional To**, **CC**, and **BCC** fields.

If bounce management is activated and an email bounces, Salesforce displays an error message. To update the email address and send the email to the updated address, click the link in the error message.

Associating Records

When authoring an email, you can choose another record, such as an account, case, or custom object, to associate with the email.

Where Sent Email Appears

Emails that are sent via **Send an Email** appear in the Activity History list of the related records. The Activity History item is titled "Email: *subject*." Click the email subject to view the body of the email.

 **Note:** On lead records, if the sender leaves the **To** field blank, the email doesn't appear in the activity history.

For Salesforce orgs with Email-to-Case or On-Demand Email-to-Case enabled, emails that are sent from the Email related list of a case are saved in the Email related list.

Tracking

HTML Formatting

The HTML Email Status related list shows the date when an email was first opened, the number of times that it was opened, and the date when it was most recently opened.

The HTML Email Status related list includes automatic emails such as those sent through Web-to-Lead and Web-to-Case response rules.

Reporting

To report on the statistics in the HTML Email Status related list, use the HTML Email Status Report that's available from the Reports tab.

Attachments

File Size

You can attach multiple files to an email as long as the total size of all attached files doesn't exceed 10 MB.

If the combined file size of attachments to an email exceeds 3 MB, or if you use mass email, Salesforce sends multiple links. For example, if you send two attachments, each of which is 1.7 MB, the recipient receives two links.

Saving

To save an attachment that was sent with an email, associate the attachment with the email later, or send the email with the attachment to Salesforce via Email-to-Case, Email-to-Salesforce, On-Demand Email-to-Case, or Salesforce for Outlook.

Attachments that are sent as links are stored for 30 days.

SEE ALSO:

[Send Email in Salesforce Classic](#)

[Send Mass Email in Salesforce Classic](#)

Considerations for Sending Mass Email

Before you send mass email, consider a few key points.

- You can send a mass email to a recipient list that consists of contacts, leads, person accounts, or users that you can view in Salesforce.
- If a standard email field is hidden via field-level security, the Mass Email links for contacts and leads don't appear.
- Mass email can be sent to an address in a standard email field. Mass email with a custom email field isn't supported.
- Before you send a mass email, create a custom view of contacts, leads, person accounts, or cases without an email address. In the search criteria, choose "Email equals," and leave the third field blank. You can then update those records before sending your emails. You can't validate an email address without sending an email message.
- You can't send a mass email using a Visualforce email template.
- Attachments in mass emails are sent as links rather than as physical files. When recipients click the attachment link in the email, the attachment opens in a separate browser window, and they can download the file. Attachments are stored for 30 days.
-  **Note:** The addressed and sent-to numbers in mass email status messages differ in the following situations.
 - The mass email would cause your organization to exceed its daily mass email limit. Salesforce does not send the message to any of the intended recipients in this case.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

- One or more selected recipients opted out of receiving mass email after the mass email was scheduled but before it was processed.
- One or more selected recipient email addresses were removed from the contact or lead after the mass email was scheduled but before it was processed.
- The user who sent the mass email was deactivated after the mass email was scheduled but before it was processed. Salesforce does not send mass emails scheduled by a user who is deactivated.

Guidelines for Sending Mass Email

If you're sending mass email, refer to these guidelines for additional information.

- By default, the My Contacts, My Leads, Active Users, or My Cases views include all records with an email address. To change the list of recipients, create a custom view. If the record contains no email address, or `Email Opt Out` is selected, a contact, lead, or person account isn't included in any email list views. Person accounts are included in contact list views.
- In the email template preview window, the template displays any merge fields included in it, such as `{!Account.AccountNumber}`. When you send your email, data from the recipients' records, or any applicable substitute text, is inserted into the email in place of those merge fields.
- When `Store an activity for each message` is selected (default), the Activity History item is associated with the contact, lead, or person account and is displayed as "Mass Email:<Template Description>." The email subject, body, and attachments aren't stored in the Activity History item. Logging Activity History items requires access for viewing or editing the records in the recipient list and the "Edit Task" permission.
- If the email deliverability option `Notify sender when mass email completes` is selected, you receive an auto-generated status email from Salesforce for each mass email that you send. The subject line of the status email contains the value that you entered in the `Mass Email Name` field when sending the mass email.
- To view and cancel mass emails that you've scheduled, from your personal settings, enter `Mass Emails` in the `Quick Find` box, then select **Mass Emails** or **My Mass Emails**.

To view and cancel mass emails that anyone in your company scheduled, if you have the "Manage Users" permission, from Setup, enter `Mass Emails` in the `Quick Find` box, then select **Mass Emails**.

Experience Salesforce in Microsoft® Email Applications

Relate important Microsoft emails to Salesforce records, such as contacts, leads, and opportunities. And see related Salesforce content directly in your Microsoft email applications.

Team up with your Salesforce administrator to choose between our cloud- and desktop-based Microsoft integration products.

Cloud-Based Lightning for Outlook

Stay on top of important sales opportunities when you work in Microsoft® Outlook®. When using Outlook Web App (OWA), Outlook 2016, or Outlook 2013 along with Microsoft Office 365™, manage your sales more efficiently. Relate email and events along with their attachments to Salesforce records—all without installing and maintaining software. And sync contacts and events between your email applications and Salesforce using Lightning Sync.

Desktop-Based Salesforce for Outlook

Sync contacts, events, and tasks between your desktop-based version of Outlook and Salesforce. Select an email in Outlook to see related Salesforce records, like leads, contacts, tasks, and opportunities. And relate that email to the Salesforce records of your choice.

Cloud-Based Lightning for Outlook

Stay on top of important sales opportunities when you work in Microsoft® Outlook®. When using Outlook Web App (OWA), Outlook 2016, or Outlook 2013 along with Microsoft Office 365™, manage your sales more efficiently. Relate email and events along with their attachments to Salesforce records—all without installing and maintaining software. And sync contacts and events between your email applications and Salesforce using Lightning Sync.

Also, create Salesforce contacts, events, leads, opportunities, tasks, and cases—directly in Outlook.

Lightning for Outlook

Stay on top of important sales opportunities when you work in Outlook. When using Outlook® Web App (OWA), Outlook 2016, or Outlook 2013 along with Microsoft Office 365™, you can manage your sales more efficiently. Relate email and attachments to Salesforce records. And, create Salesforce records—directly in Outlook.

Lightning Sync Keeps Your Microsoft® Items in Sync with Salesforce

Keep your contacts and events in sync between your email system and Salesforce without installing and maintaining software.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Lightning for Outlook

Stay on top of important sales opportunities when you work in Outlook. When using Outlook® Web App (OWA), Outlook 2016, or Outlook 2013 along with Microsoft Office 365™, you can manage your sales more efficiently. Relate email and attachments to Salesforce records. And, create Salesforce records—directly in Outlook.

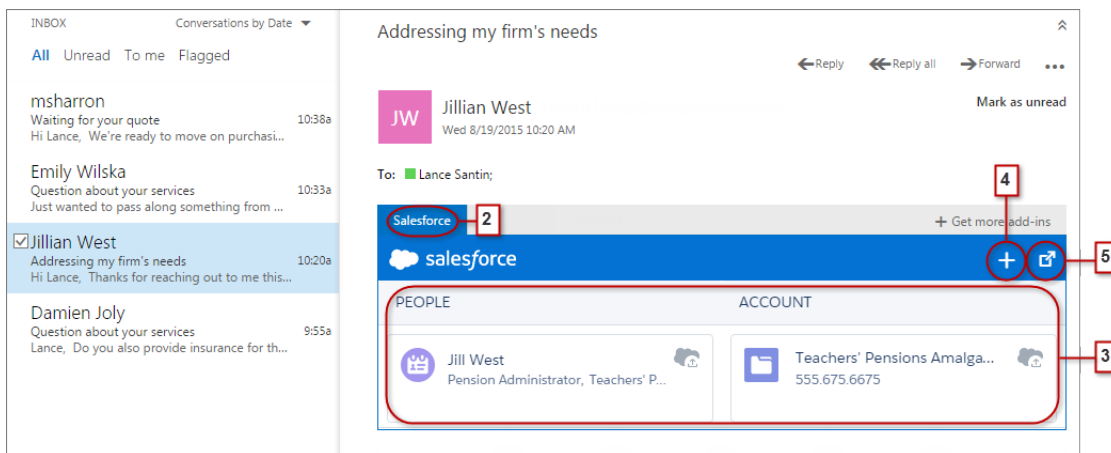

After your administrator enables Lightning for Outlook, you complete one-time procedures to get your Salesforce content to appear in your email application.

Then, when you select an email (1) or event and select **Salesforce** (2), you see relevant sales-related records (3). For the records that appear, you can add the email or event to multiple contacts—provided your administrator enabled Shared Activities. Also add the email or event to one other record that accepts tasks, like an opportunity, a lead, or a case. You choose whether to include the attachments.

EDITIONS

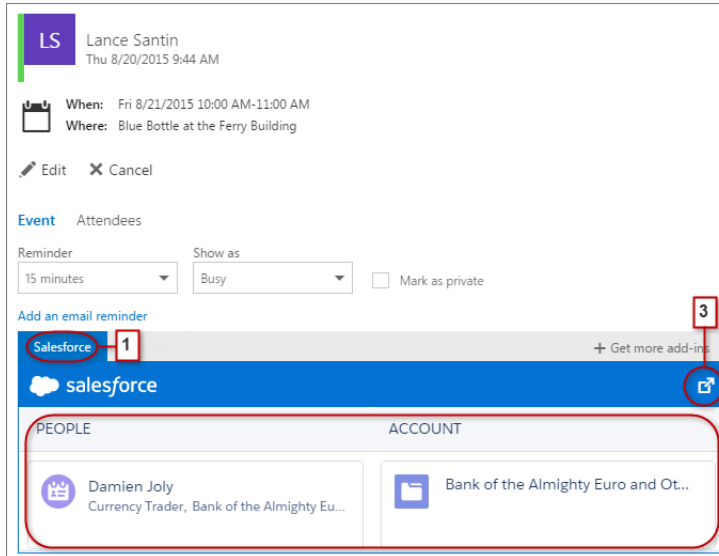

Available in: Salesforce Classic and Lightning Experience

Available in: **Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Select the record to see more details about it in your email application. Or get complete details about the record or the email added to it directly in Salesforce (4).

As an attendee to events in Microsoft calendars, you see relevant Salesforce records. First, open an event in your Microsoft email application. Then, select Salesforce (1).

Relevant Salesforce records appear (2). And like when you work with emails, you can select a record to see more details in your email application. Or, you can get complete details about the record directly in Salesforce (3).

As an event organizer, you can see a different view of relevant Salesforce records. After you open an event you've organized, select **Add-ins > Salesforce**. Relevant records appear in the right pane.

[Lightning for Outlook System Requirements](#)

Make sure that your system meets these requirements before you set up Lightning for Outlook.

[Set Up Microsoft® Outlook® to Experience Salesforce](#)

Get your system ready to relate email, its attachments, and events to Salesforce records from Outlook Web App (OWA), Outlook 2016, or Outlook 2013. Create Salesforce records—all while you're working in Outlook.

[Experience Salesforce in Microsoft® Outlook®](#)

Keep your opportunities on track when you access sales-related records in Microsoft Outlook Web App (OWA), Outlook 2016, and Outlook 2013, along with Office 365™.

Lightning Sync Keeps Your Microsoft® Items in Sync with Salesforce

Keep your contacts and events in sync between your email system and Salesforce without installing and maintaining software.

Your productivity increases when your administrator sets up your company to sync contacts and events between your email server and Salesforce. That's because there's no need for you to duplicate your work between the two systems. Lightning Sync can sync contacts and events you create and maintain, whether you're at your desk or working remotely from your mobile device.

Depending on the settings your administrator selected, Lightning Sync automatically syncs contacts between your company's email system and Salesforce in both directions, or one direction. In addition, Lightning Sync can sync events in one direction, from your Exchange-based calendar system to Salesforce.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Your administrator can select more settings to define your sync experience. Ask your administrator about how you're set up to sync in these cases:

- Are you syncing all calendar events or only the events you relate to Salesforce using [Lightning for Outlook?](#)
- Are you syncing private events?
- Are events you delete from your calendar automatically removed from Salesforce?

Lightning Sync Limitations

Currently, Lightning Sync doesn't:

- Sync events from Salesforce to Exchange
- Sync recurring events
- Sync invitees included in events
- Delete syncing contacts in one action
- Support Platform Encryption

[Get Ready to Sync Events](#)

You can choose which events sync from your company's calendar application to Salesforce.

[Get Ready to Sync Contacts](#)

Learn how to sync contacts between your company email system and Salesforce. Depending on which direction you're syncing, you'll move the email contacts you want to sync with Salesforce to a special folder in your email application.

[Fix Sync Issues](#)

If you have trouble syncing between Microsoft® Exchange and Salesforce, you can have your Salesforce administrator reset your sync process to clear out and then restore the connections between the records in your email and calendar application, and your records in Salesforce.

SEE ALSO:

[Lightning Sync Setup Guide \(for Users\)](#)

[Get Ready to Sync Contacts](#)

[Get Ready to Sync Events](#)

[Fix Sync Issues](#)

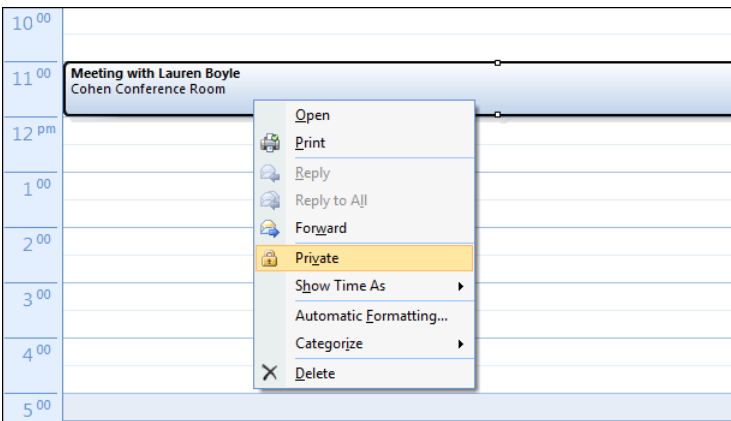

Get Ready to Sync Events

You can choose which events sync from your company’s calendar application to Salesforce.

If your administrator has set up Salesforce to sync events, your events sync automatically from the calendar in your company’s email system to Salesforce.

You can prevent personal events from syncing with Salesforce in different ways.

- Create a separate calendar in your calendar application to keep track of your personal events. (Lightning Sync is designed to sync only your main Exchange account calendar to Salesforce.)
- Ask your admin if your sync configuration is set up to sync private events. If you’re not syncing private events, you can assign your personal events with the `Private` option in your calendar application, and those events won’t sync with Salesforce.

It’s best if you manage the events you don’t want to sync before your administrator initiates sync for the first time. If your events begin syncing before you manage them, you can still remove them from Salesforce by deleting them manually.

Other events sync from your calendar to Salesforce every few minutes. If you’re syncing a lot of events, your first sync might take some time.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To sync events from Exchange to Salesforce:

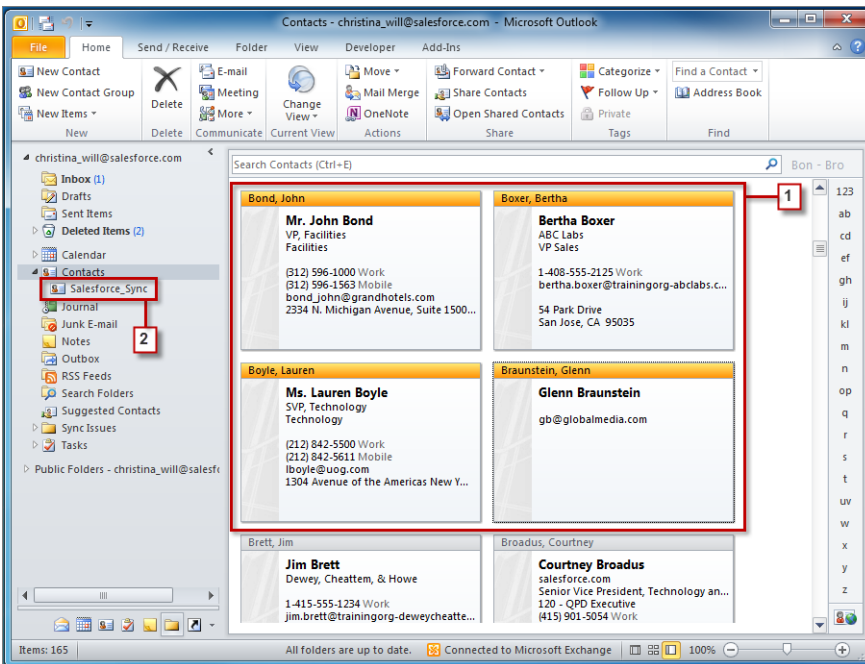

- “Create” on events, AND
Event sync direction set to “Exchange to Salesforce” in Exchange configurations

Get Ready to Sync Contacts

Learn how to sync contacts between your company email system and Salesforce. Depending on which direction you're syncing, you'll move the email contacts you want to sync with Salesforce to a special folder in your email application.

After your administrator initiates contacts sync for you, Lightning Sync creates a folder in your email application called `Salesforce_Sync`. You can find the `Salesforce_Sync` folder under your contacts directory. Any contacts that have synced from Salesforce to your email system are in `Salesforce_Sync`. Don't rename, move, or delete the `Salesforce_Sync` folder, or syncing between Salesforce and your email system stops.

1. Ask your administrator which direction you're set up to sync.
 - If you're set up to sync from Salesforce to your email only, syncing is already in progress, and you don't need to do anything else. You're ready to access your Salesforce contacts directly from your email system!
 - If you're set up to sync from your email to Salesforce or to sync both ways, you'll move the email contacts you want to sync to Salesforce now.
2. In your email application, select the contacts you want to sync. You can select multiple contacts at a time.

3. Move—do not copy—your selected contacts to the folder `Salesforce_Sync`. If you copy your contacts, you'll have duplicate ones, which is a hassle!

The contacts you move to the `Salesforce_Sync` folder begin to sync every few minutes. If you move a lot of contacts to `Salesforce_Sync`, your first sync might take some time.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To sync contacts both ways:

- "Read" and "Edit" on contacts, and "Read" on accounts, AND

Contact sync direction set to "Sync both ways" in Exchange configurations

To sync contacts from Salesforce to Exchange:

- "Read" on contacts, AND

Contact sync direction set to "Salesforce to Exchange" in Exchange configurations

To sync contacts from Exchange to Salesforce:

- "Create" on contacts, AND

Contact sync direction set to "Exchange to Salesforce"

Fix Sync Issues

If you have trouble syncing between Microsoft® Exchange and Salesforce, you can have your Salesforce administrator reset your sync process to clear out and then restore the connections between the records in your email and calendar application, and your records in Salesforce.

1. To reset sync for your contacts, make sure your `SALESFORCE_SYNC` folder in your email application contains only the contacts you want to sync with Salesforce.
2. To reset sync for your events, make sure the events that you don't want to sync are assigned the `Private` option in your calendar application.
3. Ask your Salesforce administrator to reset your sync process.

Desktop-Based Salesforce for Outlook

Sync contacts, events, and tasks between your desktop-based version of Outlook and Salesforce. Select an email in Outlook to see related Salesforce records, like leads, contacts, tasks, and opportunities. And relate that email to the Salesforce records of your choice.

Watch a Demo: [▶ Getting Started with Salesforce for Outlook](#)

Salesforce for Outlook, a Microsoft® Outlook® integration application that you install, syncs contacts, events, and tasks between Outlook and Salesforce. In addition to syncing these items, you can add Outlook emails, attachments, events, and tasks to multiple Salesforce contacts, and view Salesforce records related to the contacts and leads in your emails and events—all directly in Outlook.

You may be able to customize what you sync and the sync directions between Outlook and Salesforce. Your administrator determines the level at which you can customize these settings in Salesforce.

Here's a quick look at how Salesforce for Outlook helps you avoid duplicating your work and boost your productivity.

- Thai
- Vietnamese

Download the Salesforce for Outlook Installer

Download the installer from Salesforce.

1. Close Microsoft® Outlook®.
2. Close Salesforce for Outlook. To do so, right-click the Salesforce for Outlook icon (📧) in your system tray, and then click **Exit**.
3. If you're upgrading from Salesforce for Outlook v2.4.2 or earlier, uninstall your current version from the Microsoft Windows® Control Panel. If you're upgrading from Salesforce for Outlook v2.5.0. or later, or installing Salesforce for Outlook for the first time, continue to the next step.
4. From your personal settings, enter *Salesforce for Outlook* in the Quick Find box, then select **Salesforce for Outlook**.
5. Click **Download**. Then click **Save File**. If the **Download** button is unavailable, ask your administrator to assign you to an Outlook configuration.

If you're an administrator, deploy installations to multiple users simultaneously using the .msi version of the installer.

Available in all editions

USER PERMISSIONS

To install Salesforce for Outlook:

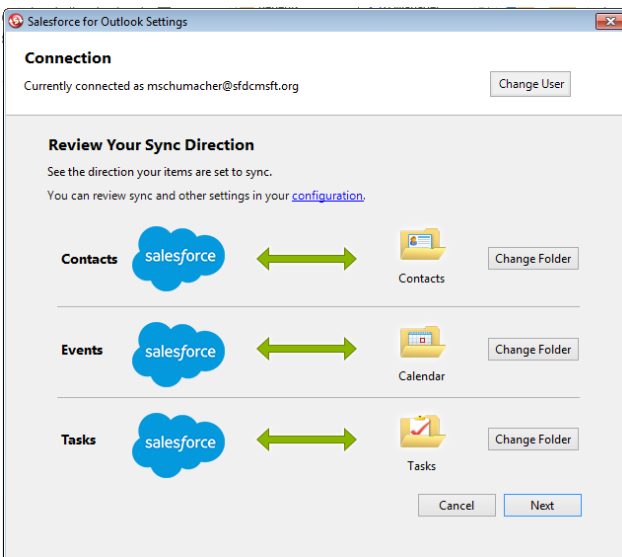

- Assigned to an active configuration AND Valid data set for each object being synced

To change sync folders:

- Your Outlook profile set as the default in your Mail Settings AND Allow users to modify "Outlook folder for syncing contacts" in your Outlook configuration

Install and Set Up Salesforce for Outlook

- Open the installation file you downloaded and saved, and complete the installation wizard.
 - Note:** If you don't yet have .NET 4 installed, the installation wizard installs it for you. Keep in mind that the installation wizard prompts you to restart your machine after it installs .NET 4. You then need to run the installation wizard again to complete the installation process.
- Open Microsoft® Outlook®. The setup wizard opens, and the Salesforce for Outlook icon (📧) appears in your system tray. If the wizard doesn't open, you can start it manually. Just right-click 📧 and click **Settings**.
- If you need to log in to a Salesforce site other than the default, click **Change URL** and pick the server to which you want to connect. If the server you want isn't listed, select *Other...* and enter the URL, such as a custom domain used by your organization.
- Enter your Salesforce username and password.
- Click **Approve**. This creates a secure connection between Outlook and Salesforce. You won't need to log in again unless you encounter an error.
 - Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. This lets you connect without IP restrictions from anywhere.
- Click **Next**, and review the sync directions set up by your administrator. If you need to select different folders where your Outlook items will sync, click **Change Folder** and select ones that are within your default folders or the main Mailbox folder.

- Click **Next**, and then select your sync method.
 - Choose to sync all of your contacts, events, and tasks. You'll mark items you don't want to sync with the "Don't Sync with Salesforce" category in Outlook.
 - Choose to sync individual contacts, events, and tasks. You'll mark items you want to sync with the "Sync with Salesforce" category in Outlook.

Specify Which Salesforce Fields Sync to Microsoft® Outlook®

Depending on your Salesforce for Outlook permissions, map fields from the Salesforce records you sync to Outlook.

Edit Your Salesforce for Outlook Email Settings

See whether your administrator lets you add emails to Salesforce from Microsoft® Outlook®, and change your email settings based on your needs.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.

If **Add Email** is selected, the **Add Email** and **Send and Add** options appear in Outlook.

 **Note:** If you don't see the **Add Email** and **Send and Add** options, ask your administrator to activate Email to Salesforce.

2. Click **Email to Salesforce Settings**.
3. Enter your own email address in `My Acceptable Email Addresses`. If you send email from more than one address, separate each address with a comma.
4. Choose whether all emails are sent to My Unresolved Items (so that you can manually assign them to related records) or to have Salesforce try to assign them first.
5. Configure Email to Salesforce to add emails as activities to matching opportunities, leads, contacts, or all three. If you configure Email to Salesforce to associate emails to matching leads or contacts, Salesforce searches the **To** and **CC** fields for the email addresses of your leads or contacts. If any leads or contacts are found, Salesforce saves the email to the Activity History related list on the appropriate record.
6. If you selected leads or contacts:
 - Specify how Email to Salesforce processes emails that contain lead or contact information that matches duplicate records.
 - Select `If no matching records are found, create a task and send it to My Unresolved Items` to have email sent to My Unresolved Items if no matching records are found. If this checkbox isn't selected, and Salesforce can't identify the email addresses in the `To` or `From` fields, the email isn't saved in Salesforce.
7. Select `Always save email attachments` to save attachments on emails sent to Salesforce.
8. To receive a confirmation email when an email is sent to Salesforce, select `Email me confirmation of association`.
9. Click **Save**.

[Manage Your Salesforce for Outlook Configuration](#)

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Customize Your Salesforce for Outlook Sync Direction

Depending on whether your administrator gave you permission, customize sync directions between Microsoft® Outlook® and Salesforce based on your preferences.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.
2. Select one of these options under Sync Direction for a particular object.
 - *Outlook to Salesforce*—During its first sync, a record in Outlook creates or updates a record in Salesforce. During future syncs, changes made to Outlook records appear in Salesforce, regardless of whether the Salesforce version has changed. In addition, deleting a synced record in Outlook deletes its Salesforce counterpart. Salesforce changes are never sent to Outlook. The required conflict behavior setting for this option is *Outlook always wins*. This option isn't available for contacts.
 - *Salesforce to Outlook*—When data first syncs, a record in Salesforce creates or updates a record in Outlook. During future syncs, changes made to Salesforce records appear in Outlook, regardless of whether the Outlook version of the record has changed. In addition, deleting a synced record in Salesforce deletes its Outlook counterpart. Outlook changes are never sent to Salesforce. The required conflict behavior setting for this option is *Salesforce always wins*.
 - *Sync both ways*—When records sync, changes to Outlook and Salesforce sync between the two systems. If records conflict, the conflict behavior setting determines which record wins.
3. Save your changes. All changes take effect the next time your data syncs. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator can change your settings as needed.

Edit Conflict Settings

Specify what happens when Salesforce for Outlook encounters a conflict as it syncs records between Microsoft® Outlook® and Salesforce.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.
2. Under Conflict Behavior for each object you're syncing, select one of these options.
 - *Salesforce always wins*
 - *Outlook always wins*
3. Save your changes. All changes take effect the next time your data syncs. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator can change your settings as needed.

Viewing Your Salesforce for Outlook Matching Criteria

See the matching criteria your administrator assigned to you.

If you have multiple Salesforce contacts that match a contact in Outlook, Salesforce for Outlook needs a way to determine which contact to sync. Your administrator sets criteria for the way Salesforce for Outlook chooses the correct contact.

Review the matching preference assigned to you. Available options include:

- `Most recent activity`—Choose the Salesforce contact that shows the most recent activity (such as a phone call or email), as shown in the contact's Activity History related list. This option is the default matching criteria.
- `Last updated`—Choose the Salesforce contact that was most recently modified.
- `Oldest`—Choose the Salesforce contact that has the earliest creation date.

Specify Which Salesforce Fields Sync to Microsoft® Outlook®

Depending on your Salesforce for Outlook permissions, map fields from the Salesforce records you sync to Outlook.

Field mappings define which Salesforce and Outlook fields correspond when items sync between the two systems.

1. From your personal settings in Salesforce, search for Salesforce for Outlook. Then click **View My Configuration**.
2. Under Data Settings, click **Edit Field Mappings** under *Contacts*, *Events*, or *Tasks* to display all the fields for records on that object.
3. Review which Salesforce fields are mapping to each Outlook field.
4. Edit the Salesforce or Outlook field mappings you'd like to change, or create mappings for custom fields. Salesforce for Outlook lets you edit any field mapping with a picklist. You can add more mappings at the bottom of the list. You can remove mappings by clicking the X next to the mapping.

 **Warning:** If you map a custom field that is universally required, make sure that it has a default value to avoid errors. Also, mapping custom fields that require validation by Salesforce can cause sync errors. For example, you map a custom Salesforce field that requires a unique value. If you enter a non-unique value in the Outlook field, you receive a sync error.

5. Click **Save**. Field mappings begin syncing on items the next time those items are updated in either Salesforce or Outlook. Return to your original settings any time by clicking **Revert to default** at the top of your modified configuration. Your administrator can change your settings as needed.

	Recurring Salesforce tasks to Outlook	"Sync recurring Salesforce tasks to Outlook"

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

Before you download and install Salesforce for Outlook, make sure your Outlook folders include the items you want to sync. If you're syncing from Outlook to Salesforce, moving a record out of a synced Outlook folder deletes that record in Salesforce. If you're syncing from Salesforce to Outlook, removing a record from Salesforce deletes that record in Outlook.

Learning about Sync Schedules

Salesforce for Outlook syncs your items based on your system activity. Events and tasks sync automatically every ten minutes; contacts sync automatically every hour. If, however, Salesforce for Outlook detects keyboard or mouse inactivity for 30 minutes, the sync frequency for events and tasks changes to 30 minutes. After two hours of inactivity, the frequency for all updates changes to hourly, and after four hours, the frequency changes to every four hours.

You can, of course, sync manually whenever you'd like. Just right-click the system tray icon (🔌), and then click **Sync > Sync Now**.

Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

Syncing Contacts with Salesforce for Outlook

You can keep your important Outlook and Salesforce contacts in sync using Salesforce for Outlook. When contacts initially sync, Salesforce for Outlook checks to see whether a contact with the same email address exists in both Outlook and Salesforce. If a matching email address exists, the two contacts are synced. If it doesn't exist, Salesforce for Outlook checks to see whether a contact with the same first name, last name, and company name exists. If it doesn't exist, a new contact is created and the two are synced.

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. You can set up Salesforce for Outlook to sync in the following ways, depending on whether your administrator allows you to change sync directions.

- *Salesforce to Outlook*
- *Sync both ways*

Salesforce for Outlook lets you sync up to 5,000 contacts, and isn't case-sensitive when matching contacts.

This diagram shows how contacts sync.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To sync contacts from Salesforce to Outlook:

- "Read" on contacts

AND

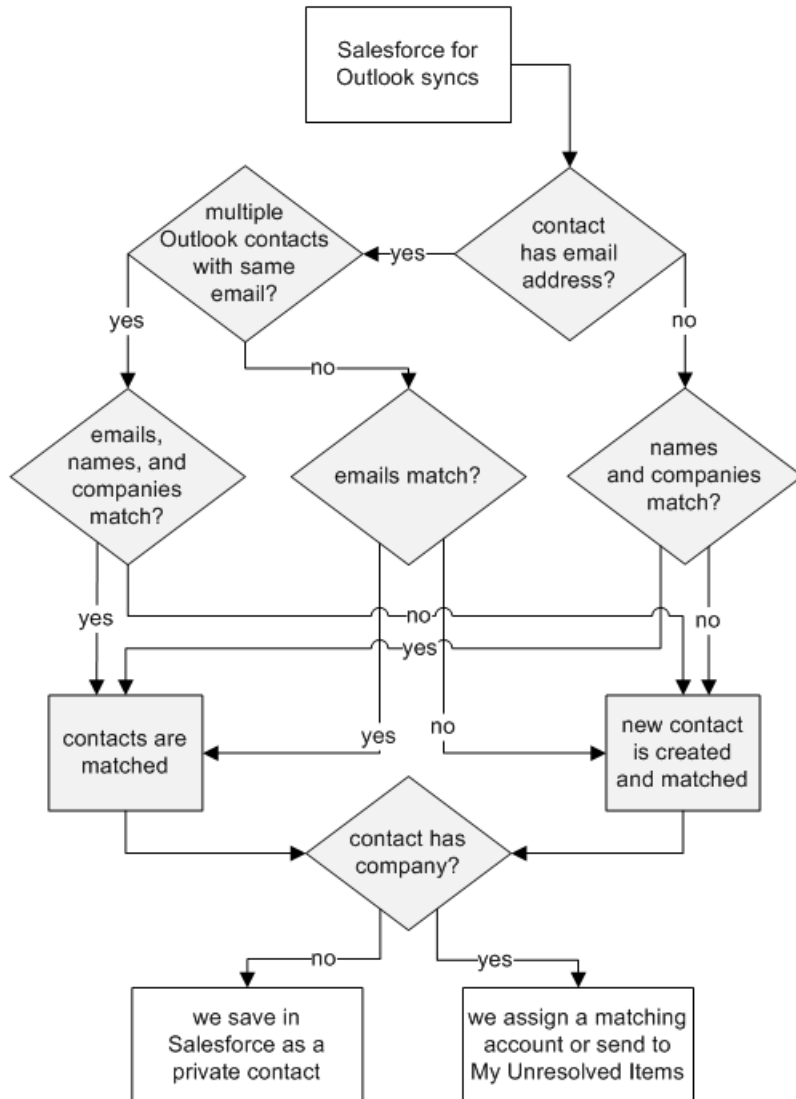

Contact sync direction set to *Salesforce to Outlook*

To sync contacts both ways:

- "Read" and "Edit" on contacts, and "Read" on accounts

AND

Contact sync direction set to *Sync both ways*

Syncing Contacts from Salesforce to Outlook

If

Then

A contact already exists in Outlook

The Salesforce contact replaces the Outlook contact and the two are synced.

A contact doesn't yet exist in Outlook

Salesforce for Outlook syncs the Salesforce contact, which creates the contact in Outlook.

You delete a contact in Outlook

Salesforce for Outlook won't sync the Salesforce contact again.

Multiple matching contacts exist in Outlook

Salesforce for Outlook selects one of them and syncs it.

You update a contact in Salesforce

The Salesforce contact overwrites the Outlook contact.

If	Then
You update a contact in Outlook	The updates remain in the Outlook contact, but won't sync to Salesforce. The next time updates are made to the Salesforce counterpart, the Salesforce counterpart overwrites the Outlook contact.
You delete a Salesforce contact	The Outlook counterpart is also deleted. If the Outlook contact is deleted and the Salesforce contact is updated, the contact is recreated in Outlook.

Syncing Contacts Both Ways Between Salesforce and Outlook

If	Then
A contact exists on one side only	The contact is automatically created on the other side and the two are synced.
A matching contact exists	One contact record replaces the other one, and the records are synced. If your Outlook configuration specifies that Outlook contacts win, the Outlook version replaces the Salesforce version, and vice versa if Salesforce is set to win. Any change to either record is automatically reflected in the other. If records conflict, the conflict behavior setting determines which record wins.
Multiple matching Salesforce contacts exist	As long as there's only one version of the Outlook contact and that contact has an email address, we sync the Outlook contact with a Salesforce contact based on your matching preference, such as the contact that was most recently updated.
You update a contact	Both contacts are updated with the latest changes. If records conflict, the conflict behavior setting determines which record wins.
You delete a Salesforce contact and update an Outlook contact	The Outlook counterpart is deleted if Salesforce is set to win, and the contact is recreated in Salesforce if Outlook is set to win.
You delete an Outlook contact and update a Salesforce contact	The Salesforce counterpart is deleted if Outlook is set to win, and the contact is recreated in Outlook if Salesforce is set to win.

Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

Syncing Events with Salesforce for Outlook

You can keep your Outlook and Salesforce events in sync using Salesforce for Outlook. After an event is in Salesforce, you can assign it to related records, like contacts, accounts, opportunities, and so on. Syncing events also lets you maintain an accurate view of your availability when you create events and request meetings from your Salesforce calendar.

Which Events Sync

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. The event filters in your configuration determine which events sync. The possible filters are:

- *TODAY*—Syncs events that end on or after today. The start time is 12:00 a.m.
- *LAST MONTH*—Syncs events that ended on or after the first day of last month.
- *LAST N DAYS*—Syncs events that ended on or after a specified number of days ago, such as *LAST 30 DAYS*.

Event updates stop syncing once the event falls outside of the range you're configured to sync.

The following items don't sync: all-day events beginning on the first day you're configured to sync, and event attendees. Multiday events sync as single events in either direction. Recurring event patterns must match exactly. Salesforce for Outlook syncs events based on their end dates rather than their start dates. For example, if you're syncing current and future events only, a two-day event that started yesterday still syncs.

How We Match Events

When events first sync, we either link them with existing events that have the same subject and time or create new events if nothing matches.

How You Assign Events to Salesforce records

After an event is added to Salesforce, you can assign it to other records using the My Unresolved Items page or the *Related To* and *Name* fields on the event record. The event is added to the associated record's Activity History or Open Activities related list. You can't save changes if your events have a required custom field or an activity custom field becomes required after items are added to your unresolved events list.

Who Sees Synced Events in Salesforce

Events that aren't marked as private are visible Salesforce to you, those above you in your role hierarchy, and anyone who has access to the records they're associated with. You can also grant access to view your calendar to other users, personal and public groups, roles, or roles and subordinates.

Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

[Syncing Recurring Events with Salesforce for Outlook Overview](#)

Syncing Recurring Events with Salesforce for Outlook Overview

If your organization is set up to sync recurring events, you can keep them synced between Outlook and Salesforce using Salesforce for Outlook. You can sync recurrences with the following patterns.

- Daily
- Weekly
- Monthly
- Yearly

After you sync recurring events to Salesforce, you can assign the recurrences to related records, such as contacts, accounts, opportunities, and so on. Syncing recurring events also helps you maintain an accurate view of your availability when you create events and request meetings from your Salesforce calendar.

Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

Understanding Differences Between Outlook and Salesforce

Recurring events work differently between Outlook and Salesforce.

For	You should know that
Ranges of occurrences	If your recurrences include more than 100 occurrences, Salesforce for Outlook creates the series with 100 occurrences in Salesforce. After the dates of occurrences pass, Salesforce for Outlook then automatically adds another group of occurrences, bringing the total future occurrences up to 100 again. The schedule on which Salesforce adds these groups depends on the number of occurrences that passed and when you last synced, as well as whether you changed any existing occurrences.
Monthly occurrences	Salesforce for Outlook doesn't support the Outlook recurrence pattern option weekend day .
Yearly occurrences	Salesforce for Outlook lets you set up events that recur every year. If you enter a number other than <i>1</i> for the Recur every option in Outlook

EDITIONS

Available for set up from: both Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To sync recurring events between Outlook and Salesforce:

- "Recurring Events"

In addition, "Read" and "Edit" on events, and event sync direction set to any of the following directions.

Outlook to Salesforce,
Salesforce to Outlook, or
Sync both ways

For	You should know that
	<p>recurrence patterns, Salesforce for Outlook won't sync the recurring series. This mean that you can set up yearly recurrences, but not recurrences for every other year or every three years.</p> <p>In addition, Salesforce for Outlook doesn't support the Outlook recurrence pattern option weekend day.</p>
Events lasting longer than 24 hours	Salesforce doesn't support recurring events lasting longer than 24 hours.

Modifying Recurring Series

You can modify recurring series, but it's good to know what to avoid, so that you won't lose any details for occurrences that you've individually modified.

If you modify	You should know that
Recurring series in Outlook	<p>Those changes won't propagate to individually modified occurrences in Salesforce.</p> <p>For example, you modify the appointment time of an occurrence, and then later modify the appointment time for the entire series. The appointment time modification for the series won't propagate to the one modified occurrence.</p> <p>Critical changes include modifications to:</p> <ul style="list-style-type: none"> • Appointment times • Recurrence patterns • Ranges of occurrences <p>If you make critical changes to recurring series, individually modified occurrences lose their modifications.</p>
Start dates for recurring series in Outlook	Salesforce doesn't support modifications to start dates that already occurred.
End dates for recurring series in Salesforce	<p>This is a critical change in Outlook, and will clear any modifications you make to individual occurrences within the series. Those modifications won't propagate to Outlook. You can, however, modify end dates in Outlook, but that type of critical change will clear all modifications you've made to individual occurrences—in both Outlook and Salesforce.</p>
Individual occurrences	<ul style="list-style-type: none"> • You may lose those changes if you make critical changes to the recurring series. • If you delete an occurrence, and then move the following occurrence into its place, Salesforce for Outlook doesn't update Salesforce correctly. Instead, the occurrence you deleted in Outlook remains in Salesforce along with the occurrence you moved into its place. <p>For example, you change your recurring event in Outlook. You delete the October 4th occurrence, and move the October 5th occurrence into its place. In Salesforce, you'll see two occurrences on October 4th: the one you deleted, and the one you moved into its place. For October 5th, you'll have no occurrences.</p>

If you modify**You should know that**

- Outlook modifications propagate to occurrences in Salesforce, regardless of whether the ones in Salesforce include critical modifications. Deleted occurrences in Salesforce, however, remain deleted, and aren't replaced with individually modified occurrences from Outlook.

Syncing Tasks with Salesforce for Outlook

Keep Microsoft® Outlook® and Salesforce tasks in sync.

After a task is in Salesforce, you can assign it to related records, like contacts, accounts, and opportunities.

Which Tasks Sync

Your Outlook configuration defines which items are set to sync, which direction the data flows between Outlook and Salesforce, and what happens when data conflicts. The task filters in your configuration determine which tasks sync. The possible filters are:

- *TODAY*—Syncs tasks that are due on or after today. The start time is 12:00 a.m.
- *LAST MONTH*—Syncs tasks that were due on or after the first day of last month.
- *LAST N DAYS*—Syncs tasks that were due on or after a specified number of days ago, such as *LAST 30 DAYS*.

Salesforce for Outlook doesn't sync every kind of task. These kinds of tasks sync until they fall outside of the date range set in your task filter:

- Recurring Salesforce tasks to Outlook
- Completed tasks, if marked as completed after Salesforce for Outlook syncs
- Deferred tasks
- In progress tasks
- Not started tasks
- Repeating tasks, which you create in Salesforce
- Tasks flagged for follow-up
- Waiting on someone else tasks

Which Tasks Don't Sync

- Recurring Outlook tasks to Salesforce
- Completed tasks, if marked as completed before Salesforce for Outlook syncs
- Tasks created automatically when you flag an email or contact for follow-up

How We Match Tasks

When tasks first sync, we link them with existing tasks that have the same subject and due date. If you don't assign due dates to tasks, we link them using the same subject only.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To sync tasks from Outlook to Salesforce:

- "Read" and "Edit" on tasks, and task sync direction set to *Outlook to Salesforce*

To sync tasks from Salesforce to Outlook:

- "Read" and "Edit" on tasks, and task sync direction set to *Salesforce to Outlook*

To sync tasks both ways:

- "Read" and Edit" on tasks, and task sync direction set to *Sync both ways*

How You Assign Tasks to Salesforce Records

After a task is added to Salesforce, you can assign it to other records using the My Unresolved Items page or the `Related To` and `Name` fields on the task record. The task is added to the associated record's Activity History or Open Activities related list. You can't save changes if your tasks have a required custom field or an activity custom field becomes required after items are added to your unresolved tasks list.

Excluding Certain Records from Syncing

If you chose the Automatic option for your sync method, you have a couple of options for excluding certain items from syncing with Salesforce for Outlook.

- You can choose to sync items you mark as Private in Microsoft® Outlook®. If you don't want to sync private items, open Salesforce for Outlook Settings, and deselect the types of private items you don't want to sync.

If you have synced items in Outlook that you later mark as Private, those items remain in Salesforce. The corresponding Salesforce items, however, will no longer receive updates if you modify the ones in Outlook.

- If you don't want certain Outlook items to sync, regardless of whether they're marked as Private, assign them to the category *Don't Sync with Salesforce* in Outlook. For details on using categories in Outlook, refer to your Outlook documentation.

Automatic Account Assignments for Synced Contacts

After syncing contacts from Outlook, Salesforce for Outlook tries to automatically assign them to accounts, as shown in this diagram.

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To assign accounts:

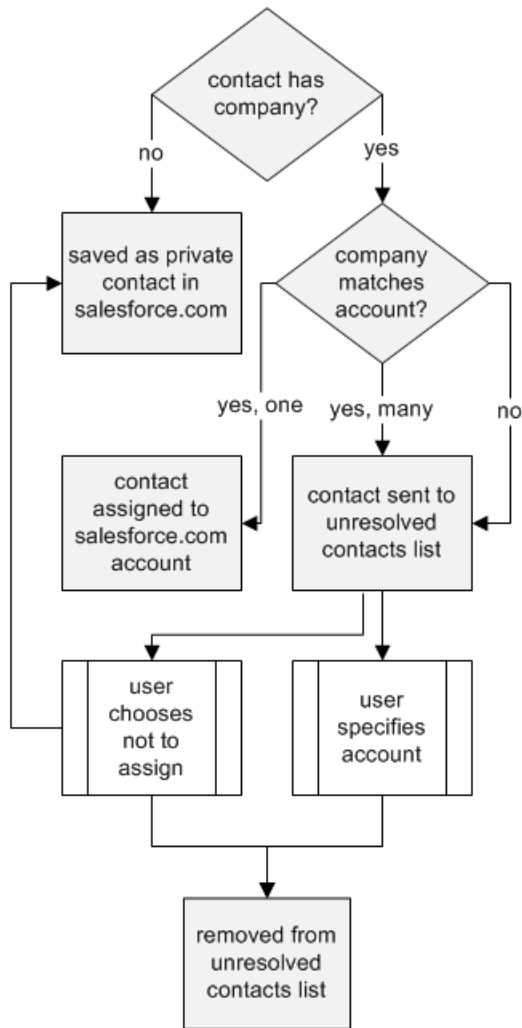

- "Read" on accounts and "Edit" on contacts

To create new accounts:

- "Create" on accounts and "Edit" on contacts

AND

"Show Quick Create"

This table describes the account assignment process.

If	Then
A contact's company matches a single Salesforce account	The contact is assigned to that account.
A contact's company matches many Salesforce accounts or none	The contact is sent to My Unresolved Items in Salesforce, which you can access from the Contact home page or the Salesforce for Outlook system tray application. You can use this list to manually assign contacts to existing accounts, create new accounts, or confirm that contacts are private.
A contact doesn't have a company name	The contact is treated as a private contact and is not sent to My Unresolved Items.
A contact's company changes in Outlook	If a matching account is found in Salesforce, the contact is assigned to that account. Otherwise, the contact is sent to My Unresolved Items to be resolved.

If	Then
An unresolved contact is deleted in Outlook	The contact is removed from My Unresolved Items the next time you open the list.
An unresolved contact is changed in Outlook	The contact record is updated in My Unresolved Items. If the contact's company changes, Salesforce checks to see if that information matches any existing accounts and assigns it to an account if it finds a match.

Manage How Microsoft® Outlook® Items Sync with Salesforce

Manage your contacts, events, and tasks using Outlook categories to get your Outlook items to sync with Salesforce the way you want—by either selecting the items you'd like to sync, or syncing all your items, and selecting the items you'd like to prevent from syncing.

View your sync settings from the Windows® system tray, and then manage how you'll sync your Outlook items with Salesforce.

1. Right click the Salesforce for Outlook icon (📧) in the system tray.

2. Click **Settings**, and then click **Next**.
3. See whether you're set up to sync items with the `Sync Only the Outlook Items I Select` option or the `Sync All Outlook Items` option.
 - If you're set up to sync with the `Sync Only the Outlook Items I Select` option, Salesforce for Outlook syncs only the Outlook items you choose. You'll [assign the category Sync with Salesforce to the items you want to sync](#) on page 1596.
 - If you're set up to sync with the `Sync All Outlook Items` option, Salesforce for Outlook syncs all your Outlook items. You'll [assign the category Don't Sync with Salesforce to the items you want to prevent from syncing](#) on page 1596.
4. Click **Cancel**.

EDITIONS

Choose Which Microsoft® Outlook® Items Sync with Salesforce

If you're set up to sync your Outlook contacts, events, and tasks to Salesforce using the `Sync Only the Outlook Items I Select` option in Salesforce for Outlook, you'll need to select which Outlook items you want to sync.

1. In Outlook, select the contacts, events, and tasks you want to sync.
2. On the Outlook ribbon, click **Categorize**.
3. Select the category `Sync with Salesforce`.

The items you categorized will start syncing during the next sync cycle.

Prevent Which Microsoft® Outlook® Items Sync with Salesforce

If you're set up to sync your Outlook contacts, events, and tasks to Salesforce using the `Sync All Outlook Items` option in Salesforce for Outlook, you can still control which items you don't want to sync.

1. In Outlook, select the contacts, events, and tasks you want to prevent from syncing.
2. On the Outlook ribbon, click **Categorize**.
3. Select the category `Don't Sync with Salesforce`.

The items you categorized will stop syncing after the next sync cycle.

My Unresolved Items

When you use Salesforce for Outlook, Lightning Sync, or Email to Salesforce to sync items or add emails from your email app to Salesforce, any items that these features can't automatically assign to Salesforce records appear in My Unresolved Items.

As part of your daily routine, you'll use this page to manage the unresolved items that require your attention. Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

Resolving Your Synced Contacts

When contacts sync from your email app with Salesforce for Outlook or Lightning Sync, some contacts are automatically assigned to accounts based on their company. The rest are added to My Unresolved Items, where you can either assign contacts to Salesforce accounts or confirm that you want to leave them unassigned.

1. Access your unresolved contacts from the sidebar shortcut **Unresolved Items**.
2. Resolve each contact in any of these ways.
 - Assign an account.
 - Select an account under Choose Suggested Account in the drop-down list. We suggest accounts only if we detect possible matches based on the contact's company. Suggested accounts always show the `Account Name` field and the first three additional fields defined in your account search layout. If your organization has contact lookup filters that prevent certain accounts from being assigned to contacts, those accounts won't appear as suggested accounts and can't be assigned to contacts.
 - Select `Search Salesforce.com...` In the lookup, either click **New**, enter account information, and click **Save**, or enter search criteria, click **Go!**, and click the right account. If you don't see the lookup, you may need to first allow popups from Salesforce.
 - Leave unassigned—Select `Don't Assign New Account` from the drop-down list if you want to confirm that a contact with no account should remain unassigned. Unassigned contacts aren't related to Salesforce records and are visible to you and your administrator only.
 - Choose an account if there's a conflict—If the email contact and Salesforce contacts' companies are different, click `Don't Assign New Account` in the drop-down list to overwrite one with the other. The Salesforce account overwrites the email contact company if Salesforce is set to win, and the email contact overwrites the Salesforce account if the email contact is set to win.
 - Cancel a selection—Select `None Selected` from the drop-down list.
3. Click **Save** to save your changes. All modified items are removed from the list. Remaining items continue to sync, and you can return any time to resolve them. Clicking **Cancel** cancels all changes on the page. Every contact assigned to an account now appears on the Contacts related list for that account.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience (only when prompted to resolve Salesforce for Outlook items from the Windows system tray)

Available in all editions

USER PERMISSIONS

To view or edit unresolved contacts:

- "Edit" on contacts and "Read" on accounts
- AND
- Sync enabled for contacts

To create new accounts:

- "Edit" on contacts and "Create" on accounts
- AND
- "Show Quick Create"

 **Note:** You can also resolve a contact from the contact record by marking it private or by assigning it to an account.

Your unresolved contacts list works like a standard list view. Click **Edit** or **Create New View** to define filters and customize columns.

Resolving Your Synced Events

When non-recurring events sync from your email app with Salesforce for Outlook or Lightning Sync, they appear in your Salesforce calendar and on the My Unresolved Items page. Use this page to either assign events to related Salesforce records or confirm that you want to leave them unassigned.

 **Note:** Recurring events do not appear on the My Unresolved Items page. Instead, you can go directly to the recurring events in your calendar to associate the recurring events with Salesforce records.

1. Access your unresolved events from the sidebar shortcut **Unresolved Items**.
2. Depending on how you want to resolve an event, choose either of these actions.
 - Assign to related records—Enter a related record in one or both fields. If you need to, first select the correct record type from the drop-down list. If you assign a lead, you can't assign additional records. Clear an entry to cancel an assignment.
 - Leave unassigned—Click **Don't Assign**. Unassigned events, such as internal meetings or personal appointments, aren't linked to any other records and are visible to you only.
3. Click **Save** to save your changes. All modified items are removed from the list. Remaining items continue to sync, and you can return any time to resolve them. Clicking **Cancel** cancels all changes on the page. The event is added to the associated record's Activity History or Open Activities related list. You can't save changes if your events have a required custom field or an activity custom field becomes required after items are added to your unresolved events list.

 **Note:** You can also resolve an event from the event record by marking it private or by assigning it to other Salesforce records using the `Related To` and `Name` fields. Assigned and private events are automatically removed from your unresolved events list. Click  next to the subject to see an event's description.

Delete Items Syncing with Salesforce for Outlook

Remove an item syncing with Salesforce for Outlook from both Salesforce and Outlook by deleting the item in one system only. Take care to give special treatment to recurring tasks and recently-updated items you want to delete.

First, check the sync direction for the contact, event, or task you want to delete. Next, delete the item from the system in which the item is set to flow from. If your items are set to sync in both directions, you can delete items from either system.

As a result, Salesforce for Outlook automatically removes the corresponding item in the other system.

 **Note:** Recurring tasks only sync from Salesforce, so there's no need to check the sync direction before deleting those items: always delete recurring tasks in Salesforce.

1. From your personal settings, enter *Salesforce for Outlook* in the **Quick Find** box, then click **View My Configuration**.
2. Review the sync direction setting for the contact, event, or (non-recurring) task that you want to delete.
3. Delete the item in the system from which sync is flowing.
For example, if you want to delete a contact, and your contacts are set to sync from Outlook to Salesforce, delete the contact in Outlook.
The item you deleted is removed from both systems during the next sync cycle.

If the item was not removed from both systems, you—or another sales rep—may have updated that record within the same sync cycle and Salesforce for Outlook gave preference to the update over the delete. This behavior happens as a result of `Conflict Behavior` set in someone's Salesforce for Outlook configuration, which would have let the update in one system "win" over the delete in the other. In this case, delete the record again to remove it from both systems. Or maybe check with your coworker first, who obviously cares about that item!

When you select an email from the Inbox or an event from the Calendar in Outlook, the Salesforce Side Panel displays related Salesforce contact and lead details directly in Outlook. After your administrator enables the side panel in your Outlook configuration, the side panel displays up to 10 contacts and leads from your email's From, To, and Cc fields.

In addition, the Salesforce Side Panel:

- Displays as many as four activities, opportunities, and cases related to the contacts and leads that appear in the side panel.
- Makes it easy to add Outlook emails and their attachments to multiple Salesforce records, as well as add Outlook events and tasks to multiple contacts, and to one other record with which you can associate tasks, such as an account, a case, or even a custom object record.
- Discovers duplicate contacts or leads. You choose the most appropriate ones to display in the side panel.
- Lets you create Salesforce records directly from the side panel.
- Includes a Search feature to find additional Salesforce records.
- Includes links to view full record details directly in Salesforce.

Here's how you'll use the side panel.

1. Select an email or event in Outlook.
2. Review the Salesforce content that appears in the side panel, which displays contacts and leads based on the order they appear in your email's From, To, and Cc fields. For each contact and lead, it's easy to view related activities, opportunities, and cases. If you want to view full record details, just click on a record's link to open it directly in Salesforce.

To add your email or event to the Salesforce records of your choice, click or next to those records. Email attachments are included automatically when you add an email to Salesforce, unless your organization has enabled the feature that allows you to select specific email attachments. In that case, you'll see next to the individual attachments in your side panel. Click the icon to add those attachments to Salesforce.

If you have the Social Accounts and Contacts feature enabled in Salesforce, the side panel displays either Facebook® or Twitter™ profile photos—whichever ones you chose to show in Salesforce for those contacts and leads.

3. Select the other contacts and leads related to your email to view their details, along with related activities, cases, and opportunities.
4. Quickly see the Salesforce records to which you've added emails or events. If you'd like to create a new account, case, contact, lead, opportunity, or a custom object record related to your email, click . If you don't see records you're looking for, click  to find other records, and then add emails, events, or tasks from the Outlook tasks list to them. There's even a collapse feature () to hide the side panel.

[Add Microsoft® Outlook® Emails to Salesforce Records](#)

Keep track of important Outlook emails related to Salesforce records from the Salesforce Side Panel.

[Remove Microsoft® Outlook® Emails from Salesforce Records](#)

You can remove Microsoft Outlook emails from your Salesforce records with the Side Panel for Salesforce for Outlook.

[Add Microsoft® Outlook® Events to Salesforce Records](#)

Add Outlook events to Salesforce records by using the Salesforce Side Panel. The event is added to the Salesforce record as an activity, which you can see on the record's Activity History or Open Activities related lists.

[Add Microsoft® Outlook® Tasks to Salesforce Records](#)

You can add Outlook tasks to multiple Salesforce contacts and to one other record that accepts tasks, like an account, a lead, or an opportunity. The task is added to the Salesforce record as an activity, which you can see on the record's Activity History or Open Activities related lists.

USER PERMISSIONS

To display the Salesforce Side Panel in Outlook:	"Side Panel" in your Outlook configuration
To add Outlook emails (including attachments), events, and tasks to Salesforce records:	"Add Email" in your Outlook configuration
To add specific email attachments to Salesforce:	"Allow users to select attachments" in your Outlook configuration
To add emails (including attachments), events, and tasks to multiple contacts:	"Allow Users to Relate Multiple Contacts to Tasks and Events" in Activity Settings

EDITIONS

This feature available to manage from: both Salesforce Classic and Lightning Experience

Available in all editions

To add emails to multiple Salesforce records that accept tasks: Contact Salesforce Customer Support

Keep track of important Outlook emails related to Salesforce records from the Salesforce Side Panel.

You'll complete this procedure using the Salesforce Side Panel, a feature that's available in Salesforce for Outlook. If you're not yet familiar with the side panel, learn about it in [View Salesforce Records in Microsoft® Outlook®](#).

1. In Outlook, either:

- Select an email from your Inbox.
- Create a new email.

You can add an email to multiple contacts and to one other record with which you can associate tasks, such as an account, a case, or an opportunity.

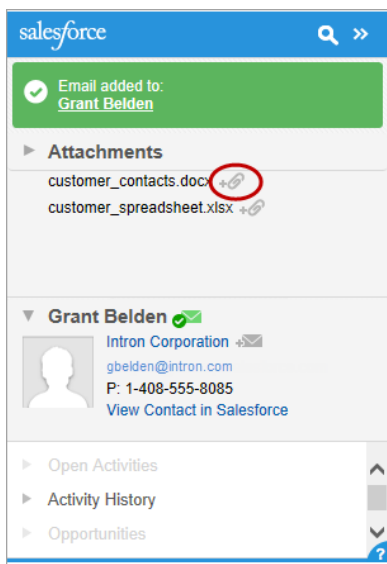

2. In the side panel, click for the contact, account, case, opportunity, or lead to which you want to add the email. The side panel confirms the Salesforce records to which you added your email.

If you're sending a new email, we'll add it to Salesforce records after you click **Send**.

3. You'll add attachments differently depending on how you're set up to use the side panel.

- If the attachments section appears after you add your email to Salesforce, click  to include specific email attachments on the record.

- If you don't see the option to add attachments, your attachments are included automatically when you add your email to Salesforce.

What's the difference between private items in both Salesforce and Microsoft® Outlook®?

Private items in Microsoft Outlook and Salesforce differ in unexpected ways. Before choosing to sync private events, consider how they're displayed to colleagues in each system.

Item	Private in Outlook	Marked private in Salesforce
Contacts	Your Exchange administrator can see your contacts. Other users cannot.	<p>Other Salesforce users can see contacts that are associated with accounts.</p> <p>Contacts that aren't associated with accounts are private and aren't visible to other Salesforce users except for Salesforce administrators who can view, edit, and report on contacts.</p>
Events	Your Exchange administrator can see your events. Other users cannot.	Only blocks of time, and not event details are visible to other Salesforce users, except for Salesforce administrators who can view, edit, and report on contacts.

Item	Private in Outlook	Marked private in Salesforce
Tasks	Your Exchange administrator can see your tasks. Other users cannot.	Salesforce doesn't include any means for keeping tasks private. So other Salesforce users can see your tasks.

Does Salesforce for Outlook support terminal servers?

No. Salesforce for Outlook does not support terminal servers, such as Citrix.

SEE ALSO:

[Desktop-Based Salesforce for Outlook](#)

Why is my Salesforce for Outlook installation failing on the prerequisites screen?

Your system may not meet all system requirements for Salesforce for Outlook. Verify your system meets these requirements, then try installing Salesforce for Outlook again.

SEE ALSO:

[Desktop-Based Salesforce for Outlook](#)

[Install and Set Up Salesforce for Outlook](#)

[Salesforce for Outlook System Requirements](#)

Why can't I log in to Salesforce for Outlook?

Your inability to log in may be related to your company's IP address requirements. If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

SEE ALSO:

[Desktop-Based Salesforce for Outlook](#)

Can I map custom fields I'm syncing with Salesforce for Outlook?

Yes. You can map a Salesforce field to a custom Outlook field, or an Outlook field to a custom Salesforce field using Salesforce for Outlook. These field types are available to map:

- Outlook text fields
- Salesforce text fields
- Some Salesforce picklist fields

To map to custom fields, open an Outlook configuration. Under **Field Mapping**, select *Custom Field...* from the end of the corresponding **Outlook Field** picklist. Enter the field's name and click **OK**.

SEE ALSO:

[Specify Which Salesforce Fields Sync to Microsoft® Outlook®](#)

Can I mass configure Salesforce for Outlook?

Yes, you can create a configuration in Salesforce and assign it to profiles or even specific users. When those users set up Salesforce for Outlook, the configuration's settings are automatically deployed to Outlook.

SEE ALSO:

[Manage Your Salesforce for Outlook Configuration](#)

Can I use filter logic in Salesforce for Outlook data sets?

No, you can't use filter logic to limit which records your users sync using Salesforce for Outlook.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Can I sync person accounts by using Salesforce for Outlook?

No. You can't upload person accounts by using Salesforce for Outlook.

For information on how to import person accounts into your Salesforce organization, see [Data Import Wizard](#) on page 650.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Can I add cases using Salesforce for Outlook?

Yes, Salesforce for Outlook supports adding emails to Salesforce as cases.

SEE ALSO:

[Create Cases from the Outlook Ribbon with Salesforce for Outlook](#)

[Set Up Create Case for Salesforce for Outlook Users](#)

Can I associate Outlook records to custom objects using Salesforce for Outlook?

You can assign synced events and tasks to several different objects, including custom objects, but you can assign synced contacts only to accounts.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why does Salesforce for Outlook create duplicate records in Microsoft® Outlook®?

If you either mark items as Private or assign them to the Outlook category *Don't Sync with Salesforce*, and you sync contacts, events, and tasks from Salesforce to Outlook, Salesforce for Outlook may create duplicate records in Outlook.

This can happen if you have Salesforce items that contain the same information as the Outlook items you either marked as Private or assigned to the category *Don't Sync with Salesforce*. These items were never mapped to each other, so Salesforce for Outlook treats them separately, resulting in duplicates.

If you want to remove duplicates, it's best to remove the ones in Outlook that you either marked as Private or assigned to the Outlook category *Don't Sync with Salesforce*. Doing this ensures that you don't delete information in Salesforce to which other users may have contributed.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why does Salesforce for Outlook create duplicate contacts in Salesforce and Microsoft® Outlook®?

If you sync your team's records and they include different information for some of the same contacts you own, Salesforce for Outlook may create duplicate contacts in both Salesforce and Outlook.

For example, you and a team member both have a contact for Christina Wills. But the two contacts list different companies for her. Salesforce for Outlook syncs the contacts for you and your team members, resulting in duplicates in Salesforce and Outlook.

To avoid this, coordinate with your team members so you share the same contact information. You'll need to remove the contacts containing the outdated information.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why does Salesforce for Outlook delete my Outlook records after I sync?

Salesforce for Outlook automatically syncs records you own, as well as records to which you have read/write access that are:

- Associated with accounts you own
- Associated with accounts of which you are an account team member
- Owned by members of your sync profile's groups

If you try to sync a record from Outlook to Salesforce that doesn't fit in the above categories, the sync process may attempt to delete that record from Outlook during a later sync. To avoid deletion of these records, assign them to the Outlook category *Don't Sync with Salesforce*.

SEE ALSO:

[Syncing Between Microsoft® Outlook® and Salesforce Overview](#)

Why isn't Salesforce for Outlook adding emails to the right contact or lead in Salesforce?

One of the following may be occurring.

If you see	Salesforce for Outlook may be adding your emails to	You should
Duplicate records in Salesforce Side Panel	The wrong records	Consider merging the duplicate records
No matching record in Salesforce side panel	My Unresolved Items	Add the matching contacts or leads to Salesforce and associate the unresolved emails with your new contacts or leads Remove your company's domain from Excluded Domains in your My Email to Salesforce settings

SEE ALSO:

[Edit Your Salesforce for Outlook Email Settings](#)

Why can't I add emails to Salesforce?

If you receive the error message `User is not authorized to send emails to this service` when you use Salesforce for Outlook to add emails, your email address isn't authorized in Salesforce.

To authorize email addresses in Salesforce:

1. From your personal settings, enter *My Email to Salesforce* in the `Quick Find` box, then select **My Email to Salesforce**.
2. In My Acceptable Email Addresses, enter the email addresses you want to authorize. Salesforce allows you to add emails through Salesforce for Outlook from only the addresses listed in this field. You cannot leave this field empty.

SEE ALSO:

[Edit Your Salesforce for Outlook Email Settings](#)

[Personalize Your Salesforce Experience](#)

When I add emails to Salesforce, how can I include email attachments?

You can include email attachments when you add emails to Salesforce if you and your administrator have enabled the correct settings, and your Salesforce organization has enough space to store the attachment.

When you add an email to Salesforce, the email is added as a new task. Email attachments are included on the `Attachments` related lists.

Depending on how your administrator configured your settings, you can add email attachments to Salesforce in one of several ways.

If you're using	You enable	Your administrator enables	Attachments are added to Salesforce like this
Salesforce for Outlook with side panel		Side Panel and Add Email in your Outlook configuration	Automatically, after you add an email to Salesforce from the side panel.
		Side Panel, Add Email, and Allow users to	When you select  after you add an email to Salesforce from the side panel.

If you're using	You enable	Your administrator enables	Attachments are added to Salesforce like this
		select attachments in your Outlook configuration	
Salesforce for Outlook without side panel	Email to Salesforce in your Email settings, with Always save email attachments selected	Email to Salesforce for your organization and an active Outlook configuration that includes you	Automatically, after you add an email to Salesforce using the Add Emails or Send and Add buttons in Outlook.
Email to Salesforce	Email to Salesforce in your Email settings, with Always save email attachments selected	Email to Salesforce for your organization	Automatically, after you send the email to your Email to Salesforce address.

How do I enable contacts for sync in Salesforce for Outlook?

Your administrator needs to perform the following two tasks before you can sync contacts between Microsoft® Outlook® and Salesforce.

- Your administrator creates a configuration that allows users to sync contacts.
- Your administrator defines a data set for that configuration.

After your administrator performs those tasks, you may have permissions to enable contacts for sync by completing the following procedure.

1. From your personal settings, enter *Salesforce for Outlook* in the Quick Find box, then select **Salesforce for Outlook**.
2. Click **View My Configuration**.
3. Under the Sync Settings section, verify you have **Contacts** selected. If you're unable to select it, contact your administrator, who can enable contact syncing for you.

How does Salesforce for Outlook protect emails?

Salesforce supports both delegated authentication and Security Assertion Markup Language (SAML) requirements for Salesforce for Outlook. When using SAML for Salesforce for Outlook, My Domain is required.

SEE ALSO:

[Edit Your Salesforce for Outlook Email Settings](#)

Does Salesforce support single sign-on (SSO) for Salesforce for Outlook?

Yes. Salesforce supports both delegated authentication and Security Assertion Markup Language (SAML) requirements for Salesforce for Outlook. When using delegated authentication, users need to log into Salesforce the first time they use Salesforce for Outlook. When using SAML for Salesforce for Outlook, My Domain is required.

How secure is Salesforce for Outlook?

Salesforce for Outlook, a .NET application you install on your machine, securely connects to Salesforce. Specifically,

For	Salesforce for Outlook uses
Username and passwords	OAuth 2.0 to authenticate with Salesforce. We store usernames and encrypted OAuth refresh tokens locally. We never store passwords.
Connections to Salesforce	SSL 128-bit encryption through an HTTPS connection.

Connect for Outlook (Retired)

Before you get interested in our retired, legacy Connect for Outlook product, we urge you to explore either our cloud- or desktop-based Microsoft integration products: Lightning for Outlook or Salesforce for Outlook.

 **Important:** Effective Winter '16, we retired Connect for Outlook. This means the product no longer saves your emails or syncs your contacts, events, and tasks between Microsoft® Outlook® and Salesforce.

But don't worry! Become even more productive when you migrate to either Lightning for Outlook or Salesforce for Outlook. Team up with your Salesforce administrator to determine which product is best for you and your colleagues.

Relate Emails to Salesforce Records with Email to Salesforce

Relate emails to leads, contacts, and opportunities or to other specific records in Salesforce. That way, it's easy to track your sales-related communications.

[How Does Email to Salesforce Work?](#)

When you send email from external email applications, use Email to Salesforce to automatically relate those emails to your Salesforce Lead, Contact, and Opportunity records.

[Considerations for Using Email to Salesforce](#)

Before you use Email to Salesforce, consider a few key points.

[Set up Email to Salesforce](#)

To be able to use Email to Salesforce, start by configuring it.

[Relate Emails to Your Salesforce Records](#)

Relate emails you send with external email applications to leads, contacts, and opportunities, or to specific Salesforce records, to track your sales-related communications.

[Guidelines for Using Email to Salesforce](#)

If you're using Email to Salesforce, review a few key points for additional information.

[Handle Emails That Email to Salesforce Doesn't Assign to Records](#)

When emails are sent to Salesforce via Email to Salesforce or Salesforce for Outlook, some are assigned to related records based on your Email to Salesforce settings. The rest are added to My Unresolved Items, where you assign them to related Salesforce records or confirm that you want to leave them unassigned.

How Does Email to Salesforce Work?

When you send email from external email applications, use Email to Salesforce to automatically relate those emails to your Salesforce Lead, Contact, and Opportunity records.

When composing, forwarding, or replying to an email, you enter a special Email to Salesforce address in the BCC field (or any other recipient field). Salesforce receives a copy of the email. Depending on your configuration, Salesforce adds the email to the Activity History related list of the record whose email address matches the recipient's email address, or to the My Unresolved Items page. From the My Unresolved Items page, you can manually assign the email to a record. Unassigned emails also appear in your open task list.

Relating Emails to Leads, Contacts, and Opportunities

If you configure Email to Salesforce to associate emails to matching leads or contacts, Salesforce searches the **To** and **CC** fields for the email addresses of your leads or contacts. If any leads or contacts are found, Salesforce saves the email to the Activity History related list on the appropriate record.

If you configure Email to Salesforce to associate emails to matching opportunities, Salesforce searches the **To** and **CC** fields for the email addresses of your contacts. If contacts are found, Salesforce saves the email to the Activity History related list on all open opportunities, as long as the contact is assigned a contact role on the opportunity.

If Salesforce can't match any email addresses for recipients that appear in the **To** and **CC** fields of emails that you add to Salesforce, the My Unresolved Items page displays one row for each email.

Relating Emails to Specific Records

To relate an email to a specific Salesforce record, include the record ID in the subject line or body of the email.

If you configure Email to Salesforce to associate email with matching leads, contacts, or opportunities, an unresolved task is created when an email is associated with a lead, contact, or opportunity using a record ID but not a matching email address. For example, you configure emails to be associated with matching leads. You then send an email directly to your Email to Salesforce address with a lead record ID in the body or subject line of the email. The email is associated with the lead, and an unresolved task is created.

Getting Started

When your Salesforce admin activates Email to Salesforce, you receive an email that contains your system-generated Email to Salesforce address. This address also appears in your personal settings.

Access your personal settings to configure Email to Salesforce before you use it.

SEE ALSO:

[Considerations for Using Email to Salesforce](#)

[Set up Email to Salesforce](#)

[Relate Emails to Your Salesforce Records](#)

[Guidelines for Using Email to Salesforce](#)

Considerations for Using Email to Salesforce

Before you use Email to Salesforce, consider a few key points.

General Considerations

- Use Email to Salesforce to capture email sent with external email applications such as IBM® Lotus Notes® and Microsoft® Outlook® and with webmail such as Gmail® and Yahoo! Mail®.
- Email to Salesforce attempts to match the email address in the **To** or **CC** fields with the one in the **Email** standard field. Email to Salesforce doesn't support matching on custom email fields.
- Salesforce ignores invalid IDs or IDs for records that you don't have read access to.
- Email to Salesforce is required to use the Add Email feature with Salesforce for Outlook. Disabling one feature disables the other. With Salesforce for Outlook, you add emails via Add Email and Send and Add, not the **BCC** field.
- If you enter a recipient's email address in the **BCC** field, the owner of the address receives the email, but the email isn't related to records that contain the email address.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Limits

- The maximum number of email addresses that Email to Salesforce can match is 50. If the combined number of addresses in the **To** and **CC** fields exceeds this limit, Email to Salesforce processes only the first 50 unique addresses in the email.
- Email to Salesforce can create a maximum of 50 email activities for each email that it receives. It can relate up to 50 contacts to each email task record.
- The size limit for an attached file is 25 MB when attached directly to the related list. The size limit for multiple files attached to the same email is 25 MB, with a maximum size of 5 MB per file. For each matching record, all attachments that are sent with the email are duplicated, which affects your data size limit. Any attachments that aren't added are listed in the confirmation email that you receive from Salesforce.
- Email text and HTML are truncated to 32 KB.

Set up Email to Salesforce

To be able to use Email to Salesforce, start by configuring it.

1. From your personal settings, enter *Email to Salesforce* in the **Quick Find** box, then select **My Email to Salesforce**.
2. Enter your own email address in **My Acceptable Email Addresses**. If you send email from more than one address, separate each address with a comma.

 **Important:** Your Email to Salesforce address accepts email only from addresses that you list here. If you don't list an email address, email that's sent to your Email to Salesforce address isn't associated with any records.

3. Under **Email Associations**, select options as needed.
4. If you exclude multiple email domains from automatic association in **Excluded Domains**, separate them with commas.
5. Click **Save**.

Relate Emails to Your Salesforce Records

Relate emails you send with external email applications to leads, contacts, and opportunities, or to specific Salesforce records, to track your sales-related communications.

To relate externally sent emails to leads, contacts, or opportunities:

1. Compose an email from an email account that you listed in **My Acceptable Email Addresses** on the **My Email to Salesforce** setup page.
2. Enter your Email to Salesforce address in the **BCC** field.
3. Send the email.

To relate externally sent emails to specific Salesforce records:

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

1. Compose an email from an email account that you listed in `My Acceptable Email Addresses` on the `My Email to Salesforce` setup page.
2. In Salesforce, locate the record ID of the record to associate the email with. The record ID is the 15-digit, case-sensitive, alphanumeric code at the end of the URL for the record.
3. In the subject line or body of the email, type `ref:` followed by the record ID. For example: `ref: 701D0000000HQZy`.
4. Enter your Email to Salesforce address in the `To`, `CC`, or `BCC` fields.
5. Send the email.

[Guidelines for Using Email to Salesforce](#)

[Set up Email to Salesforce](#)

Guidelines for Using Email to Salesforce

If you're using Email to Salesforce, review a few key points for additional information.

General Guidelines

- For easy access, add your Email to Salesforce address to the address book of your email program.
- When you use Email to Salesforce to save a message as an email activity, the default task type is specified by the `Send Email Default` setting. To change the default value, edit the `Task Type` picklist field.
- Emails that come from excluded domains go to `My Unresolved Items`. From there, manually assign them or leave them unassigned.
- To save a message as an email activity without sending it to another person, forward the email with your Email to Salesforce address in the `To` field. Make sure that no other email address is in the `To`, `CC`, or `BCC` fields. Salesforce receives a copy of the email and searches the `From`, `To`, and `CC` fields in the forwarded email for the email addresses of your leads and contacts. If any leads or contacts are found, Salesforce saves the email in the Activity History related list on the appropriate record.
- If Email to Salesforce matches an email address to multiple lead or contact records in Salesforce, you can associate the email with all matching records, the oldest record, or the record with the most activity.
- If Email to Salesforce matches an email to multiple opportunity records in Salesforce, the email is included in the activity history on all matching open records.

Record IDs

- The record ID is the 15-digit, case-sensitive, alphanumeric code at the end of the URL for a record. For example, if you view the detail page of a campaign record, the URL resembles this one:
`https://yourInstance.salesforce.com/701D0000000HQZy`. The record ID for this record is `701D0000000HQZy`.
- You can type record IDs on a separate line or within the email body text if surrounded by `()`, `[]`, or `{}`. For example: `(ref: 701D0000000HQZy)`. Separate multiple record IDs with commas, for example: `ref: 701D0000000HQZy, 801D0000000IRAz, 901D0000000JSBa`.

EDITIONS

Handle Emails That Email to Salesforce Doesn't Assign to Records

When emails are sent to Salesforce via Email to Salesforce or Salesforce for Outlook, some are assigned to related records based on your Email to Salesforce settings. The rest are added to My Unresolved Items, where you assign them to related Salesforce records or confirm that you want to leave them unassigned.

1. Access your unassigned emails in My Unresolved Items.
2. Choose one of these actions.
 - Assign to related records: Enter a related record in one or both fields. If you need to, select the correct record type from the drop-down list. If you assign a lead, you can't assign more records. To cancel an assignment, clear an entry.
 - Leave unassigned: The text *Unresolved Email*: is removed from the subject line, and the email is assigned to you as a completed task. If the task's `STATUS` picklist includes more than one "completed" status, Salesforce uses the first one.
3. Save your changes.

Assigned emails are added to the associated records. All modified items are removed from the list.

Using Salesforce-Integrated Email FAQs

Can I use Salesforce to send mass emails?

If you want to send mass marketing emails, we suggest using a third-party application in the [AppExchange](#) that allows you to centrally manage email campaigns and track the responses back to Salesforce. This allows your marketing team to track the number of qualified leads and ROI for their email campaigns.

If you want to send mass sales emails, in Salesforce click **Contacts**. Then, in the Tool section, choose **Mass Email Contacts**, and follow the Mass Email wizard.

SEE ALSO:

- [General Importing Questions](#)
- [Send Mass Email in Salesforce Classic](#)
- [Can I use Salesforce to send HTML emails?](#)

Can I use Salesforce to send HTML emails?

Yes, you can use Salesforce to send HTML emails to contacts, leads, person accounts, and users in your organization. You can send emails to individuals, send mass emails to multiple contacts, and set up templates for HTML emails you send frequently.

Generating Form Letters with Templates

Mail Merge

A mail merge is the process of generating form letters and other Microsoft® Word documents that are personalized for the recipient, who is often a contact or lead. The content of each document is predefined in a mail merge template. Mail merge templates include variables called merge fields where data from your Salesforce records—for example a contact's name and address—displays in the generated document.

 **Important:** When [Salesforce disables TLS 1.0](#), we're ending support for standard Mail Merge. This change means that sales reps can no longer generate mail merge documents in Microsoft® Word. Even if reps are able to access the feature, Salesforce no longer provides support or maintenance when there is an issue. But don't worry! Reps can continue running mail merges with Salesforce data when you migrate them to [Extended Mail Merge](#).

 **Note:** Standard mail merge requires:

- Microsoft® Internet Explorer® versions 9, 10, and 11
- Microsoft Word 2003 or 2007
- Microsoft Windows® XP and Windows Vista® (32-bit only) - Until [Salesforce disables TLS 1.0](#).

EDITIONS

This feature is available in both Salesforce Classic and Lightning Experience

Available in all editions

Generating Single Mail Merge Documents

To generate a Microsoft Word document for an individual record, open the record's detail page and click **Mail Merge** on the Activity History related list.

Generating Mass Mail Merge Documents

To generate Microsoft Word documents for multiple records, such as when sending a mass mailing, see the [Salesforce Bulk Mail Merge Process](#) document.

Alternatively, if Extended Mail Merge has been enabled for your organization you can easily generate mail merge documents—such as form letters with matching envelopes and address labels—for multiple records at the same time.

SEE ALSO:

[Installing the Mail Merge ActiveX Control](#)

[Generate Mass Mail Merge Documents with Extended Mail Merge](#)

[Send a Single Mail Merge Document](#)

Installing the Mail Merge ActiveX Control

When Salesforce disables TLS 1.0, we're ending support for Standard Mail Merge. To continue creating mail merges with your Salesforce data, contact Salesforce Customer Support to enable Extended Mail Merge..

 **Important:** When [Salesforce disables TLS 1.0](#), we're ending support for standard Mail Merge. This change means that sales reps can no longer generate mail merge documents in Microsoft® Word. Even if reps are able to access the feature, Salesforce no longer provides support or maintenance when there is an issue. But don't worry! Reps can continue running mail merges with Salesforce data when you migrate them to [Extended Mail Merge](#).

With standard mail merge, the first time you generate a mail merge document you must install an ActiveX control that helps Salesforce communicate with Word. **You must be logged in as a Windows user with sufficient administrative privileges to download ActiveX controls.** If you are unable to download ActiveX controls, contact your IT department or Windows system administrator for assistance.

Standard mail merge requires:

- Microsoft® Internet Explorer® versions 9, 10, and 11
- Microsoft Word 2003 or 2007
- Microsoft Windows® XP and Windows Vista® (32-bit only) - Until [Salesforce disables TLS 1.0](#).

Configure your Web browser to accept ActiveX controls as follows:

1. Click **Tools > Internet Options** to open the Internet Options dialog.
2. Go to the Security tab.
3. Click the icon for the **Internet** zone, then click **Custom level**.
4. In the "ActiveX controls and plug-ins" section, select **Enable** or **Prompt** for the following settings: "Download signed ActiveX controls," "Run ActiveX controls and plug-ins," and "Script ActiveX controls marked safe for scripting."
5. In the "Downloads" section, select **Enable** for the "File download" setting.
6. Click **OK**.
7. Repeat the custom level settings above for the **Trusted sites** zone.
8. Ensure that Salesforce is a trusted site by clicking the **Sites** button and looking for `https://*.salesforce.com` in the list. If it is not there, type `https://*.salesforce.com` in the text box and click **Add**. Click **OK**.
9. Go to the Advanced tab of the Internet Options dialog.
10. In the Security section at the bottom of the Settings box, confirm that "Do not save encrypted pages to disk" is blank and does not have a check mark.
11. Click **OK**.
12. You may need to restart Internet Explorer for your changes to take effect.

If you use Internet Explorer 7 or 8, the first time you perform a mail merge, the popup message `Exception: Automation server can't create object` may occur. You can disregard this message. Click **OK** to close the popup and proceed with your mail merge.

 **Note:** Extended Mail Merge does not require the installation of an ActiveX control.

Managing Templates

Your administrator can create and maintain templates for defining letterheads, sending outbound email, and generating mail merge documents.

- Letterheads define the look and feel of your HTML email templates. Your HTML email templates can inherit the logo, color, and text settings from a letterhead.
- Email templates allow you to send email to contacts, leads, and others using predefined templates.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **All Editions** except **Database.com**

- Mail merge templates allow you to create custom documents using the information from your records. For example, you can create a customized thank you letter to a specific lead.

SEE ALSO:

[Create a Letterhead](#)

[Manage Email Templates](#)

[Managing Mail Merge Templates](#)

Create Mail Merge Templates

1. Open a new blank document in Microsoft® Word 2007.
2. Use Word to compose the document so it contains the text, data, and formatting your users require.
3. Locate the text or data variables in your Word document that will change each time the template is used. For example, in the salutation “Dear Bob,” “Bob” is a variable because it will change when the letter is sent to a different person.
4. Replace each variable with the appropriate Salesforce merge field.

 **Important:** Each mail merge field label you use must be unique.

- a. Place your cursor where you want to insert a merge field.
- b. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
- c. Select **Mail Merge** in the Categories drop-down list.
- d. Select **MergeField** in the Field names box.
- e. In the Field Properties area of the Field name box, manually enter the valid merge field, such as `Opportunity_LineItem_ProductName`. To create a complete list of the standard and custom fields available in your Salesforce organization, visit the [Locate Record Field Names for Mail Merge](#) article.
- f. Click **OK**.

 **Note:** To list information about all products associated with an opportunity, insert the `Opportunity_LineItem_Start` merge field where you want to begin listing product information. Then, insert all the merge fields you want to include for each product on an opportunity. Finally, insert the `Opportunity_LineItem_End` to end the list.

5. Save your Word document.
6. Proceed to [Uploading Mail Merge Templates to Salesforce](#) on page 1631.

 **Tip:** For best results:

- Do not configure mail merge templates as “protected” or “restricted access” in Microsoft Word. Please refer to Word's help for information about protected Word documents. (In Word, press F1 to open help.)
- Do not connect mail merge templates to external data sources such as Excel worksheets or Access databases. Please refer to Word's help for information about restoring mail merge documents to what Word calls “normal Word documents.”

Modify Existing Mail Merge Templates

1. Download the [sample mail merge templates](#) and unzip the files to a convenient directory on your hard drive.
2. Review the instructions provided in `salesforce_mailmerge_templates_howto.doc`.
3. Open the desired sample template in Microsoft Word.
4. Save a copy of the sample template to your computer's desktop or other convenient location. In Word 2007, select **Save As** from the Office button then choose an appropriate file name and destination folder.

5. Optionally, customize the text and formatting of the template.

6. Press ALT+F9 to display the hidden mail merge field codes.

Each of the mail merge fields should now appear in curly braces as follows: `{MERGEFIELD Contact_FullName * MERGEFORMAT}`

7. Change or add merge fields as necessary.

- a. Place your cursor where you want to insert a merge field.

- b. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.

- c. Select **Mail Merge** in the Categories drop-down list.

- d. Select **MergeField** in the Field names box.

- e. In the Field Properties area of the Field name box, manually enter the valid merge field, such as `Opportunity_LineItem_ProductName`. To create a complete list of the standard and custom fields available in your Salesforce organization, visit the [Locate Record Field Names for Mail Merge](#) article.

- f. Click **OK**.

Note: To list information about all products associated with an opportunity, insert the `Opportunity_LineItem_Start` merge field where you want to begin listing product information. Then, insert all the merge fields you want to include for each product on an opportunity. Finally, insert the `Opportunity_LineItem_End` to end the list.

8. Save your Word document.

9. Proceed to [Uploading Mail Merge Templates to Salesforce](#) on page 1631.

Tip: For best results:

- Do not configure mail merge templates as “protected” or “restricted access” in Microsoft Word. Please refer to Word's help for information about protected Word documents. (In Word, press F1 to open help.)

[Managing Mail Merge Templates](#)

[Considerations for Using Merge Fields in Mail Merge Templates](#)

[Mail Merge](#)

Create Mail Merge Templates with Microsoft® Word

The Connect for Office Word add-in provides a complete list of valid merge fields for you to insert. When Salesforce disables TLS 1.0, we're ending support for Connect for Office.

-  **Important:** When [Salesforce disables TLS 1.0](#), we're ending support for Connect for Office. This change means that there's no guarantee that Connect for Office can establish a connection between Salesforce and Microsoft® Word or Excel. Even if sales reps can establish a connection, Salesforce no longer provides support or maintenance when there's an issue.

-  **Important:** Each mail merge field label you use must be unique.

1. Open Microsoft Word.

2. **If you use** **You'll**

Word 2003 or earlier	Select Log In from the Salesforce drop-down menu on the toolbar.
Word 2007	Open the Salesforce tab on the Ribbon, click the Merge Fields drop-down menu, and then select Log In .

3. Enter your Salesforce username and password.

4. Click **Login**.

-  **Note:** When you are successfully logged in and have an active session, the **Log In** command in the drop-down button is disabled. To log out, click **Log Out**.

5. Create your mail merge template from an existing or blank Word document.

6. Place your cursor where you want to insert a Salesforce merge field. To replace an existing merge field, select the entire merge field in your template. Mail merge fields must be unique.

7. In Word 2003 and earlier, select **Insert Merge Field** from the **Salesforce** drop-down menu. In Word 2007, click the **Merge Fields** drop-down menu at the Salesforce tab on the Ribbon, and then select **Insert Merge Field**.

8. In the Insert Merge Fields dialog, select a field type and then select the merge field you want to insert. If you use products in Salesforce, see [Including Opportunity Product Data in Mail Merge Templates](#) on page 1630.

9. Click **Insert** to add the merge field at your current cursor position in your Word document.

10. Insert additional merge fields as desired to build your mail merge template.

11. After your mail merge template is complete, upload it to Salesforce from Setup by entering *Mail Merge Templates* in the Quick Find box, then selecting **Mail Merge Templates**.

EDITIONS

Including Opportunity Product Data in Mail Merge Templates

Products are available in Professional, Enterprise, Unlimited, Performance, and Developer Editions. To add opportunity product data to your mail merge template, in the Insert Merge Fields dialog select Opportunity Line Item Fields and then select the fields to insert. This inserts a table with the selected merge fields and special “start” and “end” fields. (You can download sample [default mail merge templates](#) which include a table of opportunity product data.) You can modify this table as needed, but the `Opportunity_LineItem_Start` merge field must be before all opportunity product merge fields and the `Opportunity_LineItem_End` merge field must be after all opportunity product merge fields. These start and end fields trigger Salesforce to list all of the products on the opportunity.

If you also want to insert product merge fields into the table of opportunity product merge fields, you can do so manually without using the Salesforce Word add-in:

1. In your Word document, place your cursor where you want to insert the merge field.
2. In Word 2003 and earlier, select **Insert** and then **Field** from the Word menu bar. In Word 2007, select the Insert tab on the Ribbon, click **Quick Parts** in the Text group, and then click **Field**.
3. Select **Mail Merge** in the Categories drop-down list.
4. Select **MergeField** in the Field names box.
5. In the Field name box in the Field Properties area, enter the merge field name manually, such as `Opportunity_LineItem_ProductName`.
6. Click **OK**.

Uploading Mail Merge Templates to Salesforce

Administrators and users with the “Manage Public Templates” permission must upload completed Microsoft Word mail merge templates to Salesforce to make them available for use.

 **Tip:** Before uploading a template, we recommend reviewing [Guidelines for Uploading Mail Merge Templates](#).

1. In Salesforce, from Setup, enter *Mail Merge Templates* in the **Quick Find** box, then select **Mail Merge Templates**.
2. Click **New Template**.
3. Enter a name and description for the template. This will help users correctly choose a template when generating mail merge documents.

If your organization uses Extended Mail Merge, choose the appropriate document type: *Document, Label, or Envelope*.
4. Click **Browse** to select your Word mail merge template.
5. Click **Save** to finish.

SEE ALSO:

- [Managing Mail Merge Templates](#)
- [Merge Fields Overview](#)
- [Mail Merge](#)

Using Letterheads

A letterhead defines the logo, page color, and text settings for your HTML email templates. For best results, create a single letterhead to use for all your HTML email templates. You can create letterheads and make them available organization-wide.

To use letterheads, from Setup, enter *Letterheads* in the **Quick Find** box, then select **Letterheads**.

From the Letterheads list page:

- To view a letterhead, select the name from the list.
- To edit a letterhead, click the name from the list and choose one of the edit options: **Edit Properties** or **Edit Letterhead**.
- To delete a letterhead, click **Del** next to the name. You cannot delete a letterhead that is used in any HTML email templates.

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or change letterheads:

- “Manage Letterheads”

Create a Letterhead

Letterheads define the look and feel of your HTML email templates. Your HTML email templates can inherit the logo, color, and text settings from a letterhead.

A letterhead consists of properties and details. The properties are only visible inside your organization; they help users identify a letterhead. The details are applied to an email when using that letterhead. Use the letterhead wizard to create both the properties and details of your letterhead.

1. From Setup, enter *Letterheads* in the **Quick Find** box, then select **Letterheads**.
2. Click **New Letterhead**.

Setting Letterhead Properties

1. Check **Available For Use** if you would like users to be able to use the new letterhead immediately.
2. Enter a **Letterhead Label**. The label is used to refer to the letterhead on user interface pages.
3. If necessary, change the **Letterhead Unique Name**. This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Letterhead Unique Name** field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
4. Enter a description for this letterhead. The name and description fields are for internal use only to describe the letterhead to other users.
5. Click **Save**. The letterhead detail page appears.

Setting Letterhead Details

1. Set the attributes for the letterhead.
 - Click **Edit Background Color**, and enter a color for the background of your letterhead. Click the color picker button to choose a color.
 - Click **Edit Header Properties**, and select the color, alignment, and height for the top section of the letterhead.
 - Click **Select Logo** to include an image of your company logo in the top or bottom section of the letterhead.

 **Note:** You must upload the logo image to the Documents tab before you can add it to the letterhead. Make sure the document is marked as an **Externally Available Image** so it is visible to non-Salesforce users when it is received in an email. For more information, see "Upload and Replace Documents" in the Salesforce Help.

To select an image, choose a folder, and click the document name to attach the document. Alternatively, click **Search in Documents**, and enter the file name to search for documents by name.

- Click **Remove Logo** to delete the image from the letterhead.
- Click **Edit Top Line**, and enter a color and height for a horizontal line below the header. Click the color picker button to choose a color.
- Click **Edit Body Colors**, and enter the background color for the main body of your letterhead.
- Click **Edit Middle Line**, and enter a color and height for the middle border in your letterhead. Click the color picker button to choose a color.
- Click **Edit Footer Properties**, and select a color, alignment, and height for the bottom section of the letterhead.
- Click **Edit Bottom Line**, and select a color and height of a bottom horizontal line. Click the color picker button to choose a color.

Available in all editions

USER PERMISSIONS

To create or change letterheads:

- "Manage Letterheads"

2. Optionally, click **Preview** to display the letterhead in a separate browser window.
3. Click **Save**.

To create an HTML email template that contains the settings in your letterhead, see [Create HTML Email Templates](#) on page 1966.

SEE ALSO:

[Manage Email Templates](#)

[Create Custom HTML Email Templates](#)

Letterhead Fields

Here is a description, in alphabetical order, of the fields that appear on the Letterhead Detail page.

Field	Description
Available For Use	Check mark that indicates the letterhead can be applied to an HTML template.
Created By	Name of the user who created the letterhead, including the date and time.
Description	Text that helps distinguish this letterhead from others.
Letterhead Label	Internal name to identify the letterhead.
Letterhead Unique Name	This is a unique name used to refer to the component when using the Force.com API. In managed packages, this unique name prevents naming conflicts on package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the <code>Letterhead Unique Name</code> field, a developer can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
Modified By	Name of the user who last modified the letterhead, including the date and time.
Namespace Prefix	The namespace prefix used by the email template within the API.

[Create a Letterhead](#)

Manage Email Templates

In Salesforce Classic, you can create four different types of email templates: text, HTML with letterhead, custom, and Visualforce. All of these email templates can include text, merge fields, and attached files. You can also include images on your HTML and Visualforce templates. You can use email templates when you send an email from the Activity History related list of a record. Text and HTML templates can also be used when you send mass email. A button to check the spelling of your template is available for text templates and Visualforce templates without HTML tags.

- **Text** - All users can create or change text email templates. See [Create Text Email Templates](#) on page 1636.
- **HTML with letterhead** - Administrators and users with the “Edit HTML Templates” permission can create HTML email templates based on a letterhead. See [Create HTML Email Templates](#) on page 1966.
- **Custom HTML** - Administrators and users with the “Edit HTML Templates” permission can create custom HTML email templates without using a letterhead. You must either know HTML or obtain the HTML code to insert in your email template. See [Create Custom HTML Email Templates](#) on page 1965.
- **Visualforce** - Administrators and developers can create templates using Visualforce. Visualforce email templates allow for advanced merging with a recipient's data, where the content of a template can contain information from multiple records. See [Create Visualforce Email Templates](#).

 **Note:** You can't send a mass email using a Visualforce email template.

To access your email templates, do one of the following:

- If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
- If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Click the name of any email template to go to the [Viewing Email Templates](#) page.
- To edit or delete a template, click **Edit** or **Del** next to the template name in the list.
- Click **New Template** to create any type of email template.

 **Note:** Email templates used in the following features must be both public and active:

- Web-to-Lead
- Web-to-Case
- Email-to-Case or On-Demand Email-to-Case
- Assignment rules
- Escalation rules
- Auto-response rules

To create or change HTML email templates:

- “Edit HTML Templates”

To create or change Visualforce email templates:

- “Customize Application”

To create or change public email template folders:

- “Manage Public Templates”

Viewing Email Templates

To view a template, click the template name in the list. The options vary depending on the template type (custom, HTML, Visualforce, or text):

- For text templates, click **Edit** to change the message content, subject, or merge fields.
- For custom and HTML templates:
 - Change the content or merge fields of the HTML version by clicking **Edit HTML Version**.
 -  **Note:** All custom and HTML email templates include a text-only version for recipients who can't view HTML emails. If you leave the text-only version blank, the text-only version is generated automatically when you edit the HTML version.
 - Change the content or merge fields of the text-only version by clicking **Edit Text Version**.
 -  **Warning:** We recommend that you leave the text-only version blank. If you leave it blank, Salesforce automatically creates the text-only content based on the current HTML version. If you enter content manually, subsequent edits to the HTML version aren't reflected in the text-only version.
- For Visualforce templates:
 - Change the markup of the template page by clicking **Edit Template**.
 - The Visualforce Attachments related list indicates which attachments are being generated through Visualforce markup.
 - If the Visualforce markup references components in installed managed packages, the Version Settings related list shows the package versions of the installed packages containing the components. Some kinds of components in installed managed packages can include another class, a trigger, or a custom object.
 - If the email template includes encrypted data, remember that the data is displayed as encrypted within the generated email and in the Visualforce template page. For security reasons, it isn't displayed in plain text.
- View a sample of the template populated with data from records you choose and send a test email by clicking **Send Test and Verify Merge Fields**.
- Click **Attach File** from the Attachments related list. The attached file is included in every email based on the template.

To select a file:

 - To search for files in the Documents tab, click the **Search in Documents** link. If you select an image logo or other graphics file, mark the document `Externally Available` on the Documents tab.
 - Alternatively, select a file from your computer or from a document folder by choosing an option from the **File Location** drop-down list.
- If you have the "Manage Public Templates" permission, you can click **[Change]** next to the `Author` field to select a different author. By default, the author is the person who created the email template.
- Remove the template by clicking **Delete**.
- Clone a template by clicking **Clone**. For more information, see [Clone Email Templates](#) on page 1639.
- If "Developer Mode" is enabled, see what components the template references by clicking **Show Dependencies**.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

HTML and Visualforce email templates not available in: **Personal Edition**

USER PERMISSIONS

To create or change HTML email templates:

- "Edit HTML Templates"

To create or change Visualforce email templates:

- "Customize Application"

To create or change public email template folders:

- "Manage Public Templates"

Create Text Email Templates

You can create plain-text email templates to send to recipients who can't read HTML email.

- Do one of the following:
 - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
 - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Click **New Template**.
- Choose the **Text** template type, and click **Next**.
- Choose a folder in which to store the template.
- To make the template available for use, select the **Available For Use** checkbox.
- Enter a name in **Email Template Name**.
- If necessary, change the **Template Unique Name**. This unique name refers to the component when you use the Force.com API. In managed packages, this unique name prevents naming conflicts in package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Template Unique Name** field, you can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
- If desired, choose a different character set from the **Encoding** drop-down list.
- Enter a **Description** for the template. Both template name and the description are for your internal use only.
- Enter a **Subject** for the message.
- Enter the text of the message.
- If desired, enter merge fields in the template subject and text body. When you send an email, these fields are replaced with information from your records.
- Click **Save**.

Tip: View a sample of the template populated with data from records you choose and send a test email by clicking **Send Test and Verify Merge Fields**.

Attach Files to Templates

To add an attachment to a template:

- Do one of the following:
 - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
 - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Select a template.
- Click **Attach File** from the email template detail page.

Using the Format Toolbar

Use the formatting toolbar to edit text in HTML. Select the text you wish to format and click the appropriate option described below:

Option	Description
Font	Choose a character style. Select the text you want applied to a font and then choose the appropriate font.
Size	Choose a character size. Select the text you want applied to the size and then choose the size.
	Insert a graphic from the documents library. This option is not available when doing some actions such as creating custom home page components.
	Choose a background color
	Choose a font color
	Make text bold
	Make text italic
	Underline text
	Insert a new hyperlink or edit an existing link. Select the text you want to link, click this button, and enter the URL for the link. To use a merge field such as <code>{ !Case_Link }</code> as the destination of the link, insert the merge field after the http:// .
	Left justify text
	Center text
	Right justify text
	Bullet a list
	Number a list
	Increase text indent
	Decrease text indent

Create Custom HTML Email Templates

You can create custom HTML email templates without using letterhead. If you don't know HTML, you can paste HTML code into your template.

- Do one of the following:
 - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
 - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
- Click **New Template**.
- Choose **Custom (without using Letterhead)** and click **Next**.
- Choose a folder in which to store the template.
- To make the template available for use, select the **Available For Use** checkbox.
- Enter a name in **Email Template Name**.
- If necessary, change the **Template Unique Name**. This unique name refers to the component when you use the Force.com API. In managed packages, this unique name prevents naming conflicts in package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the **Template Unique Name** field, you can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
- If desired, choose a different character set from the **Encoding** drop-down list.
- Enter a **Description** for the template. Both template name and the description are for your internal use only. The description is used as the title of any email activities you log when sending mass email.
- Click **Next**.
- Enter a **Subject** for the message.
- Enter the HTML source text for the message. Include all the HTML tags.

 **Note:** If you are including an image, we recommend uploading it to the Documents tab. Then you can reference the copy of the image on our server. For example:

```

```

- If desired, enter merge fields in the template subject and body. When you send an email, these fields are replaced with information from your lead, contact, account, opportunity, case, or solution.
- Click **Next**.
- If desired, enter the text-only version of your email or click **Copy text from HTML version** to paste the text from your HTML version without the HTML tags automatically. The text-only version is available to recipients who can't view HTML emails.

 **Warning:** We recommend that you leave the text-only version blank. If you leave it blank, Salesforce automatically creates the text-only content based on the current HTML version. If you enter content manually, subsequent edits to the HTML version aren't reflected in the text-only version.

EDITIONS

Clone Email Templates

Cloning an email template involves saving an existing email template with a new name.

1. Do one of the following:
 - If you have permission to edit public templates, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**.
 - If you don't have permission to edit public templates, go to your personal settings. Enter *Templates* in the **Quick Find** box, then select **Email Templates** or **My Templates**—whichever one appears.
2. Click the name of an email template in the list.
3. Click **Clone**.
4. Choose a folder in which to store the template.
5. To make the template available for use, select the **Available For Use** checkbox.
6. Enter a name in **Email Template Name**.
7. Enter a **Description** for the template. Both template name and the description are for your internal use only.
8. Click **Save**.

HTML and Visualforce email templates not available in: **Personal Edition**

USER PERMISSIONS

To create or change HTML email templates:

- "Edit HTML Templates"

To create or change Visualforce email templates:

- "Customize Application"

To create or change public email template folders:

- "Manage Public Templates"

Adding Images to Email Templates

You can include images or logos on your HTML and Visualforce email templates. For HTML with letterhead templates, logos or images come from the [letterhead](#) you choose when creating the template.

When creating custom HTML or Visualforce templates, simply include `img` tags that reference the image. We recommend uploading the images to the Documents tab and referencing the copy of the image on the Salesforce server. For example, for HTML:

```

```

Visualforce example:

```
<apex:image id="Logo"
value="https://yourInstance.salesforce.com/servlet/servlet.ImageServer?
id=015D0000000Dpwc&oid=00DD0000000FHAG&lastMod=1270576568000"
height="64" width="64"/>
```

Email Template Fields

An email template has the following fields, listed in alphabetical order.

Field	Description
API Version	(Visualforce email templates only) Displays the version number of the Force.com API the template was created under.
Author	The person who created the template.

EDITIONS

Available in: Salesforce Classic

Available in: **All Editions**

Mass email not available in: **Personal, Contact Manager, and Group Editions**

HTML and Visualforce email templates not available in: **Personal Edition**

USER PERMISSIONS

To create or change HTML email templates:

- "Edit HTML Templates"

To create or change Visualforce email templates:

- "Customize Application"

To create or change public email template folders:

- "Manage Public Templates"

Field	Description
Available for Use	Indicates if users can use the template when sending emails.
Created By	The name of the user who created the template.
Description	Description of the template. This text is used as the title of any activities logged when sending mass email. The Activity History item displays as "Mass Email: {Template Description}".
Template Unique Name	This unique name refers to the component when you use the Force.com API. In managed packages, this unique name prevents naming conflicts in package installations. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. With the <code>Template Unique Name</code> field, you can change certain components' names in a managed package and the changes are reflected in a subscriber's organization.
Email Layout	(HTML email templates only) Name of the column layout sample that decides the text columns.
Encoding	Indicates the character set for the email template.
Folder	The place where the template is stored.
Last Used Date	The most recent date that any user sent an email using the template.
Letterhead	(HTML email templates only) Name of the letterhead that decides the logo, colors, and text settings. See Letterhead Fields on page 1633 for more details.
Modified By	The name of the user who last modified the template.
Namespace Prefix	The namespace prefix used by the email template within the API.
Subject	Subject of the email. This text appears in the Subject field of every email sent with this template. It is also used as the title of an activity logged when sending a single email. The Activity History item displays as "Email: {Template Subject}". The subject is not stored in Activity History items that you log when sending mass email.
Email Template Name	Name to identify the template.
Text Body	Body of the email. This text appears in the body of every email sent with this template. The maximum size is 384 KB.
Times Used	The total number of times that users have sent emails using the selected template. This includes single and mass emails.

Merge Fields for Cases

The list of available merge fields depends on the type of data that you're working with. Most of the merge fields for cases correspond directly with a case field. This table explains the more advanced merge fields that represent values derived from processing a case record.

Field	Merge Field	Description
Articles as PDFs	Case.Articles_as_PDFs	Articles associated with the case converted to PDF attachments. In the Emails related list on the case detail page, users can click Send an Email and choose a template containing this merge field. The attachments can be previewed or deleted before the email is sent.
Email Thread	Case.Email_Thread	A thread of all emails where the case contact is a sender or recipient (To, CC, or BCC). The emails are listed in reverse chronological order so the most recent emails appear at the top of the thread. The thread inserts the text version of the emails. You can't use this merge field in Visualforce pages. The limits for the email thread are: <ul style="list-style-type: none"> • Maximum number of emails: 200 • Email body truncation size: 32 KB
Last Case Comment	Case.Last_Case_Comment	The description of the most recent comment to be created on a case.
Solution Attachments	Case.Solution_Attachments	Attachments for the case solution..
Solution Description	Case.Solution_Description	The details of the solution associated with the case. If more than one solution is associated with the case, the description of each solution appears in a list.
Solution Subject	Case.Solution_Subject	The title of the solution associated with the case. If more than one solution is associated with the case, the title of each solution appears in a list.
Solution Subject and Description	Case.Solution_Subject_and_Description	The title and details of the solution associated with the case. If more than one solution is associated with the case, the title and description of each solution appears in a list.

EDITIONS

Available in: Salesforce Classic

The available merge fields vary according to which Salesforce edition you have.

Field	Merge Field	Description
Suggested Solutions	<code>Case.Suggested_Solutions</code>	Links to the subject and description of each suggested solution that may help customers solve their issues.  Note: Sending mass emails using templates with the suggested solutions merge field can take several minutes and isn't recommended.
Case Thread Id	<code>Case.Thread_Id</code>	A unique identifier for the case email thread in Email-to-Case. The thread ID is the unique ID of each case email, such as [ref:_DV0Txx._500V0U9YB:ref]. By default, the thread ID is added to both the subject and body of case emails. The default location for the thread ID is at the end of the body. Use this merge field to position it elsewhere in the body.

Notes on Merge Fields for Cases

Merge fields for entitlements on cases

Merge fields for entitlements on cases aren't supported. For example, if you add the `Entitlement Name` `{!Case.Entitlement}` merge field to an email template, the field is not populated on the template.

Merge fields for Email-to-Case or On-Demand Email-to-Case

If you have enabled Email-to-Case or On-Demand Email-to-Case, you can create email templates that support agents can use to respond to case emails. These templates can include merge fields that display information from the original email in the response. See [Manage Email Templates](#) on page 1634.

Merge fields for Web-to-Case

To reference the name, email, phone, or company of the customer who submitted an online case with Web-to-Case, use the relevant `{!Case_OnlineCustomer...}` field. To reference the contact or account associated with a case, use the relevant contact or account merge fields.

Merge Fields for Communities

You can add merge fields to Communities email templates.

When you enable Salesforce Communities in your organization, three text-based email templates are created:

- Communities: Changed Password Email
- Communities: Forgot Password Email
- Communities: New Member Welcome Email

These templates use unique merge fields. These merge fields are not available to select and copy when editing a template, but you can enter them manually. These merge fields will only work properly if used in a text or HTML template selected for a community.

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Field Name	Description
<code>{!Community_Name}</code>	The name of the community, as entered during community creation.

Field Name	Description
<code>{!Community_Url}</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if:</p> <ul style="list-style-type: none"> The template containing this field is selected as the Welcome New Member template for a community, and Send welcome email is selected, OR The template containing this field is selected as either the Forgot Password or Change Password template and the user receiving the email is an external user who is a member of the community.
<code>{!Receiving_User.Username}</code>	The user name of the user who will receive the welcome email.

You can create custom email templates for communities using Visualforce, which allows you to use custom company branding in your email templates. For Visualforce email template, use the `$Network` global merge field type and its properties, as described in this table.

Field Name	Description
<code>\$Network.Name</code>	The name of the community, as entered during community creation.
<code>\$Network.NetworkUrlForUserEmails</code>	<p>The URL to the login page of a community. For instance, https://acme.force.com/partners/login.</p> <p>If this merge field is part of the welcome email being sent to a new external user, the URL is appended with a link to a reset password page.</p> <p>This field is populated only if it is used in a Visualforce email template for one of three email types supported for Communities.</p>

If your community is using cases, approvals, or workflows, emails created from an email template that use the `{!<any_object>.Link}` or `{!Case.Link}` merge fields include a link to the record in the community. If the user receiving the email is a member of multiple active communities, the link goes to the oldest active community. If the user is already logged in to a community and clicks the link in the email, the link goes to that community. If the user is not a member of any community, the link goes to the internal organization. If the user is a member of a portal and a community, the link goes to the community.

Field Name	Description
<code>{!Case.Link}</code>	<p>Used in:</p> <ul style="list-style-type: none"> Case comment notifications to contacts and owners Case creation and update notifications to contacts

Field Name	Description
{!<any_object>.Link}	Used in: <ul style="list-style-type: none"> Approval requests sent to approvers and delegated approvers Workflow email alerts

To find out if your email templates use these merge fields, from Setup, enter *Email Templates* in the **Quick Find** box, then select **Email Templates**, then click **Edit** next to any email template.

Generate Mass Mail Merge Documents with Extended Mail Merge

 **Note:** You can generate mail merge documents using the Extended Mail Merge feature. Extended Mail Merge is available by request only. Contact Salesforce Customer Support if you are interested in this feature.

In addition, your administrator must activate the feature before you can use Extended Mail Merge.

With Extended Mail Merge, you can easily generate mail merge Microsoft® Word documents—such as form letters with matching envelopes and address labels—for multiple records at the same time.

1. Click the accounts, contacts, or leads tab. Other kinds of records are not currently supported.
2. In the Tools area, click **Mass Mail Merge** to start the mass mail merge wizard.
3. Choose an appropriate list view from the **view** drop-down list.
4. Select the records to include in the mail merge. To select all records currently displayed on the page, select the checkbox in the column header.
5. Click **Next**.
6. Select the types of Word documents you'd like to generate. The supported document types are documents, envelopes, and labels.
7. Select the **Log an activity...** checkbox to log the generation of these mail merge documents by adding a completed task on each record.
8. Click **Next**.
9. Select the appropriate [mail merge templates](#).
For documents, choose whether to create one Word document that includes all output or a separate Word document for each record.
10. Optionally, click **Preview Template** to review the Word document with merge fields but without your data. Note that although you can edit the Word document that opens, those changes won't be applied to your current mail merge request. To make a newly revised template available for mail merge, it must be [uploaded](#) first.

EDITIONS

This feature is available in both Salesforce Classic and Lightning Experience

Available in all editions

USER PERMISSIONS

To generate mass mail merge documents:

- "Manage Public Documents"

11. Click **Finish**.

-  **Note:** If your request exceeds the maximum size limit for Extended Mail Merge, you're prompted to select either fewer records or smaller templates.

Salesforce sends you an email when your generated documents are ready. When mail merge documents are:

- Under 3 MB, Salesforce sends them to your email as either Word document (.doc) or Zip file (.zip) attachments. If the attachment size exceeds your organization's maximum email attachment size, or your administrator has set all mail merge documents to be saved to the Documents tab, Salesforce automatically saves your generated documents to the Documents tab. You'll receive an email with a link to the document's location.
- Over 3 MB, Salesforce saves them to your personal documents folder on the Documents tab.

Mail Merge Considerations

Extended Mail Merge supports the following additional environments: the Mozilla Firefox Web browser and the Apple Mac OS. Furthermore, it doesn't require the installation of an ActiveX control.

Extended Mail Merge supports Microsoft Word 2007.

- Extended Mail Merge does not support templates saved in .docx or .dotx file formats.
- Mail merge documents give you access only to the fields that are accessible to you via your page layout and field-level security settings.
- Extended mail merge doesn't support formatting from rich text area fields.
- Using mail merge from a record detail page automatically triggers standard workflow and validation rules for that record. Using Extended Mail Merge, however, doesn't trigger those rules.
- With Extended Mail Merge, a mail merge operation can't exceed the following limits:
 - 1,000 records
 - The selected mail merge template(s) total size can't be larger than 1 MB.
 - For mass mail merges, the number of selected records multiplied by the combined sizes of the selected mail merge templates can't be larger than 50 MB.
- When you preview a mail merge document, you see only the template. The preview doesn't populate merge fields with your data because there's no record detail available to the preview template.

SEE ALSO:

[Mail Merge](#)

[Send a Single Mail Merge Document](#)

Send a Single Mail Merge Document

Create mail merge documents using fields supported objects.

-  **Important:** When [Salesforce disables TLS 1.0](#), we're ending support for standard Mail Merge. This change means that sales reps can no longer generate mail merge documents in Microsoft® Word. Even if reps are able to access the feature, Salesforce no longer provides support or maintenance when there is an issue. But don't worry! Reps can continue running mail merges with Salesforce data when you migrate them to [Extended Mail Merge](#).

EDITIONS

This feature is available in both Salesforce Classic and Lightning Experience

Available in all editions

1. Click **Mail Merge** in the Activity History related list on the appropriate record. Accounts, contacts, leads, cases, opportunities, and custom objects are supported.

Note: With standard mail merge, the first time you create a mail merge document you must install an ActiveX control that helps Salesforce communicate with Word. For more information, see [Installing the Mail Merge ActiveX Control](#) on page 1625.

2. Use the lookup to specify the record from which information will be merged.
3. Select a mail merge template.
4. Click **Generate**.

If the custom object has a master-detail relationship with opportunities, the primary contact for the opportunity is selected by default.

5. Salesforce then generates your document:

- If your organization uses standard mail merge, Word opens with your generated document. When the document displays, choose **Save As** from the **File** menu to save the document to your hard drive.
- If your organization uses Extended Mail Merge and your request exceeds the maximum size limit, you are prompted to select a smaller mail merge template. With Extended Mail Merge, Word does not open when you click **Generate**. Instead, Salesforce sends you an email that either includes your generated Word document as an attachment or provides a link to it on the Documents tab.

6. If you chose to log an activity for the mail merge, enter the task information, and optionally create a follow-up task.

The `Subject` of the mail merge task is set to the mail merge template name by default, and the task is displayed as a completed activity in the Activity History related list. The merged document is not stored with the task.

You can log an activity for mail merge if you have access to view or edit the record you are merging and are able to create tasks (that is, you have the “Edit Task” permission).

7. Print and mail your document or send it as an email attachment.

Mail Merge Considerations

Extended Mail Merge supports the following additional environments: the Mozilla Firefox Web browser and the Apple Mac OS. Furthermore, it doesn't require the installation of an ActiveX control.

Extended Mail Merge supports Microsoft Word 2007.

- Extended Mail Merge does not support templates saved in `.docx` or `.dotx` file formats.
- Mail merge documents give you access only to the fields that are accessible to you via your page layout and field-level security settings.
- Extended mail merge doesn't support formatting from rich text area fields.
- Using mail merge from a record detail page automatically triggers standard workflow and validation rules for that record. Using Extended Mail Merge, however, doesn't trigger those rules.
- With Extended Mail Merge, a mail merge operation can't exceed the following limits:
 - 1,000 records
 - The selected mail merge template(s) total size can't be larger than 1 MB.
 - For mass mail merges, the number of selected records multiplied by the combined sizes of the selected mail merge templates can't be larger than 50 MB.

- When you preview a mail merge document, you see only the template. The preview doesn't populate merge fields with your data because there's no record detail available to the preview template.

Connect Offline

Force.com Connect Offline

With Force.com Connect Offline, work on your key deals anywhere, any time—totally unplugged.

Connect Offline is a client application that lets you access a subset of Salesforce records using the same browser-based interface as the online system but without an Internet connection. Use Connect Offline to view, edit, create, and delete accounts, activities, contacts, opportunities, leads, and custom object records (including relationship groups). You can also add and update products and schedules on opportunities.

The subset of Salesforce records accessible in Connect Offline is referred to as a *briefcase*.

Administrators can create *briefcase configurations*, which are sets of parameters that determine the records available in the briefcases of users with a specific profile. Organizations can have multiple briefcase configurations and associate each with a different set of profiles to simultaneously suit

the needs of various types of offline users. For example, one configuration might include leads and opportunities in the briefcases of users with a Sales Representative profile, while another configuration includes accounts and related opportunities in the briefcases of users with an Account Executive profile. Users without an assigned briefcase configuration can [configure the settings for their own Connect Offline briefcase](#) and can [manually select the accounts the briefcase includes](#).

When online, users can [synchronize their Connect Offline briefcases with Salesforce](#). During synchronization, the changes to records in the briefcase are implemented in Salesforce, and vice-versa. This ensures that both Salesforce and Connect Offline have the most current records. If updates to a record in the briefcase conflict with updates to a record in Salesforce, Connect Offline displays the conflict resolution tool, which allows users to easily [resolve the conflict](#).

To start using Connect Offline today, log into Salesforce and [install the Connect Offline client application](#).

SEE ALSO:

[Install Connect Offline](#)

[What is Your Default Connect Offline Briefcase Contents?](#)

[Log in to Connect Offline](#)

[Tabs Available in Connect Offline](#)

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Log in to Connect Offline

1. On your computer, click **Start > Programs > salesforce.com > Connect Offline**, or double-click the Connect Offline desktop icon.

 **Important:** The first time you log into Connect Offline, you must have an Internet connection.

2. Enter your Salesforce username and password.

 **Note:** If your organization restricts IP addresses, logins from untrusted IPs are blocked until they're activated. Salesforce automatically sends you an activation email that you can use to log in. The email contains a security token that you must add to the end of your password. For example, if your password is *mypassword*, and your security token is *XXXXXXXXXX*, you must enter *mypasswordXXXXXXXXXX* to log in.

3. Select the `Update tab names` checkbox if you want Connect Offline to reflect any changes to the names of fields, objects, and tabs in Salesforce since the last time you selected this option.

 **Note:** Salesforce automatically updates your tabs the first time you log in.

4. Select the `Synchronize my data` checkbox to synchronize your Connect Offline briefcase with Salesforce.
5. Click **Login**.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

User Permissions Needed

To view records in Connect Offline:

- "Read" on the appropriate type of record such as accounts, contacts, or opportunities

To update records in Connect Offline:

- "Create," "Edit," or "Delete" on the appropriate type of record such as accounts, contacts, or opportunities

Briefcase Configuration

Manage Connect Offline Briefcase Configurations

Connect Offline *briefcase configurations* are sets of parameters that determine the records available in the briefcases of both individual users as well as users with a specific profile. You can create multiple briefcase configurations and associate each with different users and profiles to simultaneously suit the needs of various types of offline users. For example, one configuration might include leads and opportunities for sales representatives, while another configuration includes accounts and related opportunities for account executives.

Users without assigned briefcase configurations see the [default briefcase contents](#) and can manually configure settings for their own Connect Offline briefcase; however, Salesforce recommends using briefcase configurations instead of allowing users to manually configure their own offline briefcases because briefcase configurations provide:

- Centralized configuration
- Synchronization with any custom object, as opposed to personal briefcase settings that only support custom objects related to accounts, contacts, opportunities, or leads
- The ability to define [data sets](#) with greater flexibility and filtering capabilities

To manage briefcase configurations for your organization, from Setup, enter *Offline Briefcase Configurations* in the **Quick Find** box, then select **Offline Briefcase Configurations**.

- To create a briefcase configuration, click **New Offline Briefcase Configuration**.
- To define a data set for an offline briefcase configuration, click the name of the briefcase configuration, then click **Edit** in the Data Sets related list.
- To make changes to a briefcase configuration, click **Edit**.
- To delete a briefcase configuration, click **Del**.
- To view details about a briefcase configuration, click its name.
- To clone a briefcase configuration, select the briefcase configuration you want to clone and click **Clone**.
- To activate a briefcase configuration, click **Edit** next to the configuration you want to activate, select **Active**, and click **Save**.
- To deactivate a briefcase configuration, click **Edit** next to the configuration you want to deactivate, deselect **Active**, and click **Save**.

 **Important:** If you deactivate an active briefcase configuration, users assigned to that configuration cannot synchronize their briefcases.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view Connect Offline briefcase configurations:

- “View Setup and Configuration”

To create, change, or delete Connect Offline briefcase configurations:

- “Manage Mobile Configurations”

Create an Offline Briefcase Configuration

1. From Setup, enter *Offline Briefcase Configurations* in the Quick Find box, then select **Offline Briefcase Configurations** to access the briefcase configurations list page.
2. Click **New Offline Briefcase Configuration**.
3. Enter a name for the briefcase configuration.
4. Select the **Active** checkbox if you want to activate the briefcase configuration immediately after you create it. The configuration does not work until you select this checkbox.
5. Enter a description for the briefcase configuration.
6. Select users and profiles from the **Available Members** box and click the **Add** arrow to assign them to the briefcase configuration. If you do not immediately see the user or profile you want to add, enter the profile name in the search box and click **Find**. You can assign each user or profile to only one briefcase configuration.

If there are users and profiles in the **Assigned Members** box you do not want to assign to the briefcase configuration, select them and click the **Remove** arrow.

 **Warning:** If you remove a user or profile from an active briefcase configuration, those users can no longer synchronize their briefcases to that configuration. The next time the users synchronize, Connect Offline synchronizes their briefcases with the [default briefcase content](#).

When you assign profiles to a briefcase configuration, the configuration applies to all Connect Offline users with that profile and overrides users' personal briefcase configurations.

7. Click **Save**.
8. Also, you must [create the data sets](#) for this offline briefcase configuration to determine the data that members of the configuration receive in their briefcase.

Note that your offline briefcase configuration is not active until you select the **Active** checkbox. Also, you must [create the data sets](#) for this briefcase configuration to determine the records that users with this configuration can access in Connect Offline.

USER PERMISSIONS

To create, change, or delete briefcase configurations:

- "Manage Mobile Configurations"

Define Connect Offline Data Sets

After you create a briefcase configuration, define its data sets to specify the records that users can access in Connect Offline if that briefcase configuration is assigned to their profile.

Data sets are the parameters in briefcase configurations that determine which records appear in the briefcases of users assigned to the briefcase configuration. Each data set pertains to records of a single object and is classified by the name of that object. For example, the Accounts data set only includes account records. Filters and limits within each data set let you further restrict the records the data set includes.

Data sets can have child data sets for records associated with a top-level (parent) data set. For example, if the first level of your hierarchy has an Accounts data set, you can add a Contacts child data set for all contact records related to the account records.

A single briefcase configuration can have multiple data sets for the same object and at different levels. For example, you can have an Events parent data set and an Events child data set under Leads.

To define the data sets for a briefcase configuration:

1. From Setup, enter *Offline Briefcase Configurations* in the Quick Find box, then select **Offline Briefcase Configurations**.
2. Click the name of the briefcase configuration that you want to modify.
3. In the Data Sets related list, click **Edit**.
4. From the Data Sets page, you can:
 - Add a data set.
 - Remove a data set by selecting the data set you want to remove and clicking **Remove**.
 - Edit a data set by selecting the data set you want to edit in the hierarchy. The right pane displays the filters for that data set.

As you define and modify the data sets, Salesforce automatically saves your changes.

5. In the Test Data Size section, select a user and click **Estimate Data Size** to estimate the amount of data the data sets will synchronize to a user's briefcase. Larger data sets take longer to synchronize and consume more disk space on users' computers.

 **Note:** The `select a user` field defaults to the name of the user currently logged in; however, it is important to test the data size for users who will actually be assigned to the briefcase configuration for which you are defining the data sets.

When the test completes, the Test Data Size section provides data set size summary information, and the data set hierarchy at the top of the page displays the number of records generated by each data set and the size of each data set. Use these statistics to identify data sets that might require additional filtering criteria to reduce the size.

The test statistics in the Test Data Size section do not automatically refresh if you edit the data sets. Click **Refresh Data Size** to update the test results.

6. Click **Done** when you are finished.

Adding Data Sets

To add a data set:

1. In the hierarchy, select **Data Sets** to create a parent data set, or select an existing data set to create a child data set.
2. Click **Add...**

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To view Connect Offline data sets:

- "View Setup and Configuration"

To create, change, or delete Connect Offline data sets:

- "Manage Mobile Configurations"

3. In the popup window, select the object for the records you want the data set to include. Salesforce lets you create parent data sets for all custom objects and the following standard objects:

- Accounts
- Contacts
- Events
- Leads
- Opportunities
- Products
- Tasks
- Users

For child data sets, the popup window only lists objects that relate to the selected parent data set.

 **Note:** Salesforce automatically transfers parent records of objects if that type of parent record is anywhere in the data set, even if the parent object is not connected to the child object in the hierarchy.

4. Click **OK**. The data set you created appears in the hierarchy.

5. Optionally, use filters to restrict the records that a parent or child data set includes:

- a. Use the Filter by Record Ownership options to configure Salesforce to automatically synchronize records based on the owner of the record. The possible options are:
 - **All Records:** Salesforce automatically synchronizes all records the user can access.
 - **User's Records:** Salesforce automatically synchronizes all records the user owns.
 - **User's Team's Records:** Salesforce automatically synchronizes all records owned by the user and the user's subordinates in the role hierarchy.
 - **User's Account Team's Records:** Salesforce automatically synchronizes accounts for which the user is an account team member, but does not include accounts owned by the user.
 - **User's Opportunity Team's Records:** Salesforce automatically synchronizes opportunities for which the user is an opportunity team member, but does not include opportunities owned by the user.
 - **None (Search Only):** Salesforce does not automatically synchronize any records for this data set.

Salesforce only displays options that relate to the selected data set. For example, selecting an account data set displays the **User's Account Team's Records** option, while selecting an opportunity data set displays the **User's Opportunity Team's Records** option.

If your offline needs for an object require a combination of the available record ownership filters, you can add the same object data set up to four times on the same hierarchy level. For example, a sales manager might want to synchronize his opportunities, opportunities owned by his subordinates, and opportunities for which he is an opportunity team member. In this case, you would add an opportunity data set and select **User's Team's Records**, then add a second opportunity data set at the same level in the hierarchy and select **User's Opportunity Team's Records**. Note that objects with only one ownership filter option cannot be added multiple times at the same level of the hierarchy.

- b. Set the filter criteria to automatically synchronize only records that meet specific criteria in addition to the Filter by Record Ownership option you selected. For example, you can set the filter to only include opportunity records with amounts greater than \$50,000, or contact records with the title "Buyer." Several \$User global variables are available in offline configuration filters.

Click **Add Filter Logic** to change the default AND relationship between each filter.

- c. To prevent a single data set from consuming a large amount of memory, select the second radio button under Set Max Record Limit and enter the maximum number of records this data set can transfer to a briefcase. Use the Order By and Sort drop-down lists to specify which records are synchronized if the number of records available is higher than the limit you set.

If the limit is reached, Salesforce synchronizes records in accordance with the Order By and Sort settings. For example, if the settings are Last Modified Date and Descending, Salesforce transfers the most recently modified records and removes the same number of records that were least recently modified.

If you selected the **None (Search Only)** Filter by Record Ownership option, the limit you set does not apply because no records are automatically synchronized.

Tip: Do not use Set Max Record Limit in place of filters. Only use Set Max Record Limit as a safety mechanism, and use filters as the primary means of limiting the number of records in the briefcase. This ensures that your Connect Offline users receive the correct records.

6. Click **Done** when you are finished.

Notes on Data Sets

- Connect Offline users can view opportunity contact roles in their briefcases. To add contact roles to a briefcase, include the contact data set as a child of the opportunity data set in your briefcase configuration.
- Recurring events are not available in Connect Offline.
- Each data set can synchronize a maximum of 5,000 records.
- If you add a custom object containing a custom tab icon to a data set, the look and feel of the custom tab defaults to the Star tab style in Connect Offline.
- Connect Offline does not support the Force.com app menu. If your briefcase configuration synchronizes custom objects, all the tabs for those custom objects are visible when you log into Connect Offline, even if they belong to different apps.

[Sample Offline Data Sets](#)

Add Accounts to Your Connect Offline Briefcase Manually

If an administrator doesn't assign a briefcase configuration to your profile, click the **Include Offline** button on any account detail page to manually add the account to your Connect Offline briefcase.

The next time you synchronize your briefcase, Salesforce transfers the account to Connect Offline, as well as:

- All contacts associated with the account, if you have at least read access to the contacts
- All opportunities associated with the account, if you have at least read access to the opportunities. This includes opportunities that have been shared with you, that are owned by users below you in the role hierarchy, or where you are on the opportunity team. Products and schedules for downloaded opportunities are also included.
- All the custom objects that have a master-detail relationship with the account
- Tasks and events related to the included account, according to these guidelines:
 - Events dated this month, the past two months, or up to 24 months in the future
 - All open tasks up to 24 months in the future

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

USER PERMISSIONS

To manually add accounts to Connect Offline:

- "View" on accounts

- Closed tasks with a due date this month, the past two months, or 24 months in the future
- Tasks with a blank due date that were created or modified this month or within the past two months

You can manually add up to 100 accounts in your briefcase.

 **Note:** The **Include Offline** button automatically appears on the account detail page for all Connect Offline users assigned to profiles without any briefcase configurations. You do not need to add the **Include Offline** button to account page layouts.

Removing Manually-Added Accounts from Connect Offline

You can remove manually added accounts from your briefcase as follows:

1. From your personal settings, enter *Connect Offline* in the *Quick Find* box, then select **Force.com Connect Offline**.
2. Click **Briefcase Setup**.
3. Select the checkbox next to the account to remove.
4. Click **Remove from Briefcase**.

The next time you synchronize your briefcase, Salesforce removes the account from your briefcase, as well as its related contacts, opportunities, and activities, and custom object records that have a master-detail relationship with the account.

What is Your Default Connect Offline Briefcase Contents?

If your user profile does not have an associated briefcase configuration, your default briefcase automatically includes the following:

- All of your contacts (including your private contacts) and read access to related accounts or opportunities
- All contacts associated with the accounts in your briefcase, if you have at least read access to the contacts
- All opportunities associated with the accounts in your briefcase that are either open or have a close date in the current month, the past two months, or up to 24 months in the future if you have at least read access to the opportunities. This includes opportunities that have been shared with you, that are owned by users below you in the role hierarchy, or where you are on the opportunity team. Products and schedules for downloaded opportunities are also included.
- All of your leads up to a maximum of 5000
- All custom object records that have a master-detail relationship with any account, contact, or opportunity that is included in your briefcase
- Your tasks and events, as well as tasks and events related to the accounts in your briefcase, according to these guidelines:
 - Events dated the past two months or up to 24 months in the future
 - All of your open tasks up to 24 months in the future
 - Closed tasks with a due date the past two months or up to 24 months in the future
 - Tasks with a blank due date that were created or modified this month or within the past two months

 **Note:** For tasks and events that are related to custom objects not available offline, the *Related To* field on the activity indicates that the record is not available in Connect Offline.

If your user profile does not have an associated briefcase configuration, your default briefcase also includes all accounts associated with opportunities you own; however, you can change the account selection in your briefcase to include one of the following options instead:

- Accounts that you manually include

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

- Accounts related to the activities in your briefcase
- All your accounts

To edit your account selections, edit **Briefcase Setup**.

Change Your Connect Offline Briefcase Account Selection

If an administrator does not assign a briefcase configuration to your profile, your briefcase contains the [default briefcase contents](#), which includes accounts that are associated with opportunities you own, accounts that you [manually include](#), and accounts related to your contacts. To change the selection of accounts in your Connect Offline briefcase:

1. From your personal settings, enter *Connect Offline* in the `Quick Find` box, then select **Connect Offline**.
2. Click **Briefcase Setup**.
3. Click **Edit** next to Briefcase Settings.
4. Choose one of the following options to specify the accounts you want to include in your briefcase:
 - Manually selected — Up to 100 accounts that you [manually include](#) by clicking the **Include Offline** button on the account detail page, and accounts related to your contacts.
 - Opportunity-based briefcase — Up to 5000 accounts that are associated with opportunities you own (in addition to accounts that you [manually include](#) and accounts related to your contacts). The following restrictions apply:
 - You must have at least read access to the account.
 - The opportunity must be open or have a close date in the past two months or up to 24 months in the future.
 Opportunity-based briefcase is the default briefcase configuration.
 - Activity-based briefcase — Up to 5000 accounts related to the activities in your briefcase (in addition to accounts that you [manually include](#) and accounts related to your contacts).
 - All my accounts — Up to 5000 accounts you own or where you are on the account team (in addition to accounts that you [manually include](#) and accounts related to your contacts).
5. Click **Save**.

Important: If an administrator assigns a briefcase configuration to your profile after you change the selection of accounts in your briefcase, the assigned briefcase configuration overrides your briefcase account selection the next time you synchronize Connect Offline.

Synchronize Your Briefcase

When using Connect Offline with an Internet connection, you can synchronize your briefcase with Salesforce. During synchronization, Connect Offline updates Salesforce to reflect any changes you made to your briefcase records while offline. Connect Offline also updates your briefcase records to reflect any changes in Salesforce since your last synchronization. This ensures that both Salesforce and Connect Offline have the most current records.

Your briefcase automatically synchronizes the first time you log into Connect Offline. When you are using Connect Offline with an Internet connection, you can synchronize your briefcase anytime by clicking **Synchronize Briefcase** in the upper right corner of the browser window.

Data conflicts can occur during synchronization if a user modified an online record that you also modified offline. If updates to a record in your briefcase conflict with updates to a record in Salesforce, Connect Offline displays the Conflict Resolution tool, which allows you to easily [resolve the conflicts](#). If you do not want to resolve the conflicts at that time, click **Cancel** to exit the Conflict Resolution tool. You can return to the Conflict Resolution tool later by clicking the link in the Errors section of the Connect Offline Home tab.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Emptying Your Briefcase

The **Empty Briefcase** link in the upper right corner of the browser window resets Connect Offline to its initial state.

Warning: If you click the **Empty Briefcase** link, Connect Offline deletes all of your briefcase files and settings. Only empty your briefcase if you change the time zone on your computer or if your administrator requests you to do so.

Resolve Connect Offline Conflicts

When you synchronize, data conflicts occur if a user modified the same record in Salesforce that you modified in Connect Offline. For example, a conflict occurs if you change a contact's phone number in Connect Offline and another user changes that contact's address in Salesforce before you synchronize.

When a conflict occurs, Connect Offline displays a conflict resolution tool that enables you to resolve the conflict by identifying the most recent and correct values. The left side of the window displays a list of the records that have data conflicts, while the right side of the dialog box displays the fields that have conflicting data for the record you select in the left side.

To use the conflict resolution tool:

1. In the left pane, use the drop-down list to choose whether to display records in a tree or list view, then choose the record that you want to resolve.
2. In the right pane, use the drop-down list to choose whether to display all fields on the record or only those that have conflicting data, then select the radio button next to the correct value.
3. If necessary, click the pencil icon () and manually enter the value you want to save.

Note: The pencil icon is not available for read-only fields on some objects, such as products or opportunities.

4. Repeat these steps for each record listed in the left pane. When you have selected a value to resolve the conflict, the status of the record in the left pane displays a green check.
5. Click **Submit** when you have finished making selections for all records in conflict.

When working with the conflict resolution tool, note the following:

- If you choose not to resolve your data conflicts at this time, click **Cancel**. You can continue to work in Connect Offline, but the conflict resolution tool displays whenever you synchronize your data.
- Connect Offline lets you enter values that violate validation rules; however, such validation rule violations appear as data conflicts in the conflict resolution tool.

The conflict resolution tool displays only one violation at a time. If a record violates multiple validation rules, resolve and synchronize each violation separately.

- The field values on some objects, such as products or opportunities, are read only in the conflict resolution tool; however, you can change these values as follows:
 1. Switch to the tree view in the left pane.
 2. Select the deepest branch after expanding all the branches.
 3. Choose the `Your Values` radio button to save the Connect Offline values, or the `Salesforce Values` radio button to save the ones on the server instead. The values of the read-only fields change accordingly.
 4. Click **Submit**.

If you click **Submit** without choosing an option, Connect Offline stores the value on the client for any read-only values in conflict resolution.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

USER PERMISSIONS

To view records in Connect Offline:

- "Read" on the appropriate type of record such as accounts, contacts, or opportunities

To update records in Connect Offline:

- "Create," "Edit," or "Delete" on the appropriate type of record such as accounts, contacts, or opportunities

Tabs Available in Connect Offline

A subset of tabs and features are available in Connect Offline.

The tabs you see may differ if your administrator renames any Salesforce standard tab names or adds custom objects to your briefcase configuration.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

Home Tab

- View, create, modify, or delete your events and tasks except multi-person events
- Update or empty your briefcase contents
- Synchronize, search, and view recent items in the sidebar
- Expand the Briefcase Info section to see the number of records you have in Connect Offline for each object, and the number of records that you have modified since your last synchronization.

 **Note:** The list of modified records in Briefcase Info does not include deleted records. Also, search results do not include long text area fields like account **Description**.

- Click the icons below the calendar to display different views of activities
- To launch the Conflict Resolution tool, click the “You have conflicts to resolve” link when it displays in the sidebar.

Accounts Tab

- View your recent accounts on the accounts home page
- Select a standard list view to list the offline accounts
- View, create, modify, or delete accounts
- View, create, modify, or delete [person accounts](#). This feature is available in Connect Offline version 3.5.2.13 or later.
- View, create, modify, or delete custom objects associated with offline accounts
- Link contacts, opportunities, and activities to offline accounts
- Use your organization’s record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your Briefcase may include some records that are read only depending on the records’ sharing settings.

Relationship Groups Tab

- Track the familial and professional roles of different relationship group members
 - Assign primary and secondary designations to the two most important members of a relationship group
 - View roll-up related lists of all activities for the members of a relationship group
 - View roll-up related lists of the custom objects that are related to the accounts in a relationship group
-  **Note:** This feature is available in Connect Offline version 3.5.2.13 or later. Related lists on the relationship group detail page are not available in Connect Offline.

Contacts Tab

- View your recent contacts on the contacts home page
- Select a standard list view to list the offline contacts

- View, create, modify, clone, or delete contacts
- View, create, modify, or delete custom objects associated with offline contacts
- Link activities to offline contacts
- Use your organization's record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your briefcase may include some records that are read only depending on the records' sharing settings.

Opportunities Tab

- View your recent opportunities on the opportunities home page
- Select a standard list view to list the offline opportunities
- View, create, modify, clone or delete opportunities
- View, create, modify, or delete custom objects associated with offline opportunities
- Associate activities and contact roles to offline opportunities
- Add and update contact roles, products, and schedules, and change the price book for an opportunity
- Use your organization's record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
- Update records to which you have edit access. Your briefcase may include some records that are read only depending on the records' sharing settings.

Leads Tab

- View your recent leads on the leads home page
- Select a standard list view to list the offline leads
- View, create, modify, or delete leads depending on sharing settings
-  **Note:** Changes made to leads in Connect Offline do not trigger assignment rules.
- Link activities to offline leads
- Use record types, dynamic page layouts, field-level security, and translated values (as defined in the Translation Workbench)
-  **Note:** Leads and custom object records are only available in Connect Offline 2.0 and later, which is indicated by the briefcase icon  you use to launch the application.

Notes on Working with Connect Offline

Consider the following when using Connect Offline:

- Multi-person events are visible in Connect Offline but you can't create or edit them. If you have been invited to an event, but are not the organizer, you can't modify or delete that event offline.
- Automatically generated fields such as formula fields and auto-number fields are not available in Connect Offline.

- Related lists in Connect Offline do not display lookup fields.

[Log in to Connect Offline](#)

[Troubleshoot Connect Offline](#)

Troubleshoot Connect Offline

Review the following common situations and solutions to troubleshoot Connect Offline issues.

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer Editions**

Activities

Unable to edit the record associated with an activity offline

While you may be able to change the record associated with a task or event in Salesforce, the `Related To` field on an activity is only available in Connect Offline when the related record is available offline. For example, if an event is associated with an account that is not in your Briefcase, you will not be able to change the account on the event using Connect Offline.

Visible in Self-Service field is not available offline

While you may see this field in your activity page layouts using Salesforce, it is not visible from Connect Offline because the field indicates if an activity is associated with a case and cases are not available in Connect Offline.

Unable to update group events in Connect Offline

Multi-person events are visible in Connect Offline but you can't create or edit them. If you have been invited to an event, but are not the organizer, you can't modify or delete that event offline.

Briefcase Contents

Unable to edit some records in my briefcase

Depending on your briefcase settings, records are read only if they are available offline only because they are associated with records that are included offline due to your briefcase settings. For example, if you have selected an opportunity-based briefcase, some accounts will be read only offline even though they are not related to an opportunity, but because they are related to a contact in your briefcase.

Briefcase exceeds limit

Read only records that are included by association with other records in your briefcase do not count toward your limits. For example, the maximum number of accounts you can include is 5000 but your briefcase may contain 5200 if you have 200 accounts included because they are related to other records in your briefcase.

Browsers

Windows XP SP2 displays a warning banner in Connect Offline

To prevent the warning banner from displaying, modify your Internet Explorer settings as follows:

1. Launch Internet Explorer.
2. Click the **Tools** menu and choose **Internet Options**.
3. Select the **Advanced** tab.
4. Locate the Security section.
5. Enable `Allow active content to run in files on My Computer`.

6. Click **Apply**.
7. Click **OK**.

Unable to download and install Connect Offline using Firefox

Although other browsers are supported in Salesforce, you must use Internet Explorer to download and install Connect Offline.

Receiving error that says “A connection with Salesforce could not be established to update your Connect Offline.”

This message can appear in the following scenarios:

- Your computer is configured to use a proxy server to connect to the Internet that requires authentication. This connection is made automatically using Single Sign-On or another manner to authenticate where you do not have to enter a username or password to connect to the Internet.
- Your computer is behind a firewall
- Your computer is actively running antivirus software

Conflict Resolution

Unable to choose fields in conflict resolution

The field values on some objects, such as products on opportunities, are read only in the conflict resolution tool; however, you can change these values as follows:

1. Switch to the tree view in the left pane.
2. Select the deepest branch after expanding all the branches.
3. Choose the `Your Values` radio button to save the Connect Offline values, or the `Salesforce Values` radio button to save the ones on the server instead. The values of the read-only fields change accordingly.
4. Click **Submit**.

If you click **Submit** without choosing an option, Connect Offline stores the value on the client for any read-only values in conflict resolution.

Conflict resolution prompts me to create a new record or retry

Your sharing settings may have changed. If you have access to perform the action, click **Retry**. Otherwise, create a new record in Connect Offline.

Cannot change value of dependent picklist in conflict resolution tool

When resolving conflicts for a dependent picklist field, you cannot change the picklist value of the conflicting field. To resolve these types of conflicts, select whether to apply the Salesforce value or the Connect Offline value.

 **Note:** In offline mode, if a dependent picklist's controlling field is hidden by field-level security, the information icon for the dependent picklist displays the controlling field's API name rather than the label name.

Fields

Unable to see lookup fields in Connect Offline related lists

Related lists in Connect Offline do not display lookup fields.

Unable to see custom formula fields and auto-numbers in Connect Offline

Automatically generated fields such as formula fields and auto-number fields are not available in Connect Offline.

Auto-number fields do not generate in Connect Offline

When you create a record in Connect Offline that increments an auto-number field, Connect Offline displays a label for that field while you are using Connect Offline. When you synchronize, Salesforce inserts the next unique number in the field.

Home Tab

Record count is wrong in Home tab list of modified records

In the sidebar, the list of modified records in briefcase Info does not include deleted records.

Installation

What gets installed?

Connect Offline installs SForceDB.exe, which runs continuously in the background and hosts the Connect Offline database.

Unable to install Connect Offline

Connect Offline requires Salesforce to install components that edit the registry on your computer. If your organization imposes security that prevents you from editing the registry, log in as the administrator of your machine before installing these components or contact your IT department for assistance.

Can I do mass deployments of Connect Offline?

Yes, you can perform system-wide deployments.

How can I tell what Connect Offline version my users have?

Each user's Connect Offline version is listed in the Login History.

Leads

Unable to see leads in Connect Offline

Leads are only available in Connect Offline 2.0 and later. If you are using Connect Offline 2.0 or later, you will launch the application using this icon: . To upgrade Connect Offline:

1. Synchronize your data in Connect Offline.
2. Optionally, remove the previous installation of Connect Offline using Add/Remove Programs in the Windows Control Panel.
3. Install Connect Offline. by going to the Connect Offline page in your personal settings.
4. Synchronize your data in Connect Offline.

Check to make sure you have the appropriate user permissions to view leads.

Lead assignment rules do not appear to be working

Leads created in Connect Offline will not be automatically assigned based on lead assignment rules. Once connected to Salesforce again, assign them by doing a mass transfer of records.

Multicurrency Display Differences

Opportunity amounts display a fractional difference

If your organization has enabled multicurrency, and the currency used for an opportunity is different from the corporate currency, a small display difference may be observed. The converted amount you see in the offline opportunity detail page may be off by a cent or two as compared to the same page in the Salesforce application. There is no error in the actual stored value.

Relationship Groups

Unable to see the Relationship Groups tab in Connect Offline

The Relationship Groups tab is only available if the Relationship Groups AppExchange package is installed in the Salesforce organization with which you synchronize Connect Offline.

Search

Search results are missing fields

Search results do not include long text area fields such as account `Description`.

Timeouts, Timestamps, and Time Zones

The timestamps of files updated in Connect Offline do not appear as expected

For records that you create or update in Connect Offline, the `Created By` and `Modified By` fields reflect the time on your PC, even after synchronization.

Activities that you create in Connect Offline reflect the time you enter and the time zone of your PC. During synchronization, Salesforce converts the activity times to the time zone set in your Salesforce personal information.

If you change the time zone on your computer, empty and synchronize your briefcase to reflect the change in Connect Offline.

Connect Offline times out when synchronizing large data sets

Edit the `HttpTimeout` registry setting in `HKEY_LOCAL_MACHINE\SOFTWARE\salesforce.com\Offline2`. The default is 360 seconds.

Edit Stay-in-Touch Settings

 **Note:** Stay-in-Touch Requests is scheduled for retirement in all Salesforce orgs as of Summer '17. For more information, see, [Stay-in-Touch Request Retirement](#).

To set your preferences for requesting contact information updates:

 **Note:** If your organization uses person accounts, person accounts are also affected by these settings. For more information, see [What Is a Person Account?](#) on page 1110.

1. From your personal settings, enter `stay-in-touch` in the `Quick Find` box, then select **My Stay-in-Touch Settings**.
2. Choose `Yes` for `Automatic Bcc` to receive copies of your sent Stay-in-Touch emails. This option is only available if your organization has not enabled compliance BCC emails.
3. Enable the reminder if you would like to be prompted to send a Stay-in-Touch request whenever you save a new contact.
4. Enter a default subject for the email.
5. In the note area, enter a message to the recipient.
6. In the signature area, enter a signature with your contact information.
7. Use the merge fields area at the top of the page to display available merge field values, which you can copy and paste into the subject, note, or signature boxes as needed.
8. Click **Save**.

Make and Receive Calls with Voice

Use Voice to access telephony features without ever leaving Salesforce. Make and receive calls, add call notes, and log call information with ease. It just takes a single click from phone number fields in Lightning Experience, such as numbers on contacts, leads, and list views.

 **Note:** For now, we support outgoing calls to the U.S. and Canada only.

EDITIONS

Available in: Lightning Experience

Available in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Voice is available for an additional cost as an add-on license.

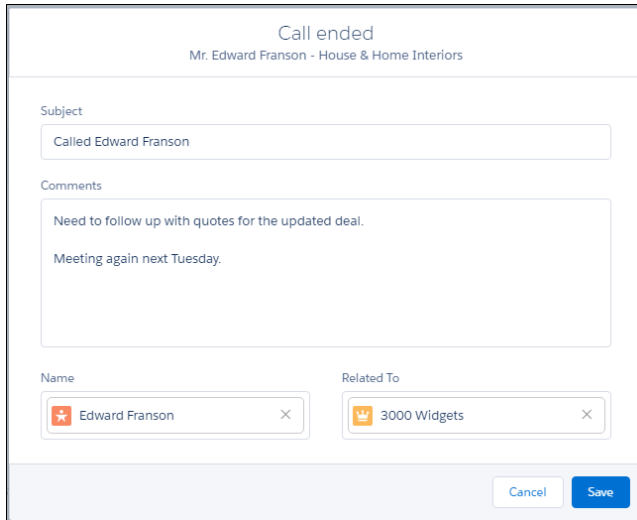

The screenshot displays the Salesforce Lightning Experience interface for a lead record. At the top, the lead is identified as "LEAD Mr. Edward Franson" with a profile picture. Below this, the lead's details are shown: Company (House & Home Interiors), Title (President), Phone (+1.415.866.0932), and Email (efranson@hhi.com). The phone number is circled in red. A progress bar indicates the lead's status: "Contacted" (highlighted in blue), "Unqualified", and "Converted". A "Mark Status as Complete" button is visible. The main content area is divided into "ACTIVITY", "COLLABORATE", and "DETAILS" tabs. The "ACTIVITY" tab is active, showing a "Log a Call" button and a "New Task" button. Below these, there are fields for "Subject" (containing "Call") and a "Save" button. A "Show" dropdown menu is set to "All Activities". The "Next Steps" section includes a "Send quotes" checkbox. The "Past Activity" section shows two call records: "Called Edward Franson" with the note "Sorted out more product details." and another "Called Edward Franson" with the note "Great call: requested a follow-up email with further product information." A modal window titled "Edward Franson - Dialing" is open, showing a profile picture of Mr. Edward Franson, his name, company, and title, and the text "Dialing...". An "End Call" button is at the bottom of the modal.

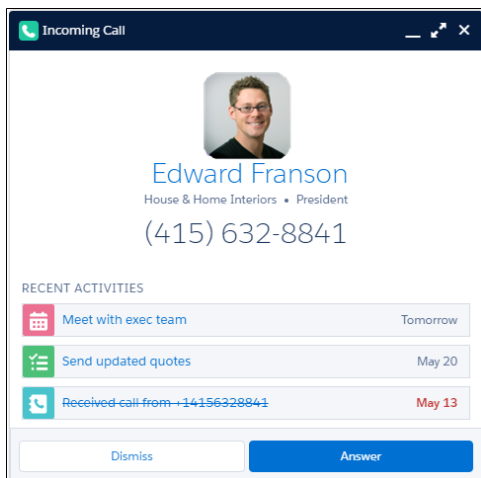

The call appears in a composer window, so you can multitask while you're on a call. You can access relevant records, add call notes directly in the composer window, or create tasks, events, or other records related to the call.

 **Tip:** Assign yourself a Voice number so the calls you make don't appear to be coming from an unknown number.

You can also add more details after a call has ended, and the call details are logged in the activity timeline.

Optionally, you can also receive calls with Voice. Incoming calls show a list of related activities, so you have access to relevant information before you've even answered the call.

If you don't answer within 30 seconds or dismiss the call, the call ends. If you're not on Lightning Experience when someone calls, the person calling hears a message that you're not available.

For information about setting up Voice, see "Set Up Voice" in the Salesforce Help.

[Assign a Voice Number](#)

Assign a Voice number from your personal settings so the calls you make and receive don't appear to be coming from an unknown number.

[Voice Best Practices](#)

For the best calling experience, use a wired headset and hardwired connection to your network with adequate bandwidth.

Assign a Voice Number

Assign a Voice number from your personal settings so the calls you make and receive don't appear to be coming from an unknown number.

1. From your personal settings, enter *My Voice Settings* in the *Quick Find* box, then select **My Voice Settings**.
2. Click **Find Now**.
3. Select your country and enter an area code to display a list of available numbers.
Once you assign yourself a number, you can't choose a new one or view available numbers.
4. Select a number.
5. Click **Save**.

Voice Best Practices

For the best calling experience, use a wired headset and hardwired connection to your network with adequate bandwidth.

Use a Good Connection

A wireless connection can work, but a hardwired connection is preferable.

Having a dedicated network for your Voice calls is best. We recommend having at least 10 kbps per Voice session available, but having 500 kbps+ per Voice session is optimal. Limiting the number of applications you have running and your open browser tabs also improves performance.

Also make sure you're using the most up-to-date Chrome or Firefox browser.

Make Calls with a Quality Headset

An analog headset works best. Wireless or mobile phone earbuds work, but you may experience issues with call quality.

EDITIONS

Administering People and Organizations That Users Sell To

Administering Accounts

Enable Person Accounts

 **Note:** This release contains a beta version of person accounts in Lightning Experience that is production quality but has known limitations. For more information see the [Lightning Experience Limitations](#) on page 242.

 **Important:** Once person accounts have been enabled, they can't be turned off. Therefore, we recommend existing customers [create a sandbox](#) to preview how person accounts will affect their organization.

Before you begin, make sure to:

- Create at least one record type for accounts.
- Grant read permission on contacts for profiles that have read permission on accounts.
- Ensure that the contact sharing organization-wide default is set to "Controlled by Parent."

Once you complete the preliminary steps, contact Salesforce to enable person accounts and then:

1. From the object management settings for person accounts, go to Record Types.
2. Assign person account record types to profiles that require person accounts.

 **Note:** Person accounts count against both account and contact storage because each person account consists of one account as well as one contact. Additional storage might be necessary when you implement person accounts, so you should review your storage usage.

Managing Account Teams

Your users can add account team members to accounts. Similar to opportunity teams on opportunities, account teams are teams of users who work together on accounts by defining each user's role and granting specialized levels of access to the account and its related records.

[Enable Account Teams](#)

To make it easy for your sales reps to collaborate on accounts, enable account teams in Salesforce.

[Customize Account Team Roles](#)

Every account team member has a role in working with that account, such as Account Manager or Sales Rep. To track the roles that team members play in your company, customize your account team roles in Salesforce.

[Considerations for Disabling Account Teams](#)

Before you disable account teams, review these key considerations.

SEE ALSO:

[Enable Account Teams](#)

Enable Account Teams

To make it easy for your sales reps to collaborate on accounts, enable account teams in Salesforce.

1. From Setup, enter *Account Teams* in the **Quick Find** box, then select **Account Team Settings**.
2. Define the settings as needed.
3. Save your changes.

Customize Account Team Roles

Every account team member has a role in working with that account, such as Account Manager or Sales Rep. To track the roles that team members play in your company, customize your account team roles in Salesforce.

Warning:

- Account teams share roles with opportunity teams. If you remove an account team role, that role is no longer listed as an opportunity team role.
1. From Setup, enter *Team Roles* in the **Quick Find** box, then select **Team Roles** under Account Teams.
 2. Edit the picklist values for team roles as needed.
 3. Save your changes.
 4. To update a changed picklist value in all your files, enter *Replace Team Roles* in the **Quick Find** box, then select **Replace Team Role**.

SEE ALSO:

[Managing Account Teams](#)

Considerations for Disabling Account Teams

Before you disable account teams, review these key considerations.

- Disabling account teams irreversibly removes existing teams from all accounts and delete users' default account teams, and removes the Account Team related list from all page layouts.
- You cannot disable account teams for your organization if team members are referenced in Apex. For example, if Apex code references the `Team Member` field (represented as `AccountTeamMember` in the code), account teams cannot be disabled.

Administering Relationship Groups

Install and Implement Relationship Groups

Obtaining the Relationship Groups Custom App

The relationship groups custom app comes preinstalled in most Salesforce for Wealth Management organizations. If your Salesforce for Wealth Management organization does not have the relationship groups custom app, contact Salesforce to request it.

Verifying the Installation of the Relationship Groups Custom App

If the relationship groups custom app has been installed in your organization, the Relationship Groups option displays in the Force.com app menu.

In addition, administrators can use the following procedure to verify that the relationship groups custom app was successfully installed:

1. From Setup, enter *Apps* in the *Quick Find* box, then select **Apps** and verify that the relationship groups custom app is present and has the  Managed - Installed icon.
2. From your management settings for custom objects, verify that the relationship group and relationship group member objects are present and that each has the  Managed - Installed icon.

Configuring the Relationship Groups Custom App

Perform the following implementation tasks to configure the custom app. If the relationship groups custom app came pre-installed with Salesforce for Wealth Management, some of these configurations may already be set in your organization.

Customizing Account Page Layouts

From the object management settings for accounts, go to Page Layouts, then remove the following related lists from the appropriate account page layouts.

- Relationship Groups (Primary Account)
- Relationship Groups (Secondary Account)

Customizing Person Account Page Layouts

From the object management settings for person accounts, go to Page Layouts, then edit the appropriate person account page layouts.

1. In the Related List Section, drag and drop to edit the following related lists:
 - Add **Relationship Group Members**
 - Remove **Relationship Groups (Primary Account)**
 - Remove **Relationship Groups (Secondary Account)**
2. Edit the Relationship Group Members related list as follows:
 - At minimum, include the following fields: *Relationship Group Member: Role*, *Relationship Group Member: Priority*, *Relationship Group Member: Include in Roll-Up*
 - Remove the standard **New** button
 - Add the custom **New** button

EDITIONS

Available in: Salesforce Classic

Available in: Salesforce for Wealth Management

USER PERMISSIONS

To install apps:

- “Download AppExchange Packages”

To configure and deploy installed apps:

- “Customize Application”

Setting Context-Sensitive Help for Relationship Groups

By default, the **Help for this Page** links on relationship group pages open help content about custom objects in general. To redirect those links to help topics that specifically describe relationship groups:

1. Go to the management settings for custom objects.
2. Click **Relationship Group** to open its custom object definition.
3. In the Custom Object Definition Detail section, click **Edit**.
4. For **Context-Sensitive Help Setting**, choose **Open a window using a custom s-control**.
5. For **Custom S-Control**, choose **Relationship Groups Help**.
6. Click **Save**.

Note: Repeat this procedure for the Relationship Group Member custom object. This sets an appropriate context-sensitive destination for the help links on the Relationship Group Member related lists.

Overriding Standard Relationship Group Buttons

To customize the buttons on the relationship group detail page:

1. Go to the management settings for custom objects.
2. Click **Relationship Group** to open its custom object definition.
3. In the Buttons, Links, and Actions section, click **Edit** next to **New** and replace that button with the `NewHousehold` s-control.

Customizing Relationship Group Search Layouts

To customize the search layouts for relationship groups:

1. Go to the management settings for custom objects.
2. Click **Relationship Group** to open its custom object definition.
3. In the Search layouts section, click **Edit** to modify the appropriate search layout. At minimum, we recommend setting the following columns for search results:
 - Relationship Group Name
 - Primary Account
 - Secondary Account
 - Last Modified By

Customizing Relationship Group Page Layouts

To customize the layout of the relationship group detail page, from the object management settings for relationship groups, go to Page Layouts, then click **Edit** next to the appropriate page layout name. Edit the page layout as follows:

1. Remove the **Clone** button from the detail page.
2. Edit the Open Activities related list as follows:
 - Remove the standard **New Task** and **New Event** buttons
 - Add the custom **New Task** and **New Event** buttons
3. Edit the Activity History related list as follows:
 - Remove the standard **Log a Call**, **Mail Merge**, **Send an Email**, **Request Update**, and **View All** buttons
 - Add the custom **Log a Call**, **Mail Merge**, and **Send an Email** buttons
4. In the Relationship Group Members related list, include the following fields, at minimum:
 - Relationship Group

- Role
- Priority
- Include in Roll-Up

Overriding Standard Relationship Group Member Buttons

To customize the buttons on the relationship group member detail page:

1. Go to the management settings for custom objects.
2. Click **Relationship Group Member** to open its custom object definition.
3. In the Buttons, Links, and Actions section, click **Edit** next to **New** and replace that button with the `Edit Household Members` s-control.

After configuring the relationship groups custom app, verify that a Relationship Groups option displays in the Force.com app menu.

Note:

- In some cases, the custom app and its custom objects may have the label “Households” instead of “Relationship Groups” throughout. Whatever the labels are, they cannot be changed because the app is a managed package.
- Installing the Relationship Groups custom app may cause an error if your organization has fewer than 21 account records. You may ignore this error and continue the installation process.
- For all installations, the API names of the custom objects begin with the namespace prefix `household__`.
- The Relationship Group Member object is only supported in API version 11.0 and later.

SEE ALSO:

[Relationship Groups Overview](#)

[Creating Relationship Groups](#)

[Find Object Management Settings](#)

Testing the Relationship Groups Package

The relationship groups managed package provides unit tests that run when you install the package in your sandbox or production organization. In some cases, a component like an Apex trigger, validation rule, workflow rule, or custom field prevents the unit tests from completing successfully.

If the unit tests fail, do the following before running the tests again:

- Install the latest version of the relationship groups managed package. The functionality of the new version is the same as the older version except the unit tests have been enhanced. Contact Salesforce and request the latest version of the package (not available on the AppExchange).
- Deactivate components that prevent account, household, or household member objects from being edited or deleted. Apex triggers are a common cause of failed unit tests.

To ensure the relationship groups package runs successfully in your organization, the unit tests attempt to edit and delete some account, household, and household member objects. These tests do not permanently modify your organization's data. If a platform element prevents these objects from being edited or deleted, the unit tests fail.

Configuring Contacts and Contact Roles

Creating Contact Sharing Rules

Contact sharing rules can be based on the record owner or on other criteria, including record type and certain field values. You can define up to 300 contact sharing rules, including up to 50 criteria-based sharing rules.

1. If you plan to include public groups in your sharing rule, confirm that the appropriate groups have been created.
2. From Setup, enter *Sharing Settings* in the **Quick Find** box, then select **Sharing Settings**.
3. In the Contact Sharing Rules related list, click **New**.
4. Enter the **Label Name** and **Rule Name**. The Label is the sharing rule label as it appears on the user interface. The Rule Name is a unique name used by the API and managed packages.
5. Enter the **Description**. This field describes the sharing rule. It is optional and can contain up to 1000 characters.
6. Select a rule type.
7. Depending on the rule type you selected, do the following:
 - **Based on record owner**—In the *owned by members of* line, specify the users whose records will be shared: select a category from the first drop-down list and a set of users from the second drop-down list (or lookup field, if your organization has over 200 queues, groups, roles, or territories).
 - **Based on criteria**—Specify the Field, Operator, and Value criteria that records must match to be included in the sharing rule. The fields available depend on the object selected, and the value is always a literal number or string. Click **Add Filter Logic...** to change the default AND relationship between each filter.

 **Note:** To use a field that's not supported by criteria-based sharing rules, you can create a workflow rule or Apex trigger to copy the value of the field into a text or numeric field, and use that field as the criterion.
8. In the *Share with* line, specify the users who get access to the data: select a category from the first drop-down list and a set of users from the second drop-down list or lookup field.
9. Select the sharing access setting for users.

Access Setting	Description
Read Only	Users can view, but not update, records.
Read/Write	Users can view and update records.

10. Click **Save**.

Set Up Contacts to Multiple Accounts

Let your sales reps easily track the relationships between the customers and businesses they work with. Contacts to Multiple Accounts is quick to set up and allows reps to relate a single contact record to multiple accounts.

If you disable Contacts to Multiple Accounts, keep in mind that doing so deletes all indirect account-contact relationships. Associations between a contact and its primary account remain.

 [Watch a Demo](#) (3:58 minutes)

1. From Setup, enter *Account Settings* in the **Quick Find** box, then select **Account Settings**.
2. Select **Allow users to relate a contact to multiple accounts**.
3. If you want to use custom fields to capture unique information about relationships—for example, the best time to call a contact—now's a good time to set that up. From the object management settings for Account Contact Relationship,
 - In Lightning Experience, go to **Fields & Relationships**.
 - In Salesforce Classic, go to **Fields**.
4. Make sure you have the most relevant fields on your Account Contact Relationship page layout. From the object management settings for Account Contact Relationship, go to **Page Layouts**.
5. Add the Related Contacts related list to the account page layouts your reps use.
Because the Related Contacts related list automatically includes all direct contacts, you can remove the Contacts related list on your account page layouts.

 **Tip:** Easily see who's a direct contact for the account when you add the **Direct** field to the Related Contacts related list.

6. Add the Related Accounts related list to the contact page layouts your reps use.

 **Tip:** Easily see which account is the contact's primary account when you add the **Direct** field to the Related Accounts related list.

7. Decide whether you want to prevent activities from automatically rolling up to a contact's primary account. If so, from Setup, go to the Activities Settings page and deselect **Roll up activities to a contact's primary account**.
8. If you want to look at the relationships between contacts and accounts, create custom report types.

Create Custom Report Types for Account Contact Relationships

If you've enabled Contacts to Multiple Accounts, run reports that show the relationships between contacts and accounts. First, set up custom report types so that sales managers and other teammates can create the reports they need.

1. Make sure you're familiar with custom report types and the general steps for creating and maintaining them.
2. Create custom report types with the appropriate object relationships, and configure them as necessary.

Check out these examples of custom report types to get you started.

Report type	Lets teammates run reports that show	A (Primary Object)	B	C	Make sure you also
Related Contacts	All the contacts, both direct and indirect, that are related to accounts.	Accounts	Contact Relationships		Add the <code>Direct</code> and <code>Full Name</code> fields to the Contact Relationships page layout.
Related Accounts	All the accounts, both direct and indirect, that are related to contacts.	Contacts	Account Relationships		
Related Contacts with or without Activities	All the contacts, both direct and indirect, that are related to accounts, and whether there's recent activity.	Accounts	Contact Relationships	Activities	

3. Deploy the report types you want to make available.

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in: **Contact Manager, Group, Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To create or update custom report types:

- "Manage Custom Report Types"

To delete custom report types:

- "Modify All Data"

- Let your sales teams know that they can create reports using these custom report types.

SEE ALSO:

[Set Up Contacts to Multiple Accounts](#)

Enable Social Accounts, Contacts, and Leads

Increase your users' access to social intelligence by enabling the Social Accounts, Contacts, and Leads feature for your organization or Salesforce1.

The Social Accounts, Contacts, and Leads feature and access to all available social networks are enabled by default for organizations created after the Spring '12 release. If your organization was created before that, you must enable the feature manually.

 **Note:** If the Social Accounts, Contacts, and Leads feature is already enabled and but users can't see one or more social networks, see [Troubleshoot Social Accounts, Contacts, and Leads](#).

- From Setup, enter *Social Accounts* in the **Quick Find** box, then select **Social Accounts and Contacts Settings**.
- Select **Enable Social Accounts and Contacts**.
- Select the social networks that users in your organization can access. By default, all social networks are selected.
In Salesforce Lightning Experience and the Salesforce1 mobile app, users can access Twitter only, even if other networks are enabled.
- Click **Save**.
- To make Twitter accessible in the Salesforce1 mobile app, add the Twitter card to the Mobile Cards section of the accounts, contacts, and leads page layouts.
- Let your users know that they can configure Social Accounts, Contacts, and Leads for their individual use.

Considerations for Enabling and Managing the Customer Portal for Contacts

Consider key points before enabling the customer portal for contacts. Then use best practices to maintain your contact information.

Enabling the Customer Portal for Contacts

- Before you enable a contact for the customer portal, make sure that the owner of the contact's account is associated with a role in your organization.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Business accounts available in: **All** Editions except **Database.com**

Person accounts available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

Contacts available in **All** Editions except **Database.com**

Leads available in: **Groups, Professional, Enterprise, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable, configure, or disable Social Accounts, Contacts, and Leads:

- "Customize Application"

EDITIONS

Available in: Salesforce Classic

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

- If a user is a partner user *and* a customer user, two contact records for the user are required to provide separate usernames and passwords for each portal.
- A contact can either be a Self-Service user and a partner user *or* a customer user.
-  **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.
- Any data that's created or owned by a Self-Service user can be visible to a partner user or customer user who's associated with the same contact.
- The user's `Nickname` defaults to the user's email alias unless you specify otherwise. For example, if the user's `Email` is "jsmith@company.com," the user's `Nickname` defaults to "jsmith" when you click **Save**.
- The first time you enable a contact for the customer portal on an account, the contact is assigned to the customer user role, which includes the name of the contact's account. You can update the contact's portal role later. (This behavior doesn't apply to [high-volume customer users](#), because they don't have roles and aren't included in the role hierarchy.)

Managing the Customer Portal for Contacts

- Edit an enabled contact's access to your customer portal. Click **Manage External User**, and then choose **View Customer User**.
- [Merge contacts that are enabled to use a customer portal.](#)
- [Change the account on the contact.](#)
- Make sure that you keep your contacts' access to your customer portal up-to-date by deactivating and disabling access as needed.
- You can delete contacts only if they're disabled from the portal. Inactive portal users can't be deleted.

SEE ALSO:

[Enable the Customer Portal for Contacts and Person Accounts](#)

[Contacts Limitations](#)

Enable the Customer Portal for Contacts and Person Accounts

To allow a customer to access your Salesforce customer portal, enable the customer's contact or person account record as a customer user.

1. From a contact or person account detail page, click **Manage External User**, and then select **Enable Customer User**.
2. Verify the general information and locale settings, and enter any missing information. The customer's `Username` defaults to the customer's `Email`.
3. Select a portal user license. The user license that you choose determines the permission sets, user profile, and role hierarchy options that you can select for the customer user. See [Customer Portal User Licenses](#) on page 2343.
4. Select `Generate new password and notify user immediately` to email a customer portal username and password to the customer.
If your Salesforce org uses multiple customer portals, customer users can access all customer portals that are assigned to their profiles with a single username and password. See [Creating Multiple Customer Portals](#) on page 2314.
5. Click **Save**.
6. To troubleshoot or confirm the portal configuration, on the contact detail page, click **Manage External User**, and then choose **Log in to Portal as User**. A new browser window opens and logs you in to the portal as the partner user.

You can [deactivate customer users](#) as needed.

Available in: **Enterprise, Performance, Unlimited,** and **Developer** Editions

USER PERMISSIONS

To enable customer users or to log in as a portal user:

- "Edit" on the account that's associated with the customer user
- AND
- "Edit Self-Service Users"

Enable Self-Service for Contacts and Person Accounts

To provide access to your Self-Service portal, enable Self-Service for a customer's contact or person account record. A Self-Service user can view cases in the Self-Service portal only if they're associated with the user's account record.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

1. From the contact or person account detail page, click **Enable Self-Service**.
2. Verify the general information and locale settings, and enter any missing information. The customer's Self-Service `Username` defaults to the customer's `Email`.
3. To enable the customer as a Self-Service super user, select the `Super User` checkbox. Super users can view case information, add comments, and upload attachments for all cases that anyone in their company submits.
4. Select `Generate new password and notify user immediately` to email a Self-Service username and password to the customer.
5. Click **Save**.

[What Is a Person Account?](#)

Define Contact Roles for Contacts on Opportunities

Determine what contact roles are available for your sales reps to add to contacts on opportunities. Specify the values for the contact roles that appear in picklists and the sequence they appear in. And define how colors represent contact roles in charts that include them.

1. From Setup, enter `Contact` in the `Quick Find` box, then select **Contact Roles on Opportunities**.
2. Manage predefined contact roles, or create other contact roles as needed.
3. Save your changes.

USER PERMISSIONS

To enable Self-Service users:

- "Edit Self-Service Users"

EDITIONS

Available in: both Salesforce Classic and Lightning Experience

Available in all editions

Allow Users to Create Private Contacts

Private contacts are contacts that aren't associated with an account. To give your users the ability to create private contacts, adjust your contact page layouts so the `Account Name` field isn't required.

Contacts that aren't associated with an account are always private, regardless of your organization's sharing model. Before allowing private contacts, consider the downside: they're easy to forget because they're hidden from all users except their owner and the system administrator.

1. From the object management settings for contacts, go to Page Layouts.
2. Select the layout you want to edit.
3. Find the `Account Name` field on the layout and hover over it. Then, click the wrench icon to show the field properties.
4. Deselect the `Required` checkbox.
5. Confirm your changes.

Improve Your Organization's Data Quality

High quality data is key to business success. When data quality is high, it means your records are complete and up-to-date; it means you have the right connections at the companies that interest you; and it means you have the information you need to close deals and expand your business. In short, high quality data lets you understand, adapt, focus, and execute with surgical precision. Data.com offers a suite of products to give your business the high quality data it needs when it needs it. That way, you spend less time entering and updating data and more time growing your business.

[Set Up Data.com Prospector](#)

Let your reps prospect for companies, leads, and contacts right in Salesforce. To do so, just set up and implement Data.com Prospector.

[Set Up Data.com Clean](#)

Your business is only as good as its data. Do you want to spend less time updating and enriching data and more time growing your business? Just set up and implement Data.com Clean. Then, your Salesforce records will be complete and up-to-date!

[Get an Assessment of the Account Data in Your Salesforce Org](#)

Do you really know if your account data is healthy? Get an assessment of your account data to understand its overall health, including matchability, accuracy, and uniqueness. Data assessments aren't available to current Data.com Clean customers.

[Set Up Data.com Social Key](#)

Let your reps get social profiles for their contacts and leads. To do so, just set up and implement Data.com Social Key.

Set Up Data.com Prospector

Let your reps prospect for companies, leads, and contacts right in Salesforce. To do so, just set up and implement Data.com Prospector.

Important: You need to assign a Data.com license directly to a user in order for that user to add and export files from Data.com.

1. [Enable Data.com Clean for Data.com Prospector](#)
Let users manually clean account, contact, and lead records. You can even clean records that were added from another source. Clean is automatically enabled when you use Data.com Prospector. With Data.com Premium Prospector, you can manually clean D&B Company records that are linked to account or lead records.
2. [Configure Data.com Corporate Prospector](#)
Data.com Corporate Prospector provides a basic set of Dun & Bradstreet account and lead data, including D-U-N-S Number, NAICS Code, TradeStyle, and more. Here's how to implement this product.
3. [Configure Data.com Premium Prospector](#)
Data.com Premium Prospector is an upgrade to Data.com Corporate Prospector. With Premium Prospector, you get all the features and fields available in Corporate Prospector, plus over 70 additional D&B fields for accounts and leads you add to Salesforce from Data.com. Like Data.com Corporate Prospector users, Premium Prospector users can also view a limited number of D&B fields on account and lead records.
4. [Manage Access to Data.com Search Results and Related Features](#)
Use the **Add to Salesforce** and **Export Results** to limit what users can do with Data.com search results for Data.com features that use the search results.
5. [Respect Do-Not-Contact Settings in Data.com Search Results and Exports](#)
In Data.com search results and export files, you can prevent certain contact information from being displayed.
6. [Enable or Disable Data.com API Functionality](#)
Data.com API functionality is enabled by default.

To install AppExchange packages:

- "Download AppExchange Packages"

Set Up Data.com Users

Give users access to Data.com and set their record addition limits so they can start taking advantage of Data.com's rich database of accounts, contacts, and leads. The number of Data.com users you can set up—within Salesforce or via the Data Loader—depends on the number of Data.com licenses you purchased.

 **Important:** You need to assign a Data.com license directly to a user in order for that user to add and export files from Data.com.

[Walk Through It: Set Up Data.com Users](#)

1. From Setup, enter *Manage Users* in the Quick Find box, then select **Users**.
2. Click **Edit** for a user.
3. Select a *Data.com User Type*. (You can [review the types of Data.com users](#) on page 1688.)
4. Select the *Data.com Monthly Addition Limit* for the user.
5. Save the user.

 **Tip:** You can also use the Apex Data Loader to set up Data.com users, select the Data.com user type, and set the monthly addition limit, if applicable. To do so, export your user records to a *.csv* file, change the necessary fields for each user you want to set up, and then import the *.csv* file into Salesforce. The fields to export from the User object are `LastName`, `FirstName`, `UserPermissionsJigsawProspectingUser`, `JigsawImportLimitOverride`, and `UserPreferencesJigsawListUser`. For more information about the User object, see the *Object Reference for Salesforce and Force.com*.

How Do Data.com User Types, Licenses, and Record Addition Limits Work?

User types, licenses, and record addition limits control what users can access Data.com and what Data.com users can do.

[Check Data.com License Information, Record Addition Balances, and Limits](#)

Check important license, record addition, and limits information from the Data.com Licenses & Limits page in Setup. This page also shows daily API limits for Data.com.

[How Do Licenses Work for Data.com Prospector?](#)

Data.com Prospector user licenses let users search Data.com for accounts and contacts, and add them as records to Salesforce. Users can be assigned one of two types of licenses—Data.com User and Data.com List User—and each type has its own characteristics.

[How Do Licenses Work for Data.com Clean?](#)

If your organization uses Data.com Prospector, users with those licenses can manually clean the account, contact, and lead records they have access to. If your organization purchased a Data.com Clean product, you can also run automated jobs to clean records, and all Salesforce users (not just those with Data.com Prospector licenses) can manually clean records.

SEE ALSO:

[Using Data.com FAQ](#)

[Set Up Data.com Users](#)

Check Data.com License Information, Record Addition Balances, and Limits

Check important license, record addition, and limits information from the Data.com Licenses & Limits page in Setup. This page also shows daily API limits for Data.com.

 **Important:** The Data.com API Limits section has information on calls to the Data.com Match API and calls to the Data.com Search API. You can only see the information on Match calls if your organization has Data.com Clean. You can only see the information on Search calls if you are assigned a Data.com Prospector user license.

[Walk Through It: Check Data.com License Information](#)

1. From Setup, enter *Licenses & Limits* in the Quick Find box, then select **Licenses & Limits**.

To see how many records each user has added or exported, check the All Data.com Users page. From Setup, enter *Users* in the Quick Find box, then select **Prospector Users**. Or, if your organization has access to custom report types, you can use the Data.com Usage object to create a report that shows more detailed usage information.

How Do Licenses Work for Data.com Prospector?

Data.com Prospector user licenses let users search Data.com for accounts and contacts, and add them as records to Salesforce. Users can be assigned one of two types of licenses—Data.com User and Data.com List User— and each type has its own characteristics.

 **Important:** You need to assign a Data.com license directly to a user in order for that user to add and export files from Data.com.

Data.com User

Data.com Users get a limited number of account, contact, and lead records to add or export per month. The default number of records per licensed user is 300. The record addition limit for each licensed user refreshes at midnight on the first of the month (based on the time zone of the organization) regardless of your contract start date. Unused record additions expire at the end of each month, *do not* rollover to the next month, and are not refundable. You can select the `Data.com Monthly Addition Limit` for each user. This is the number of account, contact, and lead records the user can add each month. You can select up to the organization limit for any user or all users, but once the organization's monthly limit is reached, users won't be able to add more records.

 **Example:** The sales division of Universal Telco has 14 sales reps, and they purchase 20 Data.com Prospector licenses, each of which has a record addition limit of 300. This means that Data.com Users within the organization can add as many as 6,000 records per month. The Universal Telco administrator distributes the Data.com Users' monthly record addition limits as follows.

- Ten of the sales reps have limits of 300 each
- Two of the sales reps have limits of 500 each
- Two of the sales reps have a limit of 1,000 each

Data.com List User

Data.com List Users get a limited number of account, contact, and lead records to add or export per month. Unused record additions expire at the end of each month and *do not* rollover to the next month. After the monthly limit is used, List Users draw record additions from a pool that is shared by all List Users in the organization. Unused pool additions expire one year from purchase. Only Data.com List Users can draw from the organization's pool limit. If a Data.com User wants to draw from the organization's pool limit, you need to change that user to a Data.com List User.

 **Example:** The marketing division of Universal Telco has four marketing reps. Each rep has a Data.com Prospector license and each is a Data.com List User. Universal Telco purchases enough monthly record additions so that each Data.com user has a monthly default limit of 300 records. The company also purchases a record addition pool of 5,000 records. This means that after each marketing rep uses his monthly limit, he can start using the pool limit. Together, all four marketing reps can add 5,000 records from the pool. One rep might add 2,500 records, leaving 2,500 to be added by one or more of the other three users.

How Do Licenses Work for Data.com Clean?

If your organization uses Data.com Prospector, users with those licenses can manually clean the account, contact, and lead records they have access to. If your organization purchased a Data.com Clean product, you can also run automated jobs to clean records, and all Salesforce users (not just those with Data.com Prospector licenses) can manually clean records.

The Data.com Licenses & Limits page in Setup shows which users can clean records and whether your organization can use automated clean jobs.

 **Note:** If your organization purchased only Data.com Prospector, only users with licenses can clean records.

SEE ALSO:

[How Do Data.com User Types, Licenses, and Record Addition Limits Work?](#)

Enable Data.com Clean for Data.com Prospector

Let users manually clean account, contact, and lead records. You can even clean records that were added from another source. Clean is automatically enabled when you use Data.com Prospector. With Data.com Premium Prospector, you can manually clean D&B Company records that are linked to account or lead records.

 **Note:**

- If you've purchased Data.com Clean, you can clean account, contact, and lead records manually *and with automated jobs*. If you've purchased the Data.com Premium Clean version of the product, you can also use automated jobs to clean D&B Company records that are linked to account or lead records. For complete details, see [Set Up Data.com Clean](#).
- Enabling Clean *does not* clean your records immediately, and you can click **Disable** to turn off the feature.

1. From Setup, enter *Clean Settings* in the Quick Find box, then select **Clean Settings**
2. Confirm that Data.com Clean is enabled.

[Considerations for Custom Mapping of Data.com and Salesforce Fields](#)

Custom mappings put Data.com values in the Salesforce account, contact, and lead fields where you want those values. Before mapping fields, make sure you understand how mapping works, what preparations to make, and what kind of results you should expect.

[Considerations for Allowing Duplicate Data.com Records in Salesforce](#)

Organizations that use a sharing model may want to allow Data.com users to add duplicate account, contact, or lead records to Salesforce.

SEE ALSO:

[Data.com Clean](#)

[Set Up Data.com Clean](#)

Considerations for Custom Mapping of Data.com and Salesforce Fields

Custom mappings put Data.com values in the Salesforce account, contact, and lead fields where you want those values. Before mapping fields, make sure you understand how mapping works, what preparations to make, and what kind of results you should expect.

Not all Data.com fields are available for all Salesforce fields. To be mappable, the new Salesforce field must be the same data type as the default field. For example, the `DESCRIPTION` field can be mapped to a long text area field with 1,000 characters or more.

Custom field mappings apply when:

- Data.com records are added to Salesforce
- Salesforce records are matched with Data.com records and cleaned either manually or with automated jobs

Before you map fields, make sure you understand these potential outcomes and the related actions you should take.

- Mapping fields or updating mappings forces a full sync with Data.com: all records of enabled CRM objects (accounts, contacts, and leads) are updated, even if no records have changed.
- Data.com field mappings may conflict with any Salesforce field customizations (such as approvals, workflow rules, or Apex triggers) you use for accounts, contacts, leads, or D&B Company records. Review and edit your customizations as needed so they will work with the values supplied by your mappings.
- You can skip mapping individual Data.com fields, but values for skipped fields won't be added, exported, or considered when we calculate a record's clean status.
- Skipping or changing mappings for fields used to match Salesforce and Data.com records may change some records' clean status to `NOT FOUND`.
- For account records, skipping or changing the mapping for the `D-U-N-S NUMBER` field will cause all account jobs to use the Data.com matching service, rather than the `D-U-N-S NUMBER` field, to rematch account records.
- If you map fields and also set Clean job preferences to flag, auto-fill, or overwrite Salesforce fields, you'll see any *custom-mapped* fields when you set those preferences. Default mappings (such as from the Data.com `PHONE` field to the Salesforce `PHONE` field) do not appear.
- If you export Data.com search results, the column headers in your Excel file will show the mapped field names. For example, if you map the Data.com `PHONE` field to the Contact object's `MOBILE` field, you'll see a header called "Mobile" for contacts, not "Phone".
- If you map Data.com fields that do not have values, some Salesforce records might revert to `NOT FOUND` clean status.
- If you map a Data.com field to a custom Salesforce field, the custom field's label will appear on the Clean comparison page.
- If you want to track changes to field mappings, you'll find them in the Setup Audit Trail. From Setup, enter *View Setup Audit Trail* in the `QUICK FIND` box, then select **View Setup Audit Trail**.

Customize Data.com-to-Salesforce Field Mappings

You can create custom mappings to put Data.com values in particular Salesforce fields.

Walk Through It: Customize Data.com-to-Salesforce Field Mapping

Custom field mappings apply when:

- Data.com records are added to Salesforce
- Salesforce records are matched with Data.com records and cleaned either manually or with automated jobs

Before you change field mappings, it's important to [understand how mapping works, what preparations to make, and what kind of results you should expect](#).

 **Note:** Not all Data.com fields are available for all Salesforce fields. To be mappable, the new Salesforce field must be the same data type as the default field. For example, the `Description` field can be mapped to a long text area field with 1,000 characters or more.

1. From Setup, enter the name of the object you want to map the Data.com fields to, for example, **Accounts**, then select **Fields**.
2. Click **New** next to Custom Fields & Relationships for the object you want to map the fields to, for example, **Accounts Custom Fields & Relationships**.
3.  **Tip:** It's best to create all the fields in the object that you are adding fields to before mapping them from **Data.com Administration**.

Follow the steps in the New Custom Field wizard. When you're finished, be sure to click **Save**.

4. From Setup, enter **Data.com Administration**, then click **Field Mapping**.
5. Find the field you want to map, and select the custom mapping from the list box next to the field.
6. Click **Save**.

SEE ALSO:

[Default Data.com-to-Salesforce Field Mappings](#)

[Considerations for Custom Mapping of Data.com and Salesforce Fields](#)

Considerations for Allowing Duplicate Data.com Records in Salesforce

Organizations that use a sharing model may want to allow Data.com users to add duplicate account, contact, or lead records to Salesforce.

Keep these considerations in mind when setting your duplicate preferences.

- Records are considered duplicates when they have the same Data.com ID number in the `Data.com Key` field. This includes records that were added from Data.com as both contacts and leads.
- You can allow duplicates by object for the entire organization—not for individual users. If, however, you want to prevent a user or profile from being able to add duplicates, you can create a trigger.

EDITIONS

Available in: Salesforce Classic

To enable Data.com users:

- "Manage Internal Users"

To install AppExchange packages:

- "Download AppExchange Packages"

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available with a Data.com Premium Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

- Records that are already in Salesforce are marked with a green dot (●) in search results. These records can be re-added by any Data.com user if your organization allows duplicates for the object.
- Records that have been added to Salesforce from Data.com are marked with a blue checkmark (✓) in search results. These records can be re-added by any Data.com user if your organization allows duplicates for the object. Adding a record affects the record balance only the first time that record is added to Salesforce: adding duplicates *does not* affect the record balance.
- If your Data.com preferences are set to allow duplicates but your organization also uses duplicate rules to prevent the creation of duplicate records, the duplicate rule will determine if the duplicate record is allowed or blocked.

Configure Data.com Corporate Prospector

Data.com Corporate Prospector provides a basic set of Dun & Bradstreet account and lead data, including D-U-N-S Number, NAICS Code, TradeStyle, and more. Here's how to implement this product.

 **Note:** To find out which Data.com Prospector product your organization has, from Setup, enter *Licenses & Limits* in the Quick Find box, then select **Licenses & Limits**. On the Licenses & Limits page, check the Data.com Prospector Licenses section. You'll see either "Corporate" or "Premium."

1. Make sure you've [implemented Data.com](#).
2. [Enable Data.com Clean so your users can manually clean account, contact, and lead records](#).
3. [Configure your account, contact, and lead page layouts with the buttons and fields you need](#).
4. If you use Enterprise, Unlimited, or Performance Editions, you'll need to [update your field-level security so users see fields provided by D&B](#).

Best Practices for Your Configuration

If your organization uses either version of Data.com Prospector, and you create validation rules for the fields that the product provides, those rules will still attempt to run even if you stop using the product, so disable any validation rules using those fields in that case. Data.com Prospector fields are identified in the help topics "Account Fields" and "Lead Fields".

Configure Data.com Premium Prospector

Data.com Premium Prospector is an upgrade to Data.com Corporate Prospector. With Premium Prospector, you get all the features and fields available in Corporate Prospector, plus over 70 additional D&B fields for accounts and leads you add to Salesforce from Data.com. Like Data.com Corporate Prospector users, Premium Prospector users can also view a limited number of D&B fields on account and lead records.

 **Note:** To find out which Data.com Prospector product your organization has, from Setup, enter *Licenses & Limits* in the *Quick Find* box, then select **Licenses & Limits**. On the Licenses & Limits page, check the Data.com Prospector Licenses section. You'll see either "Corporate" or "Premium."

Here's how to configure Data.com Premium Prospector.

1. Make sure you've [implemented Data.com Prospector](#).
2. [Confirm that Data.com Clean is enabled, so your users can manually clean account, contact, and lead records.](#)
3. [Configure your account, contact, and lead page layouts with the buttons and fields you need.](#)
4. If you use Professional, Enterprise, Unlimited, or Performance Editions, you'll need to [update your field-level security so users see fields provided by D&B](#).
5. Add the D&B Companies tab to user profiles.
6. Verify that profiles have *D&B Companies* read and delete permissions selected under Standard Object Permissions.
7. (Optional) We've created a default layout for D&B Company records, but you may want to use the Enhanced Page Layout Editor to customize the page layout.

Best Practices for Your Configuration

- You can let your users view and delete D&B Company records. To do this, you'll assign permissions to standard and custom profiles.
 - For standard profiles, assign the permission *Delete D&B Company records* in addition to the preassigned permission *Read D&B Company records*.
 - For custom profiles, assign both of the permissions *Read D&B Company records* and *Delete D&B Company records*.
- If your organization uses either version of Data.com Prospector, and you create validation rules for the fields that the product provides, those rules will still attempt to run even if you stop using the product, so disable any validation rules using those fields in that case. Data.com Prospector fields are identified in the help topics "Account Fields" and "Lead Fields".

USER PERMISSIONS

To implement Data.com Premium Prospector:

- "Customize Application"

Manage Access to Data.com Search Results and Related Features

Use the **Add to Salesforce** and **Export Results** to limit what users can do with Data.com search results for Data.com features that use the search results.

The checkboxes under **Button Preferences** settings control whether specific Data.com Prospector features are visible to users in your org.

 **Warning:** Changing button preferences impacts all features associated with **Find Contacts** and **Find Accounts** for both Classic and Lightning features.

1. From Setup, enter *Prospector Preferences* in the Quick Find box, then select **Prospector Preferences**.
2. In the **Button Preferences** section of the page, deselect what you want to hide or select what you want to show.
3. Click **Save**.

[Make Sure You Can See Data.com Prospecting Insights](#)

Data.com Prospecting Insights shows up on the account home page only when **Account Insights** under **Account Settings** is selected.

[Enable Get More Contacts Button in Lightning Experience for an Existing Org](#)

The **Get More Contacts** button shows up on the account details page only when the **Button Preferences** in **Data.com Prospector Preferences** are selected.

Make Sure You Can See Data.com Prospecting Insights

Data.com Prospecting Insights shows up on the account home page only when **Account Insights** under **Account Settings** is selected.

Do you already have a Data.com Prospector license, but you don't see the **See More Insights** button on account details pages? Make sure **Enable Account Insights** under **Apps > Sales > Account Settings** is selected.

Here is what to do to make the **See More Insights** button show up on your org's account details pages.

1. From Setup, enter *Account* in the Quick Find box, then select **Account Settings**.
2. Click **Edit**.
3. Select **Enable Account Insights**.
4. Click **Save**.

Enable Get More Contacts Button in Lightning Experience for an Existing Org

The **Get More Contacts** button shows up on the account details page only when the **Button Preferences** in **Data.com Prospector Preferences** are selected.

Do you already have a Data.com Prospector license, but you don't see the **Get More Contacts** button on account details pages? Make sure the **Button Preferences** under **Data.com Prospector Preferences** are selected.

Here is what to do to make the **Get More Contacts** button show up on your org's account details pages.

1. From Setup, enter *Prospector Preferences* in the Quick Find box, then scroll to the **Button Preferences** Section.
2. Select **Add to Salesforce** for both **Find Contacts** and **Find Accounts**.
3. Click **Save**.

Respect Do-Not-Contact Settings in Data.com Search Results and Exports

In Data.com search results and export files, you can prevent certain contact information from being displayed.

In particular, you can mask out or remove:

- Email and phone values for contact and lead records already in Salesforce that have `Do Not Call` or `Email Opt Out` selected; and
- Email values for all contact and lead records with Canada addresses (to support Canada's privacy requirements)

For example: You have a lead record in Salesforce for Sally Larkin and on that record the `Do Not Call` checkbox is selected. You search for Sally Larkin as a contact on the Data.com tab and her record appears in the search results list, marked as already in Salesforce (●). The `Phone` field is masked in the search results list, and also on Sally's contact card. If you export the record, its `Phone` field is blank in the `.csv` file.

1. From Setup, enter *Preferences* in the `Quick Find` box, then select **Prospector Preferences**.
2. Select `Respect Do-Not-Contact Settings` and `Canada's Privacy Requirements`.

For records that have `Do Not Call` or `Email Opt Out` selected, `Phone` or `Email` field values are masked in the search results and on the contact card, and blank in `.csv` files created when you export records. For records with Canada addresses, `Email` field values are masked in the search results and on the contact card, and blank in `.csv` files created when you export records.

Enable or Disable Data.com API Functionality

Data.com API functionality is enabled by default.

1. From Setup, enter *Data.com Administration* in the `Quick Find` box, then select **API Preferences**.
2. Select or deselect the **Allow Data.com API Access** checkbox.
3. Save the page.

Guidelines for Letting Your Users Prospect for Companies, Contacts, and Leads with Data.com Prospector

We offer two versions of Data.com Prospector. Both let you search and add data from Data.com: Check out some guidelines for implementing both versions.

-  **Note:** If a search produces many results, you don't see data past page 10. Contact Salesforce Customer Support to enable unlimited view.
- If you add more than 200 leads to Salesforce at one time, any lead assignment rules your organization uses don't run. To make sure your lead assignment rules run, instruct your users to limit their additions to fewer than 200 leads at any time.
- If your organization uses validation rules on fields that are mapped to Data.com, either deactivate the rules or make sure that they match Data.com field names to avoid errors when adding records.

Resolve Data.com Record Addition Errors

If errors prevent you from adding one or more Data.com records to Salesforce, we'll provide a .csv error log file to help you fix any record addition errors.

How we provide the error log depends on what you were trying to do. If you were trying to add:

- Fewer than 200 records, you'll see a message with a link to the error log on the Files tab.
 - Two hundred records or more, you'll receive an email with a link to the error log on the Files tab.
 - Any number of records and you *do not* have Chatter enabled, you'll receive an email with the error log attached.
1. Open the record addition error log and review the errors, then take one of these actions.
 - If you see errors regarding duplicate records, you don't need to do anything. *Duplicate* errors mean that the records are already in Salesforce, so you don't need to add them again. If your Data.com preferences are set to allow duplicates, the error log will not include any *duplicate* errors. If your Data.com preferences are set to allow duplicates but your organization also uses duplicate rules to prevent the creation of duplicate records, the duplicate rule will determine if the duplicate record is allowed or blocked. Records that are blocked by the duplicate rule will appear in the error log.
 - If you see errors regarding your organization's custom configurations, such as triggers, validation rules, or workflow, let your administrator know because they may need to correct these configurations.
 - If your organization uses state and country picklists and you see errors regarding available states or countries, notify your administrator, who will need to add the particular state or country to the picklist.
 - For all other errors, contact your administrator, who may need to contact Salesforce Customer Support.
 2. After your administrator resolves the errors, try again to add the Data.com records to Salesforce.

Create a Custom Report Type for Account, Contact, or Lead Clean Info

Create custom report types to report on clean information for accounts, contacts, and leads. Clean Info custom report types can help you easily see clean information for multiple records in one report. Use that information to identify patterns and trends in your data and to manage or modify how your records are cleaned.

1. From Setup, enter *Report Types* in the **Quick Find** box, then select **Report Types**.
2. Click **New Custom Report Type**.
3. For Primary Object, select *Accounts*, *Contacts*, or *Leads*—whatever object you want to report on—and define the other required fields.
4. For Category, select either *Accounts & Contacts* or *Leads*, as appropriate.
5. Click **Next**.
6. Relate the companion Clean Info object (Account Clean Info, Contact Clean Info, or Lead Clean Info) to the primary object you selected. Accept the default for A to B Relationship.
7. Select a deployment status.
8. Click **Save**.

Now you can create custom reports based on your new custom report types.

How Are Salesforce and Data.com Records Matched?

If you clean your Salesforce account, contact, and lead data with Data.com, it's important to understand how your Salesforce records are compared and matched with records from Data.com.

 **Tip:** For complete details about how the Data.com matching service works, including a graphic overview and extensive examples, please see our white paper, [Data.com Record Matching in Salesforce](#).

Watch a Demo:  [Understanding Matching Rules](#)

Salesforce and Data.com records can be compared and matched in two ways.

- Manually, when a user clicks **Clean** on an individual account, contact, or lead record.
- Via Clean jobs, which automatically attempt to match all your account, contact, or lead records.

Automated clean jobs are only available to organizations that purchase Data.com Clean. *Manual* clean is available to all licensed Data.com Prospector users.

The first time a Salesforce record is cleaned—either manually or via automated job—the matching service searches Data.com for similar records. It examines the field values in each record and looks for enough identical or similar information to indicate that the two records represent the same entity (that is—the same account, contact, or lead). If Data.com finds a match, the two records are linked by a numeric value in the `Data.com Key` field. For contact and lead records, every time the Salesforce record is cleaned, the

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Prospector license in: **Contact Manager** (no Lead object), **Group**, **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

Available with a Data.com Clean license in: **Professional**, **Enterprise**, **Performance**, and **Unlimited** Editions

matching service is used to match the record. For account records, every time the Salesforce record is cleaned, the `D-U-N-S Number` field is used to match (or look up) the record. If the `D-U-N-S Number` field is blank, the matching service will be used to find a match. If the Salesforce record changes substantially, the next time it is cleaned, the matching service may look for a better match from other Data.com records.

 **Note:**

- If you prefer to rematch account records with the matching service, regardless of whether a D-U-N-S Number is present, please contact Salesforce Customer Support. Doing so, however, may cause some account records to have the Data.com `Clean Not Found` status.
- If you've remapped or skipped mapping for the `D-U-N-S Number` field, or if you're organization purchased Data.com prior to December 16, 2011, the matching service will automatically be used to rematch account records.

For contacts and leads, the important fields are:

- `Name`
- `Email`

Ideally, use a direct email address rather than a group address like `info@org.com`. (Identical Email values will almost always trigger a match unless other values in the record conflict.) **Note:** Data.com does not store emails that may be personal contact information, such as those from Gmail or Yahoo.

- `Account Name` for contacts; `Company` for leads.
- `Title`
- `Phone`

For accounts, the important fields are:

- `Account Name`
 - Make sure the account name doesn't contain any unrelated artifacts, such as numbers (1002), special characters (!#@#), or unrelated words. (These symbols are acceptable if they are part of the company's name.)
 - Try to avoid country and state names as values unless they are part of the company's name.
 - If the account name contains more than one word, like *DSGI Business (PC World Business)* try both of them.
 - If an account name is also a Website (like *salesforce.com*), try leaving off the subdomain (*.com* and the like).
- `Billing Address`
 - Use a full address, if possible.
 - Try to specify a value for the `Country` field. This will optimize your match rates.
 - Try to specify a value for the `State` or `ZIP code` field.
 - If you know the account's street name but not its street number, use the street name only. A street name without a street number is better than no value.
- `Website`
- `Phone`

Guidelines for Using D&B Company Records

Review some guidelines so your organization gets the most out of D&B Company records, which contain over 100 fields of industry, financial, and competitive information from Dun & Bradstreet®.

- If your organization has Data.com Premium Prospector or Data.com Premium Clean, you have access to the `DandBCompany` object, which provides Dun & Bradstreet data for accounts and leads you add to Salesforce.
- Make sure you add the D&B Companies tab to user profiles. That's how they'll access a list of all D&B Company records. The D&B Companies tab lists all the D&B Company records you have in Salesforce.
- To let your users delete D&B Company records, you need to create a permission set with the `Delete D&B Company records` and `Read D&B Company records` permissions and assign that permission set to users. You may also need to add the **Delete** button to page layouts.
- If your company also uses Data.com Premium Clean, you can use automated jobs to update your D&B Company records.
- Add the **Refresh** button to your D&B Company page layouts, so you can manually update D&B Company records to get the latest data from Dun & Bradstreet. You can also use automated jobs to update D&B Company records.
- D&B Company records linked to account records are not cleaned along with linked account records.
- For accounts or leads not added from Data.com (those created manually, for example), if a corresponding D&B Company record exists, it is added to Salesforce and linked to the account or lead record the first time that record is cleaned.
- SIC8 code fields (for example, `Primary SIC8 Code`) are not updated when existing D&B Company records are refreshed—either manually or as part of a job. These fields are only populated when the D&B Company record is created. To get SIC8 code values for an existing D&B Company record, you can delete the record and then clean its corresponding account. This recreates the D&B Company record, and it now includes values for the SIC8 code fields. Alternatively, you can get SIC8 values from the Data.com Search API, and add them to the D&B Company record.

D&B Company Fields

If you add or update an account or lead with Data.com Premium Prospector or Data.com Premium Clean, a D&B Company record is automatically created and linked to that account or lead via the `D&B Company` field. Just click the link in the `D&B Company` field to access the associated D&B Company record, which has over 100 fields of industry, financial, and competitive information from Dun & Bradstreet®. This gives your organization integrated access to Dun & Bradstreet's trusted global database of company information directly in Salesforce.

-  **Example:** If you add an account record for Starbucks from Data.com, when you open its record, the `D&B Company` field value is Starbucks Corporation. The value is underlined to identify it as a link. Just click the link to open the Starbucks Corporation D&B Company record.
-  **Example:** If you update an account record for Google using Data.com Premium Clean—either manually or with jobs—when you open its record, the `D&B Company` field value is Google. The value is underlined to identify it as a link. Just click the link to open the Google D&B Company record.
-  **Note:** Some D&B field labels are different from the object field labels they are mapped to. For example, the `Account Site` field on account records maps to the `Location Type` field on the linked D&B Company record. For a list of default mappings, see [Default Data.com-to-Salesforce Field Mappings](#) on page 1691

Field	Description
<code>Annual Sales Volume</code>	The total annual sales revenue in the headquarters' local currency. Dun & Bradstreet tracks revenue data for publicly traded companies, Global Ultimates, Domestic Ultimates, and some headquarters. Dun & Bradstreet does not supply this data for branch locations.
<code>Annual Sales Volume Indicator</code>	The reliability of the Annual Sales Volume figure. Available values are <i>Actual number</i> , <i>Low</i> , <i>Estimated (for all records)</i> , <i>Modeled (for non-US records)</i> . A blank value indicates this data is unavailable.
<code>Company Description</code>	A brief description of the company, which may include information about its history, its products and services, and its influence on a particular industry. This data is supplied by Hoover's.
<code>Delinquency Risk</code>	The probability that a company will pay with a significant delay compared to the agreed terms. The risk level is based on the standard Commercial Credit Score, and ranges from low risk to high risk. Also known as marketing prescreen. Available values are <i>High risk of delinquency</i> , <i>Low risk of delinquency</i> , and <i>Moderate risk of delinquency</i> . Dun & Bradstreet supplies this data for US and Canadian organizations only.
	 Important: Use this information for marketing pre-screening purposes only.

Field	Description
Domestic Ultimate Business Name	The primary name of the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure.
Domestic Ultimate D-U-N-S Number	The D-U-N-S Number for the Domestic Ultimate, which is the highest ranking subsidiary, specified by country, within an organization's corporate structure.
D-U-N-S Number	The Data Universal Numbering System (D-U-N-S) number is a unique, nine-digit number assigned to every business location in the Dun & Bradstreet database that has a unique, separate, and distinct operation. D-U-N-S numbers are used by industries and organizations around the world as a global standard for business identification and tracking.
Facsimile Number	The company's facsimile number.
Fifth NAICS Code	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code .
Fifth NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description .
Fifth SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Fifth SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Fifth SIC Code	An additional SIC code used to further classify an organization by industry. See Primary SIC Code .
Fifth SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description .
Fifth Tradestyle	An additional tradestyle used by the organization. See Primary Tradestyle .
FIPS MSA Code	The Federal Information Processing Standards (FIPS) and the Metropolitan Statistical Area (MSA) codes identify the organization's location. The MSA codes are defined by the US Office of Management and Budget. Dun & Bradstreet supplies this data for US organizations only.
FIPS MSA Code Description	A brief description of an organization's FIPS MSA code . Dun & Bradstreet supplies this data for US organizations only.
Fourth NAICS Code	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code .
Fourth NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description .

Field	Description
Fourth SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Fourth SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Fourth SIC Code	An additional SIC code used to further classify an organization by industry. See Primary SIC Code .
Fourth SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description .
Fourth Tradestyle	An additional tradestyle used by the organization. See Primary Tradestyle .
Fortune 1000 Rank	The numeric value of the company's Fortune 1000 ranking. A null or blank value means that the company isn't ranked as a Fortune 1000 company.
Geocode Accuracy	The level of accuracy of a location's geographical coordinates compared with its physical address. Available values include <i>Rooftop level, Street level, Block level, Census tract level, Mailing address level, ZIP code level, Geocode could not be assigned, Places the address in the correct city, Not matched, Not matched, Street intersection, PO BOX location, and Non-US rooftop accuracy</i> .
Global Ultimate Business Name	The primary name of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
Global Ultimate D-U-N-S Number	The D-U-N-S Number of the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.
Import/Export	Identifies whether a business imports goods or services, exports goods or services, and/or is an agent for goods.
International Dialing Code	The required code for international calls.
Latitude	The geographical coordinates that specify the north-south position of a point on the Earth's surface. Used with longitude to specify a precise location, which is then used to assess the Geocode Accuracy .
Legal Structure	Identifies the legal structure of an organization. Available values include <i>Cooperative, Nonprofit organization, Local government body, Partnership of unknown type, and Foreign company</i> .

Field	Description
Local Currency Code	The currency in which the company's sales volume is expressed. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet.
Local Currency ISO Code	The code used to represent a company's local currency. This data is provided by the International Organization for Standardization (ISO) and is based on their three-letter currency codes. For example, USD is the ISO code for United States Dollar.
Location Ownership Indicator	Indicates whether a company owns or rents the building it occupies.
Location Type	Identifies the organizational status of a company. Available values are <i>Single location, Headquarters/Parent, and Branch</i> .
Longitude	The geographical coordinates that specify the east-west position of a point on the Earth's surface. Used with latitude to specify a precise location, which is then used to assess the company's Geocode Accuracy .
Mailing Address	The address where a company has its mail delivered. If the mailing address is the same as the primary address, this field will be blank.
Marketing Segmentation Cluster	Twenty-two distinct, mutually exclusive profiles, created as a result of cluster analysis of Dun & Bradstreet data for US organizations. Available values include <i>High-Tension Branches of Insurance/Utility Industries, Rapid-Growth Large Businesses, Labor-Intensive Giants, Spartans, Main Street USA</i> . Dun & Bradstreet supplies this data for US organizations only.
Minority-Owned Indicator	Indicates whether an organization is owned or controlled by a member of a minority group. Dun & Bradstreet supplies this data for US organizations only.
National Identification Number	The identification number used in some countries for business registration and tax collection. This field does not apply to US organizations.
National Identification System	Identifies the type of national identification number used. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet.
Number of Business Family Members	The total number of family members, worldwide, within an organization, including the Global Ultimate, its subsidiaries (if any), and its branches (if any).
Number of Employees—Global	The total number of employees at the Global Ultimate, which is the highest entity within an organization's corporate structure and may oversee branches and subsidiaries.

Field	Description
Number of Employees—Location	The number of employees at a specified location, such as a branch location.
Number of Employees—Location Indicator	The reliability of the Number of Employees—Location figure. Available values are <i>Actual number</i> , <i>Low</i> , <i>Estimated (for all records)</i> , <i>Modeled (for non-US records)</i> . A blank value indicates this data is unavailable.
Number of Employees—Total	The total number of employees in the company, including all subsidiary and branch locations. This data is only available on records that have a value of <i>Headquarter/Parent</i> in the Location Type field.
Number of Employees—Total Indicator	The reliability of the Number of Employees—Total figure. Available values are <i>Actual number</i> , <i>Low</i> , <i>Estimated (for all records)</i> , <i>Modeled (for non-US records)</i> . A blank value indicates this data is unavailable.
Out of Business Indicator	Indicates whether the company at the specified address has discontinued operations.
Ownership Type Indicator	Indicates whether ownership of the company is public or private. The subsidiaries of a publicly traded parent company will show a value of <i>Private</i> unless the subsidiaries are independently traded.
Parent Company Business Name	The primary name of the parent or headquarters company.
Parent Company D-U-N-S Number	The D-U-N-S Number for the parent or headquarters.
Primary Address	The address where a company is physically located. This field is Billing Address on account records.
Primary Business Name	The primary or registered name of a company.
Primary NAICS Code	The six-digit North American Industry Classification System (NAICS) code is the standard used by business and government to classify business establishments according to their economic activity for the purpose of collecting, analyzing, and publishing statistical data related to the US business economy. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet.
Primary NAICS Description	A brief description of an organization's line of business, based on its NAICS code.
Primary SIC Code	The four-digit Standard Industrial Classification (SIC) code is used to categorize business establishments by industry. The full list of values can be found at the Optimizer Resources page maintained by Dun & Bradstreet.
Primary SIC Description	A brief description of an organization's line of business, based on its SIC code.

Field	Description
Primary Tradestyle	A name, different from its legal name, that an organization may use for conducting business. Similar to "Doing business as" or "DBA".
Prior Year Employees	The total number of employees for the prior year.
Prior Year Revenue	The annual revenue for the prior year.
Second SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Second SIC8 Code Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Second NAICS Code	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code .
Second NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description .
Second SIC Code	An additional SIC code used to further classify an organization by industry. See Primary SIC Code .
Second SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description .
Second Tradestyle	An additional tradestyle used by the organization. See Primary Tradestyle .
Sixth NAICS Code	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code .
Sixth NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description .
Sixth SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Sixth SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Sixth SIC Code	An additional SIC code used to further classify an organization by industry. See Primary SIC Code .
Sixth SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description .
Small Business Indicator	Indicates whether the company is designated a small business as defined by the Small Business Administration of the US government. Dun & Bradstreet supplies this data for US organizations only.
Stock Exchange	The corresponding exchange for a company's ticker symbol . For example: NASDAQ or NYSE.

Field	Description
Subsidiary Indicator	Indicates whether a company is more than 50 percent owned by another organization.
S&P 500	A true or false value. If <code>true</code> , the company is listed in the S&P 500 Index. If <code>false</code> , the company isn't listed in the S&P 500 Index.
Telephone Number	A company's primary telephone number.
Third NAICS Code	An additional NAICS code used to further classify an organization by industry. See Primary NAICS Code .
Third NAICS Description	A brief description of an organization's line of business, based on the corresponding NAICS code. See Primary NAICS Description .
Third SIC8 Code*	An additional SIC code used to further classify an organization by industry. Maximum size is 8 characters.
Third SIC8 Description	A brief description of an organization's line of business, based on the corresponding SIC code. Maximum size is 80 characters.
Third SIC Code	An additional SIC code used to further classify an organization by industry. See Primary SIC Code .
Third SIC Description	A brief description of an organization's line of business, based on the corresponding SIC code. See Primary SIC Description .
Third Tradestyle	An additional tradestyle used by the organization. See Primary Tradestyle .
Ticker Symbol	The abbreviation used to identify publicly traded shares of a particular stock. Also known as the stock symbol.
URL	An organization's primary website address.
US Tax ID Number	The identification number for the company used by the Internal Revenue Service (IRS) in the administration of tax laws. Also referred to as Federal Taxpayer Identification Number. Dun & Bradstreet supplies this data for US organizations only.
Woman-Owned Indicator	Indicates whether a company is more than 50 percent owned or controlled by a woman. Dun & Bradstreet supplies this data for US organizations only.
Year Started	The year the company was established or the year when current ownership or management assumed control of the company. If the company establishment or ownership year is unavailable, then the year the Dun & Bradstreet record was created will be used. Dun & Bradstreet does not supply this data for branch locations.

* Available with Data.com Premium Prospector license only.

How do I know which Data.com product my organization has?

You can find out by going to the Data.com Licenses & Limits page. From Setup, enter *Licenses & Limits* in the Quick Find box, then select **Licenses & Limits**. If your organization has purchased Data.com Corporate Prospector, you'll see "Corporate" in the heading for this section of the page. If your organization has purchased Data.com Premium Prospector, you'll see "Premium" in the heading.

What Salesforce Fields Are Affected by Data.com Clean?

Note:

- These fields may be different if your organization uses customized Data.com-to-Salesforce field mappings.
- If you can't edit one or more fields on an account, contact, or lead record, you may receive a message that says, *You have limited access to data, so you can not completely clean this record or You have limited access to account fields, so you can not update all the fields shown here.* If this happens, ask your administrator for help.

When you use Data.com Clean to clean a Salesforce record, either manually or with automated jobs, the record's fields are updated with Data.com data. Here's a list of the fields that are updated.

Account Fields

[Using Data.com FAQ](#)

How Often Are *All* My Accounts, Contacts, Leads, and D&B Companies Updated with Data.com Clean Jobs?

You choose when you want jobs to run using the Clean Jobs page. There are two types of jobs.

Full Sync Job

All records are cleaned, regardless of their clean status.

 **Note:** If your jobs are set to bypass skipped records, records with a `skipped` clean status are not cleaned.

Incremental Sync Job

Only records with a `Not Compared` clean status are cleaned.

For a full sync job to run, you must have jobs scheduled for at least one day of the week.

For contacts and leads, a full sync job runs every 14 days for all eligible records.

For D&B Company records, a full sync job runs every 14 days. D&B Company records are cleaned using only a full sync job.

For accounts, how often a full sync job runs depends on the matching service you select and whether accounts have a value for the `Company D-U-N-S Number` field. For accounts *with* a D-U-N-S number, a full sync job runs every 14 days, regardless of the matching service. For accounts *without* a D-U-N-S number, check out this table.

Matching Service	How often can a full sync job clean accounts <i>without</i> a D-U-N-S number?
Data.com matching	Every 14 days
DUNSRight matching	Every 30 days

 **Note:** You must set the `Full Sync With Next Job` option on the `Clean Jobs` page to `On` each time you want to run a full sync job for accounts without a D-U-N-S number. After a full sync job runs, this option changes to `Off`, and it can't be toggled to `On` for 30 days from the time the last full sync job finished.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:
Professional, Enterprise, Performance, and Unlimited Editions

Your business is only as good as its data. Do you want to spend less time updating and enriching data and more time growing your business? Just set up and implement Data.com Clean. Then, your Salesforce records will be complete and up-to-date!

 **Note:** If you're using Data.com Prospector together with Data.com Clean, see [Set Up Data.com Prospector](#) on page 1685.

1. [Confirm That Data.com Clean Is Enabled](#)

Learn how to enable Data.com Clean so your organization can start keeping its records up to date.

2. [Configure Page Layouts for Data.com Prospector and Data.com Clean](#)

When you implement Data.com Prospector and Data.com Clean, so that users can use the product, you need to add buttons and fields to your Account, Contact, and Lead page layouts. If you use Data.com Premium Prospector or Data.com Premium Clean, you can add a button to your D&B Companies page layouts so users can refresh linked D&B Company records.

3. [Set Field-Level Security for Data.com](#)

If your organization uses Data.com Prospector or Data.com Clean, you can view a number of D&B fields on account records, and those fields are included when users manually clean records. To make sure your users can read and edit the fields and their values, and that they appear on the Account Card, you need to set field-level security.

4. [Define Your Preferences and Select an Account Matching Service for Data.com Clean](#)

Clean preferences let you specify which objects' records you want to clean and how you want to clean them. This includes selecting the matching service that's used to clean accounts.

5. [Set Up Data.com Clean Jobs](#)

If your organization has a Data.com Clean license, you can set up automated jobs to clean your records.

6. [Review Triggers and Workflow Rules for Clean Compatibility](#)

If your organization uses triggers or workflow rules on objects enabled for Clean (Account, Contact, Lead, or D&B Company), review the triggers and workflows and consider making adjustments or bypassing them so users don't encounter unexpected results when records are cleaned.

7. [Configure List Views for Data.com Clean](#)

Before your Data.com Clean users can clean records from a list, you'll need to add the `Clean_Status` field to your organization's list views.

8. [Set Up Data.com Clean Rules](#)

Help your sales and marketing teams maintain great relationships with customers and pursue the most promising leads and opportunities by automatically enriching your Salesforce accounts, contacts, and leads with the latest information. It's all done using Data.com clean rules.

9. [Report on Salesforce Records with a Specific Data.com Clean Status](#)

Create a custom report to show Salesforce account, contact, or lead records that have a specific clean status (such as `Different`).

SEE ALSO:

[Data.com Clean](#)

Confirm That Data.com Clean Is Enabled

Learn how to enable Data.com Clean so your organization can start keeping its records up to date.

Data.com Clean ensures that your CRM records are always up to date. You can use Clean with all your account, contact, and lead records—not just those records added from Data.com. When you purchase the Data.com product, Clean is automatically enabled, so you can set up automated Clean jobs and users can clean individual records manually or clean groups of records from a list view.

Enabling Clean makes clean features available to your organization, and it causes the **Preferences** and **Jobs** links to appear in Setup under the Clean section.

 **Note:** Enabling Clean *does not* clean your records immediately, and you can click **Disable** to turn off the feature.

1. From Setup, enter *Clean Settings* in the Quick Find box, then select **Clean Settings**.
2. Confirm that Data.com Clean is enabled.

SEE ALSO:

[Data.com Clean](#)

[Set Up Data.com Clean](#)

Configure Page Layouts for Data.com Prospector and Data.com Clean

When you implement Data.com Prospector and Data.com Clean, so that users can use the product, you need to add buttons and fields to your Account, Contact, and Lead page layouts. If you use Data.com Premium Prospector or Data.com Premium Clean, you can add a button to your D&B Companies page layouts so users can refresh linked D&B Company records.

 **Note:** If your organization uses Professional Edition, custom page layouts are not available, so you must add *all* available Data.com fields and buttons to your page layout for each object (accounts, contacts, leads, and D&B Companies).

1. From the object management settings for accounts, go to Page Layouts.
2. From the list of page layouts, click **Edit** next to the layout(s) your Data.com Prospector or Data.com Clean users will use.
3. On the Account Layout page, from the list of page element categories, click **Fields**.
4. Drag the `Clean Status` field into place on the page where you want it to appear.
5. If you use Data.com Corporate Prospector or Data.com Premium Prospector, add the D&B fields you want users to see. These include `Account Site`, `D-U-N-S Number`, `NAICS Code`, `Tradestyle`, and more. For a complete list of the D&B fields available on account records, see [Account Fields](#).

 **Tip:** We recommend creating a section for D&B fields and grouping them there. To create a section, from the **Fields** group, just drag the `Section` element into place on the page.

Set Field-Level Security for Data.com

If your organization uses Data.com Prospector or Data.com Clean, you can view a number of D&B fields on account records, and those fields are included when users manually clean records. To make sure your users can read and edit the fields and their values, and that they appear on the Account Card, you need to set field-level security.

Set field-level security for these fields.

- `Account Site`
- `D&B Company` (Data.com Premium Prospector only)
- `D-U-N-S Number`
- `NAICS Code`
- `NAICS Description`
- `Ownership`
- `SIC Code`
- `Ticker Symbol`

EDITIONS

Available in: Salesforce Classic

Available in: **Professional, Enterprise, Performance, and Unlimited** Editions

USER PERMISSIONS

To set field-level security:

- "Customize Application"

- Tradestyle
- Year Started

There are multiple ways to set field-level security (such as by profile or permission set), but because you need to set field-level security for only ten fields, we recommend starting from the fields and choosing the user profiles for users who use Data.com.

1. From the management settings for accounts, go to the fields section.
2. Click the field label to open the detail page for each of the fields.
3. On each field's detail page, click `Set Field-Level Security`. For each profile whose users need to read and edit the fields, select **Visible**. For example, if users in the Standard User profile will use Data.com Clean, select **Visible** for that profile.

 **Note:** Because these fields are maintained by Data.com Clean, making them editable by setting the field-level security to **Visible** could create mismatched data when a Clean job is run.

Define Your Preferences and Select an Account Matching Service for Data.com Clean

Clean preferences let you specify which objects' records you want to clean and how you want to clean them. This includes selecting the matching service that's used to clean accounts.

If your organization does not have a Data.com Clean license, you won't be able to select preferences for jobs.

1. Review the [guidelines](#) for selecting a matching service that's used to clean accounts.
2. From Setup, enter `Preferences` in the `Quick Find` box, then select **Preferences** under the Clean section.
3. Select the matching service for cleaning accounts. If you select D&B DUNSRight™ matching service, adjust your confidence code if needed.
D&B's Confidence Code ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). We won't *automatically* match any Data.com record below the code you select here, and if we have multiple records at or above your selection, we'll match the best quality record. When you *manually* clean a record, you may be able to select a match between our preset confidence code (5) and the code you select here.
4. Review the [guidelines](#) for selecting job preferences.
5. Make sure the `Enable Clean jobs` checkbox is selected for each object whose records you want to clean. If your organization has a Data.com Premium Clean license and you want to clean D&B Company records, select the `Enable Clean jobs for D&B Companies` checkbox.
6. For each object you've enabled, select your clean preference.
7. Save your preferences.

Guidelines for Selecting an Account Matching Service

If you use Data.com Prospector or Data.com Clean, you can select the matching service your organization uses to clean account records. It's important to understand each service, its clean behaviors, and related considerations before selecting your service.

The available matching services are:

Data.com matching

Data.com's own matching technology, which matches on the `Account Name`, `Billing Address`, `Website`, and `Phone` fields.

The Data.com matching service is always used when cleaning accounts that have a valid `D-U-N-S Number`, even if the DUNSRight matching service is selected.

D&B DUNSRight™ matching

D&B's proprietary data-quality technology, which uses a rigorous process to normalize data and match D&B company records to your account records. The process also employs the D&B Confidence Code, which ranks Data.com match candidates based on how similar they are to your record, from 1 (not similar) to 10 (identical or highly similar). D&B also provides letter-coded match grades for individual fields. For details about how D&B DUNSRight matching works, see [D&B Entity Matching](#).

[Set Up Data.com Clean Jobs](#)

[Define Your Preferences and Select an Account Matching Service for Data.com Clean](#)

Guidelines for Selecting Data.com Clean Job Preferences

Before you define your Data.com Clean jobs, it's important to understand the preferences you can set.

- Data.com Clean offers three options for cleaning your data with jobs. Jobs can:
 - Flag all differences per record to *only identify* fields whose values are different from Data.com values
 - Flag differences and auto-fill blank fields to identify fields whose values are different *and fill blank fields* with values from Data.com.
 - Customize settings field by field.
- If you select the `Customize` option for any object, you can:
 - Flag fields on your Salesforce records that have different values from matched Data.com records.
 - Flag different field values on your Salesforce records and automatically fill blank fields with Data.com values.
 - Overwrite different field values on your Salesforce records with Data.com values. If you overwrite Salesforce record values, you should set history tracking for those fields.
- You can set flag-only and flag and auto-fill preferences for entire records or by field. You set overwrite preferences by field.
- If you use Data.com Premium Clean, you can also clean D&B Company records that are linked to accounts and leads. D&B Company clean jobs automatically fill or overwrite field values on D&B company records, but do not change data on linked account or lead records.
- Your preferences take effect when the next scheduled clean job runs, and users will see the flags, as appropriate, when they clean records manually.
- If, after changing matching services, you want to do a one-time rematch using the new matching service, you can manually remove the `D-U-N-S Number` on account records to force the matching service to rematch the records. Be aware that this might affect your match rates.
- We don't recommend mapping a custom field or skipping mapping for either matching service.
- Converted leads are excluded from Lead clean jobs.
- If you select a field to be overwritten by Clean jobs, and a user marks that field as *wrong* on a record, jobs will not overwrite that field on that record.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:
Professional, Enterprise, Performance, and Unlimited Editions

- Person accounts are excluded from Account and Contact clean jobs.

Set Up Data.com Clean Jobs

If your organization has a Data.com Clean license, you can set up automated jobs to clean your records.

[Considerations for Scheduling Data.com Clean Jobs](#)

Here's some things to understand before you start keeping your records clean automatically with jobs.

[Schedule Data.com Clean Jobs](#)

To keep your records' clean status up to date, schedule automated jobs to compare your records with Data.com. Jobs are only available to organizations with a Data.com Clean license.

[Schedule a Full Sync of Your Salesforce Account Records with Data.com Clean](#)

If you use the D&B DUNSRight™ Matching service, you can schedule a full sync of your account records with Data.com's the next time your account clean jobs run. The full sync compares all of your account records with records from Data.com, and may find matches for records that were not matched during previous jobs.

[Prevent Data.com Clean Jobs from Updating Records](#)

You can prevent individual account, contact, and lead records from being updated with Data.com data when automated jobs run.

[Review Data.com Clean Job History](#)

The Data.com Clean Job History table lets you review your current jobs and access job error logs.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in: **Professional, Enterprise, Performance, and Unlimited** Editions

Considerations for Scheduling Data.com Clean Jobs

Here's some things to understand before you start keeping your records clean automatically with jobs.

! **Important:** If you have set up triggers to run when account, contact, or lead records are updated, and your triggers perform SOQL queries, the queries may interfere with jobs for those objects. Your Apex triggers (combined) can't exceed 200 SOQL queries per batch. If they do, your job for that object will fail. In addition, if your triggers are @future methods, they are subject to a limit of 10 @future calls per batch.

- Jobs are only available to organizations with a Data.com Clean license.
- You must have jobs scheduled for at least one day in a week them to run.
- Jobs only process records of enabled objects
- In a full sync job, all records are cleaned, regardless of their clean status. In an *incremental sync* job, only records with a `Not Compared` clean status are cleaned.
- When a full sync job runs, it runs instead of an incremental sync job.
- If a full sync job is scheduled to run, it runs even if no records have changed.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in: **Professional, Enterprise, Performance, and Unlimited** Editions

- The duration between jobs is counted from the time the previous job finishes to the start of the next job.
- Jobs are queued according to your scheduling settings, and they run independently for accounts, contacts, and leads. If you use Data.com Social Key, jobs also run a process that finds and associates social handles for your contacts and leads.
- How long it takes for a job to complete depends on several things, including which matching service you've selected (for account jobs), how many records your job cleans, and overall Salesforce performance. Using Data.com matching, it takes about a day for jobs to clean 3,000,000 records. Using DUNSRight™ matching, it takes about a day for jobs to clean 750,000 records.
- Use your sandbox environment to try out the automated clean jobs before running them in your production org with live data. After Data.com Clean is provisioned in your production org, refresh your sandbox so it has the same permissions and data. Then follow the steps in [Implementing Data.com Clean](#) to set up Clean in your sandbox. If everything runs smoothly in your sandbox environment, follow the same implementation steps in your production org.
- Jobs scheduled in a sandbox environment expire after 30 days.
- For best results, we recommend including a valid value for the `Country` and `State/Province` fields.
- Before scheduling jobs, we recommend you schedule regular backups of your account, contact, and lead data. It's always a good practice, and if your Salesforce records are ever matched inappropriately, you can revert to previous versions.
- Set up field history tracking for accounts, contacts, and leads. Field history tracking helps you identify changes to field values, and tracks who made changes and when. If you use field history tracking, make sure you add the Account History, Contact History, and Lead History related lists to those objects' respective page layouts.
- Jobs do not process person account records.

Use **Skipped** Clean Status to Prevent Data.com Clean Jobs from Updating Records

Use the **Skipped records** Data.com Clean job bypass preference, which makes sure records with a **Clean Status** of **Skipped** are not updated by jobs. This is the recommended method of preventing jobs from updating records.

1. From Setup, enter *Preferences* in the **Quick Find** box, then select **Preferences** under the **Clean** section.
2. Select **Skipped records** from the **Job Bypass Preferences for Accounts, Contacts, and Leads** jobs.
3. Save your preferences.
4. Set the **Clean Status** to *Skipped* for records that you don't want jobs to update.

 **Tip:** You can use the Salesforce API, the Data Loader, or an Apex trigger to set the **Clean Status** for multiple records.

5. To make sure the **Clean Status** for **Skipped** records does not change when records are updated, create an Apex trigger. When a record is updated, the trigger sets its **Clean Status** back to **Skipped**. Then, jobs won't update the record.

[Use Custom Fields and Validation Rules to Prevent Data.com Clean Jobs from Updating Records](#)

Use Custom Fields and Validation Rules to Prevent Data.com Clean Jobs from Updating Records

Use a custom field to identify the records you don't want auto-updated. Then, create a validation rule that tells jobs to skip these records.

 **Important:** If you create a validation rule to prevent auto-updates, keep this best practice in mind.

The validation rule generates entries and related messages in Data.com Clean job logs, but your jobs may generate other entries and errors, as well, so make sure that you examine your job logs carefully.

1. Create a custom field for each object in which there are records you want to prevent Clean jobs from automatically updating.

Here's an example of how to define the custom field.

Field	Value or Selection
Field Type	Checkbox
Field Label	<i>Data.com Does Not Auto-Update</i>
Default Value	Unchecked
Description	<i>Prevents automated Clean jobs from updating fields with the matched Data.com record's values.</i>

USER PERMISSIONS

To create or change custom fields:

- "Customize Application"

To define or change field validation rules:

- "Customize Application"

To view field validation rules:

- "View Setup Configuration"

Field	Value or Selection
Help Text	<i>Exclude this record from automated field updates from Data.com Clean jobs</i>

- To block auto-updates on records that have Data.com Does Not Auto-Update (or whatever you've named the custom field) selected, create a validation rule.

Here's an example of how to define the validation rule for each object.

Field	Value or Selection
Rule Name	<i>Block_autoupdate_from_Data_com</i>
Description	<i>Record-level prevention of automated Clean jobs from automatically updating field values.</i>
Error Condition Formula (for Accounts)	<pre>(YOUR CUSTOM FIELD API NAME) && (\$User.Alias = "autocln") && (ISCHANGED(DunsNumber) ISCHANGED(NumberOfEmployees) ISCHANGED(AnnualRevenue) ISCHANGED(TickerSymbol) ISCHANGED(Website) ISCHANGED(Industry) ISCHANGED(Ownership) ISCHANGED(BillingCity) ISCHANGED(BillingCountry) ISCHANGED(BillingState) ISCHANGED(BillingStreet) ISCHANGED(BillingPostalCode) ISCHANGED(Phone) ISCHANGED(Fax) ISCHANGED(Site) ISCHANGED(Tradestyle) ISCHANGED(YearStarted) ISCHANGED(Sic) ISCHANGED(SicDesc) ISCHANGED(NaicsCode) ISCHANGED(NaicsDesc) ISCHANGED(Description))</pre>
Error Condition Formula (for Contacts)	<pre>(YOUR CUSTOM FIELD API NAME) && (\$User.Alias = "autocln") && (ISCHANGED(Title) ISCHANGED(Email) ISCHANGED(Phone) ISCHANGED(MailingStreet) ISCHANGED(MailingCity) ISCHANGED(MailingState) ISCHANGED(MailingCountry) ISCHANGED(MailingPostalCode))</pre>
Error Condition Formula (for Leads)	<pre>(YOUR CUSTOM FIELD API NAME) && (\$User.Alias = "autocln") && (ISCHANGED(Company) ISCHANGED(Title) ISCHANGED(Email) ISCHANGED(Phone</pre>

Field	Value or Selection
	<pre>) ISCHANGED(Street) ISCHANGED(City) ISCHANGED(State) ISCHANGED(PostalCode) ISCHANGED(Country) ISCHANGED(NumberOfEmployees) ISCHANGED(AnnualRevenue) ISCHANGED(Industry) ISCHANGED(CompanyDunsNumber))</pre>
Error Message	<i>This record has been excluded from automated field updates from Data.com Clean jobs.</i>

- Open each record that you don't want to be auto-updated, and select `Do Not Auto-Update` (or whatever you've named the custom field).

When automated jobs run, for each record that is not updated, you see a message in the job log: "This record has been excluded from automated field updates from Data.com Clean jobs."

 **Tip:** You can use the Data Loader or a custom trigger to select this checkbox for multiple records.

Review Data.com Clean Job History

The Data.com Clean Job History table lets you review your current jobs and access job error logs.

 **Important:** If you use the Do Not Auto-Update validation rule to prevent selected records from being automatically updated by Data.com Clean jobs, make sure you understand its effects on Clean job logs. The rule generates entries and related messages in job logs, but your jobs may generate other entries and errors, as well. So make sure you examine your job logs carefully. The validation rule is available in the Data.com Reports AppExchange package.

- From Setup, enter `Jobs` in the `Quick Find` box, then select `Jobs`.
- View job details in the Clean Jobs History section.
- If the job encountered errors when processing records, click the link in either the `Batch Errors` or `Entity Errors` columns to download the job log `.csv` file.

We store job logs for 21 days.

Here are the definitions for the table columns.

Column Heading	Definition
Date	The date the job was run.

EDITIONS

Available in: Salesforce Classic

Available with a Data.com Clean license in:

Professional, Enterprise, Performance, and Unlimited Editions

USER PERMISSIONS

To schedule Data.com Clean jobs and view job history:

- "Customize Application"

Column Heading	Definition
Time Submitted	The time the job was submitted to the job queue. Jobs run independently, so this might not be the exact time the job was run.
Job Type	<p>The type of job: for Accounts, D&B Companies, Contacts, or Leads. There are multiple types of account jobs.</p> <p>Account (Data.com Matching): the Data.com matching service was used to match the account records.</p> <p>Account (DUNSRight Matching): the DUNSRight matching service was used to match the account records.</p> <p>Account (D-U-N-S Number Lookup): the D-U-N-S Number field, if present, was used to rematch (or look up) the account records.</p>
Job Status	<p>The status of the job:</p> <p>Queued: the job is in the queue to run. For jobs in this status, the Time Submitted column displays a dash (-).</p> <p>Preparing: the job is being prepared to run.</p> <p>Processing: the job is in process.</p> <p>Completed: the job has finished running (with or without errors).</p> <p>Failed: the job failed to run.</p> <p>Aborted: the job was aborted before or while it ran.</p>
Records	The total number of Salesforce records processed by the job.
Matched	The total number of Salesforce records the job matched to Data.com records.
Unmatched	The total number of Salesforce records the job did not match to Data.com records.
Inactive	The number of Salesforce records that are marked as Inactive in Data.com.
Batch Errors	The total number of batch errors a job encountered while it ran. A dash indicates either no errors or no data. If the job produces a batch error job log, click the link to download and open its .csv file.
Entity Errors	The total number of entity errors a job encountered while it ran. A dash indicates either no errors or no data. If the job produces an entity error job log, click the link to download and open its .csv file. There you'll find an explanation of any entity error that was produced because a record failed to save—for example, because of a validation rule failure. Entity errors usually result from validation rule failures or required field violation. If an explanation exists, we'll provide it.

Column Heading**Definition**

The unique ID of a record that produced an error during the job. To open the record, append the 15-digit ID to the URL of your Salesforce instance. For example:
<https://na1.salesforce.com/0013000000hKBTq>.

Review Triggers and Workflow Rules for Clean Compatibility

If your organization uses triggers or workflow rules on objects enabled for Clean (Account, Contact, Lead, or D&B Company), review the triggers and workflows and consider making adjustments or bypassing them so users don't encounter unexpected results when records are cleaned.

1. If you use triggers on any object that's cleaned manually or by Clean jobs, from the object's management settings, go to Triggers.
2. Open and examine each trigger to make sure that your system or users won't encounter any unexpected results when records are cleaned. If you find that one or two triggers might cause unexpected results, you may be able to adjust those triggers. If you use Clean jobs and find multiple triggers that may cause unexpected results, consider bypassing triggers when jobs are run. You can select that option on the Clean Preferences page: from Setup, enter *Preferences* in the **Quick Find** box, then select **Preferences** under Clean.
3. If you use workflows, from Setup, enter *Workflow Rules* in the **Quick Find** box, then select **Workflow Rules**.
4. Open and examine each workflow rule to make sure that your system or users won't encounter any unexpected results when records are cleaned. If you find that one or two workflow rules might cause unexpected results, you may be able to adjust those rules. If you use Clean jobs and find multiple rules that may cause unexpected results, consider bypassing workflow rules when jobs are run. You can select that option on the Clean Preferences page. You can select that option on the Clean Preferences page: from Setup, enter *Preferences* in the **Quick Find** box, then select **Preferences** under Clean.
5. For all triggers and workflow rules you're using, check results on affected object records after the next Clean job runs for that object.

 **Example:** your organization has a trigger that creates and assigns a task every time a lead record is updated by any means. If you clean leads using Clean jobs, your users could get more tasks than expected, so you might want to adjust the trigger so that tasks are only created and assigned when records are *manually edited or cleaned by Salesforce users*. You can determine who last updated a record by checking the **Last Modified By** field. Records last updated by a Clean job show **Data.com Clean** in that field, and records updated by users show the first and last name of the user.

Configure List Views for Data.com Clean

Before your Data.com Clean users can clean records from a list, you'll need to add the `Clean Status` field to your organization's list views.

1. Click the tab (Accounts, Contacts, or Leads) for the object whose records you want to clean from your list.

 **Note:** If your organization uses DUNSRight matching to clean account records, list view cleaning is not available for account records.

2. Select a view from the drop-down and click **Edit**.
3. Scroll down the Available Fields list to find the `Clean Status` field, then add it to the list of Selected Fields.
The **Clean** button will automatically be added to the list view.
4. If you use Data.com Social Key, you can also add the fields for the social networks you've enabled (LinkedIn®, Twitter, or Facebook) to your contact list views.
The social network fields aren't available on the lead list views.

Set Up Data.com Clean Rules

Help your sales and marketing teams maintain great relationships with customers and pursue the most promising leads and opportunities by automatically enriching your Salesforce accounts, contacts, and leads with the latest information. It's all done using Data.com clean rules.

[What Are Clean Rules?](#)

Clean rules keep your data squeaky clean, complete, and up-to-date. Just set up and activate your organization's Data.com clean rules. Then, your records are automatically checked against a data service to see if new data is available. Based on the clean rule settings, your records are updated with the new data. With clean rules, maintaining high-quality data is a piece of cake!

[Automatically Get Geocodes for Addresses](#)

Help your sales and marketing teams find nearby prospects, assign territories and campaigns, and more! All this is a cinch with geocodes. In just a few clicks, you can automatically get geocodes for addresses on accounts, contacts, and leads.

[Automatically Enrich Leads with Critical Company Information](#)

Make it easier for your sales and marketing reps to pursue the most promising leads and immediately assign them to the right territories and campaigns. If your organization has a Data.com Premium Clean license, then it's easy to enrich your leads with valuable company information like annual revenue, industry, D-U-N-S number, and number of employees.

[Guidelines for Determining How Well Clean Rules Are Working](#)

Do you want to know how well Data.com Clean is working for your organization? Check out the Clean Vitals page, which shows the match rate for your clean rules. You'll see the percentage of processed records that Data.com matched to a record in the data service. When a record's matched, it can be updated with the latest data.

[Standard Data.com Clean Rules](#)

Learn key details about the standard clean rules, which help you automatically add or assess information on your Salesforce records. Find a description of how each clean rule works and the fields it affects.

Statuses for Data.com Clean Rules

If you've activated any Data.com clean rules, you'll see a status associated with the rule on records. This status indicates how the record's data compares with the data service.

What Are Clean Rules?

Clean rules keep your data squeaky clean, complete, and up-to-date. Just set up and activate your organization's Data.com clean rules. Then, your records are automatically checked against a data service to see if new data is available. Based on the clean rule settings, your records are updated with the new data. With clean rules, maintaining high-quality data is a piece of cake!

Clean rules are a Data.com Clean feature, but you don't need a Data.com license to use every clean rule. For example, geocode clean rules are available to everyone! Clean rules are independent of other clean features, though clean rules may update the same records as other clean features like Clean jobs.

So how do these mysterious clean rules work?

It's simple! Clean rules control how your Salesforce records are cleaned.

When you clean a record, you compare it to a matching record from a data service. If new data is available, you can add it to your record. The clean rule controls the entire process. A clean rule is used every time a record is cleaned to specify things like:

- The data service for cleaning, which includes source that your records are compared to and the processes that figures out if your records match records from the data source
- The object that's cleaned
- The fields used to match your records with records from the data service
- The fields that are updated when a match is found
- How fields are updated when records are cleaned (for example, values on Salesforce fields are overwritten with data from the data service)
- If triggers and workflow rules run when records are cleaned

 **Note:** Some clean rules are set up only to assess your data. These "Assessment Only" rules just check to see if new data is available for your records and tell you how much value you get from that data.

After you activate a clean rule, it immediately goes to work. Existing records are checked to see if new data is available. New records are checked when they're saved. If there's new data available, the record is updated based on the clean rule settings.

 **Example:** You have an app that assigns leads to territories based on the latitude and longitude of lead addresses. There's just one problem: Your lead addresses in Salesforce don't have updated values for latitude and longitude. No need to worry! Just set up and activate the `Geocodes for Lead Address` clean rule. Then, geocode information is automatically added to all your existing *and* new leads. Here's a summary for this rule.

Attribute	Value
Name	<code>Geocodes for Lead Address</code>
Data Service	Data.com Geo
Object	Lead

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Geocode clean rules available in: **Professional, Enterprise, Performance, Unlimited,** and **Developer** Editions

Other clean rules available with a Data.com Premium Clean license in: **Professional, Enterprise, Performance,** and **Unlimited** Editions

Attribute	Value
Fields Cleaned	Latitude, longitude, and accuracy fields associated with the Address field: <ul style="list-style-type: none"> • Latitude • Longitude • GeocodeAccuracy  Note: These fields can't be added to the page layout. However, you can view them using custom formula fields or by querying the Salesforce API.
How Fields Are Updated	Overwrite
Clean All Records When the Rule Is Activated or Saved	Yes
Bypass Triggers?	Yes
Bypass Workflow Rules?	Yes
Do Not Update Last Modified Info	Yes

Automatically Get Geocodes for Addresses

Help your sales and marketing teams find nearby prospects, assign territories and campaigns, and more! All this is a cinch with geocodes. In just a few clicks, you can automatically get geocodes for addresses on accounts, contacts, and leads.

 **Important:** Geocodes are added to records using Data.com technology. However, a Data.com license is *not* required to use this feature.

[Considerations for Setting Up Geocode Clean Rules](#)

Review these considerations before adding geocode information to Salesforce accounts, contacts, and leads using Data.com geocode clean rules.

[Set Up Geocode Clean Rules](#)

In a few steps, you can set up and activate your Data.com geocode clean rules. Then, geocodes are automatically added to existing accounts, contacts, and leads. New accounts, contacts, and leads get this information when they're saved.

[Guidelines for Setting Up Geocode Clean Rules](#)

Follow some important guidelines when automatically adding geocode information to Salesforce records with Data.com.

EDITIONS

Available in: Salesforce Classic and Lightning Experience

Available in: **Professional, Enterprise, Performance, Unlimited, and Developer** Editions

[Check the Clean Status of Geocode Clean Rules](#)

The Data.com geocode clean rules automatically add geocodes for addresses on your accounts, contacts, and leads. You can check whether an individual record was processed with a geocode clean rule and the status of that processing. If you'd like to test the clean rule, you can manually clean the record using the clean rule. Remember: With clean rules, your records are automatically cleaned, so manually cleaning a record isn't necessary.

[Verify Geocodes Were Added to Records](#)

Since geocode fields are not typically visible on a record, you need to complete a few steps to verify that geocodes were added to Salesforce records with a Data.com geocode clean rule.

[Geocode Fields](#)

Geocode information identifies a location using a latitude, a longitude, and an accuracy rating. Geocode fields are available for standard addresses on accounts, contacts, and leads in Salesforce. Geocode fields are not visible on records, but they can be viewed using the Salesforce API.

Considerations for Setting Up Geocode Clean Rules

Review these considerations before adding geocode information to Salesforce accounts, contacts, and leads using Data.com geocode clean rules.

 **Important:** Geocodes are added to records using Data.com technology. However, a Data.com license is *not* required to use this feature.

- When geocode information is added to records:
 - Existing values in geocode information fields are overwritten.
 - The `SystemModStamp` field is always updated. Review any integrations that use this field to make sure that they aren't affected.
 - The `LastModifiedDate` and `LastModifiedById` fields are *not updated*. This is the default option. You can change it when you set up your geocode clean rules.
- Geocode information is not visible on records. However, it can be viewed using the Salesforce API. Also, you can create custom fields using formulas to show geocode information fields on records.
- Status information associated with clean rules can't be copied to or from a sandbox. For example, in your production organization, you activate your `Geocodes for Lead Address` clean rule, and geocode information is successfully added to all of your existing leads. As a result, the status of the `Geocodes for Lead Address` clean rule for each lead is `In Sync`. You can't copy this status information for records to your sandbox. To get status information in your sandbox, you need to activate your clean rules and process your records in your sandbox.
- Person accounts are not currently supported.
