## Usage

The `Status` field specifies the current state of an order. Status strings represent its current state (*Draft* or *Activated*).

When a client application creates an order, the `Status Code` must be *Draft* and the `Status` must be any value that corresponds to a `Status Code` of *Draft*. The application can subsequently activate an order by updating it and setting the value in its `Status` field to an *Activated* state; however, the `Status` field is the only field you can update when activating the order.

After an order is activated, your client application can change the `Status` back to the *Draft* state—but only if the order doesn't have any child reduction order products. Your client application can delete orders when the `Status` is *Draft* but not when its `Status` is *Activated*.

Client applications can use the API to create, update, delete, and query any Attachment associated with an order.

# OrderFeed

---

Represents a single feed item in the feed displayed on an order.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

## Usage

Use this object to track changes for an order record.

SEE ALSO:

[Order](#)

## OrderHistory

Represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.

## Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                                                                                                             |

## Usage

Order history entries are automatically created each time an order is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, Jane Doe is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field-level security on the parent object.

| ServiceDate | <p><b>Type</b><br/>date</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>Start date for the order product.<br/>Label is <b>Start Date</b>.</p>                                                                                                                                        |
| UnitPrice   | <p><b>Type</b><br/>currency</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>Unit price for the order product. In the Salesforce user interface, this field's value is calculated by dividing the total price of the order product by the quantity listed for that order product.</p> |

## Usage

An order can have associated order product records only if the order has a price book associated with it. An order product must correspond to a product that is listed in the order's price book.

## OrderItemFeed

Represents a single feed item in the feed displayed on the detail page for an order product record.

An order product feed shows changes to an order product for fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to order products in Salesforce.

## Supported Calls

`delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this object to manage the sharing rules for orders. For example, the following code creates an order owner sharing rule between two public groups, which can also contain portal users.

```
OrderOwnerSharingRule rule = new OrderOwnerSharingRule();
rule.setName("RuleName"); // Set the sharing rule name
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx0000000000"); // Set the group of users to share records from
```

```
rule.setUserOrGroupId("00Gx0000000001"); // Set the group of users to share records to
rule.setOrderAccessLevel("Edit");
connection.create(rule);
```

## Organization

Represents key configuration information for an organization.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

Executing a SOQL SELECT query returns the value of fields in this object, but no value is visible for some of the fields.

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                  | Details                                                                                                                                                                                                                                     |

## Usage

Query this object to obtain information about an organization's settings. Only one organization object exists per organization.

SEE ALSO:

[Object Basics](#)

## OrgWideEmailAddress

Represents an organization-wide email address for user profiles.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field   | Details                                                                   |

|                    | <b>Description</b><br>The organization-wide email address.                                                                                                                                                                                                                                                                                                                            |
| IsAllowAllProfiles | <b>Type</b><br>boolean <b>Properties</b><br>Create, Defaulted on create, Filter, Group, Sort, Update <b>Description</b><br>If <code>true</code> , any user profile in your organization can use this object. If <code>false</code> , only specified user profiles can use this object when sending email. If you do not have the appropriate user profile, you can't use this object. |
| DisplayName        | <b>Type</b><br>string <b>Properties</b><br>Create, Filter, Sort, Update <b>Description</b><br>The name that is used to identify the sender of the email.                                                                                                                                                                                                                              |

## Usage

This object represents an email alias for user profiles. You can pass in the ID to an `OrgWideEmailAddress` record when calling `sendEmail()` for a `SingleEmailMessage`.

## OwnedContentDocument

Represents a file owned by a user. This object is available in version 30.0 and later.

## Supported Calls

`describeSObjects()`

## Usage

Use this object to determine the number of licenses allowed and in use for a managed package installed in your organization.

The following example demonstrates the use of the API to manage licenses for a package. The example defines an Apex class that does the following.

- Retrieves the PackageLicense record for the specified package (identified by its namespace prefix).
- Defines a function that returns a list of all users with the specified profile.
- Creates a UserPackageLicense record for each user with that profile, which has the effect of assigning a license for the package to all users with that profile.
- Returns an error message if the number of users exceeds the number of available licenses.

```
public class AssignPackageLicense {

    static String PACKAGE_NAMESPACE_PREFIX = 'acme_101';
    static String PROFILE_ID = '00exx000000jz1SAAQ';
    public static String exceptionText {get; set;}

    public AssignPackageLicense() {
        exceptionText = 'Initialized';
    }

    static List<User> getUsersWithProfile(){
        String userQuery = 'SELECT Id FROM User WHERE ProfileId = :PROFILE_ID';
        List<User> matchingUsers = new List<User>();
        matchingUsers = [SELECT Id FROM User WHERE ProfileId = :PROFILE_ID];
        return matchingUsers;
    }

    public static void assignLicenseByProfile() {
        //find the PackageLicense Id
        PackageLicense pl = [SELECT Id, NamespacePrefix, AllowedLicenses, UsedLicenses,
            ExpirationDate, Status FROM PackageLicense WHERE
            NamespacePrefix = :PACKAGE_NAMESPACE_PREFIX];
        System.assert(pl != null, 'PackageLicense cannot be null.');
```

List<User> usersToAssignLicenses = getUsersWithProfile();  
List<UserPackageLicense> firstUPLs = new List<UserPackageLicense>();

//create a new UserPackageLicense record for each user with the specified profile

```
for (Integer i = 0; i< usersToAssignLicenses.size(); i++){
    UserPackageLicense upl = new UserPackageLicense();
    upl.PackageLicenseId = pl.Id;
    upl.UserId = usersToAssignLicenses[i].Id;
    firstUPLs.add(upl);
}

try {
    //bulk insert
    insert(firstUPLs);
} catch(DmlException e) {
    for (Integer i = 0; i < e.getNumDml(); i++) {
        // process exception here
        System.debug(e.getDmlMessage(i));
        String status = e.getDmlStatusCode(i);
        System.debug(status + ' ' + e.getDmlMessage(i));
        if(status.equals('LICENSE_LIMIT_EXCEEDED')){
```

```

        exceptionText = 'You tried to assign more licenses than available. '
        + ' You tried to create ' + firstUPLs.size() + ' licenses but only have '
        + (pl.AllowedLicenses - pl.UsedLicenses) + ' licenses free.';
        System.debug(exceptionText);
    }
}
}
}
}

```

## Partner

Represents a partner relationship between two Account records or between an Opportunity and an Account.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- You must have the “View All Data” permission to access this object via the API. All of the Partner fields are accessible in the `describeSObjects()` and `query()` calls. You cannot `update()` or `upsert()` partners via the API.
- Customer Portal users can’t access this object.

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Role          | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort,</p> <p><b>Description</b><br/>UserRole that the account has towards the related opportunity or account, such as consultant or distributor.</p>                                                                                                                                                                                                                                                                                                                             |

## Roles

In the Salesforce user interface, system administrators can set up the valid role values and their corresponding reverse role values in the `PartnerRole` object. Each account in the relationship is assigned a `Role` (such as `Consultant` or `Distributor`) designating that account's role towards the related account or opportunity.

## Creating an Account-Opportunity Partner Relationship

When you create a partner relationship between an account and an opportunity (when you create a `Partner` object and specify the `OpportunityId` field), the API automatically creates an `OpportunityPartner` with the corresponding values:

- The value of the `Partner` field `AccountToId` maps to the value of the `OpportunityPartner` field `AccountToId`.
- The values of the `OpportunityId`, `Role`, and `IsPrimary` fields in both objects are the same.
- If you set the `IsPrimary` value to 1 (`true`) upon insert of a new `OpportunityPartner`, any other existing primary partners for that opportunity will automatically have the `IsPrimary` value set to 0 (`false`).

This mapping allows the API to manage the objects and their relationship efficiently.

## Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a `Partner` object and specify the `AccountFromId`), the API automatically creates two `AccountPartner` objects, one for the forward relationship and one for the reverse. For example, if you create a `Partner` object with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`, the API automatically creates two `AccountPartner` objects:

- The forward relationship `AccountPartner` with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`.
- The reverse relationship `AccountPartner` with "Acme Consulting" as the `AccountFromId` and "Acme, Inc." as the `AccountToId`.
- The value of the `Role` field in the reverse relationship `AccountPartner` is set to the `PartnerRole` object `ReverseRole` value associated with the value of the `Role` field in the forward relationship `AccountPartner`.

This mapping allows the API to manage the objects and their relationship efficiently.

## Usage

Represents Salesforce to Salesforce standard and replication connections. This object is referenced by all objects that have been shared with other organizations, enabling you to determine which connections shared a record with you. If the organization does not have Salesforce to Salesforce enabled, the PartnerNetworkConnection object is not available, and you can't access it via the API.

SEE ALSO:

## PartnerNetworkRecordConnection

Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`

| Field | Details                                                                                                                                                                                                                                                                                                                        |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <p><b>Description</b></p> <p>The status of the shared record. One of the following values:</p> <ul style="list-style-type: none"> <li>• Active (received)</li> <li>• Active (sent)</li> <li>• Connected</li> <li>• Inactive</li> <li>• Inactive (converted)</li> <li>• Inactive (deleted)</li> <li>• Pending (sent)</li> </ul> |

## Usage

When you create a `PartnerNetworkRecordConnection`, you forward a record to a connection.

 **Note:** Attempting to forward a record from an object to which the connection is not subscribed results in an `Invalid Partner Network Status` error.

Don't forward a record to the connection that originally shared it. Doing so causes errors when Apex triggers run.

When you delete a `PartnerNetworkRecordConnection`, you stop sharing a record with a connection.

- To share a record, use the following fields: `LocalRecordID` and `ConnectionId`
- To share a child of a parent record, use the following fields: `LocalRecordID`, `ConnectionId`, and `ParentRecordID`
- To share a child of a parent record and its child records, use the following fields: `LocalRecordID`, `ConnectionId`, `ParentRecordID`, and `RelatedRecords`

If the organization does not have Salesforce to Salesforce enabled, the `PartnerNetworkRecordConnection` object is not available, and you can't access it using the API.

## Sample Code—Apex

The following example shows how to forward a record.

```
List<PartnerNetworkConnection> connMap = new List<PartnerNetworkConnection>(
    [select Id, ConnectionStatus, ConnectionName from PartnerNetworkConnection
     where ConnectionStatus = 'Accepted']
);
for(PartnerNetworkConnection network : connMap) {
    PartnerNetworkRecordConnection newrecord = new PartnerNetworkRecordConnection();

    newrecord.ConnectionId = network.Id;
    newrecord.LocalRecordId = accountId;
    newrecord.RelatedRecords = 'Contact,Opportunity,Orders__c';
    newrecord.SendClosedTasks = true;
    newrecord.SendOpenTasks = true;
    newrecord.SendEmails = true;
```

```
        insert newrecord;
    }
```

The following example shows how to stop sharing a record.

```
List<PartnerNetworkRecordConnection> recordConns = new List<PartnerNetworkRecordConnection>(
    [select Id, Status, ConnectionId, LocalRecordId from PartnerNetworkRecordConnection
     where LocalRecordId in :accounts]
);

for(PartnerNetworkRecordConnection recordConn : recordConns) {
    if(recordConn.Status.equalsignorecase('Sent')){ //account is connected - outbound

        delete nets;
    }
}
```

## PartnerNetworkSyncLog

Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log’s twenty most recent entries, and provides a link to the log.

### Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`

### Special Access Rules

The Org Sync Log tab can only be added in organizations where Organization Sync has been enabled. To add the tab to the Salesforce user interface, users must also have the “Manage Connections” user permission.

## Usage

This object represents a value in the partner role picklist. In the user interface, the partner role picklist provides additional information about the role of a Partner, such as their corresponding reverse role. Query this object to retrieve the set of values in the partner role picklist, and then use that information while processing PartnerRole records to determine more information about a given partner role. For example, the application could determine the reverse role of a given Partner Role value and the value of the ReverseRole property in the associated PartnerRole object.

## Period

Represents a fiscal period defined in FiscalYearSettings.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                | Details                                                                                                                                                                                                                                                    |

## Usage

In API version 36.0 and earlier, querying the Period object yields no results. In API version 37.0 and later, a query returns period records.

[FiscalYearSettings](#)

## PermissionSet

Represents a set of permissions that's used to grant additional access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

You can use permission sets to grant access, but not to deny access.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Fields

| Field Name            | Details                                                                                                                                                                                                                                                                                                  |

## Usage

Use the PermissionSet object to query existing permission sets.

For example, to search for all permission sets that contain the “Modify All Data” permission:

```
SELECT Name, PermissionsModifyAllData
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

When combined with the PermissionSetAssignment object, you can create a nested query that returns all users assigned to a particular permission like “Modify All Data”:

```
SELECT Name, (SELECT AssigneeId FROM Assignments)
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

You can also create a permission set, or delete a permission set if it isn't assigned to a user.

## User Licenses

The user license controls the permissions that are available in a permission set.

Every permission set may be associated with a user license. If you plan to assign a permission set to multiple users with different licenses, leave `UserLicenseId` empty. If only users with one type of license will use this permission set, set the `UserLicenseId` to that single user license. To get the `UserLicenseId`, run this query:

```
SELECT Id, Name
FROM UserLicense
```

Alternatively, to query a user or profile for the `UserLicenseId`.

```
SELECT Id, Profile.UserLicenseId
FROM User
```

## Child Objects

When using the API, think of each permission set or related set of access controls as starting as an empty container that you fill with permission records.

In the API, a permission set can contain user, object, and field permissions, as well as setup entity access settings for other settings, such as Apex classes.

- ObjectPermissions and FieldPermissions objects are available in API version 24.0 and later.
- The SetupEntityAccess object is available in API version 25.0 and later.

Only user permissions are managed in the PermissionSet API object; all other permission types are managed in child API objects.

In these child objects, access is stored in a record, while the absence of a record indicates no access. In order to return a record in a SOQL query, a minimum permission or setting is required for each child object.

Because permissions are stored in related objects, it's important to understand what questions to ask when using SOQL. For example, you may want to know which permission sets have "Delete" on an object or have the right to approve a return merchandise authorization (where the approval checkbox is controlled with field permissions). Asking the right questions when using SOQL with permission sets will ensure that you get the information you need to make an informed decision, such as whether to migrate permissions or assign a permission set to a user.

For example, the following returns all permission sets where the "Read" permission is enabled for the Merchandise\_\_c object.

```
SELECT ObjectType, ParentId, PermissionsRead
FROM ObjectPermissions
WHERE PermissionsRead = True AND ObjectType = 'Merchandise__c'
```

You can query for all permission sets that have "Read" on an object. However, you can't query for permission sets that have no access on an object, because no records exist for that object. For example, the following returns no records because the object must have at least "Read" to return any records.

```
SELECT ObjectType, ParentId, PermissionsRead
FROM ObjectPermissions
WHERE PermissionsRead = False AND ObjectType = 'Merchandise__c'
```

If you have at least the "Read" permission on an object, you can create a conditional query on other permissions in the same object. For example, the following returns any records where the object has at least the "Read" permission but not the "Edit" permission.

```
SELECT ParentId, PermissionsRead, PermissionsEdit
FROM ObjectPermissions
WHERE PermissionsEdit = False AND ObjectType = 'Merchandise__c'
```

To set an object or field permission to no access, just delete the record that contains the permission. For example, to disable all object permissions in the Merchandise\_\_c object for a particular permission set, first query to retrieve the ID of the object permission record.

```
SELECT Id
FROM ObjectPermissions
WHERE SubjectType = 'Merchandise__c'
```

Then delete the IDs returned from the query.

**Note:** If you try to update the object or field permissions by setting all permissions to false, the permission record is automatically deleted. As a result, any subsequent queries for the record ID won't return any results and you must add a new permission record to grant access.

## Viewing a Permission Set with Nested Queries

You can build on the PermissionSet object using child relationships that show all of the permissions in a single permission set. For example, the following returns all permission sets and displays the “Transfer Leads” permission as well as any “Read” permissions on any objects and fields.

```
SELECT Label, PermissionsTransferAnyLead,
(SELECT SubjectType, PermissionsRead FROM ObjectPerms),
(SELECT SubjectType, Field, PermissionsRead FROM FieldPerms)
FROM PermissionSet
```

## Associated Profiles

In API version 25.0 and later, every profile is associated with a permission set that stores the profile's user, object, and field permissions, as well as setup entity access settings. Permission sets that are owned by profiles can be queried but not modified.

The following example returns all permission sets, including those owned by a profile.

```
SELECT Id, Label, ProfileId, Profile.Name
FROM PermissionSet
```

The following returns all permission sets except those owned by profiles.

```
SELECT Id, Label, ProfileId, Profile.Name, IsOwnedByProfile
FROM PermissionSet
WHERE IsOwnedByProfile = FALSE
```

Because permission sets have child objects in the API, you can query their values on permission sets owned by a profile. For example, the following returns all enabled object permission records for profiles only.

```
SELECT Id, ParentId, PermissionsRead, SubjectType, Parent.ProfileId
FROM ObjectPermissions
WHERE Parent.IsOwnedByProfile = TRUE
```

Once you have the IDs for permission sets that are owned by profiles as well as those not owned by profiles, you can use the [PermissionSetAssignment](#) object to determine whether users can access an object or field via a permission in their profile or any of their permission sets. For example, the following SOQL query returns all users who have the “Read” permission on the Merchandise\_\_c object and specifies whether the permission is granted through a profile or permission set.

```
SELECT Assignee.Name, PermissionSet.Id, PermissionSet.isOwnedByProfile
FROM PermissionSetAssignment
WHERE PermissionSetId
```

```
IN (SELECT ParentId
FROM ObjectPermissions
WHERE SObjectType = 'Merchandise__c' AND PermissionsRead = true)
```

 **Note:** For permission sets that are owned by profiles, don’t use any Name and Label values that are returned in a query, as they can change at any time.

# PermissionSetAssignment

Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AssigneeId      | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>ID of the User to assign the permission set specified in <code>PermissionSetId</code>.</p> |
| PermissionSetId | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>ID of the PermissionSet to assign to the user specified in <code>AssigneeId</code>.</p>    |

## Usage

### Finding Permission Set Assignments

Use the `PermissionSetAssignment` object to query permission set assignments to find out which permission sets are assigned to which users. Because each user may be assigned to many permission sets and each permission set may be assigned to many users, each `PermissionSetAssignment` ID represents the association of a single user and single permission set.

For example, to search for all of the permission sets assigned to a particular user:

```
SELECT Id, PermissionSetId
FROM PermissionSetAssignment
WHERE AssigneeId = '005600000017cKt'
```

To search for all users assigned to a particular permission set:

```
SELECT Id, AssigneeId
FROM PermissionSetAssignment
WHERE PermissionSetId = '0PS30000000000e'
```

You can also create a new permission set assignment, or use delete to remove a permission set that's assigned to a user. To update an assignment, delete an existing assignment and insert a new one.

### User Licenses

When assigning a permission set, if the `PermissionSet` has a `UserLicenseId`, its `UserLicenseId` and the Profile `UserLicenseId` must match. To determine a user's license assignment, query the user's profile and then query the profile's license.

For example, to find a user's profile ID:

```
SELECT Id, ProfileId
FROM User
WHERE Id = '005D00000001GMAT'
```

To find a permission set's `UserLicenseId`:

```
SELECT Id, UserLicenseId
FROM PermissionSet
WHERE Id = '0PS30000000000e'
```

If the IDs match, the assignment succeeds.

To find all the permission sets with no license that are assigned to any user:

```
SELECT Id, Assignee.Name, PermissionSet.Name
FROM PermissionSetAssignment
WHERE PermissionSet.UserLicenseId = null
```

[PermissionSet](#)

## PermissionSetLicense

Represents a license that's used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| ExpirationDate | <p><b>Type</b><br/>date</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The date at which the permission set license expires.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Language       | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The language of the permission set license.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| MasterLabel    | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The label of the permission set license. | UsedLicenses                             | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of this permission set license that are currently assigned to users.</p>                                                                                                                                                                                                                                             |

## Usage

Users with the “View Setup and Configuration” permission can use the PermissionSetLicense object to view the set of currently defined permission set licenses in your organization.

Use the PermissionSetLicense object to query existing permission licenses.

For example, to return a list of all active permission set licenses:

```
SELECT MasterLabel
FROM PermissionSetLicense
WHERE Status = 'Active'
```

When combined with the PermissionSetLicenseAssign object, you can create a nested query that returns all users assigned to a particular permission set license like “Identity Connect”:

```
SELECT MasterLabel, (SELECT AssigneeId FROM PermissionSetLicenseAssignments)
FROM PermissionSetLicense
WHERE MaximumPermissionsIdentityConnect=true
```

SEE ALSO:  
[PermissionSetLicenseAssign](#)

## PermissionSetLicenseAssign

Represents the association between a User and a PermissionSetLicense. This object is available in API version 29.0 and later.

 **Note:** The relationship name for PermissionSetLicenseAssign is *PermissionSetLicenseAssignments*.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name             | Details                                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AssigneeId             | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>ID of the User to assign the permission set license specified in <code>PermissionSetLicenseId</code>.</p> |
| PermissionSetLicenseId | <p><b>Type</b></p> <p>reference</p>                                                                                                                                                                                                    |

| Field Name | Details                                                                             |
|------------|-------------------------------------------------------------------------------------|
|            | <b>Properties</b><br>Create, Filter, Group, Sort                                    |
|            | <b>Description</b><br>The ID of the permission set license the user is assigned to. |

## Usage

Use the PermissionSetLicenseAssign object for querying permission set license assignments to find out which permission set licenses are assigned to which users. Because each user can be assigned to many permission set licenses, each PermissionSetLicenseAssign ID represents the association of a single user and single permission set license.

For example, to search for all of the permission sets assigned to a particular user:

```
SELECT Id, PermissionSetLicenseId
FROM PermissionSetLicenseAssign
WHERE AssigneeId = '005D0000001RFek'
```

To search for all users assigned to a particular permission set license:

```
SELECT AssigneeId
FROM PermissionSetLicenseAssign
WHERE PermissionSetLicenseId = '0PLD000000003mwOAA'
```

You can also create a new permission set license assignment, or use delete to remove a permission set license that’s been assigned to a user. To update an assignment, delete an existing assignment and insert a new one.

## PlatformAction

PlatformAction is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.

## Supported Calls

query()

## Fields

For action links, subtypes are <code>Api</code> , <code>ApiAsync</code> , <code>Download</code> , and <code>Ui</code> . Standard buttons and productivity actions have no subtype.                                                                                           |

| Field | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The type of the action. Valid values are:</p> <ul style="list-style-type: none"> <li>• <b>ActionLink</b>—An indicator on a feed element that targets an API, a web page, or a file, represented by a button in the Salesforce Chatter feed UI.</li> <li>• <b>CustomButton</b>—When clicked, opens a URL or a Visualforce page in a window or executes JavaScript.</li> <li>• <b>InvocableAction</b></li> <li>• <b>ProductivityAction</b>—Productivity actions are predefined by Salesforce and are attached to a limited set of objects. You can't edit or delete productivity actions.</li> <li>• <b>QuickAction</b>—A global or object-specific action.</li> <li>• <b>StandardButton</b>—A predefined Salesforce button such as New, Edit, and Delete.</li> </ul> |

## Usage

PlatformAction can be described using describeSObject().

You can directly query for PlatformAction. For example, this query returns all fields for actions associated with each of the records of the listed objects:

```
SELECT ExternalId, ActionTargetType, ActionTargetUrl, ApiName, Category,
       ConfirmationMessage, ExternalId, GroupId, UiTheme, IconUrl, IconContentType,
       IconHeight, IconWidth, PrimaryColor, InvocationStatus, InvokedByUserId,
       IsGroupDefault, Label, LastModifiedDate, Subtype, SourceEntity, Type
FROM PlatformAction
WHERE SourceEntity IN ('001xx000003DGsH', '001xx000003DHBq', 'Task', 'Global') AND
       ActionListContext = 'Record';
```

 **Note:** To query PlatformAction, provide the ActionListContext and SourceEntity. If you query for ActionListContext with a value of RelatedList, and don't specify a RelatedSourceEntity, the query returns the API name of the related list.

This query uses multiple ActionListContext values in its WHERE clause to return all actions in the Lightning Experience user interface (DeviceFormat = 'Desktop') for the specified object:

```
SELECT ActionListContext, Label, Type, Subtype, Section, SourceEntity,
       RelatedSourceEntity, ActionTarget, ActionTargetType, ApiName, Category,
       ConfirmationMessage, DeviceFormat, ExternalId, GroupId, IconContentType,
       IconHeight, IconUrl, IconWidth, Id, InvocationStatus, InvokedByUserId,
       IsGroupDefault, LastModifiedDate, PrimaryColor
FROM PlatformAction
WHERE ActionListContext IN ('Record', 'Chatter', 'RelatedList') AND
       SourceEntity = '001xx000003DlvX' AND
       DeviceFormat = 'Desktop';
```

# PlatformEventMetrics

Represents a roll-up aggregation of an organization’s login events over time. This object is available in API version 36.0 and later.

## Supported Calls

`query()`

## Special Access Rules

tbd

## Metrics Types

The `MetricType` field on `PlatformEventMetrics` stores `LoginEvent` metric types. In the context of login forensics, metrics are roll-up aggregations of events over time. Use metrics to recognize atypical behavior in your organization.

This table outlines the available metrics.

| Metric Type       | Description                                                                                                                                                                                                                                                                                                                             |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NumLogins         | <b>Label</b><br>Count of logins<br><b>Use</b><br>See how many logins were attempted. Rapid increase of logins could indicate an increased work period (for example, the end of the quarter) or malicious log in activity to the organization.<br><b>Aggregation Field Name</b><br>null<br><b>Aggregation Field Value Example</b><br>N/A |
| NumDistinctLogins | <b>Label</b><br>Count of distinct logins<br><b>Use</b><br>See how many unique users logged in.                                                                                                                                                                                                                                          |

| Metric Type          | Description                                                                                                                                                                                                                                                                                             |

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

Set to <code>true</code> by default.                                                                       |
| PresenceStatusOnDeclineId     | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The ID of the presence status that's automatically assigned to the agent when the agent declines a work item. Available only if <code>OptionsIsDeclineEnabled</code> is set to <code>true</code> . |
| PresenceStatusOnPushTimeoutId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The ID of the presence status that's automatically assigned to the agent when the agent doesn't respond to a work item before push timeout occurs. Available in API version 36.0 and later.        |

## PresenceUserConfigProfile

Represents a configuration that determines the settings that are assigned to presence users who are assigned to a specific profile. User-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field                | Details                                                                                                                                                                                                                                             |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PresenceUserConfigId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>If an individual user is also assigned a presence configuration through the PresenceUserConfigProfile, this configuration will override that. |
| ProfileId            | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the profile that's associated with this presence configuration. A profile can be associated with only one presence configuration.   |

## PresenceUserConfigUser

Represents a configuration that determines the settings that are assigned to a presence user. These user-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field                | Details                                                                                                                                     |

|       | <b>Description</b><br>The ID of the user who's associated with this presence configuration. A user can be associated with only one presence configuration. |

## Pricebook2

Represents a price book that contains the list of products that your organization sells.

**Note:** Price books are represented by Pricebook2 objects. The Pricebook object is no longer available. Requests containing Pricebook are refused, and responses do not contain the Pricebook object.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field       | Details                                                                                                                                                                                                                                                               |

## Usage

A price book is a list of products that your organization sells:

- Each organization has one standard price book that defines the standard or generic list price for each product or service that it sells.
- An organization can have multiple custom price books that can be used for specialized purposes, such as a discount price book, price books for different channels or markets, price books for select accounts or opportunities, and so on. While your client application can create, delete, and update custom price books, your client application can only update the standard price book.
- For some organizations, the standard price book might be the only price needed, but if you need to set up further price books, you can reference the standard price book when setting up list prices in custom price books.

Use this object to query standard and custom price books that have been configured for your organization. A common use of this object is to allow your client application to obtain valid Pricebook2 object IDs for use when configuring PricebookEntry records via the API.

Your client application can perform the following tasks on PricebookEntry objects:

- Query
- Create for the standard pricebook or custom pricebooks.
- Update
- Delete
- Change the `IsActive` field when creating or updating records

## PriceBook2, Product2, and PricebookEntry Relationships

In the API:

- Price books are represented by Pricebook2 objects (the Pricebook object is no longer available).
- Products are represented by Product2 objects (the Product object is not available as of version 8.0.).
- Each price book contains zero or more entries (represented by PricebookEntry records) that specify the products that are associated with the price book. A price book entry defines the price for which you sell a product at a particular currency.

These objects are defined only for those organizations that have products enabled as a feature. If the organization does not have the products feature enabled, the Pricebook2 object does not appear in the `describeGlobal()` call, and you can't access it via the API.

If you delete a Pricebook2, while a line item references PricebookEntry in the price book, the line item is unaffected, but the Pricebook2 will be archived and unavailable from the API.

For a visual diagram of the relationships between Pricebook2 and other objects, see Product and Schedule Objects.

## Price Book Setup

The process of setting up a price book via the API usually means:

1. Initially loading product data from your organization into Product2 objects (creating a Product2 record for each product that you want to add).
2. For each Product2 object, creating a PricebookEntry that links the Product2 object to the standard Pricebook2. You need to define a standard price for a product at a given currency (if you have multicurrency enabled), before defining a price for that product in the same currency in a custom price book.
3. Creating a custom Pricebook2.
4. Querying the Pricebook2 object to obtain their IDs.
5. For each Pricebook2 object, creating a PricebookEntry for every Product2 that you want to add, specifying unique properties for each PricebookEntry (such as the `UnitPrice` and `CurrencyIsoCode`) as needed.

## Code Sample—Java

```
public void pricebookSample() {
    try {
        //Create a custom pricebook
        Pricebook2 pb = new Pricebook2();
        pb.setName("Custom Pricebok");
        pb.setIsActive(true);
        SaveResult[] saveResults = connection.create(new SObject[]{pb});
        pb.setId(saveResults[0].getId());

        // Create a new product
        Product2 product = new Product2();
        product.setIsActive(true);
        product.setName("Product");
        saveResults = connection.create(new SObject[]{product});
        product.setId(saveResults[0].getId());

        // Add product to standard pricebook
```

```
QueryResult result = connection.query(
    "select Id from Pricebook2 where isStandard=true"
);
SObject[] records = result.getRecords();
String stdPbId = records[0].getId();

// Create a pricebook entry for standard pricebook
PricebookEntry pbe = new PricebookEntry();
pbe.setPricebook2Id(stdPbId);
pbe.setProduct2Id(product.getId());
pbe.setIsActive(true);
pbe.setUnitPrice(100.0);
saveResults = connection.create(new SObject[]{pbe});

// Create a pricebook entry for custom pricebook
pbe = new PricebookEntry();
pbe.setPricebook2Id(pb.getId());
pbe.setProduct2Id(product.getId());
pbe.setIsActive(true);
pbe.setUnitPrice(100.0);
saveResults = connection.create(new SObject[]{pbe});
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
```

# Pricebook2History

Represents historical information about changes that have been made to the standard fields of the associated Pricebook2, or to any custom fields with history tracking enabled. This object is available in API version 37.0 and later.

## Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

## Special Access Rules

This object is always read-only.

## Fields

| Field        | Details           |
|--------------|-------------------|

## Usage

Price book history entries are indirectly created each time a price book is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, `Jane Doe` is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

|       | <b>Description</b><br>Indicates whether this price book entry uses the standard price defined in the standard Pricebook2 record ( <code>true</code> ) or not ( <code>false</code> ). If set to <code>true</code> , then the <code>UnitPrice</code> field is read-only, and the value will be the same as the <code>UnitPrice</code> value in the corresponding PricebookEntry in the standard price book (that is, the PricebookEntry record whose <code>Pricebook2Id</code> refers to the standard price book and whose <code>Product2Id</code> and <code>CurrencyIsoCode</code> are the same as this record). For PricebookEntry records associated with the standard Pricebook2 record, this field must be set to <code>true</code> . |

## Usage

Use this object to define the association between your organization's products (Product2) and your organization's standard price book or to other, custom-defined price books (Pricebook2). Create one PricebookEntry record for each standard or custom price and currency combination for a product in a Pricebook2.

When creating these records, you must specify the IDs of the associated Pricebook2 record and Product2 record. Once created, your client application can't update these IDs.

This object is defined only for those organizations that have products enabled as a feature. If the organization does not have the products feature enabled, then the PricebookEntry object does not appear in the `describeGlobal()` call, and you can't access it.

If you delete a PricebookEntry while a line item references it, the line item is unaffected, but the PricebookEntry will be archived and unavailable from the API.

You must load the standard price for a product before you are permitted to load its custom price(s).

## Usage

Use this object to read the description of an approval process. The definition is read-only.

## ProcessInstance

Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.

**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

For approval process instances that were completed before the Summer '14 rollout, all Process Instance fields are automatically populated, with one exception: `CompletedDate` is never populated for approval process instances that were completed before January 1, 2013.

For approval process instances that were pending during the Summer '14 rollout, all ProcessInstance fields are automatically populated, with two exceptions: `CompletedDate` and `LastActorId` are populated only after the approval process instance is complete.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

## Usage

Use this object to query or retrieve an approval process.

The following SOQL query returns details for all the ProcessInstanceStep records related to individual ProcessInstance records. The nested query references `Steps`, which is the child `relationshipName` for ProcessInstanceStep in the ProcessInstance object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM Steps)
FROM ProcessInstance
```

The following SOQL query returns details for all the ProcessInstanceWorkitem records related to individual ProcessInstance records. The nested query references `Workitems`, which is the child `relationshipName` for ProcessInstanceWorkitem in the ProcessInstance object.

```
SELECT Id, (SELECT Id, ActorId, ProcessInstanceId FROM Workitems)
FROM ProcessInstance
```

ProcessInstanceHistory can help provide a unified read-only view of the ProcessInstanceStep and ProcessInstanceWorkitem objects.

## Usage

This object helps you replicate the related list functionality of the Salesforce user interface for approval processes. Use ProcessInstanceHistory for a unified read-only view of the ProcessInstanceStep and ProcessInstanceWorkitem objects. You can't query ProcessInstanceHistory. Instead, you can query ProcessInstanceHistory by including it in a nested query on the parent ProcessInstance object. For example, the following SOQL query returns all the ProcessInstanceHistory records related to individual ProcessInstance records. The nested query references StepsAndWorkitems, which is the child relationshipName for ProcessInstanceHistory in the ProcessInstance object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM StepsAndWorkitems)
FROM ProcessInstance
```

This object respects field-level security on the parent object.

## ProcessInstanceStep

Represents one work item in an approval process (ProcessInstance).

 **Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

ProcessInstanceStep fields are never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all ProcessInstanceStep fields are populated only after the approval process instance is next acted upon after the Summer '14 rollout.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Portal and Communities users can't access this object.

## Fields

| Field    | Details                                                                                                                                                                                  |

|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| StepStatus | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The current status of this approval step.</p> <ul style="list-style-type: none"> <li>• Approved</li> <li>• Fault</li> <li>• Held</li> <li>• NoResponse</li> <li>• Pending</li> <li>• Reassigned</li> <li>• Rejected</li> <li>• Removed</li> <li>• Started</li> </ul> <p>If the approval step requires unanimous approval and one approver rejects the request, the value of this field for the other approvers changes to NoResponse. Likewise, if approval is based on the first response and an approver responds, the value of this field for the other approvers changes to NoResponse.</p> |

## Usage

Query or retrieve a new step in an approval process (ProcessInstance).

SEE ALSO:

[ProcessInstance](#)

[ProcessInstanceHistory](#)

[ProcessInstanceWorkitem](#)

## ProcessInstanceNode

Represents a step in an instance of an approval process. Compare to ProcessNode, which describes the step in a process definition. Use this object to retrieve approval history.

**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

ProcessInstanceNode fields are never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all ProcessInstanceNode fields are populated only after the approval process instance is next acted upon after the Summer '14 rollout.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Portal and Communities users can't access this object.

| NodeStatus        | <b>Type</b><br>picklist<br><b>Properties</b><br>Filter, Group, Restricted picklist, Sort<br><b>Description</b><br>The status of this approval instance, for example Started, Pending, or Approved. |
| ProcessInstanceId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The approval process this step is part of.                                                           |
| ProcessNodeId     | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The identifier for this step.                                                                        |
| ProcessNodeName   | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The name of this step.                                                                                  |

## ProcessInstanceWorkitem

Represents a user's pending approval request.

**Note:** Exceptions apply to approval history data retrieved with this object and available only via the SOAP API. For each approval process instance that was pending when Summer '14 became available for your organization, some field values are never populated or are populated only after the approval process instance is next acted upon—such as when a user approves, rejects, or reassigns an approval request—after the Summer '14 rollout.

ProcessInstanceWorkitem fields are never populated for approval process instances that were completed before the Summer '14 rollout. For approval process instances that were pending during the Summer '14 rollout, all ProcessInstanceWorkitem fields are populated after the approval process instance is next acted upon after the Summer '14 rollout, with three exceptions: `ElapsedTimeInDays`, `ElapsedTimeInDays`, and `ElapsedTimeInMinutes` fields are never populated in ProcessInstanceWorkitem records for which equivalent ProcessInstanceStep records were created before the Summer '14 rollout.

For all other ProcessInstanceWorkitem records, these three fields are populated after the approval process instance is next acted upon after the Summer '14 rollout.

**Note:** Because ProcessInstanceHistory combines fields from ProcessInstanceStep and ProcessInstanceWorkitem, you may notice incorrect elapsed times of 0 in ProcessInstanceHistory records because the elapsed time fields were never populated in the related ProcessInstanceWorkitem record.

## Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

Portal and Communities users can't access this object.

## Fields

| Field              | Details                                                                                                                                                                              |

| ProcessInstanceId    | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort, Update<br><b>Description</b><br>ID of the ProcessInstance associated with this approval request.  |

## Usage

Use this object to manage a pending approval request for a user.

SEE ALSO:

[ProcessInstance](#)  
[ProcessInstanceHistory](#)  
[ProcessInstanceStep](#)

## ProcessNode

Describes a step in a process definition. Compare to `ProcessInstanceNode`, which describes the step in a running process.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Portal and Communities users can't access this object.

## Fields

| Field             | Details                                                                                                                                               |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description       | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Nillable, Sort<br><b>Description</b><br>A description of this node, no longer than 3,000 bytes. |
| DeveloperName     | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The external name of the node; the name seen by users.     |
| Name              | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The unique node name.                                      |
| ProcessDefinition | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the object affected by this approval instance.    |

## Usage

Use this object to get the description of a process definition.

The following SOQL query returns details for all the ProcessInstanceStep records related to individual ProcessInstance records. The nested query references `Steps`, which is the child `relationshipName` for ProcessInstanceStep in the ProcessInstance object.

```
SELECT Id, (SELECT Id, StepStatus, Comments FROM Steps)
FROM ProcessInstance
```

The following SOQL query returns details for all the ProcessInstanceWorkitem records related to individual ProcessInstance records. The nested query references `Workitems`, which is the child `relationshipName` for `ProcessInstanceWorkitem` in the `ProcessInstance` object.

```
SELECT Id, (SELECT Id, ActorId, ProcessInstanceId FROM Workitems)
FROM ProcessInstance
```

`ProcessInstanceHistory` can help provide a unified read-only view of the `ProcessInstanceStep` and `ProcessInstanceWorkitem` objects.

# Product2

Represents a product that your organization sells.

This object has several fields that are used only for quantity and revenue schedules (for example, annuities). Schedules are available only for organizations that have enabled the products and schedules features. If these features aren't enabled, the schedule fields don't appear in the `DescribeSObjectResult`, and you can't query, create, or update the fields.

 **Note:** Products are represented by `Product2` objects. The `Product` object is no longer available. Requests containing `Product` are refused, and responses do not contain the `Product` object.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field                               | Details                                                                                                                                                                                                                                                                                                 |

## Schedule Enabled Flags

When enabling the schedules feature, organizations can decide whether to enable quantity schedules, revenue schedules, or both. In addition, you can use the API to control quantity and revenue scheduling at the product level via the `CanUseQuantitySchedule` and `CanUseRevenueSchedule` flags. A value of `true` for either flag indicates that the product and any `OpportunityLineItems` can have a schedule of that type. These flags can be set when creating or updating `Product2` records.

## Default Schedule Fields

The remaining schedule fields for this object define default schedules. Default schedule values are used to create an `OpportunityLineItemSchedule` when an `OpportunityLineItem` is created for the `Product`.

The default schedule fields support the following valid values (all fields are also nillable).

| Field                       | Valid Values                              |
|-----------------------------|-------------------------------------------|
| RevenueScheduleType         | Divide, Repeat                            |
| RevenueInstallmentPeriod    | Daily, Weekly, Monthly, Quarterly, Yearly |
| NumberOfRevenueInstallments | Integer between 1 to 150, inclusive.      |

| Field                        | Valid Values                              |
|------------------------------|-------------------------------------------|
| QuantityScheduleType         | Divide, Repeat                            |
| QuantityInstallmentPeriod    | Daily, Weekly, Monthly, Quarterly, Yearly |
| NumberOfQuantityInstallments | Integer between 1 to 150, inclusive       |

When you attempt to set the schedule fields when creating or updating, the API applies cross-field integrity checks. The integrity requirements are:

- If the schedule type is nil, the installment period and number of installments must be nil.
- If the schedule type is set to any value, then the installment period and number of installments must be non-nil.

Any create or update that fails these integrity checks is rejected with an error.

These default schedule fields, as well as `CanUseQuantitySchedule` and `CanUseRevenueSchedule`, are restricted picklist fields and are available only if the organization has the schedules feature enabled.

## Usage

Use this object to define the default product information for your organization. This object is associated by reference with `Pricebook2` objects via `PricebookEntry` objects. The same product can be represented in different price books as price book entries. In fact, the same product can be represented multiple times (as separate `PricebookEntry` records) in the same price book with different prices or currencies. A product can only have one price for a given currency within the same price book. To be used in custom price books, all standard prices must be added as price book entries to the standard price book.

You can query the products that have been configured for your organization. For example, you can allow your client application to obtain valid product IDs for use when configuring `PricebookEntry` records via the API. Your client application can perform the following tasks on `PricebookEntry` objects:

- Query
- Create for the standard pricebook or custom pricebooks.
- Update
- Delete
- Change the `IsActive` field when creating or updating records

This object is defined only for those organizations that have products enabled as a feature. If the organization does not have the products feature, this object does not appear in the `describeGlobal()` call, and you can't describe or query this object.

If you try to delete a product via the API but there is an opportunity that uses that product, the delete fails. The workaround is to delete the product in the user interface, which gives you an option to archive the product.

 **Note:** On opportunities and opportunity products, the workflow rules, validation rules, and Apex triggers fire when an update to a child opportunity product or schedule causes an update to the parent record. This means your custom application logic is enforced when there are updates to the parent record, ensuring higher data quality and compliance with your organization's business policies.

# Product2Feed

Represents a single feed item in the feed displayed on the detail page for a product record. This object is available in API version 18.0 and later.

A product feed shows recent changes to a product record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to products in Salesforce.

**Note:** Products are represented by Product2 objects. The Product object is no longer available. Requests containing Product are refused, and responses do not contain the Product object.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Product2 object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                    |

[UserProfileFeed](#)

## ProductEntitlementTemplate

Represents predefined terms of customer support (Entitlement) that users can add to products (Product2).

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

## Fields

| Field                              | Details                                                                                                                                                                                                            |
|------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>EntitlementTemplateId</code> | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. ID of the entitlement template. Must be a valid ID.</p>                              |
| <code>Product2Id</code>            | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. ID of the Product2 associated with the entitlement template. Must be a valid ID.</p> |

## Usage

Use to query and manage entitlement templates.

SEE ALSO:

[Entitlement](#)

## Profile

---

Represents a profile, which defines a set of permissions to perform different operations, such as querying, adding, updating, or deleting information.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

## Special Access Rules

- Customer Portal users can't access this object.
- Partner portal users can't access this object.

## Field

## Details

## Description

The category of user license. Each `UserType` is associated with one or more `UserLicense` records. Each `UserLicense` is associated with one or more profiles. In API version 10.0 and later, valid values include:

- Standard: user license. This user type also includes Salesforce Platform and Salesforce Platform One user licenses. Label is **Standard**.
- PowerPartner: User whose access is limited because he or she is a partner and typically accesses the application through a partner portal or community. Label is **Partner**.
- CSPLitePortal: user whose access is limited because he or she is an organization's customer and accesses the application through a Customer Portal or community. Label is **High Volume Portal**.
- CustomerSuccess: user whose access is limited because he or she is an organization's customer and accesses the application through a Customer Portal. Label is **Customer Portal User**.
- PowerCustomerSuccess: user whose access is limited because he or she is an organization's customer and accesses the application through a Customer Portal. Label is **Customer Portal Manager**.

Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy.

- CsnOnly: user whose access to the application is limited to Chatter. This user type includes Chatter Free and Chatter moderator users. Label is **Chatter Free**.

`UserType` replaces `LicenseType`, which is unavailable as of API version 10.0. In API versions 8.0 and 9.0 `LicenseType` is still available with the following valid values:

- AUL: Force.com user license. Label is **Apex Platform**.
- AUL1: Force.com user license with only one user. Label is **Apex Platform One**.
- Salesforce: Salesforce user license. Label is **Salesforce**.
- PackageManager: user who can create and work with managed packages for Force.com AppExchange. Label is **Package Manager**.
- PRM: user whose access is limited because he or she is a partner and typically accesses the application through a partner portal. Label is **Partner**.
- CustomerUser: user whose access is limited because he or she is an organization's customer and accesses the application through a Customer Portal. Label is **Customer Portal User**.
- CustomerManager: user whose access is limited because he or she is an organization's customer and accesses the application through a Customer Portal. Label is **Customer Portal Manager**.

Users with this license type can view and edit data they directly own or data owned by or shared with users below them in the Customer Portal role hierarchy.

## Usage

Use the Profile object to query the set of currently configured user profiles in your organization. Your client application can use Profile objects to obtain valid profile IDs for use when querying or modifying users through the API.

In the user interface, profiles can be used to assign user licenses from specific pools (Force.com Platform user license or Salesforce user license, for example). If a user is assigned to a profile with a different license type, the number of available licenses in the old license type pool increases, one per user changed, and decreases by the same amount in the new license type pool.

## ProfileSkill

Represents a profile skill, which describes a user’s professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

 **Note:** For information about Live Agent skills, see the [Skill](#) topic.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Usage

Use the ProfileSkill object to look up the attributes of a skill that can be assigned to a user. This is a global object and is not owned by any specific user.

## ProfileSkillEndorsement

Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name         | Details                                                                                                                                                                      |
|--------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name               | <b>Type</b><br>string<br><b>Properties</b><br>Autonumber, Defaulted on create, Filter, idLookup, Sort<br><b>Description</b><br>The name of the profile skill being endorsed. |
| ProfileSkillUserId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the ProfileSkillUser record that is being endorsed.          |
| UserId             | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The user ID of the person giving the endorsement.    |

## Usage

Use the ProfileSkillEndorsement object to query about a single endorsement given to a user about a specific skill. Users can't endorse themselves, they can only be endorsed by others unless they are administrators with the "Modify All Data" permission.

## ProfileSkillEndorsementFeed

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillEndorsement record. This object is available in API version 34.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

## Usage

Use this read-only object to identify changes to a ProfileSkillEndorsement.

## ProfileSkillFeed

Represents a single feed item in the feed displayed on the detail page for a profile skill.

A ProfileSkill feed shows recent changes to a ProfileSkill record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to solutions.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                        |
|------------|----------------------------------------------------------------|
| Body       | <b>Type</b><br>textarea<br><b>Properties</b><br>Nillable, Sort |

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                          |

## Usage

Use this object to track changes for a `ProfileSkill` record.

## ProfileSkillHistory

Represents the history of changes to the fields of a `ProfileSkill`.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name     | Details                                                                                                                                                                     |

## Usage

Use this read-only object to identify changes to a ProfileSkill.

## ProfileSkillShare

Represents a sharing entry on a ProfileSkill.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name               | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Field Name    | Details                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>ID of the User or Group that has been given access to the ProfileSkill. |

## Usage

This object is read only. It is visible because of constraints to the ProfileSkill object, but it is ignored and does not control which users and groups can view and edit ProfileSkill records owned by other users.

## ProfileSkillUser

Represents a detail relationship of User. The object connects profile skills with users.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| UserId     | <b>Type</b><br>reference<br><br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><br><b>Description</b><br>The ID of the user. This field can't be changed once it is created. |

## Usage

Use this object to assign specific skills to specific users. ProfileSkillUser appears on the Overview tab on the Chatter profile page. Users can only create a skill mapping for themselves, they can't create skill mappings for others unless they are administrators with the "Modify All Data" permission. Additionally, users can only edit this object if they are the context user and are not editing the `UserId` field.

## ProfileSkillUserFeed

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillUser record. This object is available in API version 34.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

## Usage

Use this read-only object to identify changes to a ProfileSkillUser.

## PushTopic

Represents a query that is the basis for notifying listeners of changes to records in an organization. This is available from API version 21.0 or later.

## Supported Calls

REST: DELETE, GET, PATCH, POST (query requests are specified in the URI)

SOAP: `create()`, `delete()`, `describe()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

- This object is only available if Streaming API is enabled for your organization.
- Only users with “Create” permission can create this record.

## Fields

| Field       | Field Type | Description                                                                                                                                                                                                                                                                                                                                    |
|-------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApiVersion  | double     | Required. API version to use for executing the query specified in <code>Query</code> . It must be an API version greater than 20.0. If your query applies to a custom object from a package, this value must match the package's <code>ApiVersion</code> .<br><br>Example value: 37.0<br><b>Field Properties:</b> Create, Filter, Sort, Update |
| Description | string     | Description of the PushTopic. | NotifyForOperationDelete   | boolean    | <code>true</code> if a delete operation should generate a notification, otherwise, <code>false</code> . Defaults to <code>true</code> . Clients must connect using the <code>cometd/29.0</code> (or later) Streaming API endpoint to receive delete and undelete event notifications. This field is available in API version 29.0 and later.    |
| NotifyForOperationUndelete | boolean    | <code>true</code> if an undelete operation should generate a notification, otherwise, <code>false</code> . Defaults to <code>true</code> . Clients must connect using the <code>cometd/29.0</code> (or later) Streaming API endpoint to receive delete and undelete event notifications. This field is available in API version 29.0 and later. |
| NotifyForOperationUpdate   | boolean    | <code>true</code> if an update operation should generate a notification, otherwise, <code>false</code> . Defaults to <code>true</code> . This field is available in API version 29.0 and later.                                                                                                                                                 |
| Query                      | string     | Required. The SOQL query statement that determines which record changes trigger events to be sent to the channel.<br><br>Limit: 1,300 characters<br><br><b>Field Properties:</b> Create, Filter, Sort, Update                                                                                                                                   |

## PushTopic and Notifications

The PushTopic defines when notifications are generated in the channel. This is specified by configuring the following PushTopic fields:

- PushTopic Queries
- Events
- Notifications

## QuantityForecast

Represents a quantity-based forecast.

The API also provides revenue-based forecasts using RevenueForecast.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Requires the “View All Data” permission.
- Customer Portal users can’t access this object.

## Fields

| Field               | Details                                                                                                                                                                                                                                                                                   |

## Usage

Query this object to support customizable forecasts based on quantities.

You can update one field, `Quota`, which means that you can mass update sales users' quotas instead of updating them one by one in the user interface. Editing `Quota`, which means that you can mass update sales users' quotas instead of updating them one by one in the user interface. Editing `Quota` requires the “Modify All Data” and “Manage Users” permissions.

The rollup fields always reflect opportunity and opportunity product overrides by the forecast owner or one of the forecast owner's subordinates in the role hierarchy. In addition, the manager rollup fields include overrides by the forecast owner's direct manager in the role hierarchy.

Some of the rollup fields ignore forecast-level (**Adjusted Total**) overrides, but they never ignore opportunity forecast overrides that are visible to the owner or manager.

## Usage

This is a read-only object specific to customizable forecasting.

When a user submits a revenue-based forecast in the user interface, a new record is created. If the same forecast is ever resubmitted, additional records are added. The `CreatedDate` of a record reflects the day on which the forecast was submitted. This object respects field level security on the parent object.

This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

The score itself does not display in the application user interface.<br> <b>Note:</b> Unlike other fields of type double, you can't use a SOQL aggregate function with this field. |

## Usage

Use this object to track questions in azone.

## QuestionDataCategorySelection

A data category selection represents a data category that classifies a question.

This object can be used to associate a question with a data category from a data category group or to query the categorization for a question.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

To create, read or update data category selection, you must have create, read or update permission on the categorized question. Users who can update question can also delete its category selection. Users who can create questions can only select categories visible to their role.

## Fields

|                  | <b>Description</b><br>ID of the question associated with the data category selection.                           |

## Usage

Every question can be categorized in a data category. You can use the `QuestionDataCategorySelection` object to query and manage question categorization. Client applications can create categorization for a question. They can also delete, query, and retrieve question categorization.

**Warning:** Even though the API lets you select more than one category for `QuestionDataCategorySelection`, the Answers tab only supports one data category selection for questions. Selecting multiple categories through `QuestionDataCategorySelection` may result in unexpected behavior in the Answers tab, such as losing your multiple selections. You should only select one data category when using `QuestionDataCategorySelection`.

## Sample Code—Java

In the following example, the `selectCategory` method adds a category to a question data category selection. The `retrieveCategorySelections` method returns all the categories from a question data category selection.

```
public void selectCategory(ID parentId, String categoryGroupName, String categoryName) {
    try {
        QuestionDataCategorySelection categorySelection = new
        QuestionDataCategorySelection();

        categorySelection.setParentId(parentId);
        categorySelection.setDataCategoryGroupName(categoryGroupName);
        categorySelection.setDataCategoryName(categoryName);
        binding.create(new SObject[]{categorySelection});
    }
}
```

```
    } catch (RemoteException e) {
        System.out.println("An unexpected error has occurred." + e.getMessage());
    }
}

public String[] retrieveCategorySelections(String parentId) {
    QueryResult qr = null;

    try {
        qr = binding.query("SELECT DataCategoryName FROM QuestionDataCategorySelection
WHERE Id = '" + parentId + "'");
    } catch (RemoteException e) {
        System.out.println("An unexpected error has occurred." + e.getMessage());
    }

    String[] categoryNames = new String[qr.getRecords().length];
    for (int index = 0; index < qr.getRecords().length; index++) {
        categoryNames[index] =
            ((QuestionDataCategorySelection)qr.getRecords()[index]).getDataCategoryName();
    }

    return categoryNames;
}
```

Salesforce Knowledge uses a similar object for article data category selection. See [Article Type\\_\\_DataCategorySelection](#) for SOQL examples using this object.

# QuestionReportAbuse

Represents a user-reported abuse on a Question in a Chatter Answers community. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field | Details                                                                                                                                                                                             |

| QuestionId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the Question from which the user reported abuse.                                                       |
| Reason     | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort<br><b>Description</b><br>The reason the user reported abuse on the Question, such as Spam, Hateful, or Inappropriate. |

## Usage

Use this object to track user-reported abuse on questions created in a Chatter Answers community.

## QuestionSubscription

Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field       | Details                                                                                                                                                                                                           |

|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                | <b>Type</b><br>string<br><b>Properties</b><br>Autonumber, Defaulted on create, Filter, Sort<br><b>Description</b><br>The name of the question subscription.                                          |
| QuestionCreatedDate | <b>Type</b><br>dateTime<br><b>Properties</b><br>Filter, Nillable, Sort<br><b>Description</b><br>Required. Creation date of the Question which the user is following. This field can't be updated.    |
| QuestionId          | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Required. ID of the Question which the user is following. This field can't be updated. |
| SubscriberId        | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Required. ID of the User who is following the Question. This field can't be updated.   |

## Usage

Things to consider when following a Question:

- A user can only follow questions that they have permission to view.
- Administrators and users with the “Modify All Data” permission can configure other users to follow questions that the other user has read access to.
- Administrators and users with the “Modify All Data” permission can configure users to stop following questions.

Queries on QuestionSubscription:

- Users with the “Read” permission on Question can see which questions other users are following.
- A query must include a LIMIT clause and the limit can't exceed 1,000.
- A query using a WHERE clause can only filter by fields on Question.

# QueueSubject

Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object. A queue is a Group whose `Type` is `Queue`. To create a Group, you must have the "Manage Users" permission.

## Fields

| Field       | Details                                                                                                                                                                                                                                         |

| SubjectType | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>A list of object types that can be associated with the queue specified by the <code>QueueId</code>.</p> |

## Usage

Use this object to associate a queue with the sObject that can be associated with the queue, including custom objects.

SEE ALSO:  
[Object Basics](#)

## QuickText

This object stores a snippet of text that allows an agent to send a quick response to a customer in the Live Agent console. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                    |

## Usage

Use this object to create and manage the Quick Text messages available to agents in the Live Agent console. You can categorize multiple QuickText records into groups using the Category field. The Category field can also be a parent to multiple custom dependent Picklist fields to create a hierarchical structure of categories.

## QuickTextHistory

Represents changes to field values on a QuickText object. This object is available in API version 24.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name  | Details                                                                                                                                                  |

## Usage

Use this object to identify changes to a QuickText.

## QuickTextOwnerSharingRule

Represents a rule for sharing a QuickText object with users other than the owner.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Name          | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to <b>Label</b> in the user interface. |
| UserorGroupID | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter<br><b>Description</b><br>The ID representing the target user or group. Target users or groups have access to the QuickText.                                                            |

## Usage

Use this object to manage the sharing rules for a QuickText object.

## QuickTextShare

Represents a sharing entry on a QuickText object. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage

This object lets you determine which users and groups can view and edit QuickText records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

## Quote

---

The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

Quotes can be created from and synced with opportunities, and emailed as PDFs to customers

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field             | Details                                                                                                                                                                                                                                  |

## Usage

Use Quote to manage proposed product prices for customers. To update a Quote, your client application needs "Edit" permission.

- Client applications can create, update, delete, and query Attachment records associated with a quote via the API.
- You can sync a quote and its parent Opportunity.

## Usage

A Quote record can have QuoteLineItem records only if the Quote has a Pricebook2. A QuoteLineItem must correspond to a Product2 that is listed in the quote's Pricebook2.

**Note:** If the multicurrency option has been enabled, the `CurrencyIsoCode` field is present. It can't be modified, it is always set to the value of the `CurrencyIsoCode` of the parent Quote.

## Effects on Quotes

Quotes that have associated QuoteLineItem objects are affected in the following ways:

- Creating a QuoteLineItem increments the Quote value by the `TotalPrice` of the QuoteLineItem.

- When you create or update a QuoteLineItem, the API verifies that the line item corresponds to a PricebookEntry in the Pricebook2 that is associated with the quote.

- [Opportunity](#)

# RecentlyViewed

Represents records that the current user has recently viewed or referenced (by viewing a related record).

## Supported Calls

`query()`, `update()`

## Special Usage Rules

The RecentlyViewed object does not support the Report, KnowledgeArticle, and Article objects.

## Fields

| Field     | Details                                                                                                                        |
|-----------|--------------------------------------------------------------------------------------------------------------------------------|
| Alias     | <div>Typestring</div> <div>PropertiesFilter, Group, Nillable, Sort</div> <div>DescriptionThe alias on the record.</div>        |

|            | <b>Description</b><br>The ID of the user role associated with this object.                                                                                |

## Usage

This object provides a heterogeneous list of different object types and consists of recently viewed records or records that were recently referenced (a related record was viewed). A record is considered viewed when the user sees the details associated with it, but not when the user sees it in a list with other records. Use this object to programmatically construct a list of recently viewed items specific to the current user, for example, on a custom user interface or for search auto-complete options. You can also retrieve a filtered list of records by object type (Type). The RecentlyViewed data is periodically truncated down to 200 records per object.

Use this query in your code to retrieve a list of all the records that were recently viewed. The results are ordered from most to least recent.

```
SELECT Id, Name
FROM RecentlyViewed
WHERE LastViewedDate !=null
ORDER BY LastViewedDate DESC
```

Use this query to retrieve data that was either viewed or referenced, but only for a limited set of objects.

```
SELECT Id, Name
FROM RecentlyViewed
WHERE Type IN ('Account', 'Contact', 'Plan__c')
ORDER BY LastViewedDate DESC
```

This query retrieves a list of all recently viewed contacts with contact-specific fields, such as the contact's account name, and the custom website field. Records are ordered from most to least recent.

```
SELECT Account.Name, Title, Email, Phone, Website__c
FROM Contact
WHERE LastViewedDate != NULL
ORDER BY LastViewedDate DESC
```

## RecordType

Represents a record type.

## Supported Calls

`create()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                          | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <code>DeveloperName</code>     | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Record Type Name</b>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| <code>IsActive</code>          | <p><b>Type</b><br/>boolean</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| SubjectType | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>Object to which this record type applies, including custom objects.</p> |

## Usage

Use this object to offer different BusinessProcess records and subsets of picklist values to different users based on their Profile. Your client application can describe or query RecordType records.

The following objects have a `RecordTypeId` field:

- Account
- Campaign
- CampaignMember
- Case
- Contact
- Contract
- Lead
- Opportunity
- QuickText
- Solution
- Custom objects

Client applications can create or update values in `RecordTypeId` on these objects, specifying a valid record type ID associated with these objects.

 **Note:** You can't create or update the `RecordTypeId` field on the CampaignMember records. Set the CampaignMember record type using the `CampaignMemberRecordTypeId` field on Campaign.

A client application can retrieve the list of valid record type IDs for a given object by querying the RecordType.

## RecordTypeLocalization

Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|       | <b>Description</b><br>The ID of the RecordType associated with the label that is being translated.                                                                                     |
| Value | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Nillable, Update<br><b>Description</b><br>The actual translated label for the record type. Label is <b>Translation</b> . |

## Usage

Use this object to translate the labels of your record types into other supported languages.

## Reply

Represents a reply that a user has submitted to a question in an answers community.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Usage

Use this object to track replies to a Question.

## ReplyReportAbuse

Represents a user-reported abuse on a Reply in a Chatter Answers community. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field   | Details                                                                                                                                                                                                             |

## Usage

Use this object to track user-reported abuse on replies created in a Chatter Answers community.

## Report

Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

## Supported Calls

`describeObjects()`, `query()`, `retrieve()`, `search()`

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Description   | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The description of the report. Limit: 255 characters.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Report Unique Name</b>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| FolderName    | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>Name of the folder that contains the report. Available in API version 35.0 and later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Format        | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. Indicates the format of the report. This field is available in API version 37.0 and later. Can have one of these values:</p> <ul style="list-style-type: none"> <li>• Tabular for reports in that format. The label is <code>Tabular</code>.</li> <li>• Summary for reports in that format. The label is <code>Summary</code>.</li> <li>• Matrix for reports in that format. The label is <code>Matrix</code>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Field                           | Details                                                                                                                                                                                                                                                                                                     |

|         | <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><code>namespacePrefix__componentName</code></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> <p>This field can't be accessed unless the logged-in user has the "Customize Application" permission.</p> |
| OwnerId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter</p> <p><b>Description</b><br/>The ID of the user who currently owns this report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Supported Query Scopes

Use these scopes to help specify the data your SOQL query returns.

### allPrivate

Records saved in all users' private folders.

Requires the user permission "Manage All Private Reports and Dashboards." Available in API version 36.0 and later.

### created

Records created by the user running the query.

### everything

All records except records saved in other users' private folders.

### mine

Records saved in the private folder of the user running the query.

### organizationOwned

Records saved in Unfiled Public Reports. In Lightning Experience, the Unfiled Public Reports folder is called Public Reports.

## Usage

Use the report object to get report metadata. Query, search, or retrieve specific metadata on reports. Report object fields are read-only.

## Example: Reports with “Sales” in Their Name

This SOQL query returns reports that contain the name “Sales” and lists their developer names, format, ID, and report name.

```
SELECT DeveloperName,Format,Id,Name FROM Report WHERE Name LIKE '%Sales%'
```

## Example: Reports in an Inactive User’s Private Folder

This SOQL query returns reports saved in a specific user’s private folder.

```
SELECT Id FROM Report USING SCOPE allPrivate WHERE OwnerId = '005A0000000Bc2deFG'
```

## ReportFeed

Represents a single feed item in the feed displayed on a report. This object is available in API version 20.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:

- “Modify All Data”
- “Moderate Chatter”

 **Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

## Fields

| Field | Details          |
|-------|------------------|
| Body  | Type<br>textarea |

| Field              | Details                                                                                                                                                                                                                                                                                                                       |

## Usage

ReportTag stores the relationship between its parent TagDefinition and the Report being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

# ReputationLevel

Represents a reputation level defined for a community. This object is available in API version 32.0 and later.

## Supported Calls

```
describeSObjects(), query(), retrieve()
```

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization. Only users with permissions to create or manage a community can view the ReputationPointsRule records.

# ReputationPointsRule

Represents the reputation point rules for a community. Each rule specifies an action that community members can earn points from and the points associated with those actions in a particular community. This object is available in API version 32.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization. Only users with permissions to create or manage a community can view the ReputationPointsRule records.

## Usage

Query this object to support customizable forecasts based on revenue. Requires the “View All Data” permission.

You can also update `CurrencyIsoCode` and `Quota`, which means that you can mass update sales users' quotas instead of updating them one by one in the user interface. Editing `Quota` requires “Modify All Data” and “Manage Users” permissions.

The rollup fields always reflect opportunity and opportunity product overrides by the forecast owner or one of the forecast owner's subordinates in the role hierarchy. In addition, the manager rollup fields include overrides by the forecast owner's direct manager in the role hierarchy.

Some of the rollup fields ignore forecast-level (**Adjusted Total**) overrides, but they never ignore opportunity forecast overrides that are visible to the owner or manager.

[Object Basics](#)

## RevenueForecastHistory

Represents historical information about revenue-based forecasts that have been submitted (saved) in the user interface.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Requires the “View All Data” permission.
- Customer Portal users can't access this object.

## Usage

This is a read-only object specific to customizable forecasting.

When a user submits a revenue-based forecast in the user interface, a new record is created. If the same forecast is ever resubmitted, additional records are added. The `CreatedDate` of a record reflects the day on which the forecast was submitted. This object respects field-level security on the parent object.

## RuleTerritory2Association

Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

### Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization’s sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

### Fields

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## SamlSsoConfig

Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

Single sign-on is a process that allows network users to access all authorized network resources without having to log in separately to each resource. Single sign-on allows you to validate usernames and passwords against your corporate user database or other client application rather than having separate user passwords managed by Salesforce.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Scontrol

A custom s-control, which is custom content that is hosted by the system but executed by the client application.

**Important:** Visualforce pages supersede s-controls. Organizations that haven't previously used s-controls can't create them. Existing s-controls are unaffected, and can still be edited. We recommend that you move your s-controls to Visualforce. We continue to support the Scontrol object.

Represents a custom s-control, which is custom content that the system hosts, but client applications execute. An s-control can contain any type of content that you can display or run in a Web browser.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

- Your organization must be using Enterprise, Developer, or Unlimited Edition and be enabled for custom s-controls.
- Customer Portal users can't access this object.

## Fields

| Field         | Details                                                                                                                                                                                                                                                            |

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>S-Control Name</b>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

|       | <b>Description</b><br>Indicates whether the s-control supports caching ( <code>true</code> ) or not ( <code>false</code> ). |

## Usage

Use custom s-controls to manage custom content that extends application functionality. All users can view custom s-controls, but the “Customize Application” permission is required to create or update custom s-controls.

SEE ALSO:

[Object Basics](#)

## ScontrolLocalization

The translated value of the field label for an s-control.

**Important:** Visualforce pages supersede s-controls. Organizations that haven’t previously used s-controls can’t create them. Existing s-controls are unaffected, and can still be edited.

When the Translation Workbench is enabled for your organization, provides the translation of the field label of an s-control.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, or Unlimited Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

## SearchPromotionRule

Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user’s search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

A user must have the “Manage Promoted Search Terms” permission.

| Query      | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>The text of the promoted search term. Maximum length: 100 characters.<br><br>You can associate the same promoted search term with multiple articles. If the user's search matches the promoted term, all associated articles are promoted in search results, ordered by relevancy. For best results, create promoted search terms selectively and limit the number of articles that are promoted per term. |

## Usage

Use this object to optimize article search results in Salesforce Knowledge.

## SecureAgent

Represents a Secure Agent that connects Salesforce to on-premises external data sources like SharePoint 2010 and 2013. This object is available in API version 32.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## SecureAgentsCluster

Represents a cluster consisting of several Secure Agents on different servers. Clusters provide failover protection if an agent on a particular server becomes inaccessible. This object is available in API version 35.0 and later.

Secure Agents connect Salesforce to content in on-premises external data sources, such as SharePoint 2010 and 2013. To edit individual agents that are part of a cluster, use the [SecureAgent](#) object.

## Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

## SelfServiceUser

Represents a Contact who has been enabled to use your organization's Self-Service portal, where he or she can obtain online support.

 **Note:** Starting with Spring '12, the Self-Service portal isn't available for new orgs. Existing orgs continue to have access to the Self-Service portal.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

|                | <b>Description</b><br>Indicates whether this Self-Service user is a super user with additional access on his or her company's Self-Service portal ( <code>true</code> ) or not ( <code>false</code> ).                                                                                                                                                                        |
| TimeZoneSidKey | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort, Update<br><b>Description</b><br>Required. This is a restricted picklist field. The time zone of a affects the offset used when displaying or entering times in the Self-Service portal.                                                                                     |
| Username       | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Required. This contains the name that a Self-Service user enters to log into the Self-Service portal. Value must be unique in your organization. If you try to create or update a user with a duplicate value, the operation is rejected and an error is returned. |

## Usage

For security reasons, you can't query Self-Service user passwords via the API or the user interface. However, the API allows you to set and reset Self-Service user passwords using the `setPassword()` and `resetPassword()` calls.

SelfServiceUser records created from the API don't cause a notification email to be sent. If you want to notify the user, you must send them an email after creating the user.

## ServiceChannel

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| CapacityPercentage | <p><b>Type</b><br/>percent</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>The percentage of an agent's capacity for work items that's consumed by a specific type of work item from this service channel.</p> <p>For example, you might give phone calls a capacity percentage of <code>100</code>. If an agent receives a phone call, the agent won't receive new work items until the call ends, because at that point the agent's capacity will have reached 100%.</p> <p>This field is available in API version 32.0 and earlier. For later API versions, you can set the capacity percentage of work items on the <a href="#">QueueRoutingConfig</a> object.</p>                                                                                                                                                                                                                                                |
| CapacityWeight     | <p><b>Type</b><br/>double</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>The amount of an agent's capacity for work items that's consumed by a work item from this service channel.</p> <p>For example, if an agent has a capacity of <code>6</code>, and cases are assigned a capacity weight of <code>2</code>, an agent can be assigned up to 3 cases before the agent is at capacity and can't receive new work items.</p> <p>This field is available in API version 32.0 and earlier. For later API versions, you can set the capacity weight of work items on the <a href="#">QueueRoutingConfig</a> object.</p>                                                                                                                                                                                                                                                                                               |
| DeveloperName      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

| Field         | Details                                                                                                                                                                                                   |

## Usage

Use this object to query and manage service contracts.

SEE ALSO:

[ServiceContractHistory](#)

[ServiceContractShare](#)

[ServiceContractOwnerSharingRule](#)

## ServiceContractFeed

Represents a single feed item in the feed displayed on the detail page for a service contract record. This object is available in API version 23.0 and later.

A service contract feed shows recent changes to a service contract for any fields that are tracked in feeds, and comments and posts about the record. It's a useful way to stay up-to-date with changes to service contracts.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the ServiceContract object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                                           |

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.<br/><br/>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort,</p> <p><b>Description</b><br/>The ID representing the source group. Service contracts owned by users in the source group trigger the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| UserorGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter<br><b>Description</b><br>The ID representing the target user or group. Target users or groups are given access. |

## Usage

Use this object to manage the sharing rules for a service contract. General sharing and territory management-related sharing use this object.

SEE ALSO:

[ServiceContract](#)  
[ServiceContractShare](#)  
[ServiceContractHistory](#)

## ServiceContractShare

Represents a sharing entry on a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

## Usage

This object allows you to determine which users and groups can view and edit ServiceContract records owned by other users.

If you attempt to create a new record that matches an existing record, the create call updates any modified fields and returns the existing record.

## ServicePresenceStatus

Represents a presence status that can be assigned to a service channel. This object is available in API version 32.0 and later.

### Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort, Update</p> <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| Language      | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b></p> <p>The language of the presence status.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Field       | Details                                                                                                                                      |

| MasterLabel | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>The label of the presence status. |

## SessionPermSetActivation

The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user's specific session. This object is available in API versions 37.0 and later as part of the Session-Based Permission Sets Developer Preview.

 **Note:** Session-Based Permission Sets is currently available as a Developer Preview.

 **Important:** Managed packages with permission sets that require session activation cannot be installed on customer orgs without this feature.

## Supported Calls

`describeCompactLayouts()`, `describeLayout()`, `query()`, `retrieve()`

## Fields

| Field Name    | Details                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AuthSessionId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The session ID related to this permission set assignment for its duration. |
| Description   | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The session details, such as device used and browser.               |

| Field Name      | Details                                                                                                                                                                            |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PermissionSetId | <b>Type</b><br>reference <b>Properties</b><br>Filter, Group, Sort <b>Description</b><br>The permission set ID related to this permission set assignment and user for its duration. |
| UserId          | <b>Type</b><br>reference <b>Properties</b><br>Filter, Group, Sort <b>Description</b><br>The user ID of the user to whom this permission set assignment applies for its duration.   |

## Usage

Use SessionPermSetActivation to create a permission set available only for a specified session's duration. For example, create permission sets that provide access to specific applications only during authenticated sessions.

In the following Apex example, an identified session is activated after session information is submitted via a button. Successful activation results in a confirmation message displayed to the user.

```
public class SessionPermSetActivationController {
    // id of the session permission set to be activated
    private final String sessionPermSetId = '0PSxx00000004rJ';
    private final String sessionId;

    public SessionPermSetActivationController() {
        Map<String, String> sessionManagement = Auth.SessionManagement.getCurrentSession();

        sessionId = sessionManagement.get('SessionId');
    }

    public PageReference activate() {
        // activate the permission set
        SessionPermSetActivation activation = new SessionPermSetActivation();
        activation.AuthSessionId = sessionId;
        activation.PermissionSetId = sessionPermSetId;
        activation.Description = 'created by SessionPermSetActivationController';

        insert activation;
        return null;
    }
}
```

```
public boolean getActivated() {
    Integer alreadyActivated = [SELECT count()
                                FROM SessionPermSetActivation
                                WHERE AuthSessionId = :sessionId
                                And PermissionSetId = :sessionPermSetId LIMIT
1];
    return alreadyActivated > 0;
}

<apex:page controller="SessionPermSetActivationController">
    <apex:outputPanel rendered="{!!Activated}">
        <h3>Activate Session Permission Set</h3>
        <br />
        <apex:form >
            <apex:commandButton action="{!activate}" value="Activate"
id="activateButton"/>
        </apex:form>
    </apex:outputPanel>
    <apex:outputPanel rendered="{!Activated}">
        <h3>Session Permission Set is already active.</h3>
    </apex:outputPanel>
</apex:page>
```

# SetupAuditTrail

Represents changes you or other administrators made in your organization’s Setup area. This object is available in API version 15.0 and later.

 **Note:** SetupAuditTrail is not a supported standard controller. Using SetupAuditTrail as a standard controller in a Visualforce page results in an error.

## Supported Calls

query(), retrieve()

 **Note:** Aggregate queries aren’t supported on this object. For example, `SELECT count() FROM SetupAuditTrail` works but `SELECT count(Id) FROM SetupAuditTrail` fails.

## Fields

| Field  | Details                           |
|--------|-----------------------------------|
| Action | <b>Type</b><br>string             |
|        | <b>Properties</b><br>Filter, Sort |

| Field        | Details                                                                                                                                                                                                                                                                                                                                            |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <p><b>Description</b></p> <p>The category of the change made in Setup. For example, a value of <i>PermSetCreate</i> indicates that an administrator created a permission set. The <i>Display</i> field contains more specific information.</p>                                                                                                     |
| DelegateUser | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Filter, Nillable, Sort</p> <p><b>Description</b></p> <p>The Login-As user who executed the action in Setup. If a Login-As user didn't perform the action, this field is blank. This field is available in API version 35.0 and later.</p>                                             |
| Display      | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Nillable, Sort</p> <p><b>Description</b></p> <p>The full description of changes made in Setup. For example, if the <i>Action</i> field has a value of <i>PermSetCreate</i>, the <i>Display</i> field has a value like "Created permission set MAD: with user license Salesforce."</p> |
| Section      | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Nillable, Sort</p> <p><b>Description</b></p> <p>The section in the Setup menu where the action occurred. For example, Manage Users or Company Profile.</p>                                                                                                                            |

**Note:** You can use SOQL joins to get the information you need more quickly. For example, running `SELECT CreatedBy.Name FROM SetupAuditTrail LIMIT 10` returns the first and last names of the last 10 people to make changes in Setup.

## SetupEntityAccess

Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

To grant users access to an entity, associate the appropriate SetupEntityAccess record with a PermissionSet that's assigned to a user.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| SetupEntityId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the entity for which access is enabled, such as an Apex class or Visualforce page.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| SetupEntityType | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The type of setup entity for which access is enabled. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>ApexClass</code> for Apex classes</li> <li>• <code>ApexPage</code> for Visualforce pages</li> <li>• In API version 28.0 and later, <code>ConnectedApplication</code> for OAuth connected apps</li> <li>• In API version 31.0 and later, <code>CustomPermission</code> for custom permissions</li> <li>• In API version 28.0 and later, <code>ServiceProvider</code> for service providers</li> <li>• In API version 28.0 and later, <code>TabSet</code> for apps</li> </ul> |

## Usage

Because SetupEntityAccess is a child of the PermissionSet object, the usage is similar to other PermissionSet child objects like FieldPermissions and ObjectPermissions.

For example, the following code returns all permission sets that grant access to any setup entities for which access is enabled:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
```

The following code returns permission sets that grant access only to Apex classes:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE SetupEntityType='ApexClass'
```

The following code returns permission sets that grant access to any setup entities, and are not owned by a profile:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId
FROM SetupEntityAccess
WHERE ParentId
IN (SELECT Id
    FROM PermissionSet
    WHERE isOwnedByProfile = false)
```

You may want to return only those permission sets that have access to a specific setup entity. To do this, query the parent object. For example, this code returns all permission sets that grant access to the `helloWorld` Apex class:

```
SELECT Id, Name,
    (SELECT Id, Parent.Name, Parent.Profile.Name
     FROM SetupEntityAccessItems)
FROM ApexClass
WHERE Name = 'helloWorld'
```

While it's possible to return permission sets that have access to a `ConnectedApplication`, `ServiceProvider`, or `TabSet` by `SetupEntityId`, it's not possible to return permission sets that have access to these `SetupEntityType` fields by any other `AppMenuItem` attribute, such as `Name` or `Description`. For example, to find out if a user has access to the Recruiting app, you'd run two queries. First, query to get the `AppMenuItem` ID:

```
SELECT Id, Name, Label
FROM AppMenuItem
WHERE Name = 'Recruiting'
```

Let's say the previous query returned the `AppMenuItem` ID `02uD0000000GliMIAW`. Using this ID, you can now run a query to find out if a user has access to the Recruiting app:

```
SELECT Id, SetupEntityId, SetupEntityType
FROM SetupEntityAccess
WHERE ParentId
IN
    (SELECT PermissionSetId
     FROM PermissionSetAssignment)
```

```
WHERE AssigneeId = '005D00000001QOzF')
AND (SetupEntityId = '02uD00000000GIiMIAW')
```

## SignupRequest

Represents a request for a new Trialforce sign-up. This object is available in API version 27.0 and later.

**Note:** You are limited to 20 sign-ups per day. If you need to make additional sign-ups, log a case in the Partner Community.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                       | <p><b>Description</b></p> <p>The language of the trial organization being created. Specify the language using a language code listed under Fully Supported Languages in “Which Languages Does Salesforce Support?” in the Salesforce Help. For example, use <code>zh_CN</code> for simplified Chinese. The value you select overrides the language set by locale. If you specify an invalid language, the organization defaults to English. Likewise, if you specify a language that isn’t supported by the Salesforce edition associated with your trial template, the trial organization defaults to English. This field is available in API version 35.0 and later.</p> |

## Usage

The Java class below uses the REST API to create a SignupRequest object. It authenticates to the Trialforce Management Organization and then posts a request to the SignupRequest object.

Here are the variables you need to specify in this example.

- **SERVER** — The name of the host server for the Trialforce Management Organization (TMO), for example, *"yourInstance.salesforce.com."*
- **USERNAME** — The admin username for the TMO.
- **PASSWORD** — The concatenation of the admin password and the security token for the TMO. To get an email with the security token, from your personal settings in Salesforce select **Reset My Security Token** and click **Reset Security Token**.
- **CLIENT\_ID** — From Setup in Salesforce, enter *Apps* in the *Quick Find* box, select **Apps**, and click **New** under Connected Apps. Enter values for the required fields (the Callback URL is required but can initially be set to any valid URL as it's not used), grant full access for the OAuth scopes in the "Selected OAuth Scopes" selector, and click **Save**. Then copy the value of "Consumer Key" and use it for this variable.
- **CLIENT\_SECRET** — On the same page, click **Click to reveal**. Then copy the value of "Consumer Secret" and use it for this variable.

```
public class IsvSignupDriver {
    private static final String SERVER = server_name:port;
    private static final String USERNAME = tmo_username;
    private static final String PASSWORD = tmo_passwordsecurity_token;
    private static final String CLIENT_ID = consumer_key;
    private static final String CLIENT_SECRET = consumer_secret;

    private static SignupRequestInfo signupRequest = null;

    public static String createSignupRequest (SignupRequestInfo sr)
        throws JSONException, IOException {
        JSONObject createResponse = null;
        signupRequest = sr;
        JSONObject loginResponse = login(SERVER, USERNAME, PASSWORD);
    }
}
```

```

        String instanceUrl = loginResponse.getString("instance_url");
        String accessToken = loginResponse.getString("access_token");
        createResponse = create(instanceUrl, accessToken);
        System.out.println("Created SignupRequest object: " + createResponse + "\n");
        return createResponse.toString();
    }

    /* Authenticates to the TMO using the required credentials */

    private static JSONObject login(String server, String username, String password)
        throws ClientProtocolException, IOException, JSONException {
        String authEndPoint = server + "/services/oauth2/token";
        HttpClient httpClient = new DefaultHttpClient();
        try {
            HttpPost post = new HttpPost(authEndPoint);

            List<NameValuePair> params = new ArrayList<NameValuePair>();
            params.add(new BasicNameValuePair("grant_type", "password"));
            params.add(new BasicNameValuePair("client_id", CLIENT_ID));
            params.add(new BasicNameValuePair("client_secret", CLIENT_SECRET));
            params.add(new BasicNameValuePair("username", username));
            params.add(new BasicNameValuePair("password", password));
            post.setEntity(new UrlEncodedFormEntity(params, Consts.UTF_8));

            BasicResponseHandler handler = new BasicResponseHandler();
            String response = httpClient.execute(post, handler);
            return new JSONObject(response);
        } finally {
            httpClient.getConnectionManager().shutdown();
        }
    }

    /* Posts a request to the SignupRequest object */

    private static JSONObject create(String instanceUrl, String accessToken)
        throws ClientProtocolException, IOException, JSONException {
        HttpClient httpClient = new DefaultHttpClient();
        try {
            HttpPost post = new HttpPost(instanceUrl +
                "/services/data/v27.0/objects/SignupRequest/");
            post.setHeader("Authorization", "Bearer " + accessToken);
            post.setHeader("Content-Type", "application/json");

            JSONObject requestBody = new JSONObject();
            requestBody.put("TemplateId", signupRequest.getTemplateID());
            requestBody.put("SignupEmail", signupRequest.getEmail());
            requestBody.put("username", signupRequest.getUsername());
            requestBody.put("Country", "US");
            requestBody.put("Company", signupRequest.getCompanyName());
            requestBody.put("lastName", signupRequest.getLastName());

            StringEntity entity = new StringEntity(requestBody.toString());
            post.setEntity(entity);
            BasicResponseHandler handler = new BasicResponseHandler();
            String response = httpClient.execute(post, handler);

```

```

        return new JSONObject(response);
    } finally {
        httpClient.getConnectionManager().shutdown();
    }
}
}

```

## Error Codes

If the sign-up fails, the system generates an error code that can help you identify the cause. This table shows the most important error codes.

| Error Code | Description                                                                                                                                                                         |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| C-1007     | Duplicate username.                                                                                                                                                                 |
| C-1015     | Error while establishing the new organization's My Domain settings. Contact Salesforce support for assistance.                                                                      |
| C-1016     | Error while configuring the OAuth connected app for Proxy Signup. Verify that your connected app has a valid consumer key, callback URL, and unexpired certificate (if applicable). |
| C-1018     | Invalid subdomain value provided during sign-up.                                                                                                                                    |
| C-1019     | Subdomain in use. Please choose a new subdomain value.                                                                                                                              |
| C-9999     | Generic "fatal error." Contact Salesforce support for assistance.                                                                                                                   |
| S-1006     | Invalid email address (not in a proper email address format).                                                                                                                       |
| S-2006     | Invalid country code.                                                                                                                                                               |
| T-0001     | Template ID not valid (not in the format 0TTxxxxxxxxxx).                                                                                                                            |
| T-0002     | Template not found. Either the template doesn't exist (it may have been deleted), or it doesn't exist at the appropriate version.                                                   |
| T-0003     | Template not approved for use by Salesforce.                                                                                                                                        |

## Site

Represents a public website that is integrated with an Organization. This object is generally available in API version 16.0 and later. To access this object, Force.com Sites or Site.com must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.

- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

| Field                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Subdomain      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The Force.com domain that you registered for your site. For example, if your Force.com domain is <code>mycompany.force.com</code>, then <code>mycompany</code> is the subdomain.</p>                                                                                                                                                       |
| TopLevelDomain | <p><b>Type</b><br/>url</p> <p><b>Properties</b><br/>Filter, Nillable</p> <p><b>Description</b><br/>The optional branded custom Web address that you registered with a third-party domain name registrar. The custom Web address acts as an alias to your Force.com address.<br/><br/>Beginning with API version 21.0, <code>TopLevelDomain</code> is no longer available. Instead, use the <a href="#">Domain</a> and <a href="#">DomainSite</a> objects.</p> |
| UrlPathPrefix  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The unique Force.com URL that the public uses to access this site.</p>                                                                                                                                                                                                                                                                     |

## Usage

Use this read-only object to query or retrieve information on your Force.com site.

## SiteDomain

---

SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the [Domain](#) and [DomainSite](#) objects instead.

To access this object, Force.com Sites or Site.com must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.

## Fields

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Domain     | <p><b>Type</b><br/>url</p> <p><b>Properties</b><br/>Filter, Sort</p> <p><b>Description</b><br/>The branded custom Web address within the global namespace identified by this domain's type. In the Domain Name System (DNS) global namespace, this field is the custom Web address that you registered with a third-party domain name registrar. The custom Web address can be used to access the site of this domain.</p> |
| SiteId     | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the associated Site.</p>                                                                                                                                                                                                                                                                             |
| DomainType | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Sort, Nillable</p>                                                                                                                                                                                                                                                                                                                                 |

| Field | Description                                                                                                                                                                                                  |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <b>Description</b><br>The global namespace that this custom Web address belongs to. This value is set to DNS for custom Web addresses in the global DNS. This field is available in version 24.0 of the API. |

## Usage

Use this read-only object to query the custom Web addresses that are associated with each website in your organization.

## SiteHistory

Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later.

To access this object, Force.com Sites must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

| Field    | Details                                                                                                                                                           |

## Skill

Represents a category or group that Live Agent users can be assigned to. This object is available in API version 24.0 and later.

**Note:** For information about Work.com skills on a user's profile, see the [ProfileSkill](#) topic.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. |

| Field Name  | Details                                                                                                                                                                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|             |  <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record. |
| Language    | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update<br><b>Description</b><br>The language of the skill.                                                                                                                              |
| MasterLabel | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>The name of the skill.                                                                                                                                                                                        |

## Usage

Use this object to assign Live Agent users to groups based on their abilities. The skills associated with a LiveChatButton determine which agents receive chat requests that come in through that button.

## SkillProfile

Represents a join between Skill and Profile. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name | Details                                                                                |
|------------|----------------------------------------------------------------------------------------|
| ProfileId  | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort |

| Field Name | Details                                          |
|------------|--------------------------------------------------|
| SkillId    | <b>Description</b><br>The ID of the profile.     |
|            | <b>Type</b><br>reference                         |
|            | <b>Properties</b><br>Create, Filter, Group, Sort |
|            | <b>Description</b><br>The ID of the skill.       |

## Usage

Use this object to assign specific skills to specific profiles.

## SkillUser

Represents a join between Skill and User. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name | Details                                                    |
|------------|------------------------------------------------------------|
| SkillId    | <b>Type</b><br>reference                                   |
|            | <b>Properties</b><br>Create, Filter, Group, Sort           |
|            | <b>Description</b><br>The ID of the skill.                 |
|            |                                                            |
| UserId     | <b>Type</b><br>reference                                   |
|            | <b>Properties</b><br>Create, Filter, Group, Nillable, Sort |
|            | <b>Description</b><br>The ID of the user.                  |
|            |                                                            |

## Usage

Use this object to assign specific skills to specific users.

## SlaProcess

---

Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

An entitlement process is a timeline that includes all the steps (MilestoneType records) that your support team must complete to resolve cases. Each process includes the logic necessary to determine how to enforce the correct service level for your customers.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field           | Details                                                                                                                                                                                                               |

## Solution

---

Represents a detailed description of a customer issue and the resolution of that issue.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

## Usage

Use this object to manage your organization’s solutions. Client applications can create, update, delete, and query Attachment records associated with a solution.

SEE ALSO:

- [CategoryData](#)
- [CategoryNode](#)

## SolutionFeed

Represents a single feed item in the feed displayed on the detail page for a solution record. This object is available in API version 18.0 and later.

A solution feed shows recent changes to a solution record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to solutions.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn’t create, you must have one of these permissions:

- “Modify All Data”
- “Modify All” on the Solution object
- “Moderate Chatter”

 **Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                |

## Usage

This object represents a value in the solution status picklist. The solution status picklist provides additional information about the status of a Solution, such as whether a given status value represents a reviewed or unreviewed solution. Your client application can query this object to retrieve the set of values in the solution status picklist, and then use that information while processing Solution objects to determine more information about a given solution. For example, the application could test whether a given case has been reviewed or not based on its `Status` value and the value of the `IsReviewed` property in the associated `SolutionStatus` record.

## Usage

SolutionTag stores the relationship between its parent TagDefinition and the Solution being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## SOSDeployment

Represents the general settings for deploying SOS video call capability in a native mobile application. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| DeveloperName                        | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |

## Usage

Use this object to query and manage SOS deployments.

## SOSSession

This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

## Supported Calls

`create()` `delete()` `describeLayout()` `describeSOObjects()` `getDeleted()` `getUpdated()` `query()` `retrieve()` `search()` `undelete()` `update()` `upsert()`

## Usage

Use this object to query and manage SOS session records.

# SOSSessionActivity

Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

# Usage

Use this object to query and manage SOS session activities.

## SOSSessionHistory

This object is automatically created for each SOS session and stores information about changes made to the session. This object is available in API versions 34.0 and later.

# Supported Calls

describeSObjects(), getDeleted(), getUpdated(), query(), retrieve()

|------------|------------------------------------------------------------------|
|            | <b>Description</b><br>ID of the session record that was changed. |

## Usage

Use this object to identify changes to SOS session records.

## SOSSessionOwnerSharingRule

Represents the rules for sharing an SOS session record with users other than the record owner. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <code>RuleName</code> in the UI.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>The ID that represents the source group. Session records that are owned by users in the source group trigger the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Name          | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Filter, Group, idLookup, Sort, Update</p> <p><b>Description</b></p> <p>Label of the sharing rule as it appears in the user interface. Corresponds to <code>Label</code> in the UI.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| UserOrGroupId | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>The ID that represents the User or Group that you are granting access to.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage

Use this object to manage the sharing rules for SOS session records.

# SOSSessionShare

---

Represents a sharing entry on an SOS session. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage

This object lets you determine which users and groups can view and edit SOSSession records that are owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

## StaticResource

Represents a static resource that can be used in Visualforce markup.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Fields

| Field      | Details                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Body       | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Create, Nillable, Update</p> <p><b>Description</b><br/>Required. Encoded file data.</p> |

|       | <p><b>Properties</b></p> <p>Filter, Group, Nillable, Sort</p> <p><b>Description</b></p> <p>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><code>namespacePrefix__componentName</code></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> <p>This field can't be accessed unless the logged-in user has the "Customize Application" permission.</p> |

## Usage

Use static resources to upload content that you can reference in Visualforce markup, including archives (such as .zip and .jar files), images, stylesheets, JavaScript, and other files. Using a static resource is preferable to uploading a file to the Documents tab because:

- You can package a collection of related files into a directory hierarchy and upload that hierarchy as a .zip or .jar archive.
- You can reference a static resource in page markup by name using the `$Resource` global variable instead of hard-coding document IDs.

## Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

## Maximum Static Resource Size

You can create or update static resources to a maximum size of 5 MB. An organization can have up to 250 MB of static resources, total.

# StreamingChannel

Represents a channel that is the basis for notifying listeners of generic Streaming API events. Available from API version 29.0 or later.

## Supported Calls

REST: DELETE, GET, PATCH, POST (query requests are specified in the URI)

SOAP: `create()`, `delete()`, `describe()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

## Special Access Rules

- This object is available only if Streaming API is enabled for your organization.
- Only users with “Create” permission can create this record.
- You can create a permission set and grant users read and create access to all streaming channels in the org. This access isn’t for a specific channel, like with user sharing.
- You can apply user sharing to StreamingChannel. You can restrict access to receiving or sending events on a channel by sharing channels with specific users or groups. Channels shared with public read-only or read-write access send events only to clients subscribed to the channel that also are using a user session associated with the set of shared users or groups. Only users with read-write access to a shared channel can generate events on the channel, or modify the actual StreamingChannel record.

## Dynamic Streaming Channel

Generic Streaming also supports dynamic streaming channel creation, which creates a StreamingChannel when a client first subscribes to the channel. To enable dynamic streaming channels in your org, from Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface** and enable **Enable Dynamic Streaming Channel Creation**.

## Fields

| Field       | Field Type | Description                                                                                                                                                                                          |

| <code>Name</code>               | string     | Required. Descriptive name of the StreamingChannel. Limit: 80 characters, alphanumeric and “_”, “/” characters only. Must start with “/u/”. This value identifies the channel and must be unique.<br><b>Field Properties:</b> Create, Filter, Group, idLookup, Sort, Update<br><b>Label:</b> Streaming Channel Name |
| <code>OwnerId</code>            | reference  | The ID of the owner of the StreamingChannel.<br><b>Field Properties:</b> Create, Default on create, Filter, Group, Sort, Update<br><b>Label:</b> Owner Name                                                                                                                                                         |

## TagDefinition

Defines the attributes of child Tag objects.

## Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

## Fields

| Field             | Detail                                                                                                                             |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <code>Name</code> | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Nillable, Update<br><b>Description</b><br>Identifies the tag word or phrase. |

| Field | Detail                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type  | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Nillable, Restricted picklist</p> <p><b>Description</b><br/>Defines the visibility of a tag. Possible value are:</p> <ul style="list-style-type: none"> <li>• <b>Public:</b> The tag can be viewed and manipulated between all users in an organization.</li> <li>• <b>Personal:</b> The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.</li> </ul> |

## Usage

When you create a tag for a record, an association is created with to a corresponding TagDefinition:

- If the value in the tag's `Name` field is new, a new TagDefinition record is automatically created and becomes the parent of the tag.
- If the value in the tag's `Name` field already exists in a TagDefinition, that TagDefinition automatically becomes the parent of the tag.

Each TagDefinition record has a one-to-many relationship with its child tag records.

The following standard objects represent tags for records:

- AccountTag
- AssetTag
- CampaignTag
- CaseTag
- ContactTag
- ContractTag
- DocumentTag
- EventTag
- LeadTag
- NoteTag
- OpportunityTag
- SolutionTag
- TaskTag

Custom objects may also be tagged. Tags for custom objects are identified by a suffix of two underscores immediately followed by the word `tag`. For example, a custom object named `Meeting` has a corresponding tag named `Meeting__tag` in that organization's WSDL. `Meeting__tag` is only valid for `Meeting` objects.

TagDefinition is useful for mass operations on any tag record. For instance, if you want to rename existing tags, you can search for the appropriate TagDefinition object, update it, and the child tag's `Name` values are also changed. The following Java example replaces all `WC` tags with the phrase `West Coast`:

```
public void tagDefinitionSample() {
    String sqlQuery = "SELECT Id, Name FROM TagDefinition " +
        "WHERE Name = 'WC'";
```

```

QueryResult qResult = null;
try {
    qResult = connection.query(sqlQuery);
    TagDefinition tagDef = (TagDefinition) qResult.getRecords()[0];
    tagDef.setName("West Coast");
    connection.update(new SObject[]{tagDef});
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}

```

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## Task

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

**Note:** Task fields related to calls are exclusive to Salesforce CRM Call Center. Additionally, `query()`, `delete()`, and `update()` aren't allowed with tasks related to more than one contact in API versions 23.0 and earlier.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field     | Field Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|       | <b>Description</b><br><p>The Whold represents a human such as a lead or a contact. Wholds are polymorphic. Polymorphic means a Whold is equivalent to a contact's ID or a lead's ID. The label is Name ID.</p> <p>If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the Whold field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is Name ID.</p> |

## Usage

### Recurring Tasks

- Recurring tasks are available in API version 16.0 and later.
- After a task is created, it can't be changed from recurring to nonrecurring or vice versa.
- When you delete a recurring task series through the API, all open and closed task occurrences in the series are removed. However, when you delete a recurring task series through the user interface, only open tasks occurrences (`IsClosed` is `false`) in the series are removed.
- If `IsRecurrence` is `true`, then `RecurrenceStartDateOnly`, `RecurrenceEndDateOnly`, `RecurrenceType`, and any properties associated with the given recurrence type (see the following table) must be populated.
- When you change the `RecurrenceStartDateOnly` field or the recurrence pattern, all open tasks occurrences in the series are deleted and new open task occurrences are created based on the new recurrence pattern. The recurrence pattern is determined by the following fields: `RecurrenceType`, `RecurrenceTimeZoneSidKey`, `RecurrenceInterval`, `RecurrenceDayOfWeekMask`, `RecurrenceDayOfMonth`, `RecurrenceInstance`, and `RecurrenceMonthOfYear`.
- When you change the value of `RecurrenceEndDateOnly` to an earlier date (for example, from January 20th to January 10th), all open task occurrences in the series with the `ActivityDate` value greater than the new end date value are deleted. Other open and closed task occurrences in the series are not affected.
- When you change the value of `RecurrenceEndDateOnly` to a later date (for example, from January 10th to January 20th), new task occurrences are created up to the new end date. Existing open and closed tasks in the series are not affected.

The following table describes the usage of recurrence fields. Each recurrence type must have all of its properties set. All unused properties must be set to null.

| RecurrenceType Value | Properties              | Example Pattern                             |
|----------------------|-------------------------|---------------------------------------------|
| RecursDaily          | RecurrenceInterval      | Every second day                            |
| RecursEveryWeekday   | RecurrenceDayOfWeekMask | Every weekday - can't be Saturday or Sunday |

| RecurrenceType Value | Properties                                                             | Example Pattern                                     |
|----------------------|------------------------------------------------------------------------|-----------------------------------------------------|
| RecursMonthly        | RecurrenceDayOfMonth<br>RecurrenceInterval                             | Every second month, on the third day of the month   |
| RecursMonthlyNth     | RecurrenceInterval<br>RecurrenceInstance<br>RecurrenceDayOfWeekMask    | Every second month, on the last Friday of the month |
| RecursWeekly         | RecurrenceInterval<br>RecurrenceDayOfWeekMask                          | Every three weeks on Wednesday and Friday           |
| RecursYearly         | RecurrenceDayOfMonth<br>RecurrenceMonthOfYear                          | Every March on the twenty-sixth day of the month    |
| RecursYearlyNth      | RecurrenceDayOfWeekMask<br>RecurrenceInstance<br>RecurrenceMonthOfYear | The first Saturday in every October                 |

### JunctionIdList

The `JunctionIdList` field is now implemented in the Event and Task objects. With a single API call, it's easy to create many-to-many relationships between the Event or Task object with contacts, leads, or users.

To create a Task with related Contacts without `JunctionIdList`, you first have to create the task, then use the returned task ID to create the `TaskRelation` records. If the `TaskRelation` save call fails, error handling is your responsibility because the task has already been committed to the database.

```
public void createTasksOld(Contact[] contacts) {
    Task task = new Task();
    task.setSubject("New Task");
    SaveResult[] results = null;
    try {
        results = connection.create(new Task[] {
            task
        });
        if (results[0].isSuccess()) {
            TaskRelation[] relations = new TaskRelation[contacts.size()];
            for (int i = 0; i < contacts.length; i++) {
                relations[i] = new TaskRelation();
                relations[i].setTaskId(results[0].getID());
                relations[i].setRelationId(contacts[i].getID());
            }
            results = connection.create(relations);
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

To create a task using `JunctionIdList`, IDs are pulled from the related contacts and both the task and the `TaskRelation` records are created in one API call. If the `TaskRelation` fails, the task is rolled back because it's all done in a single API call.

```
public void createTaskNew(Contact[] contacts) {
    String[] contactIds = new String[contacts.size()];
    for (int i = 0; i < contacts.size(); i++) {
        contactIds[i] = contacts[i].getID();
    }
}
```

```
}
Task task = new Task();
task.setSubject("New Task");
task.setTaskWhoIds(contactIds);
SaveResult[] results = null;
try {
    results = connection.create(new Task[] {
        task
    });
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}
```

# TaskFeed

Represents a single feed item in the feed on a Task. This object is available in API version 20.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

## Usage

Use this object to track changes for a task record.

## TaskPriority

Represents the importance or urgency of a Task, such as High, Normal, or Low.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Usage

This object represents a value in the task priority picklist. The task priority picklist provides additional information about the importance of a Task, such as whether a given priority value represents a high priority. Your client application can query on this object to retrieve the set of values in the task priority picklist, and then use that information while processing Task objects to determine more information about a given task. For example, the application could test whether a given Task is high priority based on its `Priority` value and the value of the `IsHighPriority` in the associated TaskPriority object.

[Object Basics](#)

# TaskRelation

Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

TaskRelation is only available if you've enabled Shared Activities in your organization.

TaskRelation allows the following relationships:

- A task can be related to one lead or up to 50 contacts.
- A task can also be related to one account, asset, campaign, case, contract, opportunity, product, solution, or custom object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `queryAll()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AccountId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Indicates the Account ID of the relation.<br/>For information on IDs, see <a href="#">ID Field Type</a>.</p>                                                                                                                                                                                                                                                                                                                                                             |
| IsDeleted  | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether a task has been deleted; label is <b>Deleted</b>. When a TaskRelation record is deleted, it isn't moved to the Recycle Bin and can't be undeleted, unless the record was cascade-deleted when the parent object was deleted. Don't use the <code>IsDeleted</code> field to detect deleted records in SOQL queries or <code>queryAll()</code> calls on directly deleted relation records. Instead, use the call <code>getDeleted()</code>.</p> |
| IsWhat     | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Field Name | Details                                                                                                                                                                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p><b>Description</b></p> <p>Indicates whether the relation is an Account, Opportunity, Campaign, Case, other standard object, or a custom object. Value is <code>false</code> if <code>RelationId</code> is a contact or lead and <code>true</code> otherwise.</p>                                                             |
| RelationId | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>Indicates the <code>whatId</code> or <code>whoId</code> in the relationship. For more information, see <a href="#">Task</a>.</p> <p>For information on IDs, see <a href="#">ID Field Type</a>.</p> |
| TaskId     | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>Represents the ID of the associated Task.</p> <p>For information on IDs, see <a href="#">ID Field Type</a>.</p>                                                                                    |

## Usage

### See contacts associated with a task

```
public void queryWhosOfTaskSample() {
    String soqlQuery = "SELECT Id, Subject, (SELECT RelationId, Relation.Name, IsWhat
from TaskRelations WHERE isWhat = false) FROM Task WHERE Id = '00T x00000005OKEN'";
    QueryResult qResult = null;
    try {
        qResult = connection.query(soqlQuery);
        TaskRelation relation1 =
(TaskRelation)qResult.getRecords()[0].getTaskRelations().getRecords()[0];
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

| MasterLabel | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort                                                                                                                                                                                                                      |

| Field     | Details                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <b>Description</b><br>Master label for this task status value. This display value is the internal label that does not get translated. Limit: 255 characters.                                                                                                                  |
| SortOrder | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Number used to sort this value in the task status picklist. These numbers are not guaranteed to be sequential, as some previous task status values might have been deleted. |

## Usage

This object represents a value in the task status picklist. The task status picklist provides additional information about the status of a Task, such as whether a given status value represents an open or closed task. Your client application can query this object to retrieve the set of values in the task status picklist, and then use that information while processing Task records to determine more information about a given task. For example, the application could test whether a given task is open or closed based on the Task `Status` value and the value of the `IsClosed` property in the associated TaskStatus record.

| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Restricted picklist</p> <p><b>Description</b><br/>Defines the visibility of a tag.<br/><br/>Valid values:</p> <ul style="list-style-type: none"> <li>• <b>Public</b>—The tag can be viewed and manipulated by all users in an organization.</li> <li>• <b>Personal</b>—The tag can be viewed or manipulated only by a user with a matching OwnerId.</li> </ul> |

## Usage

TaskTag stores the relationship between its parent TagDefinition and the Task being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## TaskWhoRelation

Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

This derived object is a filtered version of the [TaskRelation](#) on page 1591 object; that is, IsParent is *true* and IsWhat is *false*. It doesn't represent relationships to accounts, opportunities, or other objects.

TaskWhoRelation allows a variable number of relationships: one lead or up to 50 contacts. Available only if you've enabled Shared Activities for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                                                       |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RelationId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Indicates the ID of the contacts or lead related to the task.</p>       |
| TaskId     | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Indicates the ID of the task.</p>                                       |
| Type       | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Indicates whether the person related to the task is a lead or contact.</p> |

## Usage

### Apex example that queries contacts associated with a task

```
public void queryWhosOfTaskSample() {
    String soqlQuery = "SELECT Id, Subject, (SELECT RelationId, Relation.Name, IsWhat
from TaskWhoRelations) FROM Task WHERE Id = '00Tx0000005OKEN'";
    QueryResult qResult = null;
    try {
        qResult = connection.query(soqlQuery);
        TaskWhoRelation relation1 =
(TaskWhoRelation)qResult.getRecords()[0].getTaskWhoRelations().getRecords()[0];
    } catch (ConnectionException ce) {
```

```
ce.printStackTrace();
    }
}
```

# TenantSecret

This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

You can rotate the tenant secret once every four hours in a sandbox organization or every 24 hours in production organizations.

 **Note:** This information is about Shield Platform Encryption and not Classic Encryption.

## Supported Calls

`create()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name  | Details                                                                                                                                                                  |

Data encrypted with this key when it was active can no longer be decrypted. Files and attachments encrypted with this key can no longer be downloaded.</p> |
| Version    | <b>Type</b><br>int <b>Properties</b><br>Filter, Group, idLookup, Sort <b>Description</b><br>The version number of this secret. The version number is unique within your organization.                                                                                                                                                                                                                                                                                                                                         |

## Usage

Use this object to create or update your organization-specific tenant secret. For example, you can build an automated tenant secret creation and activation solution similar to the following.

1. Start by creating an Apex class to create the new tenant secret.

```
global class CreateNewSecret implements Schedulable {
    global void execute(SchedulableContext SC) {
        TenantSecret k = new TenantSecret ();
        k.description = 'Created new secret from scheduled job';
        insert k;
    }
}
```

2. Schedule the Apex class to run at the specified interval.

This Apex code only needs to be run a single time to schedule the job. This code runs the job every 90 days.

```
CreateNewSecret secret = new CreateNewSecret();
String schedule = '0 0 0 1 JAN,APR,JUL,OCT ?';
String jobID = system.schedule('Automated secret creation and activation', schedule,
secret);
```

3. Validate that the job is scheduled.
4. Validate that tenant secrets are created after the job is run.

Here is an example of destroying a tenant secret.

 **Warning:** Your tenant secret is unique to your organization and to the specific data to which it applies. Once you destroy a tenant secret, related data is not accessible unless you previously exported the key and then import the key back into Salesforce.

```
TenantSecret secret = [SELECT Id FROM TenantSecret WHERE Version = 2];
secret.SecretValue = NULL;
update secret;
```

## Territory

Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                  |

| DeveloperName           | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization. Corresponds to <b>Territory Name</b> in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

Label is <b>Confine Opportunity Assignment</b>.</p> |

## Usage

Use the Territory object to query your organization’s territory hierarchy. Use it to obtain valid territory IDs when querying or modifying records associated with territories.

SEE ALSO:

- [AccountTerritoryAssignmentRule](#)
- [AccountTerritoryAssignmentRuleItem](#)
- [UserTerritory](#)

## Territory2

---

Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization’s sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

## Fields

# Territory2Model

Represents a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization's sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

# Territory2ModelHistory

Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name        | Details                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field             | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The name of the field whose value was changed.</p> |
| NewValue          | <p><b>Type</b><br/>anyType</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The new value of the changed field.</p>                                       |
| OldValue          | <p><b>Type</b><br/>anyType</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The previous value of the changed field.</p>                                  |
| Territory2ModelId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the territory model whose history is tracked.</p>            |

## Usage

This object is automatically generated whenever any field value changes on a territory model record. Use this object it to identify those changes.

## Territory2Type

Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

All users (including standard users) have access to this object in the user interface

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Priority    | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, SortUpdate</p> <p><b>Description</b><br/>Required. Used for Filter-Based Opportunity Territory Assignment (Pilot in Spring '15 / API version 33). Lets you specify a priority for a territory type. For opportunity assignments, the filter examines all territories assigned to the account that the opportunity is assigned to. The account-assigned territory whose territory type priority is highest is then assigned to the opportunity. The <code>priority</code> field value on each territory type must be unique. Further, if there are multiple territories with the same territory type (and therefore the same priority) assigned to the account, no territory is not assigned to the opportunity.</p> |

## TestSuiteMembership

Represents a class in an ApexTestSuite. This object is available in API version 36.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name      | Description                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ApexClassId     | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The Apex class whose tests are to be executed.      |
| ApexTestSuiteId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The test suite to which the Apex class is assigned. |

## Usage

Insert a TestSuiteMembership object using an API call to associate an Apex class with an ApexTestSuite object. (ApexTestSuite and TestSuiteMembership aren't editable through Apex DML.) To remove the class from the test suite, delete the TestSuiteMembership object. If you delete an Apex test class or test suite, all TestSuiteMembership objects that contain that class or suite are deleted.

The following SOQL query returns the membership object that relates this Apex class to this test suite.

```
SELECT Id FROM TestSuiteMembership WHERE ApexClassId = '01pD0000000Fhy9IAC'
AND ApexTestSuiteId = '05FD00000004CDBMA2'
```

[ApexTestSuite](#)

## ThirdPartyAccountLink

Represents the list of external users who authenticated using an Auth. Provider. This object is available in API version 32.0 and later.

A list of third-party account links is generated when users of an organization authenticate using an external Auth. Provider. Use this object to list and revoke a given user's social sign-on connections (such as Facebook®).

## Supported Calls

`describeSObjects()`, `query()`

## Fields

| Field Name       | Details                                                                                                                                                                                                                                                                                          |

## Usage

Use this object makes to build custom screens to manage a user's third-party account links.

Administrators (with the "Manage Users" permission) querying this object can see all the links for all users in the organization. Without the "Manage Users" permission, users can only retrieve thier own links. A user may not have access to the `SsoProvider` value (the foreign key). In this case, use the `SsoProviderName` to render the name of the provider for the associated link.

Use the Apex method `Auth.AuthToken.revokeAccess()` to revoke a link.

In API version 34.0 and later, this object was enhanced to help manage high instance counts. A `query()` call returns up to 500 rows. A `queryMore()` call returns 500 more, up to 2500 total. No more records are returned after 2500. To make sure you don't miss any records, issue a `COUNT()` query in a `SELECT` clause for `ThirdPartyAccountLink`. This gives you the total number of records. If there are more than 2500 records, divide your query by filtering on fields, like `UserId`, to return subsets of less than 2500 records.

# Topic

Represents a topic on a Chatter post or record. This object is available in API version 28.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this object to query a specific topic or to get a list of all topics, even those used solely in private groups and on records, and the number of people talking about them.

Use this object to create, edit, or delete topics. To create a topic, you must have the "Create Topics" permission. To edit a topic, you must have the "Edit Topics" permission. To delete a topic, you must have the "Delete Topics" or "Modify All Data" permission.

## TopicAssignment

---

Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

Administrators must enable topics for objects before users can add topics to records of that object type. Topics for most objects are available in API version 30.0 and later. Topics for ContentDocument are available in API version 37.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`

| TopicId    | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>Identifier of the topic.</p>                                                                                                                                                                                                                                                                                                                             |

## Usage

Use this object to query the assignments of topics to feed items, records, or files. To assign or remove topics, you must have the “Assign Topics” permission.

In SOQL `SELECT` syntax, this object supports nested semi-joins, allowing queries on Knowledge articles assigned to specific topics. For example:

```
SELECT parentId FROM KnowledgeArticleViewStat
WHERE parentId in (SELECT KnowledgeArticleId FROM KnowledgeArticleVersion
WHERE publishStatus = 'Online' AND language = 'en_US'
AND Id in (select EntityId from TopicAssignment where TopicId ='0T0xx0000000xxx'))
```

No SOQL limit if logged-in user has “View All Data” permission. If not, do one of the following:

- Specify a `LIMIT` clause of 1,100 records or fewer.
- Filter on `Id` or `Entity` when using a `WHERE` clause with “=”.

SEE ALSO:

[Topic](#)  
[FeedItem](#)

# TopicFeed

Represents a single feed item on a topic page. This object is available in API version 29.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

## TopicLocalization—Beta

Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in communities. This object is available in API version 33.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Users with the Translation Workbench enabled can view topic translations, but the “Customize Application,” “Manage Translation,” or “Manage Categories” permission is required to create or update them.

## Fields

## TwoFactorInfo

Stores a user's secret for two-factor operations. Use this object when customizing two-factor authentication in your organization. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

You need the "Manage Two-Factor Authentication in API" permission to create or update this object.

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                           |

## Usage

### Query invitees who have not responded to an invitation to an event

```
SELECT eventId, type, response FROM UndecidedEventRelation WHERE
eventId='00UTD0000000ZH5LA'
```

[DeclinedEventRelation](#)

## User

Represents a user in your organization.

## Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

- To create or update a User record, you must have the “Manage Internal Users” permission. Additionally, if the user is a Customer Portal user, you must have the “Edit Self-Service Users” permission, and if the user is a partner portal user, you must have the “Manage External Users” permission.

- If [Communities](#) is enabled in your organization, to create or update external users for Customer Portal, partner portal, or Communities, you must also have the “Manage External Users” permission.
- Information in hidden fields in a user's profile is not searchable by external users (with a portal profile) in a community. For example, if a user in a community has a hidden email address and an external user searches for it, the user record is not returned in the search results. Hidden field values are also not returned when external users perform searches on non-hidden fields. So if an external user searches for a user's name (cannot be hidden), any hidden field values associated with the user record (for example, a hidden email address) are not returned in the search results.

Internal users from your organization who belong to the same community, however, can both search for and view hidden field values in search results.

- When requested by portal users, queries that look up to the User object, such as `owner.name` or `owner.email` might not return values when the portal user making the request doesn't have Read access to the User record being queried.

The behavior depends on the number of domains associated with the lookup field. If the object can look up to more than one domain, `owner.name` returns a value, but other detail fields don't. For example, Case owner can look up to the User or Queue objects. In this case, portal users can see only the value of `owner.name`. Other User detail fields, such as `owner.email` or `owner.phone` don't return a value.

If the object can look up to only a single domain, such as Account owner, then no detail fields return values, including `owner.name`.

- Changing ownership of a record by updating its `OwnerId` field requires the user making the change to have both the “Transfer Record” permission and Read access to the User record of the new record owner.

## Fields

| Field          | Details                                                                                                                                                                                                                                                 |

Acceptable values are numbers between -90 and 90 with up to 15 decimal places.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>LocaleSidKey</code> | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b></p> <p>Required. This field is a restricted picklist field. The value of the field affects formatting and parsing of values, especially numeric values, in the user interface. It does not affect the API.</p> <p>The field values are named according to the language, and country if necessary, using two-letter ISO codes. The set of names is based on the ISO standard. It can often be more convenient to manually set a user's locale in the user interface, and then use that value for inserting or updating other users via the API.</p> |

Contact Salesforce Customer Support to enable this field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| TimeZoneSidKey                     | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort, Update<br><b>Description</b><br>Required. This field is a restricted picklist field. A User time zone affects the offset used when displaying or entering times in the user interface. However, the API does not use a User time zone when querying or setting values.<br><br>Values for this field are named using region and key city, according to ISO standards. It can often be more convenient to manually set one User time zone in the user interface, and then use that value for creating or updating other User records via the API.             |

If you are a Professional Edition customer and purchased Wireless Edition prior to November 7, 2005 or are an Enterprise Edition customer who has signed or renewed your Salesforce contract prior to November 7, 2005, you may continue using Wireless Edition through the end of your existing contract term.</p> |

## Usage

Use this object to query information about users and to provision and modify users in your organization. Unlike other objects, the records in the User table represent actual users—not data owned by users. Any user can query or describe User records.

For example, the following SOQL code finds users with a particular user role.

```
SELECT Id, Username
FROM User
WHERE UserRoleId='00ED0000000xicT'
```

Each portal user is associated with a portal account. A portal account can have a maximum of three portal roles (Executive, Manager, and User). You can select the default number of roles to be created from the user interface. The role hierarchy is maintained when you insert and delete portal roles, and roles are created bottom-up. Deleting the User role causes the Manager role to be renamed to User role. Deleting both the Executive and User roles causes the Manager role to be renamed to User role. Before deleting a role, you must assign users under that role to another role.

## Deactivate Users

You can't delete a user in the user interface or the API. You can deactivate a user in the user interface; and you can deactivate or disable a Customer Portal or partner portal user in the user interface or the API. Because users can never be deleted, we recommend that you exercise caution when creating them.

If you deactivate a user, any EntitySubscription where the user is associated with the ParentId or SubscriberId field, meaning all subscriptions both to and from the user, are soft deleted. If the user is reactivated, the subscriptions are restored. However, if you deactivate multiple users at once and these users follow each other, their subscriptions are hard deleted. In this case, the user-to-user EntitySubscription is deleted twice (double deleted). Such subscriptions can't be restored upon user reactivation.

## Passwords

For security reasons, you can't query User passwords via the API or the user interface. However, the API allows you to set and "reset" User passwords using the `setPassword()` and `resetPassword()` calls. The password lockout status and the ability to reset the User locked-out status is not available via the API. You must check and reset the User password lockout status using the user interface.

SEE ALSO:

- UserRole
- UserLicense

## UserAccountTeamMember

Represents a User on the default account team of another User.  
See also OpportunityTeamMember, which represents a User on the opportunity team of an Opportunity

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

## Usage

This object is available only in organizations that have enabled the account teams functionality, which can be done using the user interface.

If you attempt to create a record that matches an existing record, the create call updates any modified fields and returns the existing record.

You can set up a User record so the default account team includes the others who typically work with them on accounts.

## UserAppMenuCustomization

Represents an individual user's settings for items in the Force.com app menu or App Launcher. This object is available in API version 35.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                 |

For example, a menu item with a sort order value of 5 will appear between items with sort order values of 3 and 9. |

## Usage

See the AppMenuItem object for the organization-wide default settings. This object contains the fields representing any changes the user made to the menu.

## UserAppMenuCustomizationShare

Represents a sharing entry on a UserAppMenuCustomization record. This object is available in API version 35.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

# UserAppMenuItem

---

Represents the organization-wide settings for items in the Force.com app menu or App Launcher that the requesting user has access to in Setup. This object is available in API version 35.0 and later.

## Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `search()`

## Fields

| Field Name    | Details                                                                                                                                                                        |

|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UserSortOrder | <p><b>Type</b></p> <p>int</p> <p><b>Properties</b></p> <p>Filter, Group, Nillable, Sort</p> <p><b>Description</b></p> <p>The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 will appear between items with sort order values of 3 and 9.</p> <p>This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use:</p> <pre>SELECT ApplicationId,SortOrder,UserSortOrder FROM AppMenuItem order by userSortOrder NULLS LAST, sortOrder NULLS LAST</pre> |

## Usage

See the AppMenuItem object for the organization-wide default settings This object contains the fields the requesting user has permission to see.

## UserConfigTransferButton

Represents the association between a Live Agent configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name       | Details                                                                                                                                                                                                      |

## UserConfigTransferSkill

Represents the association between a Live Agent configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name           | Details                                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LiveChatUserConfigId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the Live Agent configuration; agents associated with this configuration can transfer chats to the chat button indicated by the <code>LiveChatButtonId</code> . |
| SkillId              | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort<br><b>Description</b><br>The ID of the skill group that agents can transfer chats to.                                                                                                   |

## UserFeed

Represents a single feed item in the feed displayed on a Chatter user profile feed. A user profile feed shows changes to a user record for fields that are tracked in feeds, and posts and comments about the record. This object is available in API version 18.0 and later.

A user feed shows recent changes to a user record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to users in the organization.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

If you use the `FeedComment` object to comment on a user record, the user can delete the comment. For example, if John Smith makes a comment about Sasha Jones, Sasha can delete the comment.

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the User object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                |

|       | <ul style="list-style-type: none"> <li>On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.</li> </ul> |

## Usage

Use this object to track changes for a user record.

SEE ALSO:

[User](#)

[EntitySubscription](#)

[NewsFeed](#)

[UserProfileFeed](#)

## UserLicense

Represents a user license in your organization. A user license entitles a user to specific functionality and determines the profiles and permission sets available to the user.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field                             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Usage

Users with the “View Setup and Configuration” permission can use the UserLicense object to view the set of currently defined user licenses in your organization.

The UserLicense object is currently used by bulk user creation to determine the user license to which each profile and permission set belongs. For example, if you use the API to create portal users and you want to know which profile belongs to each portal user license, you can query this object for each profile and check the `LicenseDefinitionKey` to identify the associated user license.

[Profile](#)

## UserLogin

Represents the settings that affect a user’s ability to log into an organization. To access this object, you need the `UserPermissions.ManageUsers` permission. This object is available in API version 29.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name       | Details                                                                                                                                                                                                                                                                                                                           |

| IsFrozen         | <b>Type</b><br>boolean<br><b>Properties</b><br>Defaulted on create, Filter, Group, Sort, Update<br><b>Description</b><br>If <code>true</code> , the user account associated with this object is frozen.                                                                                                                           |
| IsPasswordLocked | <b>Type</b><br>boolean<br><b>Properties</b><br>Defaulted on create, Filter, Group, Sort, Update<br><b>Description</b><br>If <code>true</code> , the user account associated with this object is locked because of too many login failures. From the API, you can set this field to <code>false</code> , but not <code>true</code> |
| UserId           | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>ID of the associated user account. This field can't be updated.                                                                                                                                                           |

## Usage

To query for all frozen users in your organization:

```
SELECT Id, UserId
FROM UserLogin
WHERE IsFrozen = true
```

## UserMembershipSharingRule

Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Fields

| Description   | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID representing the source group.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Name          | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, idLookup, Sort, Update</p> <p><b>Description</b><br/>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to <b>Label</b> on the user interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Field           | Details                                                                                                                                                                                                                                                                                                       |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UserAccessLevel | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>A value that represents the type of sharing being allowed. The possible values are:</p> <ul style="list-style-type: none"><li>• Read</li><li>• Edit</li></ul> |
| UserOrGroupId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID representing the target group being given access.</p>                                                                                                                              |

## Usage

Use this object to manage sharing rules for user records. Source and target groups can include internal users, portal users, Chatter or Chatter External users.

## UserPackageLicense

Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name       | Details                                                                                                                                                                                        |

| PackageLicenseId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The 18-character Globally Unique ID (GUID) that identifies the package license</p> |

| Field Name | Details                                                                                                                                            |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| UserId     | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The User ID of the user licensed to use this package |

## Usage

Use this object, in conjunction with PackageLicense, to provide users access to a managed package installed in your organization.

## UserPreference

Represents a functional preference for a specific user in your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preference | <b>Type</b><br>picklist<br><b>Properties</b><br>Defaulted on create, Filter, Group, Restricted picklist, Sort<br><b>Description</b><br>The name of the user preference. Supported values are Event Reminder Default Lead Time, Task Reminder Default Time, Prevent Logs on Load, Autocomplete Apex After Key Press, Visualforce Viewstate Inspector, Forecasting Displayed Type, Editor Theme, Editor Font Size, Pinned Folders, Enable Query Plan, and Email Transport Type. These values are related to UserPreferencesEventRemindersCheckboxDefault and UserPreferencesTaskRemindersCheckboxDefault on the User object. Enable New Open Dialog is reserved for future use. |

Label is <b>User ID</b>.</p>                                                                                                                                                                                                                                                                                            |
| Value  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>The value of the user preference. For <b>Event Reminder Default Lead Time</b>, the values are increasing intervals of time from 0 minutes to 2 days. For <b>Task Reminder Default Time</b>, the values are half-hours from 12:00 AM to 11:30 PM. To view the respective sets of values, access the Reminders in your personal settings in the online application.</p> |

## Usage

Use this object to query the set of currently configured user preferences in your organization. In your client application, you can query the User object to obtain valid User IDs in order to access the UserPreference object.

All users can invoke `query()` or `describeObjects()` with this object.

## UserProfile

Represents a Chatter user profile.

**Note:** This object has been deprecated as of API version 32.0. Use the [User](#) object to query information about a user in API version 32.0 and later.

## Supported Calls

`describeLayout()`, `query()`, `retrieve()`

## Special Access Rules

- Information in hidden fields in a user's profile is not searchable by external users (with a portal profile) in a community. For example, if a user in a community has a hidden email address and an external user searches for it, the user record is not returned in the search results. Hidden field values are also not returned when external users perform searches on non-hidden fields. So if an external user searches for a user's name (cannot be hidden), any hidden field values associated with the user record (for example, a hidden email address) are not returned in the search results.

Internal users from your organization who belong to the same community, however, can both search for and view hidden field values in search results.

- Any fields that have been restricted in visibility will be returned empty, whether or not they are, and will not be removed from the field listing.

## Fields

The default value is <code>false</code>. This field is available in API version 26.0 and later.</p> |
| UserPreferencesTaskRemindersCheckboxDefault | <p><b>Type</b></p> <p>boolean</p> <p><b>Properties</b></p> <p>Filter</p> <p><b>Description</b></p> <p>When <code>true</code>, a reminder popup is automatically set on the user's tasks. Corresponds to the <code>By default, set reminder on Tasks to...</code> checkbox on the Reminders page in the user interface. This field is related to UserPreference and customizing activity reminders.</p>                                                                                                                                                                                                            |

## Usage

Use this object to query Chatter—related information about the user. While the User object contains all the information about a user and is historically tied to user management, UserProfile is a read-only entity that contains the information that is relevant in a Chatter context.

## UserProfileFeed

Represents a user profile feed, which tracks all actions by a user on records that can be tracked in a feed. This feed is displayed on the user profile page.

UserProfileFeed is available in API version 18.0 through API 26.0. In API version 27.0 and later, UserProfileFeed is no longer available in the SOAP API. Use the Chatter REST API to access UserProfileFeed.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"

- “Moderate Chatter”

**Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

- “Manage Unlisted Groups”

Only users with this permission can delete items in unlisted groups.

## Fields

| Field              | Details                                                                                                                                                                                                                                                                      |

This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> <p><code>Visibility</code> can have the following values:</p> <ul style="list-style-type: none"> <li>• <code>AllUsers</code>—The feed item is available to all users who have permission to see the feed item.</li> <li>• <code>InternalUsers</code>—The feed item is available to internal users only.</li> </ul> <p>Note the following exceptions for <code>Visibility</code>:</p> <ul style="list-style-type: none"> <li>• For record posts, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default.</li> <li>• External users can set <code>Visibility</code> only to <code>AllUsers</code>.</li> <li>• On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.</li> </ul> |

## Usage

Use this object to query and retrieve record changes tracked in a user profile feed. Note the following when working with user profile feeds:

- This object is read only in the API.
- Queries retrieve feed items that include mentions from other users.
- Use this object to query and retrieve lead feed items that were associated with a converted lead record.

- Include a `WITH` clause and specify the `UserId` of the user whose profile you want to query. The `WITH` clause must come after a `WHERE` clause.

Users that do not have the “View All Data” permission have the following limitations when querying records:

- Must specify a `LIMIT` clause and the limit must be less than or equal to 1000.
- Can include a `WHERE` clause that references `UserProfileFeed` fields, but cannot include references to fields in related objects. For example, you can filter by `CreatedDate` or `ParentId`, but not by `Parent.Name`.
- Can include an `ORDER BY` clause that references `UserProfileFeed` fields, but cannot include references to fields in related objects. For example, you can `ORDER BY CreatedDate` or `ParentId`, but not by `Parent.Name`.

 **Tip:** To query for the most recent feed items, you should `ORDER BY CreatedDate DESC, Id DESC`.

Note the following SOQL restrictions.

- No SOQL limit if logged-in user has “View All Data” permission. If not, specify a `LIMIT` clause of 1,000 records or fewer.
- SOQL `ORDER BY` on fields using relationships is not available. Use `ORDER BY` on fields on the root object in the SOQL query.

## UserProvAccount

---

Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IsKnownLink | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Setting the <code>IsKnownLink</code> value to <code>true</code> implies the administrator or another user is managing the relationship between the Salesforce user account and the third-party user account, manually. This field helps Salesforce coordinate updates between the <code>UserProvAccountStaging</code> object and the <code>UserProvAccount</code> object while committing staged accounts. Typically, for a matching user account (the same <code>ExternalUserId</code> for both objects), Salesforce copies the values from the <code>UserProvAccountStaging</code> object to the <code>UserProvAccount</code> object.</p> <p>However, if Salesforce encounters a <code>UserProvAccountStaging</code> object with a matching <code>ExternalUserId</code> but different <code>LinkState</code> and <code>SalesforceUserId</code> values during this process, Salesforce checks the <code>UserProvAccount IsKnownLink</code> value. If the <code>IsKnownLink</code> value is <code>true</code>, Salesforce doesn't copy the <code>LinkState</code> and <code>SalesforceUserId</code> values from the <code>UserProvAccountStaging</code> object to the <code>UserProvAccount</code> object (all other values are copied).</p> <p>The default is <code>false</code>, meaning Salesforce manages the account relationship.</p> |
| LinkState   | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The state of the current connection between the user account in the Salesforce organization and the associated user account in the target system. ## UserProvAccountStaging

Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the UserProvAccount object when you click the button to collect and analyze accounts on the target system.

User provisioning links a Salesforce user account with an account in a third-party (target) system. To configure user provisioning, you use a User Provisioning Wizard that guides you through the setup process. As you enter values about account details in the wizard, these values are stored in this object until you click the button to collect and analyze accounts on the target system. The general user provisioning configuration details are stored in the UserProvisioningConfig object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Usage

When committing fields from a `UserProvAccountStaging` to a `UserProvAccount` object, Salesforce looks up the `UserProvAccount` record where `UserProvAccountStaging.ExternalUserId = UserProvAccount.ExternalUserId`.

- If an `ExternalUserId` doesn't match an existing account, Salesforce creates a `UserProvAccount` record based on the `UserProvAccountStaging` record.
- If an `ExternalUserId` matches, then Salesforce checks the `UserProvAccount.isKnownLink` value, and does the following.
  - If `UserProvAccount.IsKnownLink = true`, Salesforce copies the `UserProvAccountStaging` values to the `UserProvAccount` object, except for the `ExternalUserId` and `LinkState` values.
  - If `UserProvAccount.IsKnownLink = false`, Salesforce copies all of the `UserProvAccountStaging` values to the `UserProvAccount` object.

## UserProvMockTarget

Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

During the user provisioning process, user account information is sent to a third-party system to create, update or delete a user account on that system. While configuring user provisioning for your organization using a flow or Apex plugin, you can use this object to confirm the associated flow or plugin is sending the desired data. After confirming the correct fields and values, you can update the flow or Apex plugin to send the data to the target system.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## UserProvisioningConfig

Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

# UserProvisioningLog

Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

Some messages for this object are generated automatically by Salesforce, and others are created by the developers of the user provisioning plugin. Developers can use this object to log messages from the flow associated with the user provisioning process or the Apex plugin that calls the target system. Administrators can use this object as a log of all user provisioning activity and as a troubleshooting tool if desired behavior is missing. This object is available as a custom report type.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

## UserProvisioningRequest

Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

A UserProvisioningRequest (UPR) record is created for each provisioning action for each user, and for each connected app available to the user. For example, if a user has two connected apps, and a provisioning request is sent to two different services to create an account for the user, Salesforce creates two UPR objects. Provisioning actions include creating, updating, or deleting a user account.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field          | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage

The `State` value changes during a reconciliation process (`Operation = Reconcile`) to gather and compare users on the third-party system to Salesforce users. Typically, when a UPR entry is first created, it has a `State` value of `New`. When a collection process is triggered, the `State` transitions to `Collecting` until that process is finished and the `State` is `Collected`. When an analyze process is triggered, the `State` transitions to `Analyzing` until that process is finished and the `State` is `Analyzed`. If a process commits the request, the `State` then transitions to `Committing`, and the properties move from the

UserProvAccountStaging object to the UserProvAccount object. When those properties are saved in the UserProvAccount object, the `State` transitions to `Completed`.

However, the `State` does not necessarily start at `New`. For example, UserProvAccountStaging entries can be inserted programmatically. If a process is initiated that triggers linking these rows to accounts on the third-party service, a UPR entry could start with the `Analyzing` `State`.

Also, the `State` cannot go backwards from an active task. For example, a successful `Analyzing` `State` must progress to `Analyzed`; unless the active process fails, and then the `State` must change to `Failed`. Certain `State` transitions cannot be made programmatically and must be triggered by Salesforce.

The following table shows the `State` transitions that can occur for each `State` value. Each row corresponds to a current `State` value and each column corresponds to a new `State` after a potential transition.

-  — the transition to this value is not allowed.
-  — the transition to this value is allowed.
-  — only Salesforce can transition the `State` to this value.

|                    | New                                                                                 | Requested                                                                           | Collecting                                                                          | Collected                                                                           | Analyzing                                                                           | Analyzed                                                                            | Committing                                                                          | Completed                                                                             | Failed                                                                                | Retried                                                                               | Manually Completed                                                                    |

## State Values for Managing Provisioning Failures

The `state` value changes to `Failed` for several reasons, such as network outages, session timeouts, permissions issues, and record locks. The `Failed` state can transition to either `Retried` or `Manually Completed` to indicate what action was taken to address the failure. Actions can include correcting the root cause of the failure and requesting that the provisioning engine retry the UPR. Or, it can be completing the action against the target manually. Each UPR is an independent transaction and it's possible the retry causes a failure with a different root cause. So it's hard to distinguish failed events that you addressed from the ones that require more action.

If you tried to correct the cause of the failure and requested the provisioning engine to retry the UPR, you can mark the failed UPR `Retried`. Or, if the action against the target was completed manually, you can mark it `Manually Completed`.

When a retry event is created, the failed UPR is cloned, and resubmitted. The `ParentID` field contains a lookup to the failed UPR to use to clone the new UPR. The `Retry Count` field contains the number of retry attempts that were performed on a UPR. With the `Retry Count` field, you can add custom business logic like "Retry 5 times then stop and notify your admin."

## UserProvisioningRequestOwnerSharingRule

---

Represents a rule for sharing a `UserProvisioningRequest` object with users other than the owner. This object is available in API version 34.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

| Field Name                 | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## UserProvisioningRequestShare

Represents a sharing entry on a UserProvisioningRequest record. This object is available in API version 34.0 and later.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Usage

Use this object to query a user's access to records. You can't create, delete, or update any records using this object.

Up to 200 record IDs can be queried. You can include an `ORDER BY` clause for any field that is being selected in the query.

The following sample query returns the records, whether the queried user has read and transfer access to each record, and the user's maximum access level to each record.

```
SELECT RecordId, HasReadAccess, HasTransferAccess, MaxAccessLevel
  FROM UserRecordAccess
 WHERE UserId = [single ID]
 AND RecordId = [single ID]           //or Record IN [list of IDs]
```

The following query returns the records to which a queried user has read access.

```
SELECT RecordId
  FROM UserRecordAccess
 WHERE UserId = [single ID]
 AND RecordId = [single ID]           //or Record IN [list of IDs]
 AND HasReadAccess = true
```

Using API version 30.0 and later, `UserRecordAccess` is a foreign key on the records. You can't filter by or provide the `UserId` or `RecordId` fields when using this object as a lookup or foreign key. The previous sample queries can be run as:

```
SELECT Id, Name, UserRecordAccess.HasReadAccess, UserRecordAccess.HasTransferAccess,
       UserRecordAccess.MaxAccessLevel
  FROM Account
```

```
SELECT Id, Name, UserRecordAccess.HasReadAccess
  FROM Account
```

SOQL restrictions for API version 29.0 and earlier:

- When the running user is querying a user's access to a set of records, records that the running user does not have read access to are filtered out of the results.
- When filtering by `UserId` and `RecordId` only, you must use `SELECT RecordId` and optionally one or more of the access level fields: `HasReadAccess`, `HasEditAccess`, `HasDeleteAccess`, `HasTransferAccess`, and `HasAllAccess`. You may include `MaxAccessLevel`.
- When filtering by `UserId`, `RecordId`, and an access level field, you must use `SELECT RecordId` only.

## UserRole

Represents a user role in your organization.

**Note:** This object was called "Role" in previous versions of the API documentation.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| ContactAccessForAccountOwner | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The contact access level for the account owner.</p> <p> <b>Note:</b> When DefaultContactAccess is set to Controlled by Parent, you can't create or update this field.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| DeveloperName                | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Role Name</b> in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |

## Usage

Use this object to query the set of currently configured user roles in your organization. Use it in your client application to obtain valid UserRole IDs to use when querying or modifying a User record.

All users have access to invoke query or describe this object. If your client application logs in with the “Manage Users” permission, it can query, create, update, or delete UserRole records.

 **Note:** You can’t update any field for a portal role.

For example, the following code finds all roles that are not assigned to any users.

```
SELECT Id, Name, DeveloperName,  
FROM UserRole  
WHERE Id NOT IN (SELECT UserRoleId  
                  FROM User  
                  WHERE UserRoleId != '0000000000000000')
```

## UserShare

Represents a sharing entry on a user record. This object is available in API version 26.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage

This object allows you to determine which users and groups can view or edit User records owned by other users.

## UserTeamMember

Represents a single User on the default opportunity team of another User.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- This object is available only in organizations that have enabled the team selling functionality.
- Customer Portal users can't access this object.

## Usage

If you attempt to create a record that matches an existing record, the create request updates any modified fields and returns the existing record.

Users can set up their default opportunity team to include other users that typically work with them on opportunities.

## UserTerritory

Represents a User who has been assigned to a Territory.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Only available if territory management has been enabled for your organization.
- Customer Portal users can't access this object.

## Fields

| Field                    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Usage

If a user is inactive in a territory, and the opportunities they own that are associated with the territory are all closed, then the user is not returned.

SEE ALSO:

[Territory](#)

[AccountTerritoryAssignmentRule](#)

[AccountTerritoryAssignmentRuleItem](#)

## UserTerritory2Association

Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization's sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

Available values are:</p> <ul style="list-style-type: none"> <li>AutomatedSuccess—Salesforce Authenticator approved the request for access because the request came from a trusted location. After users enable location services in Salesforce Authenticator, they can designate trusted locations. When a user trusts a location for a particular activity, such as logging in from a recognized device, that activity is approved from the trusted location for as long as the location is trusted.</li> <li>Denied—The user denied the approval request in the authenticator app, such as Salesforce Authenticator.</li> <li>FailedGeneralError—An error caused by something other than an invalid verification code, too many verification attempts, or authenticator app connectivity.</li> <li>FailedInvalidCode—The user provided an invalid verification code.</li> </ul> |

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <ul style="list-style-type: none"> <li>FailedTooManyAttempts—The user attempted to verify identity too many times. For example, the user entered an invalid verification code repeatedly.</li> <li>Initiated—Salesforce initiated identity verification but hasn't yet challenged the user.</li> <li>InProgress—Salesforce challenged the user to verify identity and is waiting for the user to respond or for Salesforce Authenticator to send an automated response.</li> <li>RecoverableError—Salesforce can't reach the authenticator app to verify identity, but will retry.</li> <li>ReportedDenied—The user denied the approval request in the authenticator app, such as Salesforce Authenticator, and also flagged the approval request to report to an administrator.</li> <li>Succeeded—The user's identity was verified.</li> </ul>                                                                                                                                                                                                                                |
| UserId             | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the user verifying identity.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| VerificationMethod | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The method by which the user attempted to verify identity in the verification event. The label is Method. Available values are:</p> <ul style="list-style-type: none"> <li>Email—Salesforce sent an email with a verification code to the address associated with the user's account.</li> <li>Hotp—Reserved for future use.</li> <li>SalesforceAuthenticator—Salesforce Authenticator sent a notification to the user's mobile device to verify account activity.</li> <li>Sms—Salesforce sent a text message with a verification code to the user's mobile device.</li> <li>TempCode—A Salesforce admin or a user with the "Manage Two-Factor Authentication in User Interface" permission generated a temporary verification code for the user. This value is available in API version 37.0 and later.</li> <li>Totp—An authenticator app generated a time-based, one-time password (TOTP) on the user's mobile device.</li> </ul> |

| Field Name       | Details                                                                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VerificationTime | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Filter, Sort</p> <p><b>Description</b><br/>The time of the identity verification attempt. The time zone is based on GMT. The label is Time.</p> |

## Usage

Here are two examples of the types of API queries you can perform.

| Query                                                                          | String                                                                                                                                                                       |
|--------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Show verification history for a user's login record                            | <pre>SELECT Activity, EventGroup, Policy, Remarks, Status, UserId, VerificationMethod, VerificationTime FROM VerificationHistory WHERE LoginHistoryId = '0YaD000#####'</pre> |
| Get detailed geographic location information for a user's verification attempt | <pre>SELECT City, CountryIso, Latitude, Longitude, PostalCode FROM LoginGeo WHERE LoginGeoId = '0LE#####'</pre>                                                              |

## Vote

Represents a vote that a user has made on an Idea or a Reply.

**Note:** In API version 16.0 and earlier, SOQL queries on the Vote object only return votes for the Idea object. Starting in API version 17.0, SOQL queries return votes for both Idea and Reply.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field     | Details                                                                                 |
|-----------|-----------------------------------------------------------------------------------------|
| IsDeleted | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter</p> |

| Field    | Details                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | <p><b>Description</b></p> <p>Indicates whether the object has been moved to the Recycle Bin (true) or not (false). Label is <b>Deleted</b>.</p>                                                                                                                                                                                                                                                                              |
| ParentId | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Group, Sort, Create, Filter</p> <p><b>Description</b></p> <p>ID of the Idea or Reply associated with this vote.</p>                                                                                                                                                                                                                                          |
| Type     | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Group, Sort, Create, Filter, Restricted picklist</p> <p><b>Description</b></p> <p>Picklist that indicates the type of vote. The value <b>Up</b> indicates that the vote is a user's positive endorsement of the associated idea or reply. The value <b>Down</b> indicates that the vote is a user's negative endorsement of the associated idea or reply.</p> |

 **Note:** If you are importing Vote data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

## Usage

In version 12.0 and later, use this object to track the votes that users made on ideas. For more information on ideas, see “Ideas Overview” in the Salesforce online help.

In version 17.0 and later, use this object to track the votes users made on replies. For more information, see “Answers Overview” in the Salesforce online help.

In version 17.0 and later, you must filter using the following syntax when querying this object in a SOQL query: `ParentId = single ID`, `Parent.Type = single Type`, `Id = single ID`, or `Id IN (list of IDs)`. See Comparison Operators in the [Salesforce SOQL and SOSL Reference Guide](#) for a sample query.

A SOQL query must filter using one of the following Parent or Id clauses.

- `ParentId = [single ID]`
- `Parent.Type = [single type]`
- `Id = [single ID]`

- Id IN = [*list of IDs*]

# WebLink

Represents a custom link to a URL or Scontrol.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

- To create a custom link, the client application must be logged in with the “Customize Application” permission.
- Customer Portal users can’t access this object.

|                 | <p><b>Description</b></p> <p>Indicates whether the object is protected (<code>true</code>) or not (<code>false</code>). Protected components that have been installed in other organizations can't be linked to or referenced by components created in the subscriber organization. A developer can easily delete a protected component contained in a managed package in a future release of the package without worrying about failing installations. However, once a component is marked as unprotected and is released globally, the developer can't delete it.</p> |

## Usage

Use this object to programmatically manage custom links, which allow client applications to integrate data with external URLs, an organization's intranet, or other back-end office systems. A custom link can point to:

- An external URL, such as `www.google.com` or your company's intranet.
- A custom s-control, such as a Java applet or Active-X control.

Custom links can include fields as tokens within the URL or custom s-control.

SEE ALSO:

[Scontrol](#)

## WebLinkLocalization

Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the "View Setup and Configuration" permission.

## Usage

Use this object to translate your custom links to URLs or s-controls into the different languages supported by Salesforce. Users with the Translation Workbench enabled can view custom link translations, but either the “Customize Application” or “Manage Translation” permission is required to create or update custom link translations.

SEE ALSO:

[CategoryNodeLocalization](#)

[ScontrolLocalization](#)

## WorkAccess

Used to grant or restrict user access to give badge definitions. Each badge definition record must have one WorkAccess record.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

WorkAccess is not available through Schema Builder and is not customizable. A WorkAccess record is **required** for users to **Give** BadgeDefinitions. If a WorkAccess record is not created, BadgeDefinitions will not be available to users.

The sharing of WorkAccess records is through [WorkAccessShare](#) on page 1775 For each WorkBadgeDefinition record, you must create both a WorkAccess record (per WorkBadgeDefinition) and WorkAccessShare records for sharing to users or groups.

## Fields

| Field Name | Details                                                                                                                                                                                           |

## WorkAccessShare

Used to control Givers of WorkBadgeDefinition records.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

Related to [WorkAccess Object](#). WorkAccess is the parent of WorkAccessShare.

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

## WorkBadge

Represents information about who the badge was given to and which badge was given. A WorkBadge record is created for each recipient of a WorkBadgeDefinition.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

WorkBadge is a lookup to WorkThanks. Each WorkBadge record must derive a SourceId from WorkThanks. There can be multiple WorkBadge records tied to a single WorkThanks record.

## Fields

| Field Name         | Details                                                                                                                                                                                                     |

|            | <b>Description</b><br>Salesforce unique ID for Thanks record referenced to this badge. |

## WorkBadgeDefinition

Represents the attributes of a badge including the badge name, description, and image. Each WorkBadge record must have a lookup to a WorkBadgeDefinition since badge attributes (like badge name) are derived from the WorkBadgeDefinition object.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

WorkBadgeDefinition has a field called `ImageUrl` that references a DocumentID. This is a required field for creating a Badge.

To grant “giver” access to a WorkBadgeDefinition, you must also create the [WorkAccess](#) (and the related [WorkAccessShare](#)) records.

Each WorkBadgeDefinition has an `ImageUrl` field that must be populated with a DocumentID of the Document record containing the badge image.

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                               |

# WorkCoaching

---

Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. WorkCoaching is feed-enabled so there is a private feed available to the coach and coachee.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                              |

## WorkCoachingFeed

Represents a single feed item in the feed on the detail page for a coaching record.

A coaching feed shows recent changes to a lead record for any fields that are tracked in feeds, and posts and comments about the record. It's a useful way to stay up-to-date with changes made to coaching in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items that you created. To delete feed items that you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the WorkCoachingFeed object
- "Moderate Chatter"

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                  |

## WorkCoachingShare

Represents a sharing entry on a WorkCoaching object.

### Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|------------|--------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>ID of the user or group that was given access to the coaching relationship. This field can't be updated. |

## WorkFeedback

Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

- Ownership is transferred to the requester on submit for certain types (ad-hoc feedback).
- The record is read-only after the request that it's linked to is Submitted.
- You can't link a feedback object to a request unless you are the recipient.
- The question that the feedback is linked to must be part of the same question set that the request is linked to.

## Fields

| Field Name | Details                                                                                                                                                                                                      |

| WorkFeedbackQuestionId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the WorkFeedbackQuestion.                             |

## WorkFeedbackQuestionSet

Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

In the Work.com performance application, a question set defines the type of summaries and their due dates that will accompany the deployment of a specific performance summary cycle.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                                                  |

| Field Name | Details                                                                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>If a question set is associated to a performance summary cycle, then that cycle ID is referenced in this field. This field applies only to performance summaries. |

## WorkFeedbackQuestionSetHistory

Represents the history of changes to the values in the fields of a WorkFeedbackQuestionSet object. Access is read-only.

### Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Fields

| Field Name                | Details                                                                                                                                                   |

# WorkFeedbackRequest

Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, WorkFeedbackRequest represents feedback that is offered about a subject. In the performance application, WorkFeedbackRequest represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Additional Considerations and Related Objects

- After a request's state is changed to Submitted, fields can't be changed, except for LastSharedDate and IsUnreadByOwner.
- If LastRemindDate is updated, a reminder notification will be sent to the request's recipient (only possible when request is in Draft state).
- When a new request is created, a notification is sent to the recipient.
- When a recipient of a request submits their feedback (Draft->Submitted), a notification will be sent to requester (except for offered feedback).
- Requester cannot modify the subject of the question set after a request is created.
- For offered feedback (to user, to manager, or both), the person who is offering feedback is both the creator of WorkFeedbackRequest as well as the recipient.

## Fields

## WorkFeedbackRequestFeed

Represents a single feed item in the feed displayed on the feedback request detail page.

The feedback request feed shows changes to a request for fields that are tracked in feeds, posts, and comments about the request.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

## Field Name

## Details

**Description**

The type of feed item. Except for `ContentPost`, `LinkPost`, and `TextPost`, don't create feed item types directly from the API

- `ActivityEvent`—indirectly generated event when a user or the API adds a `Task` associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a `Task` or `Event` associated with a case record (excluding email and call logging).

For a recurring `Task` with `CaseFeed` disabled, one event is generated for the series only. For a recurring `Task` with `CaseFeed` enabled, events are generated for the series and each occurrence.

- `AdvancedTextPost`—created when a user posts a group announcement.
- `AnnouncementPost`—Not used.
- `ApprovalPost`—generated when a user submits an approval.
- `BasicTemplateFeedItem`—Not used.
- `CanvasPost`—a post made by a canvas app posted on a feed.
- `CollaborationGroupCreated`—generated when a user creates a public group.
- `CollaborationGroupUnarchived`—Not used.
- `ContentPost`—a post with an attached file.
- `CreatedRecordEvent`—generated when a user creates a record from the publisher.
- `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed.
- `LinkPost`—a post with an attached URL.
- `PollPost`—a poll posted on a feed.
- `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile.
- `QuestionPost`—generated when a user posts a question.
- `ReplyPost`—generated when Chatter Answers posts a reply.
- `RypplePost`—generated when a user creates a Thanks badge in Work.com.
- `TextPost`—a direct text entry on a feed.
- `TrackedChange`—a change or group of changes to a tracked field.
- `UserStatus`—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to `CaseFeed`:

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## WorkGoalCollaborator

Represents collaborators on a WorkGoal object. This doesn't include WorkGoal followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the [Goal](#) object to query information about Work.com goals.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                       |

## WorkGoalFeed

Represents a single feed item in the feed displayed on the goal page for a Goal record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal, and updates on metrics. This object has been deprecated as of API version 35.0. Use the [GoalFeed](#) object to query information about feed items for Work.com goals.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

# WorkGoalShare

---

Represents a sharing entry on a WorkGoal object. This object has been deprecated as of API version 35.0. Use the [GoalShare](#) object to query information about sharing for Work.com goals.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## WorkOrder

Represents a task or series of tasks to be performed, typically in field service. This object is available in API version 36.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Work orders must be enabled in your organization. Work orders are available in Enterprise, Performance, Unlimited, and Developer Editions with the Service Cloud.

## Fields

| Field Name | Details                                                                                                                                                                               |

|            | <b>Description</b><br>An eight-digit, auto-generated number that identifies the work order. |

## Usage

A work order can be a child record of accounts, assets, cases, contacts, entitlements, service contracts, and other work orders. We recommend adding work order line items to the work order to break the main task into smaller subtasks.

## WorkOrderFeed

Represents a single feed item on a work order record detail page. This object is available in API version 36.0 and later.

A work order feed shows changes to tracked fields on a work order record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to work orders in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Work orders must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Work Order object
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name | Details                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## WorkOrderHistory

Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Work orders must be enabled in your organization, and field tracking for work order fields must be configured.

## Fields

| Field Name  | Details                                                                                                                                                                                                          |

| OldValue    | <p><b>Type</b><br/>anyType</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The value of the field before it was changed.</p>                                                           |
| WorkOrderId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the work order being tracked. The history is displayed on the detail page for this record.</p> |

# WorkOrderLineItem

---

Represents a subtask on a work order, typically in field service. This object is available in API version 36.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Work orders must be enabled in your organization.

|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WorkOrderId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The line item's parent work order. Because work order line items must be associated with a work order, this is a required field.</p> |

## Usage

A work order line item is a child record of a work order. It represents a specific subtask on a work order.

For example, suppose a customer purchased a truck from you. The truck is represented as an asset in your Salesforce org. After some time, the truck needs both headlight bulbs replaced. Here's one way that you can use work orders and work order line items to track the repair.

1. Create a work order named "Replace Headlight Bulbs" from the asset record detail page.
2. Add three work order line items to the work order: "Replace Left Headlight Bulb," "Replace Right Headlight Bulb," and "Test Headlights."
3. Assign the work order to a technician via a queue.
4. As the technician completes each line item, he or she marks the item as **Completed**.
5. When all the line items are complete, the technician marks the work order as **Completed**.

## WorkOrderLineItemFeed

Represents a single feed item on a work order line item record detail page. This object is available in API version 36.0 and later.

A work order line item feed shows changes to tracked fields on a work order line item record. It also shows posts and comments about the record. It's a useful way to stay up to date with changes made to work order line items in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Work orders must be enabled in your organization, and you can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Work Order Line Item object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                                                                              |

## WorkOrderLineItemHistory

Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

### Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Special Access Rules

Work orders must be enabled in your organization, and field tracking for work order line item fields must be configured.

## Field Name

## Details

**Description**

The type of feed item. Except for `ContentPost`, `LinkPost`, and `TextPost`, don't create feed item types directly from the API

- `ActivityEvent`—indirectly generated event when a user or the API adds a `Task` associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a `Task` or `Event` associated with a case record (excluding email and call logging).

For a recurring `Task` with `CaseFeed` disabled, one event is generated for the series only. For a recurring `Task` with `CaseFeed` enabled, events are generated for the series and each occurrence.

- `AdvancedTextPost`—created when a user posts a group announcement.
- `AnnouncementPost`—Not used.
- `ApprovalPost`—generated when a user submits an approval.
- `BasicTemplateFeedItem`—Not used.
- `CanvasPost`—a post made by a canvas app posted on a feed.
- `CollaborationGroupCreated`—generated when a user creates a public group.
- `CollaborationGroupUnarchived`—Not used.
- `ContentPost`—a post with an attached file.
- `CreatedRecordEvent`—generated when a user creates a record from the publisher.
- `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed.
- `LinkPost`—a post with an attached URL.
- `PollPost`—a poll posted on a feed.
- `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile.
- `QuestionPost`—generated when a user posts a question.
- `ReplyPost`—generated when Chatter Answers posts a reply.
- `RypplePost`—generated when a user creates a Thanks badge in Work.com.
- `TextPost`—a direct text entry on a feed.
- `TrackedChange`—a change or group of changes to a tracked field.
- `UserStatus`—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to `CaseFeed`:

## WorkReward

Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

You must have the Reward permission enabled in order to use the Rewards feature, including WorkRewardFund and WorkReward.

## Additional Considerations and Related Objects

WorkReward is a lookup to WorkRewardFund. WorkRewardFund must have at least one WorkReward record to be available for use. Each WorkBadge record with a `RewardId` indicates a reward badge given to a Recipient.

## WorkRewardFund

Represents a Reward Fund and describes the Reward Fund attributes.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

To use the Rewards feature, including WorkRewardFund and WorkReward, you must have the Reward permission enabled. To create Rewards, the user must have Create on WorkRewardFund, which is not a standard permission.

## Additional Considerations and Related Objects

WorkReward is a lookup to WorkRewardFund. WorkRewardFund must have at least one WorkReward record available. Each WorkBadgeDefinition with a RewardFundId is a "Reward Badge."

## Fields

## Reusable Terms for API Objects

### API Version Availability.

This object is available in API version 37.0 and later.

This object is available in API version 27.0 and later.

This object is available in API version 21.0 and later.

This object is available in API version 20.0 and later.

This object is available in API version 18.0 and later.

## CHAPTER 3 Data Model

The entity relationship diagrams (ERDs) for standard Salesforce objects in this section illustrate important relationships between objects. The available ERDs are:

- [Sales Objects](#)—includes accounts, contacts, opportunities, leads, campaigns, and other related objects
- [Task and Event Objects](#)—includes tasks and events and their related objects
- [Support Objects](#)—includes cases and solutions and their related objects
- [Salesforce Knowledge Objects](#)—includes view and vote statistics, article versions, and other related objects
- [Document, Note, and Attachment Objects](#)—includes documents, notes, and attachments and their related objects
- [User, Sharing, and Permission Objects](#)—includes users, profiles, and roles
- [Profile and Permission Objects](#)—includes users, profiles, permission sets, and related permission objects
- [Record Type Objects](#)—includes record types and business processes and their related objects
- [Product and Schedule Objects](#)—includes opportunities, products, and schedules
- [Sharing and Team Selling Objects](#)—includes account teams, opportunity teams, and sharing objects
- [Customizable Forecasting Objects](#)—includes forecasts and related objects
- [Forecasts Objects](#)—includes objects for Collaborative Forecasts.
- [Territory Management](#)—includes territories and related objects
- [Process Objects](#)—includes approval processes and related objects
- [Content Objects](#)—includes content and libraries and their related objects
- [Chatter Feed Objects](#)—includes objects related to feeds
- [Work.com Badge and Reward Objects](#)—includes badge and reward objects
- [Work.com Feedback and Performance Cycle Objects](#)—includes feedback and performance cycle objects

Each entity relationship diagram includes links to the topics that describe the fields in objects related to the diagram. The data model for your custom objects depends on what you create.

## Chatter Objects

Diagram showing the relationships between the Chatter objects

The following diagram shows the relationships between the major Chatter objects.

- A feed item is an entry in the feed, such as a change to a record that's being followed, an updated post, or a user status change.
- All feed items have a `ParentId`, which is either:
  - the record that is changed
  - the user who received the post
