## Usage

Use this object to retrieve the current contents of the feed fields, such as type of feed or feed ID.

## DashboardFeed

Represents a single feed item in the feed displayed on a dashboard. This object is available in API version 20.0 and later.

Shows changes to dashboard fields tracked in feeds, and posts and comments about the dashboard.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Type            | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Restricted picklist<br><b>Description</b><br>Defines the visibility of a tag.<br>Valid values: <ul style="list-style-type: none"> <li>• <b>Public</b>—The tag can be viewed and manipulated by all users in an organization.</li> <li>• <b>Personal</b>—The tag can be viewed or manipulated only by a user with a matching OwnerId.</li> </ul> |

## Usage

DashboardTag stores the relationship between its parent TagDefinition and the Dashboard being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## Usage

Use the DatacloudCompany object to search the Data.com database for companies with the specific criteria that you enter. Use this object to find company records that you are interested in purchasing for your organization. Data.com APIs use the term "company," which is similar to Salesforce term "accounts."

 **Important:** DatacloudCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

## DatacloudContact

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

## Supported Calls

`describeSObjects()`, `query()`

## Usage

This object searches the Data.com database for contacts with the specific criteria that you enter. Use this object to find contact records that you are interested in purchasing for your organization.

 **Important:** DatacloudContact can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

## DatacloudDandBCompany

Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.

## Supported Calls

`describeSObjects()`, `query()`

## Usage

Use this object to return D&B Company information. These fields are read-only.

**Important:** DatacloudDandBCompany can't be used in Apex test methods, because an external web service call is required to access it. These calls are not allowed in Apex test methods.

## DatacloudOwnedEntity

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name          | Details                                                                                                                                                                                                                                                                                                       |

## Usage

The DatacloudPurchaseUsage object allows you to track Data.com record purchases for CRM users.

# DatacloudSocialHandle

---

Returns normalized URLs with userids for different social media used by Data.com contacts. The DatacloudSocialHandle object is a child object of the DatacloudContact object. This object is available in API version 30.0 or later.

## Supported Calls

`describeSObjects(), query()`

## Fields

| Field Name         | Details                                                                                                                                                              |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DatacloudContactId | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Nillable, Sort<br><b>Description</b><br>The unique numeric identifier for a Data.com contact record.           |
| ProviderName       | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Nillable, Sort<br><b>Description</b><br>The name of the social media provider.                                 |
| SocialId           | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Nillable, Sort<br><b>Description</b><br>The normalized userid for the user on this social media.               |
| Url                | <b>Type</b><br>url<br><b>Properties</b><br>Filter, Nillable, Sort<br><b>Description</b><br>A normalized URL and userid for the website of the social media provider. |

## Usage

Returns social handles with Data.com contacts from the DatacloudContact object. Social handle fields are read only fields and can't be used to filter results.

## DatedConversionRate

---

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`,

## Special Access Rules

Customer Portal users can't access this object.

|           | <b>Properties</b><br>Filter                                                                                                                                          |
|           | <b>Description</b><br>The date on which the effective dated exchange rate starts.                                                                                    |

## Usage

This object is for multicurrency organizations with advanced currency management enabled. Use this object to define the exchange rates your organization uses for a date range. This object is not available in single-currency organizations, nor is it available if the organization does not have advanced currency management enabled.

## DcSocialProfile

The `DcSocialProfile` object is a read-only object accessible only through the Data.com Social Key API. This object is available in API version 32.0 or later.

## Supported Calls

`describeSObjects()`, `query()`

## Special Access Rules

This is a read-only object that is accessed by only the Data.com Social Key API

|            | The last name of a contact.                       |
|            | <b>Type</b>                                       |
|            | string                                            |
|            | <b>Properties</b>                                 |
|            | Filter, Group, Nillable, Sort                     |
|            | <b>Description</b>                                |
|            | The two-letter standard abbreviation for a state. |

## Usage

Provides social handle information to the Data.com Social Key API.

## DcSocialProfileHandle

The `DcSocialProfileHandle` object, a child object to `DcSocialProfile`, is a read-only object accessible only through the Data.com Social Key API. The `DcSocialProfileHandle` object is a child object of the `DcSocialProfile` object. This object is available in API version 32.0 or later.

## Supported Calls

`describeSObjects()`, `query()`

## Special Access Rules

This is a read-only object that is accessed by only the Data.com Social Key API

## Fields

| Field Name        | Details                                            |
|-------------------|----------------------------------------------------|
| DcSocialProfileId | <b>Type</b>                                        |
|                   | string                                             |
|                   | <b>Properties</b>                                  |
|                   | Filter, Group, Nillable, Sort                      |
|                   | <b>Description</b>                                 |
|                   | A unique identifier for a contacts social handles. |

| Field Name   | Details                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| Handle       | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>A normalized social handle for a contact. |
| ProviderName | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The name of the social media provider.    |

## Usage

Provides social handle information to the Data.com Social Key API.

## DeclinedEventRelation

Represents invitees with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                |

## Division

---

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Divisions must be enabled for your organization to access this object. To discover whether divisions have been enabled for an organization, inspect the User or Group object for the `DefaultDivision` field—if it is present, then divisions have been enabled, and this field (the field is named `Division` in objects other than User and Group) will be available in all relevant objects.
- Customer Portal users can't access this object.

## Fields

| Field                         | Details                                                                                                                                                                                                                                                                             |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>IsActive</code>         | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Update</p> <p><b>Description</b><br/>Indicates whether the division is active (<code>true</code>) or not (<code>false</code>). Label is <b>Active</b>.</p>                             |
| <code>IsGlobalDivision</code> | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on createFilter</p> <p><b>Description</b><br/>Indicates whether the division is your organization's global default division (<code>true</code>) or not (<code>false</code>). Label is <b>Global Division</b>.</p> |
| <code>Name</code>             | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Update</p> <p><b>Description</b><br/>A descriptive name for the division. Limit: 80 characters.</p>                                                                                                          |

| Field     | Details                                                                                                                                                                                                                                                                       |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SortOrder | <p><b>Type</b></p> <p>int</p> <p><b>Properties</b></p> <p>Create, Filter, Nillable, Update</p> <p><b>Description</b></p> <p>The order in which this division name appears in the Division picklist field when creating or editing users in the Salesforce user interface.</p> |

## Usage

The values available for that field are the global division ID for the organization, created when divisions are first enabled, and any other division IDs that have been created. The division ID associated with a user is populated in the objects owned or created by the user.

You can use the division ID to make searches, reports, and list views run more quickly and return more relevant results if an organization has very large data sets. For more information, see the Salesforce online help, in the Fields description for the object.

You can use WITH in SOSL to pre-filter results based on division. This is faster than specifying the division in a WHERE clause.

**Note:** The User object has a `Division` field that is unrelated to this object. The `Division` field is a standard text field similar to Company or Department that has no special properties. Do not confuse it with the `DefaultDivision` field, which does relate to this object.

## DivisionLocalization

When the Translation Workbench is enabled for your organization, the DivisionLocalization object provides the translation of the label for a division.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Usage

Use this object to translate the labels of your divisions into the different languages supported by Salesforce.

## Document

---

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

You must have the “Edit” permission on documents and the appropriate access to the Folder that contains a document in order to create or update a document in that Folder.

## Fields

| Field      | Details                                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| DeveloperName    | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Document Unique Name</b>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| FolderId         | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Required. | Field | Details                                                                                                                                                                                                                                                                 |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <b>Description</b><br>File type of the Document. In general, the values match the file extension for the type of Document (such as pdf or jpg). Label is <b>File Extension</b> .                                                                                        |
| Url   | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Nillable, Group, Sort, Update<br><b>Description</b><br>URL reference to the file (instead of storing it in the database). If specified, do not specify the <code>Body</code> or <code>BodyLength</code> . |

## Usage

When creating or updating a document, you can specify a value in either the `Body` or `Url` fields, but not both.

## Encoded Data

The API sends and receives the binary file data encoded as a base64 data type. Prior to creating a record, clients must encode the binary file data as base64. Upon receiving an API response, clients must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

## Maximum Document Size

You can only create or update documents to a maximum size of 5 MB.

SEE ALSO:

[Object Basics](#)

## DocumentAttachmentMap

Maps the relationship between an EmailTemplate and its attachment, which is stored as a Document.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                         | Details                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Restricted picklist</p> <p><b>Description</b><br/>Defines the visibility of a tag.<br/><br/>Valid values:</p> <ul style="list-style-type: none"> <li>• <b>Public</b>—The tag can be viewed and manipulated by all users in an organization.</li> <li>• <b>Personal</b>—The tag can be viewed or manipulated only by a user with a matching <b>OwnerId</b>.</li> </ul> |

## Usage

DocumentTag stores the relationship between its parent TagDefinition and the Document being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## Domain

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

To access this object, Force.com Sites or Site.com must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the Domain and [DomainSite](#) objects.

## Fields

| Field      | Description                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage

Use this read-only object to query the domains that are associated with each website in your organization.

## DomainSite

Read-only junction object that joins together the Site and Domain objects. This object is available in API version 26.0 and later.

To access this object, Force.com Sites or Site.com must be enabled for your organization.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Customer Portal users can't access this object.
- To view this object, you must have the "View Setup and Configuration" permission.
- Site.com Publisher users have read-only API access to the [Domain](#) and DomainSite objects.

## Fields

| Field    | Description                                                                       |
|----------|-----------------------------------------------------------------------------------|
| DomainId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> |

|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>The ID of the associated Domain.                                                                                                                                                     |
| PathPrefix | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>Shows where a site's root exists on a domain. Can only be set for custom Web addresses. Always begins with a /. |
| SiteId     | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The ID of the associated Site.                                                                               |

## Usage

Use this read-only object to query or retrieve information about your Force.com site.

## DuplicateRecordItem

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

To access this object, your organization must have Data.com Duplicate Management enabled. Data.com Duplicate Management is currently available as a beta feature. Contact Salesforce for more information. For users to access this object, they must be given read and write access by their system administrator.

## Fields

| Field Name           | Details                                                                                                                                                                                                                               |

For example, account, contact, or lead.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage

DuplicateRule is available to organizations that use duplicate rules.

You can only view details of a duplicate rule using the API. You must use the full Salesforce site to create, edit, and delete duplicate rules.

# EmailDomainKey

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage

Use this object to define a DomainKeys Identified Mail (DKIM) key, which is used to authenticate outbound email that Salesforce sends on your organization's behalf. When you create a DKIM key, Salesforce generates a public and private key pair. You must publish the public key in the DNS, which tells recipients that you, as the owner of the domain, have authorized the use of this key to sign your mail. Salesforce uses the private key to create DKIM signature headers on your outgoing email. Then, recipients of the mail, can compare the signature header with the public key in the DNS to determine that the mail was signed with an authorized key. If your domain also publishes a Domain-based Message Authentication, Reporting and Conformance (DMARC) policy, recipients can use the DKIM signature to verify that the mail conforms to DMARC.

For each domain key you create, we recommend this sequence:

1. Insert the `Domain`, `DomainMatch`, and `Selector`.
2. Update your domain's DNS records.
  - a. Locate the DNS record at **`selector._domainkey.domain`**. For example, `mail._domainkey.mail.example.com`.
  - b. Add the `PublicKey` value, like this: `V=DKIM1; p=public_key`.

DKIM Signing Outbound Email

- a. In addition, you can optionally put the record in testing mode, which instructs recipients to not make decisions based on the email signature. Add parameter `t=y` to the DNS entry, like this: `V=DKIM1; t=y; p=public_key`.
3. Update the key via the API or UI to be active.

Consider the following when using domain keys.

- Make sure you add the public key to your DNS record before you make your key active in Salesforce and start DKIM signing. DKIM signing is active whenever your DKIM key is in the active state.
- You can't have more than one active DKIM key per domain name. You might have multiple active DKIM keys if your organization mails from more than a single domain or if you use subdomains under your organizational domain and have specified domain matching at the subdomain level.
- If you want to use the same DKIM key for multiple organizations, you can. Create the key and ensure it's working for one organization first. Then using the API or UI create the key in your other organizations by setting the corresponding fields in the new key to the same values as the original.
- When you insert or update a DKIM key, it's possible that the change affects existing domain keys. For example, if you've set `DomainMatch` to `DomainAndSubdomains` for the `example.com` domain, and you then set `DomainMatch` to `SubdomainsOnly` for the `mail.example.com` domain, either key could be used. Here's how we resolve conflicts in the case when DKIM keys overlap.
  - If two keys are equally specific about matching for the same domain, the new key replaces and deactivates the existing key.
  - If a new key is more specific about matching than an existing key, the new key is used and the existing key is modified to inactive.
  - If multiple keys have different domains that match the sending domain, the key with the longest domain name is used. In case of a tie, the most specific key is used. For example, because `DomainOnly` and `SubdomainsOnly` are more specific than `DomainAndSubdomains`, a new `DomainOnly` key would change the `DomainMatch` for an existing `DomainAndSubdomains` key to become `SubdomainsOnly`. In case of a tie, the most specific key is used.

## EmailMessage

---

Represents an email in Salesforce.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

EmailMessage is only available for organizations that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

Customer Portal users have read access to EmailMessage if the value for the `ParentID` field is associated with a case. Otherwise, access is determined by sharing access of the associated task.

`update()` is supported only on records whose `Status` is `Draft`. When a record's `Status` is *not* `Draft`, `update()` is supported only for the `IsExternallyVisible` field and custom fields.

## Fields

| Field                   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ActivityId</code> | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the activity that is associated with the email. Usually represents an open task that is created for the case owner when a new unread email message is received.</p>                                                                                                                                                                                                                                                                                                                                                                |
| <code>BccAddress</code> | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>A string array of email addresses for recipients who were sent a blind carbon copy of the email message. This field should include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>BccIds</code> field instead of adding their email address to the <code>BccAddress</code> field. Then the email message is automatically associated with the contact, lead, or user.</p>                                         |
| <code>BccIds</code>     | <p><b>Type</b><br/>JunctionIdList</p> <p><b>Properties</b><br/>Create, Update</p> <p><b>Description</b><br/>A string array of IDs for contacts, leads, and users who were sent a blind carbon copy of the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record.</p> <p> <b>Warning:</b> Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p> |
| <code>CcAddress</code>  | <p><b>Type</b><br/>string</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Field                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| ToAddress | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Update</p> <p><b>Description</b><br/>A string array of email addresses for recipients who were sent the email message. This field should include only email addresses that are not associated with Contact, Lead, or User records in Salesforce. If the recipient is a contact, lead, or user, add their ID to the <code>ToIds</code> field instead of adding their email address to the <code>ToAddress</code> field. Then the email message is automatically associated with the contact, lead, or user.</p> |
| ToIds     | <p><b>Type</b><br/>JunctionIdList</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Field | Details                                                                                                                                                                                                                                                                       |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <b>Properties</b><br>Create, Update                                                                                                                                                                                                                                           |
|       | <b>Description</b><br>A string array of IDs for contacts, leads, and users who were sent the email message. Each ID is linked to an <code>EmailMessageRelation</code> record, which represents the relationship between an email message and a Contact, Lead, or User record. |
|       |  <b>Warning:</b> Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.                |

## Usage

If your organization uses Email-to-Case, a case is created when an email is sent to one of your company's addresses. The email, which is related to the case by the `ParentID` field, is stored as an EmailMessage record. When users view the email, they see the EmailMessage record.

If your organization uses Enhanced Email, each email is stored as an EmailMessage record and a Task record. When users view an email, they see the EmailMessage record.

SEE ALSO:

[Case](#)

[Object Basics](#)

## EmailMessageRelation

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later

## Special Access Rules

EmailMessageRelation is only available for organizations that use Email-to-Case or Enhanced Email, which is automatically enabled for most customers.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Usage

EmailMessageRelation allows an email to be related to contacts, leads, and users.

## EmailServicesAddress

An email service address.

Each email service has one or more email addresses to which users can send messages for processing. An email service only processes messages it receives at one of its addresses.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

| IsTextTruncated | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>This field is deprecated. It is not available as of API version 23.0 and is deprecated and hidden in versions 17.0 through 22.0. In all API versions, the email service now accepts inbound email messages up to the 10 MB size limit, without truncating the text. Previously, it indicated whether the email service truncated and accepted email messages with HTML body text, plain body text, and text attachments over approximately 100,000 characters (<code>true</code>) or rejected these email messages and notified the sender (<code>false</code>).</p>                                                                                                                                                                                                                                                                                                                                 |
| IsTlsRequired   | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Configures the email service to use Transport Layer Security (TLS), a protocol for secure email communication, to ensure the security and authenticity of inbound email.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| OverLimitAction | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>Indicates what the email service does with messages if the total number of messages processed by all email services combined has reached the daily limit for your organization. One of the following values:</p> <ul style="list-style-type: none"> <li>0—The system default is used.</li> <li>1—The email service returns the message to the sender with a notification that explains why the message was rejected.</li> <li>2—The email service deletes the message without notifying the sender.</li> <li>3—The email service queues the message for processing in the next 24 hours. If the message is not processed within 24 hours, the email service returns the message to the sender with a notification that explains why the message was rejected.</li> </ul> <p>The system calculates the limit by multiplying the number of user licenses by 1,000.</p> |

## Usage

This object supports the email services feature, which allows you to create automated processes that use Apex classes to process the contents, headers, and attachments of inbound email. For example, you can create an email service that automatically creates contact records based on contact information in messages.

[EmailServicesAddress](#)

## EmailStatus

---

Represents the status of email sent.

## Supported Calls

`describeSObjects()`

## Special Access Rules

Customer Portal users can't access this object.

## EmailTemplate

Represents a template for mass email, or email sent when the activity history related list of a record is modified.

**Note:** You can't send a mass email using a Visualforce email template.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## EntitlementFeed

Represents a single feed item in the feed displayed on the detail page for an entitlement. An entitlement feed shows recent changes to an entitlement record for any fields that are tracked in feeds, and comments and posts about the record. It's a useful way to stay up-to-date with changes to entitlements. This object is available in API version 23.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"

- “Modify All” on the Entitlement object
- “Moderate Chatter”

**Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of the EntitlementFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with “CanApproveFeedPostAndComment” or “ModifyAllData” permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |

## Field Name

## Details

**Description**

The type of EntitlementFeed item:

- **ActivityEvent**—indirectly generated event when a user or the API adds a **Task** associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a **Task** or **Event** associated with a case record (excluding email and call logging).

For a recurring **Task** with **CaseFeed** disabled, one event is generated for the series only. For a recurring **Task** with **CaseFeed** enabled, events are generated for the series and each occurrence.

- **AdvancedTextPost**—created when a user posts a group announcement.
- **AnnouncementPost**—Not used.
- **ApprovalPost**—generated when a user submits an approval.
- **BasicTemplateFeedItem**—Not used.
- **CanvasPost**—a post made by a canvas app posted on a feed.
- **CollaborationGroupCreated**—generated when a user creates a public group.
- **CollaborationGroupUnarchived**—Not used.
- **ContentPost**—a post with an attached file.
- **CreatedRecordEvent**—generated when a user creates a record from the publisher.
- **DashboardComponentAlert**—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- **DashboardComponentSnapshot**—created when a user posts a dashboard snapshot on a feed.
- **LinkPost**—a post with an attached URL.
- **PollPost**—a poll posted on a feed.
- **ProfileSkillPost**—generated when a skill is added to a user's Chatter profile.
- **QuestionPost**—generated when a user posts a question.
- **ReplyPost**—generated when Chatter Answers posts a reply.
- **RypplePost**—generated when a user creates a Thanks badge in Work.com.
- **TextPost**—a direct text entry on a feed.
- **TrackedChange**—a change or group of changes to a tracked field.
- **UserStatus**—automatically generated when a user adds a post. Deprecated.

The following values appear in the **Type** picklist for all feed objects but apply only to **CaseFeed**:

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

[EntitlementContact](#)

## EntitlementTemplate

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

All users, even those without the “View Setup and Configuration” user permission, can view entitlement templates via the API.

## Usage

Use this object to manage entitlement templates.

## EntityHistory

Represents historical information about an object's changed field values. This object is only available to users with the "View All Data" permission. This object is unavailable beginning with API version 8.0. Use the object-specific History objects instead: `CaseHistory`, `ContractHistory`, `LeadHistory`, `OpportunityFieldHistory`, `OpportunityHistory`, `ProcessInstanceHistory`, `QuantityForecastHistory`, `RevenueForecastHistory`, or `SolutionHistory`.

## Supported Calls

`describeSObjects()`, `getUpdated()`, `getDeleted()`, `query()`, `retrieve()`

## Fields

| Field     | Details                                                                                                                                                                                                                                                        |

| Field            | Details                                                                                                                                                  |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParentObjectType | <b>Type</b><br>picklist<br><br><b>Properties</b><br>Filter, Restricted picklist<br><br><b>Description</b><br>The kind of object that contains the field. |

## Usage

In API version 7.0 and later, this object works with Case, Contract, and Solution objects:

- This object is always read-only in the online application.
- When a field is modified, this object records both the old and new field values. There are exceptions to this behavior for certain fields such as long text areas and multi-select picklists. These fields appear in this object to indicate that the field was changed, but the old and new values are not recorded.
- Two rows are added to this object when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, "Jane Doe" is recorded as the name of a contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.
- Up to a total of twenty fields (standard or custom) can be tracked for a given object.
- In the online application, you can specify which fields are tracked or not tracked at any time.
- As soon as tracking is turned on for a field, all changes to its value are recorded in the database.
- Turning off tracking for a field stops further changes from being recorded, but the history data is not deleted.
- Be advised that deleting a custom field also permanently deletes the history data for that custom field.

## EntityMilestone

Represents a required step in a customer support process on a record. The Salesforce user interface uses the term "object milestone." This object is available in API version 37.0 and later.

As of Summer '16, object milestones are supported only for work orders.

**Note:** Milestones on cases use the [CaseMilestone](#) object type.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

## Special Access Rules

Object milestones are accessible only when entitlement management is enabled. You can add milestones to work orders only when work orders are enabled.

## Fields

| Field Name              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Usage

When you create an entitlement process, you select its type based on the type of record that you want the process to run on: Case or Work Order. Processes created before Summer '16 use the Case type. When a Work Order entitlement process runs on a work order, the resulting milestones on the work order are object milestones. Conversely, when a Case entitlement process runs on a case, the resulting milestones are case milestones, a separate standard object.

**Tip:** If an entitlement has an entitlement process associated with it, don't use the entitlement for multiple types of support records. An entitlement process works only on records that match the process's type. For example, when a Case entitlement process is applied to an entitlement, the process runs only on cases associated with that entitlement. If a work order is also associated with the entitlement, the process doesn't run on the work order. To ensure that the milestones you set up work as expected, associate a customer's work orders and cases with different entitlements.

Customize page layouts, validation rules, and more for object milestones from the Object Milestones node in Setup under Entitlement Management.

## EntitySubscription

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field     | Details                                                                                                                                                                                                                                                                                                                  |

| NetworkId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the <a href="#">community</a> that this file originated from. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.</p> |
| ParentId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. ID of the record or user which the user is following.</p>                                                                                                                                  |

| Field        | Details                                                                                                                                                                               |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SubscriberId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. ID of the User who is following the record or user.</p> |

## Usage

Consider this when following records and users:

- Users can only follow records that they can see.
- Users can see which records other users are following, unless they don't have access to the records.
- Administrators and users with the "Modify All Users" permission can configure a user to follow records that the user has read access to.
- Administrators and users with the "Modify All Users" permission can configure users to stop following records.
- Following topics is available in API version 29.0 and later. For this reason, a topic ID is now a supported value for the `ParentId` field.
- If you deactivate a user, any EntitySubscription where the user is associated with the `ParentId` or `SubscriberId` field, meaning all subscriptions both to and from the user, are soft deleted. If the user is reactivated, the subscriptions are restored. However, if you deactivate multiple users at once and these users follow each other, their subscriptions are hard deleted. In this case, the user-to-user EntitySubscription is deleted twice (double deleted). Such subscriptions can't be restored upon user reactivation.

When using `query()` with EntitySubscription,

- A query must include a `LIMIT` clause and the limit can't exceed 1000.
- A query using a `WHERE` clause can only filter by fields on the EntitySubscription object.
- If user sharing is enabled and the querying user is not an administrator, a SOQL query must be constrained either by the `ParentId` or `SubscriberId`. Otherwise, the query behavior at run time is undefined, meaning the result set can be incomplete or inconsistent from invocation to invocation. For an unconstrained query, the sharing check limits imposed on a non-administrative user are likely to be exceeded before the query completes, because access checks are run against both parent and subject, for each row of the result set. We recommend using the Chatter REST API to query EntitySubscription data instead of running a SOQL query.
- Users without the "View All Data" permission
  - Need read access on the object associated with the `ParentId` field to see which users are following records for the object.
  - Can use an `ORDER BY` clause in a query only to order by fields on the EntitySubscription object. For example, if the subscription relates to an Account record, the query can `ORDER BY ParentId`, but it can't `ORDER BY Account.Name`.
  - Don't always get all matching subscriptions when running a query. For these users, a query evaluates visibility criteria on a maximum of 500 records to reduce the prospect of long-running queries. If a user runs a query to see the CEO's subscriptions, it might scan a large number of records. The query only returns matches within the first 500 records scanned. It is possible that there are more subscriptions that are visible to the user, but they are not returned. To mitigate this, we recommend using a `WHERE` clause, if possible, to reduce the scope of the query.

## Sample—SOQL

The following SOQL query returns subscriptions for all the accounts that a subscriber is following that have more than 10 employees:

```
SELECT Id
FROM EntitySubscription
WHERE SubscriberId = '005U0000000Rg2CIAS'
AND ParentId IN (
  SELECT Id FROM Account
  WHERE NumberOfEmployees > 10
)
LIMIT 200
```

## EnvironmentHubMember

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

**Note:** You can only create 20 member orgs per day. If you need to create additional orgs, log a case in the Partner Community.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

## Fields

## Usage

Use this object to access and modify settings of member organizations in the Environment Hub.

## Event

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

### Note:

- An EventRelation object can't be related to a child event, and child events don't include the invitee related list.
- `query()`, `delete()`, and `update()` aren't allowed with events related to more than one contact in API versions 25.0 and earlier.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field                   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Division          | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| DurationInMinutes | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Contains the event length, in minutes. Note that even though this field represents a temporal value, it is an integer type—not a Date/Time type.</p> <p>This field is required in versions 12.0 and earlier if <code>IsAllDayEvent</code> is false.</p> <p>In versions 13.0 and later, this field is optional, depending on the following:</p> <ul style="list-style-type: none"> <li>• If <code>IsAllDayEvent</code> is true, you can supply a value for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time. If both fields are <code>null</code>, the duration defaults to one day.</li> <li>• If <code>IsAllDayEvent</code> is false, a value must be supplied for either <code>DurationInMinutes</code> or <code>EndDateTime</code>. Supplying values in both fields is allowed if the values add up to the same amount of time.</li> </ul> <p>If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the <code>DurationInMinutes</code> field. API versions 12.0 and earlier can't access event objects whose <code>DurationInMinutes</code> is greater than 1440. For more information, see <a href="#">Multiday Events</a>.</p> |
| EndDateTime       | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RecurrenceDayOfWeekMask | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Indicates the day or days of the week on which the event repeats. This field contains a bitmask. The values are as follows:</p> <ul style="list-style-type: none"> <li>• Sunday = 1</li> <li>• Monday = 2</li> <li>• Tuesday = 4</li> <li>• Wednesday = 8</li> <li>• Thursday = 16</li> <li>• Friday = 32</li> <li>• Saturday = 64</li> </ul> <p>Multiple days are represented as the sum of their numerical values. For example, Tuesday and Thursday = 4 + 16 = 20.</p> |
| RecurrenceEndDateOnly   | <p><b>Type</b><br/>date</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Indicates the last date on which the event repeats. For multiday recurring events, this is the day on which the last occurrence starts. This field is a date field with a timestamp that is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the timestamp to account for time zone differences.</p>                                                                                                                     |
| RecurrenceInstance      | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>Indicates the frequency of the event's recurrence. For example, 2nd or 3rd.</p>                                                                                                                                                                                                                                                                                                                                                                 |
| RecurrenceInterval      | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Indicates the interval between recurring events.</p>                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Field                    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| StartDateTime | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>Indicates the start date and time of the event. Available in versions 13.0 and later.</p> <p>If the Event <code>IsAllDayEvent</code> flag is set to true (indicating that it is an all-day Event), then the event start date information is contained in the <code>StartDateTime</code> field. This field is a regular Date/Time field with a relevant time portion. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. Translate the time portion to or from a local time zone for the user or the application, as appropriate.</p> <p>If the Event <code>IsAllDayEvent</code> flag is set to false (indicating that it is not an all-day event), then the event start date information is contained in the <code>StartDateTime</code> field. The time portion is always transferred in the Coordinated Universal Time (UTC) time zone. You need to translate the time portion to or from a local time zone for the user or the application, as appropriate.</p> <p>If this field has a value, then <code>ActivityDate</code> and <code>ActivityDateTime</code> must either be <code>null</code> or match the value of this field.</p> |

Represents the count of related <code>EventRelations</code> pertaining to the <code>WhoId</code> .                                                                                                                                                                                                                                                                                       |
| WhoId                    | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Field | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <p><b>Description</b></p> <p>The Whold represents a human such as a lead or a contact. Wholds are polymorphic. Polymorphic means a Whold is equivalent to a contact's ID or a lead's ID. The label is <code>Name ID</code>.</p> <p>If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the Whold field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is <code>Name ID</code>.</p> <p>If the <code>JunctionIdList</code> field is used, all <code>whoIds</code> are included in the relationship list.</p> |

## Usage

Use Event to manage calendar appointments.

### Querying and Filtering Events

Queries on events will be denied before they time out if they involve amounts of data that are deemed too large. In such cases, the exception code `OPERATION_TOO_LARGE` is returned. If you receive `OPERATION_TOO_LARGE`, refactor your query to return or scan a smaller amount of data.

When querying for events with a specific due date, you must filter on both the `ActivityDateTime` and `ActivityDate` fields. For example to find all events with a due date of February 14, 2003, you need two filters:

- One filter with the `ActivityDate` field equal to the Coordinated Universal Time (UTC) time zone on February 14, 2003.
- One filter with the `ActivityDateTime` field greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

Alternatively, in version 13.0 and later, you can find events with a specific due date by filtering on `StartDateTime`. For example, to find all events with a due date of February 14, 2003, filter with the `StartDateTime` greater than or equal to midnight on February 14, 2003 in the user's local time zone AND less than or equal to midnight on February 15, 2003 in the user's local time zone.

The `EventId` field of an `EventRelation` object always points to the master record. An invitee on a group event can query the `EventRelation` object to view the master record.

### Multiday Events

- Multiday events are available in version 13.0 and later. Also, in earlier versions SOQL queries do not return multiday events.
- Multiday events are enabled through the user interface from Setup by entering *Activity Settings* in the *Quick Find* box, then selecting **Activity Settings**.
- If the multiday event feature is enabled, then API versions 13.0 and later support values greater than 1440 for the `DurationInMinutes` field. API versions 12.0 and earlier can't access event objects whose `DurationInMinutes` is greater than 1440.
- Multiday events can't exceed 14 days.

### Recurring Events

- Recurring events are available in version 7.0 and later.
- After an event is created, it can't be changed from recurring to nonrecurring or vice versa.
- When you delete a recurring event series through the API, all past and future events in the series are removed. However, when you delete a recurring event series through the user interface, only future occurrences are removed.

- When creating a recurring event series, the duration of the event must be 24 hours or less (either the `DurationInMinutes` or the difference between `RecurrenceStartDateTime` and `EndDateTime` must be greater than 24 hours). Once the recurring event series is created, you can extend the length of individual occurrences beyond 24 hours if Multiday events are enabled; see **Multiday Events**.
- If `IsRecurrence` is `true`, then `RecurrenceStartDateTime`, `RecurrenceEndDateOnly`, `RecurrenceType`, and any properties associated with the given recurrence type (see the following table) must be populated.
- When updating a recurring event series, it's not possible to update the `EventRelation` for the event series object and the `EventRelation` for the series object occurrences at the same time.

The following table describes the usage of recurrence fields. Each recurrence type must have all of its properties set. All unused properties must be set to null.

| RecurrenceType Value | Properties                                                          | Example Pattern                                     |
|----------------------|---------------------------------------------------------------------|-----------------------------------------------------|
| RecursDaily          | RecurrenceInterval                                                  | Every second day                                    |
| RecursEveryWeekday   | RecurrenceDayOfWeekMask                                             | Every weekday - can't be Saturday or Sunday         |
| RecursMonthly        | RecurrenceDayOfMonth<br>RecurrenceInterval                          | Every second month, on the third day of the month   |
| RecursMonthlyNth     | RecurrenceInterval RecurrenceInstance<br>RecurrenceDayOfWeekMask    | Every second month, on the last Friday of the month |
| RecursWeekly         | RecurrenceInterval<br>RecurrenceDayOfWeekMask                       | Every three weeks on Wednesday and Friday           |
| RecursYearly         | RecurrenceDayOfMonth<br>RecurrenceMonthOfYear                       | Every March on the twenty-sixth day of the month    |
| RecursYearlyNth      | RecurrenceDayOfWeekMask<br>RecurrenceInstance RecurrenceMonthOfYear | The first Saturday in every October                 |

### JunctionIdList

To create an event using `JunctionIdList`, IDs are pulled from the related contacts and both the event and the `EventRelation` records are created in one API call. If the `EventRelation` fails, the event is rolled back because it's all done in a single API call.

```
public void createEventNew(Contact[] contacts) {
    String[] contactIds = new String[contacts.size()];
    for (int i = 0; i < contacts.size(); i++) {
        contactIds[i] = contacts[i].getID();
    }
    Event event = new Event();
    event.setSubject("New Event");
    event.setEventWhoIds(contactIds);
    SaveResult[] results = null;
    try {
        results = connection.create(new Event[] {
            task
        });
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

```
}  
}
```

[Object Basics](#)

# EventFeed

Represents a single feed item in the feed on an Event. This object is available in API version 20.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b></p> <p>textarea</p> <p><b>Properties</b></p> <p>Nullable, Sort</p> <p><b>Description</b></p> <p>The content of EventFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                         |
| CommentCount | <p><b>Type</b></p> <p>int</p> <p><b>Properties</b></p> <p>Filter, Group, Sort</p> <p><b>Description</b></p> <p>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two</p> |

| Field                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                                 | <p>comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| <code>ConnectionId</code>       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>   |
| <code>ContentData</code>        | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>                                                                                                      |
| <code>ContentDescription</code> | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. The description of the file specified in <code>ContentData</code>.</p>                                                                                                                                                                                                                                  |
| <code>ContentFileName</code>    | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. This field is required if <code>Type</code> is <code>ContentPost</code>. The name of the file uploaded to the feed. Setting <code>ContentFileName</code> automatically sets <code>Type</code> to <code>ContentPost</code>.</p>                                                                     |

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ContentSize  | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. The size of the file (in bytes) uploaded to the feed. This field is read-only and is automatically determined during insert.</p>                                                                                                                                                                                    |
| ContentType  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. The MIME type of the file uploaded to the feed. This field is read-only and is automatically determined during insert.</p>                                                                                                                                                                                       |
| CreatedDate  | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Sort</p> <p><b>Description</b><br/>Date and time when this record was created. This field is a standard system field.<br/><br/>Ordering by <code>CreatedDateDESC</code> sorts the feed by the most recent feed item.</p>                                                                                                                                                              |
| FeedPostId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>This field was removed in API version 22.0, and is available in earlier versions for backward compatibility only.<br/><br/>ID of the associated <a href="#">FeedPost</a>. A <a href="#">FeedPost</a> represents the following types of changes in an <code>FeedItem</code>: changes to tracked fields, text posts, link posts, and content posts.</p> |
| InsertedById | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>                                                                                                                              |

## Usage

Use this object to track changes for an event record. You can only delete a feed if you created it, or if you have the “Modify All Data” permission.

## EventLogFile

Represents event log files for event monitoring. This object is available in API versions 32.0 and later.

The event monitoring feature allows you to gather information about your Salesforce organization’s operational events, which you can use to analyze usage trends and user behavior. You can interact with event monitoring data by querying fields on the `EventLogFile` object (like `EventType` and `LogDate`). To view the underlying event data, query the `LogFile` field. The `EventType` determines the schema of this field. See [Supported Event Types](#) for more information.

**Note:** Log data schema for each `EventType` can change. At the start of each release, use the `LogFileFieldNames` and `LogFileFieldTypes` fields to validate schema changes for each `EventType`. In the unlikely case where no log files are generated for 24 hours, contact Salesforce.

Refer to the [Force.com REST API Developer’s Guide](#) for details about event monitoring.

## Special Access Rules

Accessing this object requires View Event Log Files and API Enabled user permissions. Users with View All Data permission can view event log files.

## Supported Calls

`query()`, `retrieve()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Supported Event Types

The EventType field supports the following events.

- Apex Callout
- Apex Execution
- Apex SOAP
- Apex Trigger
- API
- Asynchronous Report Run
- Bulk API
- Change Set Operation
- Console
- Content Distribution
- Content Document Link
- Content Transfer
- Dashboard
- Document Attachment Downloads
- Login As
- Login
- Logout
- Metadata API Operation
- Multiblock Report

- [Package Install](#)
- [Queued Execution](#)
- [Report](#)
- [Report Export](#)
- [REST API](#)
- [Sandbox](#)
- [Sites](#)
- [Time-Based Workflow](#)
- [Transaction Security](#)
- [UI Tracking](#)
- [URI](#)
- [Visualforce Request](#)
- [Wave Change](#)
- [Wave Interaction](#)
- [Wave Performance](#)

The following tables serve as a reference for each event and its associated fields. Some common fields, such as CPU\_TIME and RUN\_TIME, can have null or zero values depending on how the events are generated for a given feature.

**Note:** The Login and Logout events are available in supported Salesforce editions at no additional cost. Contact Salesforce to purchase the remaining event types.

## Apex Callout

Apex Callout events contain details about callouts (external requests) during Apex code execution.

| Field      | Details                                                                                                                                                                                                                                                                |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IP  | <b>Type</b><br>IP<br><br><b>Description</b><br>The IP address of the client that's using Salesforce services.<br><br><b>Example</b><br>96.43.144.26                                                                                                                    |
| CPU_TIME   | <b>Type</b><br>Number<br><br><b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| EVENT_TYPE | <b>Type</b><br>String                                                                                                                                                                                                                                                  |

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The type of event.                                                                                                                                                          |
|                 | <b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                                         |
| LOGIN_KEY       | <b>Type</b><br>Id                                                                                                                                                                                 |
|                 | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring. |
|                 | <b>Example</b><br>GeJCsym5eyvtEK2l                                                                                                                                                                |
| METHOD          | <b>Type</b><br>String                                                                                                                                                                             |
|                 | <b>Description</b><br>The HTTP method of the callout.                                                                                                                                             |
|                 | <b>Example</b><br>GET, POST, PUT, and so on.                                                                                                                                                      |
| ORGANIZATION_ID | <b>Type</b><br>Id                                                                                                                                                                                 |
|                 | <b>Description</b><br>The 15-character ID of the organization.                                                                                                                                    |
|                 | <b>Example</b><br>00D000000000123                                                                                                                                                                 |
| REQUEST_ID      | <b>Type</b><br>String                                                                                                                                                                             |
|                 | <b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.                             |
|                 | <b>Example</b><br>3nWgxWbDKWWDik0FKfF5DV                                                                                                                                                          |
| REQUEST_SIZE    | <b>Type</b><br>Number                                                                                                                                                                             |
|                 | <b>Description</b><br>The size of the callout request body, in bytes.                                                                                                                             |

RESPONSE\_SIZE

**Type**

Number

**Description**

The size of the callout response, in bytes.

RUN\_TIME

**Type**

Number

**Description**Not used for this event type. Use the `TIME` field instead.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

SUCCESS

**Type**

Boolean

**Description**

1 if the request was successful, and 0 if not.

TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds (ms).

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

TYPE

**Type**

String

**Description**

The type of Apex callout.

**Example**

REST or AJAX

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

URI\_ID\_DERIVED

**Type**

ID

**Description**

The 18-character case insensitive ID of the URI of the page that's receiving the request.

URL

**Type**

String

**Description**

The callout endpoint URL.

**Example**

www.salesforce.com

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

0059000000001SNIA0

## Apex Execution

Apex Execution events contain details about Apex classes that are used.

| Field         | Details                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CALLOUT_TIME  | <b>Type</b><br>Number<br><br><b>Description</b><br>The execution time of the external Apex calls.                                                                                                                                                                      |
| CLIENT_IP     | <b>Type</b><br>IP<br><br><b>Description</b><br>The IP address of the client that's using Salesforce services.<br><br><b>Example</b><br>96.43.144.26                                                                                                                    |
| CPU_TIME      | <b>Type</b><br>Number<br><br><b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| DB_TOTAL_TIME | <b>Type</b><br>Number<br><br><b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.                     |
| ENTRY_POINT   | <b>Type</b><br>String<br><br><b>Description</b><br>The entry point for this Apex execution.<br><br><b>Example</b> <ul style="list-style-type: none"> <li>• <code>GeneralCloner.cloneAndInsertRecords</code></li> <li>• VF- /apex/CloneUser</li> </ul>                  |
| EVENT_TYPE    | <b>Type</b><br>String<br><br><b>Description</b><br>The type of event.                                                                                                                                                                                                  |

|                     |                                                                                                                                                                                                                                                                                                                                                                                   |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | <p><b>Example</b></p> <p>ReportExport, URI, UITracking, API, RestApi, and so on.</p>                                                                                                                                                                                                                                                                                              |
| EXEC_TIME           | <p><b>Type</b></p> <p>Number</p> <p><b>Description</b></p> <p>The end-to-end Apex execution time.</p>                                                                                                                                                                                                                                                                             |
| LOGIN_KEY           | <p><b>Type</b></p> <p>Id</p> <p><b>Description</b></p> <p>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.</p> <p><b>Example</b></p> <p>GeJCsym5eyvtEK2l</p>                                                                                           |
| NUMBER_SOQL_QUERIES | <p><b>Type</b></p> <p>Number</p> <p><b>Description</b></p> <p>The number of SOQL queries that were executed during the event.</p>                                                                                                                                                                                                                                                 |
| ORGANIZATION_ID     | <p><b>Type</b></p> <p>Id</p> <p><b>Description</b></p> <p>The 15-character ID of the organization.</p> <p><b>Example</b></p> <p>00D0000000000123</p>                                                                                                                                                                                                                              |
| QUIDDITY            | <p><b>Type</b></p> <p>String</p> <p><b>Description</b></p> <p>The type of outer execution associated with this event.</p> <p><b>Example</b></p> <ul style="list-style-type: none"> <li>• A—Old Batch</li> <li>• C—Scheduled Apex</li> <li>• E—Inbound Email Service</li> <li>• F—Future</li> <li>• H—Apex REST</li> <li>• I—Invocable Action</li> <li>• K—Quick Action</li> </ul> |

- X–Execute Anonymous

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

|                 |                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z                              |
| URI             | <b>Type</b><br>String<br><b>Description</b><br>The URI of the page that's receiving the request.<br><b>Example</b><br>/home/home.jsp                                                            |
| URI_ID_DERIVED  | <b>Type</b><br>ID<br><b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                                                            |
| USER_ID         | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.<br><b>Example</b><br>00530000009M943                      |

## Apex SOAP

Apex SOAP events contain details about Web Services API calls.

| Field      | Details               |
|------------|-----------------------|
| CLASS_NAME | <b>Type</b><br>String |

|                     |                                                                                                                                                                                                                                                                    |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | <b>Description</b><br>The Apex class name. If the class is part of a managed package, this string includes the package namespace.                                                                                                                                  |
| CLIENT_IP           | <b>Type</b><br>IP<br><b>Description</b><br>The IP address of the client that's using Salesforce services.<br><b>Example</b><br>96.43.144.26                                                                                                                        |
| CPU_TIME            | <b>Type</b><br>Number<br><b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| DB_TOTAL_TIME       | <b>Type</b><br>Number<br><b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.                     |
| EVENT_TYPE          | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                                     |
| LIMIT_USAGE_PERCENT | <b>Type</b><br>Number<br><b>Description</b><br>The percentage of Apex SOAP calls that were made against the organization's limit.                                                                                                                                  |
| LOGIN_KEY           | <b>Type</b><br>Id                                                                                                                                                                                                                                                  |

|                 |                                                                                                                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.                                                                                      |
|                 | <b>Example</b><br>GeJCsym5eyvtEK2l                                                                                                                                                                                                                                                     |
| METHOD_NAME     | <b>Type</b><br>String<br><b>Description</b><br>The name of the calling Apex method.                                                                                                                                                                                                    |
| ORGANIZATION_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D0000000000123                                                                                                                                                              |
| QUERY           | <b>Type</b><br>String<br><b>Description</b><br>The SOQL query, if one was performed.                                                                                                                                                                                                   |
| REQUEST_ID      | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDik0FKfF5DV                                             |
| REQUEST_STATUS  | <b>Type</b><br>String<br><b>Description</b><br>The status of the request for a page view or user interface action.<br><b>Possible Values</b> <ul style="list-style-type: none"><li>• S: Success</li><li>• F: Failure</li><li>• U: Undefined</li><li>• A: Authorization Error</li></ul> |

- R: Redirect
- N: Not Found

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

URI\_ID\_DERIVED

**Type**

ID

|                 |                                                                                                                                                                                                         |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                                                                                         |
| USER_ID         | <b>Type</b><br>Id<br><br><b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.<br><br><b>Example</b><br>005300000009M943                     |
| USER_ID_DERIVED | <b>Type</b><br>Id<br><br><b>Description</b><br>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.<br><br><b>Example</b><br>005900000000I1SNIA0 |

## Apex Trigger

Apex Trigger events contain details about triggers that fire in an organization.

| Field         | Details                                                                                                                                                                                                                                                                |
|---------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IP     | <b>Type</b><br>IP<br><br><b>Description</b><br>The IP address of the client that's using Salesforce services.<br><br><b>Example</b><br>96.43.144.26                                                                                                                    |
| CPU_TIME      | <b>Type</b><br>Number<br><br><b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| DB_TOTAL_TIME | <b>Type</b><br>Number                                                                                                                                                                                                                                                  |

|                 |                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.                                        |
| ENTITY_NAME     | <b>Type</b><br>String<br><b>Description</b><br>The name of the object affected by the trigger.                                                                                                                                                               |
| EVENT_TYPE      | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                               |
| EXEC_TIME       | <b>Type</b><br>Number<br><b>Description</b><br>The end-to-end Apex execution time.                                                                                                                                                                           |
| LOGIN_KEY       | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.<br><b>Example</b><br>GeJCsym5eyvtEK2l |
| ORGANIZATION_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                                     |
| REQUEST_ID      | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same <code>REQUEST_ID</code> .                                                 |

|                   |                                                                                                                                                                                                                                                                                                                                     |

| USER_ID                                    | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.<br><b>Example</b><br>00530000009M943                                                           |

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

00590000000011SNIA0

## API

API events contain details about your organization's Force.com Web Services API activity.

**Field****Details**

API\_TYPE

**Type**

String

**Description**

The type of API request.

**Possible Values**

- D: Apex Class
- E: SOAP Enterprise
- I: SOAP Cross Instance
- L: Live Agent
- M: SOAP Metadata
- O: Old SOAP
- P: SOAP Partner
- R: REST API
- S: SOAP Apex
- T: SOAP Tooling
- X: XmlRPC

API\_VERSION

**Type**

String

**Description**

The version of the API that's being used.

**Example**

36.0

CLIENT\_IP

**Type**

IP

|               |                                                                                                                                                                                                                                           |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Description</b><br>The IP address of the client that's using Salesforce services.                                                                                                                                                      |
|               | <b>Example</b><br>96.43.144.26                                                                                                                                                                                                            |
| CLIENT_NAME   | <b>Type</b><br>String                                                                                                                                                                                                                     |
|               | <b>Description</b><br>The name of the client that's using Salesforce services.                                                                                                                                                            |
| CPU_TIME      | <b>Type</b><br>Number                                                                                                                                                                                                                     |
|               | <b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| DB_BLOCKS     | <b>Type</b><br>Number                                                                                                                                                                                                                     |
|               | <b>Description</b><br>Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.                                            |
| DB_CPU_TIME   | <b>Type</b><br>Number                                                                                                                                                                                                                     |
|               | <b>Description</b><br>Allows you to monitor trends in database uptime.                                                                                                                                                                    |
| DB_TOTAL_TIME | <b>Type</b><br>Number                                                                                                                                                                                                                     |
|               | <b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.                                  |
| ENTITY_NAME   | <b>Type</b><br>Set                                                                                                                                                                                                                        |
|               | <b>Description</b><br>API objects that are accessed.                                                                                                                                                                                      |
|               | <b>Example</b><br>Account, Opportunity, Contact, and so on.                                                                                                                                                                               |

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

LOGIN\_KEY

**Type**

Id

**Description**

The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.

**Example**

GeJCsym5eyvtEK2l

METHOD\_NAME

**Type**

String

**Description**

The name of the calling Apex method.

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

REQUEST\_SIZE

**Type**

Number

**Description**

The size of the callout request body, in bytes.

REQUEST\_STATUS

**Type**

String

**Description**

The status of the request for a page view or user interface action.

**Possible Values**

- S: Success
- F: Failure
- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

RESPONSE\_SIZE

**Type**

Number

**Description**

The size of the callout response, in bytes.

ROWS\_PROCESSED

**Type**

Number

**Description**

The number of rows that were processed in the request.

**Example**

150

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

QUERY

**Type**

String

**Description**

The SOQL query, if one was performed.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URL events while the user is interacting with an Accounts page.

|                                    |                                                                                                                                                                                               |

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

00590000000011SNIA0

## Asynchronous Report Run

Asynchronous Report Run events are created for reporting requests that are scheduled. This category includes dashboard refreshes, asynchronous reports, schedule reports, and analytics snapshots.

| Field                | Details                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IP            | <b>Type</b><br>IP <b>Description</b><br>The IP address of the client that's using Salesforce services. <b>Example</b><br>96.43.144.26                                                                                                                           |
| CPU_TIME             | <b>Type</b><br>Number <b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| DASHBOARD_ID         | <b>Type</b><br>String <b>Description</b><br>The 15-character ID of the dashboard that was run.                                                                                                                                                                  |
| DASHBOARD_ID_DERIVED | <b>Type</b><br>String <b>Description</b><br>The 18-character case insensitive ID of the dashboard that was run.                                                                                                                                                 |
| DB_TOTAL_TIME        | <b>Type</b><br>Number                                                                                                                                                                                                                                           |

|              |                                                                                                                                                                                                                                                             |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.                                       |
| DB_BLOCKS    | <b>Type</b><br>Number<br><b>Description</b><br>Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.                                     |
| DB_CPU_TIME  | <b>Type</b><br>Number<br><b>Description</b><br>Allows you to monitor trends in database uptime.                                                                                                                                                             |
| DISPLAY_TYPE | <b>Type</b><br>String<br><b>Description</b><br>The report display type, indicating the run mode of the report.<br><b>Possible Values</b> <ul style="list-style-type: none"><li>• D: Dashboard</li><li>• S: Show Details</li><li>• H: Hide Details</li></ul> |
| ENTITY_NAME  | <b>Type</b><br>String<br><b>Description</b><br>The name of the object affected by the trigger.                                                                                                                                                              |
| EVENT_TYPE   | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                              |
| LOGIN_KEY    | <b>Type</b><br>Id                                                                                                                                                                                                                                           |

|                          |                                                                                                                                                                                                                                                                                                                                                                       |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.<br><b>Example</b><br>GeJCsym5eyvtEK2l                                                                                                                               |
| NUMBER_BUCKETS           | <b>Type</b><br>Number<br><b>Description</b><br>The number of buckets that were used in the report.                                                                                                                                                                                                                                                                    |
| NUMBER_COLUMNS           | <b>Type</b><br>Number<br><b>Description</b><br>The number of columns in the report.                                                                                                                                                                                                                                                                                   |
| NUMBER_EXCEPTION_FILTERS | <b>Type</b><br>Number<br><b>Description</b><br>The number of exception filters that are used in the report.                                                                                                                                                                                                                                                           |
| ORGANIZATION_ID          | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                                                                                                                                              |
| RENDERING_TYPE           | <b>Type</b><br>String<br><b>Description</b><br>The report rendering type, describing the format of the report output.<br><b>Possible Values</b> <ul style="list-style-type: none"><li>• w: Web (HTML)</li><li>• E: Email</li><li>• P: Printable</li><li>• X: Excel</li><li>• C: Comma-separated values (CSV)</li><li>• J: JavaScript Object Notation (JSON)</li></ul> |

REPORT\_ID

**Type**

Id

**Description**

The 15-character ID of the report that was run.

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

REQUEST\_STATUS

**Type**

String

**Description**

The status of the request for a page view or user interface action.

**Possible Values**

- S: Success
- F: Failure
- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

SORT

**Type**

String

|                   |                                                                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The sort column and order that was used in the report.                                                                                                                  |
| TIMESTAMP         | <b>Type</b><br>String<br><b>Description</b><br>The access time of Salesforce services.<br><b>Example</b><br>20130715233322.670                                                                |
| TIMESTAMP_DERIVED | <b>Type</b><br>Datetime<br><b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z |
| URI               | <b>Type</b><br>String<br><b>Description</b><br>The URI of the page that's receiving the request.<br><b>Example</b><br>/home/home.jsp                                                          |
| URI_ID_DERIVED    | <b>Type</b><br>ID<br><b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                                                          |
| USER_ID           | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.<br><b>Example</b><br>005300000009M943                   |
| USER_ID_DERIVED   | <b>Type</b><br>Id                                                                                                                                                                             |

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

00590000000011SNIA0

## Bulk API

Bulk API events contain details about Bulk API requests.

| Field       | Details                                                                                                                                                                                                                                                            |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BATCH_ID    | <b>Type</b><br>String<br><b>Description</b><br>The 15-character ID of the Bulk API batch.                                                                                                                                                                          |
| CLIENT_IP   | <b>Type</b><br>IP<br><b>Description</b><br>The IP address of the client that's using Salesforce services.<br><b>Example</b><br>96.43.144.26                                                                                                                        |
| CPU_TIME    | <b>Type</b><br>Number<br><b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| ENTITY_TYPE | <b>Type</b><br>String<br><b>Description</b><br>The type of entity that the Bulk API used.                                                                                                                                                                          |
| EVENT_TYPE  | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                                     |

JOB\_ID

**Type**

String

**Description**

The 15-character ID of the Bulk API job.

LOGIN\_KEY

**Type**

Id

**Description**

The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.

**Example**

GeJCsym5eyvtEK2l

MESSAGE

**Type**

EscapedString

**Description**

Any success or error message that's associated with the request.

NUMBER\_FAILURES

**Type**

Number

**Description**

The number of failures that were returned with the request.

OPERATION\_TYPE

**Type**

String

**Description**

The type of Bulk API operation that was performed.

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Example</b><br>3nWgxWbDKWWDIk0FKfF5DV                                                                                                                                                                                              |
| ROWS_PROCESSED    | <b>Type</b><br>Number<br><b>Description</b><br>The number of rows that were processed in the request.<br><b>Example</b><br>150                                                                                                        |
| RUN_TIME          | <b>Type</b><br>Number<br><b>Description</b><br>The amount of time that the request took in milliseconds.                                                                                                                              |
| SESSION_KEY       | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events for a particular activity session. For example, URL events while the user is interacting with an Accounts page.<br><b>Example</b><br>d7DEq/ANa7nNZZVD |
| SUCCESS           | <b>Type</b><br>Boolean<br><b>Description</b><br>Whether the batch was successful.                                                                                                                                                     |
| TIMESTAMP         | <b>Type</b><br>String<br><b>Description</b><br>The access time of Salesforce services.<br><b>Example</b><br>20130715233322.670                                                                                                        |
| TIMESTAMP_DERIVED | <b>Type</b><br>Datetime<br><b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z                                         |

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

URI\_ID\_DERIVED

**Type**

ID

**Description**

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

## Change Set Operation

Change Set Operation events contain information from change set migrations.

**Field****Details**

CHANGE\_SET\_NAME

**Type**

String

**Description**

The name of the change set.

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

CPU\_TIME

**Type**

Number

|                 |                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The CPU time in milliseconds used to complete the request.<br>This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.                 |
| EVENT_TYPE      | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                               |
| LOGIN_KEY       | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.<br><b>Example</b><br>GeJCsym5eyvtEK2l |
| OPERATION       | <b>Type</b><br>String<br><b>Description</b><br>The operation that's being performed.<br><b>Possible Values</b> <ul style="list-style-type: none"><li>• DEPLOY</li><li>• RETRIEVE</li><li>• LIST</li><li>• DESCRIBE</li></ul>                                 |
| ORGANIZATION_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                                     |
| REQUEST_ID      | <b>Type</b><br>String                                                                                                                                                                                                                                        |

|                   |                                                                                                                                                                            |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.      |
|                   | <b>Example</b><br>3nWgxWbDKWWDik0FKfF5DV                                                                                                                                   |

## Console

Console events contain information about the performance and use of Salesforce Consoles. The Console events are logged whenever a Console tab is opened with a sidebar component. Outside of that, when Console tabs are opened, a regular view record detail event is served just like in Salesforce Classic.

| Field     | Details                                                                              |
|-----------|--------------------------------------------------------------------------------------|
| CLIENT_IP | <b>Type</b><br>IP                                                                    |
|           | <b>Description</b><br>The IP address of the client that's using Salesforce services. |
|           | <b>Example</b><br>96.43.144.26                                                       |

|                      |                                                                                                                                                                                                                                                                    |

| CONSOLE_ID_DERIVED   | <b>Type</b><br>Id<br><b>Description</b><br>The 18-character, case-insensitive ID of the console.                                                                                                                                                                   |
| CPU_TIME             | <b>Type</b><br>Number<br><b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| DB_TOTAL_TIME        | <b>Type</b><br>Number<br><b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.                     |
| EVENT_TYPE           | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                                     |
| LOGIN_KEY            | <b>Type</b><br>Id                                                                                                                                                                                                                                                  |

|                   |                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.                                          |
|                   | <b>Example</b><br>GeJCsym5eyvtEK2l                                                                                                                                                                                                         |
| ORGANIZATION_ID   | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                   |
| RECORD_ID         | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the record that's associated with the console.                                                                                                                           |
| RECORD_ID_DERIVED | <b>Type</b><br>Id<br><b>Description</b><br>The 18-character, case-insensitive ID of the record that's associated with the console.                                                                                                         |
| RELATED_ENTITY_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the record that's associated with the delivery distribution.                                                                                                             |
| REQUEST_ID        | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDik0FKfF5DV |
| REQUEST_STATUS    | <b>Type</b><br>String                                                                                                                                                                                                                      |

|                   |                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The status of the request for a page view or user interface action.                                                                                                                                             |
|                   | <b>Possible Values</b> <ul style="list-style-type: none"><li>• S: Success</li><li>• F: Failure</li><li>• U: Undefined</li><li>• A: Authorization Error</li><li>• R: Redirect</li><li>• N: Not Found</li></ul>                         |
| RUN_TIME          | <b>Type</b><br>Number<br><b>Description</b><br>The amount of time that the request took in milliseconds.                                                                                                                              |
| SESSION_KEY       | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.<br><b>Example</b><br>d7DEq/ANa7nNZZVD |
| TIMESTAMP         | <b>Type</b><br>String<br><b>Description</b><br>The access time of Salesforce services.<br><b>Example</b><br>20130715233322.670                                                                                                        |
| TIMESTAMP_DERIVED | <b>Type</b><br>Datetime<br><b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z                                         |

## Content Distribution

Content Distribution events contain information about content distributions and deliveries to users.

| Field  | Details                                                                                                   |
|--------|-----------------------------------------------------------------------------------------------------------|
| ACTION | <b>Type</b><br>String                                                                                     |
|        | <b>Description</b><br>The action that's used when a delivery is viewed.                                   |
|        | <b>Possible Values</b> <ul style="list-style-type: none"><li>VIEW</li><li>INSERT</li><li>UPDATE</li></ul> |

DELIVERY\_ID

**Type**

Id

**Description**

The 15-character ID of the content delivery.

DELIVERY\_LOCATION

**Type**

String

**Description**

The location of the delivery.

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

RELATED\_ENTITY\_ID

**Type**

Id

**Description**

The 15-character ID of the record that's associated with the delivery distribution.

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

|                   |                                                                                                                                                                                               |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Example</b><br>20130715233322.670                                                                                                                                                          |
| TIMESTAMP_DERIVED | <b>Type</b><br>Datetime<br><b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z |
| USER_ID           | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.<br><b>Example</b><br>00530000009M943                    |
| VERSION_ID        | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the content version.                                                                                                        |

## Content Document Link

Content Document Link events contain sharing information for content documents.

| Field       | Details                                                                                                                                        |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| DOCUMENT_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the document that's being shared.                                            |
| EVENT_TYPE  | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on. |

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

SHARED\_WITH\_ENTITY\_ID

**Type**

Id

**Description**

Who the document was shared with.

SHARING\_OPERATION

**Type**

String

**Description**

The type of sharing operation on the document.

**Possible Values**

- INSERT
- UPDATE
- DELETE

SHARING\_PERMISSION

**Type**

String

**Description**

What permissions the document was shared with.

**Possible Values**

- v: Viewer
- c: Collaborator
- i: Inferred—that is, the sharing permissions were inferred from a relationship between the viewer and document. For example, a document's owner has a sharing permission to the document itself. Or, a document can be a part of a content collection, and the viewer has sharing permissions

to the collection rather than explicit permissions to the document directly.

**FIELD**  
TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

**FIELD**  
TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

**FIELD**  
USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

## Content Transfer

Content Transfer events contain information about content transfer events, such as downloads, uploads, and previews.

**Field****Details**

**FIELD**  
DOCUMENT\_ID

**Type**

Id

**Description**

The 15-character ID of the document that's being shared.

**FIELD**  
DOCUMENT\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the document that's being shared.

|                   |                                                                                                                                                                                                                                            |

VERSION\_ID\_DERIVED

**Type**  
Id**Description**

The 18-character case insensitive ID of the content version.

## Dashboard

Dashboard events contain details about dashboards that users view.

**Field****Details**

CLIENT\_IP

**Type**  
IP**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

CPU\_TIME

**Type**  
Number**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DASHBOARD\_COMPONENT\_ID

**Type**  
Id**Description**

The 15-character ID of the dashboard component.

DASHBOARD\_ID

**Type**  
String**Description**

The 15-character ID of the dashboard that was run.

DASHBOARD\_ID\_DERIVED

**Type**  
String**Description**

The 18-character case insensitive ID of the dashboard that was run.

DASHBOARD\_TYPE

**Type**

String

**Description**

The type of dashboard.

**Possible Values**

- R: Run as running user
- C: Run as context user
- S: Run as specific user

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

IS\_SCHEDULED

**Type**

Boolean

**Description**The value is `true` if the dashboard is a scheduled dashboard.

IS\_SUCCESS

**Type**

Boolean

**Description**

1 if the dashboard component ran successfully, 0 if it didn't.

LOGIN\_KEY

**Type**

Id

**Description**

The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.

**Example**

GeJCsym5eyvtEK2l

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

| REQUEST_ID      | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDIk0FKfF5DV |

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

## Login As

Login As events contain details about what an administrator did while logged in as another user.

**Field****Details**

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

DELEGATED\_USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.

DELEGATED\_USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case-insensitive ID of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.

DELEGATED\_USER\_NAME

**Type**

String

**Description**

The username of the user who's using Salesforce services through the UI or API. In this case, the user who's doing the impersonation.

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDIk0FKfF5DV

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

00590000000I1SNIA0

## Login

Login events contain details about your organization's user login history.

**Field****Details**

API\_TYPE

**Type**

String

**Description**

The type of API request.

**Possible Values**

- D: Apex Class
- E: SOAP Enterprise
- I: SOAP Cross Instance
- L: Live Agent
- M: SOAP Metadata
- O: Old SOAP
- P: SOAP Partner
- R: REST API
- S: SOAP Apex
- T: SOAP Tooling
- X: XmlRPC

API\_VERSION

**Type**

String

**Description**

The version of the API that's being used.

**Example**

36.0

BROWSER\_TYPE

**Type**

String

**Description**

The browser used for login.

**Example Values**

- 10011000: Internet Explorer Desktop 11
- 10011001: Internet Explorer Mobile 11
- 11035000: Firefox Desktop 35
- 11035001: Firefox Mobile 35
- 13050000: Chrome Desktop 50
- 13050001: Chrome Mobile 50
- 14012000: Safari Desktop 12
- 14012001: Safari Mobile 12

CIPHER\_SUITE

**Type**

String

**Description**

The TLS cipher suite used for the login. Values are OpenSSL-style cipher suite names, with hyphen delimiters. For more information, see [OpenSSL Cryptography and SSL/TLS Toolkit](#).

CPU\_TIME

**Type**

Number

**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

DB\_TOTAL\_TIME

**Type**

Number

**Description**

The time in nanoseconds for a database round trip. Compare this field to CPU\_TIME to determine whether performance issues are occurring in the database layer or in your own code.

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

LOGIN\_KEY

**Type**

Id

**Description**

The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.

**Example**

GeJCsym5eyvtEK2l

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

REQUEST\_STATUS

**Type**

String

**Description**

The status of the request for a page view or user interface action.

**Possible Values**

- S: Success
- F: Failure
- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

SOURCE\_IP

**Type**

IP

**Description**

The source IP of the login request.

TIMESTAMP

**Type**

String

|                   |                                                                                                                                  |

| TLS_PROTOCOL      | <b>Type</b><br>String                                                                                                            |
|                   | <b>Description</b><br>The TLS protocol used for the login.                                                                       |
|                   | <b>Example</b><br>There are 3 possible values. <ul style="list-style-type: none"><li>• 1.0</li><li>• 1.1</li><li>• 1.2</li></ul> |
| URI               | <b>Type</b><br>String                                                                                                            |
|                   | <b>Description</b><br>The URI of the page that's receiving the request.                                                          |
|                   | <b>Example</b><br>/home/home.jsp                                                                                                 |
| URI_ID_DERIVED    | <b>Type</b><br>ID                                                                                                                |
|                   | <b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                  |
| USER_ID           | <b>Type</b><br>Id                                                                                                                |
|                   | <b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.                 |
|                   | <b>Example</b><br>00530000009M943                                                                                                |

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

0059000000001SNIA0

USER\_NAME

**Type**

String

**Description**

The username that's used for login.

## Logout

Logout events contain details of user logouts.

**Field****Details**

API\_TYPE

**Type**

String

**Description**

The type of API request.

**Possible Values**

- D: Apex Class
- E: SOAP Enterprise
- I: SOAP Cross Instance
- L: Live Agent
- M: SOAP Metadata
- O: Old SOAP
- P: SOAP Partner
- R: REST API
- S: SOAP Apex
- T: SOAP Tooling
- X: XmlRPC

API\_VERSION

**Type**

String

**Description**

The version of the API that's being used.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>Example</b><br>36.0                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| CLIENT_VERSION | <b>Type</b><br>Number<br><b>Description</b><br>The version of the client that was in use upon logging out.                                                                                                                                                                                                                                                                                                                                                                      |

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

PLATFORM\_TYPE

**Type**

Number

**Description**

The code for the client platform. If a timeout caused the logout, this field is null.

**Example Values**

- 1000: Windows
- 2003: Macintosh/Apple OSX
- 5005: Android
- 5006: iPhone
- 5007: iPad

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

RESOLUTION\_TYPE

**Type**

Number

**Description**

The screen resolution of the client. If a timeout caused the logout, this field is null.

SESSION\_LEVEL

**Type**

String

**Description**

The security level of the session that was used when logging out.

**Possible Values**

- 1: Standard Session
- 2: High-Assurance Session

SESSION\_TYPE

**Type**

String

**Description**

The session type that was used when logging out.

**Possible Values**

- A: API
- I: APIOnlyUser
- N: ChatterNetworks
- Z: ChatterNetworksAPIOnly
- C: Content
- P: OAuthApprovalUI
- O: OAuth2
- T: SiteStudio
- R: SitePreview
- S: SubstituteUser
- B: TempContentExchange
- G: TempOAuthAccessTokenFrontdoor
- Y: TempVisualforceExchange
- F: TempUIFrontdoor
- U: UI
- E: UserSite
- V: Visualforce
- W: WDC\_API

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

|                          | <b>Example</b><br>00530000009M943                                                                                                                                          |

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

0059000000001SNIA0

## Multiblock Report

Multiblock Report events contain details about Joined Report reports.

**Field****Details**

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

CPU\_TIME

**Type**

Number

**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DB\_TOTAL\_TIME

**Type**

Number

**Description**

The time in nanoseconds for a database round trip. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

HAS\_CHART

**Type**

Boolean

**Description**

True if the report has a chart.

LOGIN\_KEY

**Type**

Id

**Description**

The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.

**Example**

GeJCsym5eyvtEK2l

MASTER\_REPORT\_ID

**Type**

String

**Description**

The 15-character ID of the master report.

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

REQUEST\_STATUS

**Type**

String

**Description**

The status of the request for a page view or user interface action.

**Possible Values**

- S: Success
- F: Failure

- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nZZVD

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

URI\_ID\_DERIVED

**Type**

ID

|                 |                                                                                                                                                                                                 |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                                                                                 |
| USER_ID         | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.<br><b>Example</b><br>005300000009M943                     |
| USER_ID_DERIVED | <b>Type</b><br>Id<br><b>Description</b><br>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.<br><b>Example</b><br>005900000000I1SNIA0 |

## Package Install

Package Install events contain details about package installation in the organization.

| Field      | Details                                                                                                                                                                                                                                                            |

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

URI\_ID\_DERIVED

**Type**

ID

**Description**

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

005900000001SNIA0

## Queued Execution

Queued Execution events contain details about queued executions—for example, batch Apex.

| Field         | Details                                                                                                                                                                                                                                                                                                        |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IP     | <p><b>Type</b><br/>IP</p> <p><b>Description</b><br/>The IP address of the client that's using Salesforce services.</p> <p><b>Example</b><br/>96.43.144.26</p>                                                                                                                                                  |
| CPU_TIME      | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>The CPU time in milliseconds that it took to complete the batch apex request. This field indicates the amount of activity taking place in the app server layer, allowing you to identify pieces of Apex or Visualforce code that need refactoring.</p> |
| DB_TOTAL_TIME | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.</p>                                                    |
| ENTRY_POINT   | <p><b>Type</b><br/>String</p> <p><b>Description</b><br/>The name of the Apex class that serves as the execution point for the batch job.</p> <p><b>Example</b><br/>TaskPhoneExtensionBatchUpdate</p>                                                                                                           |
| EVENT_TYPE    | <p><b>Type</b><br/>String</p> <p><b>Description</b><br/>The type of event.</p> <p><b>Example</b><br/>ReportExport, URI, UITracking, API, RestApi, and so on.</p>                                                                                                                                               |
| JOB_ID        | <p><b>Type</b><br/>String</p>                                                                                                                                                                                                                                                                                  |

| Field           | Details                                                                                                                                                                                                                                                                        |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <p><b>Description</b><br/>The ID of the batch Apex job.</p> <p><b>Example</b><br/>7073000000IDquo</p>                                                                                                                                                                          |
| LOGIN_KEY       | <p><b>Type</b><br/>Id</p> <p><b>Description</b><br/>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.</p> <p><b>Example</b><br/>GeJCsym5eyvtEK2l</p> |
| ORGANIZATION_ID | <p><b>Type</b><br/>Id</p> <p><b>Description</b><br/>The 15-character ID of the organization.</p> <p><b>Example</b><br/>00D0000000000123</p>                                                                                                                                    |
| REQUEST_ID      | <p><b>Type</b><br/>String</p> <p><b>Description</b><br/>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.</p> <p><b>Example</b><br/>3nWgxWbDKWWDik0FKfF5DV</p>                   |
| RUN_TIME        | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>The amount of time that the request took in milliseconds.</p>                                                                                                                                                          |
| SESSION_KEY     | <p><b>Type</b><br/>Id</p> <p><b>Description</b><br/>The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.</p>                                                                   |

| Field             | Details                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Example</b><br>d7DEq/ANa7nNZZVD                                                                                                                                                            |
| TIMESTAMP         | <b>Type</b><br>String<br><b>Description</b><br>The access time of Salesforce services.<br><b>Example</b><br>20130715233322.670                                                                |
| TIMESTAMP_DERIVED | <b>Type</b><br>Datetime<br><b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z |
| URI               | <b>Type</b><br>String<br><b>Description</b><br>The URI of the page that's receiving the request.<br><b>Example</b><br>/home/home.jsp                                                          |
| URI_ID_DERIVED    | <b>Type</b><br>ID<br><b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                                                          |
| USER_ID           | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.<br><b>Example</b><br>00530000009M943                    |

# Report

Report events contain information about what happened when a user ran a report.

| Field         | Details                                                                                                                                                                                                                                                                         |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IP     | <p><b>Type</b><br/>IP</p> <p><b>Description</b><br/>The IP address of the client that's using Salesforce services.</p> <p><b>Example</b><br/>96.43.144.26</p>                                                                                                                   |
| CPU_TIME      | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p> |
| DB_BLOCKS     | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.</p>                                            |
| DB_CPU_TIME   | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>Allows you to monitor trends in database uptime.</p>                                                                                                                                                                    |
| DB_TOTAL_TIME | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code.</p>                     |
| DISPLAY_TYPE  | <p><b>Type</b><br/>String</p> <p><b>Description</b><br/>The report display type, indicating the run mode of the report.</p>                                                                                                                                                     |

|                          |                                                                                                                                                                                                                                                              |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <b>Possible Values</b> <ul style="list-style-type: none"><li>• D: Dashboard</li><li>• S: Show Details</li><li>• H: Hide Details</li></ul>                                                                                                                    |
| ENTITY_NAME              | <b>Type</b><br>String<br><b>Description</b><br>The name of the object affected by the trigger.                                                                                                                                                               |
| EVENT_TYPE               | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                               |
| LOGIN_KEY                | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.<br><b>Example</b><br>GeJCsym5eyvtEK2l |
| NUMBER_BUCKETS           | <b>Type</b><br>Number<br><b>Description</b><br>The number of buckets that were used in the report.                                                                                                                                                           |
| NUMBER_COLUMNS           | <b>Type</b><br>Number<br><b>Description</b><br>The number of columns in the report.                                                                                                                                                                          |
| NUMBER_EXCEPTION_FILTERS | <b>Type</b><br>Number<br><b>Description</b><br>The number of exception filters that are used in the report.                                                                                                                                                  |
| ORGANIZATION_ID          | <b>Type</b><br>Id                                                                                                                                                                                                                                            |

|                   |                                                                                                                                                                                                                                                                                                                                                                       |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The 15-character ID of the organization.                                                                                                                                                                                                                                                                                                        |
|                   | <b>Example</b><br>00D000000000123                                                                                                                                                                                                                                                                                                                                     |

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

SORT

**Type**

String

**Description**

The sort column and order that was used in the report.

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

URI\_ID\_DERIVED

**Type**

ID

**Description**

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

0059000000001SNIA0

## Report Export

Report Export events contain details about reports that a user exported.

**Field****Details**

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

CLIENT\_INFO

**Type**

String

**Description**

Information about the client that's using Salesforce services.

CPU\_TIME

**Type**

Number

**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

LOGIN\_KEY

**Type**

Id

**Description**

The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.

**Example**

GeJCsym5eyvtEK2l

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REPORT\_DESCRIPTION

**Type**

String

**Description**

Information about the report that was run.

REQUEST\_ID

**Type**

String

|                   |                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDik0FKfF5DV                     |
| RUN_TIME          | <b>Type</b><br>Number<br><b>Description</b><br>The amount of time that the request took in milliseconds.                                                                                                                              |
| SESSION_KEY       | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.<br><b>Example</b><br>d7DEq/ANa7nNZZVD |
| TIMESTAMP         | <b>Type</b><br>String<br><b>Description</b><br>The access time of Salesforce services.<br><b>Example</b><br>20130715233322.670                                                                                                        |
| TIMESTAMP_DERIVED | <b>Type</b><br>Datetime<br><b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z                                         |
| URI               | <b>Type</b><br>String<br><b>Description</b><br>The URI of the page that's receiving the request.<br><b>Example</b><br>/home/home.jsp                                                                                                  |

URI\_ID\_DERIVED

**Type**  
ID**Description**

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER\_ID

**Type**  
Id**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

USER\_ID\_DERIVED

**Type**  
Id**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

00590000000I1SNIA0

## REST API

REST API events contain details about REST-specific requests.

**Field****Details**

CLIENT\_IP

**Type**  
IP**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

CPU\_TIME

**Type**  
Number**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

DB\_BLOCKS

**Type**

Number

**Description**

Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.

DB\_CPU\_TIME

**Type**

Number

**Description**

Allows you to monitor trends in database uptime.

DB\_TOTAL\_TIME

**Type**

Number

**Description**

The time in nanoseconds for a database round trip. Compare this field to `CPU_TIME` to determine whether performance issues are occurring in the database layer or in your own code.

ENTITY\_NAME

**Type**

Set

**Description**

API objects that are accessed.

**Example**

Account, Opportunity, Contact, and so on.

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

LOGIN\_KEY

**Type**

Id

**Description**

The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.

**Example**

GeJCsym5eyvtEK2l

MEDIA\_TYPE

**Type**

String

|                 |                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The media type of the response.                                                                                                                                                                                                                                                                               |
| METHOD          | <b>Type</b><br>String<br><b>Description</b><br>The HTTP method of the request—GET, POST, PUT, and so on.                                                                                                                                                                                                                            |
| NUMBER_FIELDS   | <b>Type</b><br>Number<br><b>Description</b><br>The number of fields or columns, where applicable.                                                                                                                                                                                                                                   |
| ORGANIZATION_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                                                                                                            |
| REQUEST_STATUS  | <b>Type</b><br>String<br><b>Description</b><br>The status of the request for a page view or user interface action.<br><b>Possible Values</b> <ul style="list-style-type: none"><li>• S: Success</li><li>• F: Failure</li><li>• U: Undefined</li><li>• A: Authorization Error</li><li>• R: Redirect</li><li>• N: Not Found</li></ul> |
| REQUEST_ID      | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDIk0FKfF5DV                                                                                          |

ROWS\_PROCESSED

**Type**

Number

**Description**

The number of rows that were processed in the request.

**Example**

150

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

STATUS\_CODE

**Type**

Number

**Description**

The HTTP status code for the response.

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

URI

**Type**

String

|                 |                                                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The URI of the page that's receiving the request.                                                                 |
|                 | <b>Example</b><br>/home/home.jsp                                                                                                        |
| URI_ID_DERIVED  | <b>Type</b><br>ID                                                                                                                       |
|                 | <b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                         |
| USER_AGENT      | <b>Type</b><br>Number                                                                                                                   |
|                 | <b>Description</b><br>The numeric code for the type of client used to make the request (for example, the browser, application, or API). |
| USER_ID         | <b>Type</b><br>Id                                                                                                                       |
|                 | <b>Description</b><br>The 15-character ID of the user who's using Salesforce services through the UI or the API.                        |
|                 | <b>Example</b><br>005300000009M943                                                                                                      |
| USER_ID_DERIVED | <b>Type</b><br>Id                                                                                                                       |
|                 | <b>Description</b><br>The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.       |

## Sites

Sites events contain details of Site.com requests. Requests can originate from the browser (UI) or the API.

| Field     | Details                                                                                                                                     |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IP | <b>Type</b><br>IP<br><b>Description</b><br>The IP address of the client that's using Salesforce services.<br><b>Example</b><br>96.43.144.26 |
| CPU_TIME  | <b>Type</b><br>Number                                                                                                                       |

|                  |                                                                                                                                                                                                                                                    |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.          |
| DB_TOTAL_TIME    | <b>Type</b><br>Number<br><br><b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code. |
| EVENT_TYPE       | <b>Type</b><br>String<br><br><b>Description</b><br>The type of event.<br><br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                             |
| HTTP_HEADERS     | <b>Type</b><br>String<br><br><b>Description</b><br>The HTTP headers that were sent in the request.                                                                                                                                                 |
| METHOD           | <b>Type</b><br>String<br><br><b>Description</b><br>The HTTP method of the request—GET, POST, PUT, and so on.                                                                                                                                       |
| IS_API           | <b>Type</b><br>Boolean<br><br><b>Description</b><br>True if this page was an API or Web Services request.                                                                                                                                          |
| IS_ERROR         | <b>Type</b><br>Boolean<br><br><b>Description</b><br>True if this page was an error page.                                                                                                                                                           |

|                   | <b>Example</b><br>/home/home.jsp                                                                                                                                           |
| USER_ID           | <b>Type</b><br>Id                                                                                                                                                          |

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

005300000009M943

---

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

005900000000I1SNIA0

---

## Time-Based Workflow

Time-Based Workflow events contain details about queue activity monitoring.

**Field****Details**

DATA

**Type**

String

**Description**

The record details of time queue activity.

---

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

---

LOG\_GROUP\_ID

**Type**

String

**Description**

Marks log records that are committed or rolled back.

---

NUMBER\_OF\_RECORDS

**Type**

Number

**Description**

The number of processed records.

---

ORGANIZATION\_ID

**Type**

Id

**Description**

The 15-character ID of the organization.

**Example**

00D000000000123

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

TYPE

**Type**

String

**Description**

The type of Apex callout.

**Example**

REST or AJAX

## Transaction Security

Transaction Security events contain details about policy execution.

| Field              | Details                                                                                                                                                                                                                                                                                                                               |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CLIENT_IP          | <p><b>Type</b><br/>IP</p> <p><b>Description</b><br/>The IP address of the client that's using Salesforce services.</p> <p><b>Example</b><br/>96.43.144.26</p>                                                                                                                                                                         |
| CPU_TIME           | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.</p>                                                       |
| EVALUATION_TIME_MS | <p><b>Type</b><br/>Number</p> <p><b>Description</b><br/>The time in milliseconds used to evaluate the policy.</p>                                                                                                                                                                                                                     |
| EVENT_TIMESTAMP    | <p><b>Type</b><br/>String</p> <p><b>Description</b><br/>The time at which the Transaction Security event was generated in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ). This value may be earlier than TIMESTAMP_DERIVED by the amount of time taken to log the event.</p> <p><b>Example</b><br/>2015-07-27T11:32:59.555Z</p> |
| EVENT_TYPE         | <p><b>Type</b><br/>String</p> <p><b>Description</b><br/>The type of event.</p> <p><b>Example</b><br/>ReportExport, URI, UITracking, API, RestApi, and so on.</p>                                                                                                                                                                      |
| LOGIN_KEY          | <p><b>Type</b><br/>Id</p>                                                                                                                                                                                                                                                                                                             |

|                   |                                                                                                                                                                                                                                            |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.                                          |
|                   | <b>Example</b><br>GeJCsym5eyvtEK2l                                                                                                                                                                                                         |
| ORGANIZATION_ID   | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                   |
| POLICY_ID         | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the policy being evaluated.<br><b>Example</b><br>00530000009M943                                                                                                         |
| POLICY_ID_DERIVED | <b>Type</b><br>Id<br><b>Description</b><br>The 18-character case-insensitive ID of the policy being evaluated.<br><b>Example</b><br>0059000000011SNIA0                                                                                     |
| REQUEST_ID        | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDIk0FKfF5DV |
| RESULT            | <b>Type</b><br>String<br><b>Description</b><br>The outcome of evaluating the policy.                                                                                                                                                       |

|                   |                                                                                                                                                                                                                                                                                                                          |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Example</b><br>TRIGGERED or NOT TRIGGERED                                                                                                                                                                                                                                                                             |
| RUN_TIME          | <b>Type</b><br>Number<br><br><b>Description</b><br>The amount of time that the request took in milliseconds.                                                                                                                                                                                                             |
| SESSION_KEY       | <b>Type</b><br>Id<br><br><b>Description</b><br>The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.<br><br><b>Example</b><br>d7DEq/ANa7nNZZVD                                                                            |

---

APP\_NAME

**Type**

EscapedString

**Description**

The name of the application that the user accessed.

---

BROWSER\_NAME

**Type**

String

**Description**

The name of the browser that's accessed by the user.

---

BROWSER\_VERSION

**Type**

String

**Description**

The browser version that's accessed by the user.

---

CARRIER

**Type**

String

**Description**

The name of the cellular service provider.

---

CLIENT

**Type**

EscapedString

**Description**

The context of access.

**Example**

Phone, tablet, desktop, and so on.

---

CLIENT\_ID

**Type**

String

**Description**

The API client ID.

---

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

---

CONNECTION\_TYPE

**Type**

String

**Description**

The type of the connection.

**Possible Values**

- WIFI
- CDMA1x
- CDMA
- EDGE
- EVDO0
- EVDOA
- EVDOB
- GPRS
- HSDPA
- HSUPA
- HRPD
- LTE

DELTA

**Type**

Number

**Description**

The elapsed time between the start and end of the event in milliseconds.

DEVICE\_ID

**Type**

String

**Description**

The unique device identifier.

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

LOCATION

**Type**

EscapedString

|                 |                                                                                                                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The hierarchical location.                                                                                                                                                          |
| NETWORK_ID      | <b>Type</b><br>Id<br><b>Description</b><br>The network ID of the request.                                                                                                                                 |
| NUMBER1         | <b>Type</b><br>Number<br><b>Description</b><br>The record of a numeric value based on the operation. For example, the number of results returned by a search.                                             |
| NUMBER2         | <b>Type</b><br>Number<br><b>Description</b><br>The record of a numeric value based on operation, but for multiple values.<br><b>Example</b><br>NUMBER1 items selected in a list containing NUMBER2 items. |
| OBJECT_TYPE     | <b>Type</b><br>String<br><b>Description</b><br>The API name of the record in the action.                                                                                                                  |
| ORGANIZATION_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                  |
| OS_NAME         | <b>Type</b><br>String<br><b>Description</b><br>The operating system name.                                                                                                                                 |
| OS_VERSION      | <b>Type</b><br>String<br><b>Description</b><br>The operating system version.                                                                                                                              |

PAGE\_OPTION

**Type**

String

**Description**

A comma-separated list of additional information about the current page.

**Example**

isVisualforce

RECORD\_ID

**Type**

Id

**Description**

The ID of the record the user accessed.

RECORD\_TYPE\_ID

**Type**

Id

**Description**

The ID of the record type the user accessed.

REFERRER

**Type**

EscapedString

**Description**

The HTTP referrer header.

REQUEST\_METHOD

**Type**

String

**Description**

The HTTP request method.

SDK\_APP\_NAME

**Type**

String

**Description**

The name of the mobile SDK application that's installed on the device.

**Example**

Salesforce1

SDK\_APP\_TYPE

**Type**

String

**Description**

The mobile SDK application type.

**Example**

Native, hybrid, and so on.

SDK\_APP\_VERSION

**Type**

String

**Description**

The mobile SDK application version.

**Example**

5.0

SDK\_MODEL

**Type**

String

**Description**

The model of the mobile SDK application that's installed on the device.

**Example**

Salesforce1

SDK\_VERSION

**Type**

String

**Description**

The mobile SDK version.

**Example**

2.1.0

SESSION\_ID

**Type**

String

**Description**

The user's unique session ID.

SIGNAL\_STRENGTH

**Type**

Number

**Description**

The cellular signal strength.

STATUS

**Type**

Boolean

**Description**

Indicates whether an error was logged. Information is logged in data.

TARGET

**Type**

EscapedString

**Description**

The request target.

TARGET2

**Type**

EscapedString

**Description**

Additional information for the request target.

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

UNIQUE\_PAGE\_ID

**Type**

String

**Description**

The unique request ID for all the requests from 1 page.

USAGE\_TIMESTAMP

**Type**

String

**Description**

The time when the usage occurred. Format: YYYYMMDDHHMMSS.sss.

USER\_AGENT

**Type**

Escaped String

**Description**

The numeric code for the type of client used to make the request (for example, the browser, application, or API) as a string.

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## URI

URI events contain details about user interaction with the web browser UI.

| Field     | Details           |
|-----------|-------------------|
| CLIENT_IP | <b>Type</b><br>IP |

|               |                                                                                                                                                                                                                                                                    |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               | <b>Description</b><br>The IP address of the client that's using Salesforce services.                                                                                                                                                                               |
|               | <b>Example</b><br>96.43.144.26                                                                                                                                                                                                                                     |
| CPU_TIME      | <b>Type</b><br>Number<br><b>Description</b><br>The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring. |
| DB_BLOCKS     | <b>Type</b><br>Number<br><b>Description</b><br>Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.                                            |
| DB_CPU_TIME   | <b>Type</b><br>Number<br><b>Description</b><br>Allows you to monitor trends in database uptime.                                                                                                                                                                    |
| DB_TOTAL_TIME | <b>Type</b><br>Number<br><b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to CPU_TIME to determine whether performance issues are occurring in the database layer or in your own code.                                  |
| EVENT_TYPE    | <b>Type</b><br>IP<br><b>Description</b><br>The IP address of the client that's using Salesforce services.<br><b>Example</b><br>96.43.144.26                                                                                                                        |
| LOGIN_KEY     | <b>Type</b><br>Id                                                                                                                                                                                                                                                  |

|                 |                                                                                                                                                                                                                                                                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.                                                                                                                                   |
|                 | <b>Example</b><br>GeJCsym5eyvtEK2l                                                                                                                                                                                                                                                                                                  |
| ORGANIZATION_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                                                                                                            |
| REFERRER_URI    | <b>Type</b><br>String<br><b>Description</b><br>The referring URI of the page that's receiving the request.                                                                                                                                                                                                                          |
| REQUEST_ID      | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDIk0FKfF5DV                                                                                          |
| REQUEST_STATUS  | <b>Type</b><br>String<br><b>Description</b><br>The status of the request for a page view or user interface action.<br><b>Possible Values</b> <ul style="list-style-type: none"><li>• S: Success</li><li>• F: Failure</li><li>• U: Undefined</li><li>• A: Authorization Error</li><li>• R: Redirect</li><li>• N: Not Found</li></ul> |
| RUN_TIME        | <b>Type</b><br>Number                                                                                                                                                                                                                                                                                                               |

|                   |                                                                                                                                                                                                                                       |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                   | <b>Description</b><br>The amount of time that the request took in milliseconds.                                                                                                                                                       |
| SESSION_KEY       | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.<br><b>Example</b><br>d7DEq/ANa7nNZZVD |
| TIMESTAMP         | <b>Type</b><br>String<br><b>Description</b><br>The access time of Salesforce services.<br><b>Example</b><br>20130715233322.670                                                                                                        |
| TIMESTAMP_DERIVED | <b>Type</b><br>Datetime<br><b>Description</b><br>The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)<br><b>Example</b><br>2015-07-27T11:32:59.555Z                                         |
| URI               | <b>Type</b><br>String<br><b>Description</b><br>The URI of the page that's receiving the request.<br><b>Example</b><br>/home/home.jsp                                                                                                  |
| URI_ID_DERIVED    | <b>Type</b><br>ID<br><b>Description</b><br>The 18-character case insensitive ID of the URI of the page that's receiving the request.                                                                                                  |
| USER_ID           | <b>Type</b><br>Id                                                                                                                                                                                                                     |

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

---

USER\_ID\_DERIVED

**Type**

Id

**Description**

The 18-character case insensitive ID of the user who's using Salesforce services through the UI or the API.

**Example**

00590000000I1SNIA0

---

## Visualforce Request

VISUALFORCE\_\_REQUEST\_EVENT events contain details of Visualforce requests. Requests can originate from the browser (UI) or the API.

**Field****Details**

---

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

---

CONTROLLER\_TYPE

**Type**

Number

**Description**

The type of controller that's used by the requested Visualforce page.

---

CPU\_TIME

**Type**

Number

**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

---

DB\_BLOCKS

**Type**

Number

---

|------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  | <b>Description</b><br>Indicates how much activity is occurring in the database. A high value for this field suggests that adding indexes or filters on your queries would benefit performance.                                                 |
| DB_CPU_TIME      | <b>Type</b><br>Number<br><b>Description</b><br>Allows you to monitor trends in database uptime.                                                                                                                                                |
| DB_TOTAL_TIME    | <b>Type</b><br>Number<br><b>Description</b><br>The time in nanoseconds for a database round trip. Compare this field to <code>CPU_TIME</code> to determine whether performance issues are occurring in the database layer or in your own code. |
| EVENT_TYPE       | <b>Type</b><br>String<br><b>Description</b><br>The type of event.<br><b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                 |
| HTTP_METHOD      | <b>Type</b><br>String<br><b>Description</b><br>The HTTP method of the request—GET, POST, PUT, and so on.                                                                                                                                       |
| IS_AJAX_REQUEST  | <b>Type</b><br>Boolean<br><b>Description</b><br>The value is <code>true</code> if the request is a partial page request.                                                                                                                       |
| IS_FIRST_REQUEST | <b>Type</b><br>Boolean<br><b>Description</b><br>1 if this page is the first Visualforce transaction in the request, or 0 if it isn't.                                                                                                          |
| LOGIN_KEY        | <b>Type</b><br>Id                                                                                                                                                                                                                              |

|                           |                                                                                                                                                                                                                                            |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.<br><b>Example</b><br>GeJCsym5eyvtEK2l    |
| MANAGED_PACKAGE_NAMESPACE | <b>Type</b><br>String<br><b>Description</b><br>If the page is part of a managed package, the namespace of that package.                                                                                                                    |
| ORGANIZATION_ID           | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D0000000000123                                                                                                                  |
| PAGE_NAME                 | <b>Type</b><br>String<br><b>Description</b><br>The name of the Visualforce page that was requested.                                                                                                                                        |
| QUERY                     | <b>Type</b><br>String<br><b>Description</b><br>The SOQL query, if one was performed.                                                                                                                                                       |
| REQUEST_ID                | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDIk0FKfF5DV |
| REQUEST_SIZE              | <b>Type</b><br>Number<br><b>Description</b><br>The size of the request body, in bytes.                                                                                                                                                     |

REQUEST\_STATUS

**Type**

String

**Description**

The status of the request for a page view or user interface action.

**Possible Values**

- S: Success
- F: Failure
- U: Undefined
- A: Authorization Error
- R: Redirect
- N: Not Found

REQUEST\_TYPE

**Type**

String

**Description**

The request type.

**Possible Values**

- page: a normal request for a page
- content\_UI: a content request for a page that originated in the user interface
- content\_apex: a content request initiated by an Apex call
- PDF\_UI: a request for a page in PDF format through the user interface
- PDF\_apex: a request for PDF format by an Apex call (usually a Web Service call)

RESPONSE\_SIZE

**Type**

Number

**Description**

The size of the response, in bytes.

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

|                          |                                                                                                                                                                            |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>USER_ID</b>           | <b>Type</b><br>Id                                                                                                                                                          |

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

---

VIEW\_STATE\_SIZE

**Type**

Number

**Description**

The size of the Visualforce view state, in bytes.

---

## Wave Change

Wave Change events represent route or page changes made in the Salesforce Wave Analytics user interface.

**Field****Details**

---

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

---

CPU\_TIME

**Type**

Number

**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

---

EVENT\_TYPE

**Type**

String

**Description**

The type of event.

**Example**

ReportExport, URI, UITracking, API, RestApi, and so on.

---

IS\_NEW

**Type**

Boolean

---

|                 |                                                                                                                                                                                                                                                              |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>If the change routes to a new page, the value of this field is true. If it routes to an existing page, this field is false.                                                                                                            |
| LOGIN_KEY       | <b>Type</b><br>Id<br><b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring.<br><b>Example</b><br>GeJCsym5eyvtEK2l |
| ORGANIZATION_ID | <b>Type</b><br>Id<br><b>Description</b><br>The 15-character ID of the organization.<br><b>Example</b><br>00D000000000123                                                                                                                                     |
| RECORD_ID       | <b>Type</b><br>String<br><b>Description</b><br>The Salesforce ID of the Wave object.                                                                                                                                                                         |
| REOPEN_COUNT    | <b>Type</b><br>Number<br><b>Description</b><br>If IS_NEW is false, the number of times that an existing page opens.                                                                                                                                          |
| REQUEST_ID      | <b>Type</b><br>String<br><b>Description</b><br>The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST_ID.<br><b>Example</b><br>3nWgxWbDKWWDIk0FKfF5DV                   |
| RUN_TIME        | <b>Type</b><br>Number<br><b>Description</b><br>The amount of time that the request took in milliseconds.                                                                                                                                                     |

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

TYPE

**Type**

String

**Description**

The Wave object type.

URI

**Type**

String

**Description**

The URI of the page that's receiving the request.

**Example**

/home/home.jsp

URI\_ID\_DERIVED

**Type**

ID

**Description**

The 18-character case insensitive ID of the URI of the page that's receiving the request.

USER\_ID

**Type**

Id

**Description**

The 15-character ID of the user who's using Salesforce services through the UI or the API.

**Example**

00530000009M943

WAVE\_SESSION\_ID

**Type**

String

**Description**

The ID of a particular session of Wave. Use this field to determine which log lines originated from a particular session.

WAVE\_TIMESTAMP

**Type**

Number

**Description**

The time at which this log line was generated.

## Wave Interaction

Wave Interaction events track user interactions with the Wave Analytics user interface.

**Field****Details**

CLIENT\_IP

**Type**

IP

**Description**

The IP address of the client that's using Salesforce services.

**Example**

96.43.144.26

CPU\_TIME

**Type**

Number

**Description**

The CPU time in milliseconds used to complete the request. This field indicates the amount of activity taking place in the app server layer, highlighting pieces of Apex or Visualforce code that need refactoring.

EVENT\_TYPE

**Type**

String

|                 |                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <b>Description</b><br>The type of event.                                                                                                                                                          |
|                 | <b>Example</b><br>ReportExport, URI, UITracking, API, RestApi, and so on.                                                                                                                         |
| LOGIN_KEY       | <b>Type</b><br>Id                                                                                                                                                                                 |
|                 | <b>Description</b><br>The ID that ties together all events in a given user's login session. This starts with a Login event and ends either with a Logout event or with the user session expiring. |
|                 | <b>Example</b><br>GeJCsym5eyvtEK2l                                                                                                                                                                |
| NUM_CLICKS      | <b>Type</b><br>Number                                                                                                                                                                             |
|                 | <b>Description</b><br>The number of clicks performed on a page in the Wave user interface.                                                                                                        |
| NUM_SESSIONS    | <b>Type</b><br>Number                                                                                                                                                                             |
|                 | <b>Description</b><br>The number of times a user returned to a particular page.                                                                                                                   |

| READ_TIME       | <b>Type</b><br>Number                                                                                                                                                                             |
|                 | <b>Description</b><br>The amount of time a user spent on a particular tab.                                                                                                                        |
| RECORD_ID       | <b>Type</b><br>String                                                                                                                                                                             |
|                 | <b>Description</b><br>The Salesforce ID of the Wave object.                                                                                                                                       |

REQUEST\_ID

**Type**

String

**Description**

The unique ID of a single transaction. A transaction can contain one or more events. Each event in a given transaction has the same REQUEST\_ID.

**Example**

3nWgxWbDKWWDik0FKfF5DV

RUN\_TIME

**Type**

Number

**Description**

The amount of time that the request took in milliseconds.

SESSION\_KEY

**Type**

Id

**Description**

The ID that ties together all events for a particular activity session. For example, URI events while the user is interacting with an Accounts page.

**Example**

d7DEq/ANa7nNZZVD

TIMESTAMP

**Type**

String

**Description**

The access time of Salesforce services.

**Example**

20130715233322.670

TIMESTAMP\_DERIVED

**Type**

Datetime

**Description**

The access time of Salesforce services in ISO8601-compatible format (YYYY-MM-DDTHH:MM:SS.sssZ)

**Example**

2015-07-27T11:32:59.555Z

TOTAL\_TIME

**Type**

Number

**Description**

The total amount of time a tab was open in milliseconds.

|                 |                                                                                                                                                                                                 |

|                   | <b>Example</b><br>00530000009M943                                                                                    |

WAVE\_SESSION\_ID

**Type**

String

**Description**

The ID of a particular session of Wave.

WAVE\_TIMESTAMP

**Type**

Number

**Description**

The time at which this log line was generated.

## EventRelation

Represents people (a user, a lead, or contacts) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees' responses to invitations. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules.

EventRelation allows a variable number of relationships and handles deleted events differently, depending on whether Shared Activities is enabled.

### If Shared Activities Is Enabled

- An event can be related to up to 50 contacts or one lead.
- If you delete an event, then relations between the event and any specified contacts, leads, and records are also deleted. The `WhoId`, `WhatId`, and `AccountId` field values are cleared. If you restore a deleted event, relations between the event and any specified contacts, leads, and records are also restored. The `WhoId`, `WhatId`, and `AccountId` field values are recalculated using the field values on EventRelation.

### If Shared Activities Isn't Enabled

- An event can be related to only one contact or lead.
- If you delete an event, the `WhoId`, `WhatId`, and `AccountId` field values aren't cleared.

Whether or not Shared Activities is enabled, an event can be related to one other kind of record, such as an account, an opportunity, or a custom object (in addition to one or more contacts).

### Note:

- With API versions 26.0 and later, the EventRelation object replaces the EventAttendee object, and the EventAttendee object is no longer visible. You can still query the EventAttendee object using packages that support API versions 25.0 and earlier, or by using Apex.
- An EventRelation object can't be created for a child event.
- EventRelation includes deactivated users.
- In API versions 25.0 and earlier, you can't use `query()`, `delete()`, or `update()` with events related to more than one contact.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `queryAll()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Usage

- Invitee related lists display slightly different content. In Salesforce1, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner. To reproduce the full site functionality in Salesforce1, use the following API queries.

If you use Shared Activities in your Salesforce org, use this query:

```
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]'
```

where *Event\_Id* is the child event's ID.

If you don't use Shared Activities, use this query:

```
SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]'
```

These queries get the main event's relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

### Send email notifications

To send email notifications for a given event, query `EventRelation` for the event, iterate through the list, examine the status, and send email notifications to every person who accepted the invitation.

### Determine what events a given invitee is attending

To determine all the events that a particular person is attending during a given time period (for example, next week), you can have a client application query the `Event` object for a given date range, iterate through the results, and, for each event, query the `EventRelation` object to determine whether the particular person (`RelationId`) has accepted an invitation to that event.

### Create an invitee if Shared Activities is enabled (or during the process of enabling it or rolling back)

If the invitee is already a contact or lead, update `IsInvitee` to `true`.

If the invitee is not already a contact or lead, create an `EventRelation` object for the invitee with `IsInvitee` set to `true`.

### Create an invitee if Shared Activities is not enabled

Create an `EventRelation` object for the invitee.

**Query relations to a contact or a lead**

```
List<EventRelation> whoRelations = [SELECT Id, Relation.Name FROM
    EventRelation WHERE EventId = '00UD0000005zijD' AND isParent = true AND isWhat =
    false];
```

**Query invitee relations**

```
List<EventRelation> inviteeRelations = [SELECT Id, Relation.Name FROM
    EventRelation WHERE EventId = '00UD0000005zijD' AND isInvitee = true];
```

**Update an invitee relation to a contact or lead invitee relation**

```
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId =
    '00UD0000005zijD' AND isInvitee = true and isParent = false LIMIT 1];
er.isParent = true;
update er;
```

**Update a contact or lead relation to a contact or lead invitee relation**

```
EventRelation er = [SELECT Id FROM EventRelation WHERE EventId =
    '00UD0000005zijD' AND isParent = true and isInvitee = false LIMIT 1];
er.isInvitee = true;
update er;
```

**Insert a contact or lead relation**

```
EventRelation er = new EventRelation(EventId = '00UD0000005zijH',
    RelationId = '003D000000Q8aeV', isParent = true, isInvitee = false);
insert er;
```

**Insert an invitee relation**

If `isParent`, `isWhat` and `IsInvitee` are not set, and `RelationId` is a contact, lead, user, or calendar, `IsInvitee` defaults to `true`. This means if an `EventRelation` isn't specifically inserted as a relation to a contact or lead, it's treated as an Invitee relation by default.

```
EventRelation er = new EventRelation(EventId = '00UD0000005zijH',
    RelationId = '003D000000Q8adv');
insert er;
```

**Reproduce invitee related list functionality in Salesforce1**

Invitee related lists display slightly different content in Salesforce1 and the full site. In Salesforce1, the invitee related list includes invitees only, whereas in the full site, it also includes the event owner.

If you use Shared Activities in your Salesforce org, use the following query to reproduce the full site functionality in Salesforce1:

```
SELECT RelationId FROM EventRelation WHERE isInvitee = true AND eventId='[Event_Id]'
```

where `Event_Id` is the child event's ID.

If you don't use Shared Activities, use this query:

```
SELECT RelationId FROM EventRelation WHERE eventId='[Event_Id]'
```

These queries get the main event’s relations and display them for the given child event. To further filter the results, add a `WHERE` clause.

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type       | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Restricted picklist</p> <p><b>Description</b><br/>Defines the visibility of a tag.</p> <p>Valid values:</p> <ul style="list-style-type: none"><li>• <code>Public</code>—The tag can be viewed and manipulated by all users in an organization.</li><li>• <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.</li></ul> |

## Usage

EventTag stores the relationship between its parent TagDefinition and the Event being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## EventWhoRelation

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the [EventRelation](#) on page 844 object; that is, `IsParent` is `true` and `IsWhat` is `false`. It doesn't represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

EventWhoRelation allows a variable number of relationships: one lead or up to 50 contacts. Available only if you've enabled Shared Activities for your organization.

**Note:** EventWhoRelation objects aren't created for child events.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                     |
|------------|---------------------------------------------------------------------------------------------|
| EventId    | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> |

| Field Name | Details                                                                                                                                                                      |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>Indicates the ID of the event.                                                                                                                         |
| RelationId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Indicates the ID of the contacts or lead related to the event.       |
| Type       | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Indicates whether the person related to the event is a contact or lead. |

## Usage

### Apex example that queries relations to a contact or lead

```
List<EventWhoRelation> whoRelations = [SELECT Id, Relation.Name FROM
EventWhoRelation WHERE EventId = '00UD0000005zizD'];
```

SEE ALSO:

[EventRelation](#)

## ExternalDataSource

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name          | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CustomConfiguration | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>A JSON-encoded configuration string that defines parameters specific to the type of external data source.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| DeveloperName       | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| Endpoint            | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>The URL of the external system, or if that URL is defined in a named credential, the named credential URL.</p> <p>A named credential URL contains the scheme <code>callout:</code>, the name of the named credential, and an optional path. For example: <code>callout:My_Named_Credential/some_path</code>. You can append a query string to a named credential URL. Use a question mark (?) as the separator between the named credential URL and the query string. For example:<br/><code>callout:My_Named_Credential/some_path?format=json</code>.</p>                                                                                                                                                                                                                                                                    |
| isWritable          | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Query, Sort</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Usage

Define an external data source to connect to data or content that's stored outside the Salesforce org. Then create external objects, which map to the external system's data and behave similarly to custom objects.

SEE ALSO:

[ExternalDataUserAuth](#)

[NamedCredential](#)

## ExternalDataUserAuth

Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that's configured to use per-user authentication. This object is available in API version 27.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name | Details                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>Username portion of the credentials for the Salesforce user to access the external system. |

## Usage

These authentication settings enable a Salesforce user to access an external system. The external system is defined in Salesforce as one of the following.

- External data source—Provides access to external objects, whose data is stored outside the Salesforce organization.
- Named credential—Enables the user’s actions to trigger authenticated callouts to the endpoint that’s specified in the named credential.

If you grant users access to the external data source or named credential via permission sets or profiles, those users can manage their own authentication settings. See “Store Authentication Settings for External Systems” in the Salesforce Help.

## FeedAttachment

Represents an attachment to a feed item, such as a file attachment or a link. Use FeedAttachment to add various attachments to one feed item. This object is available in API version 36.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- You can read, create, update, or delete a FeedAttachment only if you have the corresponding access to the associated FeedItem.
- Inline images aren’t creatable, updatable, or deletable through SOAP API.

You can't add an inline image directly by using FeedAttachment.</li> <li>Link—A link.</li> </ul> |
| Value      | <b>Type</b><br>string<br><br><b>Properties</b><br>Create, Filter, Nillable, Sort, Update<br><br><b>Description</b><br>The string value of this FeedAttachment. This field is optional. If the feed attachment is a Link FeedAttachment, the value is the link URL string.                                                                                                                                                                                                                                      |

## Usage

- This Apex example shows how to add an attachment to a Lead using API version 36.0 and later. First, post a feed item.

```
//create and insert post
FeedItem post = new FeedItem();
post.Body = 'HelloThere';
post.ParentId = 'ID_OF_LEAD_ENTITY';
post.Title = 'FileName';
insert post;
```

Then insert the attachment.

```
//create and associate a content attachment to the post
FeedAttachment feedAttachment = new FeedAttachment();
feedAttachment.FeedEntityId = post.Id;
feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
feedAttachment.Title = 'FileName';
feedAttachment.Type = 'CONTENT';
insert feedAttachment;
```

- You can only create one link attachment (FeedAttachment of type `Link`) per feed item.
- If the feed item type is one of the following, you can add content or link feed attachments to a FeedItem.
  - AdvancedTextPost
  - TextPost
  - ContentPost
  - LinkPost
  - QuestionPost
- When a FeedAttachment is added or removed from a feed item, Salesforce updates the type of the feed item to its most appropriate value, as follows.
  - If all content feed attachments are removed from a feed item of type `ContentPost`, the type of this feed item is updated to `TextPost`.
  - Conversely, if a content feed attachment is added to a feed item of type `TextPost`, the type of this feed item is updated to `ContentPost`.
  - If all link feed attachments are removed from a feed item of type `LinkPost`, the type of this feed item is updated to `TextPost`.
  - Conversely, if a link feed attachment is added to a feed item of type `TextPost`, the type of this feed item is updated to `LinkPost`.
  - The type of all other feed items, such as `QuestionPost` or `AdvancedTextPost` feed items, doesn't change when any feed attachments are added or removed.
  - If a content feed attachment is added to a feed item of type `LinkPost`, the feed item type is updated to `ContentPost`.
  - If all content attachments are removed from a feed item of type `ContentPost`, but there's also a link attachment, the feed item type is updated to `LinkPost`.
- Those without administrator privileges can't retrieve a FeedAttachment by its ID in a SOQL query. They can retrieve attachments by specifying the associated `FeedEntityId`, as follows:

```
SELECT Id FROM FeedAttachment WHERE FeedEntityId = 'some_feedItem_id'
```

- Alternatively, retrieve attachments by using a SOQL query on FeedItem with a subquery on the FeedAttachments child relationship, as follows.

```
SELECT Body, (SELECT RecordId, Title, Type, Value FROM FeedAttachments)
FROM FeedItem
WHERE Id = 'some_feedItem_id'
```

- FeedAttachment is not a triggerable object. You can access feed attachments in FeedItem *update* triggers by retrieving them through a SOQL query. For a trigger example, and to learn about trigger considerations for FeedAttachment, see [Triggers for Chatter Objects](#) in the *Apex Developer Guide*.

## FeedComment

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

Note the following when working with feed comments.

- You must have read access to the feed's parent type to see a FeedComment record.
- You must have access to the feed to add a comment.
- If the comment is related to a user record, the user can delete the comment. For example, if John Smith makes a comment about Sasha Jones, Sasha can delete the comment.
- If the logged-in user has the "Insert System Field Values for Chatter Feeds" user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the object associated with the feed and delete permission on the parent feed
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

- "Manage Unlisted Groups"

Only users with this permission can delete items in unlisted groups.

## Fields

| Field       | Details                                 |
|-------------|-----------------------------------------|
| CommentBody | <b>Type</b><br><a href="#">textarea</a> |

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| SystemModstamp | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Defaulted on create, Filter</p> <p><b>Description</b><br/>Date and time when a user or automated process (such as a trigger) last modified this record. SystemModstamp is a read-only <a href="#">system field, available in FeedComment as of API version 37.0</a>.</p> |

## Usage

- As of API version 23.0 and later, if you have “View All Data” permission, you can query FeedComment records directly without an ID filter. If you don’t have “View All Data” permission, you can’t query FeedComment records directly, with or without an ID filter.

For example, the following query returns general information about a feed:

```
SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName,
       CreatedBy.LastName, ParentId, Parent.Name, Body
FROM FeedItem
WHERE CreatedDate > LAST_MONTH
ORDER BY CreatedDate DESC, Id DESC
```

- You can search for text in comments using SOSL. For example, the following Java class uses `search()` to find the string “foo” in any field of a record:

```
public void searchSample() {
    try {
        SearchResult sr = connection.search("find {foo} in all fields " +
            "returning feedcomment(Id, FeedItemId, CommentBody)");
        // Put the results into an array of SearchRecords
        SearchRecord[] records = sr.getSearchRecords();
        // Check the length of the returned array of records to see
        // if the search found anything
        if (records != null && records.length > 0) {
            System.out.println("Found " + records.length + " comments: ");
            // Display each comment
            for (SearchRecord record : records) {
                FeedComment comment = (FeedComment) record.getRecord();
                System.out.println(comment.getId() + ": " +
                    comment.getCommentBody());
            }
        } else {
            System.out.println("No records were found for the search.");
        }
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}
```

- If you use an Apex trigger to modify the `Body` of a `FeedComment` object, all mentions hyperlinks are converted to plain text. The mentioned users don't get email notifications.

 **Note:** This object is hard deleted. It isn't sent to the Recycle Bin.

## FeedItem

`FeedItem` represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces `FeedPost`.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

- "Manage Unlisted Groups"

Only users with this permission can delete items in unlisted groups.

Only users with the "Modify All Data" permission can delete a `FeedItem` of `Type` `TrackedChange`.

If the logged-in user has the "Insert System Field Values for Chatter Feeds" user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

## Fields

| Field Name                 | Details                                                                                                                                                                                                                                                                   |

| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/><a href="#">Create</a>, <a href="#">Nillable</a>, <a href="#">Sort</a>, <a href="#">Update</a> on page 17</p> <p><b>Description</b><br/>The content of the FeedItem. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p> <p> <b>Tip:</b> See the <a href="#">IsRichText</a> field for a list of HTML tags supported in the body of rich text posts.</p>                                                                                                                                                                                                                                                                                                                                                                                |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/><a href="#">Filter</a>, <a href="#">Group</a>, <a href="#">Sort</a></p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |

## Field Name

## Details

- **QuestionPost**—generated when a user posts a question.
- **ReplyPost**—generated when Chatter Answers posts a reply.
- **RypplePost**—generated when a user creates a Thanks badge in Work.com.
- **TextPost**—a direct text entry on a feed.
- **TrackedChange**—a change or group of changes to a tracked field.
- **UserStatus**—automatically generated when a user adds a post. Deprecated.

The following values appear in the **Type** picklist for all feed objects but apply only to [CaseFeed](#):

- **AttachArticleEvent**—generated event when a user attaches an article to a case.
- **CallLogPost**—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- **CaseCommentPost**—generated event when a user adds a case comment for a case object.
- **ChangeStatusPost**—generated event when a user changes the status of a case.
- **ChatTranscriptPost**—generated event when Live Agent transcript is saved to a case.
- **EmailMessageEvent**—generated event when an email related to a case object is sent or received.
- **FacebookPost**—generated when a Facebook post is created from a case. Deprecated.
- **MilestoneEvent**—generated when a case milestone is completed or reaches violation status.
- **SocialPost**—generated when a social post is created from a case.

**Note:** If you set **Type** to **ContentPost**, also specify **ContentData** and **ContentFileName**.

## Visibility

## Type

[picklist](#)

## Properties

[Create](#), [Filter](#), [Group](#), [Nillable](#), [Restricted picklist](#), [Sort](#), [Update](#)

## Description

Specifies whether this feed item is available to all users or internal users only. This field is available in API version 26.0 and later, if Salesforce Communities is enabled for your organization.

**Visibility** can have the following values:

- **AllUsers**—The feed item is available to all users who have permission to see the feed item.

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <ul style="list-style-type: none"> <li>InternalUsers—The feed item is available to internal users only.</li> </ul> <p>Note the following exceptions for Visibility:</p> <ul style="list-style-type: none"> <li>For record posts, Visibility is set to InternalUsers for all internal users by default.</li> <li>External users can set Visibility only to AllUsers.</li> <li>Visibility can be updated on record posts.</li> <li>The Update property is supported only for feed items posted on records.</li> </ul> |

## Usage

- This Apex example shows how to add an attachment to a Lead using API version 36.0 and later. First, post a feed item.

```
//create and insert post
FeedItem post = new FeedItem();
post.Body = 'HelloThere';
post.ParentId = 'ID_OF_LEAD_ENTITY';
post.Title = 'FileName';
insert post;
```

Then insert the attachment.

```
//create and associate a content attachment to the post
FeedAttachment feedAttachment = new FeedAttachment();
feedAttachment.FeedEntityId = post.Id;
feedAttachment.RecordId = 'ID_OF_CONTENT_VERSION';
feedAttachment.Title = 'FileName';
feedAttachment.Type = 'CONTENT';
insert feedAttachment;
```

- If you are using API version 23.0 or later and have “View All Data” permission, you can directly query for a FeedItem. The following example returns the 20 most recent feed items.

```
SELECT ID, CreatedDate, CreatedById, CreatedBy.FirstName, CreatedBy.LastName, ParentId,
       Parent.Name, Body,
       (SELECT ID, FieldName, OldValue, NewValue FROM FeedTrackedChanges ORDER BY ID DESC)
FROM FeedItem
WHERE CreatedDate > LAST_MONTH
ORDER BY CreatedDate DESC
```

- If you are using an earlier API version than version 23.0, query FeedItem objects through a feed (such as [AccountFeed](#) or [OpportunityFeed](#)). The following example returns all feed items for a given account, ordered by date descending:

```
SELECT Id, Type, FeedItem.Body
FROM AccountFeed
WHERE ParentId = AccountId ORDER BY CreatedDate DESC
```

 **Note:** Provide the ParentId for API version 22.0 and earlier.

- A FeedItem of type `UserStatus` is automatically created when a user adds a post to update the status. You can't explicitly create a FeedItem of type `UserStatus`.
- The FeedItem object doesn't support aggregate functions in queries.
- If the logged-in user has the "Insert System Field Values for Chatter Feeds" user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post's author and creation date. The fields can't be updated after migration.
- The size limit for an attachment on a profile or news feed is 25 MB.
- The size limit for an attachment on a record feed is 5 MB.
- You can't use the content fields to update or delete the content.
- You can't filter or update the content fields.
- Deleting a FeedItem via the API also deletes the associated content. Likewise, undeleting a FeedItem restores associated content.

**Note:** This object is hard deleted. It isn't sent to the Recycle Bin.

- After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in a FeedItem object appear as `null` in a SOQL query.
- You can't explicitly create or delete a [FeedTrackedChange](#) record.
- If you insert a FeedItem or [FeedComment](#) of Type `ContentPost` on a [User](#) or [Group](#) to create a file, the `NetworkScope` field value of the FeedItem is passed to the file.
- If you use an Apex trigger to modify the `Body` of a FeedItem object, all mentions hyperlinks are converted to plain text. The mentioned users don't get email notifications.
- If you insert rich text into the feed item body, make sure that the case of the opening and closing HTML tags matches. For example, `<b>This is bold text</B>` generates an error.
- To check file sharing with Apex triggers, write triggers on `ContentDocumentLink` instead of `FeedItem`. For a `ContentDocumentLink` trigger example, see [ContentDocumentLink](#).
- In API version 36.0 and later, use [FeedAttachment](#) to attach one or more content items to a FeedItem. As a result of multiple attachment support through `FeedAttachment`, all fields related to content attachments have been removed. These fields are: `ContentData`, `ContentDescription`, `ContentFileName`, `ContentSize`, and `ContentType`.

## FeedLike

---

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

FeedLike records represent likes on posts and not likes on comments. Likes on comments can't be queried via the API. A FeedLike is a child object of an associated FeedItem, FeedTrackedChange, or object feed, such as `AccountFeed`.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`

## Special Access Rules

If the logged-in user has the "Insert System Field Values for Chatter Feeds" user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post's author and creation date. The fields can't be updated after migration.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FeedItemId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the feed item that the user liked.</p>                                                                                                                                                                                                                                                                           |
| FeedEntityId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The Id of a feed item or feed comment the user liked.<br/><br/>If the user liked a comment, FeedEntityId is set to the ID of the comment. If the user liked a feed item, FeedEntityId is set to the ID of the feed item.<br/><br/>FeedEntityId is an optional field. The default value is the ID of the feed item.</p> |
| InsertedById | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the user who added this object to the feed. For example, if an application migrates posts and comments from another application into a feed, the <code>InsertedBy</code> value is set to the ID of the logged-in user.</p>                                                                                               |

## Usage

You can't query FeedLike records directly. They can only be queried via the entity feed, such as AccountFeed.

FeedLike records represent likes on posts and not likes on comments. Likes on comments can't be queried via the API.

## FeedPollChoice

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

## Supported Calls

`query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

- "Manage Unlisted Groups"

Only users with this permission can delete items in unlisted groups.

## Fields

| Field Name | Details                                                                                                                                                   |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| ChoiceBody | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group</p> <p><b>Description</b><br/>A choice in the poll.</p>                                      |
| FeedItemId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the feed item for the poll.</p> |
| Position   | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Group, Sort</p> <p><b>Description</b><br/>Shows the position of the poll choice.</p>                  |

## Usage

Use this object to query all of the choices associated with a particular poll. To view how people voted on the poll, see the FeedPollVote object.

## FeedPollVote

---

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

### Supported Calls

`query()`, `retrieve()`

### Fields

| Field Name | Details                                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ChoiceId   | <b>Type</b><br>reference<br><br><b>Properties</b><br>Filter, Group<br><br><b>Description</b><br>Indicates which choice a user selected on a poll posted in a feed. |
| FeedItemId | <b>Type</b><br>reference<br><br><b>Properties</b><br>Filter, Group, Sort<br><br><b>Description</b><br>ID of the feed item for the poll.                            |

### Usage

Use this object to query how users voted on a particular poll.

## FeedPost

---

FeedPost represents the following types of changes in a record feed, such as AccountFeed: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. FeedPost is no longer available in later versions. Starting with API version 21.0, use FeedItem to represent text posts, link posts, and content posts in feeds.

### Supported Calls

`create()`, `delete()`, `describeObjects()`, `search()`

### Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- “Modify All Data”
- “Moderate Chatter”

**Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

Only users with the “Modify All Data” permission can delete a FeedItem of Type `TrackedChange`.

If the logged-in user has the “Insert System Field Values for Chatter Feeds” user permission, the `create` field property is available on `CreatedBy` and `CreatedDate` system fields. During migration, the logged-in user can set these fields to the original post’s author and creation date. The fields can’t be updated after migration.

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                  |

## Usage

- You can't directly query for a FeedPost. FeedPosts are always associated with a feed item, so you can query for them through the feeds. The following example returns all feed items for a given account, ordered by date descending:

```
SELECT Id, Type, FeedPost.Body
FROM AccountFeed
WHERE ParentId = AccountId ORDER BY CreatedDate DESC
```

- A FeedPost of type `UserStatus` is automatically created when a user adds a post to update the current status. You can't explicitly create a FeedPost of type `UserStatus`.
- The size limit for an attachment on a profile, news, or record feed is 2 GB.
- You can't use the content fields to update or delete the content.
- You can't filter or update the content fields.
- Deleting a FeedPost via the API also deletes the associated content and FeedPost objects. Likewise, undeleting a FeedPost restores associated content and FeedPost objects.

 **Note:** This object is hard deleted. It isn't sent to the Recycle Bin.

- After uploading to a feed, it is possible for an attachment or document to be deleted, marked private, or hidden by sharing rules. In this case, all content fields in FeedPost appear as `null` in a SOQL query.
- You can't explicitly create or delete a FeedTrackedChange record.

## FeedRevision

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

## Usage

This object tracks the changes made to a feed item or feed comment and stores a list of attributes that changed for each revision.

- To query the FeedRevision object, users need the “View All Data” permission or supply a WHERE clause on the `FeedEntityId`.

# FeedTrackedChange

Represents an individual field change or set of field changes. A FeedTrackedChange is a child object of a record feed, such as AccountFeed. This object is available in API version 18.0 and later..

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Usage

A user can subscribe to a record or to another user. Changes to the record and updates from the users are displayed in the Chatter feed on the user's home page, which is a useful way to stay up-to-date with other users and with changes made to records in Salesforce. Feeds are available in API version 18.0 and later.

If you move a custom field to the Recycle Bin, all `FeedTrackedChange` records that track historical changes to the custom field are automatically deleted and are not restored if the custom-field is undeleted.

The following sections outline the difference between standard feeds and custom feeds.

## Standard Feeds

A standard feed is a record feed, such as `AccountFeed`. `FeedTrackedChange` records for standard feeds can only be queried via the parent feed object.

Note the following when working with standard feed items:

- Feed items for standard feeds are read only in the API.
- A `FeedTrackedChange` record is visible when you have read access on the record feed, and when the field in the `FeedTrackedChange` is visible in the field-level security settings.

## Custom Feeds

If you want more control over the information provided in a record feed, such as `AccountFeed`, you can create a custom feed. A custom feed can replace or augment an existing record feed. For example, you might want to:

- Disable the standard account record feed and use an Apex trigger to generate FeedTrackedChange records for the events that you want to track in the feed instead.
- Augment the standard contact record feed by writing an API client that inserts feed items for events that are not tracked in the standard feed.

## Tracking of Special Events

The `FieldName` field also tracks other events that are not related to an individual field for a parent feed. These events occur as the parent record advances through its pipeline. For example, a value of `leadConverted` indicates that a lead has been converted to an opportunity.

Valid values for the `FieldName` field for multiple objects:

- `created`
- `ownerAccepted`
- `ownerAssignment`

Additional valid values for the `FieldName` field for individual objects:

### Account

- `accountCreatedFromLead`
- `accountMerged`
- `accountUpdatedByLead`
- `personAccountUpdatedByLead`

### Case

- `closed`
- `ownerEscalated`

### Contact

- `contactCreatedFromLead`
- `contactMerged`
- `contactUpdatedByLead`

### Contract

# FieldHistoryArchive

---

Represents field history values for all objects that retain field history. This is a `BigObject`, available only to users with the “Retain Field History” permission. This object is available in API version 29.0 and later.

Each instance of the `FieldHistoryArchive` object represents a single change in the value of a field. `FieldHistoryArchive` stores history for both standard and custom fields.

The `Field` field returns the name of the field unless the parent field or object is deleted, in which case it returns the field ID. You can use the ID to retrieve the old field and object name from the `FieldNameAfterArchival` and `ParentNameAfterArchival` fields, respectively.

## Supported Calls

`describeSObjects()`, `query()`

## Fields

| Field Name                     | Details                                                                                                                                                                                                                                                    |

## Usage

When sorting fields, order them as follows:

1. FieldHistoryType ASC
2. ParentID ASC
3. CreatedDate DESC

## FieldPermissions

---

Represents the enabled field permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

To grant a user access to a field, associate a FieldPermissions record with a PermissionSet that's assigned to a user. FieldPermissions records are only supported in PermissionSet, not in Profile.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                    |

| Field Name               | Details                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          | <b>Description</b><br>If <code>true</code> , users assigned to the parent <code>PermissionSet</code> can view this field. A <code>FieldPermissions</code> record must have at minimum <code>PermissionsRead</code> set to <code>true</code> , or it will be deleted. |
| <code>SubjectType</code> | <b>Type</b><br>picklist<br><br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort<br><br><b>Description</b><br>The object's API name. For example, <code>Merchandise__c</code> .                                                                  |

## Usage

`FieldPermissions` work similarly to `ObjectPermissions`. However, `FieldPermissions` includes a `Field` attribute to return the name of the field.

For example, the following query returns all `FieldPermissions` records that have at least the “Read” permission. The results includes the field, object, and permission set names.

```
SELECT SubjectType, Field, PermissionsRead, Parent.Name
FROM FieldPermissions
WHERE PermissionsRead = True
```

Include the field's parent object when querying `FieldPermissions`. For example, to find all rows that match the `Account` object's `Type` field, create the following query:

```
SELECT Id, SubjectType, Field
FROM FieldPermissions
WHERE Field = 'Account.Type' AND SubjectType = 'Account'
```

Both `SubjectType` and `Field` must be included in the `SELECT` line of the query. You must also provide the full API name of the field in the form of `SubjectType.Field` when querying for a field.

**Note:** When using the `FieldPermission` object to download records, depending on the SOQL query you use, you might not receive all expected records. Results might also appear incomplete. However, all records do download; fields that don't support field security and rows for entities not visible to the org. are hidden.

## Special Properties for Field Permissions

The auto-number and formula fields have special rules for how field permissions work. Both have `FieldPermissions` records, but inserting and updating is limited to `PermissionsRead`. `PermissionsEdit` isn't allowed for either field type, since these fields must be read-only for users.

The following field types don't return a `FieldPermissions` record because they are assumed to always be readable.

- `Id`
- `CreatedById`
- `CreatedDate`

- IsDeleted
- LastModifiedById
- LastModifiedDate
- SystemModStamp

The following field types don't return a FieldPermissions record because they are assumed to always be readable and writable.

- OwnerId
- Master-detail custom (relationship) fields
- Universally required custom fields

As a result, the following query returns no records, even though users do have some access to some of the fields.

```
SELECT Field, SubjectType, PermissionsRead
FROM FieldPermissions
WHERE Field='Id'
```

To determine if a field can return a FieldPermissions record, you can call a `describeObject()` on the field. For example, `describeObject('Merchandise__c')`, returns all the properties of the Merchandise custom object, including field properties. If you're using a field whose `permissionable` property is `false` (such as any of the field types listed in this section), you can't query, insert, update, or delete any field permissions records, because none exist.

## Working with Custom Activity Fields

While tasks and events are considered separate objects, they share a common set of activity custom fields. As a result, when a custom task field is created, a custom event field is also created, and vice versa. You can display the custom field on the event layout, task layout, or both event and task layouts.

Although custom activity fields are shared between tasks and events, you'll see separate FieldPermissions records for the task and event. However, changes made to one field permission record are automatically made to the other. For example, if you create a custom activity field, assign field permissions to it in a permission set, and run the following query, the query will return two records with the same permission value.

```
SELECT Field, Id, ParentId, PermissionsEdit, PermissionsRead, SubjectType
FROM FieldPermissions
WHERE SubjectType = 'event' OR SubjectType = 'task'
```

If you then update one of the records with a different set of field permission values and run the query again, the same permission values for both records are returned.

## Nesting Field Permissions

You can nest FieldPermissions in a PermissionSet query. For example, the following returns any permission sets where "Edit Read Only Fields" is `true`. Additionally, the result set will include both the "Read" and "Edit" field permission on the Merchandise object. This is done by nesting the SOQL with a field permission query using the relationship name for field permissions: `FieldPerms`.

```
SELECT PermissionsEditReadOnlyFields,
(SELECT SubjectType, Field, PermissionsRead, PermissionsEdit
FROM FieldPerms
WHERE SubjectType = 'Merchandise__c')
FROM PermissionSet
WHERE PermissionsEditReadOnlyFields = true
```

As a result, it's possible to traverse the relationship between the PermissionSet and any child related objects (in this case, FieldPermissions). You can do this from the PermissionSet object by using the child relationship (ObjectPerms, FieldPerms, and so on) or from the child object by referencing the PermissionSet with Parent.***permission\_set\_attribute***.

It's important to consider when to use a conditional WHERE statement to restrict the result set. To query based on an attribute on the permission set object, nest the SOQL with the child relationship. However, to query based on an attribute on the child object, you must reference the permission set parent attribute in your query.

The following two queries return the same columns with different results, based on whether you use the child relationship or parent notation.

```
SELECT PermissionsEditReadOnlyFields,
  (SELECT SubjectType, Field, PermissionsRead, PermissionsEdit
   FROM FieldPerms
  WHERE SubjectType = 'Merchandise__c')
FROM PermissionSet
WHERE PermissionsEditReadOnlyFields = true
```

versus:

```
SELECT SubjectType, Field, PermissionsRead, PermissionsEdit, Parent.Name,
  Parent.PermissionsEditReadOnlyFields
FROM FieldPermissions
WHERE SObjectType='Merchandise__c'
```

## FlexQueueItem

Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the AsyncApexJob. This object is available in API version 36.0 and later.

## Supported Calls

`describeSObjects()`, `query()`

## Fields

| Field Name      | Description                                                                                                                                                               |

|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| JobPosition | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The position in the flex queue of the waiting job. The highest-priority job in the queue is at position 0.</p>                                                                                                                                                                                                                                                                                  |
| JobType     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The type of the job. Valid values are:</p> <ul style="list-style-type: none"> <li>• ApexToken</li> <li>• BatchApex</li> <li>• BatchApexWorker</li> <li>• Future</li> <li>• Queueable</li> <li>• ScheduledApex</li> <li>• SharingRecalculation</li> <li>• TestRequest</li> <li>• TestWorker</li> </ul> <p>Currently, queries are supported only on BatchApex jobs.</p> |

## Usage

To find the position of an AsyncApexJob in the flex queue, query JobPosition. For example:

```
SELECT JobPosition FROM FlexQueueItem WHERE JobType = 'BatchApex' AND AsyncApexJobId = '707xx000000DABC'
```

To find the job at a given position, query AsyncApexJobId. For example:

```
SELECT AsyncApexJobId FROM FlexQueueItem WHERE JobType = 'BatchApex' AND JobPosition = '2'
```

To find all batch jobs in the flex queue, query JobType. To get other information about the jobs, include AsyncApexJob in your query. For example:

```
SELECT JobType, JobPosition, AsyncApexJob.ApexClass.Name, AsyncApexJob.CreatedDate, AsyncApexJob.CreatedBy FROM FlexQueueItem WHERE JobType='BatchApex' AND AsyncApexJob.ApexClass.Name LIKE '%BatchAJob%' ORDER BY JobPosition DESC
```

## FlowInterview

---

Represents a flow interview. A *flow interview* is a running instance of a flow.

### Supported Calls

`delete()`, `describeLayout()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `describeSObject()`

### Special Access Rules

To delete a flow interview, you must have the “Manage Force.com Flow” user permission. All other calls require the “Run Flows” user permission or the `Force.com Flow User` field enabled on the user detail page.

### Fields

| Field Name                  | Details                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Usage

Use this object to manage the sharing rules for FlowInterview records. Sharing rules don't affect who can resume the FlowInterview. Only the owner or a flow admin can resume a FlowInterview. General sharing uses this object.

## FlowInterviewShare

---

Represents a sharing entry on a FlowInterview. This object is available in API version 33.0 and later.

## Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field                    | Details                                                                                                                                                                                                                                                                                                                                                                                                                            |

You can only write to this field when its value is either omitted or set to <code>Manual</code> (default).</p>                                                                                                                            |

| Field                      | Details                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            | Valid values include: <ul style="list-style-type: none"> <li>• <code>Manual</code>—The User or Group has access because a user with “All” access manually shared the FlowInterview with them.</li> <li>• <code>Owner</code>—The User is the owner of the FlowInterview.</li> <li>• <code>Rule</code>—The User or Group has access via a FlowInterview sharing rule.</li> </ul> |
| <code>UserOrGroupId</code> | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the User or Group that has been given access to the FlowInterview. This field can't be updated.</p>                                                                                                                                                  |

## Usage

This object lets you determine which users and groups can view and edit FlowInterview records owned by other users. However, it doesn't let you determine who can resume the FlowInterview. Only the owner or a flow admin can resume a FlowInterview.

## Folder

Represents a repository for a Document, EmailTemplate, Report, or Dashboard. Only one type of item can be contained in a folder.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- You must have the “Modify All Data” permission to create, update, or delete document folders and email template folders.
- Customer Portal users can't access this object.
- To query this object, no special permissions are needed.
- As of API version 35.0, when a folder is shared with a role, it is only visible to users in that role. Superior roles in the role hierarchy don't gain visibility.
- If analytics folder sharing is turned on, then users need these permissions to create and manage report folders and dashboard folders:
  - “Create Dashboard Folders”
  - “Create Report Folders”

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <b>NamespacePrefix</b> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> <p>This field can't be accessed unless the logged-in user has the "Customize Application" permission.</p> |
| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>Required. Type of objects contained in the Folder. This field can't be updated. Available values include:</p> <ul style="list-style-type: none"> <li>• Dashboard</li> <li>• Document</li> <li>• Email template</li> <li>• Report</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

# Usage

Only one type of item can be contained in a folder, either Document, EmailTemplate, Report, or Dashboard.

SEE ALSO:  
[Object Basics](#)

# FolderedContentDocument

Represents the relationship between a parent and child ContentFolderItem in a ContentWorkspace.

# Supported Calls

describeSObjects()

## ForecastingAdjustment

This object represents an individual sales manager's adjustment for a subordinate's forecast via a ForecastingItem. Available in API versions 26 and greater. This object is separate from the ForecastingOwnerAdjustment object, which represents forecast users' adjustments of their *own* forecasts.

 **Note:** This information only applies to Collaborative Forecasts.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

|                         | Commit, Omitted, and Closed. You can customize forecast category names. The forecast categories display information for that specific category; for example, Best Case only reflects amounts in the Best Case category.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ForecastingItemCategory | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>This field indicates which type of forecast rollup the manager adjustment belongs to. Depending on whether your organization uses individual forecast category rollups or cumulative forecast rollups, you have these possible values for the <code>ForecastingItemCategory</code> field.</p> <p><b>Individual forecast category rollups:</b></p> <ul style="list-style-type: none"> <li>• PipelineOnly - Rollup from Pipeline opportunities only.</li> <li>• BestCaseOnly - Rollup from Best Case opportunities only. Adjustable.</li> <li>• CommitOnly - Rollup from Commit opportunities only. Adjustable.</li> </ul> <p><b>Cumulative forecast rollups:</b></p> <ul style="list-style-type: none"> <li>• OpenPipeline - Rollup from Pipeline + Best Case + Commit opportunities.</li> <li>• BestCaseForecast - Rollup from Best Case + Commit + Closed opportunities. Adjustable.</li> <li>• CommitForecast - Rollup from Commit + Closed opportunities. Adjustable.</li> </ul> <p><b>Either cumulative or individual forecast category rollups:</b></p> <ul style="list-style-type: none"> <li>• ClosedOnly - Rollup from Closed opportunities only.</li> </ul> <p>The <code>ForecastingItemCategory</code> field differs from the <code>ForecastCategoryName</code> field.</p> <ul style="list-style-type: none"> <li>• The <code>ForecastCategoryName</code> field represents the forecast category of the <i>underlying opportunities</i> rolling up to forecast amounts. In organizations using cumulative forecast rollups, the <code>ForecastCategoryName</code> field can be null because the cumulative forecast amounts include opportunities from multiple forecast categories.</li> <li>• The new <code>ForecastingItemCategory</code> field represents the <i>type of rollup</i> a forecast amount or adjustment is from. In organizations using individual forecast category columns, it contains the individual forecast rollup categories. In organizations using cumulative forecast rollups, it contains the cumulative rollup categories.</li> </ul> <p>When inserting manager adjustments, the values you insert for <code>ForecastCategoryName</code> and <code>ForecastingItemCategory</code> must be compatible with each other. In organizations using cumulative forecast rollups, the <code>ForecastCategoryName</code> is nillable. These are the valid pairs.</p> |

## Usage

Use this object to obtain a manager's adjustment detail for a specified `ForecastingItem`. The `ForecastingAdjustment` object itself is visible to all users, but only forecast managers and users above them in the forecast hierarchy can read or write `ForecastingAdjustment` records.

**Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType`

object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

## ForecastingFact

This is a read-only object linking a `ForecastingItem` with its opportunities, such as opportunities that share the same owner or forecast category and have a closing date within the period of the forecasting item. Available in API versions 26 and greater.

 **Note:** This information only applies to Collaborative Forecasts.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

## ForecastingItem

This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: `AmountWithoutAdjustments`, `AmountWithoutManagerAdjustment`, `ForecastAmount`, `OwnerOnlyAmount`. The amounts users see include one of the following when forecasting in quantity: `QuantityWithoutAdjustments`, `QuantityWithoutManagerAdjustment`, `ForecastQuantity`, `OwnerOnlyQuantity`. Available in API versions 26 and greater.

Additionally, note that users:

- with the “View All Forecasts” permission have access to all `ForecastingItem` fields.
- without the “View All Forecasts” permission have access to all fields for their own subordinates.

Other users can see the `ForecastingItem` object, but not its records.

 **Note:** This information only applies to Collaborative Forecasts.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | adjustments made by their manager or by the subordinate themselves, plus the rollup of the owner's own opportunities. <i>It doesn't include adjustments made by the forecast owner.</i> This field is available in API version 38.0 and later. |

## Usage

Use this object to obtain individual forecast amounts, either with or without adjustments, based on a user's perspective and forecast role. The `ForecastingItem` object is visible to all users, but only forecast managers and users above them in the forecast hierarchy can read or write `ForecastingAdjustment` records.

 **Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType` object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

## ForecastingOwnerAdjustment

This object represents an individual forecast user's adjustment of their *own* forecast via a `ForecastingItem`. Available in API versions 33 and greater. This object is separate from the `ForecastingAdjustment` object, which represents managers' adjustments of *subordinates'* forecasts.

 **Note:** This information only applies to Collaborative Forecasts.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Usage

Use this object to obtain a user's adjustment detail for a specified `ForecastingItem` in their own forecast.

**Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType` object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

## ForecastingQuota

This object represents an individual user's quota for a specified time period. The "Manage Quotas" user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates' quotas, not their own.) The "View All Forecasts" permission is required to View any user's forecast, regardless of the forecast role hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates who report to them in the forecast hierarchy.

**Note:** This information only applies to Collaborative Forecasts.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name        | Details                                                                                                                                                                                                                                                                                                      |

| Field Name | Details                                                                                                                                                             |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>The start of the quota, expressed as month and year. The date can include any day in a given month. Stored using the first date of the month. |

## Usage

Use this object to get an individual user's quota for a specified time period.

**Note:** Beginning with API version 30.0, organizations can have more than one forecasting type enabled. The `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingItem`, and `ForecastingFact` objects can all have records with different `ForecastingTypeId` values. Use the `ForecastingType` object to determine the ID for each forecast type and then filter `ForecastingQuota`, `ForecastingAdjustment`, `ForecastingItem`, or `ForecastingFact` records as necessary.

SEE ALSO:

[ForecastingAdjustment](#)

[ForecastingFact](#)

[ForecastingItem](#)

## ForecastingType

This object is used to identify the forecast type associated with `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects. Available in API versions 30.0 and greater.

**Note:** This information only applies to Collaborative Forecasts.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Usage

Use this object to identify the forecast type of `ForecastingAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects.

## ForecastShare

Represents the sharing of a customizable forecast at a given role and territory.

**Note:** This information applies to Customizable Forecasting and not [Collaborative Forecasts](#).

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field       | Details                                                                                                                                                                                                                                      |

## Usage

This object allows you to determine which users and groups can view or submit forecasts owned by other users.

## Goal

The Goal object represents the components of a goal such as its name, description, and status.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

## GoalFeed

Represents a single feed item in the feed displayed for a Goal record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                    |

## GoalHistory

This read-only object contains historical information about changes that have been made to the Goal object.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                 |
|--------------------|-------------------------|
| <code>Field</code> | <b>Type</b><br>picklist |

| Field Name | Details                                                                                                                                     |

## GoalLink

Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name   | Details                                                                                                                                                        |

## GoalShare

Represents a sharing entry on a Goal object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

## Group

A set of User records.

Groups are sets of users. They can contain individual users, other groups, the users in a particular role or territory, or the users in a particular role or territory plus all of the users below that role or territory in the hierarchy.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `search()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

## Usage

Unlike users, this object can be deleted. Any User can access this object—no special permissions are needed.

Only public groups are accessible via the API. Personal groups are not available.

In API version 38.0 and later, you can query a Group using `Related.Name` to retrieve the Group's name. `Related.Name` is supported for public groups, user roles, territories, manager groups, and user names.

In API version 13.0 and later, if you delete a public group, it will be deleted even if it has been used in sharing, consistent with the behavior for UserRole. In versions before 13.0, such sharing prevents the record from being deleted.

[GroupMember](#)

[Object Basics](#)

## GroupMember

Represents a User or Group that is a member of a public group.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users cannot access this object.

## Fields

| Field         | Details                                                                                                                                                                       |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GroupId       | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>Required. ID of the Group.                                              |
| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>Required. ID of the User or Group that is a direct member of the group. |

## Usage

A record exists for every User or Group who is a direct member of a public group whose `Type` field is set to Regular. User records that are indirect members of Regular public groups are not listed as group members. A User can be an indirect member of a group if he or she is in a `UserRole` above the direct group member in the hierarchy, or if he or she is a member of a group that is included as a subgroup in that group.

If you attempt to create a record that matches an existing record, system simply returns the existing record.

[Object Basics](#)

## HashtagDefinition

HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

 **Important:** Starting in Spring '16, API access to HashtagDefinition is disabled across all API versions. Any integrations relying on API queries to this object stop working. You can continue to use hashtags in posts and comments, and the hashtags continue to create corresponding topics. We recommend that you redirect all API queries and reports using the HashtagDefinition object to use the Topic object instead. For more information, see [Retiring the Legacy HashtagDefinition Object—FAQs](#).

## Supported Calls

`describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Usage

Use this object to identify public hashtag topics and see how often they're used.

SEE ALSO:

[Topic](#)

# Holiday

---

Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

All users, even those without the "View Setup and Configuration" user permission, can view holidays via the API.

## Fields

| Field            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Field              | Details                                                                                                                                                                                                                                                                                                            |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RecurrenceType     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>Indicates how often the holiday repeats. For example, daily, weekly, or every Nth month (where “Nth” is defined in <code>RecurrenceInstance</code>).</p> |
| StartTimeInMinutes | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>The start time of the holiday in minutes.</p>                                                                                                                                      |

## Usage

Use this object to view and update holidays, which specify dates and times at which associated business hours and escalation rules are suspended.

## Idea

Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

**Note:** For other standard objects, the `describeLayout()` call returns the `recordTypeMappings` section that contains the layout ID and picklist values for each record type. However, the `recordTypeMappings` section and the fields it includes are not available for the Idea object.

When performing a SOSL search on Idea objects, IdeaComment objects are also searched.

|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|           | <p>newer votes, simulating exponential decay. The score itself does not display in the application user interface.</p> <p> <b>Note:</b> Unlike other fields of type double, you can't use a SOQL aggregate function with this field.</p>                                                                                                                                                                 |
| VoteTotal | <p><b>Type</b><br/>double</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>An Idea's total number of points. Each vote a user makes is worth ten points, therefore the value of this field is ten times the number of votes an idea has received.</p> <p> <b>Note:</b> Unlike other fields of type double, you can't use a SOQL aggregate function with this field.</p> |

 **Note:** If you are importing Idea data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

## Usage

Use this object to track ideas, which are written suggestions on which users can vote and comment.

SEE ALSO:

[IdeaComment](#)

[Vote](#)

## IdeaComment

Represents a comment that a user has submitted in response to an idea.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

 **Note:** When performing a SOSL search on IdeaComment objects, Idea objects are also searched.

## Fields

| Field                | Field Type                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Field Name | Details                                                                                                                                                                         |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>Minimum number of points for this level. The threshold must be unique within the zone or internal organization and must be greater than or equal to zero. |

## Usage

Use to create or edit reputation levels for an Ideas zone or internal organization.

## IdeaTheme

Represents an invitation to community members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`,

## Fields

| Field Name      | Details                                                                                                                                                                                                          |

| Field Name | Details                                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title      | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, idLookup, Namefield, Sort, Update<br><b>Description</b><br>Title of the idea theme. |

## Usage

Use the object to track ideas that are submitted to an idea theme.

## KnowledgeableUser

Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                                                                                                                   |

|------------|--------------------------------------------------------------------------------------------------------------------------------------|
| TopicId    | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>Unique ID for the topic in Salesforce. |
| UserId     | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>Unique ID for the user in Salesforce.  |

## KnowledgeArticle

Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later.

Unlike KnowledgeArticleVersion, the ID of a KnowledgeArticle record is identical irrespective of the article's version (status). For more information on articles and article types, see “Work with Articles and Translations” and “Knowledge Article Types” in the Salesforce online help.

## Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

A user must have the “View Articles” permission enabled. Salesforce Knowledge users, unlike Customer Portal and partner portal users, must also be granted the `Knowledge User` feature license.

## Fields

| Field Name   | Details                                                                                                                                              |

| Field Name     | Details                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                | <b>Description</b><br>The timestamp for when the current user last viewed a record related to this record.                                                                                                                                                                                          |
| LastViewedDate | <b>Type</b><br>date<br><br><b>Properties</b><br>Filter, Nillable, Sort, Update<br><br><b>Description</b><br>The timestamp for when the current user last viewed this record. If this value is null, this record might only have been referenced ( <code>LastReferencedDate</code> ) and not viewed. |
| MasterLanguage | <b>Type</b><br>picklist<br><br><b>Properties</b><br>Filter, Restricted picklist<br><br><b>Description</b><br>The article's original language. Only accessible if your knowledge base supports multiple languages.                                                                                   |

## Usage

Use this object to query or retrieve articles. KnowledgeArticle can be used in a SOQL clause, but doesn't provide access to the fields from the article. Provides read-only access to an article and the ability to delete the master article.

SEE ALSO:

[KnowledgeArticleVersion](#)

## KnowledgeArticleVersion

Provides a global view of standard article fields across all article types depending on their version. This object is available in API version 18.0 and later.

Use this object to:

- Query or search generically across multiple article types.
- Filter on a specific version.
- Update standard fields, those fields that are updateable, in draft versions.

When you query on the archived article, the results include both the article and the article's archived versions.

**Note:** You can't update draft translations with the API.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, and `update()`.

### Note:

- You can only update draft versions.
- To create, update, or delete a Knowledge article version, use the call on `ArticleType_kav`, where *ArticleType* is the name of the article's type. For example, to delete, use `ArticleType_kav.delete()`.

## Special Access Rules

A user must have the “View Articles” permission enabled. Salesforce Knowledge users, unlike Customer Portal and partner portal users, must also be granted the `Knowledge User` feature license to view and edit article versions.

## Usage

Use this object to query, retrieve, or search for articles across all article types depending on their version. You can update draft master articles. Additionally, you can delete articles that are not drafts. Client applications can use `KnowledgeArticleVersion` with `describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()` to return the category groups and the category structure associated with Salesforce Knowledge.

Alternatively, client applications can use the article type `API Name` followed by `__kav` to query, retrieve, or search for articles for a specific article type.

To access an article independent of its version, use the KnowledgeArticle object.

## SOQL Samples

The following SOQL clause uses KnowledgeArticleVersion to query all published articles from **all article types** complying with the classification specified in the WITH DATA CATEGORY clause:

```
SELECT Title, Summary
FROM KnowledgeArticleVersion
WHERE PublishStatus='Online'
AND Language = 'en_US'
WITH DATA CATEGORY Geography__c ABOVE_OR_BELOW europe__c AND Product__c BELOW All__c
```

The following SOQL clause uses the article type API Name to limit the query to all draft articles from the Offer\_\_kav article type:

```
SELECT Id, Title
FROM Offer__kav
WHERE PublishStatus='Draft'
AND Language = 'en_US'
WITH DATA CATEGORY Geography__c AT (france__c,usa__c) AND Product__c ABOVE dsl__c
```

The following SOQL clause uses KnowledgeArticleVersion to query the Ids of all archived versions of a particular article:

```
SELECT Id
FROM KnowledgeArticleVersion
WHERE PublishStatus='Archived'
AND IsLatestVersion=false
AND KnowledgeArticleId='kA1D000000001PQ6KAM'
```

## SOQL and SOSL with KnowledgeArticleVersion

- Always filter on a single value of PublishStatus unless the query filters on one or more primary key IDs. To support security, only users with the “Manage Articles” permission see articles whose PublishStatus value is Draft.
- Archived article versions are stored in the articletype\_\_kav object. To query archived article versions, specify the article Id and set IsLatestVersion='0'.
- Always filter on a single value of Language. However, in SOQL, you can filter on more than one Language if there is a filter on Id or KnowledgeArticleId.

## KnowledgeArticleVersionHistory

---

Enables read-only access to the full history of an article. This object is available in API version 25.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

This object respects field, entity, and record-level security. You must have at least “Read” permission on the article type or the field to access its history. For data category security, Salesforce determines access based on the categorization of the online version of an article. If there is no online version, then security is applied based on the archived version, followed by the security of the draft version.

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| VersionId        | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The ID assigned to a version of the article.                                           |
| VersionNumber    | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The number assigned to a version of an article. This field is available in API version 24.0 and later. |

## Usage

Use this object to query events in the history of an article. For example, you can retrieve the number of edits a particular user has made to an article, how many times the article has been published, and so on.

## KnowledgeArticleViewStat

---

Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Users must have access to the published version of an article to retrieve its views. For more information on published article version, see the `PublishStatus` field in `KnowledgeArticleVersion`.

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Channel         | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Filter, Restricted picklist</p> <p><b>Description</b></p> <p>The channel where the article is viewed:</p> <ul style="list-style-type: none"><li>• <code>AllChannels</code> for article views across all channels.</li><li>• <code>App</code> for the internal Salesforce Knowledge application.</li><li>• <code>Pkb</code> for article views in public knowledge base.</li><li>• <code>Csp</code> for Customer Portal.</li><li>• <code>Prm</code> for article view in partner portal.</li></ul> |
| NormalizedScore | <p><b>Type</b></p> <p>double</p> <p><b>Properties</b></p> <p>Filter, Nillable</p> <p><b>Description</b></p> <p>Article's weighted views in the selected channel. The article with most views has a score of 100. Other article views are then calculated relative to this highest view score. For example, if the best read article has 2000 views and another has 1000. The first one gets a score of 100 while the second gets 50.</p>                                                                                                                       |

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParentId   | <b>Type</b><br>reference<br><b>Properties</b><br>Filter<br><b>Description</b><br>ID of the viewed article. This corresponds to a KnowledgeArticle record.                                                                                                                                                                                                                                                                                 |
| ViewCount  | <b>Type</b><br>int<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>The number of unique views an article has received in the selected channel. An article with a high number of views may not always have a high normalized score. The normalized score for an article is calculated based on views over time, with more recent views earning a higher score. This field is available in API version 27.0 and later. |

## Usage

Use this object to query or retrieve statistics for article views.

Alternatively, client applications can use the article type `API Name` followed by `__ViewStat` to query or retrieve most viewed articles from a specific article type.

## SOQL Samples

The following SOQL clause uses KnowledgeArticleViewStat to query all the article views in Salesforce Knowledge and return the related articles:

```
SELECT Id, NormalizedScore, Parent.Id
  FROM KnowledgeArticleViewStat where Channel = 'App'
 ORDER BY NormalizedScore
```

Use the following clause to restrict your query to Offer articles for the Offer article type:

```
SELECT Id, NormalizedScore, Parent.Id
  FROM Offer__ViewStat where Channel = 'App'
 ORDER BY NormalizedScore
```

# KnowledgeArticleVoteStat

Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Users must have access to the published version of an article to retrieve its votes. For more information on published article version, see the `PublishStatus` field in `KnowledgeArticleVersion`

**Note:** If you import Lead data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

## Converted Leads

Leads have a special state to indicate that they have been converted into an Account, Contact, and optionally, an Opportunity. Your client application can convert leads via the `convertLead()` call. Users can also convert leads through the user interface. Once a lead has been converted, it is read-only. You can't update or delete a converted lead. However, you can query converted lead records.

Leads have several fields that indicate their converted status. These special fields are set when converting the lead in the user interface.

- `ConvertedAccountId`
- `ConvertedContactId`
- `ConvertedDate`
- `ConvertedOpportunityId`
- `IsConverted`
- `Status`

**Note:** If person account record types have been enabled, and if the value of `Company` is null, the lead converts to a person account.

## Unread Leads

Leads have a special state to indicate that they have not been viewed or edited by the lead owner. In the user interface, this is helpful for users to know which leads have been assigned to them but which they have not touched yet. `IsUnreadByOwner` is `true` if the lead owner has not yet viewed or edited the lead, and `false` if the lead owner has viewed or edited the lead at least once.

## Lead Status Picklist

Each `Status` value corresponds to either a converted or unconverted status in the lead status picklist, as defined in the user interface. To obtain the lead status values in the picklist, a client application can query `LeadStatus`.

You can't convert a lead via the API by changing `Status` to one of the converted lead status values. When you convert qualified leads into an account, contact, and opportunity, you can select one of the converted status types for the lead. Leads with a converted status type are no longer available in the Leads tab, although you can include them in reports.

## Usage

To update a Lead or to convert one with `convertLead()`, your client application must log in with the "Edit" permission on leads.

When you create, update, or upsert a lead, your client application can have the lead automatically assigned to one or more User records based on assignment rules that have been configured in the user interface.

To use this feature, your client application needs to set either of the following options (but not both) in the `AssignmentRuleHeader` used in create or update:

| Field                         | Field Type | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>assignmentRuleId</code> | reference  | <p>ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and <code>useDefaultRule</code> is <code>true</code>, then the default assignment rule is used.</p> <p>To find the ID for a given assignment rule, query the <code>AssignmentRule</code> object (specifying <code>RuleType="leadAssignment"</code>), iterate through the returned <code>AssignmentRule</code> records, find the one you want to use, retrieve its ID, and then specify its ID in this field in the <code>AssignmentRuleHeader</code>.</p> |

| Field          | Field Type | Details                                                                                                                                                                    |
|----------------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| useDefaultRule | boolean    | Specifies whether to use the default rule for rule-based assignment ( <code>true</code> ) or not ( <code>false</code> ). Default rules are assigned in the user interface. |

## Java Sample

The following Java sample shows how to automatically assign a newly created lead.

```
package wsc;

import com.sforce.soap.enterprise.Connector;
import com.sforce.soap.enterprise.EnterpriseConnection;
import com.sforce.ws.ConnectionException;
import com.sforce.ws.ConnectorConfig;
import com.sforce.soap.enterprise.sobject.Lead;
import com.sforce.soap.enterprise.QueryResult;
import com.sforce.soap.enterprise.SaveResult;
import com.sforce.soap.enterprise.sobject.SObject;

public class LeadAssignment {

    static final String USERNAME = "REPLACE USER NAME";
    static final String PASSWORD = "REPLACE PASSWORD";
    static EnterpriseConnection connection;

    static LeadAssignment _leadAssignment;

    // Main
    public static void main(String[] args)
    {
        // Establish connection and login
        ConnectorConfig config = new ConnectorConfig();
        config.setUsername(USERNAME);
        config.setPassword(PASSWORD);
        try {
            connection = Connector.newConnection(config);
            System.out.println("Logged in, endpoint: " + config.getAuthEndpoint());
        } catch (ConnectionException e1) {
            e1.printStackTrace();
        }
    }

    // Create lead
    _leadAssignment = new LeadAssignment();
    try {
        _leadAssignment.CreateLead();
    } catch (Exception e) {
        e.printStackTrace();
    }

    // Logout
    try {
        connection.logout();
    }
```

```

        System.out.println("Logged out");
    } catch (ConnectionException ce) {
        ce.printStackTrace();
    }
}

public void CreateLead() throws ConnectionException
{
    // Create a new Lead and assign various properties
    Lead lead = new Lead();

    lead.setFirstName("Joe");
    lead.setLastName("Smith");
    lead.setCompany("ABC Corporation");
    lead.setLeadSource("API");
    // The lead assignment rule will assign any new leads that
    // have "API" as the LeadSource to a particular user

    // In this sample we will look for a particular rule and if found
    // use the id for the lead assignment. If it is not found we will
    // instruct the call to use the current default rule. You can't use
    // both of these values together.
    QueryResult qr = connection.query("SELECT Id FROM AssignmentRule WHERE Name = " +
                                     "'Mass Mail Campaign' AND SubjectType = 'Lead'");
    if (qr.getSize() == 0) {
        connection.setAssignmentRuleHeader(null, true);
    } else {
        connection.setAssignmentRuleHeader(qr.getRecords()[0].getId(), false);
    }

    // Every operation that results in a new or updated lead will
    // use the specified rule until the header is removed from the
    // connection.
    SaveResult[] sr = connection.create(new SObject[] {lead});
    for (int i=0;i<sr.length;i++) {
        if (sr[i].isSuccess()) {
            System.out.println("Successfully created lead with id of: " +
                              sr[i].getId() + ".");
        } else {
            System.out.println("Error creating lead: " +
                              sr[i].getErrors()[0].getMessage());
        }
    }

    // This call effectively removes the header, the next lead will
    // be assigned to the default lead owner.
    connection.clearAssignmentRuleHeader();
}
}

```

## C# Sample

The following C# sample shows how to automatically assign a newly created lead.

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
using System.ServiceModel;
using LeadSample.sforce;

namespace LeadSample
{
    class LeadAssignment
    {
        private static SoapClient client;
        private static SoapClient apiClient;
        private static SessionHeader header;
        private static LoginResult loginResult;
        private static readonly string Username = "REPLACE USERNAME";
        private static readonly string Password = "REPLACE PASSWORD AND SECURITY TOKEN";

        // Create the proxy binding and login
        private LeadAssignment()
        {
            client = new SoapClient();

            try
            {
                loginResult = client.login(null, Username, Password);
            }
            catch (Exception e)
            {
                Console.WriteLine("Unexpected login error: " + e.Message);
                Console.WriteLine(e.StackTrace);
                return;
            }

            // Access API endpoint and create new client
            header = new SessionHeader();
            header.sessionId = loginResult.sessionId;
            apiClient = new SoapClient("Soap", loginResult.serverUrl);
        }

        [STAThread]

## LeadCleanInfo

Stores the metadata Data.com Clean uses to determine a lead record's clean status. Helps you automate the cleaning or related processing of lead records.

Lead Clean Info provides a snapshot of the data in your Salesforce lead record and its matched Data.com record at the time the Salesforce record was cleaned.

Lead Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentTitle`

field. If the `IsDifferentTitle` field's value is `False`, that means the `Title` field value is *the same* on the Salesforce lead record and its matched Data.com record.

LeadCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the lead record.
- `IsDifferent` indicates whether or not a field on the lead record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the lead record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the lead record is in a `Reviewed` state, which means that the value was reviewed but not accepted..

Their individual bits are defined here

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Usage

Developers can create triggers that read the Lead Clean Info fields to help automate the cleaning or related processing of lead records.

## LeadFeed

Represents a single feed item in the feed displayed on the detail page for a lead record. This object is available in API version 18.0 and later.

A lead feed shows recent changes to a lead record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to leads in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Lead object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of LeadFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId | <p><b>Type</b><br/>reference</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Field            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IsRichText       | <p><b>Type</b></p> <p>boolean</p> <p><b>Properties</b></p> <p>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via the SOAP API. Otherwise, the post is rendered as plain text.</p> <p>Rich text supports the following HTML tags:</p> <ul style="list-style-type: none"> <li>• <code>&lt;p&gt;</code></li> <li>•  <b>Tip:</b> Though the <code>&lt;br&gt;</code> tag isn't supported, you can use <code>&lt;p&gt;&amp;nbsp;  &lt;/p&gt;</code> to create lines.</li> <li>• <code>&lt;b&gt;</code></li> <li>• <code>&lt;code&gt;</code></li> <li>• <code>&lt;i&gt;</code></li> <li>• <code>&lt;u&gt;</code></li> <li>• <code>&lt;s&gt;</code></li> <li>• <code>&lt;ul&gt;</code></li> <li>• <code>&lt;ol&gt;</code></li> <li>• <code>&lt;li&gt;</code></li> <li>• <code>&lt;img&gt;</code></li> </ul> <p>The <code>&lt;img&gt;</code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code>&lt;img src="sfdc://069B0000000omjh"&gt;&lt;/img&gt;</code></p> <p> <b>Note:</b> In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.</p> |
| LastModifiedDate | <p><b>Type</b></p> <p>dateTime</p> <p><b>Properties</b></p> <p>Defaulted on create, Filter, Sort</p> <p><b>Description</b></p> <p>Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

[UserProfileFeed](#)

## LeadHistory

Represents the history of changes to the values in the fields of a lead.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field                  | Details                                                                                                                                                                                                                                                        |

| DeveloperName   | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.<br/><br/>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId         | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID representing the source group. Leads owned by users in the source group trigger the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| LeadAccessLevel | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>A value that represents the type of sharing being allowed. ## LeadShare

Represents a sharing entry on a Lead.

## Supported Calls

`describeObjects()`, `query()`, `retrieve()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the User or Group that has been given access to the Lead. This field can't be updated. |

## Usage

This object allows you to determine which users and groups can view or edit leads owned by other users.

If you attempt to create a record that matches an existing record, the existing record is returned.

These numbers are not guaranteed to be sequential, as some previous lead status values might have been deleted.</p> |

## Usage

This object represents a value in the lead status picklist (see Lead Status Picklist). The lead status picklist provides additional information about the status of a Lead, such as whether a given status value represents a converted Lead. Query this object to retrieve the set of values in the lead status picklist, and then use that information while processing Lead objects to determine more information about a given lead. For example, the application could test whether a given lead is converted based on its `Status` value and the value of the `IsConverted` property in the associated LeadStatus record.

|            | <ul style="list-style-type: none"><li>• <b>Personal</b>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.</li></ul> |

## Usage

LeadTag stores the relationship between its parent TagDefinition and the Lead being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## LimitAllocationPerApp

Represents a connected app quota for an API limit. This object is available in API version 30.0 and later.

**Note:** LimitAllocationPerApp is currently available through a pilot program. For information on enabling LimitAllocationPerApp for your organization, contact Salesforce.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Percentage  | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The percentage of the API limit reserved for the connected app. The app can't consume more than this percentage of the API limit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Field Name****Details**

You can find the available percentage for each limit type through the user interface or by using the `query()` call.

## Usage

App quotas for API limits enable you to reserve API capacity for mission-critical connected apps or set a ceiling for API usage of non-critical connected apps.

## LineitemOverride

A forecast override of a line item on an Opportunity. This read-only object for customizable forecasting has a child-parent relationship with OpportunityOverride.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

This object is only accessible if your organization has enabled the customizable forecasting feature, which can be done in the user interface. Requires the “View All Data” permission.

## Fields

**Field****Details**

`AmountInherited`

**Type**

boolean

**Properties**

Create, Defaulted on create, Filter, Group, Sort, Update

**Description**

Indicates whether the overridden amount rolls up through the forecast hierarchy (`true`), or was overridden by the owner of this record (`false`).

`ForecastCategoryInherited`

**Type**

boolean

**Properties**

Create, Defaulted on create, Filter, Group, Sort, Update

**Description**

Indicates whether the overridden forecast category rolls up through the forecast hierarchy (`true`), or was overridden by the owner of this record (`false`).

[OpportunityOverride](#)

## LinkedArticle

Represents a Knowledge article that is attached to a record. This object is available in API version 37.0 and later.

As of Summer '16, linked articles are supported only for work orders and work order line items.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Knowledge must be set up in your org.

## Fields

| Field Name                | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage

Admins can customize linked articles' page layouts, fields, validation rules, and more from the Linked Articles node in Setup under Knowledge.

## LinkedArticleFeed

Represents a single feed item on a linked Knowledge article attached to a record. This object is available in API version 37.0 and later. As of Summer '16, linked articles are supported only for work orders and work order line items.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Knowledge must be set up in your org.

## Fields

| Field Name   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# ListView

Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Name             | Details                                                                                                                                                   |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

|               | <p><b>Description</b></p> <p>API name of the chart. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| ExternalId    | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Filter, Group, Nillable, Sort</p> <p><b>Description</b></p> <p>Reserved for future use.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Field Name        | Details                                                                                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IsLastViewed      | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates if a chart is the last viewed by a user.</p>                                                 |
| Label             | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The display name of the chart.</p>                                                                                           |
| ListViewChartId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the chart created by a user. For standard charts, this is null.</p>                                                 |
| ListViewContextId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the list view in context of which the chart is generated. Required to query <code>ListViewChartInstance</code>.</p> |
| SourceEntity      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>API name of the entity to which the chart is related. Required to query <code>ListViewChartInstance</code>.</p>              |

## Usage

### Example 1. Retrieve all custom and standard charts for Account entity for All Accounts list view

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId,
  GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId,
  ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account'
  and ListViewContextId='00BR0000000U8Hr'
```

### Example 2. Retrieve metadata for a specific custom chart by ID for Account entity and All Accounts list view

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId,
  GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId,
  ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account'
  and ListViewContextId='00BR0000000U8Hr' and ListViewChartId='0DdR00000004CBxKAM'
```

### Example 3. Retrieve metadata for a specific standard chart by its developer name for Account entity and All Accounts list view

```
SELECT AggregateField, AggregateType, ChartType, DataQuery, DeveloperName, ExternalId,
  GroupingField, Id, IsDeletable, IsEditable, IsLastViewed, Label, ListViewChartId,
  ListViewContextId, SourceEntity FROM ListViewChartInstance WHERE SourceEntity='Account'
  and ListViewContextId='00BR0000000U8Hr' and DeveloperName='AccountsByIndustry'
```

## LiveAgentSession

This object is automatically created for each Live Agent session and stores information about the session. This object is available in API versions 28.0 and later.

**Note:** Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

## Fields

| Field Name | Details                                                            |
|------------|--------------------------------------------------------------------|
| AgentId    | <b>Type</b><br>reference                                           |

| Field Name | Details                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>The amount of time an agent spent with a status of “Online” during a session. |

## Usage

Use this object to query and manage live chat session records.

## LiveAgentSessionHistory

This object is automatically created for each Live Agent session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

**Note:** Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name         | Details                                                                                                                                                                       |

| OldValue   | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The original value of the field that was changed. |

## Usage

Use this object to identify changes to live chat session records.

## LiveAgentSessionOwnerSharingRule

Represents the rules for sharing a Live Agent session record with users other than the record owner. This object is available in API version 28.0 and later.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field       | Details                                                                                                                                                                                                                                                                                                                        |

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the UI.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID representing the source group. Session records owned by users in the source group trigger the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Name          | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, idLookup, Sort, Update</p> <p><b>Description</b><br/>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label in the UI.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|       | <b>Description</b><br>The ID representing the target user or group. The target user or group is being given access. |

## Usage

Use this object to manage the sharing rules for Live Agent session records.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

## LiveAgentSessionShare

This object is automatically created for each Live Agent session and stores information about the session. This object is available in API versions 28.0 and later.

**Note:** Standard fields for the LiveAgentSession object can only be modified if your administrator has given you editing permissions for these records.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Usage

This object lets you determine which users and groups can view and edit LiveAgentSession records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

## LiveChatBlockingRule

Represents a rule for blocking chat visitors' IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| MasterLabel | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Label for the blocking rule.                                                                                                                                                                                                                                     |
| ToIpAddress | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>(Optional) The end of the range of IP addresses that you want to block. The range begins with and includes the IP address in the <code>FromIpAddress</code> field, and it ends with and includes the IP address in the <code>ToIpAddress</code> field. |

## Usage

Use this object to query and manage rules for blocking customers from starting new chats with agents.

## LiveChatButton

Represents a button that allows visitors to request chats with Live Agent users. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `query()`, `retrieve()`, `update()`, `upsert()`

With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |

|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WindowLanguage | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>The language used for standard chat windows. Custom chat windows use the language of the user's browser.</p> |

## Usage

Use this object to query and manage live chat buttons and automated chat invitations.

## LiveChatButtonDeployment

Associates a Live Agent automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name   | Details                                                                                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ButtonId     | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the automated invitation associated with the deployment.</p>           |
| DeploymentId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, NillableSort</p> <p><b>Description</b><br/>The ID of the deployment that will feature the automated invitation.</p> |

## Usage

Use this object to associate automated chat invitations with specific deployments.

## LiveChatButtonSkill

Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `update()`

## Fields

| Field Name | Details                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ButtonID   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The record ID of the button.</p>          |
| SkillID    | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The record ID of the skill.</p> |

## Usage

Use this object to assign a specific skill to a specific button for multi-skill routing. For example:

```
String myButtonId = "button_Id";
String myButtonDevName = "button_DeveloperName";
List<String> skillIds = new List<String>();

//Get one skill ID from button
for(LiveChatButton lcb : [SELECT SkillId FROM LiveChatButton WHERE DeveloperName =:
myButtonDevName]) {
    skillIds.add(lcb.SkillId);
}
//Get remaining skills from LiveChatButtonSkill join object
```

```
for(LiveChatButtonSkill lcbs : [SELECT SkillID FROM LiveChatButtonSkill WHERE ButtonId =:
myButtonId]) {
    skillIds.add(lcbs.SkillId);
}
//Retrieve all skills into a single list
List<Skill> skills = [SELECT Id, DeveloperName FROM Skill WHERE Id IN :SkillIds];
```

## LiveChatDeployment

Represents the general settings for deploying Live Agent on a website. This object is available in API version 24.0 and later.

### Supported Calls

`create()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

| Field Name                | Details                                                                                                                                                                                                                           |

## Usage

Use this object to query and manage live chat deployments.

## LiveChatSensitiveDataRule

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

With this field, a developer can change the object’s name in a managed package and the changes are reflected in a subscriber’s organization.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

## Usage

Use this object to mask or delete data of specified patterns, such as credit card, social security, phone and account numbers, or even profanity.

## LiveChatTranscript

This object is automatically created for each Live Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name                  | Details                                                                                                                                                                                                                                                      |

## Usage

Use this object to query and manage live chat transcripts.

## LiveChatTranscriptEvent

---

Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

## Usage

Use this object to query and manage live chat transcript events.

## LiveChatTranscriptHistory

Represents changes to field values on a LiveChatTranscript object. This object is available in API version 24.0 and later.

## Supported Calls

`getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name           | Details                                                                                                                                                                    |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field                | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The name of the field that was changed</p> |
| LiveChatTranscriptID | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the transcript that was changed</p>                  |
| NewValue             | <p><b>Type</b><br/>anyType</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The new value of the field that was changed</p>                       |
| OldValue             | <p><b>Type</b><br/>anyType</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The old value of the field that was changed</p>                       |

## Usage

Use this object to identify changes to a live chat transcript.

# LiveChatTranscriptOwnerSharingRule

Represents the rules for sharing a Live Agent chat transcript record with users other than the record owner. This object is available in API version 29.0 and later.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Fields

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

This field is available in API version 29.0 and later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                        |
| DeveloperName | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to Rule Name in the UI.</p> |

| Field         | Details                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |  <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record. |
| GroupId       | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID representing the source group. Chat transcript records owned by users in the source group trigger the rule to give access.                                                                                  |
| Name          | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, idLookup, Sort, Update<br><b>Description</b><br>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to Label in the UI.                                                                            |
| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID representing the target user or group. The target user or group is being given access.                                                                                                                      |

## Usage

Use this object to manage the sharing rules for Live Agent chat transcript records.

[Metadata API Developer Guide: SharingRules](#)

## LiveChatTranscriptShare

Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| UserOrGroupID | <p><b>Type</b><br/>reference</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Field Name | Details                                                                                             |
|------------|-----------------------------------------------------------------------------------------------------|
|            | <b>Properties</b><br>Create, Filter, Group, Sort                                                    |
|            | <b>Description</b><br>ID of the User or Group that has been given access to the LiveChatTranscript. |

## Usage

This object lets you determine which users and groups can view and edit LiveChatTranscript records owned by other users.

If you attempt to create a new record that matches an existing record, the `create()` call updates any modified fields and returns the existing record.

## LiveChatTranscriptSkill

Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

## Supported Calls

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`

## Fields

| Field Name   | Details                                                                                                                                                        |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|

| TranscriptId | <b>Type</b><br>reference                                                                                                                                       |

| Field Name | Details                                                |
|------------|--------------------------------------------------------|
|            | <b>Properties</b><br>Create, Filter, Group, Sort       |
|            | <b>Description</b><br>The record ID of the transcript. |

## Usage

Use this object to assign a specific skill to a specific transcript for multi-skill routing.

## LiveChatUserConfig

Represents a setting that controls the console settings for Live Agent users. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name       | Details                                                                                                          |
|------------------|------------------------------------------------------------------------------------------------------------------|

| DeveloperName     | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.<br> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record. |

## Usage

Use this object to query and manage agent configurations in Live Agent.

## LiveChatUserConfigProfile

Represents a join between LiveChatUserConfig and Profile. This object is available in API version 24.0 and later.

## Supported Calls

`create()` `delete()` `query()` `retrieve()` `update()` `upsert()`

## Fields

| Field Name           | Details                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| LiveChatUserConfigId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The record ID of the agent configuration |
| ProfileId            | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The record ID of the profile             |

## Usage

Use this object to assign specific agent configurations to specific user profiles.

## LiveChatUserConfigUser

Represents a join between LiveChatUserConfig and User. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name           | Details                                                                                                                                        |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| LiveChatUserConfigId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The record ID of the agent configuration |

| Field Name | Details                                                    |
|------------|------------------------------------------------------------|
|            | <b>Properties</b><br>Create, Filter, Group, Nillable, Sort |
|            | <b>Description</b><br>The record ID of the user            |

## Usage

Use this object to assign specific agent configurations to specific users.

## LiveChatVisitor

Represents a website visitor who has started or tried to start a chat session. This object is available in API version 24.0 and later.

## Supported Calls

`create()`, `delete()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name                      | Details                                                                                                                                                                                                                                                                                     |

## Usage

Use this object to query and manage live chat visitors.

## LoginEvent

Represents a trackable user login event in your org. This object is available in API version 36.0 and later.

## Supported Calls

`query()`

## Special Access Rules

Accessing this object requires View Login Forensics Events and API Enabled user permissions.

## Fields

## Working with AdditionalInfo

`AdditionalInfo` enables you to extend the login event with custom data that can be queried later. For example, you can capture a correlation ID when a user logs in from an external system that shares that unique ID. This process enables tracking logins across systems. To store data with `LoginEvent`, begin all `AdditionalInfo` field names with `x-sfdc-addinfo-{fieldname}`. For example, a valid field assignment is `x-sfdc-addinfo-correlation_id = ABC123` where `x-sfdc-addinfo-correlation_id` is the field name and `ABC123` is the field value.

When defining field names, note the following:

- `x-sfdc-addinfo-` is case-*insensitive*. `x-sfdc-addinfo-{field name}` is the same as `X-SFDC-ADDINFO-{FIELD NAME}`.
- Fields can contain only alphanumeric and `"_"` (underscore) characters.
- Field names must be between 2 and 29 characters in length, excluding `x-sfdc-addinfo-`.
- Field names that don't start with `x-sfdc-addinfo-` are ignored.
- Names that contain invalid characters after `x-sfdc-addinfo-` are ignored.

- Only the first 30 valid field names are stored in `AdditionalInfo`. Field names are not necessarily stored in the same order in which they were passed to authentication.

When determining field values, keep the following in mind:

- You can't use existing API field names as `AdditionalInfo` names in the HTTP header. If the `AdditionalInfo` name conflicts with an object's API name, the field value isn't stored. For example, the HTTP header `X-SFDC-ADDINFO-UserId='abc123'` doesn't get stored in `AdditionalInfo`.
- Additional field values can contain only alphanumeric, `"_"` and `"-"` characters.
- Field values must be 255 characters in length or fewer. If a field value exceeds 255 characters, only the first 255 characters are stored and the rest are truncated.
- Field values that contain invalid characters are saved with a field header of Empty String (`""`).
- Only the first 30 valid field names are stored in the `AdditionalInfo` field. They are not guaranteed to be stored in the same order that they were passed into the authentication.
- When `AggregationFieldName` is `SourceIp`, you can't filter on `AggregationFieldValue` if its value is *Salesforce.com IP*.

## How to Pass Additional Information by Using HTTP with cURL

Here's an example of passing additional information via the command line.

```
curl https://yourInstance.salesforce.com/services/oauth2/token -d "grant_type=password"
-d
"client_id=3MVG9PhR6g6B7ps4RF_kNPoWSxVQstrazijsE8njPtkpUzVPPffzy8
jIoRE6q9rPznNtIsqbP9ob8kUfMjXXX" -d "client_secret=4180313776440635XXX" -d
"username=user@company.com" -d "password=123456" -H "X-PrettyPrint:1" -H
"x-sfdc-addinfo-correlationid:
d18c5a3f-4fba-47bd-bbf8-6bb9a1786624"
```

## How to Pass Additional Information in Java

Here's an example of passing additional information in Java.

```
//adding additional info headers ..
Map<String, String> httpHeaders = new HashMap<String,String>();
httpHeaders.put("x-sfdc-addinfo-fieldname1" /* additional info field*/ ,
"d18c5a3f-4fba-47bd-bbf8-6bb9a1786624" /* value*/);
httpHeaders.put("x-sfdc-addinfo-fieldname2" /* additional info field*/ ,
"d18c5a3f-4fba-47bd-bbf8-6bb9a1786624" /* value*/);
ConnectorConfig config = new ConnectorConfig();
config.setUsername(userId) ;
config.setPassword(passwd) ;
config.setAuthEndpoint(authEndPoint) ;
config.setProxy(proxyHost, proxyPort) ;
//setting additional info headers
for (Map.Entry<String, String> entry : httpHeaders.entrySet()) {
config.setRequestHeader(entry.getKey(), entry.getValue());
}
// Set the username and password if your proxy must be authenticated
9
LoginEvent
```

```
config.setProxyUsername(proxyUsername);
config.setProxyPassword(proxyPassword);
try {
    EnterpriseConnection connection = new EnterpriseConnection(config);
    // etc.
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
```

## SOQL Usage

Currently, the only supported SOQL function on LoginEvent is `WHERE`, and you can only use comparison operators (`=`, `<`, `>`, `<=`, and `>=`) on the final expression in a `WHERE` clause. The `!=` operator isn't supported.

**Note:** Date functions such as `convertTimezone()` aren't supported—for example, `SELECT CALENDAR_YEAR(EventDate), Count(Id) FROM LoginEvent GROUP BY CALENDAR_YEAR(EventDate)` returns an error. You can use date literals in your queries and some date and date/time functions like `TODAY`, `YESTERDAY`, and `LAST_n_DAYS:1`. However, these functions use comparison operators behind the scenes. This means you can only use them in the final expression of a `WHERE` clause.

LoginEvent allows filtering over two ordered fields: `EventDate` and `Id`. There's a catch here; your query won't work unless you use the correct order and combination of these fields. The following list provides some examples of valid and invalid queries:

- **Unfiltered**

- **Valid**—contains no `WHERE` clause, so no special rules apply.

```
SELECT Application, Browser, EventDate, Id, LoginUrl, UserId
FROM LoginEvent
```

- **Filtered on EventDate**

- **Valid**—you can filter solely on `EventDate`, but single filters on other fields fail. You can also use a comparison operator in this query type.

```
SELECT Application, Browser, EventDate, Id, LoginUrl, UserId
FROM LoginEvent
WHERE EventDate<=2014-11-27T14:54:16.000Z
```

- **Valid**—you can filter on `EventDate` using date literals.

```
SELECT Application, Browser, EventDate, Id, LoginUrl, UserId
FROM LoginEvent
WHERE EventDate<=TODAY
```

- **Filtered on EventDate and Id**

- **Valid**—successful queries on LoginEvent filter over both fields.

```
SELECT Application, Browser, EventDate, Id, LoginUrl, UserId
FROM LoginEvent
WHERE EventDate=2014-11-27T14:54:16.000Z and Id='1HBD00000001N6EOAU'
```

- **Valid**—successful queries on LoginEvent with EventDate and standard date literals.

```
SELECT Application, Browser, EventDate, Id, LoginUrl, UserId
FROM LoginEvent
WHERE EventDate=Today and Id='1HBD0000000kJDWAY'
```

- **Invalid**—filtering only on EventDate with <= or >= operator and Id field isn't supported.

```
SELECT Application, Browser, EventDate, Id, LoginUrl, UserId
FROM LoginEvent
WHERE EventDate<=2014-11-27T14:54:16.000Z and Id='1HBD00000001N6EOAU'
```

## LoginGeo

Represents the geographic location of the user's IP address for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary. This object is available in API version 34.0 and later.

## Supported Calls

`describeObjects()`, `query()`, `retrieve()`

## Special Access Rules

Only users with Manage Users permissions can access this object.

## Fields

| Field      | Details                                                                                                                                                                                                            |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

For more information, see <a href="#">Country Codes - ISO 3166</a></p>                                                                  |
| Latitude    | <p><b>Type</b><br/>double</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>The latitude where the user's IP address is physically located.</p>                                                                                                                                   |
| LoginTime   | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Filter, Sort</p> <p><b>Description</b><br/>Time of the login attempt, in GMT time zone.</p>                                                                                                                                                              |
| Longitude   | <p><b>Type</b><br/>double</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>The longitude where the user's IP address is physically located.</p>                                                                                                                                  |
| PostalCode  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The postal code where the user's IP address is physically located. This value is not localized.</p>                                                                                            |
| Subdivision | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The name of the subdivision where the user's IP address is physically located. In the U.S., this value is usually the state name (for example, Pennsylvania). This value is not localized.</p> |

## Usage

The API allows you to do many powerful queries. A few examples are:

| Sample Query                                                                                       | Query String                                                             |
|----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| Query showing the country for a login event, where<br>Id=LoginGeoId from AuthSession               | <code>SELECT Country FROM LoginGeo WHERE Id = 'OLE#####'</code>          |
| Query showing the city and postal code for a login event, where<br>Id=LoginGeoId from LoginHistory | <code>SELECT City, PostalCode FROM LoginGeo WHERE Id = 'OSO#####'</code> |

## LoginHistory

Represents the login history for all successful and failed login attempts for organizations and enabled portals. This object is available in API version 21.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

With one exception, only users with Manage Users permissions can access this object. The exception is that, in API version 37.0 and later, all users can retrieve their own login history records.

## Fields

| Field                   | Details                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>ApiType</code>    | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Indicates the API type, for example <code>Soap Enterprise</code>. Label is <b>API Type</b>.</p> |
| <code>APIVersion</code> | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Group, Nillable, Sort</p> <p><b>Description</b><br/>Displays the API version used by the client. Label is <b>API Version</b>.</p>                   |

| Field                   | Details                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Field  | Details                                                                                                                                                                       |
|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| UserId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the user logging in. Label is <b>User ID</b>.</p> |

## Usage

Not all fields are filterable. You can only filter on the following fields:

- AuthenticationServiceId
- CipherSuite
- CountryIso
- Id
- LoginTime
- LoginType
- LoginUrl
- NetworkId
- TlsProtocol
- UserId

The API allows you to do many powerful queries. A few examples are:

| Sample Query                                                                                                                            | Query String                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Simple query showing UserId & LoginTime for each user                                                                                   | <code>SELECT UserId, LoginTime from LoginHistory;</code>                                                                                                   |
| Query showing logins only after a specified date and time                                                                               | <code>SELECT UserId, LoginTime from LoginHistory<br/>WHERE LoginTime &gt; 2010-09-20T22:16:30.000Z;</code>                                                 |
| Query showing logins for a specific time interval                                                                                       | <code>SELECT UserId, LoginTime from LoginHistory<br/>WHERE LoginTime &gt; 2010-09-20T22:16:30.000Z<br/>AND LoginTime &lt; 2010-09-21T22:16:30.000Z;</code> |
| Query showing the authentication service for a SAML login event, where Id=AuthenticationServiceId from LoginHistory                     | <code>SELECT name, issuer, samlVersion FROM<br/>SamlSsoConfig WHERE Id =<br/>'OLE#####'</code>                                                             |
| Query showing the authentication service for an authentication provider login event, where Id=AuthenticationServiceId from LoginHistory | <code>SELECT Type, DeveloperName FROM<br/>AuthProvider WHERE Id =<br/>'OSO#####'</code>                                                                    |

# LoginIp

Represents a validated IP address. This object is available in version 28.0 and later.

## Supported Calls

`describeSObjects()`, `delete()`, `query()`, `retrieve()`

## Fields

| Field             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Field   | Details                                                             |
|---------|---------------------------------------------------------------------|
|         | <b>Description</b><br>The IP address the user logged in from.       |
| UsersId | <b>Type</b><br>reference                                            |
|         | <b>Properties</b><br>Filter, Group, Sort                            |
|         | <b>Description</b><br>The ID of the user associated with this item. |

## Usage

At every login, the IP address of the login request is checked against the validated IP addresses using LoginIp. A match means the login IP address is a known IP address. If there's no match, the address is unknown, and the user is asked to confirm their identity.

## LookedUpFromActivity

This read-only object is displayed as a related list on an activity record (an event or a task); the list contains records that have custom lookup relationships from the activity to another object. This object is not queryable.

## Supported Calls

`describeSObjects()`

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                              |

| ReminderDateTime | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>Represents the time at which a reminder is scheduled to fire if <code>IsReminderSet</code> is set to <code>true</code>. If <code>IsReminderSet</code> is set to <code>false</code>, then either the user has deselected the reminder checkbox in the user interface or the reminder has already fired at the time indicated by the value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| StartDateTime    | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>Indicates the start date and time of the event. Available in versions 13.0 and later.<br/>The <code>StartDateTime</code> field contains the event start date.<br/><br/>However, if the event's <code>IsAllDayEvent</code> flag is set to <code>true</code> (indicating an all-day event), then the time stamp in the <code>StartDateTime</code> field is always set to midnight in the Coordinated Universal Time (UTC) time zone. Don't attempt to alter the time stamp to account for any time zone differences.<br/><br/>If the event's <code>IsAllDayEvent</code> flag is set to <code>false</code>, then you must translate the time portion of the time stamp in the <code>StartDateTime</code> field to or from a local time zone for the user or the application, as appropriate, and the translation must be in the Coordinated Universal Time (UTC) time zone.<br/><br/>If this field has a value, then <code>ActivityDate</code> and <code>ActivityDateTime</code> either must be <code>null</code> or must match the value of this field.</p> |
| Status           | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>Indicates the current status of a task, such as in progress or complete. Each predefined status field sets a value for <code>IsClosed</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Subject          | <p><b>Type</b><br/>combobox</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>Contains the subject of the task or event.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| WhatId     | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The <code>WhatId</code> represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. <code>WhatIds</code> are polymorphic. Polymorphic means a <code>WhatId</code> is equivalent to the ID of a related object. The label is <code>Related To ID</code>.</p> |
| WhoId      | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The <code>WhoId</code> represents a human such as a lead or a contact. <code>WhoIds</code> are polymorphic. Polymorphic means a <code>WhoId</code> is equivalent to a contact's ID or a lead's ID. The label is <code>Name ID</code>.</p>                                                         |

## Usage

### Query activities related to an object

1. Optionally, issue a describe call against the object whose activities you wish to query, to get a suggestion of the correct SOQL to use.
2. Issue a SOQL relationship query with a main clause that references the object, and an inner clause that references the activity custom lookup relationship; for example:

```
SELECT id, name,
(SELECT id, subject from sponsoredact__r)
FROM Contact
```

In this example `sponsoredact__r` is a user defined relationship list.

The user interface enforces sharing rules, filtering out related-list items that a user doesn't have permission to see.

The following restrictions on users who don't have "View All Data" permission help prevent performance issues:

- In the main clause of the relationship query, you can reference only one record. For example, you can't filter on all records where the account name starts with 'A'; instead, you must reference a single account record.
- In the inner clause of the query, you can't use `WHERE`.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
- You must sort on `ActivityDate` in descending order and `LastModifiedDate` in descending order; you can display nulls last. For example: `ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC`.

# MacroInstruction

Represents an instruction in a macro. An instruction can specify the object that the macro interacts with, the context or publisher that the macro works within, the operation or action that the macro performs, and the target of the macro's actions. It is a useful way to programmatically define instructions, instead of using the macro widget in the console.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field Name | Details                                                                                                                                                                           |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MacroId    | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>ID of the macro that contains this instruction.                             |
| Name       | <b>Type</b><br>string<br><b>Properties</b><br>Autonumber, Defaulted on create, Filter, Sort<br><b>Description</b><br>Name of the instruction.                                     |
| Operation  | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort, Update<br><b>Description</b><br>The action that the macro instruction performs. |
| SortOrder  | <b>Type</b><br>int<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Order of this instruction in the macro.                                   |

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Target      | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>Object in the case feed that is the target of the operation. For example, the target might be the active case tab or a quick action.</p>                                                                                                                                                                        |
| Value       | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Sort, Update</p> <p><b>Description</b><br/>Value of a field. If the operation is Select, then the value is null, because the operation selects the object on which the macro performs an action. An instruction can contain both a <code>Value</code> field and a <code>ValueRecord</code> field, but only one of these fields can have a value. The other field value must be null.</p> |
| ValueRecord | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>ID of the value or record. The <code>ValueRecord</code> can be either a value or a record, but not both. An instruction can contain both a <code>Value</code> field and a <code>ValueRecord</code> field, but only one of these fields can have a value. The other field value must be null.</p>                                       |

## MailmergeTemplate

Represents a mail merge template (a Microsoft Word document) used for performing mail merges for your organization.

### Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

### Special Access Rules

- All users can view this object, but you need the “Customize Application” permission to modify it.
- Customer Portal users can’t access this object.

## Fields

| Field       | Details                                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this object to manage mail merge templates for your organization.

SEE ALSO:

[Object Basics](#)

## MatchingRule

Represents a matching rule that is used to identify duplicate records. This object is available in API version 33.0 and later.

A matching rule compares field values to determine whether a record is similar enough to existing records to be considered a duplicate. For example, a matching rule can specify that if the `Email` and `Phone` values of two records match exactly, the records might be duplicates. Your organization uses matching rules with duplicate rules to define what happens when duplicates are identified.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Usage

Use the Salesforce API to retrieve and view details about MatchingRule and MatchingRuleItem. Use the Salesforce Metadata API to create, update, or delete these objects.

SEE ALSO:

[MatchingRuleItem](#)

[DuplicateRule](#)

## MatchingRuleItem

Represents criteria used by a matching rule to identify duplicate records. This object is available in API version 33.0 and later.

A matching rule item determines which field the matching rule uses to identify a duplicate record. It also determines the method used to compare value that two records have for the field. For example, a matching rule item might specify that the `Email` field values of two records must match exactly in order for the records to be considered duplicates.

When a matching rule has multiple matching rule items, it means that multiple fields must match in order for the records to be identified as duplicates.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

Otherwise, the value is Released.                                                               |

## Usage

Here are examples of the types of API queries you can perform.

| Query                                                                                                        | String                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Get all package versions for the package that has a MetadataPackageID of 033D00000001xQlIAI                  | <pre>SELECT Id, Name, ReleaseState, MajorVersion, MinorVersion, PatchVersion FROM MetadataPackageVersion WHERE MetadataPackageId = '033D00000001xQlIAI'</pre> |
| Get the package version for the package with a specific MetadataPackageID and a major version greater than 1 | <pre>SELECT Id FROM MetadataPackageVersion WHERE MetadataPackageId ='033D00000001xQlIAI' AND MajorVersion &gt; 1</pre>                                        |
| Get released package versions for the package with a specific MetadataPackageID                              | <pre>SELECT Id FROM MetadataPackageVersion WHERE MetadataPackageId = '033D00000001xQlIAI' AND ReleaseState = 'Released'</pre>                                 |

## Java Code Sample

Suppose you want to push version 3.4.6 of your package to all orgs. Let's write some code to identify the orgs eligible for the upgrade. This example demonstrates how to generate the list of subscriber orgs eligible to be upgraded to version 3.4.6 of a package.

This code sample uses the Force.com Web Services Connector (WSC).

```
// Finds all Active subscriber orgs that have the package installed
String PACKAGE_SUBSCRIBER_ORG_KEY_QUERY = "Select OrgKey from PackageSubscribers where
OrgStatus = 'Active' and InstalledStatus = 'I'";

// Finds all MetadataPackageVersions lower than the version given, including the list
// of subscribers for each version
String METADATA_PACKAGE_VERSION_QUERY = "Select Id, Name, ReleaseState, (%s) from"
+ " MetadataPackageVersion where MetadataPackageId = '%s' AND ReleaseState = 'Released'"

```

```
+ " AND (MajorVersion < 3 OR (MajorVersion = 3 and MinorVersion < 4) "
+ " OR (MajorVersion = 3 and MinorVersion = 4 and PatchVersion < 6))";

// conn is an EnterpriseConnection instance initialized with a ConnectionConfig object
// representing a connection to the developer org of the package
QueryResult results = conn.query(String.format(METADATA_PACKAGE_VERSION_QUERY,
PACKAGE_SUBSCRIBER_ORG_KEY_QUERY));

// This list will hold all of the PackageSubscriber objects that are eligible for upgrade
// to the given version
List<PackageSubscriber> subscribers = new ArrayList<>();
for (SObject mpvso : results.getRecords()) {

    // Cast the sObject to a MetadataPackageVersion
    MetadataPackageVersion mpv = (MetadataPackageVersion) mpvso;

    // Add subscribers to our list
    if (mpv.getPackageSubscribers() != null) {
        for (SObject psso : mpv.getPackageSubscribers().getRecords()) {
            subscribers.add((PackageSubscriber) psso);
        }
    }
}
```

Next Step

Create a push request using PackagePushRequest.

# Metric

The Metric object represents the components of a goal metric such as its name, metric type, and current value.

## Supported Calls

create(), delete(), describeLayout(), describeSObjects(), getDeleted(), getUpdated(), query(), retrieve(), search(), undelete(), update(), upsert()

## Fields

| Field Name     | Details                                                                                                                                                                       |

## MetricsDataFile

Represents a data file containing usage metrics on all installations of a managed package in a Salesforce instance. This object is available in API version 30.0 and later.

## Supported Calls

`query()`, `delete()`

## Fields

| Field Name                 | Details                                                                                                         |

| SendingInstance | <b>Type</b><br>string<br><br><b>Properties</b><br>Filter, Query, Sort<br><br><b>Description</b><br>The server instance from which this data was collected, for example, "na8." |

## Usage

Use this object to access customer usage metrics for a managed package. Each record contains one day's data, on either custom objects or Visualforce pages, for all organizations in a Salesforce instance that have the package installed. The following data is collected each day.

- **Custom objects** — the number of records stored in each custom object.
- **Visualforce pages** — the number of times each Visualforce page was accessed, the number of unique users who accessed it, and the average loading time (in milliseconds).

The custom objects data is a snapshot that reflects the state of the organization at the time the database was sampled, while the Visualforce data covers usage over a 24-hour period.

This feature is intended for API access only. The owner of the package must write a secondary process to retrieve the metrics data from the reporting organization, and export it to another system for analysis.

The usage metrics data for all production organizations in a given instance is merged and written into a text file, in a specified format, once a day. If an instance doesn't have any organizations with the package installed or any organizations that accessed Visualforce pages in the package, a blank record is created for that day, with `MetricsDataFileLength` set to zero.

In a record for custom objects, each row of the text file contains usage data in the following order.

- Organization ID
- Organization name
- Organization edition
- Organization status
- Name of the custom object
- Number of records of the custom object on the specified day

The custom object count is a snapshot captured once each day. Here's a section of a sample data file for custom objects. It shows there were 3500 and 1500 records in the `Alpha` and `Beta` custom objects, respectively, in the specified customer organization on the specified day.

```
"00Dxx0000001gbk","org1","Enterprise Edition","TRIAL","Alpha", "3500"
"00Dxx0000001gbk","org1","Enterprise Edition","TRIAL","Beta", "1500"
```

In a record for Visualforce pages, each row of the text file contains usage data in the following order.

- Organization ID

- Organization name
- Organization edition
- Organization status
- Package version number
- Name of the Visualforce page
- Number of times the page was accessed
- Number of unique users who accessed the page
- Average loading time of the page, in milliseconds

The Visualforce counts for each organization measure the number of times the page was viewed in the duration between the start and end times. Here's a section of a sample data file for Visualforce pages.

```
"00Dxx0000001gbk","org1","Enterprise Edition","TRIAL","1.0","/apex/gml2__f1","1","1","66.0"
"00Dxx0000001gbk","org1","Enterprise Edition","TRIAL","1.0","/apex/gml2__f2","1","1","128.0"
"00Dxx0000001gbk","org1","Enterprise Edition","TRIAL","1.0","/apex/gml2__f3","1","1","107.0"
"00Dxx0000001gbf","org1","Enterprise Edition","TRIAL","1.0","/apex/gml2__f1","5","1","73.6"
"00Dxx0000001gbf","org1","Enterprise Edition","TRIAL","1.0","/apex/gml2__f2","1","1","72.0"
"00Dxx0000001gbf","org1","Enterprise Edition","TRIAL","1.0","/apex/gml2__f3","7","1","50.8"
```

## MetricShare

Represents a sharing entry on a Metric object.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field Name  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# Usage

Use this object to query and manage the milestone type for CaseMilestone records.

SEE ALSO:

- [CaseMilestone](#)
- [SlaProcess](#)

# Name

Non-queryable object that provides information about foreign key traversals when the foreign key has more than one parent.

This object is used to retrieve information from related records where the related record may be from more than one object type (a polymorphic foreign key). For example, the owner of a case can be either a user or a group (queue). This object allows retrieval of the owner name, whether the owner is a user or a group (queue). You can use a describe call to access the information about parents for an object, or you can use the `who`, `what`, or `owner` fields (depending on the object) in SOQL queries. This object cannot be directly accessed.

## Supported Calls

`describeSObjects()`

## Fields

| UserRole   | <b>Type</b><br>picklist<br><b>Properties</b><br>Filter, Nillable<br><b>Description</b><br>Name of the <code>Role</code> played by the user. Only populated for user rows. |
| UserRoleId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The ID of the user role associated with this object.              |

## Usage

To query on relationships where the parent may be more than one type of object, use `who`, `what`, or `owner` relationship fields.

SEE ALSO:

[Object Basics](#)

## NamedCredential

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts. This object is available in API version 33.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

# NavigationLinkSet

Represents the navigation menu in a community. A navigation menu consists of items that users can click to go to other parts of the community. This object is available in API version 36.0 and later.

# Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

# Special Access Rules

Navigation menus are available only in communities created using the Customer Service (Napili) template.

|                   | <b>Description</b><br>The type of navigation menu item. The available values are: <ul style="list-style-type: none"> <li>• <code>SalesforceObject</code>—Available objects include accounts, cases, contacts, and custom objects.</li> <li>• <code>ExternalLink</code>—Links to a URL outside of your community. For example, <code>http://www.salesforce.com</code>.</li> <li>• <code>InternalLink</code>—Links to a relative URL inside your community. For example, <code>/contactsupport</code>.</li> <li>• <code>NavigationalTopic</code>—A drop-down list with links to the navigational topics in your community.</li> </ul> |

## Usage

You can add up to 20 navigation menu items. You can translate navigation menu items using the Translation Workbench.

## NavigationMenuItemLocalization

Represents the translated value of a navigation menu item in a community. This object is available in API version 36.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Navigation menus are available only in communities created using the Customer Service (Napili) template.

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Network

Represents a community, which is a customizable public or private space where employees, end-customers, and partners can collaborate on best practices and business processes. Communities give you the opportunity to share information, records, and files with coworkers and related external stakeholders all in one place. This object is available in API version 26.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

## Usage

Use this object to find, view, and update communities in your organization. If you have “Modify All Data,” “View All Data,” or “Create and Set Up Communities,” you can view all communities in the organization. Users without these permissions only see the **Preview** or

Published communities that they're members of. If you have "Create and Set Up Communities," you can customize community settings.

# NetworkActivityAudit

Represents an audit trail of moderation actions in Communities. This object is available in API version 30.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

## Fields

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Usage

Use this object to view an audit trail of moderation activity for your communities. You must have the “Modify All Data” permission to access this object.

Users with “Moderate Communities Feeds”, “Moderate Communities Files” or “View All Data” can view the audit trail using reports in the Salesforce user interface.

## NetworkMember

Represents a member of a community. Members can be either users in your company or external users with portal profiles. This object is available in API version 26.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

## Fields

| Field Name                                     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage

Use this object to query members of a certain community and to update their email notification settings. If you have “Modify All Data,” “View All Data,” or “Create and Set Up Communities,” you can view all members of any community, regardless of your own membership. If you have “Modify All Data” or “Create and Set Up Communities,” you can also update any member’s email settings. Users without these permissions can update their own email settings and can see members of the communities that they’re also members of.

**Tip:** You can directly update reputation points for a community member via the Salesforce API. You can also use Apex triggers to send custom notifications based on changes to reputation points.

## NetworkMemberGroup

---

Represents a group of members in a community. Members can be either users in your internal organization or external users assigned portal profiles. An administrator adds members to a community by adding a profile or a permission set, and any user with the profile or permission set becomes a member of the community. This object is available in API version 26.0 and later.

**Note:** If a Chatter customer (from a customer group) is assigned a permission set that is also associated with a community, the Chatter customer won't be added to the community.

Prior to API version 27.0, this object was called NetworkProfile.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

**Note:** The `upsert()` call is not supported for this object.

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

## Fields

| Field Name       | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this object to view the profiles or permission sets associated with a particular community. Profiles and permission sets are added and removed asynchronously, so you can also check the status of a profile or permission set that was updated in a community.

If you have “Modify All Data,” “View All Data,” or “Create and Set Up Communities,” you can view all profiles or permission sets for any community in the organization, regardless of your membership. If you have “Modify All Data” or “Create and Set Up Communities,” you can also add profiles or permission sets. Users without these permissions can only find profiles and permission sets for communities that they’re members of.

## Sample Code

```
// Create a new NetworkMemberGroup with a profile as the ParentId
NetworkMemberGroup nmgInsert = new NetworkMemberGroup();
nmg.setNetworkId("0DBD0000000029o");
nmg.setParentId("00eD0000000z1Ww");
SaveResult[] results = connection.create(new SObject[] { nmgInsert });

// Update an existing NetworkMemberGroup to be removed from the Network
NetworkMemberGroup nmgUpdate = new NetworkMemberGroup();
nmg.setId("0DL000000003enOAA");
nmg.setAssignmentStatus("WaitingForRemove");
SaveResult[] results = connection.update(new SObject[] { nmgUpdate });
```

## NetworkModeration

Represents a flag on an item in a community. This object is available in API version 30.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

### Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Visibility     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Restricted picklist, Nillable, Sort</p> <p><b>Description</b><br/>Determines visibility of a flagged item. Values are:</p> <ul style="list-style-type: none"><li>• SelfAndModerators—The user who flagged the item and any moderators can see the flagged item. This is the default value.</li><li>• ModeratorsOnly—Only moderators can see the flagged item. If ModeratorsOnly is selected, only moderators can set flags using the API.</li></ul> |

## Usage

Use this object to view the items flagged for moderation within a community. Additionally, users with “Moderate Feeds” and “Modify All Data” can remove flags.

Flags on items are created either when a member manually flags an item in a community (if flagging is enabled for that community), or when a trigger automatically flags an item because the item met the trigger criteria.

## NetworkPageOverride

Represents information about custom pages used to override the default pages in communities. You can create Community Builder (Site.com Studio) or Visualforce pages and override the default pages in a community. Using custom pages allows you to create a more personalized experience for your users. This object is available in API version 34.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Only users with the “Create and Setup Networks” permission can update this object.
- You can’t override the Change Password Page with a page created using Community Builder (Site.com Studio). You can only override it with a Visualforce page.

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## NetworkSelfRegistration

Represents the account that self-registering community members are associated with by default. Self-registering users in a community are required to be associated with an account, which the administrator must specify while setting up self-registration for the community. If an account isn't specified, Salesforce creates person accounts (when enabled) for self-registering users. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Fields

|            |  <b>Note:</b> You can use only one account per community to assign self-registering users. |

## NewsFeed

Represents a single feed item on a user's home tab. A Chatter feed shows recent changes to records that the user is following.

NewsFeed is available in API version 18.0 through API version 26.0. In API version 27.0 and later, NewsFeed is no longer available in the SOAP API. Use the Chatter REST API to access NewsFeed.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

|              | <b>Description</b><br>The number of FeedComments associated with this feed item.                                                                                                                                                                                                                                                                                                                                                         |
|              |  <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your |

| Field                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Field

## Details

**Properties**

Filter, Group, Nillable, Restricted picklist, Sort

**Description**

The type of feed item:

- **ActivityEvent**—indirectly generated event when a user or the API adds a [Task](#) associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a [Task](#) or [Event](#) associated with a case record (excluding email and call logging).

For a recurring [Task](#) with [CaseFeed](#) disabled, one event is generated for the series only. For a recurring [Task](#) with [CaseFeed](#) enabled, events are generated for the series and each occurrence.

- **AdvancedTextPost**—created when a user posts a group announcement.
- **AnnouncementPost**—Not used.
- **ApprovalPost**—generated when a user submits an approval.
- **BasicTemplateFeedItem**—Not used.
- **CanvasPost**—a post made by a canvas app posted on a feed.
- **CollaborationGroupCreated**—generated when a user creates a public group.
- **CollaborationGroupUnarchived**—Not used.
- **ContentPost**—a post with an attached file.
- **CreatedRecordEvent**—generated when a user creates a record from the publisher.
- **DashboardComponentAlert**—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- **DashboardComponentSnapshot**—created when a user posts a dashboard snapshot on a feed.
- **LinkPost**—a post with an attached URL.
- **PollPost**—a poll posted on a feed.
- **ProfileSkillPost**—generated when a skill is added to a user's Chatter profile.
- **QuestionPost**—generated when a user posts a question.
- **ReplyPost**—generated when Chatter Answers posts a reply.
- **RypplePost**—generated when a user creates a Thanks badge in Work.com.
- **TextPost**—a direct text entry on a feed.
- **TrackedChange**—a change or group of changes to a tracked field.
- **UserStatus**—automatically generated when a user adds a post. Deprecated.

The following values appear in the **Type** picklist for all feed objects but apply only to **CaseFeed**:

- **CaseCommentPost**—generated event when a user adds a case comment for a case object
- **EmailMessageEvent**—generated event when an email related to a case object is sent or received

| Field      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Usage

Use this object to query and retrieve record changes tracked in a news feed. Note the following when working with news feeds:

- This object is read only in the API.
- Users can only query their own news feed.
- Queries retrieve feed items that include mentions from other users.
- Use this object to query and retrieve lead feed items that were associated with a converted lead record.

Users that do not have the “View All Data” permission have the following limitations when querying records:

- Must specify a `LIMIT` clause and the limit must be less than or equal to 1000.
- May include a `WHERE` clause that references `NewsFeed` fields, but may not include references to fields in related objects. For example, you can filter by `CreatedDate` or `ParentId`, but not by `Parent.Name`.
- May include an `ORDER BY` clause that references `NewsFeed` fields, but may not include references to fields in related objects. For example, you can `ORDER BY CreatedDate` or `ParentId`, but not by `Parent.Name`.

 **Tip:** To query for the most recent feed items, you should `ORDER BY CreatedDate DESC, Id DESC`.

Note the following SOQL restrictions.

- No SOQL limit if logged-in user has “View All Data” permission. If not, specify a LIMIT clause of 1,000 records or fewer.
- SOQL ORDER BY on fields using relationships is not available. Use ORDER BY on fields on the root object in the SOQL query.

## Note

Represents a note, which is text associated with a custom object or a standard object, such as a Contact, Contract, or Opportunity.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Usage

Use this object to manage notes for an object.

SEE ALSO:

[Object Basics](#)

## OAuthToken

Represents an OAuth access token for connected app authentication and can be used to create a user interface for token management. This object is available in API version 32.0 and later.

A connected app integrates an application with Salesforce using APIs. Connected apps use standard SAML and OAuth protocols to authenticate, provide single sign-on, and provide tokens for use with Salesforce APIs. In addition to standard OAuth capabilities, connected

apps allow Salesforce admins to set various security policies and have explicit control over who can use the corresponding apps. Each time that a user grants access to an application, the application obtains a new access token.

## Supported Calls

`describeSObjects()`, `query()`

## Special Access Rules

If you are a user with the “Manage Users” permission, you see all tokens for all users in the organization. Otherwise, you see only your own tokens.

## Fields

| Field Name    | Details                                                                                                                                                                                     |

| UserId       | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The owner of the token.                                                                                                                                                            |

## Usage

To delete an AccessToken, send a request to the revoke OAuth token endpoint with the DeleteToken as the parameter. For example, this URL `https://login.salesforce.com/services/oauth2/revoke?token=(the Delete Token)` causes the deletion of the token.

In API version 34.0 and later, this object was enhanced to help manage high instance counts. A `query()` call returns up to 500 rows. A `queryMore()` call returns 500 more, up to 2500 total. No more records are returned after 2500. To make sure you don't miss any records, issue a `COUNT()` query in a `SELECT` clause for OAuthToken. This gives you the total number of records. If there are more than 2500 records, divide your query by filtering on fields, like `UserId`, to return subsets of less than 2500 records.

## NoteAndAttachment

---

This read-only object contains all notes and attachments associated with an object.

## Supported Calls

`describeSObjects()`

## Fields

## Usage

Use this object to list all notes and attachments for an object.

To retrieve notes and attachments, issue a describe call on an object, which returns a query result for each activity since the record was created. You can't directly query this object.

## Usage

NoteTag stores the relationship between its parent TagDefinition and the Note being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## ObjectPermissions

---

Represents the enabled object permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

To grant a user access to an object, associate an ObjectPermissions record with a PermissionSet that's assigned to a user. ObjectPermissions records are only supported in PermissionSet, not in Profile.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

## Permission Dependencies

Some user permissions have dependencies on object permissions. For example, if a permission set has the “Transfer Leads” permission, it also has “Read” and “Create” on the leads object.

You can query from ObjectPermissions up to the parent PermissionSet object. For example:

```
SELECT Parent.Name, Parent.PermissionsTransferAnyLead, PermissionsRead, PermissionsCreate
FROM ObjectPermissions
WHERE SubjectType = 'Lead'
```

## Determining Object Access with “Modify All Data”

When using SOQL to query object permissions, be aware that some object permissions are enabled because a user permission requires them.

The exception to this rule is when “Modify All Data” is enabled. While it enables all object permissions, it doesn’t physically store any object permission records in the database. As a result, unlike object permissions that are required by a user permission—such as “View All Data” or “Import Leads”—the query still returns permission sets with “Modify All Data,” but the object permission record will contain an invalid ID that begins with “000”. This ID indicates that the object has full access due to “Modify All Data” and the object permission record can’t be updated or deleted. To remove full access from these objects, disable “Modify All Data” and then delete the resulting object permission record. This ensures that when using SOQL to find all the objects that have full access, it returns all objects that have this access regardless of whether it’s due to “Modify All Data” or because an administrator set full access.

For example, the following will return all permission sets that have “Read” on the Merchandise\_\_c object, regardless of whether it’s explicitly defined on the object or implicitly defined through “Modify All Data.”

```
SELECT Id, Parent.label, SubjectType, PermissionsRead,
       Parent.PermissionsModifyAllData, ParentId
FROM ObjectPermissions
WHERE PermissionsRead = true and SubjectType = 'Merchandise__c'
```

## Nesting Object Permissions

You can nest ObjectPermissions in a PermissionSet query. For example, the following returns any permission sets where “Transfer Leads” is true. Additionally, the result set will include the “Read” object permission on leads. This is done by nesting the SOQL with an object permission query using the relationship name for object permissions: ObjectPerms.

```
SELECT Id, Name, PermissionsTransferAnyLead,
       (SELECT Id, PermissionsRead from ObjectPerms where SubjectType='Lead')
FROM PermissionSet
WHERE PermissionsTransferAnyLead = true
```

As a result, it’s possible to traverse the relationship between the PermissionSet and any child related objects (in this case, ObjectPermissions). You can do this from the PermissionSet object by using the child relationship (ObjectPerms, FieldPerms, and so on) or from the child object by referencing the PermissionSet with `Parent.permission_set_attribute`.

It’s important to consider when to use a conditional WHERE statement to restrict the result set. To query based on an attribute on the permission set object, nest the SOQL with the child relationship. However, to query based on an attribute on the child object, you must reference the permission set parent attribute in your query.

The following two queries return the same columns with different results, based on whether you use the child relationship or parent notation.

```
SELECT Id, Name, PermissionsModifyAllData,
(SELECT Id, SobjectType, PermissionsRead from Objectperms)
FROM PermissionSet
WHERE PermissionsModifyAllData=true
```

versus:

```
SELECT Id, SOBJECTTYPE, PermissionsRead, Parent.Id, Parent.Name,
Parent.PermissionsModifyAllData
FROM ObjectPermissions
WHERE SOBJECTTYPE='Merchandise__c'
```

# ObjectTerritory2AssignmentRule

Represents a territory assignment rule that’s associated with an object, such as Account. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule is null. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

create(), delete(), describeSObjects(), query(), retrieve(), update(), upsert()

## Special Access Rules

If a territory model is in Active state, any user can view that model, including its territories, assignment rules, assigned records, and assigned users. Users cannot view territory models in other states (such as Planning or Archived).

## ObjectTerritory2AssignmentRuleItem

A single row of selection criteria for an ObjectTerritory2AssignmentRule object. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the `BooleanFilter` field on its corresponding ObjectTerritory2AssignmentRule object is a `null` value. Available only if Enterprise Territory Management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

If a territory model is in `Active` state, any user can view that model, including its territories and assignment rules. For territories in an active model, any user can view assigned records and assigned users subject to your organization's sharing settings. Users cannot view territory models in other states (such as `Planning` or `Archived`).

## OpenActivity

---

This read-only object is displayed in a related list of open activities—future events and open tasks—related to an object. It includes activities for all contacts related to the object. OpenActivity fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

## Supported Calls

`describeSObjects()`
