# Object Reference for Salesforce and Force.com

Version 38.0, Winter '17

# CONTENTS

|                                               |           |
|-----------------------------------------------|-----------|
| <b>Chapter 1: Object Basics</b>               | <b>1</b>  |
| Primitive Data Types                          | 2         |
| Field Types                                   | 3         |
| Compound Fields                               | 9         |
| Address Compound Fields                       | 9         |
| Geolocation Compound Field                    | 12        |
| Compound Field Considerations and Limitations | 13        |
| API Data Types and Salesforce Field Types     | 14        |
| Required Fields                               | 15        |
| System Fields                                 | 15        |
| API Field Properties                          | 17        |
| Custom Fields                                 | 17        |
| Custom Objects                                | 19        |
| External Objects                              | 21        |
| Relationships Among Objects                   | 23        |
| Factors that Affect Data Access               | 24        |
| <b>REFERENCE</b>                              | <b>27</b> |
| <b>Chapter 2: Standard Objects</b>            | <b>27</b> |
| AcceptedEventRelation                         | 64        |

# CHAPTER 1    Object Basics

## In this chapter ...

- [Primitive Data Types](#)
- [Field Types](#)
- [Compound Fields](#)
- [API Data Types and Salesforce Field Types](#)
- [Required Fields](#)
- [System Fields](#)
- [API Field Properties](#)
- [Custom Fields](#)
- [Custom Objects](#)
- [External Objects](#)
- [Relationships Among Objects](#)
- [Factors that Affect Data Access](#)

Generally speaking, API objects represent database tables that contain your organization's information. For example, the central object in the Salesforce data model represents accounts—companies and organizations involved with your business, such as customers, partners, and competitors. The term “record” describes a particular occurrence of an object (such as a specific account like “IBM” or “United Airlines” that is represented by an Account object). A record is analogous to a row in a database table.

Objects already created for you by Salesforce are called standard objects. Objects you create in your organization are called custom objects. Objects you create that map to data stored outside your organization are called external objects.

While this document describes all of the objects available in the API, your applications work with only the objects that you are authorized to access. Programmatic access to objects is determined by the objects defined in your organization, your organization configuration, your user permissions and access settings (which are configured by your organization's system administrator), your data sharing model, and other factors related specifically to the object.

Most of the objects accessible through the API are read-write objects. However, there are a few objects that are read-only. This fact is noted in the description for the object.

## Primitive Data Types

The API uses the following primitive data types:

| Value    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| base64   | Base 64-encoded binary data. Fields of this type are used for storing binary files in Attachment records, Document records, and Scontrol records. In these objects, the <code>Body</code> or <code>Binary</code> field contains the (base64 encoded) data, while the <code>BodyLength</code> field defines the length of the data in the <code>Body</code> or <code>Binary</code> field. In the Document object, you can specify a URL to the document instead of storing the document directly in the record.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| boolean  | Boolean fields have one of these values: <code>true</code> (or 1), or <code>false</code> (or 0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| byte     | A set of bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| date     | <p>Date data. Fields of this type contain date values, such as <code>ActivityDate</code> in the Event object. Unlike <code>dateTime</code> fields, date fields contain no time value—the time portion of a date field is not relevant and is always set to midnight in the Coordinated Universal Time (UTC) time zone.</p> <p>If you specify a date value in a query, you can filter on date fields only.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| dateTime | <p>Date/time values (timestamps). Fields of this type handle date/time values (timestamps), such as <code>ActivityDateTime</code> in the Event object or the <code>CreatedDate</code>, <code>LastModifiedDate</code>, or <code>SystemModstamp</code> in many objects. Regular <code>dateTime</code> fields are full timestamps with a precision of one second. They are always transferred in the Coordinated Universal Time (UTC) time zone. In your client application, you might need to translate the timestamp to or from a local time zone.</p> <p>If you specify a <code>dateTime</code> value in a query, you can filter on <code>dateTime</code> fields only.</p> <p>Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.</p> <p> <b>Note:</b> The Event object has a <code>DurationInMinutes</code> field that specifies the number of minutes for an event. Even though this is a temporal value, it is an integer type—not a <code>dateTime</code> type.</p>                                                                                                                                                                                                            |
| double   | <p>Double values. Fields of this type can contain fractional portions (digits to the right of the decimal place), such as <code>ConversionRate</code> in <code>CurrencyType</code>. In the API, all non-integer values (such as <a href="#">Currency Field Type</a> and <a href="#">Percent Field Type</a>) contain values of type double. Some restrictions may be applied to double values:</p> <ul style="list-style-type: none"> <li>• <code>scale</code>: Maximum number of digits to the right of the decimal place.</li> <li>• <code>precision</code>: Total number of digits, including those to the left and the right of the decimal place</li> </ul> <p>The maximum number of digits to the left of the decimal place is equal to <code>precision</code> minus <code>scale</code>. In the online application, <code>precision</code> is defined differently—it is the maximum number of digits allowed to the left of the decimal place.</p> <p>Values can be stored in scientific notation if the number is large enough (or, for negative numbers, small enough), as indicated by the <a href="#">W3C XML Schema Part 2: Datatypes Second Edition specification</a>.</p> <p> <b>Warning:</b> When the user sets the precision in custom fields in the Salesforce application, it displays the precision set by the user, even if the user enters a more precise value than defined for those</p> |

| Value  | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|        | fields. However, when you set the precision in custom fields using the API, no rounding occurs when the user retrieves the number field.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| int    | Fields of this type contain numbers with no fractional portion (digits to the right of a decimal place), such as the <code>NumberOfEmployees</code> in an <code>Account</code> . For integer fields, the <code>digits</code> field specifies the maximum number of digits that an integer can have.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| string | <p>Character strings. Fields that are of data type <code>string</code> contain text and some have length restrictions depending on the data being stored. For example, in the <code>Contact</code> object, the <code>FirstName</code> field is 40 characters, the <code>LastName</code> field is 80 characters, the <code>MailingStreet</code> is 255 characters.</p> <p> <b>Note:</b> For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code <code>STRING_TOO_LONG</code> is returned. <code>AllowFieldTruncationHeader</code> allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: <code>anyType</code>, <code>email</code>, <code>encryptedstring</code>, <code>multipicklist</code>, <code>phone</code>, <code>picklist</code>, <code>string</code>, and <code>textarea</code>.</p> |
| time   | <p>Time values. Fields of this type handle time values, such as <code>FridayEndTime</code> in the <code>BusinessHours</code> object.</p> <p>Development tools differ in the way that they handle time data. Some development tools report the local time, while others report only the Coordinated Universal Time (UTC) time zone. To determine how your development tool handles time values, refer to its documentation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

These data types are used in the SOAP messages that are exchanged between your client application and the API. When writing your client application, follow the data typing rules defined for your programming language and development environment. Your development tool handles the mapping of typed data in your programming language with these SOAP data types.

The primitive data types are:

- specified in the World Wide Web Consortium's publication *XML Schema Part 2: Data Types* at the following URL: <http://www.w3.org/TR/xmlschema-2/>.
- enumerated in the `SOAPType` field of the Field type, which is described in the `fields` property of the `DescribeObjectResult`.

Primitive types are used as a standardized way to define, send, receive, and interpret basic data types in the SOAP messages exchanged between client applications and the API. In addition, primitive data types are interpreted in a Salesforce-specific way, which is useful for display formatting and for numeric conversion (adding values of different currencies).

For example, Salesforce chooses to interpret a double value passed via SOAP as a `double` in a number of possible ways, depending on the field definition. If the field type for that data is currency, Salesforce handles the display of the data by prepending it with a currency symbol and inserting a decimal for precision. Similarly, if the field type is percent, Salesforce handles the display of the data by appending a percent sign (%). Regardless of the field type, however, the value is sent in the SOAP message as a double.

The API uses data types called field types that are defined in the WSDLs. For more information, see [Field Types](#).

## Field Types

In addition to the primitive data types, the API defines the following data types for fields:

 **Note:** For fields that contain strings, behavior is different beginning with API version 15.0. In API versions previous to 15.0, if you specify a value for a field, and that value is too large, the value is truncated. For API version 15.0 and later, if a value is specified that is too large, the operation fails and the fault code `STRING_TOO_LONG` is returned. `AllowFieldTruncationHeader` allows you to specify that the previous behavior, truncation, be used instead of the new behavior in API versions 15.0 and later. This header has no effect in versions 14.0 and earlier. The affected fields are: `anyType`, `email`, `encryptedstring`, `multipicklist`, `phone`, `picklist`, `string`, and `textarea`.

| Field Type                 | What the Field Contains                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| address                    | A compound data type that contains address field data. See <a href="#">Address Compound Fields</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| anyType                    | Polymorphic data type that returns string, picklist, reference, Boolean, currency, int, double, percent, ID, date, datetime, url, or email data depending on the kind of field involved. See <a href="#">AnyType Field Type</a> .                                                                                                                                                                                                                                                                                                                                        |
| calculated                 | Fields that are defined by a formula. See <a href="#">Calculated Field Type</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| combobox                   | A combobox, which includes a set of enumerated values and allows the user to specify a value not in the list. See <a href="#">ComboBox Field Type</a> .                                                                                                                                                                                                                                                                                                                                                                                                                  |
| currency                   | Currency values. See <a href="#">Currency Field Type</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| DataCategoryGroupReference | Reference to a data category group or a category unique name. See <a href="#">DataCategoryGroupReference Field Type</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| email                      | Email addresses. See <a href="#">Email Field Type</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| encryptedstring            | Encrypted text fields contain any combination of letters, numbers, or symbols that are stored in encrypted form. You can set a maximum length of up to 175 characters. Available in API versions 11.0 and later.                                                                                                                                                                                                                                                                                                                                                         |
| ID                         | <p>Primary key field for the object. See <a href="#">ID Field Type</a>.</p> <p>Note that most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Please consult your Web services toolkit documentation for more information.</p>                                                                                                                                                                        |
| JunctionIdList             | <p>A string array of referenced ID values that represent the many-to-many relationship of an underlying junction entity. Query and manipulate the string array to query and manipulate the underlying junction entities in a single API call. See: <a href="#">JunctionIdList Field Type</a></p> <p> <b>Warning:</b> Adding a <code>JunctionIdList</code> field name to the <code>fieldsToNull</code> property deletes all related junction records. This action can't be undone.</p> |
| location                   | A compound data type that contains latitude and longitude values for geolocation fields. See <a href="#">Geolocation Compound Field</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                |
| masterrecord               | When records are merged, the ID of the record that is saved (the other records are deleted).                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| multipicklist              | Multi-select picklists, which include a set of enumerated values from which multiple values can be selected. See <a href="#">Multi-Select Picklist Field Type</a> .                                                                                                                                                                                                                                                                                                                                                                                                      |
| percent                    | Percentage values. See <a href="#">Percent Field Type</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Field Type | What the Field Contains                                                                                                                                          |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| phone      | Phone numbers. Values can include alphabetic characters. Client applications are responsible for phone number formatting. See <a href="#">Phone Field Type</a> . |
| picklist   | Picklists, which include a set of enumerated values from which one value can be selected. See <a href="#">Picklist Field Type</a> .                              |
| reference  | Cross-references to a different object. Analogous to a foreign key field in SQL. See <a href="#">Reference Field Type</a> .                                      |
| textarea   | String that is displayed as a multiline text field. See <a href="#">Textarea Field Type</a> .                                                                    |
| url        | URL values. Client applications should commonly display these as hyperlinks. See <a href="#">URL Field Type</a> .                                                |

These field types extend [primitive data types](#). While many of these field types follow common data typing conventions that are made explicit in their metadata, certain field types have unique characteristics that you need to understand before using them in your client application.

These field types apply to both standard and custom fields. They are enumerated in the `type` field of the `Field` type, which is described in the `fields` property of the `DescribeSObjectResult`.

**Note:** Some numeric fields have precision and scale limits. In addition, certain text fields have length restrictions. These restrictions are enforced when you `create()` or `update()` objects. However, the API may return data that does not meet these restrictions.

## AnyType Field Type

The `anyType` field type is dynamic and returns `string`, `date`, `number`, or `boolean` data depending on the kind of field involved. For example, the element in a SOAP message has an `xsi:type="xsd:string"` attribute if the field is of type `string`. This field type is used in history objects for the `NewValue` and `OldValue` fields. It is also a valid field type for `fieldType` and `soapType`.

**Note:** Most SOAP toolkits automatically deserialize this element into the correct native type.

## Calculated Field Type

Calculated fields are read-only fields in the API. These are fields defined by a formula, which is an algorithm that derives its value from other fields, expressions, or values. You can filter on these fields in SOQL, but you should not replicate these fields. The length of text calculated fields is 3900 characters or less—anything longer will be truncated.

Calculated fields are called formula fields in the Salesforce user interface.

## ComboBox Field Type

A combobox is a picklist that also allows users to type a value that is not already specified in the list. A combobox is defined as a string value.

## Currency Field Type

Currency fields contain currency values, such as the `ExpectedRevenue` field in a Campaign, and are defined as type `double`.

For organizations that have the multicurrency option enabled, the `CurrencyIsoCode` field is defined for any object that can have currency fields. The `CurrencyIsoCode` field and currency fields are linked in a special way. On any specific record, the `CurrencyIsoCode` field defines the currency of that record, and thus, the values of all currency fields on that record will be expressed in that currency.

For most cases, clients do not need to consider the linking of the `CurrencyIsoCode` field and the currency fields on an object. However, clients may need to consider the following:

- The `CurrencyIsoCode` field exists only for those organizations that have enabled multicurrency support.
- When displaying the currency values in a user interface, it is preferred to prepend each currency value with its `CurrencyIsoCode` value and a space separator.
- The `CurrencyIsoCode` field is a restricted picklist field. The set of allowable values, defined in the `CurrencyType` object, can vary from organization to organization. Attempting to set it to a value that is not defined for an organization causes the operation to be rejected.
- If you update the `CurrencyIsoCode` field on an object, it implicitly converts all currency values on that object to the new currency code, using the conversion rates that are defined for that organization in the Salesforce user interface. If you specify currency values in that same `update()` call, the new currency values you specify are interpreted in the new `CurrencyIsoCode` field value, without conversion.
- The picklist values in a `CurrencyIsoCode` field do not exactly match the labels displayed in Salesforce.

To perform currency conversions, client applications can look up the `CurrencyIsoCode` in the `CurrencyType` object.

## DataCategoryGroupReference Field Type

A data category group has categories that classify articles in Salesforce Knowledge and questions in the Answers feature. Every article and question object has two fields of type `DataCategoryGroupReference` which contain the category group and category unique name. You can use the `describeDataCategoryGroups()` and `describeDataCategoryGroupStructures()` calls to retrieve the category groups and categories associated to these objects.

## Email Field Type

Email fields contain email addresses. Client applications are responsible for specifying valid and properly formatted email addresses in `create()` and `update()` calls.

## ID Field Type

With rare exceptions, all objects in the API have a field of type ID that is named `Id` and contains a unique identifier for each record in the object. It is analogous to a primary key in relational databases. When you `create()` a new record, the Web service generates an ID value for the record, ensuring that it is unique within your organization's data. You cannot use the `update()` call on ID fields. Because the ID value stays constant over the lifetime of the record, you can refer to the record by its ID value in subsequent API calls. Also, the ID value contains a three-character code that identifies the object type, which client applications can retrieve via the `describeSObjects()` call.

In addition, certain objects, including custom objects, have one or more fields of type `reference` that contain the ID value for a related record. These fields have names that end in the suffix "-Id", for example, `OwnerId` in the account object. `OwnerId` contains the ID of the user who owns that object. Unlike the field named `Id`, `reference` fields are analogous to foreign keys and can be changed via the `update()` call. For more information, see [Reference Field Type](#).

Some API calls, such as `retrieve()` and `delete()`, accept an array of IDs as parameters—each array element uniquely identifies the row to retrieve or delete. Similarly, the `update()` call accepts an array of sObject records—each sObject contains an `Id` field that uniquely identifies the sObject.

ID fields in the Salesforce user interface contain 15-character, base-62, case-sensitive strings. Each of the 15 characters can be a numeric digit (0-9), a lowercase letter (a-z), or an uppercase letter (A-Z). Two unique IDs may only be different by a change in case.

Because there are applications like Access which do not recognize that 50130000000014c is a different ID from 50130000000014C, an 18-digit, case-safe version of the ID is returned by all API calls. The 18 character IDs have been formed by adding a suffix to each ID in the Force.com API. 18-character IDs can be safely compared for uniqueness by case-insensitive applications, and can be used in all API calls when creating, editing, or deleting data.

If you need to convert the 18-character ID to a 15-character version, truncate the last three characters. Salesforce recommends that you use the 18-character ID.

**Note:** Most Web services tools, including .NET and WSC, map the ID simple type defined in the API WSDL (Enterprise or Partner) to a string. However, other tools generate a specific ID class to represent the ID simple type. Please consult your web services toolkit documentation for more information.

## JunctionIdList Field Type

Starting in API version 34.0, the `JunctionIdList` field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. `JunctionIdList` fields can be queried and updated like any other field on the entity. Queries or updates to `JunctionIdList` fields act as queries or updates to the underlying junction entity records. Fields of type `JunctionIdList` appear in the WSDL as an unbounded array of type ID.

## Multi-Select Picklist Field Type

Multi-select picklist fields contain a list of one or more items from which a user can choose multiple items. One of the items can be configured as the default item. Selections are maintained as a string containing a series of attributes delimited by semicolons. For example, a query might return the values of a multivalue picklist as “first value; second value; third value”. For information on querying multi-select picklists, see [Querying Multi-Select Picklists in the Salesforce SOQL and SOSL Reference Guide](#).

## Percent Field Type

Percent fields contain percent values. Percent fields are defined as type double.

## Phone Field Type

Phone fields contain phone numbers, which can include alphabetic characters. Client applications are responsible for phone number formatting.

## Picklist Field Type

Picklist fields contain a list of one or more items from which a user chooses a single item. They display as drop-down lists in the Salesforce user interface. One of the items can be configured as the default item.

In the Field object associated with the DescribeObjectResult, the `restrictedPicklist` field defines whether the field is a restricted picklist or not. The API does not enforce the list of values for advisory (unrestricted) picklist fields on `create()` or `update()`. When inserting an unrestricted picklist field that does not have a PicklistEntry, the system creates an “inactive” picklist value. This value can be promoted to an “active” picklist value by adding the picklist value in the Salesforce user interface.

When creating new, inactive picklists, the API checks to see if there is a match. This check is case-insensitive.

In the `Field` object associated with the `DescribeObjectResult`, the `picklistValues` field contains an array of items (`PicklistEntry` objects). Each `PicklistEntry` defines the item's label, value, and whether it is the default item in the picklist (a picklist has no more than one default value).

Enumerated fields support localization of the labels to the language of the user. For example, for the `Industry` field on an `Account`, the value "Agriculture" may be translated to various languages. The enumerated field values are fixed and do not change with a user's language. However, each value may have a specified "label" field that provides the localized label for that value. You must always use the value when inserting or updating a field. The `query()` call always returns the value, not the label. The corresponding label for a value in the `describeObjectResult` should be used when displaying the value to the user in any user interface.

The API supports the retrieval of the certain picklists in the following objects: `CaseStatus`, `ContractStatus`, `LeadStatus`, `OpportunityStage`, `PartnerRole`, `SolutionStatus`, `TaskPriority`, and `TaskStatus`. Each object represents a value in the respective picklist. These picklist entries always specify some other piece of information, such as whether the status is converted, and so on. Your client application can invoke the `query()` call on any of these objects (such as `CaseStatus`) to retrieve the set of values in the picklist, and then use that information while processing other objects (such as `Case` objects) to find more information about those objects (such as a given case). These objects are read-only via the API. To modify items in picklists, you must use the Salesforce user interface.

## Reference Field Type

A reference field contains an `Id` value that points to a unique record (usually the parent record) on another object. This is analogous to the concept of a foreign key in relational databases. The name of a reference field ends, by convention, with the letters `Id` (such as `CaseId` or `OpportunityId`). For example, in the `OpportunityCompetitor` object, the `OpportunityId` field is a reference field that points to the `Opportunity` object. It contains an ID value that uniquely identifies an `Opportunity` record.

In some cases, an object can refer to another object of its same type. For example, an `Account` can have a parent link that points to another `Account`.

The `Event` and `Task` objects both have `whoId` and `whatId` cross-reference ID fields. Each of these cross-reference fields can point to one of several other objects. The `whoId` field can point to a `Contact` or `Lead`, and the `whatId` field can point to an `Account`, `Opportunity`, `Campaign`, or `Case`. In addition, if the `whoId` field refers to a `Lead`, then the `whatId` field must be empty.

You can describe and query each cross-referenced object. When you query a cross-reference ID field, it returns an object ID of the appropriate type. You can then query that ID to get additional information about the object, using the ID in the `id` field for that query.

The cross-reference ID field value is either:

- a valid record in your organization, or
- an empty value, which indicates an empty reference

The cross-reference ID field value, if non-`null`, is guaranteed to be an object in your organization. However, it is not guaranteed that you can query that object. Users with the "View All Data" permission can always query that object. Other users may be restricted from viewing or editing the referenced object.

When specifying a value for a cross-reference ID field in a `create()` or `update()` call, the value must be a valid value of type ID, and the user must have appropriate access to that object. The exact requirements vary from field to field.

## Textarea Field Type

Textarea fields contain text that can be longer than 4000 bytes. Unlike string fields, textarea fields cannot be specified in the `WHERE` clause of a `queryString` of a `query()` call. To filter records on this field, you must do so while processing records in the `QueryResult`. For fields with this restriction, its `filterable` field in the `Field` type (described in the `fields` property of the `DescribeObjectResult`) is `false`.

## URL Field Type

URL fields contain URLs. Client applications are responsible for specifying valid and properly formatted URLs in `create()` and `update()` calls.

## Compound Fields

---

Compound fields group together multiple elements of primitive data types, such as numbers or strings, to represent complex data types, such as a location or an address. Compound fields are an abstraction that can simplify application code that handles the values, leading to more concise, understandable code.

Address compound fields are available in the SOAP and REST APIs in API version 30.0 and later. Geolocation fields are available in the SOAP and REST APIs in API version 26.0 and later, with some limitations on SOAP for API versions below 30.0.

Compound fields are accessible as a single, structured field, or as individual component fields. The values contained within the compound field and the values in individual fields both map to the same underlying data stored in Salesforce; they always have identical values. Code that references individual component fields is unaffected by the new compound fields.

Compound fields are read-only. Changes are performed by writing to the individual component fields. This maintains a single, consistent method for performing updates, and avoids the possibility of conflicts. For example, if both the `BillingAddress` compound field and `BillingCity` individual component field were updated in the same API call, it would be unclear which value should be saved.

Compound fields are available only through the SOAP and REST APIs. Compound fields are described in both the Enterprise and Partner WSDLs. Update your WSDL to at least API 30.0 to access the new compound data types.

### [Address Compound Fields](#)

Standard addresses—addresses built into standard objects in Salesforce—are accessible in the SOAP and REST APIs as an `Address`, a structured compound data type, as well as individual address elements.

### [Geolocation Compound Field](#)

Geolocation fields are accessible in the SOAP and REST APIs as a `Location`—a structured compound data type—or as individual latitude and longitude elements.

### [Compound Field Considerations and Limitations](#)

Address and geolocation compound fields are convenient and result in more concise, clear code. Here are some things to consider when using them in your apps.

## Address Compound Fields

Standard addresses—addresses built into standard objects in Salesforce—are accessible in the SOAP and REST APIs as an `Address`, a structured compound data type, as well as individual address elements.

Using API 30.0 and later, standard addresses are available in the SOAP and REST APIs as a compound field of type `Address`, a structured data type that combines the following fields.

- `Accuracy`
- `City`
- `Country`
- `CountryCode`
- `Latitude`
- `Longitude`

- PostalCode
- State
- StateCode
- Street

 **Note:** StateCode and CountryCode are always available on compound address fields, whether or not state and country picklists are enabled in your organization.

The Address type extends the Location type, the data type used for compound geolocation fields.

Address fields are provided on many standard objects, such as Account, Contact, Quote, and User. Some objects provide fields for multiple addresses. For example, Account provides for four different addresses. In this case, address field names are prefixed with the type of address, for example, BillingCity, BillingState, and so on.

 **Note:** Standard address compound fields are read-only, and are only accessible using the SOAP and REST APIs. See [Compound Field Considerations and Limitations](#) on page 13 for additional details of the restrictions this imposes.

When an address is geocoded, its latitude and longitude fields are populated with coordinates. A related geolocation field is also populated. Typically, geocoding service providers geocode addresses, and rate the accuracy of the geocodes.

The accuracy subfield GeocodeAccuracy stores the accuracy data for a geocoded location. External geolocation apps can get the accuracy level of a geocoded address via the API. When you retrieve an address via the API, any accuracy data is included. You can also retrieve the accuracy information by itself, if needed.

Like its parent, the compound Address field, the GeocodeAccuracy field is only available for standard address fields on standard objects.

## Retrieving Compound Address Fields

Using compound fields can simplify code that works with addresses, especially for SOQL queries. SOQL SELECT clauses can reference addresses directly, instead of all of the individual component fields.

```
SELECT Name, BillingAddress
FROM Account
```

To write code that's compatible with API versions before 30.0, as well as API 30.0 and above, use the individual fields:

```
SELECT Name, BillingStreet, BillingCity, BillingState, BillingPostalCode,
       BillingCountry, BillingLatitude, BillingLongitude
FROM Account
```

Compound address field values are returned as a structured data type, Address. Code that works with compound address fields needs to reference the individual components of the returned value. See the code sample below.

### **Example: Retrieve a Standard Address Compound Field with the SOAP API**

The following Java method uses the Salesforce SOAP API to retrieve and display the Mailing Address for a list of contacts.

```
// Modified version of code in the SOAP API QuickStart
private void querySample() {
    String soqlQuery = "SELECT FirstName, LastName, MailingAddress FROM Contact";
    try {
        QueryResult qr = connection.query(soqlQuery);
        boolean done = false;

        if (qr.getSize() > 0) {
            System.out.println("\nLogged-in user can see "
```

```

        + qr.getRecords().length + " contact records.");

    while (!done) {
        System.out.println("");
        SObject[] records = qr.getRecords();
        for (int i = 0; i < records.length; ++i) {
            Contact con = (Contact) records[i];
            String fName = con.getFirstName();
            String lName = con.getLastName();

            // Access the compound address field MailingAddress
            Address addr = (Address) con.getMailingAddress();
            String streetAddr = "";
            if (null != addr) streetAddr = addr.getStreet();

            if (fName == null) {
                System.out.println("Contact " + (i + 1) + ": " + lName +
                    " -- " + streetAddr);
            } else {
                System.out.println("Contact " + (i + 1) + ": " + fName +
                    " " + lName +
                    " -- " + streetAddr);
            }
        }

        if (qr.isDone()) {
            done = true;
        } else {
            qr = connection.queryMore(qr.getQueryLocator());
        }
    }
} else {
    System.out.println("No records found.");
}
} catch (ConnectionException ce) {
    ce.printStackTrace();
}
}

```

## Using Compound Address Fields as Locations

Compound address fields include latitude and longitude fields. Address fields can be used as locations in SOQL WHERE and ORDER BY clauses. For example, here's a SOQL query that uses the GEOLOCATION function to retrieve the 10 accounts closest to San Francisco.

```

SELECT Id, Name, BillingAddress
FROM Account
WHERE DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi') < 20
ORDER BY DISTANCE(BillingAddress, GEOLOCATION(37.775,-122.418), 'mi')
LIMIT 10

```

**Note:** In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo

clean rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search the AppExchange.

## Geolocation Compound Field

Geolocation fields are accessible in the SOAP and REST APIs as a `Location`—a structured compound data type—or as individual latitude and longitude elements.

In API versions 26.0 and later, geolocation fields are available in the SOAP and REST APIs as a compound field of type `Location`. This structured data type contains the following fields.

- `latitude`
- `longitude`

**Note:** SOAP calls that use API versions earlier than 30.0 return geolocation compound values as strings. See “Returned Geolocation Data Types” later in this topic.

Geolocation fields are provided on many standard objects, such as Account, Contact, Quote, and User, as part of their address field or fields. Geolocation fields can also be added as custom fields to standard or custom objects.

**Note:**

- A geolocation compound field is read-only, although its `latitude` and `longitude` subfields are editable. You can only access compound fields using the SOAP or REST API. For more information about working with compound fields and their subfields, see [Compound Field Considerations and Limitations](#) on page 13.
- Although geolocation fields appear as a single field in the user interface, custom geolocation fields count as *three* custom fields towards your organization’s limits: one for latitude, one for longitude, and one for internal use.

## Retrieving Compound Geolocation Fields

Using compound fields can simplify code that works with geolocations, especially for SOQL queries. SOQL `SELECT` clauses can reference geolocations directly, instead of the individual component fields.

```
SELECT location__c
FROM Warehouse__c
```

To write code that’s compatible with API versions earlier than 26.0 and with API versions 26.0 and later, use the individual latitude and longitude fields.

```
SELECT location__latitude__s, location__longitude__s
FROM Warehouse__c
```

## Returned Geolocation Data Types

A compound geolocation field value is returned as the structured data type `Location`. Code that works with compound geolocation fields must reference the individual components of the returned value. See the sample code in [Address Compound Fields](#) on page 10.

In API versions earlier than 30.0, SOAP calls return compound geolocation field values as strings, instead of as a structured data type, for backward compatibility. If you plan to display your latitude and longitude values or pass them to a service that expects strings, use the values that are returned. If you plan to use the values in mathematical calculations or pass them to a map service that expects numbers, cast the results to numbers.

The string value format is:

```
API location: [latitudeValue longitudeValue]
```

An example of a regular expression to parse out the latitude and longitude values is:

```
API location: \[([+-]?\d{1,2}([.]\d+)?) ([+-]?\d{1,3}([.]\d+)?)\]
```

The first capture is the latitude, and the third is the longitude.

## Compound Field Considerations and Limitations

Address and geolocation compound fields are convenient and result in more concise, clear code. Here are some things to consider when using them in your apps.

Both address and geolocation compound fields have the following limitations.

- Compound fields are read-only. To update field values, modify the individual field components.
- Compound fields are accessible only through the SOAP and REST APIs. The compound versions of fields aren't accessible anywhere in the Salesforce user interface.
- Although compound fields can be queried with the `Location` and `Address` Apex classes, they're editable only as components of the actual field. Read and set geolocation field components by appending "`__latitude__s`" or "`__longitude__s`" to the field name, instead of the usual "`__c`." For example:

```
Double theLatitude = myObject__c.aLocation__latitude__s;
myObject__c.aLocation__longitude__s = theLongitude;
```

You can't access or set the compound value.

- You can't use compound fields in Visualforce—for example, in an `<apex:outputField>`. To access or update field values, use the individual field components.
- If you select compound fields for export in the Data Loader, they cause error messages. To export values, use individual field components.
- Custom geolocation and location fields on standard addresses aren't supported with email templates.
- You can't use compound fields in lookup filters, except to filter distances that are within or not within given ranges. You can use distance lookup filters only in the Metadata API.
- The only formula functions that you can use with compound fields are `ISBLANK`, `ISCHANGED`, and `ISNULL`. You can't use `BLANKVALUE`, `CASE`, `NULLVALUE`, `PRIORVALUE`, or the equality and comparison operators with compound fields. The equality and comparison operators include `=` and `==` (equal), `<>` and `!=` (not equal), `<` (less than), `>` (greater than), `<=` (less than or equal), `>=` (greater than or equal), `&&` (AND), and `||` (OR).

Address compound fields have the following limitations.

- Compound address fields are available only for address fields that exist as part of the standard objects included in Salesforce. You can't create custom compound address fields.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo clean rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search the AppExchange.
- The accuracy subfield of address fields is populated only when an address is geocoded. Typically, geocoding service providers provide accuracy data for an address's latitude and longitude coordinates.
- Address fields can't be used in `WHERE` statements in SOQL. Address fields aren't filterable, but the `isFilterable()` method of the `DescribeFieldResult` Apex class erroneously returns `true` for address fields.

Geolocation compound fields have the following limitations.

- Geolocation fields aren't supported in custom settings.
- Geolocation fields aren't available in dashboards or Schema Builder.
- Geolocation fields are available in Visual Workflow and in formula-based workflow and approvals, but they can't be used in filter-based workflow updates and approvals.
- `DISTANCE` formulas are supported in:
  - Entry criteria for workflow rules and approval processes
  - Field update actions in workflow rules and approval processes
  - Custom validation rules
  - Lookup filters (in the Metadata API only)
- Geolocation fields and latitude and longitude on standard addresses aren't supported in Salesforce to Salesforce.
- In Developer, Professional, Enterprise, Unlimited, and Performance editions, Salesforce can automatically add or update geolocation fields for Account, Contact, Lead, and WorkOrder records. To use this feature, your administrator must enable the geo clean rule for each object. For all other objects and editions, set values for latitude and longitude by using SOQL, Workbench, SOAP or REST API, or a geocoding service. You can then use address fields as locatable values. To find geocoding services, search the AppExchange.
- Geolocation fields are supported in SOQL with the following limitations.
  - `DISTANCE` and `GEOLOCATION` are supported in `WHERE` and `ORDER BY` clauses in SOQL, but not in `GROUP BY`. `DISTANCE` is supported in `SELECT` clauses.
  - `DISTANCE` supports only the logical operators `>` and `<`, returning values within (`<`) or beyond (`>`) a specified radius.
  - When using the `GEOLOCATION` function in SOQL queries, the geolocation field must precede the latitude and longitude coordinates. For example, `DISTANCE(warehouse_location__c, GEOLOCATION(37.775,-122.418), 'km')` works but `DISTANCE(GEOLOCATION(37.775,-122.418), warehouse_location__c, 'km')` doesn't work.
  - Apex bind variables aren't supported for the units parameter in `DISTANCE` or `GEOLOCATION` functions. This query doesn't work.

```
String units = 'mi';
List<Account> accountList =
    [SELECT ID, Name, BillingLatitude, BillingLongitude
     FROM Account
     WHERE DISTANCE(My_Location_Field__c, GEOLOCATION(10,10), :units) < 10];
```

For more information and examples, see the [Force.com SOQL and SOSL Reference](#).

## API Data Types and Salesforce Field Types

Generally, API data types and field types in the user interface have the same names. For example, a date field is represented by a date data type in the API. However, some field types are represented differently depending on whether you are inspecting an object via the API or the user interface. The following table contains the mapping for field types and data types that are different:

| API Data Type | Corresponding Field Types in the User Interface |
|---------------|-------------------------------------------------|
| ID            | Lookup relationship, master-detail relationship |

| API Data Type  | Corresponding Field Types in the User Interface                                                                                                                                                                                                  |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| string         | Auto number, email, phone, picklist, multi-select picklist, text, text area, long text area, rich text area, data category group reference and URL. Different maximum lengths are specified in the WSDL for text, text area, and long text area. |
| boolean        | Checkbox                                                                                                                                                                                                                                         |
| double         | Currency, formula, number, percent, and roll-up summary                                                                                                                                                                                          |
| Varies by type | When formula fields are created in the user interface, a type must be specified. This type corresponds to the API data type of the same name: currency, date, date/time, number, percent, or text.                                               |

All other fields that you can create in the user interface fall into one of the following categories:

- The field is not available in both the user interface and the API. For example, the BusinessHours object has fields of API data type time, but you cannot create a custom field of this type.
- Field types are the same as their corresponding API data type. For example, if you create a date field in the user interface, that field is the date data type in the API.

For more information about API data types, see [Primitive Data Types](#) and [Field Types](#).

## Required Fields

Required fields must have a non-`null` value. This rule affects the create and update calls:

- In a create call, the system automatically populates the data for certain required fields (such as system fields and the object ID fields). Similarly, if a required field has a default value (its `defaultedOnCreate` attribute is set to `true`, as described in [Field](#) in a describe result, then the system implicitly assigns a value for this field when the object is created, even if a value for this field is not explicitly passed in on the create call. For all other required fields, such as ID fields that are analogous to foreign keys in SQL, a client application must explicitly assign a value when the object is created (it cannot be `null`).
- In updates, a required field cannot be set to `null`, and many required fields can't be changed.

Any field not specified as required in the object description is optional, that is, it can be `null` when updated or created.

Some required fields for some objects require special handling.

## System Fields

The following fields are read-only fields found on most objects. These fields are automatically updated during API operations. For example, the ID field is automatically generated during a create operation and the LastModifiedDate is automatically updated when a user modifies a record.

| Field | Field Type         | Description                                                                                                                                                                                                                                                                                        |
|-------|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Id    | <a href="#">ID</a> | Globally unique string that identifies a record. For information on IDs, see <a href="#">ID Field Type</a> . Because this field exists in every object, it is not listed in the field table for each object. Id fields have <a href="#">Defaulted on create</a> and <a href="#">Filter</a> access. |

| Field               | Field Type | Description                                                                                                                                                                                                             |
|---------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IsDeleted           | boolean    | Indicates whether the record has been moved to the Recycle Bin ( <code>true</code> ) or not ( <code>false</code> ). Because this field does not appear in all objects, it is listed in the field table for each object. |
| <b>Audit Fields</b> |            |                                                                                                                                                                                                                         |
| CreatedById         | reference  | ID of the <a href="#">User</a> who created this record. <code>CreatedById</code> fields have <a href="#">Defaulted on create</a> and <a href="#">Filter</a> access.                                                     |
| CreatedDate         | dateTime   | Date and time when this record was created. <code>CreatedDate</code> fields have <a href="#">Defaulted on create</a> and <a href="#">Filter</a> access.                                                                 |
| LastModifiedById    | reference  | ID of the <a href="#">User</a> who last updated this record. <code>LastModifiedById</code> fields have <a href="#">Defaulted on create</a> and <a href="#">Filter</a> access.                                           |
| LastModifiedDate    | dateTime   | Date and time when a user last modified this record. <code>LastModifiedDate</code> fields have <a href="#">Defaulted on create</a> and <a href="#">Filter</a> access.                                                   |
| SystemModstamp      | dateTime   | Date and time when a user or automated process (such as a trigger) last modified this record. <code>SystemModstamp</code> fields have <a href="#">Defaulted on create</a> and <a href="#">Filter</a> access.            |

If you import data into Salesforce and want to retain the audit field values of the source system, you can set the values for audit fields on the following objects: Account, ArticleVersion, Attachment, CampaignMember, Case, CaseComment, Contact, ContentVersion, Contract, Event, Idea, IdeaComment, Lead, Opportunity, Question, Task, Vote, and custom objects. The only audit field you cannot set a value for is `systemModstamp`.

1. From Setup, enter *User Interface* in the **Quick Find** box, then select **User Interface** under Customize.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.
4. Using the API, create a record and set its audit fields.

Not all standard objects have all audit fields. Check the Enterprise WSDL to verify which audit fields are available for a given object.

## Parent Reference Fields

If an object has a relationship to a parent object, two fields are added.

- `Parent_Name` contains the object name of the parent. For example, Case has a `Contact` field that contains a reference to the contact parent of the case.
- `Parent_NameId` contains the ID of the parent. For example, Case has a `ContactId` field that refers to the contact parent of the case. This field is used in SOQL relationship queries such as the following:

```
SELECT Case.ContactId, Case.Contact.Name FROM Case
```

Even if the object can parent itself, these fields occur. For example, the Campaign object has a `Campaign` and `CampaignId` field for referencing the parent Campaign.

## API Field Properties

Fields on objects represent the details of each object and are analogous to columns in a database table. Each field on each object has one or more of the following properties:

| Property            | Description                                                                                                                                                                                                                        |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Autonumber          | The API creates an autonumber.                                                                                                                                                                                                     |
| Create              | Value for the field can be specified during create using the API.                                                                                                                                                                  |
| Defaulted on create | When created, a default value is supplied if no other value is specified.                                                                                                                                                          |
| Delete              | Value for the field can be deleted using the API.                                                                                                                                                                                  |
| Filter              | Can be used as filter criteria in a SOQL query FROM or WHERE clause.                                                                                                                                                               |
| Group               | Can be included in the GROUP BY clause of a SOQL query ( <code>true</code> ) or not ( <code>false</code> ). Available in API version 18.0 and later.                                                                               |
| idLookup            | Can be used to specify a record in an upsert call. The <code>Id</code> field of each object has this property and some <code>Name</code> fields. There are exceptions, so check for the property in any object you wish to upsert. |
| Nillable            | The field can contain a null value.                                                                                                                                                                                                |
| Query               | The field can be queried with SOQL using the API.                                                                                                                                                                                  |
| Restricted picklist | A picklist whose values are restricted to those values defined by a Salesforce admin. Users can't load unapproved values through the API.                                                                                          |
| Retrieve            | Value of the field can be retrieved using the API.                                                                                                                                                                                 |
| Sort                | Indicates whether a query can sort on this field ( <code>true</code> ) or not ( <code>false</code> ).                                                                                                                              |
| Update              | Can be updated using the API.                                                                                                                                                                                                      |

## Custom Fields

Salesforce administrators can define custom fields for standard or custom objects in their organization using the user interface. During creation, the `custom` flag—a Boolean field in the Field object—is set to `true`. Client applications cannot define custom fields via the API. Usually, client applications do not need to know whether a field is a standard field or a custom field.

Note that all numeric custom fields are handled as type `double`.

Use the following topics to understand custom fields:

- [Objects That Support Custom Fields](#)
- [Naming Conventions for Custom Fields](#)
- [External ID Attribute on Custom Fields](#)
- [Uniqueness for Custom Fields](#)
- [Default Values in Custom Fields](#)
- [Managed Packages and API Names](#)

## Objects That Support Custom Fields

To identify the standard objects that support custom fields, see the table in [Relationships Among Custom Objects](#).

## Naming Conventions for Custom Fields

Custom objects have an associated name field that is defined by your Salesforce administrator. Custom fields must have unique names within the same object.

In the API, the names of custom fields are identified by a suffix of two underscores immediately followed by a lowercase “c” character. For example, a custom object labeled “Issue” in the user interface is seen as `Issue__c` in that organization's WSDL. Similarly, a custom field labeled “Hire Date” in the user interface is seen as `Hire_Date__c` in that organization's WSDL. For example, a custom field labeled “Hire Date” in the user interface is seen as `Hire_Date__c` in that organization's WSDL.

Relationships change the naming convention, see [Relationships Among Custom Objects](#) for more information.

## External ID Attribute on Custom Fields

In the user interface, you can identify one custom field on an object as being an external ID field. The field type must be a text, number, or email field. An external ID contains record IDs from a system outside of Salesforce. You can match against this field during import or integration, or when upserting records.

## Uniqueness for Custom Fields

In the user interface, you can specify that a custom field on a custom object contain unique values across all the records of that custom object type. The uniqueness can be either case sensitive or case insensitive. In the API, you can find out if a field is unique by issuing a describe call against the custom object and inspecting two attribute values:

- If the `unique` field is set to `true`, the custom field values must be unique across all records of that custom object type in the organization. A value of `false` means the field can have the same value in different records of that custom object type.
- If the `caseSensitive` field is set to `true`, the uniqueness (if enabled) is case sensitive. For example “ABC” and “abc” are considered two unique values. If the value is `false`, then “ABC” and “abc” are considered the same value.

These values cannot be set or modified using API calls. If a custom field on a custom object has `unique` set to `true`, and you try to insert a duplicate value, a `DUPLICATE_VALUE` exception code is returned.

## Default Values in Custom Fields

You can set a default value on a custom field using a formula field:

- The user logged in for API activity must have the “Customize Application” permission.
- The field must have a data type of currency, date, datetime, int, double, percent, string, textarea, email, phone, or url. You cannot use composite fields like Address, Person, Names, nor Fiscal Periods. Note that you can set a checkbox as checked or unchecked by default using the user interface, but you cannot set it using a formula field.
- Default formulas run on fields, and the results are saved, even if the fields are hidden by field-level security.
- Default values are not used for lead conversion, importing, or merging records.

## Managed Packages and API Names

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: `name__c` becomes `prefix__name__c`. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the [ISVforce Guide](#).

## Custom Objects

---

In the user interface, you can extend your organization's data by defining custom objects. Custom objects are custom database tables that allow you to store information unique to your organization. For custom objects, the `custom` flag—a Boolean field in the describe results—is `true`.

Client applications with sufficient permissions can invoke API calls on existing custom objects. You can create custom objects with the user interface, or by using the metadata WSDL with a client application or using the Force.com IDE. For more information about using the metadata WSDL to create custom objects, see the [Force.com Metadata API Developer's Guide](#). For more information about the Force.com IDE, see [Salesforce Developers](#).

Use the following topics to understand how the API interacts with custom objects and fields:

- [Naming Conventions for Custom Objects](#)
- [Relationships Among Custom Objects](#)
- [Audit Fields for Custom Objects](#)
- [Sharing and Custom Objects](#)
- [Required Fields in Custom Objects](#)
- [Managed Packages and API Names](#)

## Naming Conventions for Custom Objects

Your Salesforce administrator defines an associated name field for each custom object during setup. Custom objects must have unique names within your organization.

In the API, the names of custom objects include a suffix of two underscores followed by a lowercase "c". For example, a custom object labeled "Issue" in the Salesforce user interface is `Issue__c` in that organization's WSDL.

Relationships change the naming convention. See [Relationships Among Custom Objects](#) for more information.

For a custom object record to appear in the Salesforce user interface, its name field must be populated. If you use the API to create a custom object record that doesn't have a name, the record's ID is used as its name.

## Relationships Among Custom Objects

Custom objects relate to other objects and behave just like standard objects, as described in [Relationships Among Objects](#). For example, cascading deletes are supported in custom objects in a Master-Detail relationship.

Custom objects require special treatment so that they can participate in Relationship Queries. For the relationship field name of a custom object, `__r` is appended to the name to create the ID. Also, `__c` is appended to the name to create the parent object pointer. For example, if the relationship field name is `MyRel`, the name of the ID becomes `MyRelId__r`, the parent object pointer becomes `MyRel__c`, and the relationship name is `MyRel__r`. For more information, see [Understanding Relationship Names, Custom Objects, and Custom Fields](#) in the [Salesforce SOQL and SOSL Reference Guide](#).

The following table summarizes whether a standard object can be:

- The master in a master-detail relationship with a custom object. Master-detail relationships involve cascading deletes and sharing rules that the parent controls.
- The lookup in a lookup relationship on a custom object. In other words, whether a custom object can have a lookup to the standard object.
- Extended with custom fields.

| Standard Object | Master-Detail | Lookup | Custom Fields |
|-----------------|---------------|--------|---------------|
| Account         | Yes           | Yes    | Yes           |
| Campaign        | Yes           | Yes    | Yes           |
| Case            | Yes           | Yes    | Yes           |
| Contact         | Yes           | Yes    | Yes           |
| Contract        | Yes           | Yes    | Yes           |
| Event           | No            | No     | Yes           |
| Lead            | No            | No     | Yes           |
| Opportunity     | Yes           | Yes    | Yes           |
| Product2        | No            | Yes    | Yes           |
| Solution        | Yes           | Yes    | Yes           |
| Task            | No            | No     | Yes           |
| User            | No            | Yes    | Yes           |

Custom objects can also have many-to-many relationships with other custom objects or standard objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For more information, see [Relationships Among Objects](#).

## Audit Fields for Custom Objects

Custom objects can have the same audit fields as standard objects. When you create a custom object, the four audit fields, `CreatedById`, `CreatedDate`, `LastModifiedById`, and `LastModifiedDate`, are created and populated for the object. These fields are read only. If you import data into Salesforce custom objects and want to retain the audit field values from the source system, you can set the values when you create the custom objects. The only audit field you cannot set a value for is `systemModstamp`. Your organization must be API enabled, and you must have the “Modify All Data” permission.

1. From Setup, enter *User Interface* in the Quick Find box, then select **User Interface** under Customize.
2. Under Setup, select **Enable “Set Audit Fields upon Record Creation” and “Update Records with Inactive Owners” User Permissions**.
3. In the permission set or profile that you want to set audit fields with, enable the permission **Set Audit Fields upon Record Creation**.
4. Using the API, create a record and set its audit fields.

Note these restrictions:

- `CreatedDate` can't be greater than the `LastModifiedDate`.
- You can't set any date field to be greater than the current time.

For more information about audit fields, see [System Fields](#).

## Sharing and Custom Objects

A sharing rule object is created for each custom object that does not have a master-detail relationship to another object. They are similar to standard object sharing rules, for example `AccountOwnerSharingRule`. If the user creating the custom object has the “Manage Sharing” permission, a sharing rule object is automatically created for it.

Apex sharing reasons can be retrieved describing the custom object's sharing object, and examining the information in the `rowCause` field. The name of a sharing object for each custom object is of the form: `MyObjectName__Share`, similar to `AccountShare` and other standard object sharing objects.

## Tags and Custom Objects

When a custom object is created, a Tag object related to it is also created. These object names are of the form: `MyObjectName__Tag`, similar to `AccountTag` and other standard object tag objects.

## Required Fields in Custom Objects

In the user interface, you can mark a custom field as required, and this rule is also enforced in the API. Each custom field has a `isRequired` field, with a data type boolean. The default value is `false`. If set to `true`, each request supplies a value (or leaves the current value) to this field. Otherwise, the request fails. When the value is set to `true`, the next time the field is edited or created, the validation applies. If no value is supplied or default value specified, the request fails.

To edit the `isRequired` field, you must log in as a user with the “Customize Application” permission.

If you change a custom object field to be required in an existing client application or integration, be sure that a value is supplied for that field. For example, if the custom picklist field `Education Level` on the contact object is required, supply a default value for that custom field. If a required field does not have a specified or default value, an error with the status code `REQUIRED_FIELD_MISSING` is returned.

## Managed Packages and API Names

If you have an unmanaged package and a managed package version becomes available, the API names of custom fields, custom objects, and Scontrol objects in the package change. A namespace prefix is added to each component to make it unique: `name__c` becomes `prefix__name__c`. To move from an unmanaged package to a managed package version of the same application, export your data, uninstall the old package, and install the new package. Then review the name changes and import your data with the relevant mapping. For details, see the [ISVforce Guide](#).

## External Objects

---

External objects are supported in API version 32.0 and later. External objects are similar to custom objects, but external object record data is stored outside your Salesforce organization. For example, perhaps you have data that's stored on premises in an enterprise resource planning (ERP) system. Instead of copying the data into your org, you can use external objects to access the data in real time via web service callouts.

External objects are available with Salesforce Connect and Files Connect. Each external object is associated with an external data source definition in your Salesforce organization.

An external data source specifies how to access an external system. Salesforce Connect uses external data sources to access data that's stored outside your Salesforce organization. Files Connect uses external data sources to access third-party content systems. External data sources have associated external objects, which your users and the Force.com platform use to interact with the external data and content.

By accessing record data on demand, external objects always reflect the current state of the external data. You don't have to manage a copy of that data in Salesforce, so you're not wasting storage and resources keeping data in sync.

External objects are best used when you have a large amount of data that you can't or don't want to store in your Salesforce organization, and you only need to use a small amount of data at any one time.

See "Define External Objects" in the Salesforce Help for how to create and modify external objects.

## Naming Conventions for External Objects

Object names must be unique across all standard, custom, and external objects in the org.

In the API, the names of external objects are identified by a suffix of two underscores immediately followed by a lowercase "x" character. For example, an external object named "ExtraLogInfo" in the Salesforce user interface is seen as `ExtraLogInfo__x` in that organization's WSDL.

We recommend that you make object labels unique across all standard, custom, and external objects in the org.

## External Object Relationships

External objects support standard lookup relationships, which use the 18-character Salesforce record IDs to associate related records with each other. However, data that's stored outside your Salesforce org often doesn't contain those record IDs. Therefore, two special types of lookup relationships are available for external objects: external lookups and indirect lookups. See "External Object Relationships" in the Salesforce Help for details.

## Feature Support for External Objects

Most of the Salesforce features that support custom objects also support external objects. However, there are exceptions, and some features have special limitations and considerations for external objects. See the following topics in the Salesforce Help.

- [Salesforce Compatibility Considerations for Salesforce Connect—All Adapters](#)
- [Considerations for Salesforce Connect—All Adapters](#)

## Salesforce Connect Adapters

Salesforce Connect uses a protocol-specific adapter to connect to an external system and access its data. This table describes the available adapters.

| Salesforce Connect Adapter      | Description                                                                                                                                                                                                                                                                                                                                                  | Where to Find Callout Limits                                                                                                                                                                                                                                                                         |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cross-org                       | Uses the Force.com REST API to access data that's stored in other Salesforce orgs.                                                                                                                                                                                                                                                                           | No callout limits. However, each callout counts toward the API usage limits of the provider org.<br><i>Salesforce Help:</i> <a href="#">API Usage Considerations for Salesforce Connect—Cross-Org Adapter</a><br><i>Salesforce Limits Quick Reference Guide:</i> <a href="#">API Requests Limits</a> |
| OData 2.0<br>OData 4.0          | Uses Open Data Protocol to access data that's stored outside Salesforce. The external data must be exposed via OData producers.                                                                                                                                                                                                                              | <i>Salesforce Help:</i> <a href="#">General Limits for Salesforce Connect—OData 2.0 and 4.0 Adapters</a>                                                                                                                                                                                             |
| Custom adapter created via Apex | You use the Apex Connector Framework to develop your own custom adapter when the other available adapters aren't suitable for your needs.<br><br>A custom adapter can obtain data from anywhere. For example, some data can be retrieved from anywhere in the Internet via callouts, while other data can be manipulated or even generated programmatically. | <i>Apex Developer Guide:</i> <a href="#">Callout Limits and Limitations</a><br><i>Apex Developer Guide:</i> <a href="#">Execution Governors and Limits</a>                                                                                                                                           |

For more information about Salesforce Connect, see “Salesforce Connect” in the Salesforce Help.

For details on using the Apex Connector Framework, see “Salesforce Connect” and “DataSource Namespace” in the [Force.com Apex Code Developer's Guide](#).

## Relationships Among Objects

*Relationships* associate objects with other objects. For example, a relationship can link a custom object to standard object in a related list, such as linking a custom object called Bugs to cases to track product defects associated with customer cases. To view the parent and child relationships among standard objects, see the ERD diagrams in [Data Model](#).

### Note:

- You can use parent-child relationships in SOQL queries. For more information, see Relationship Queries in the [Salesforce SOQL and SOSL Reference Guide](#).
- Only lookup, external lookup, and indirect lookup relationships are available for external objects. No other relationship types are supported. See “External Object Relationships” in the Salesforce Help.

You can define different types of relationships by creating custom relationship fields on an object. The differences between relationship types include how they handle data deletion, record ownership, security, and required fields in page layouts:

- Master-Detail (1:n)** — A parent-child relationship in which the master object controls certain behaviors of the detail object:
  - When a record of the master object is deleted, its related detail records are also deleted.
  - The `Owner` field on the detail object is not available and is automatically set to the owner of its associated master record. Custom objects on the detail side of a master-detail relationship cannot have sharing rules, manual sharing, or queues, as these require the `Owner` field.

- The detail record inherits the sharing and security settings of its master record.
- The master-detail relationship field is required on the page layout of the detail record.
- By default, records can't be reparented in master-detail relationships. Administrators can, however, allow child records in master-detail relationships on custom objects to be reparented to different parent records by selecting the `Allow reparenting` option in the master-detail relationship definition.

You can define master-detail relationships between custom objects or between a custom object and a standard object. However, the standard object cannot be on the detail side of a relationship with a custom object. In addition, you cannot create a master-detail relationship in which the User or Lead objects are the master.

When you define a master-detail relationship, the custom object on which you are working is the detail side. Its data can appear as a custom related list on page layouts for the other object.

- **Many-to-many** — You can use master-detail relationships to model *many-to-many* relationships between any two objects. A many-to-many relationship allows each record of one object to be linked to multiple records from another object and vice versa. For example, you may have a custom object called “Bug” that relates to the standard case object such that a bug could be related to multiple cases and a case could also be related to multiple bugs. To create a many-to-many relationship, simply create a custom junction object with two master-detail relationship fields, each linking to the objects you want to relate. See the Salesforce online help for details.

Custom objects with two master-detail relationships are supported in API version 11 and later.

Starting in API version 34.0, the `JunctionIdList` field type lets you manipulate the many-to-many relationship of an entity directly. You no longer need to manipulate underlying junction entity records. `JunctionIdList` fields can be queried and updated like any other field on the entity. Queries or updates to `JunctionIdList` fields act as queries or updates to the underlying junction entity records. Fields of type `JunctionIdList` appear in the WSDL as an unbounded array of type ID.

`JunctionIdList` is implemented in the `Task` and `Event` objects.

- **Lookup (1:n)** — This type of relationship links two objects together, but has no effect on deletion or security. Unlike master-detail fields, lookup fields are not automatically required. When you define a lookup relationship, data from one object can appear as a custom related list on page layouts for the other object. See the Salesforce online help for details.

To create relationships, use the user interface or Salesforce Metadata API.

## Factors that Affect Data Access

---

When using the API, the following factors affect access to your organization's data:

### Access

Your organization must be enabled for API access.

Objects may not be available until you contact Salesforce and request access. For example Territory is visible only if territory management has been enabled in the application. Such requirements are in the “Usage” section for each object.

Sometimes a feature must be used once before objects related to it can be accessed with the API. For example, the `recordTypeIds` is available only after at least one record type has been created for your organization in the user interface.

To investigate data access issues, you can start by inspecting the WSDL:

- **Enterprise WSDL:** The generated enterprise WSDL file contains all of the objects that are available to your organization. By using the API, a client application can access objects that are defined in your enterprise WSDL file.
- **Partner WSDL:** When using the generated partner WSDL file, a client application can access objects that are returned in the `describeGlobal()` call.

### Object-Level and Field-Level Security

The API respects object-level and field-level security configured in the user interface. You can access objects and fields only if the logged-in user's permissions and access settings allow such access. For example, fields that are not visible to a given user are not returned in a `query()` or `describeObjects()` call. Similarly, read-only fields can't be updated.

### User Permissions

A user attempting to access the API must have the permission "API Enabled" selected. It's selected by default.

Your client application logs in as a user called a *logged-in* user. The logged-in user's permissions grant or deny access to specific objects and fields in your organization:

- **Read**—Users can only view objects of this type.
- **Create**—Users can read and create objects of this type.
- **Edit**—Users can read and update objects of this type.
- **Delete**—Users can read, edit, and delete objects of this type.

User permissions do not affect field-level security. If field-level security specifies that a field is hidden, users with "Read" on that object can view only those fields that are not hidden on the record. In addition, users with "Read" on an object can view only those records that sharing settings allow. The one exception is the "Edit Read Only Fields" permission, which gives users the ability to edit fields marked as read only via field-level security.

### Sharing

For most API calls, data that is outside of the logged-in user's sharing model is not returned. Users are granted the most permissive access that is available to them, either through organization-wide defaults or manual record sharing, just as in the application.

### User Permissions that Override Sharing

- **View All**—Users can view all records associated with this object, regardless of sharing settings.
- **Modify All**—Users can read, edit, delete, transfer, and approve all records associated with this object, regardless of sharing settings.
- **Modify All Data**—users can read, edit, delete, transfer, and approve all records regardless of sharing settings. This permission is not an object-level permission, unlike "View All" and "Modify All."

To protect the security of your data, give the logged-in user only the permissions needed to successfully execute all the calls made by the application. For large integration applications, "Modify All Data" may speed up call response times. If you are loading a large number of records, use the [Bulk API](#) instead.

### Related Objects

Some objects depend on other objects for permission. For example, `AccountTeamMember` follows sharing on the associated permission-assigned object such as the `Account` record. Similarly, a `Partner` depends on the permissions in the associated .

Ownership changes to a record do not automatically cascade to related records. For example, if ownership changes for a given `Account`, ownership does not then automatically change for any `Contract` associated with that `Account`—each ownership change must be made separately and explicitly by the client application.

### Object Properties

To create an object with the `create()` call, the object's `createable` attribute must be set to `true`. To determine what operations are allowed on a given object, your client application can invoke the `describeObjects()` call on the object and inspect the properties in the `DescribeObjectResult`.

**Note:** `replicable` allows `getUpdated()` and `getDeleted()` calls.

### Page Layouts and Record Types

Requirements defined in the Salesforce user interface for page layouts and record types are not enforced by the API:

- Page layouts can specify whether a given field is required, but the API does not enforce such layout-specific field restrictions or validations in `create()` and `update()` calls. It's up to the client application to enforce any such constraints, if applicable.
- Record types can control which picklist values can be chosen in a given record and which page layouts users with different profiles can see. However, such rules that are configured and enforced in the user interface are not enforced in the API. For example, the API does not validate whether the value in a picklist field is allowed per any record type restrictions associated with the profile of the logged-in user. Similarly, the API does not prevent a client application from adding data to a particular field simply because that field does not appear in a layout associated with the profile of the logged-in user.

### Referential Integrity

To ensure referential integrity, the API forces or prevents certain behaviors:

- ID values in [reference fields](#) are validated in `create()` and `update()` calls.
- If a client application deletes a record, then its children are automatically deleted as part of the call if the `cascadeDelete` property on `ChildRelationship` for that child has a value of `true`. For example, if a client application deletes an `Opportunity`, then any associated `OpportunityLineItem` records are also deleted. However, if an `OpportunityLineItem` is not deletable or is currently being used, then deletion of the parent `Opportunity` fails. For example, if a client application deletes an `Invoice_Statement`, then any associated `Line_Item` records are also deleted. However, if a `Line_Item` is not deletable or is currently being used, then deletion of the parent `Invoice_Statement` fails. Use `DescribeObjectResult` to view the `ChildRelationship` value if you want to be sure what will be deleted.

There are certain exceptions that prevent the execution of a `cascadeDelete`. For example, you can't delete an account if it has associated cases, if it has related opportunities that are owned by other users, or if associated contacts are enabled for the Customer Portal. In addition, if you attempt to delete an account that has closed/won opportunities owned by you or has active contracts, then the delete request for that record will fail.

# REFERENCE

## CHAPTER 2 Standard Objects

This section provides a list of standard objects and their standard fields. Some fields may not be listed for some objects.

To see the system fields for each object, see [System Fields](#).

To verify the complete list of fields for an object, you can use a describe call from the API, or inspect with an appropriate tool, for example, inspecting the WSDL or using a schema viewer.

### [AcceptedEventRelation](#)

Represents invitees with the status `Accepted` for a given event.

### [Account](#)

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

### [AccountContactRelation](#)

Represents a relationship between a contact and one or more accounts.

### [AccountCleanInfo](#)

Stores the metadata Data.com Clean uses to determine an account record's clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

### [AccountContactRole](#)

Represents the role that a Contact plays on an Account.

### [AccountFeed](#)

Represents a single feed item on an account record detail page. This object is available in API version 18.0 and later.

### [AccountHistory](#)

Represents the history of changes to the values in the fields of an account. This object is available in versions 11.0 and later.

### [AccountOwnerSharingRule](#)

Represents the rules for sharing an account with a User other than the owner.

### [AccountPartner](#)

This read-only object represents a partner relationship between two Account objects. It is automatically created when a Partner object is created for a partner relationship between two accounts.

### [AccountShare](#)

Represents a sharing entry on an Account.

### [AccountTag](#)

Associates a word or short phrase with an Account.

### [AccountTeamMember](#)

Represents a User who is a member of an Account team.

## Standard Objects

### [AccountTerritoryAssignmentRule](#)

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

### [AccountTerritoryAssignmentRuleItem](#)

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

### [AccountTerritorySharingRule](#)

Represents the rules for sharing an Account within a Territory.

### [ActionLinkGroupTemplate](#)

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

### [ActionLinkTemplate](#)

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

### [ActivityHistory](#)

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

### [AdditionalNumber](#)

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

### [AgentWork](#)

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

### [AllowedEmailDomain](#)

Represents an allowed email domain for users in your organization. You can define a whitelist to restrict the email domains allowed in a user's Email field. This object is available in API version 29.0 and later.

### [Announcement](#)

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

### [ApexClass](#)

Represents an Apex class.

### [ApexComponent](#)

Represents a definition for a custom component that can be used in a Visualforce page alongside standard components such as `<apex:relatedList>` and `<apex:dataTable>`.

### [ApexLog](#)

Represents a debug log, containing information about a transaction, including information about Apex, Visualforce, workflow and validation rules. This object is available in API version 19.0 and later.

### [ApexPage](#)

Represents a single Visualforce page.

### [ApexTestQueueItem](#)

Represents a single Apex class in the Apex job queue. This object is available in API version 23.0 and later.

## Standard Objects

### [ApexTestResult](#)

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

### [ApexTestResultLimits](#)

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each `ApexTestResult` record. This object is available in API version 37.0 and later.

### [ApexTestRunResult](#)

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

### [ApexTestSuite](#)

Represents a suite of Apex classes to include in a test run. A `TestSuiteMembership` object associates each class with the suite. This object is available in API version 36.0 and later.

### [ApexTrigger](#)

Represents an Apex trigger.

### [AppMenuItem](#)

Represents the organization's default settings for items in the Force.com app menu or App Launcher.

### [Approval](#)

Represents an approval request for a Contract.

### [Article Type\\_\\_DataCategorySelection](#)

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

### [Article Type\\_\\_Feed](#)

Represents a single feed item in the feed displayed on the detail page for an article. This object is available in API version 20.0 and later.

### [Asset](#)

Represents an item of commercial value, such as a product sold by your company or a competitor, that a customer has purchased and installed.

### [AssetFeed](#)

Represents a single feed item in the feed displayed on the detail page for an asset record. This object is available in API version 18.0 and later.

### [AssetOwnerSharingRule](#)

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

### [AssetShare](#)

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

### [AssetTag](#)

Associates a word or short phrase with an Asset.

### [AssignedResource](#)

Represents a service resource who is assigned to a service appointment. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

### [AssignmentRule](#)

Represents an assignment rule associated with a Case or Lead.

### [AsyncApexJob](#)

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`.

## Standard Objects

### [AttachedContentDocument](#)

This read-only object contains all `ContentDocument` objects associated with an object.

### [AttachedContentNote](#)

This read-only object contains all `ContentNote` objects associated with an object. This object is available in API version 35.0 and later.

### [Attachment](#)

Represents a file that a User has uploaded and attached to a parent object.

### [AuraDefinition](#)

Represents a Lightning definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

### [AuraDefinitionBundle](#)

Represents a Lightning definition bundle, such as a component or application bundle. A bundle contains a Lightning definition and all its related resources. This object is available in API version 32.0 and later.

### [AuthConfig](#)

Represents authentication options for a community or custom domain that was created by using My Domain. This object is available in API version 32.0 and later.

### [AuthConfigProviders](#)

Represents an authentication provider that's configured in an organization. This object is a child of the `AuthConfig` object. This object is available in API version 32.0 and later.

### [AuthProvider](#)

Represents an authentication provider (or auth provider) in your organization.

### [AuthSession](#)

The `AuthSession` object represents an individual user session in your organization. This object is available in versions 29.0 and later.

### [BackgroundOperation](#)

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

### [BackgroundOperationResult](#)

Stores error messages generated when running Async SOQL queries or importing data into BigObjects using Bulk API. This is a BigObject, available in API version 37.0 and later.

### [Bookmark](#)

Represents a link between opportunities that share common information.

### [BrandTemplate](#)

Letterhead for HTML EmailTemplate.

### [BusinessHours](#)

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

### [BusinessProcess](#)

Represents a business process.

### [CallCenter](#)

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

### [Campaign](#)

Represents and tracks a marketing campaign, such as a direct mail promotion, webinar, or trade show.

## Standard Objects

### [CampaignFeed](#)

Represents a single feed item in the feed on a campaign record detail page. This object is available in API version 18.0 and later.

### [CampaignInfluence](#)

Represents the association between a campaign and an opportunity in Customizable Campaign Influence. This object is available in API version 37.0 and later.

### [CampaignInfluenceModel](#)

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Salesforce influence model is the default model. This object is available in API version 37.0 and later.

### [CampaignMember](#)

Represents the association between a campaign and either a lead or a contact.

### [CampaignMemberStatus](#)

One or more member status values defined for a campaign.

### [CampaignOwnerSharingRule](#)

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

### [CampaignShare](#)

Represents a sharing entry on a Campaign.

### [CampaignTag](#)

Associates a word or short phrase with a Campaign.

### [Case](#)

Represents a case, which is a customer issue or problem.

### [CaseArticle](#)

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

### [CaseComment](#)

Represents a comment that provides additional information about the associated Case.

### [CaseContactRole](#)

Represents the role that a given Contact plays on a Case.

### [CaseFeed](#)

Represents a single feed item in the feed displayed on the detail page for a case record. A case feed shows recent changes to a case record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to cases. This object is available in API version 18.0 and later.

### [CaseHistory](#)

Represents historical information about changes that have been made to the associated Case.

### [CaseMilestone](#)

Represents a milestone (required step in a customer support process) on a Case. This object is available in API version 18.0 and later.

### [CaseOwnerSharingRule](#)

Represents the rules for sharing a case with users other than the owner.

### [CaseShare](#)

Represents a sharing entry on a Case.

### [CaseSolution](#)

Represents the association between a Case and a Solution.

## Standard Objects

### [CaseStatus](#)

Represents the status of a Case, such as New, On Hold, or In Process.

### [CaseTag](#)

Associates a word or short phrase with a Case

### [CaseTeamMember](#)

Represents a case team member, who works with a team of other users to help resolve a case.

### [CaseTeamRole](#)

Represents a case team role. Every case team member has a role on a case, such as "Customer Contact" or "Case Manager."

### [CaseTeamTemplate](#)

Represents a predefined case team, which is a group of users that helps resolve a case.

### [CaseTeamTemplateMember](#)

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

### [CaseTeamTemplateRecord](#)

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

### [CategoryData](#)

Represents a logical grouping of Solution records.

### [CategoryNode](#)

Represents a tree of Solution categories.

### [CategoryNodeLocalization](#)

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

### [ChatterActivity](#)

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

### [ChatterAnswersActivity](#)

Represents the reputation of a User in Chatter Answers communities. This object is available in API version 25.0 and later.

### [ChatterAnswersReputationLevel](#)

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

### [ChatterConversation](#)

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

### [ChatterConversationMember](#)

Represents a member of a private conversation in Chatter. A member has either sent messages to or received messages from other conversation participants. This object is available in API version 23.0 and later.

### [ChatterMessage](#)

Represents a message sent as part of a private conversation in Chatter. This object is available in API version 23.0 and later.

### [ClientBrowser](#)

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

## Standard Objects

### [CollaborationGroup](#)

Represents a Chatter group. This object is available in API version 19.0 and later.

### [CollaborationGroupFeed](#)

Represents a single feed item on a Chatter group feed. A group feed shows posts and comments about the group. This object is available in API version 19.0 and later.

### [CollaborationGroupMember](#)

Represents a member of a Chatter group. This object is available in API version 19.0 and later.

### [CollaborationGroupMemberRequest](#)

Represents a request to join a private Chatter group. This object is available in API version 21.0 and later.

### [CollaborationGroupRecord](#)

Represents the records associated with Chatter groups.

### [CollaborationInvitation](#)

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

### [CombinedAttachment](#)

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

### [Community \(Zone\)](#)

Represents a zone that contains Idea or Question objects.

### [ConnectedApplication](#)

Represents a connected app and its details; all fields are read-only.

### [Contact](#)

Represents a contact, which is an individual associated with an account.

### [ContactCleanInfo](#)

Stores the metadata Data.com Clean uses to determine a contact record's clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

### [ContactFeed](#)

Represents a single feed item in the feed on a contact record detail page. This object is available in API version 18.0 and later.

### [ContactHistory](#)

Represents the history of changes to the values in the fields of a contact. This object is available in versions 11.0 and later.

### [ContactOwnerSharingRule](#)

Represents the rules for sharing a contact with a User other than the owner.

### [ContactShare](#)

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is `Owner`.

### [ContactTag](#)

Associates a word or short phrase with a Contact.

### [ContentAsset](#)

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Enables a Salesforce file to be used for org setup and configuration purposes. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

## Standard Objects

### [ContentDistribution](#)

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

### [ContentDistributionView](#)

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

### [ContentDocument](#)

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in API versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

### [ContentDocumentFeed](#)

Represents a single feed item associated with ContentDocument. A content document feed shows these content document changes: creating a ContentDocument file and uploading a new ContentDocument. This object is available in versions 20.0 and later.

### [ContentDocumentHistory](#)

Represents the history of a document. This object is available in versions 17.0 and later.

### [ContentDocumentLink](#)

Represents the link between a Salesforce CRM Content document or Salesforce file and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

### [ContentFolder](#)

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

### [ContentFolderItem](#)

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

### [ContentFolderLink](#)

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

### [ContentFolderMember](#)

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

### [ContentHubItem](#)

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

### [ContentHubRepository](#)

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

### [ContentNote](#)

Represents a note in Salesforce. This object is available in API version 32.0 and later.

### [ContentVersion](#)

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

### [ContentVersionHistory](#)

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

### [ContentWorkspace](#)

Represents a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

## Standard Objects

### [ContentWorkspaceDoc](#)

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

### [Contract](#)

Represents a contract (a business agreement) associated with an Account.

### [ContractContactRole](#)

Represents the role that a given Contact plays on a Contract.

### [ContractFeed](#)

Represents a single feed item in the feed on the contract record detail page. This object is available in API version 18.0 and later.

### [ContractHistory](#)

Represents the history of changes to the values in the fields of a contract.

### [ContractLineItem](#)

Represents a Product2 in a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

### [ContractLineItemHistory](#)

Represents the history of changes to the values in the fields on a ContractLineItem (items in a customer support agreement). This object is available in API version 18.0 and later.

### [ContractStatus](#)

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

### [ContractTag](#)

Associates a word or short phrase with a Contract.

### [CronJobDetail](#)

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

### [CronTrigger](#)

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

### [CurrencyType](#)

Represents the currencies used by an organization for which the multicurrency feature is enabled.

### [CustomBrand](#)

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

### [CustomBrandAsset](#)

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to a community or to an organization using Salesforce1. This object is available in API version 28.0 and later.

### [Custom Metadata Type\\_\\_mdt](#)

Represents a custom metadata record. This object is available in API version 34.0 and later.

### [Custom Object\\_\\_Feed](#)

Represents a single feed item on a custom object detail page. This object is available in API version 18.0 and later.

### [CustomPermission](#)

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

## Standard Objects

### [CustomPermissionDependency](#)

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

### [DandBCompany](#)

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

### [Dashboard](#)

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

### [DashboardComponent](#)

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

### [DashboardComponentFeed](#)

Represents a single feed item in the feed displayed on a dashboard component. This object is available in API version 21.0 and later.

### [DashboardFeed](#)

Represents a single feed item in the feed displayed on a dashboard. This object is available in API version 20.0 and later.

### [DashboardTag](#)

Associates a word or short phrase with a Dashboard. This object is available in API version 20.0 and later.

### [DataAssessmentFieldMetric](#)

Represents summary statistics for matched, blank, and differing fields in account records of an org compared to records in Data.com. This object is available in API version 37.0 and later.

### [DataAssessmentMetric](#)

Represents a summary of statistics for fields matched and unmatched in your account records with Data.com account records. This object is available in API version 37.0 and later.

### [DataAssessmentValueMetric](#)

Summarizes the number of fields matched for your account records with Data.com account records. This object is available in API version 37.0 and later.

### [DatacloudCompany](#)

Represents the fields for Data.com company records. This object is available in API version 30.0 or later.

### [DatacloudContact](#)

The fields and properties for Data.com contact records. This object is available in API version 30.0 or later.

### [DatacloudDandBCompany](#)

Represents a set of read-only fields that are used to return D&B company data from Data.com API calls. This object is available in API version 30.0 or later.

### [DatacloudOwnedEntity](#)

Represents fields in the DatacloudOwnedEntity object. The DatacloudOwnedEntity object tracks user-purchased records. This object is available in API version 30.0 or later.

### [DatacloudPurchaseUsage](#)

Represents an object used to identify and track Data.com record purchases. This object is available in API version 30.0 or later.

### [DatacloudSocialHandle](#)

Returns normalized URLs with userids for different social media used by Data.com contacts. The DatacloudSocialHandle object is a child object of the DatacloudContact object. This object is available in API version 30.0 or later.

## Standard Objects

### [DatedConversionRate](#)

Represents the dated exchange rates used by an organization for which the multicurrency and the effective dated currency features are enabled.

### [DcSocialProfile](#)

The `DcSocialProfile` object is a read-only object accessible only through the Data.com Social Key API. This object is available in API version 32.0 or later.

### [DcSocialProfileHandle](#)

The `DcSocialProfileHandle` object, a child object to `DcSocialProfile`, is a read-only object accessible only through the Data.com Social Key API. The `DcSocialProfileHandle` object is a child object of the `DcSocialProfile` object. This object is available in API version 32.0 or later.

### [DeclinedEventRelation](#)

Represents invitees with the status `Declined` for a given event. This object is available in API versions 29.0 and later.

### [Division](#)

A logical segment of your organization's data. For example, if your company is organized into different business units, you could create a division for each business unit, such as "North America," "Healthcare," or "Consulting." Available only if the organization has the Division permission enabled.

### [DivisionLocalization](#)

When the Translation Workbench is enabled for your organization, the `DivisionLocalization` object provides the translation of the label for a division.

### [Document](#)

Represents a file that a user has uploaded. Unlike Attachment records, documents are not attached to a parent object.

### [DocumentAttachmentMap](#)

Maps the relationship between an `EmailTemplate` and its attachment, which is stored as a `Document`.

### [DocumentTag](#)

Associates a word or short phrase with a `Document`.

### [Domain](#)

Read-only object that represents a custom Web address assigned to a site in your organization. This object is available in API version 26.0 and later.

### [DomainSite](#)

Read-only junction object that joins together the `Site` and `Domain` objects. This object is available in API version 26.0 and later.

### [DuplicateRecordItem](#)

Represents an individual record that's part of a duplicate record set. Use this object to create custom report types.

### [DuplicateRecordSet](#)

Represents a group of records that have been identified as duplicates. Each duplicate record set contains one or more duplicate record items. Use this object to create custom report types.

### [DuplicateRule](#)

Represents a duplicate rule for detecting duplicate records.

### [EmailDomainKey](#)

Represents a domain key for an organization's domain, used to authenticate outbound email that Salesforce sends on the organization's behalf. This object is available in API version 28.0 and later.

### [EmailMessage](#)

Represents an email in Salesforce.

## Standard Objects

### [EmailMessageRelation](#)

Represents the relationship between an email and contacts, leads, and users. This object is available in API version 37.0 and later.

### [EmailServicesAddress](#)

An email service address.

### [EmailServicesFunction](#)

An email service.

### [EmailStatus](#)

Represents the status of email sent.

### [EmailTemplate](#)

Represents a template for mass email, or email sent when the activity history related list of a record is modified.

### [Entitlement](#)

Represents the customer support an Account or Contact is eligible to receive. This object is available in API version 18.0 and later. Entitlements may be based on an Asset, Product2, or ServiceContract.

### [EntitlementContact](#)

Represents a Contact eligible to receive customer support via an Entitlement. This object is available in API version 18.0 and later.

### [EntitlementFeed](#)

Represents a single feed item in the feed displayed on the detail page for an entitlement. An entitlement feed shows recent changes to an entitlement record for any fields that are tracked in feeds, and comments and posts about the record. It's a useful way to stay up-to-date with changes to entitlements. This object is available in API version 23.0 and later.

### [EntitlementHistory](#)

Represents the changes to field values on an Entitlement. This object is available in API version 18.0 and later.

### [EntitlementTemplate](#)

Represents predefined terms of customer support for a product (Product2). This object is available in API version 18.0 and later.

### [EntityHistory](#)

Represents historical information about an object's changed field values. This object is only available to users with the "View All Data" permission. This object is unavailable beginning with API version 8.0. Use the object-specific History objects instead: CaseHistory, ContractHistory, LeadHistory, OpportunityFieldHistory, OpportunityHistory, ProcessInstanceHistory, QuantityForecastHistory, RevenueForecastHistory, or SolutionHistory.

### [EntityMilestone](#)

Represents a required step in a customer support process on a record. The Salesforce user interface uses the term "object milestone." This object is available in API version 37.0 and later.

### [EntitySubscription](#)

Represents a subscription for a user following a record or another user. This object is available in API version 34.0 and later.

### [EnvironmentHubMember](#)

Represents a member organization in the Environment Hub. This object is available in API version 29.0 and later.

### [Event](#)

Represents an event in the calendar. In the user interface, event and task records are collectively referred to as activities.

### [EventFeed](#)

Represents a single feed item in the feed on an Event. This object is available in API version 20.0 and later.

### [EventLogFile](#)

Represents event log files for event monitoring. This object is available in API versions 32.0 and later.

## Standard Objects

### EventRelation

Represents people (a user, a lead, or contacts) or a resource (such as a conference room) invited to an event. This object lets you add or remove invitees from an event and use the API to manage invitees' responses to invitations. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules.

### EventTag

Associates a word or short phrase with an Event.

### EventWhoRelation

Represents the relationship between an event and a lead or contacts. This derived object is a filtered version of the [EventRelation](#) on page 844 object; that is, `IsParent` is `true` and `IsWhat` is `false`. It doesn't represent relationships to invitees or to accounts, opportunities, or other objects. This object is available in API versions 29.0 and later.

### ExternalDataSource

Represents an external data source, which defines connection details for integration with data and content that are stored outside the Salesforce org. This object is available in API version 27.0 and later.

### ExternalDataUserAuth

Stores authentication settings for a Salesforce user to access an external system. The external system must be defined in an external data source or a named credential that's configured to use per-user authentication. This object is available in API version 27.0 and later.

### FeedAttachment

Represents an attachment to a feed item, such as a file attachment or a link. Use `FeedAttachment` to add various attachments to one feed item. This object is available in API version 36.0 and later.

### FeedComment

Represents a comment added to a feed by a user. This object is available in API version 18.0 and later.

### FeedItem

`FeedItem` represents an entry in the feed, such as changes in a record feed, including text posts, link posts, and content posts. This object is available in API version 21.0 and later. This object replaces `FeedPost`.

### FeedLike

Indicates that a user has liked a feed item. This object is available in API version 21.0 and later.

### FeedPollChoice

Shows the choices for a poll posted in the feed. This object is available in API version 29.0 and later.

### FeedPollVote

Shows how users voted on a poll posted in the feed. This object is available in API version 29.0 and later.

### FeedPost

`FeedPost` represents the following types of changes in a record feed, such as `AccountFeed`: text posts, link posts, and content posts. This object is available in API version 18.0 through 21.0. `FeedPost` is no longer available in later versions. Starting with API version 21.0, use `FeedItem` to represent text posts, link posts, and content posts in feeds.

### FeedRevision

Holds the revision history of a specific feed item or comment, including a list of attributes that changed for each revision. This object is available in API version 34.0 and later.

### FeedTrackedChange

Represents an individual field change or set of field changes. A `FeedTrackedChange` is a child object of a record feed, such as `AccountFeed`. This object is available in API version 18.0 and later..

## Standard Objects

### [FieldHistoryArchive](#)

Represents field history values for all objects that retain field history. This is a BigObject, available only to users with the “Retain Field History” permission. This object is available in API version 29.0 and later.

### [FieldPermissions](#)

Represents the enabled field permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

### [FiscalYearSettings](#)

Settings to define a custom or standard fiscal year for your organization. This object has a parent-child relationship with the Period object.

### [FlexQueueItem](#)

Represents an asynchronous Apex job in the Apex flex queue. Provides information about the job type and flex queue position of the AsyncApexJob. This object is available in API version 36.0 and later.

### [FlowInterview](#)

Represents a flow interview. A *flow interview* is a running instance of a flow.

### [FlowInterviewOwnerSharingRule](#)

Represents the rules for sharing a FlowInterview with users other than the owner. This object is available in API version 33.0 and later.

### [FlowInterviewShare](#)

Represents a sharing entry on a FlowInterview. This object is available in API version 33.0 and later.

### [Folder](#)

Represents a repository for a Document, EmailTemplate, Report, or Dashboard. Only one type of item can be contained in a folder.

### [FolderedContentDocument](#)

Represents the relationship between a parent and child ContentFolderItem in a ContentWorkspace.

### [ForecastingAdjustment](#)

This object represents an individual sales manager’s adjustment for a subordinate’s forecast via a ForecastingItem. Available in API versions 26 and greater. This object is separate from the ForecastingOwnerAdjustment object, which represents forecast users’ adjustments of their *own* forecasts.

### [ForecastingFact](#)

This is a read-only object linking a ForecastingItem with its opportunities, such as opportunities that share the same owner or forecast category and have a closing date within the period of the forecasting item. Available in API versions 26 and greater.

### [ForecastingItem](#)

This is a read-only object used for individual forecast amounts. Users see amounts based on their perspectives and forecast roles. The amounts users see include one of the following when forecasting in revenue: `AmountWithoutAdjustments`, `AmountWithoutManagerAdjustment`, `ForecastAmount`, `OwnerOnlyAmount`. The amounts users see include one of the following when forecasting in quantity: `QuantityWithoutAdjustments`, `QuantityWithoutManagerAdjustment`, `ForecastQuantity`, `OwnerOnlyQuantity`. Available in API versions 26 and greater.

### [ForecastingOwnerAdjustment](#)

This object represents an individual forecast user’s adjustment of their *own* forecast via a ForecastingItem. Available in API versions 33 and greater. This object is separate from the ForecastingAdjustment object, which represents managers’ adjustments of *subordinates’* forecasts.

## Standard Objects

### ForecastingQuota

This object represents an individual user's quota for a specified time period. The "Manage Quotas" user permission is required for creating, updating, or deleting quotas. (Users can only edit their subordinates' quotas, not their own.) The "View All Forecasts" permission is required to View any user's forecast, regardless of the forecast role hierarchy. Available in API versions 25 and greater. Forecast managers can view the forecasts of subordinates who report to them in the forecast hierarchy.

### ForecastingType

This object is used to identify the forecast type associated with `ForecastingAdjustment`, `ForecastingOwnerAdjustment`, `ForecastingQuota`, `ForecastingFact`, and `ForecastingItem` objects. Available in API versions 30.0 and greater.

### ForecastShare

Represents the sharing of a customizable forecast at a given role and territory.

### Goal

The Goal object represents the components of a goal such as its name, description, and status.

### GoalFeed

Represents a single feed item in the feed displayed for a Goal record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal.

### GoalHistory

This read-only object contains historical information about changes that have been made to the Goal object.

### GoalLink

Represents the relationship between two goals. This is a many-to-many relationship, meaning that each goal can link to many other goals.

### GoalShare

Represents a sharing entry on a Goal object.

### GoogleDoc

Represents a link to a Google Document. This object is available in API version 14.0 and later.

### Group

A set of User records.

### GroupMember

Represents a User or Group that is a member of a public group.

### HashtagDefinition

HashtagDefinition represents hashtag (#) topics in public Chatter posts and comments. Public posts and comments include those on profiles and in public groups, but not those on records or in private groups. This object is available in API version 26.0 and later.

### Holiday

Represents a period of time during which your customer support team is unavailable. Business hours and escalation rules associated with business hours are suspended during any holidays with which they are affiliated.

### Idea

Represents an idea on which users are allowed to comment and vote, for example, a suggestion for an enhancement to an existing product or process. This object is available in API version 12 and later.

### IdeaComment

Represents a comment that a user has submitted in response to an idea.

## Standard Objects

### [IdeaReputation](#)

Represents a collection of statistics and scores derived from a user's activity within an Ideas zone or internal organization. This object is available in API version 28.0 and later.

### [IdeaReputationLevel](#)

Represents a reputation level within an Ideas zone or internal organization and is used by the system to calculate reputation. You can create up to 25 levels per zone or internal organization. This object is available in API version 28.0 and later.

### [IdeaTheme](#)

Represents an invitation to community members to submit ideas that are focused on a specific topic. This object is available in API version 26 and later.

### [KnowledgeableUser](#)

Represents a user identified as knowledgeable about a specific topic, and ranks them relative to other knowledgeable users. This object is available in API version 31.0 and later.

### [KnowledgeArticle](#)

Provides read-only access to an article and the ability to delete the master article. This object is available in API version 19.0 and later.

### [KnowledgeArticleVersion](#)

Provides a global view of standard article fields across all article types depending on their version. This object is available in API version 18.0 and later.

### [KnowledgeArticleVersionHistory](#)

Enables read-only access to the full history of an article. This object is available in API version 25.0 and later.

### [KnowledgeArticleViewStat](#)

Provides statistics on the number of views for the specified article across all article types. This object is read-only and available in API version 20 and later.

### [KnowledgeArticleVoteStat](#)

Provides the weighted rating for the specified article on a scale of 1 to 5 across all article types. This object is read-only and available in API version 20 and later.

### [Lead](#)

Represents a prospect or potential Opportunity.

### [LeadCleanInfo](#)

Stores the metadata Data.com Clean uses to determine a lead record's clean status. Helps you automate the cleaning or related processing of lead records.

### [LeadFeed](#)

Represents a single feed item in the feed displayed on the detail page for a lead record. This object is available in API version 18.0 and later.

### [LeadHistory](#)

Represents the history of changes to the values in the fields of a lead.

### [LeadOwnerSharingRule](#)

Represents the rules for sharing a lead with users other than the owner.

### [LeadShare](#)

Represents a sharing entry on a Lead.

### [LeadStatus](#)

Represents the status of a Lead, such as Open, Qualified, or Converted.

## Standard Objects

### [LeadTag](#)

Associates a word or short phrase with a Lead.

### [LimitAllocationPerApp](#)

Represents a connected app quota for an API limit. This object is available in API version 30.0 and later.

### [LineItemOverride](#)

A forecast override of a line item on an Opportunity. This read-only object for customizable forecasting has a child-parent relationship with OpportunityOverride.

### [LinkedArticle](#)

Represents a Knowledge article that is attached to a record. This object is available in API version 37.0 and later.

### [LinkedArticleFeed](#)

Represents a single feed item on a linked Knowledge article attached to a record. This object is available in API version 37.0 and later.

### [LinkedArticleHistory](#)

Represents the history of changes made to tracked fields on a linked article. This object is available in API version 37.0 and later.

### [ListView](#)

Represents a list view. A list view specifies a set of records for an object, based on specific criteria. This object is available in API version 32.0 and later.

### [ListViewChart](#)

Represents a graphical chart that's displayed on Salesforce1 list views. The chart aggregates data that is filtered based on the list view that's currently displayed. This object is available in API version 33.0 and later.

### [ListViewChartInstance](#)

Retrieves metadata for all standard and custom charts for a given entity in context of a given list view. This object is available in API versions 34.0 and later.

### [LiveAgentSession](#)

This object is automatically created for each Live Agent session and stores information about the session. This object is available in API versions 28.0 and later.

### [LiveAgentSessionHistory](#)

This object is automatically created for each Live Agent session and stores information about changes made to the session. This object is available in API versions 28.0 and later.

### [LiveAgentSessionOwnerSharingRule](#)

Represents the rules for sharing a Live Agent session record with users other than the record owner. This object is available in API version 28.0 and later.

### [LiveAgentSessionShare](#)

This object is automatically created for each Live Agent session and stores information about the session. This object is available in API versions 28.0 and later.

### [LiveChatBlockingRule](#)

Represents a rule for blocking chat visitors' IP addresses from starting new chats with agents. This object is available in API version 34.0 and later.

### [LiveChatButton](#)

Represents a button that allows visitors to request chats with Live Agent users. This object is available in API version 24.0 and later.

### [LiveChatButtonDeployment](#)

Associates a Live Agent automated chat invitation with a specific deployment. This object is available in API versions 28.0 and later.

## Standard Objects

### [LiveChatButtonSkill](#)

Represents all the skills available to a LiveChatButton except the one currently assigned. To retrieve the skill currently assigned, query LiveChatButton. This object is available in API version 25.0 and later.

### [LiveChatDeployment](#)

Represents the general settings for deploying Live Agent on a website. This object is available in API version 24.0 and later.

### [LiveChatSensitiveDataRule](#)

Represents a rule for masking or deleting data of a specified pattern. Written as a regular expression (regex). This object is available in API version 35.0 and later.

### [LiveChatTranscript](#)

This object is automatically created for each Live Agent chat session and stores information about the session. This object is available in API version 24.0 and later.

### [LiveChatTranscriptEvent](#)

Captures specific events that occur over the lifetime of a chat. This object is available in API version 24.0 and later.

### [LiveChatTranscriptHistory](#)

Represents changes to field values on a LiveChatTranscript object. This object is available in API version 24.0 and later.

### [LiveChatTranscriptOwnerSharingRule](#)

Represents the rules for sharing a Live Agent chat transcript record with users other than the record owner. This object is available in API version 29.0 and later.

### [LiveChatTranscriptShare](#)

Represents a sharing entry on a LiveChatTranscript object. This object is available in API version 24.0 and later.

### [LiveChatTranscriptSkill](#)

Represents a join between LiveChatTranscript and Skill. This object is available in API version 25.0 and later.

### [LiveChatUserConfig](#)

Represents a setting that controls the console settings for Live Agent users. This object is available in API version 24.0 and later.

### [LiveChatUserConfigProfile](#)

Represents a join between LiveChatUserConfig and Profile. This object is available in API version 24.0 and later.

### [LiveChatUserConfigUser](#)

Represents a join between LiveChatUserConfig and User. This object is available in API version 24.0 and later.

### [LiveChatVisitor](#)

Represents a website visitor who has started or tried to start a chat session. This object is available in API version 24.0 and later.

### [LoginEvent](#)

Represents a trackable user login event in your org. This object is available in API version 36.0 and later.

### [LoginGeo](#)

Represents the geographic location of the user's IP address for a login event. Due to the nature of geolocation technology, the accuracy of geolocation fields (for example, country, city, postal code) may vary. This object is available in API version 34.0 and later.

### [LoginHistory](#)

Represents the login history for all successful and failed login attempts for organizations and enabled portals. This object is available in API version 21.0 and later.

### [LoginIp](#)

Represents a validated IP address. This object is available in version 28.0 and later.

## Standard Objects

### [LookedUpFromActivity](#)

This read-only object is displayed as a related list on an activity record (an event or a task); the list contains records that have custom lookup relationships from the activity to another object. This object is not queryable.

### [MacroInstruction](#)

Represents an instruction in a macro. An instruction can specify the object that the macro interacts with, the context or publisher that the macro works within, the operation or action that the macro performs, and the target of the macro's actions. It is a useful way to programmatically define instructions, instead of using the macro widget in the console.

### [MailmergeTemplate](#)

Represents a mail merge template (a Microsoft Word document) used for performing mail merges for your organization.

### [MatchingRule](#)

Represents a matching rule that is used to identify duplicate records. This object is available in API version 33.0 and later.

### [MatchingRuleItem](#)

Represents criteria used by a matching rule to identify duplicate records. This object is available in API version 33.0 and later.

### [MetadataPackage](#)

Represents a managed or unmanaged package that has been developed in the org you're logged in to.

### [MetadataPackageVersion](#)

Represents a package version (managed or unmanaged) that has been uploaded from the org you're logged in to.

### [Metric](#)

The Metric object represents the components of a goal metric such as its name, metric type, and current value.

### [MetricDataLink](#)

The link between the metric and the data source, such as a report.

### [MetricDataLinkHistory](#)

This read-only object contains historical information about changes that have been made to the MetricDataLink object.

### [MetricFeed](#)

Represents a single feed item in the feed displayed on a Metric record.

### [MetricHistory](#)

This read-only object contains historical information about changes that have been made to the Metric object.

### [MetricsDataFile](#)

Represents a data file containing usage metrics on all installations of a managed package in a Salesforce instance. This object is available in API version 30.0 and later.

### [MetricShare](#)

Represents a sharing entry on a Metric object.

### [MilestoneType](#)

Represents a milestone (required step in a customer support process). This object is available in API version 18.0 and later.

### [Name](#)

Non-queryable object that provides information about foreign key traversals when the foreign key has more than one parent.

### [NamedCredential](#)

Represents a named credential, which specifies the URL of a callout endpoint and its required authentication parameters in one definition. A named credential can be specified as an endpoint to simplify the setup of authenticated callouts. This object is available in API version 33.0 and later.

## Standard Objects

### [NavigationLinkSet](#)

Represents the navigation menu in a community. A navigation menu consists of items that users can click to go to other parts of the community. This object is available in API version 36.0 and later.

### [NavigationMenuItem](#)

Represents a single menu item in a [NavigationLinkSet](#). Use this object to create, delete, or update menu items in your community's navigation menu. This object is available in API version 36.0 and later.

### [NavigationMenuItemLocalization](#)

Represents the translated value of a navigation menu item in a community. This object is available in API version 36.0 and later.

### [Network](#)

Represents a community, which is a customizable public or private space where employees, end-customers, and partners can collaborate on best practices and business processes. Communities give you the opportunity to share information, records, and files with coworkers and related external stakeholders all in one place. This object is available in API version 26.0 and later.

### [NetworkActivityAudit](#)

Represents an audit trail of moderation actions in Communities. This object is available in API version 30.0 and later.

### [NetworkMember](#)

Represents a member of a community. Members can be either users in your company or external users with portal profiles. This object is available in API version 26.0 and later.

### [NetworkMemberGroup](#)

Represents a group of members in a community. Members can be either users in your internal organization or external users assigned portal profiles. An administrator adds members to a community by adding a profile or a permission set, and any user with the profile or permission set becomes a member of the community. This object is available in API version 26.0 and later.

### [NetworkModeration](#)

Represents a flag on an item in a community. This object is available in API version 30.0 and later.

### [NetworkPageOverride](#)

Represents information about custom pages used to override the default pages in communities. You can create Community Builder (Site.com Studio) or Visualforce pages and override the default pages in a community. Using custom pages allows you to create a more personalized experience for your users. This object is available in API version 34.0 and later.

### [NetworkSelfRegistration](#)

Represents the account that self-registering community members are associated with by default. Self-registering users in a community are required to be associated with an account, which the administrator must specify while setting up self-registration for the community. If an account isn't specified, Salesforce creates person accounts (when enabled) for self-registering users. This object is available in API version 34.0 and later.

### [NewsFeed](#)

Represents a single feed item on a user's home tab. A Chatter feed shows recent changes to records that the user is following.

### [Note](#)

Represents a note, which is text associated with a custom object or a standard object, such as a Contact, Contract, or Opportunity.

### [OAuthToken](#)

Represents an OAuth access token for connected app authentication and can be used to create a user interface for token management. This object is available in API version 32.0 and later.

### [NoteAndAttachment](#)

This read-only object contains all notes and attachments associated with an object.

### [NoteTag](#)

Associates a word or short phrase with a Note.

## Standard Objects

### [ObjectPermissions](#)

Represents the enabled object permissions for the parent PermissionSet. This object is available in API version 24.0 and later.

### [ObjectTerritory2AssignmentRule](#)

Represents a territory assignment rule that's associated with an object, such as Account. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule is `null`. Available only if Enterprise Territory Management has been enabled for your organization.

### [ObjectTerritory2AssignmentRuleItem](#)

A single row of selection criteria for an ObjectTerritory2AssignmentRule object. ObjectTerritory2AssignmentRuleItem can only be created or deleted if the BooleanFilter field on its corresponding ObjectTerritory2AssignmentRule object is a `null` value. Available only if Enterprise Territory Management has been enabled for your organization.

### [ObjectTerritory2Association](#)

Represents an association (by assignment) between a territory and an object record, such as an account. Available only if Enterprise Territory Management has been enabled for your Salesforce org.

### [OpenActivity](#)

This read-only object is displayed in a related list of open activities—future events and open tasks—related to an object. It includes activities for all contacts related to the object. OpenActivity fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

### [OperatingHours](#)

Represents the hours in which a service territory, service resource, or account is available for field service work. This object is available in API version 38.0 and later.

### [OperatingHoursFeed](#)

Represents a single feed item on an operating hours record detail page. This object is available in API version 38.0 and later.

### [OperatingHoursHistory](#)

Represents the history of changes made to tracked fields on an operating hours record. This object is available in API version 38.0 and later.

### [Opportunity](#)

Represents an opportunity, which is a sale or pending deal.

### [OpportunityCompetitor](#)

Represents a competitor on an Opportunity.

### [OpportunityContactRole](#)

Represents the role that a Contact plays on an Opportunity.

### [OpportunityFeed](#)

Represents a single feed item in the feed displayed on the detail page for an opportunity record. This object is available in API version 18.0 and later.

### [OpportunityFieldHistory](#)

Represents the history of changes to the values in the fields of an opportunity. This object is available in versions 13.0 and later.

### [OpportunityHistory](#)

Represents the stage history of an Opportunity.

### [OpportunityLineItem](#)

Represents an opportunity line item, which is a member of the list of Product2 products associated with an Opportunity.

### [OpportunityLineItemSchedule](#)

Represents information about the quantity, revenue distribution, and delivery dates for a particular OpportunityLineItem.

## Standard Objects

### [OpportunityOverride](#)

Represents a forecast override of an Opportunity. This read-only object is specific to customizable forecasting. It has a parent-child relationship with LineitemOverride.

### [OpportunityOwnerSharingRule](#)

Represents a rule for sharing an opportunity with users other than the owner.

### [OpportunityPartner](#)

This read-only object represents a partner relationship between an Account and an Opportunity. This object is automatically created when a Partner object is created for a partner relationship between an account and an opportunity.

### [OpportunityShare](#)

Represents a sharing entry on an Opportunity.

### [OpportunitySplit](#)

OpportunitySplit credits one or more opportunity team members with a portion of the opportunity amount. This object is available in API version 16.0 and later for pilot customers, and version 28.0 and later for others.

### [OpportunitySplitType](#)

OpportunitySplitType provides unique labels and behavior for each split type. This object is available in API version 28.0 and later.

### [OpportunityStage](#)

Represents the stage of an Opportunity in the sales pipeline, such as New Lead, Negotiating, Pending, Closed, and so on.

### [OpportunityTag](#)

Associates a word or short phrase with an Opportunity.

### [OpportunityTeamMember](#)

Represents a User on the opportunity team of an Opportunity.

### [Order](#)

Represents an order associated with a contract or an account.

### [OrderFeed](#)

Represents a single feed item in the feed displayed on an order.

### [OrderHistory](#)

Represents historical information about changes that have been made to the standard fields of the associated order, or to any custom fields with history tracking enabled.

### [OrderItem](#)

Represents an order product that your organization sells.

### [OrderItemFeed](#)

Represents a single feed item in the feed displayed on the detail page for an order product record.

### [OrderItemHistory](#)

Represents the history of changes to the values in the fields of an order product.

### [OrderOwnerSharingRule](#)

Represents a rule which determines order sharing access for the order's owners.

### [Organization](#)

Represents key configuration information for an organization.

### [OrgWideEmailAddress](#)

Represents an organization-wide email address for user profiles.

## Standard Objects

### [OwnedContentDocument](#)

Represents a file owned by a user. This object is available in version 30.0 and later.

### [PackageLicense](#)

Represents a license for an installed managed package. This object is available in API version 31.0 and later.

### [PackagePushError](#)

Represents an error encountered during a push request. The number of PackagePushError records created depends on the number of push jobs in the request that result in an error.

### [PackagePushJob](#)

Represents an individual push job for upgrading a package in an org from one version to another version. There can be multiple push jobs created for one push request. For example, if you want to upgrade five orgs as part of one push, you have one PackagePushRequest record and five PackagePushJob records.

### [PackagePushRequest](#)

Represents the push request for upgrading a package in one or many orgs from one version to another version.

### [PackageSubscriber](#)

Represents an installation of a package in an org. This object contains installation information for managed packages developed in the org you're logged in to.

### [Partner](#)

Represents a partner relationship between two Account records or between an Opportunity and an Account.

### [PartnerNetworkConnection](#)

Represents a Salesforce to Salesforce connection between Salesforce organizations.

### [PartnerNetworkRecordConnection](#)

Represents a record shared between Salesforce organizations using Salesforce to Salesforce.

### [PartnerNetworkSyncLog](#)

Represents the Org Sync Log tab in Salesforce, where Salesforce administrators can track the replication of record inserts and updates being performed in Organization Sync. The Connection Detail page for the replication connection also displays the Org Sync Log's twenty most recent entries, and provides a link to the log.

### [PartnerRole](#)

Represents a role for an account Partner, such as consultant, supplier, and so on.

### [Period](#)

Represents a fiscal period defined in FiscalYearSettings.

### [PermissionSet](#)

Represents a set of permissions that's used to grant additional access to one or more users without changing their profile or reassigning profiles. This object is available in API version 22.0 and later.

### [PermissionSetAssignment](#)

Represents the association between a User and a PermissionSet. This object is available in API version 22.0 and later.

### [PermissionSetLicense](#)

Represents a license that's used to enable one or more users to receive a specified permission without changing their profile or reassigning profiles. You can use permission set licenses to grant access, but not to deny access. This object is available in API version 29.0 and later.

### [PermissionSetLicenseAssign](#)

Represents the association between a User and a PermissionSetLicense. This object is available in API version 29.0 and later.

## Standard Objects

### [PlatformAction](#)

PlatformAction is a virtual read-only object. It enables you to query for actions displayed in the UI, given a user, a context, device format, and a record ID. Examples include standard and custom buttons, quick actions, and productivity actions.

### [PresenceUserConfig](#)

Represents a configuration that determines a presence user's settings. This object is available in API version 32.0 and later.

### [PresenceUserConfigProfile](#)

Represents a configuration that determines the settings that are assigned to presence users who are assigned to a specific profile. User-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

### [PresenceUserConfigUser](#)

Represents a configuration that determines the settings that are assigned to a presence user. These user-level configurations override profile-level configurations. This object is available in API version 32.0 and later.

### [Pricebook2](#)

Represents a price book that contains the list of products that your org sells.

### [Pricebook2History](#)

Represents historical information about changes that have been made to the standard fields of the associated Pricebook2, or to any custom fields with history tracking enabled. This object is available in API version 38.0 and later.

### [PricebookEntry](#)

Represents a product entry (an association between a Pricebook2 and Product2) in a price book.

### [ProcessDefinition](#)

Represents the definition of a single approval process.

### [ProcessInstance](#)

Represents an instance of a single, end-to-end approval process. Use this and the node, step, and workitem process instance objects to create approval history reports.

### [ProcessInstanceHistory](#)

This read-only object shows all steps and pending approval requests associated with an approval process (ProcessInstance).

### [ProcessInstanceStep](#)

Represents one work item in an approval process (ProcessInstance).

### [ProcessInstanceNode](#)

Represents a step in an instance of an approval process. Compare to ProcessNode, which describes the step in a process definition. Use this object to retrieve approval history.

### [ProcessInstanceWorkitem](#)

Represents a user's pending approval request.

### [ProcessNode](#)

Describes a step in a process definition. Compare to ProcessInstanceNode, which describes the step in a running process.

### [Product2](#)

Represents a product that your org sells.

### [Product2Feed](#)

Represents a single feed item in the feed displayed on the detail page for a product record. This object is available in API version 18.0 and later.

### [ProductEntitlementTemplate](#)

Represents predefined terms of customer support (Entitlement) that users can add to products (Product2).

## Standard Objects

### [Profile](#)

Represents a profile, which defines a set of permissions to perform different operations, such as querying, adding, updating, or deleting information.

### [ProfileSkill](#)

Represents a profile skill, which describes a user's professional knowledge. This is a global record for the organization, and users are associated through the ProfileSkillUser object.

### [ProfileSkillEndorsement](#)

Represents a detail relationship of ProfileSkillUser. An endorsement of a profile skill shows approval and support of another user's publicly declared skill.

### [ProfileSkillEndorsementFeed](#)

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillEndorsement record. This object is available in API version 34.0 and later.

### [ProfileSkillEndorsementHistory](#)

Represents the history of changes to the fields of a ProfileSkillEndorsement.

### [ProfileSkillFeed](#)

Represents a single feed item in the feed displayed on the detail page for a profile skill.

### [ProfileSkillHistory](#)

Represents the history of changes to the fields of a ProfileSkill.

### [ProfileSkillShare](#)

Represents a sharing entry on a ProfileSkill.

### [ProfileSkillUser](#)

Represents a detail relationship of User. The object connects profile skills with users.

### [ProfileSkillUserFeed](#)

Represents a single feed item in the feed displayed on the detail page for a ProfileSkillUser record. This object is available in API version 34.0 and later.

### [ProfileSkillUserHistory](#)

Represents the history of changes to the fields of a ProfileSkillUser.

### [PushTopic](#)

### [QuantityForecast](#)

Represents a quantity-based forecast.

### [QuantityForecastHistory](#)

Represents historical information about quantity-based forecasts that have been submitted (saved) in the user interface.

### [QueueRoutingConfig](#)

Represents the settings that determine how work items are routed to agents. This object is available in API version 32.0 and later.

### [Question](#)

Represents a question in a community that users can view and reply to.

### [QuestionDataCategorySelection](#)

A data category selection represents a data category that classifies a question.

### [QuestionReportAbuse](#)

Represents a user-reported abuse on a Question in a Chatter Answers community. This object is available in API version 24.0 and later.

## Standard Objects

### [QuestionSubscription](#)

Represents a subscription for a user following a Question. This object is available in API version 24.0 and later.

### [QueueSubject](#)

Represents the mapping between a queue Group and the sObject types associated with the queue, including custom objects.

### [QuickText](#)

This object stores a snippet of text that allows an agent to send a quick response to a customer in the Live Agent console. This object is available in API version 24.0 and later.

### [QuickTextHistory](#)

Represents changes to field values on a QuickText object. This object is available in API version 24.0 and later.

### [QuickTextOwnerSharingRule](#)

Represents a rule for sharing a QuickText object with users other than the owner.

### [QuickTextShare](#)

Represents a sharing entry on a QuickText object. This object is available in API version 24.0 and later.

### [Quote](#)

The Quote object represents a quote, which is a record showing proposed prices for products and services. Available in API version 18.0 and later.

### [QuoteDocument](#)

Represents a quote in document format. Available in API version 18.0 and later.

### [QuoteLineItem](#)

The QuoteLineItem object represents a quote line item, which is a member of the list of Product2 products associated with a Quote, along with other information about those line items on that quote. Available in API version 18.0 and later.

### [RecentlyViewed](#)

Represents records that the current user has recently viewed or referenced (by viewing a related record).

### [RecordType](#)

Represents a record type.

### [RecordTypeLocalization](#)

Represents the translated value of a label for a record type when the Translation Workbench is enabled for your organization.

### [Reply](#)

Represents a reply that a user has submitted to a question in an answers community.

### [ReplyReportAbuse](#)

Represents a user-reported abuse on a Reply in a Chatter Answers community. This object is available in API version 24.0 and later.

### [Report](#)

Represents a report, a set of data that meets certain criteria, displayed in an organized way. Access is read-only. This object is available in API version 20.0 and later.

### [ReportFeed](#)

Represents a single feed item in the feed displayed on a report. This object is available in API version 20.0 and later.

### [ReportTag](#)

Associates a word or short phrase with a Report. This object is available in API version 20.0 and later.

### [ReputationLevel](#)

Represents a reputation level defined for a community. This object is available in API version 32.0 and later.

## Standard Objects

### [ReputationLevelLocalization](#)

Represents the translated value of a reputation level. Reputation level localization only applies for reputation levels in communities. This object is available in API version 35.0 and later.

### [ReputationPointsRule](#)

Represents the reputation point rules for a community. Each rule specifies an action that community members can earn points from and the points associated with those actions in a particular community. This object is available in API version 32.0 and later.

### [ResourceAbsence](#)

Represents a time period in which a service resource is unavailable to work. This object is available in API version 38.0 and later.

### [ResourceAbsenceFeed](#)

Represents a single feed item on a resource absence record detail page. This object is available in API version 38.0 and later.

### [ResourceAbsenceHistory](#)

Represents the history of changes made to tracked fields on a resource absence. This object is available in API version 38.0 and later.

### [RevenueForecast](#)

Represents a revenue-based forecast.

### [RevenueForecastHistory](#)

Represents historical information about revenue-based forecasts that have been submitted (saved) in the user interface.

### [RuleTerritory2Association](#)

Represents a record-assignment rule and its association to an object, such as Account. Available only if Enterprise Territory Management has been enabled for your organization.

### [SamlSsoConfig](#)

Represents a SAML Single Sign-On configuration. This object is available in API version 32.0 and later.

### [Scontrol](#)

A custom s-control, which is custom content that is hosted by the system but executed by the client application.

### [ScontrolLocalization](#)

The translated value of the field label for an s-control.

### [SearchPromotionRule](#)

Represents a promoted search term, which is one or more keywords that you associate with a Salesforce Knowledge article. When a user's search query includes these keywords, the associated article is returned first in search results. This object is available in API version 31.0 and later.

### [SecureAgent](#)

Represents a Secure Agent that connects Salesforce to on-premises external data sources like SharePoint 2010 and 2013. This object is available in API version 32.0 and later.

### [SecureAgentsCluster](#)

Represents a cluster consisting of several Secure Agents on different servers. Clusters provide failover protection if an agent on a particular server becomes inaccessible. This object is available in API version 35.0 and later.

### [SelfServiceUser](#)

Represents a Contact who has been enabled to use your organization's Self-Service portal, where he or she can obtain online support.

### [ServiceAppointment](#)

Represents an appointment to complete field service work for a customer. This object is available in API version 38.0 and later.

### [ServiceAppointmentFeed](#)

Represents a single feed item on a service appointment record detail page. This object is available in API version 38.0 and later.

## Standard Objects

### [ServiceAppointmentHistory](#)

Represents the history of changes made to tracked fields on a service appointment. This object is available in API version 38.0 and later.

### [ServiceAppointmentOwnerSharingRule](#)

Represents the rules for sharing a service appointment with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

### [ServiceAppointmentShare](#)

Represents a sharing entry on a service appointment. This object is available in API version 38.0 and later.

### [ServiceChannel](#)

Represents a channel of work items that are received from your organization—for example, cases, chats, or leads. This object is available in API version 32.0 and later.

### [ServiceChannelStatus](#)

Represents the status that's associated with a specific service channel. This object is available in API version 32.0 and later.

### [ServiceContract](#)

Represents a customer support contract (business agreement). This object is available in API version 18.0 and later.

### [ServiceContractFeed](#)

Represents a single feed item in the feed displayed on the detail page for a service contract record. This object is available in API version 23.0 and later.

### [ServiceContractHistory](#)

Represents the history of changes to the values in the fields on a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

### [ServiceContractOwnerSharingRule](#)

Represents the rules for sharing a ServiceContract (customer service agreement) with users other than the owner. This object is available in API version 18.0 and later.

### [ServiceContractShare](#)

Represents a sharing entry on a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

### [ServicePresenceStatus](#)

Represents a presence status that can be assigned to a service channel. This object is available in API version 32.0 and later.

### [ServiceResource](#)

Represents a service technician or dispatcher in field service. This object is available in API version 38.0 and later.

### [ServiceResourceCapacity](#)

Represents the maximum number of scheduled hours or number of service appointments that a capacity-based service resource can complete within a specific time period. This object is available in API version 38.0 and later.

### [ServiceResourceCapacityFeed](#)

Represents a single feed item on a service resource capacity record detail page. This object is available in API version 38.0 and later.

### [ServiceResourceCapacityHistory](#)

Represents the history of changes made to tracked fields on a service resource capacity record. This object is available in API version 38.0 and later.

### [ServiceResourceFeed](#)

Represents a single feed item on a service resource record detail page. This object is available in API version 38.0 and later.

### [ServiceResourceHistory](#)

Represents the history of changes made to tracked fields on a service resource. This object is available in API version 38.0 and later.

## Standard Objects

### [ServiceResourceOwnerSharingRule](#)

Represents the rules for sharing a service resource with user records other than the owner or anyone above the owner in the role hierarchy. This object is available in API version 38.0 and later.

### [ServiceResourceShare](#)

Represents a sharing entry on a service resource. This object is available in API version 38.0 and later.

### [ServiceResourceSkill](#)

Represents a skill that a service resource possesses. This object is available in API version 38.0 and later.

### [ServiceResourceSkillFeed](#)

Represents a single feed item on a service resource skill record detail page. This object is available in API version 38.0 and later.

### [ServiceResourceSkillHistory](#)

Represents the history of changes made to tracked fields on a service resource skill. This object is available in API version 38.0 and later.

### [ServiceTerritory](#)

Represents a region in which field service work can be performed. This object is available in API version 38.0 and later.

### [ServiceTerritoryFeed](#)

Represents a single feed item on a service territory record detail page. This object is available in API version 38.0 and later.

### [ServiceTerritoryHistory](#)

Represents the history of changes made to tracked fields on a service territory. This object is available in API version 38.0 and later.

### [ServiceTerritoryMember](#)

Represents a service resource who is able to be assigned to service appointments in the service territory. This object is available in API version 38.0 and later.

### [ServiceTerritoryMemberFeed](#)

Represents a single feed item on a service territory member record detail page. This object is available in API version 38.0 and later.

### [ServiceTerritoryMemberHistory](#)

Represents the history of changes made to tracked fields on a service territory member. This object is available in API version 38.0 and later.

### [SessionPermSetActivation](#)

The SessionPermSetActivation object represents a permission set assignment activated during an individual user session. When a SessionPermSetActivation object is inserted into a permission set, an activation event fires, allowing the permission settings to apply to the user's specific session. This object is available in API versions 37.0 and later as part of the Session-Based Permission Sets Developer Preview.

### [SetupAuditTrail](#)

Represents changes you or other admins made in your org's Setup area for at least the last 180 days. This object is available in API version 15.0 and later.

### [SetupEntityAccess](#)

Represents the enabled setup entity access settings (such as for Apex classes) for the parent PermissionSet. This object is available in API version 25.0 and later.

### [SignupRequest](#)

Represents a request for a new Trialforce sign-up. This object is available in API version 27.0 and later.

### [Site](#)

Represents a public website that is integrated with an Organization. This object is generally available in API version 16.0 and later.

## Standard Objects

### [SiteDomain](#)

SiteDomain is a read-only object, and a one-to-many replacement for the Site.TopLevelDomain field. This object is available in API version 21.0, and has been deprecated as of API version 26.0. In API version 26.0 and later, use the [Domain](#) and [DomainSite](#) objects instead.

### [SiteHistory](#)

Represents the history of changes to the values in the fields of a site. This object is generally available in API version 18.0 and later.

### [Skill](#)

Represents a category or group that Live Agent users or field service resources can be assigned to. This object is available in API version 24.0 and later.

### [SkillProfile](#)

Represents a join between Skill and Profile. This object is available in API version 24.0 and later.

### [SkillRequirement](#)

Represents a skill that is required to complete a particular task. Skill requirements can be added to work types, work orders, and work order line items. This object is available in API version 38.0 and later.

### [SkillRequirementFeed](#)

Represents a single feed item on a skill requirement record detail page. This object is available in API version 38.0 and later.

### [SkillRequirementHistory](#)

Represents the history of changes made to tracked fields on a skill requirement. This object is available in API version 38.0 and later.

### [SkillUser](#)

Represents a join between Skill and User. This object is available in API version 24.0 and later.

### [SlaProcess](#)

Represents an entitlement process associated with an Entitlement. This object is available in API version 19.0 and later.

### [Solution](#)

Represents a detailed description of a customer issue and the resolution of that issue.

### [SolutionFeed](#)

Represents a single feed item in the feed displayed on the detail page for a solution record. This object is available in API version 18.0 and later.

### [SolutionHistory](#)

Represents the history of changes to the values in the fields of a solution.

### [SolutionStatus](#)

Represents the status of a Solution, such as Draft, Reviewed, and so on.

### [SolutionTag](#)

Associates a word or short phrase with a Solution.

### [SOSDeployment](#)

Represents the general settings for deploying SOS video call capability in a native mobile application. This object is available in API version 34.0 and later.

### [SOSSession](#)

This object is automatically created for each SOS session and stores information about the session. This object is available in API versions 34.0 and later.

### [SOSSessionActivity](#)

Captures information about specific events that occur during an SOS video call, such as when an SOS call begins or ends. This object is available in API version 34.0 and later.

## Standard Objects

### [SOSSessionHistory](#)

This object is automatically created for each SOS session and stores information about changes made to the session. This object is available in API versions 34.0 and later.

### [SOSSessionOwnerSharingRule](#)

Represents the rules for sharing an SOS session record with users other than the record owner. This object is available in API version 34.0 and later.

### [SOSSessionShare](#)

Represents a sharing entry on an SOS session. This object is available in API version 34.0 and later.

### [StaticResource](#)

Represents a static resource that can be used in Visualforce markup.

### [StreamingChannel](#)

### [TagDefinition](#)

Defines the attributes of child Tag objects.

### [Task](#)

Represents a business activity such as making a phone call or other to-do items. In the user interface, Task and Event records are collectively referred to as activities.

### [TaskFeed](#)

Represents a single feed item in the feed on a Task. This object is available in API version 20.0 and later.

### [TaskPriority](#)

Represents the importance or urgency of a Task, such as High, Normal, or Low.

### [TaskRelation](#)

Represents the relationship between a task and a lead, contacts, and other objects related to the task. If Shared Activities is enabled, this object doesn't support triggers, workflow, or data validation rules. This object is available in API version 24.0 and later.

### [TaskStatus](#)

Represents the status of a Task, such as Not Started, Completed, or Closed.

### [TaskTag](#)

Associates a word or short phrase with a Task.

### [TaskWhoRelation](#)

Represents the relationship between a task and a lead or contacts. This object is available in API version 29.0 and later.

### [TenantSecret](#)

This object stores an encrypted organization-specific key fragment that is used with the master secret to produce organization-specific data encryption keys. This object is available in API version 34.0 and later.

### [Territory](#)

Represents a flexible collection of accounts and users where the users have at least read access to the accounts, regardless of who owns the accounts. Only available if territory management has been enabled for your organization.

### [Territory2](#)

Represents a sales territory. Available only if Enterprise Territory Management has been enabled for your organization.

### [Territory2Model](#)

Represents a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

### [Territory2ModelHistory](#)

Represents the history of changes to the values in the fields on a territory model. Available only if Enterprise Territory Management has been enabled for your organization.

## Standard Objects

### [Territory2Type](#)

Represents a category for territories (Territory2). Every Territory2 must have a Territory2Type. Available only if Enterprise Territory Management has been enabled for your organization.

### [TestSuiteMembership](#)

Associates an Apex class with an ApexTestSuite. This object is available in API version 36.0 and later.

### [ThirdPartyAccountLink](#)

Represents the list of external users who authenticated using an Auth. Provider. This object is available in API version 32.0 and later.

### [TimeSlot](#)

Represents a period of time on a specified day of the week during which field service work can be performed. Operating hours consist of one or more time slots. This object is available in API version 38.0 and later.

### [TimeSlotHistory](#)

Represents the history of changes made to tracked fields on a time slot. This object is available in API version 38.0 and later.

### [Topic](#)

Represents a topic on a Chatter post or record. This object is available in API version 28.0 and later.

### [TopicAssignment](#)

Represents the assignment of a topic to a specific feed item, record, or file. This object is available in API version 28.0 and later.

### [TopicFeed](#)

Represents a single feed item on a topic page. This object is available in API version 29.0 and later.

### [TopicLocalization—Beta](#)

Represents the translated version of a topic name. Topic localization applies only to navigational and featured topics in communities. This object is available in API version 33.0 and later.

### [TwoFactorInfo](#)

Stores a user's secret for two-factor operations. Use this object when customizing two-factor authentication in your organization. This object is available in API version 32.0 and later.

### [TwoFactorMethodsInfo](#)

Stores information about which identity verification methods a user has registered. This object is available in API version 37.0 and later.

### [TwoFactorTempCode](#)

Stores information about a user's temporary identity verification code. This object is available in API version 37.0 and later.

### [UndecidedEventRelation](#)

Represents invitees with the status `Not Responded` for a given event. This object is available in API versions 29.0 and later.

### [User](#)

Represents a user in your organization.

### [UserAccountTeamMember](#)

Represents a User on the default account team of another User.

### [UserAppInfo](#)

Stores the last Lightning app logged in to. This object is available in API version 38.0 and later.

### [UserAppMenuCustomization](#)

Represents an individual user's settings for items in the Force.com app menu or App Launcher. This object is available in API version 35.0 and later.

## Standard Objects

### [UserAppMenuCustomizationShare](#)

Represents a sharing entry on a UserAppMenuCustomization record. This object is available in API version 35.0 and later.

### [UserAppMenuItem](#)

Represents the organization-wide settings for items in the Force.com app menu or App Launcher that the requesting user has access to in Setup. This object is available in API version 35.0 and later.

### [UserConfigTransferButton](#)

Represents the association between a Live Agent configuration and a live chat button. This association allows users associated with a specific configuration to transfer chats to a button queue.

### [UserConfigTransferSkill](#)

Represents the association between a Live Agent configuration and a skill. This association allows users associated with a specific configuration to transfer chats to agents who have that skill.

### [UserCustomBadge](#)

Represents a custom badge for a user. This object is available in API version 38.0 and later.

### [UserCustomBadgeLocalization](#)

Represents the translated version of a custom badge for a user. This object is available in API version 38.0 and later.

### [UserFeed](#)

Represents a single feed item in the feed displayed on a Chatter user profile feed. A user profile feed shows changes to a user record for fields that are tracked in feeds, and posts and comments about the record. This object is available in API version 18.0 and later.

### [UserLicense](#)

Represents a user license in your organization. A user license entitles a user to specific functionality and determines the profiles and permission sets available to the user.

### [UserLogin](#)

Represents the settings that affect a user's ability to log into an organization. To access this object, you need the `UserPermissions.ManageUsers` permission. This object is available in API version 29.0 and later.

### [UserMembershipSharingRule](#)

Represents the rules for sharing user records from a source group to a target group. A user record contains details about a user. Users who are members of the source group can be shared with members of the target group. The source and target groups can be based on roles, portal roles, public groups, or territories. This object is available in API version 26.0 and later.

### [UserPackageLicense](#)

Represents a license for an installed managed package, assigned to a specific user. This object is available in API version 31.0 and later.

### [UserPreference](#)

Represents a functional preference for a specific user in your organization.

### [UserProfile](#)

Represents a Chatter user profile.

### [UserProfileFeed](#)

Represents a user profile feed, which tracks all actions by a user on records that can be tracked in a feed. This feed is displayed on the user profile page.

### [UserProvAccount](#)

Represents information that links a Salesforce user account with an account in a third-party (target) system, such as Google, for users of connected apps with Salesforce user provisioning enabled. This object is available in API version 33.0 and later.

## Standard Objects

### [UserProvAccountStaging](#)

Temporarily stores user account information while a user completes the User Provisioning Wizard. This information that is stored in the UserProvAccount object when you click the button to collect and analyze accounts on the target system.

### [UserProvMockTarget](#)

Represents an entity for testing user data before committing the data to a third-party system for user provisioning.

### [UserProvisioningConfig](#)

Represents information for a flow to use during a user provisioning request process, such as the attributes for an update. This object is available in API version 34.0 and later.

### [UserProvisioningLog](#)

Represents messages generated during the process of provisioning users for third-party applications. This object is available in API version 33.0 and later.

### [UserProvisioningRequest](#)

Represents an individual provisioning request to create, update, or delete a single user account in a third-party service system (or another Salesforce organization). This object is available in API version 33.0 and later.

### [UserProvisioningRequestOwnerSharingRule](#)

Represents a rule for sharing a UserProvisioningRequest object with users other than the owner. This object is available in API version 34.0 and later.

### [UserProvisioningRequestShare](#)

Represents a sharing entry on a UserProvisioningRequest record. This object is available in API version 34.0 and later.

### [UserRecordAccess](#)

Represents a user's access to a set of records. This object is read only and is available in API version 24.0 and later.

### [UserRole](#)

Represents a user role in your organization.

### [UserServicePresence](#)

Represents a presence user's real-time presence status. This object is available in API version 32.0 and later.

### [UserShare](#)

Represents a sharing entry on a user record. This object is available in API version 26.0 and later.

### [UserTeamMember](#)

Represents a single User on the default opportunity team of another User.

### [UserTerritory](#)

Represents a User who has been assigned to a Territory.

### [UserTerritory2Association](#)

Represents an association (by assignment) between a territory and a user record. Available only if Enterprise Territory Management has been enabled for your organization.

### [VerificationHistory](#)

Represents the past six months of your org users' attempts to verify their identity. This object is available in API version 36.0 and later.

### [Vote](#)

Represents a vote that a user has made on an Idea or a Reply.

### [WebLink](#)

Represents a custom link to a URL or Scontrol.

## Standard Objects

### [WebLinkLocalization](#)

Represents the translated value of the field label for a custom link to a URL or s-control when the Translation Workbench is enabled for your organization.

### [WorkAccess](#)

Used to grant or restrict user access to give badge definitions. Each badge definition record must have one WorkAccess record.

### [WorkAccessShare](#)

Used to control Givers of WorkBadgeDefinition records.

### [WorkBadge](#)

Represents information about who the badge was given to and which badge was given. A WorkBadge record is created for each recipient of a WorkBadgeDefinition.

### [WorkBadgeDefinition](#)

Represents the attributes of a badge including the badge name, description, and image. Each WorkBadge record must have a lookup to a WorkBadgeDefinition since badge attributes (like badge name) are derived from the WorkBadgeDefinition object.

### [WorkBadgeDefinitionHistory](#)

Represents the history of changes to the values in the fields of a WorkBadgeDefinition object.

### [WorkBadgeDefinitionShare](#)

Represents a sharing entry on a WorkBadgeDefinition object.

### [WorkCoaching](#)

Represents a single coaching relationship between two users. One of the users is defined as the coach and the other is defined as a coachee. WorkCoaching is feed-enabled so there is a private feed available to the coach and coachee.

### [WorkCoachingFeed](#)

Represents a single feed item in the feed on the detail page for a coaching record.

### [WorkCoachingHistory](#)

Represents the history of changes to the values in the fields of a WorkCoaching object.

### [WorkCoachingShare](#)

Represents a sharing entry on a WorkCoaching object.

### [WorkFeedback](#)

Represents the answer to a question that a person was asked via a feedback request. Also used to store offered feedback without linking it to a particular question.

### [WorkFeedbackHistory](#)

Represents the history of changes to the values in the fields of a WorkFeedback object. Access is read-only.

### [WorkFeedbackQuestion](#)

Represents a free-form text type or multiple choice question within a set of questions.

### [WorkFeedbackQuestionHistory](#)

Represents the history of changes to the values in the fields of a WorkFeedbackQuestion.

### [WorkFeedbackQuestionSet](#)

Represents a set of questions being asked. The question set is used to link all the individual requests where different recipients were asked the same set of questions on the same subject.

### [WorkFeedbackQuestionSetHistory](#)

Represents the history of changes to the values in the fields of a WorkFeedbackQuestionSet object. Access is read-only.

## Standard Objects

### [WorkFeedbackQuestionSetShare](#)

Represents a sharing entry on a [WorkFeedbackQuestionSet](#).

### [WorkFeedbackQuestionShare](#)

Represents a sharing entry on a [WorkFeedbackQuestion](#).

### [WorkFeedbackRequest](#)

Represents a single feedback request on a subject or topic (question) to a single recipient in the feedback application. In the case of offered feedback, [WorkFeedbackRequest](#) represents feedback that is offered about a subject. In the performance application, [WorkFeedbackRequest](#) represents a request for feedback on a set of questions from a question set, on a subject—for the recipient to complete and submit.

### [WorkFeedbackRequestFeed](#)

Represents a single feed item in the feed displayed on the feedback request detail page.

### [WorkFeedbackRequestHistory](#)

Represents the history of changes to the values in the fields of a [WorkFeedbackRequest](#).

### [WorkFeedbackRequestShare](#)

Represents a sharing entry on a [WorkFeedbackRequest](#).

### [WorkFeedbackShare](#)

Represents a sharing entry on a [WorkFeedback](#) object.

### [WorkGoal](#)

Represents the components of a goal, such as its description and associated metrics. This object has been deprecated as of API version 35.0. Use the [Goal](#) object to query information about Work.com goals.

### [WorkGoalCollaborator](#)

Represents collaborators on a [WorkGoal](#) object. This doesn't include [WorkGoal](#) followers, which is handled by Chatter Feed Follow functionality. This object has been deprecated as of API version 35.0. Use the [Goal](#) object to query information about Work.com goals.

### [WorkGoalCollaboratorHistory](#)

Represents the history of changes to the values in the fields in a [WorkGoalCollaborator](#) object. Access is read-only.

### [WorkGoalFeed](#)

Represents a single feed item in the feed displayed on the goal page for a [Goal](#) record. The goal feed shows changes to a goal for fields that are tracked in feeds, posts, and comments about the goal, and updates on metrics. This object has been deprecated as of API version 35.0. Use the [GoalFeed](#) object to query information about feed items for Work.com goals.

### [WorkGoalHistory](#)

Represents the history of changes to the values in the fields of a [WorkGoal](#). Access is read-only. This object has been deprecated as of API version 35.0. Use the [GoalHistory](#) object to query historical information for Work.com goals.

### [WorkGoalLink](#)

Represents the relationship between two goals (many to many relationship). This object has been deprecated as of API version 35.0. Use the [GoalLink](#) object to query information about the relationship between two Work.com goals.

### [WorkGoalShare](#)

Represents a sharing entry on a [WorkGoal](#) object. This object has been deprecated as of API version 35.0. Use the [GoalShare](#) object to query information about sharing for Work.com goals.

### [WorkOrder](#)

Represents a task or series of tasks to be performed, typically in field service. This object is available in API version 36.0 and later.

## Standard Objects

### [WorkOrderFeed](#)

Represents a single feed item on a work order record detail page. This object is available in API version 36.0 and later.

### [WorkOrderHistory](#)

Represents the history of changes made to tracked fields on a work order. This object is available in API version 36.0 and later.

### [WorkOrderLineItem](#)

Represents a subtask on a work order, typically in field service. This object is available in API version 36.0 and later.

### [WorkOrderLineItemFeed](#)

Represents a single feed item on a work order line item record detail page. This object is available in API version 36.0 and later.

### [WorkOrderLineItemHistory](#)

Represents the history of changes made to tracked fields on a work order line item. This object is available in API version 36.0 and later.

### [WorkOrderShare](#)

Represents a sharing entry on a work order. This object is available in API version 36.0 and later.

### [WorkPerformanceCycle](#)

Represents feedback that is gathered to assess the performance of a specific set of employees.

### [WorkPerformanceCycleFeed](#)

Represents a single feed item in the feed that is displayed on a Work.com Performance detail page.

### [WorkPerformanceCycleHistory](#)

Represents the history of changes to the values in the fields of a WorkPerformanceCycle object.

### [WorkPerformanceCycleShare](#)

Represents a sharing entry on a WorkPerformanceCycle object.

### [WorkReward](#)

Used to store reward codes tied to a Reward Fund. Reward Funds must have at least one WorkReward record.

### [WorkRewardFund](#)

Represents a Reward Fund and describes the Reward Fund attributes.

### [WorkRewardFundHistory](#)

Represents the history of changes to the values in the fields of a WorkRewardFund object.

### [WorkRewardFundShare](#)

Share records for WorkRewardFund.

### [WorkRewardFundType](#)

Represents the type of WorkRewardFund object.

### [WorkRewardFundTypeHistory](#)

Represents the history of changes to the values in the fields of a WorkRewardFundType object.

### [WorkRewardFundTypeShare](#)

Represents a sharing entry on a WorkRewardFundType.

### [WorkRewardHistory](#)

Represents the history of changes to the fields of a WorkReward.

### [WorkRewardShare](#)

Share records for WorkReward object.

### [WorkThanks](#)

Represents the source and message of a thanks post.

[WorkThanksShare](#)

Share records for WorkThanks object.

[WorkType](#)

Represents a type of work to be performed. Work types are templates that can be applied to work order or work order line items. This object is available in API version 38.0 and later.

[WorkTypeFeed](#)

Represents a single feed item on a work type record detail page. This object is available in API version 38.0 and later.

[WorkTypeHistory](#)

Represents the history of changes made to tracked fields on a work type. This object is available in API version 38.0 and later.

[Reusable Terms for API Objects](#)

## AcceptedEventRelation

---

Represents invitees with the status `Accepted` for a given event.

This object is available in API versions 29.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name                 | Details                                                                                                                                                    |

## Usage

### Query invitees who have accepted an invitation to an event

```
SELECT eventId, type, response FROM AcceptedEventRelation WHERE eventId='00UTD000000ZH5LA'
```

SEE ALSO:

[DeclinedEventRelation](#)

[UndecidedEventRelation](#)

## Account

Represents an individual account, which is an organization or person involved with your business (such as customers, competitors, and partners).

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can access their own accounts and any account shared with them.

## Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                                                                                                               |

## IsPersonAccount Fields

These fields are the subset of person account fields that are contained in the child person contact record of each person account. If the `IsPersonAccount` field has the value `false`, the following fields have a null value and can't be modified. If `true`, the fields contain the value indicated in the Description column in the following table and can be modified.

Person accounts are not enabled by default.

| Field Name          | Details                                                                                                                                                         |

**Note:** If you are importing Account data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

## Usage

Use this object to query and manage accounts in your organization. Client applications can create, update, delete, or query Attachment records associated with an account via the API.

Client applications can also create or update account objects by converting a Lead via the `convertLead()` call.

If the values in the `IsPersonAccount` Fields are not null, you can't change `IsPersonAccount` to `false`, or an error occurs.

## AccountContactRelation

Represents a relationship between a contact and one or more accounts.

This object is available in API version 37.0.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Usage

Use this object to associate a single contact record to multiple account records so you can easily track the relationships between the people and businesses they work with.

## AccountCleanInfo

Stores the metadata Data.com Clean uses to determine an account record's clean status. AccountCleanInfo helps you automate the cleaning or related processing of account records.

Account Clean Info provides a snapshot of the data in your Salesforce account record and its matched Data.com record at the time the Salesforce record was cleaned.

Account Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentState` field. If the `IsDifferentState` field's value is `False`, that means the `State` field value is *the same* on the Salesforce account record and its matched Data.com record.

AccountCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the account record.
- `IsDifferent` indicates whether or not a field on the account record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the account record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the account record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

Their individual bits are defined here.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                     |

|            | <b>Description</b><br>The year the company was established or the year when current ownership or management assumed control of the company. |

## Usage

Administrators can modify a limited set of AccountCleanInfo fields from the Account Clean Info page.

Developers can create triggers that read the Account Clean Info fields to help automate the cleaning or related processing of account records. For example, you might create a trigger that reads the `Clean Status` field on the Account object. If an account record's `Clean Status` field value is `Different` but the record has no `Billing Street` value, the trigger could update the record's status to `Not Compared`.

Create triggers that read AccountCleanInfo fields to help automate the cleaning or related processing of account records. For example:

- Keep account records' status `InSync` if the only difference from matched records is the `Phone` format (for example, `(415) 353-8000` on the account record versus `415 353 8000` on the matched Data.com record).

```
trigger AccountPhoneTrigger on Account (before update) {

    for (Account account: Trigger.new) {
        Account oldAccount = Trigger.oldMap.get(account.ID);
        if (account.CleanStatus == 'Different') {
            List <AccountCleanInfo> cleanInfo = [Select Id, IsDifferentPhone,
            IsReviewedPhone, Phone from AccountCleanInfo where AccountId = :account.Id];
            if (cleanInfo.size() > 0 && cleanInfo[0].IsDifferentPhone &&
            cleanInfo[0].Phone.StartsWith('+')) {
                // if Data.com phone number is marked Different but starts with '+',
            ignore this
                // and set the status to "Reviewed"
                AccountCleanInfo cleanInfoToUpdate = new AccountCleanInfo();
                cleanInfoToUpdate.Id = cleanInfo[0].Id;
                cleanInfoToUpdate.IsReviewedPhone = true;
                update cleanInfoToUpdate;
                account.CleanStatus = 'Reviewed';
            }
        }
    }
}
```

- Create a customized set of `Industry` field values for accounts. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.
- Read the `CleanStatus` field value on the Account object. If that value is `Different`, but a Salesforce record has no street address value, update the record's status to `Not Compared`.

# AccountContactRole

---

Represents the role that a Contact plays on an Account.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

|       | <b>Description</b><br>Specifies whether the Contact plays the primary role on the Account ( <code>true</code> ) or not ( <code>false</code> ). Note that each account has only one primary contact role. Label is <b>Primary</b> . Default value is <code>false</code> .                                                                                                                                                                                                                                                    |
| Role  | <b>Type</b><br>picklist<br><br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><br><b>Description</b><br>Name of the role played by the Contact on this Account, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>AccountId</code> , <code>ContactId</code> , and <code>Role</code> values are identical. Different contacts can play the same role on the same account. A contact can play different roles on the same account. |

## Usage

Use this object to define the role that a Contact plays on a given Account within the context of a specific Opportunity.

[Contact](#)

## AccountFeed

Represents a single feed item on an account record detail page. This object is available in API version 18.0 and later.

An account feed shows changes to an account record for fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to accounts in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Account object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of AccountFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| CommentCount | <p><b>Type</b><br/><a href="#">int</a></p> <p><b>Properties</b><br/><a href="#">Filter</a>, <a href="#">Group</a>, <a href="#">Sort</a></p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## AccountHistory

---

Represents the history of changes to the values in the fields of an account. This object is available in versions 11.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field     | Details                                                                                                                                                                                                                                                        |
|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>The name of the field that was changed.</p>                                                                                    |
| IsDeleted | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter</p> <p><b>Description</b><br/>Indicates whether the object has been moved to the Recycle Bin (<code>true</code>) or not (<code>false</code>). Label is <b>Deleted</b>.</p> |
| AccountId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>ID of the Account. Label is <b>Account ID</b>.</p>                                                                                                 |

| Field    | Details                                                                                                                                     |
|----------|---------------------------------------------------------------------------------------------------------------------------------------------|
| newValue | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The new value of the field that was changed.         |
| oldValue | <b>Type</b><br>anyType<br><b>Properties</b><br>Nillable, Sort<br><b>Description</b><br>The latest value of the field before it was changed. |

## Usage

Use this object to identify changes to an account.

This object respects field level security on the parent object.

SEE ALSO:

[Account](#)

## AccountOwnerSharingRule

Represents the rules for sharing an account with a User other than the owner.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                        | <p><b>Description</b></p> <p>A description of the sharing rule. Maximum size is 1000 characters. This field is available in API version 29.0 and later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| DeveloperName          | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface. This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId                | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>The ID representing the source group. An Account owned by a User in the source Group triggers the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Usage

Use this object to manage the sharing rules for accounts. General sharing and territory management-related sharing use this object. For example, the following code creates an account owner sharing rule between two public groups, which can also contain portal users.

```
AccountOwnerSharingRule rule = new AccountOwnerSharingRule();
rule.setName("RuleName"); // Set the sharing rule name
rule.setDeveloperName("RuleDeveloperName"); // Set the sharing rule developer name
rule.setGroupId("00Gx000000000000"); // Set the group of users to share records from
rule.setUserOrGroupId("00Gx000000000001"); // Set the group of users to share records to
rule.setAccountAccessLevel("Edit");
rule.setOpportunityAccessLevel("Read");
rule.setCaseAccessLevel("None");
connection.create(rule);
```

## AccountPartner

This read-only object represents a partner relationship between two Account objects. It is automatically created when a Partner object is created for a partner relationship between two accounts.

**Note:** This object is completely distinct and independent of Account records that have been enabled for the partner portal.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

## Creating an Account-Account Partner Relationship

When you create a partner relationship between two accounts (when you create a Partner object and specify the `AccountFromId`), the API automatically creates two AccountPartner objects, one for the forward relationship and one for the reverse. For example, if you create a Partner object with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`, the API automatically creates two AccountPartner objects:

- The forward relationship AccountPartner with "Acme, Inc." as the `AccountFromId` and "Acme Consulting" as the `AccountToId`.
- The reverse relationship AccountPartner with "Acme Consulting" as the `AccountFromId` and "Acme, Inc." as the `AccountToId`.
- The value of the `Role` field in the reverse relationship AccountPartner is set to the PartnerRole object `ReverseRole` value associated with the value of the `Role` field in the forward relationship AccountPartner.

This mapping allows the API to manage the objects and their relationship efficiently.

## AccountShare

Represents a sharing entry on an Account.

## Supported Calls

`describeObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Usage

This object allows you to determine which users and groups can view or edit Account records owned by other users.

If you attempt to create an `AccountShare` record that matches an existing record, the request updates any modified fields and returns the existing record.

For example, the following code finds all accounts owned by a user and manually shares them to a portal user.

```
QueryResult result = conn.query("SELECT Id FROM Account WHERE OwnerId = '005D0000001LPFB'");
// Create a new AccountShare object
List<AccountShare> shares = new ArrayList<AccountShare>();
for (SObject rec : result.getRecords()) {
    AccountShare share = new AccountShare();
    share.setAccountId(rec.getId());
    //Set the portal user Id to share the accounts with
    share.setUserOrGroupId("003D000000QA8T1");
    share.setAccountAccessLevel("Edit");
    share.setOpportunityAccessLevel("Read");
    share.setCaseAccessLevel("Edit");
    shares.add(share);
}
conn.create(shares.toArray(new AccountShare[shares.size()]));
```

This code shares the accounts that the user owns at the time, but not those accounts that are owned later. For these types of shares, use an owner-based sharing rule, such as [AccountOwnerSharingRule](#).

If an account is shared in multiple ways with a user, you don't always see multiple sharing records. If a user has access to an account for one or more of the following RowCause values, the records in the AccountShare object are compressed into one record with the highest level of access.

- `ImplicitParent`
- `Manual`
- `Owner`

## Usage

AccountTag stores the relationship between its parent TagDefinition and the Account being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## AccountTeamMember

Represents a User who is a member of an Account team.

See also `UserAccountTeamMember`, which represents a User who is on the default account team of another user.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- This object is available only for Enterprise, Unlimited, and Performance Edition users who have enabled the account team functionality.
- Customer Portal users can't access this object.

## Fields

| Field Name         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

# AccountTerritoryAssignmentRule

---

An account assignment rule that assigns accounts to territories based on account fields. Only available if territory management has been enabled for your organization.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>BooleanFilter</code> | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Update</p> <p><b>Description</b><br/>Advanced filter conditions that were specified for the rule in the online application. For example, "(1 AND 2) OR 3."</p>                                                                                                                                                                                                                                                                           |
| <code>IsActive</code>      | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Update</p> <p><b>Description</b><br/>Indicates whether the rule is active (<code>true</code>) or inactive (<code>false</code>). Via the API, active rules run automatically when new accounts are created and existing accounts are edited. The exception is when the <code>IsExcludedFromRealign</code> field on an account is <code>true</code>, which prevents account assignment rules from evaluating that account.</p> |
| <code>IsInherited</code>   | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Update</p> <p><b>Description</b><br/>Indicates whether the rule is an inherited rule (<code>true</code>) or a local rule (<code>false</code>). An inherited rule also acts upon territories below it in the territory hierarchy. A local rule is created at the immediate territory and only impacts the immediate territory.</p>                                                                                            |

| Field       | Details                                                                                                                                                                  |
|-------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name        | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Update<br><b>Description</b><br>A name for the rule. Limit is 80 characters.                               |
| TerritoryId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Update<br><b>Description</b><br>ID of the territory where accounts that satisfy this rule are assigned. |

## Usage

A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

## AccountTerritoryAssignmentRuleItem

A row of selection criteria for an AccountTerritoryAssignmentRule object. Only available if territory management has been enabled for your organization.

AccountTerritoryAssignmentRuleItem can be created or deleted if the `BooleanFilter` field on its corresponding AccountTerritoryAssignmentRule object is a null value.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field     | Details                                                                                                                                                                                                                                                          |
|-----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The standard or custom account field to use as a criteria.</p>                                                                        |
| Operation | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The criteria to apply, such as "equals" or "starts with."</p>                                                                         |
| RuleID    | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Update</p> <p><b>Description</b><br/>ID of the associated AccountTerritoryAssignmentRule.</p>                                                                                          |
| SortOrder | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Create, Filter, Update</p> <p><b>Description</b><br/>The order in which this row is evaluated compared to other AccountTerritoryAssignmentRuleItem objects for the given AccountTerritoryAssignmentRule.</p> |
| Value     | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Nillable, Update</p> <p><b>Description</b><br/>The field value(s) to evaluate, such as 94105 if the Field is Billing Zip/Postal Code.</p>                                                 |

## Usage

- Both standard and custom account fields can be used as criteria for account assignment rules.
- A territory will not have any accounts (with the exception of manually assigned accounts) unless at least one account assignment rule is active for the territory.

## ActionLinkGroupTemplate

---

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking on an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. Every action link belongs to an action link group and action links within the group are mutually exclusive. This object is available in API version 33.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Only users with the “Customize Application” permission can modify or delete this object.

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| NamespacePrefix | <b>Type</b><br>string<br><br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><br><b>Description</b><br>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b>namespacePrefix__componentName</b> notation.<br>The namespace prefix can have one of the following values: <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <b>NamespacePrefix</b> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> |

## Usage

Define action link templates in Setup and use `ConnectApi` in Apex or Chatter REST API to instantiate action links from the templates and to post feed elements with the action links.

If you delete a published action link group template, you delete all related action link information which includes deleting all action links that were instantiated using the template from feed items.

## ActionLinkTemplate

Action link templates let you reuse action link definitions and package and distribute action links. An action link is a button on a feed element. Clicking an action link can take a user to another Web page, initiate a file download, or invoke an API call to an external server or Salesforce. Use action links to integrate Salesforce and third-party services into the feed. This object is available in API version 33.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Only users with the “Customize Application” permission can modify or delete this object.

|            | <ul style="list-style-type: none"> <li>• <code>CustomExcludedUser</code>—Everyone but the custom user can see the action link.</li> </ul> |

## Usage

Create action link templates in Setup. Use Apex classes in the `ConnectApi` namespace or Chatter REST API to instantiate action links from templates and to post feed elements with the action links.

For information about action links, see “Working with Action Links” in the *Apex Developer Guide* or the *Chatter REST API Developer Guide*.

## ActivityHistory

This read-only object is displayed in a related list of closed activities—past events and closed tasks—related to an object. It includes activities for all contacts related to the object. ActivityHistory fields for phone calls are only available if your organization uses Salesforce CRM Call Center.

## Supported Calls

`describeSObjects()`

## Fields

| Field                     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| WhatId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The <code>WhatId</code> represents nonhuman objects such as accounts, opportunities, campaigns, cases, or custom objects. <code>WhatIds</code> are polymorphic. Polymorphic means a <code>WhatId</code> is equivalent to the ID of a related object. The label is <code>Related To ID</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| WhoId  | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The <code>Whold</code> represents a human such as a lead or a contact. <code>Wholds</code> are polymorphic. Polymorphic means a <code>Whold</code> is equivalent to a contact's ID or a lead's ID. The label is <code>Name ID</code>.</p> <p>If Shared Activities is enabled, the value of this field is the ID of the related lead or primary contact. If you add, update, or remove the <code>Whold</code> field, you might encounter problems with triggers, workflows, and data validation rules that are associated with the record. The label is <code>Name ID</code>.</p> <p>If your organization uses Shared Activities, when you query activities in API version 30.0 or later, the returned value of the <code>WhoId</code> field matches the value in the queried object, not necessarily in the activity record itself.</p> |

## Usage

### Query activities that are related to an object

1. Optionally, issue a describe call against the object whose activities you wish to query, to get a suggestion of the correct SOQL to use.
2. Issue a SOQL relationship query with a main clause that references the object, and an inner clause that references the activity history; for example:

```
SELECT
  (SELECT ActivityDate, Description
   FROM ActivityHistories)
```

```
FROM Account
WHERE Name Like 'XYZ%'
```

The user interface enforces sharing rules, filtering out related-list items that a user doesn't have permission to see.

The following constraints on users who don't have the "View All Data" permission help prevent performance issues.

- In the main clause of the relationship query, you can reference only one record. For example, you can't filter on all records where the account name starts with "A." Instead, you must reference a single account record.

```
SELECT
  (SELECT ActivityDate, Description
   FROM ActivityHistory
   ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC
   LIMIT 500)
FROM Account
WHERE Name = 'Acme'
LIMIT 1
```

- In the inner clause of the query, you can't use `WHERE`.
- In the inner clause of the query, you must specify a limit of 500 or fewer on the number of rows that are returned in the list.
- In the inner clause of the query, you must sort on `ActivityDate` in descending order and `LastModifiedDate` in descending order. You can optionally display nulls last. For example: `ORDER BY ActivityDate DESC NULLS LAST, LastModifiedDate DESC`.

## AdditionalNumber

Represents an optional additional number for a call center. This additional number is visible in the call center's phone directory.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field        | Details                  |
|--------------|--------------------------|
| CallCenterId | <b>Type</b><br>reference |

| Field       | Details                                                                                                                                                                                                                                                                                                         |

## Usage

Create an additional number for a call center directory. Use this object if the number is not easily categorized as a User, Contact, Lead, Account, or the other object. Examples include phone queues or conference rooms.

## AgentWork

Represents a work assignment that's been routed to an agent. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `getDeleted()`, `getUpdated()`, `retrieve()`, `undelete()`

## Fields

|            | <b>Description</b><br>Date and time when a user or automated process (such as a trigger) last modified this record.                                                         |
| UserId     | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the user that the work item was assigned to.                |
| WorkItemId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the object that's routed to the agent through Omni-Channel. |

## Usage

`AgentWork` records can only be deleted if they have the status Closed, Declined, or Unavailable. They can't be deleted if their status is Assigned or Opened because they're active in Omni-Channel.

`AgentWork` records have the status Assigned when they're created. Once created, the record is automatically pushed to the assigned agent.

While the metadata for `AgentWork` indicates support for `upsert()` and `update()`, these calls aren't used with `AgentWork` because none of its fields can be updated.

## AllowedEmailDomain

Represents an allowed email domain for users in your organization. You can define a whitelist to restrict the email domains allowed in a user's `Email` field. This object is available in API version 29.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

You must have the "Manage Internal Users" user permission to use this object.

**Note:** If you don't see this object, contact your Salesforce representative to enable it.

## Fields

| Field  | Details                                                                                                                                                 |

## Announcement

Represents a Chatter group announcement. This object is available in API version 30.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

Customers who purchase our services should make their purchase decisions based upon features that are currently available.</p> |

## Usage

Group owners, managers, and users with the “Modify All Data” permission can use the Announcement object to create, edit, and delete group announcements. Creating a group announcement is a three-step process.

1. Use the FeedItem object to create a text post with the announcement’s content. Use the CollaborationGroup record you want to post the announcement to as the parent of this feed item.
2. Next, use the feed item ID and an expiration date to create the announcement record.
3. Finally, update the `AnnouncementId` field in the CollaborationGroup record with the ID of the announcement you created.

To delete the group announcement, simply delete the `AnnouncementId` value in the CollaborationGroup record. To restore a group announcement, update the `AnnouncementId` field for a group with the announcement’s ID. The expiration date for the announcement should be in the future and the feed item used to create the announcement should be parented by the same group.

# ApexClass

Represents an Apex class.

**Note:** Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Force.com Migration Tool, the Salesforce user interface, or the Force.com IDE to create or update Apex classes or triggers.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"><li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li><li>• In organizations that are not Developer Edition organizations, <b>NamespacePrefix</b> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li></ul> |

## Usage

Use custom components to encapsulate a common design pattern and then reuse that pattern several times in one or more Visualforce pages. All users who can view Visualforce pages can view custom components, but the “Customize Application” permission is required to create or update custom components.

## ApexLog

---

Represents a debug log, containing information about a transaction, including information about Apex, Visualforce, workflow and validation rules. This object is available in API version 19.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

## ApexPage

Represents a single Visualforce page.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field      | Details               |

| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>• In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> |

## Usage

Use Visualforce pages to add custom content that extends the base Salesforce application functionality. All users in Visualforce-enabled organizations can view Visualforce pages, but the "Customize Application" permission is required to create or update them.

| TestRunResultID | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The ID of the associated <a href="#">ApexTestRunResult</a> object.</p> |

## Usage

Insert an `ApexTestQueueItem` object to place its corresponding Apex class in the Apex job queue for execution. The Apex job executes the test methods in the class.

To abort a class that is in the Apex job queue, perform an update operation on the `ApexTestQueueItem` object and set its `Status` field to `Aborted`.

If you insert multiple Apex test queue items in a single bulk operation, the queue items will share the same parent job. This means that a test run can consist of the execution of the tests of several classes if all the test queue items are inserted in the same bulk operation.

## ApexTestResult

Represents the result of an Apex test method execution. This object is available in API version 23.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`

## Fields

## Usage

You can query the fields of the `ApexTestResult` record that corresponds to a test method executed as part of an Apex class execution.

Each test method execution is represented by a single `ApexTestResult` record. For example, if an Apex test class contains six test methods, six `ApexTestResult` records are created. These records are in addition to the `ApexTestQueueItem` record that represents the Apex class.

Each `ApexTestResult` record has an associated [ApexTestResultLimits](#) on page 179 record, which captures the Apex limits used during execution of the test method.

## ApexTestResultLimits

Captures the Apex test limits used for a particular test method execution. An instance of this object is associated with each `ApexTestResult` record. This object is available in API version 37.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`

## Fields

| Sosl       | <b>Type</b><br>int<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>The number of SOSL queries made during the test run.      |

## Usage

The ApexTestResultLimits object is populated for each test method execution, and it captures the limits used between the Test.startTest() and Test.stopTest() methods. If startTest() and stopTest() aren't called, limits usage is not captured. Note the following:

- The associated test method must be run asynchronously.
- Limits for asynchronous Apex operations (batch, scheduled, future, and queueable) that are called within test methods are not captured.
- Limits are captured only for the default namespace.

# ApexTestRunResult

Contains summary information about all the test methods that were run in a particular Apex job. This object is available in API version 37.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

## Fields

## ApexTestSuite

Represents a suite of Apex classes to include in a test run. A TestSuiteMembership object associates each class with the suite. This object is available in API version 36.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name    | Description                                                                                                                                                                                                                                                                      |

| TestSuiteName | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort, Unique, Update</p> <p><b>Description</b></p> <p>The name of the Apex test suite. This label appears in the user interface.</p> <p>This value is case-sensitive and must be unique.</p> |

## Usage

Insert a TestSuiteMembership object using an API call to associate an Apex class with an ApexTestSuite object. (ApexTestSuite and TestSuiteMembership aren't editable through Apex DML.) To remove the class from the test suite, delete the TestSuiteMembership object. If you delete an Apex test class or test suite, all TestSuiteMembership objects that contain that class or suite are deleted.

The following SOQL query returns the membership object that relates this Apex class to this test suite.

```
SELECT Id FROM TestSuiteMembership WHERE ApexClassId = '01pD0000000Fhy9IAC'
      AND ApexTestSuiteId = '05FD00000004CDBMA2'
```

SEE ALSO:

[TestSuiteMembership](#)

## ApexTrigger

Represents an Apex trigger.

**Note:** Although Apex classes and triggers have the Create and Update field properties, a runtime exception occurs if you try to create or update them using the API. Instead, use the Force.com Migration Tool, the Salesforce user interface, or the Force.com IDE to create or update Apex classes or triggers.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Type          | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The type of application represented by this item. The types are:</p> <ul style="list-style-type: none"> <li>• ConnectedApplication</li> <li>• ServiceProvider</li> <li>• TabSet</li> </ul>                                                                                                                                                                                                                                                                                                                                                |
| UserSortOrder | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The index value that represents where the user set this item in the menu (or App Launcher). For example, an item with a sort order value of 5 appears between items with sort order values of 3 and 9.</p> <p>This value is separate from SortOrder so you can create logic incorporating both values. For example, if you want the user-sorted items to appear first, followed by the organization order for the rest, use:</p> <pre>SELECT ApplicationId,SortOrder,UserSortOrder FROM AppMenuItem order by userSortOrder NULLS LAST, sortOrder NULLS LAST</pre> |

## Usage

Use this read-only object to view an entry in the Force.com app menu or the App Launcher. You can create a SOQL query to retrieve all items, even items the user does not see from the user interface.

There are many ways you can use AppMenuItem. Here are some examples:

- Build your own App Launcher or app menu in Salesforce. Create a custom page showing all the apps you have access to and that lets you run them using single sign-on.
- Build your own App Launcher or app menu on a tablet or mobile app. You can have your own app for launching applications on various mobile devices.

- Build an app launcher into your company's intranet. There's no need to have it run on Salesforce because there's a Web service API to let you build an app launcher.

 **Tip:** To get metadata information about apps and their tabs, use the Apex `Schema.describeTabs()` method, the REST API `/vXX.X/tabs/` resource, or the SOAP API `describeTabs()` call.

## Approval

---

Represents an approval request for a Contract.

 **Note:** This object is read-only and is specific to approvals on the Contract object. It isn't equal to or involved in the approval processes represented by the ProcessInstance, which is more powerful.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                       | Details                                                                                                                                                                                                                                                        |

## Usage

This object allows client applications to programmatically handle approval requests for a Contract. Initially, to request a Contract approval, a client application might create a new Approval request record, specifying the `ParentId`, `OwnerId` (user approving or rejecting the request), `Status` (Pending), and (optionally) `RequestComment` fields. Note that when a client application creates the first approval request, if the value of the Contract `Status` field is Draft, then the Approval `Status` for this record is automatically changed to In Approval Process (see `ContractStatus` for more information).

A client application might subsequently update an existing Approval request, specifying the `Status` (Approved or Rejected) and an `ApproveComment` (required); the `RequestComment` field can't be updated. Updating an Approval record (either to approve or reject) requires the client application to be logged in with "Approve Contract" permission. To update an Approval request, its `Status`

must be Pending—a client application can't update an Approval that has already been Approved or Rejected. To re-submit an approval request for a given Contract, a client application must create a new, separate Approval record and repeat the approval process.

Once a Contract has been approved (not rejected), the Contract `LastApprovedDate` field is automatically updated, however the Contract `Status` field isn't updated, it keeps the value `InApproval`.

An approved Contract must be activated explicitly. Client applications can activate a Contract by setting the value in its `Status` field to `Activated`, or a User can activate a Contract via the Salesforce user interface.

A Contract can have multiple approval requests in various states (Pending, Approved, and Rejected). In addition, one User can have multiple approval requests associated with the same Contract.

Client applications can't explicitly delete Approval records. Approval records are deleted automatically if the parent Contract is deleted.

## *Article Type\_\_DataCategorySelection*

---

A data category selection represents a data category that classifies an article. This object is available in API version 19.0 and later.

This object can be used to associate an article with data categories from a data category group or to query the category selections for an article.

The object name is variable and has a syntax of *Article Type\_\_DataCategorySelection*, where *Article Type* is the Object Name for the article type associated with the article. For example, *Offer\_\_DataCategorySelection* represents the association between the *Offer* article type and its data categories. Every article is associated with an article type.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `getDeleted()`, `retrieve()`

## Special Access Rules

Users can only access, create or delete data category selection visible to their role, permission set, or profile. If a user has partial visibility on an article's categorization, only the visible categories are returned.

## Fields

| Field Name                         | Details                                                                                                                                                                                                    |

## Usage

Every article in Salesforce Knowledge can be categorized. A data category selection represents a category that has been selected to classify an article. You can use the *Article Type\_\_DataCategorySelection* object to query and manage article categorization in your organization. Client applications can create a categorization for an article with a Draft status. They can also delete and query article categorizations.

**Note:** When using *Article Type\_\_DataCategorySelection* to classify an article, you can't select both a category (for example USA) and one of its descendants (California) or ascendant categories (North America). In this case, only the first category is selected.

Answer communities use *QuestionDataCategorySelection* to classify questions.

## SOQL Sample

The following SOQL query returns the data category selections used to classify the article whose ID is `ka0D000000005ApIAI`.

```
SELECT Id,DataCategoryName, ParentId
FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

This clause only returns category unique names. To retrieve category labels use the following clause:

```
SELECT Id,toLabel(DataCategoryName), ParentId
FROM Offer__DataCategorySelection WHERE ParentId='ka0D000000005ApIAI'
```

**Tip:** You can also use relationship queries to retrieve categorizations from an article type.

## Article Type\_\_Feed

Represents a single feed item in the feed displayed on the detail page for an article. This object is available in API version 20.0 and later.

An article feed shows recent changes to an article record for any fields that are tracked in feeds, and posts and comments about the article. It is a useful way to stay up-to-date with changes made to articles in Salesforce Knowledge. This object is available in API version 20.0 and later. The object name is variable and uses a *Article Type\_\_Feed* syntax, where *Article Type* is the Object Name for the article type associated with the article. For example, *Offer\_\_Feed* represents a feed item on an article based on the *Offer* article type.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <i>CommentCount</i> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <i>CommentCount</i>, go through pagination until end of comments is returned.</p> |
| ContentData  | <p><b>Type</b><br/>base64</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Restricted picklist, Sort</p> <p><b>Description</b><br/>The type of feed item:</p> <ul style="list-style-type: none"> <li>• <code>ActivityEvent</code>—indirectly generated event when a user or the API adds a <a href="#">Task</a> associated with a feed-enabled parent record (excluding email tasks on cases). Also occurs when a user or the API adds or updates a <a href="#">Task</a> or <a href="#">Event</a> associated with a case record (excluding email and call logging).</li> </ul> <p>For a recurring <a href="#">Task</a> with <code>CaseFeed</code> disabled, one event is generated for the series only. For a recurring <a href="#">Task</a> with <code>CaseFeed</code> enabled, events are generated for the series and each occurrence.</p> |

**Field****Details**

- `AdvancedTextPost`—created when a user posts a group announcement.
- `AnnouncementPost`—Not used.
- `ApprovalPost`—generated when a user submits an approval.
- `BasicTemplateFeedItem`—Not used.
- `CanvasPost`—a post made by a canvas app posted on a feed.
- `CollaborationGroupCreated`—generated when a user creates a public group.
- `CollaborationGroupUnarchived`—Not used.
- `ContentPost`—a post with an attached file.
- `CreatedRecordEvent`—generated when a user creates a record from the publisher.
- `DashboardComponentAlert`—generated when a dashboard metric or gauge exceeds a user-defined threshold.
- `DashboardComponentSnapshot`—created when a user posts a dashboard snapshot on a feed.
- `LinkPost`—a post with an attached URL.
- `PollPost`—a poll posted on a feed.
- `ProfileSkillPost`—generated when a skill is added to a user's Chatter profile.
- `QuestionPost`—generated when a user posts a question.
- `ReplyPost`—generated when Chatter Answers posts a reply.
- `RypplePost`—generated when a user creates a Thanks badge in Work.com.
- `TextPost`—a direct text entry on a feed.
- `TrackedChange`—a change or group of changes to a tracked field.
- `UserStatus`—automatically generated when a user adds a post. Deprecated.

The following values appear in the `Type` picklist for all feed objects but apply only to `CaseFeed`:

- `CaseCommentPost`—generated event when a user adds a case comment for a case object
- `EmailMessageEvent`—generated event when an email related to a case object is sent or received
- `CallLogPost`—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.
- `ChangeStatusPost`—generated event when a user changes the status of a case
- `AttachArticleEvent`—generated event when a user attaches an article to a case

**Note:** If you set `Type` to `ContentPost`, also specify `ContentData` and `ContentFileName`.

## Usage

Use this object to track changes for an article. You can only delete a feed that you created, or if you have the “Modify All Data” permission or “Modify All” permission on the KnowledgeArticle object.

## Usage

Use this object to track assets previously sold into customer accounts. With asset tracking, a client application can quickly determine which products were previously sold or are currently installed at a specific account. You can also create hierarchies of assets using the `Parent Asset` field. An asset hierarchy can contain up to 10,000 assets.

For example, your organization might want to renew and up-sell opportunities on products sold in the past. Similarly, your organization might want to track competitive products that exist in a customer environment that could potentially be replaced or swapped out.

Asset tracking is also useful for product support, providing detailed information to assist with product-specific support issues. For example, the `PurchaseDate` or `SerialNumber` could indicate whether a given product has certain maintenance requirements, including product recalls. Similarly, the `UsageEndDate` might indicate when the asset was removed from service or when a license or warranty expires.

If an application creates a new Asset record, it must at least specify a `Name` and either an `AccountId`, `ContactId`, or both.

## AssetFeed

---

Represents a single feed item in the feed displayed on the detail page for an asset record. This object is available in API version 18.0 and later.

An asset feed shows recent changes to an asset record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to assets.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Asset object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field Name | Details          |

|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                           | <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of the AssetFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>CommentCount</code> | <p><b>Type</b><br/><code>int</code></p> <p><b>Properties</b><br/><code>Filter</code>, <code>Group</code>, <code>Sort</code></p> <p><b>Description</b><br/>The number of <code>FeedComments</code> associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| <code>ConnectionId</code> | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/><code>Filter</code>, <code>Group</code>, <code>Nillable</code>, <code>Sort</code></p> <p><b>Description</b><br/>When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. Available if Salesforce to Salesforce is enabled for your organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>ContentData</code>  | <p><b>Type</b><br/><code>base64</code></p> <p><b>Properties</b><br/><code>Nillable</code></p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

# Usage

Use this object to track changes for an asset record.

SEE ALSO:

- [Asset](#)
- [Product2](#)
- [FeedItem](#)

# AssetOwnerSharingRule

Represents the rules for sharing an Asset with users other than the owner. This object is available in API version 33.0 and later.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

# Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

# Special Access Rules

Customer Portal users can't access this object.

| Field         | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Name          | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. | UserOrGroupId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>The ID representing the target user or group. Target users or groups are given access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

# Usage

Use this object to manage the sharing rules for assets. General sharing uses this object.

SEE ALSO:

[Metadata API Developer Guide: SharingRules](#)

# AssetShare

Represents a sharing entry on an Asset. This object is available in API version 33.0 and later.

# Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

# Special Access Rules

Customer Portal users can't access this object.

# Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

This field can't be updated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Usage

This object allows you to determine which users and groups can view and edit Asset records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

## AssetTag

Associates a word or short phrase with an Asset.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name      | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Name            | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter</p> <p><b>Description</b><br/>Name of the tag. If this value does not already exist, a new TagDefinition is created and becomes the parent of this Tag object. Otherwise, a TagDefinition with the same name becomes the parent of this Tag object. Parent relationships are created automatically.</p>                                                                                    |
| TagDefinitionId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter</p> <p><b>Description</b><br/>ID of the parent TagDefinition object that owns the tag.</p>                                                                                                                                                                                                                                                                                                      |
| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Restricted picklist</p> <p><b>Description</b><br/>Defines the visibility of a tag.<br/><br/>Valid values:</p> <ul style="list-style-type: none"> <li>• <code>Public</code>—The tag can be viewed and manipulated by all users in an organization.</li> <li>• <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.</li> </ul> |

## Usage

AssetTag stores the relationship between its parent TagDefinition and the Asset being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## AssignedResource

---

Represents a service resource who is assigned to a service appointment. Assigned resources appear in the Assigned Resources related list on service appointments. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSOjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`

## Special Access Rules

Field Service Lightning must be enabled.

## Fields

| Field Name             | Details                                                                                                                                                                                                                                                                             |

| Field Name           | Details                                                                                                                                                                                              |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | <b>Description</b><br>The estimated number of minutes needed for the service resource to travel to the service appointment they're assigned to. You can enter a value with up to two decimal places. |
| ServiceAppointmentId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The service appointment that the resource is assigned to.                                      |
| ServiceResourceId    | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Update, Filter, Group, Sort<br><b>Description</b><br>The resource who is assigned to the service appointment.                               |

## Usage

You can assign multiple service resources to a service appointment. Service resources who are assigned to service appointments cannot be deactivated until they are removed from the appointments.

## AssignmentRule

Represents an assignment rule associated with a Case or Lead.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

## Special Access Rules

- This object is read only. Assignment rules are created, configured, and deleted in the user interface.
- Customer Portal users can't access this object.

## Fields

| Field       | Details                                                                                                                                                                                                                |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Active      | <b>Type</b><br>boolean<br><b>Properties</b><br>Defaulted on create, Filter, Group, Sort<br><b>Description</b><br>Indicates whether this assignment rule is active ( <code>true</code> ) or not ( <code>false</code> ). |
| Name        | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Name of this assignment rule.                                                                                     |
| SubjectType | <b>Type</b><br>picklist<br><b>Properties</b><br>Filter, Group, Nillable, Restricted picklist, Sort<br><b>Description</b><br>Type of assignment rule—Case or Lead.                                                      |

## Usage

Before creating or updating a new Case or Lead, a client application can query (by name) the AssignmentRule to obtain the ID of the assignment rule to use, and then assign that ID to the `assignmentRuleId` field of the AssignmentRuleHeader. The AssignmentRuleHeader can be set using either SOAP API or REST API.

## AsyncApexJob

Represents an individual Apex sharing recalculation job, a batch Apex job, a method with the `future` annotation, or a job that implements `Queueable`.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Usage

Use this object to list all `ContentDocument` objects attached to an object via a feed post.

To retrieve `ContentDocument` objects, issue a describe call on an object, which returns a query result for each activity since the record was created. You can't directly query this object.

## AttachedContentNote

This read-only object contains all `ContentNote` objects associated with an object. This object is available in API version 35.0 and later.

## Supported Calls

`describeSObjects()`

## Special Access Rules

- Notes must be enabled.

- Chatter must be enabled.

## Fields

| Field Name        | Details                                                                                                                                                              |

| LinkedEntityId    | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the record the ContentNote is attached to.                       |

| Field Name  | Details                                                                                                                                           |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| TextPreview | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>A preview of the note, up to 255 characters. |
| Title       | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>Title of the note.                                     |

## Usage

Use this object to list all `ContentNote` objects attached to an object.

To retrieve `ContentNote` objects, issue a `describe` call on an object, which returns a query result for each note created or attached. You can't directly query this object.

## Attachment

Represents a file that a User has uploaded and attached to a parent object.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>ID of the User who owns the attachment. This field was required previous to release 9.0. Beginning with release 9.0, it can be null on create.</p> <p>The owner of an attachment on a task or event must be the same as the owner of the task or event.</p>                                                                                                                                                                                                                    |
| ParentId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort</p> <p><b>Description</b><br/>Required. ID of the parent object of the attachment. The following objects are supported as parents of attachments:</p> <ul style="list-style-type: none"> <li>• Account</li> <li>• Asset</li> <li>• Campaign</li> <li>• Case</li> <li>• Contact</li> <li>• Contract</li> <li>• Custom objects</li> <li>• EmailMessage</li> <li>• EmailTemplate</li> <li>• Event</li> <li>• Lead</li> <li>• Opportunity</li> <li>• Product2</li> <li>• Solution</li> <li>• Task</li> </ul> |

**Note:** If you are importing Attachment data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. For example, for compliance reasons, you may prefer to set the `CreatedDate` to the date the record was originally created in your system, rather than the date it was imported into Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

## Usage

The API sends and receives the binary file attachment data encoded as a `base64Binary` data type. Prior to creating a record, client applications must encode the binary attachment data as base64. Upon receiving a response, client applications must decode the base64 data to binary (this conversion is usually handled for you by the SOAP client).

The create call restricts these files to a maximum size of 25 MB. For a file attached to a Solution, the limit is 1.5 MB. The maximum email attachment size is 3 MB.

The API supports attachments on email in create, delete, or update calls. The query call does not return attachments parented by email, unless the user performing the query has the “Modify All Data” permission.

### Note:

- Attachment records are not searched during text searches.
- When issued by an administrator, the query results include Attachment records from the Recycle Bin.
- When issued by a non-administrator, the `queryAll()` call results do not include Attachment records from the Recycle Bin.

Access to fields depends on the method being used:

- All of the fields are accessible using the `describeObjects()` and `query()` calls. With the `create()` call, you can insert the `Name`, `ParentId`, `Body`, `IsPrivate`, and `OwnerId` fields.
- To modify existing records, the `update()` call gives you access to change the `Name`, `Body`, `IsPrivate`, and `OwnerId` fields.
- You can access all of the fields using a `query()` call. However, you can't receive the `Body` field for multiple records in a single `query()` call. If your query returns the `Body` field, your client application must ensure that only one row with one Attachment is returned; otherwise, an error occurs. A more effective approach is to return IDs (but not Attachment records in the `Body` field) from a `query()` call and then pass them into `retrieve()` calls that return the `Body` field.
- For information about accessing the attachments of archived activities, see Archived Activities.

## AuraDefinition

---

Represents a Lightning definition, such as component markup, a client-side controller, or an event. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

## Usage

For more information, see the [Lightning Components Developer Guide](#).

## AuraDefinitionBundle

Represents a Lightning definition bundle, such as a component or application bundle. A bundle contains a Lightning definition and all its related resources. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field Name  | Details                                                                                                                                                                                     |

| MasterLabel     | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>Master label for the Lightning bundle. This internal label doesn't get translated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b>namespacePrefix__componentName</b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This</li> </ul> |

| Field Name | Details                                                                                                                                                                                                                                                                                                                                                                               |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|            | <p>field's value is the namespace prefix of the Developer Edition organization of the package developer.</p> <ul style="list-style-type: none"> <li>In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> |

## Usage

For more information, see the [Lightning Components Developer Guide](#).

## AuthConfig

Represents authentication options for a community or custom domain that was created by using My Domain. This object is available in API version 32.0 and later.

The fields for this object control the login options that show up on the login page for users of a community or custom domain.

- Logging in with a username and password
- Using SAML for single sign-on
- Authentication provider logins from a third-party service, such as Facebook or Twitter

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

You must have "View Setup and Configuration" permission to view the settings.

| Field Name | Details                                                                                                                                 |
|------------|-----------------------------------------------------------------------------------------------------------------------------------------|
|            | <b>Description</b><br>The login URL of the organization for this AuthConfig object. Each URL has only one associated AuthConfig object. |

## AuthConfigProviders

Represents an authentication provider that's configured in an organization. This object is a child of the AuthConfig object. This object is available in API version 32.0 and later.

This object links the authentication configuration for an organization to the Auth. Provider through the `AuthOptionsAuthProvider` field of the AuthConfig object. The login page of a Community or custom domain that was created by using My Domain can allow multiple SAML configurations and multiple authentication providers. These configurations can be set to show up as buttons on the login page. Each configuration has an AuthConfigProvider object.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

You must have "View Setup and Configuration" permission to view the settings.

# AuthProvider

---

Represents an authentication provider (or auth provider) in your organization.

An auth provider enables users to log into your Salesforce organization using their login credentials from an external service provider such as Facebook<sup>®</sup> or Janrain<sup>®</sup>.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Only users with the “Customize Application” and “Manage AuthProviders” permissions can access this object.

## Fields

## Usage

The AuthSession object exposes session data and enables read and delete operations on that data. For example, use this object to create a report showing who is signed in to your organization, or to create a tool to delete a session, ending that user's session. For a user, only their own sessions are available, while administrators can see all sessions.

You can't change user sessions with this object. You can only read and delete them.

## BackgroundOperation

Represents a background operation in an asynchronous job queue. This object is available in API version 35.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                                 |

|------------|--------------------------------------------------------------------------------------------------|
|            | Example for a Salesforce Connect OData operation:<br><code>services/data/v35.0/xds/upsert</code> |

## Usage

The BackgroundOperation object lets you:

- Monitor the job status of asynchronous operations.
- View errors that are related to the asynchronous operations.
- Extract statistics for the asynchronous job queue.

## BackgroundOperationResult

Stores error messages generated when running Async SOQL queries or importing data into BigObjects using Bulk API. This is a BigObject, available in API version 37.0 and later.

Each instance of `BackgroundOperationResult` represents one error. The `Message` field stores the text of the error message. The `ParentID` field stores the:

- job ID of the query, in case of Async SOQL
- batch ID for the data import, in case of Bulk API

Bulk API validates data at the time of import, and generates an error message for the first occurrence of invalid data in any row of the data file. The validation performed depends on the type of data being imported.

- **Text**—The length of the input string must be less than or equal to the length of the corresponding text field in the target object.
- **Number**—The input data must be a number, whose scale and precision are compatible with the corresponding number field in the target object.
- **ID**—The input data must be a valid 15- or 18-character ID.
- **DateTime**—The input data must be a valid dateTime value, in the approved format.
- **Lookup**—The lookup value must be a valid 15- or 18-character ID.

## Supported Calls

`describeSObjects(), query()`

|            | <b>Properties</b><br>Filter, Sort                                                              |
|            | <b>Description</b><br>The batch ID, in case of Bulk API, or the job ID, in case of Async SOQL. |

## Usage

You can check for errors by querying the `BackgroundOperationResult` object. For example, this query returns details of all errors in a data file imported using Bulk API, whose batch ID is `751xx0000000060AAQ`.

```
SELECT CreatedById, CreatedDate, Id, Message, MessageType, ParentId FROM
BackgroundOperationResult WHERE ParentId = "751xx0000000060AAQ"
```

**Note:** You can only view errors resulting from Async SOQL or Bulk API requests that you initiated, unless you have the global permission to view all data.

## Bookmark

Represents a link between opportunities that share common information.

This object is available to organizations with the Similar Opportunities feature enabled.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

## Usage

The Bookmark object works with the Opportunity object only.

Use this read-only object to query the bookmarks between opportunities in your organization. In the online application, users can search for opportunities that share attributes with their opportunity. The user can then bookmark the appropriate opportunities for future reference.

## BrandTemplate

Letterhead for HTML EmailTemplate.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| DeveloperName   | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <b>Letterhead Unique Name</b>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |

## Usage

Use this object to brand EmailTemplate records with your letterhead. You can also set a brand template to active or inactive. For example, if you have five different marketing brands, you can maintain each different brand in one template, and assign to the appropriate EmailTemplate.

[EmailTemplate](#)

## BusinessHours

Specifies the business hours of your support organization. Escalation rules are run only during these hours.

If business hours are associated with any Holiday records, then business hours and escalation rules associated with business hours are suspended during the dates and times specified as holidays.

## Supported Calls

`create()`, `getUpdated()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

Customer Portal users can't access this object.

All users, even those without the "View Setup and Configuration" user permission, can view business hours via the API.

## Usage

Use this object to specify the business hours at which your support team operates. Escalation rules only run during the business hours with which they are associated. To set business hours to 24-hours a day, set the times from midnight to midnight (00:00:00 ~ 00:00:00) on each day.

By default, business hours are set from 12:00 AM to 12:00 AM in the default time zone specified in your organization's profile.

| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><code>namespacePrefix__componentName</code></b> notation.<br/>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>• In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> </ul> |

| Field                      | Details                                                                                                                                                                                                                                                                |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                            | <ul style="list-style-type: none"><li>In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li></ul> |
| <code>TableEnumOrId</code> | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort</p> <p><b>Description</b><br/>Required. One of the following values: Case, Opportunity, or Solution. Label is <b>Entity Enumeration Or ID</b>.</p>           |

## Usage

Use the `BusinessProcess` object to offer different subsets of picklist values to different users for the `LeadStatus`, `CaseStatus`, and `OpportunityStage` fields. Similar to a `RecordType`, a `BusinessProcess` identifies the type of a row in a Case, Lead, or Opportunity and implies a subset of picklist values for these three fields. The values for the remaining picklist fields are driven off of `RecordType`.

## CallCenter

Represents a call center, which is a logical representation of a single computer-telephony integration (CTI) system instance in an organization.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

Customer Portal users can't access this object.

## Usage

Client applications can create, update, delete, and query Attachment records associated with a campaign via the API.

The Campaign object is defined only for those organizations that have the marketing feature enabled and valid marketing licenses. In addition, it is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeObjects()` or `query()` with the Campaign object.

**Note:** The main constituent of a campaign is a CampaignMember. You will commonly need to update campaigns with CampaignMember.

[Object Basics](#)

## CampaignFeed

Represents a single feed item in the feed on a campaign record detail page. This object is available in API version 18.0 and later.

A campaign feed shows recent changes to a campaign record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to campaigns.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"

- “Modify All” on the Campaign object
- “Moderate Chatter”

**Note:** Users with the “Moderate Chatter” permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of CampaignFeed. Required when Type is TextPost. Optional when Type is ContentPost or LinkPost. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, CommentCount isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with “CanApproveFeedPostAndComment” or “ModifyAllData” permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through CommentCount, go through pagination until end of comments is returned.</p> |
| ConnectionId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>When a PartnerNetworkConnection modifies a record that is tracked, the CreatedBy field contains the ID of the system administrator and the ConnectionId contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## CampaignInfluenceModel

This read-only object represents a campaign influence model in Customizable Campaign Influence. Use campaign influence models to group `CampaignInfluence` records created by a specific set of triggers and workflows that you define. The Salesforce influence model is the default model. This object is available in API version 37.0 and later.

**Note:** This information applies only to Customizable Campaign Influence and not to the original version of Campaign Influence.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

To access this object, Customizable Campaign Influence must be enabled. Customer Portal users can't access this object.

## Fields

| Field Name     | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName  | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The API name of the influence model. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p> |
| IsDefaultModel | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether the model is the primary model (<code>true</code>) or not (<code>false</code>). <code>CampaignInfluence</code> records associated with the primary model appear in the Campaign Influence related list on opportunities, the Influenced Opportunities related list on campaigns, and the Campaign Statistics section on campaigns. The value of <code>IsDefaultModel</code> can only be true for 1 model at a time.</p>                                         |
| IsModelLocked  | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether the model is locked (<code>true</code>) or not (<code>false</code>). Records for locked models can only be added, updated, or deleted via the API.</p>                                                                                                                                                                                                                                                                                                          |

| Status       | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b><br/>Controls the <code>HasResponded</code> flag on this object. You can't directly set the <code>HasResponded</code> flag, as it is read-only, but you can set it indirectly by setting this field in a create or update call. Each predefined value implies a <code>HasResponded</code> flag value. Each time you update this field, you implicitly update the <code>HasResponded</code> flag. In the Salesforce user interface, Marketing users can define valid status values for the <code>Status</code> picklist. They can choose one status as the default status. For each <code>Status</code> field value, they can also select which values should be counted as "Responded," meaning that the <code>HasResponded</code> flag will be set to <code>true</code> for those values.</p> |

| Field  | Details                                                                                                                                                                                                                                                                                      |

 **Note:** If you are importing CampaignMember data into Salesforce and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

## Usage

Each record has a unique ID, and must contain either a `ContactId` or a `LeadId`, but can't contain both. Any attempt to create a single record with both results in a successful insert but only the `ContactId` will be inserted. However, you can create two separate records on a Campaign—one for the Lead and one for the Contact.

Standard fields from a Contact or Lead are associated with the CampaignMember object but you can't query them directly. To include a lead's `Phone` in your query, for example, query the field from the Lead object.

```
SELECT Id, (SELECT Phone FROM Lead)
FROM CampaignMember
```

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. In addition, the object is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid

marketing licenses, this object does not appear in the `describeGlobal()` call, and you can't use `describeObjects()` or `query()` with the CampaignMember object.

In API version 16.0 and later, a `create()` call only creates a new record; in earlier versions, a `create()` call creates and updates records. The API determines whether a record exists with the specified `CampaignId` and either `ContactId` or `LeadId`.

**Note:** Only use a `ContactId` or `LeadId`, but not both, unless you want to track lead-based campaign members you convert to contacts.

If the record does not exist for the given `ContactId` or `LeadId`, then a new record is created. If the record exists, an error is returned and no update is made. To update an existing record, specify the ID of the CampaignMember record to update.

In API versions 15.0 and earlier, if you submit multiple records using a single create request, and if more than one record matches an existing record, only the first record submitted updates the existing record. If any of the submitted records match each other but do not match existing records, only the last record submitted is created.

The `upsert()` call is not supported in API version 16.0 and later. To use the `upsert()` call on this object, you must first delete all data in ID fields except the record ID.

To delete a record, specify the ID of the CampaignMember record to delete.

When creating or updating records, the `Status` field value specified in the call is verified as a valid status for the given Campaign:

- If the specified `Status` value is a valid status, the value is updated, and the `HasResponded` field is updated to either `true` or `false`, depending on the `Status` value association with `HasResponded`.
- If the specified `Status` value is not a valid status, the API assigns the default status to the `Status` field and updates the `HasResponded` field with the associated value. However, if the given Campaign does not have a default status, the API assigns the value specified in the call to the `Status` field, and the `HasResponded` field is set to `false`.

## CampaignMemberStatus

---

One or more member status values defined for a campaign.

### Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Special Access Rules

Customer Portal users can't access this object.

You can't delete a CampaignMemberStatus if that status is designated as the default status or if the status is currently used in a Campaign.

## Fields

| Field        | Details                                                                                                                                                                                                                                                            |

| Field | Details                                                                                |
|-------|----------------------------------------------------------------------------------------|
|       | <b>Description</b><br>Order where this campaign member status appears in the picklist. |

## Usage

Use this object to create picklist items for the member status in a campaign.

This object is defined only for those organizations that have the marketing feature and valid marketing licenses. In addition, the object is accessible only to those users that are enabled as marketing users. If the organization does not have the marketing feature or valid marketing licenses, this object does not appear in a `describeGlobal()` call, and you can't use `describeObjects()` or `query()` with the CampaignMember object.

## CampaignOwnerSharingRule

Represents the rules for sharing a campaign with User records other than the owner or anyone above the owner in the role hierarchy.

**Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

[Metadata API Developer Guide: SharingRules](#)

## CampaignShare

Represents a sharing entry on a Campaign.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field               | Details                                                                                                                                                                                                                                                               |

## Usage

This object allows you to determine which users and groups can view or edit Campaign records owned by other users.

## CampaignTag

Associates a word or short phrase with a Campaign.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`

## Fields

| Type            | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Restricted picklist</p> <p><b>Description</b><br/>Defines the visibility of a tag.<br/><br/>Valid values:</p> <ul style="list-style-type: none"><li>• <b>Public</b>—The tag can be viewed and manipulated by all users in an organization.</li><li>• <b>Personal</b>—The tag can be viewed or manipulated only by a user with a matching <b>OwnerId</b>.</li></ul> |

## Usage

CampaignTag stores the relationship between its parent TagDefinition and the Campaign being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## Case

---

Represents a case, which is a customer issue or problem.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

| Type          | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Nillable, Sort, Update</p> <p><b>Description</b></p> <p>The type of case, such as <code>Feature Request</code> or <code>Question</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                  |

**Note:** If you are importing Case data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself.

## Usage

Use the Case object to manage cases for your organization. Client applications can query, update, and delete Attachment records associated with a case via the API.

## Assignment Rules

When you query or update a case, your client application can have the case automatically assigned to one or more User records based on assignment rules that have been configured in the user interface. To use this feature, your client application must set either of the following options (but not both) in the AssignmentRuleHeader used in the create or update:

| Field                         | Field Type | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>assignmentRuleId</code> | reference  | ID of the assignment rule to use. Can be an inactive assignment rule. If unspecified and <code>useDefaultRule</code> is <code>true</code> , then the default assignment rule is used. To find the ID for a given assignment rule, query the AssignmentRule object (specifying <code>RuleType="caseAssignment"</code> ), iterate through the returned AssignmentRule objects, find the one you want to use, retrieve its ID, and then specify its ID in this field in the AssignmentRuleHeader. |
| <code>useDefaultRule</code>   | boolean    | Specifies whether to use the default rule for rule-based assignment ( <code>true</code> ) or not ( <code>false</code> ). The default rule is assigned by users in the Salesforce user interface.                                                                                                                                                                                                                                                                                               |

For a code example that shows setting the AssignmentRuleHeader for a Lead (which is similar to setting the AssignmentRuleHeader for a Case), see [Lead](#).

## Separating Accounts from Contacts in Cases

In releases before 8.0, the `AccountId` could not be specified, it was derived from the contact's account. This behavior will continue to be supported in future releases, but you can also now specify an `AccountId`. If you do not specify the `AccountId` during the creation of a case, the value will default to the contact's `AccountId`.

**Note:** When a record is updated, if the `ContactId` has not changed, then the `AccountId` is not regenerated. This prevents the API from overwriting a value previously changed in the Salesforce user interface. However, if an API call changes the `ContactId` and the `AccountId` field is empty, then the `AccountId` is generated using the contact's account.

## Using `_case` with Java

Depending on the development tool you use, you might need to write your application using `_case` instead of `Case`, because `case` is a reserved word in Java.

# CaseArticle

---

Represents the association between a Case and a KnowledgeArticle. This object is available in API version 20.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Access to this object is controlled by the parent Case and KnowledgeArticle. However, when querying, access is only controlled by the parent Case.

Customer Portal users can't access this object.

## Fields

| Field                | Details                                                                                                                                                                                            |

|                    | <b>Properties</b><br>Create, Filter, Group, Sort                                                     |
|                    | <b>Description</b><br>ID of the KnowledgeArticle associated with the Case.                           |

## Usage

This object represents the association of a knowledge article with a Case. An article is associated with a case when it's relevant to a specific issue, when it helps an agent solve the case, or when the agent sends the article to a customer.

You can use this object to include case-article associations in Apex and Visualforce.

You can't update this object via the API. If you attempt to create a record that matches an existing record, the create request simply returns the existing record.

**Note:** If you are importing CaseComment data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

## Usage

In the Salesforce user interface, comments are generally entered by a User working on a Case. All users have access to create and view CaseComment in the Salesforce user interface and when using the API. In the API, CaseComment records can't be modified after insertion

unless the user has the “Modify All” object-level permission for Cases or the “Modify All Data” permission. If not, users can only update the `IsPublished` field, and can't delete CaseComment.

|       | <b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update                                                                                                                                                                                                                                                                                                                                                     |
|       | <b>Description</b><br>Name of the role played by the contact on this contract, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>ContractId</code> , <code>ContactId</code> , and <code>Role</code> values are identical. Different contacts can play the same role on the same contract. A contact can play different roles on the same contract. |

## Usage

Use this object to define the role that a given Case plays on a given Contact. For example, you can use this object to be able to see all contacts who are associated to a case, or, given a contact, be able to query all cases that they are associated with, even if they are not the primary contact on the case.

## CaseFeed

Represents a single feed item in the feed displayed on the detail page for a case record. A case feed shows recent changes to a case record for any fields that are tracked in feeds, and comments and posts about the record. It is a useful way to stay up-to-date with changes to cases. This object is available in API version 18.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Case object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field | Details                             |
|-------|-------------------------------------|

| <code>CommentCount</code>       | <b>Type</b><br><code>int</code><br><b>Properties</b><br><code>Filter, Group, Sort</code><br><b>Description</b><br><p>The number of <code>FeedComments</code> associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| <code>ConnectionId</code>       | <b>Type</b><br>reference<br><b>Properties</b><br><code>Filter, Group, Nillable, Sort</code><br><b>Description</b><br><p>When a <code>PartnerNetworkConnection</code> modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator and the <code>ConnectionId</code> contains the ID of the <code>PartnerNetworkConnection</code>. ## Usage

Case history entries are indirectly created each time a case is modified.

Two rows are added to this record when foreign key fields change. One row contains the foreign key object names that display in the online application. For example, `Jane Doe` is recorded as the name of a Contact. The other row contains the actual foreign key ID that is only returned to and visible from the API.

This object respects field level security on the parent object.

- [SlaProcess](#)

## CaseOwnerSharingRule

Represents the rules for sharing a case with users other than the owner.

 **Note:** To programmatically update owner sharing rules, we recommend that you use Metadata API. Contact Salesforce customer support to enable access to this object for your org.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

| DeveloperName | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.</p> <p>This field is available in API version 24.0 and later.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique DeveloperName for each record. If no DeveloperName is specified, performance may slow while Salesforce generates one for each record.</p> |
| GroupId       | <p><b>Type</b></p> <p>reference</p> <p><b>Properties</b></p> <p>Create, Filter, Group, Sort</p> <p><b>Description</b></p> <p>The ID representing the source group. Cases owned by users in the source group trigger the rule to give access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## CaseShare

Represents a sharing entry on a Case.

## Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

The properties available for some fields depend on the default organization-wide sharing settings. The properties listed are true for the default settings of such fields.

| Field                        | Details                                                                                                                                                                                                                                                                                                                                                                                 |

## Usage

This object allows you to determine which users and groups can view and edit Case records owned by other users.

If you attempt to create a new record that matches an existing record, request updates any modified fields and returns the existing record.

## Usage

This object represents a value in the case status picklist. The case status picklist provides additional information about the status of a Case, such as whether a given `Status` value represents an open or closed case. Query the `CaseStatus` object to retrieve the set of values in the case status picklist, and then use that information while processing Case records to determine more information about a given case. For example, the application could test whether a given case is open or closed based on its `Status` value and the value of the `IsClosed` property in the associated `CaseStatus` object.

| Type            | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Restricted picklist<br><b>Description</b><br>Defines the visibility of a tag.<br>Valid values: <ul style="list-style-type: none"><li>• <code>Public</code>—The tag can be viewed and manipulated by all users in an organization.</li><li>• <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.</li></ul> |

## Usage

CaseTag stores the relationship between its parent TagDefinition and the Case being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## CaseTeamMember

---

Represents a case team member, who works with a team of other users to help resolve a case.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

## CaseTeamRole

---

Represents a case team role. Every case team member has a role on a case, such as “Customer Contact” or “Case Manager.”

### Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

### Fields

| Field                                | Details                                                                                                                                                                                                                                                                                                                                             |

## CaseTeamTemplate

---

Represents a predefined case team, which is a group of users that helps resolve a case.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field       | Details                                                                                                                                                         |
|-------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Description | <b>Type</b><br>textarea<br><b>Properties</b><br>Create, Filter, Nillable, Sort, Update<br><b>Description</b><br>A text description of the predefined case team. |
| Name        | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>The name of the predefined case team.                |

## CaseTeamTemplateMember

Represents a member on a predefined case team, which is a group of users that helps resolve cases.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field    | Details                                                                                                                                                                             |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MemberId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the user or contact who is a team member on a predefined case team. |

| Field          | Details                                                                                                                                                                             |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TeamRoleId     | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><b>Description</b><br>The ID of the predefined case team member's case team role. |
| TeamTemplateId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the predefined case team's template.                                |

## CaseTeamTemplateRecord

The CaseTeamTemplateRecord object is a linking object between the Case and CaseTeamTemplate objects. To assign a predefined case team to a case (customer inquiry), create a CaseTeamTemplateRecord record and point the `ParentId` to the case and the `TeamTemplateId` to the predefined case team.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field          | Details                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ParentId       | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID of the case with which the case team template record is associated. |
| TeamTemplateId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort                                                                                                     |

| Field | Details                                                                                                          |
|-------|------------------------------------------------------------------------------------------------------------------|
|       | <b>Description</b><br>The ID of the predefined case team with which the case team template record is associated. |

## CategoryData

Represents a logical grouping of Solution records.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field                         | Details                                                                                                                                                                                                                                               |

| <code>RelatedSubjectId</code> | <b>Type</b><br>reference<br><br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>ID of the solution related to the category.                                                                                         |

## Usage

This object allows you to assign one or more categories to a Solution. It is an intermediate data table with two foreign keys that defines the relationship between a CategoryNode and a Solution record.

CategoryData has two foreign keys:

- The first foreign key, `CategoryNodeId`, refers to the ID of a CategoryNode.
- The other foreign key, `RelatedSubjectId`, refers to a Solution ID.

This is a many-to-many relationship, so there can be multiple rows returned with a `CategoryNodeId`. A Solution can be associated with multiple categories.

SEE ALSO:

[Object Basics](#)

## CategoryNode

---

Represents a tree of Solution categories.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Customer Portal users can't access this object.
- Attempting to delete a CategoryNode that has children (referred by `CategoryNode.Parent`), or is referred to elsewhere, causes a failure.

## Fields

| Field       | Details                                                                                                                           |

|           | <b>Description</b><br>ID of the parent of this node, if any.                                                                                                                                          |
| SortOrder | <b>Type</b><br>int<br><br><b>Properties</b><br>Create, Filter, Group, Nillable, Sort, Update<br><br><b>Description</b><br>Indicates the sort order of child CategoryNode objects.                     |
| SortStyle | <b>Type</b><br>picklist<br><br><b>Properties</b><br>Create, Filter, Group, Restricted picklist, Sort, Update<br><br><b>Description</b><br>Indicates whether the sort order is alphabetical or custom. |

## Usage

A CategoryNode defines a category of solutions. In the user interface, you can edit category definitions from Setup by entering *Solution Categories* in the **Quick Find** box, then selecting **Solution Categories**.

[CategoryData](#)

[Solution](#)

## CategoryNodeLocalization

When the Translation Workbench is enabled for your organization, the CategoryNodeLocalization object provides the translation of the label of a solution category.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Your organization must be using Professional, Enterprise, Developer, Unlimited, or Performance Edition and be enabled for the Translation Workbench.
- To view this object, you must have the “View Setup and Configuration” permission.

## Fields

| Field             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage

Use this object to translate the labels of your solution categories into a supported language. Users with the Translation Workbench enabled can view category node translations, but either the "Customize Application," "Manage Translation," or "Manage Categories" permission is required to create or update category node translations.

## ChatterActivity

ChatterActivity represents the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user. This object is available in API version 23.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name             | Details                                                                                                                                                                                                       |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                        | <b>Description</b><br>Identifier of the object type to which the ChatterActivity is related. In API version 38.0, the <code>ParentId</code> must be a <code>UserId</code> or <code>SelfServiceUser</code> ID. |
| <code>PostCount</code> | <b>Type</b><br>int<br><br><b>Properties</b><br>Filter, Group, Sort<br><br><b>Description</b><br>The number of FeedItems made by the <code>ParentId</code> .                                                   |

## Usage

- Use this object to reference the Chatter activity statistics, which include the number of posts and comments made by a user and the number of comments and likes on posts and comments received by the same user.
- You can directly query for ChatterActivity.

```
SELECT Id, PostCount, LikeReceivedCount
FROM ChatterActivity
WHERE ParentId = UserId
```

**Note:** To query ChatterActivity, you must provide the `ParentId`. In API version 38.0, the `ParentId` must be a `UserId` or `SelfServiceUser` ID.

- A ChatterActivity record is created for users the first time they post or comment. Users who have never posted or commented don't have ChatterActivity records. If users make only one post and then delete it, they do have ChatterActivity records. In both cases, the user interface displays zeros for their Chatter activity.
- Use the `InfluenceRawRank` field to reference a user's Chatter influence rank. This field is available in API version 26.0 and later.

## ChatterAnswersReputationLevel

Represents a reputation level within a Chatter Answers zone. This object is available in API version 26.0 and later.

## Supported Calls

`create()`, `delete()`, `query()`, `retrieve()`, `update()`

## Fields

| Field       | Details                                                                                                                                                              |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CommunityID | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>ID of the zone for which you're creating the reputation level. |
| Name        | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Name of the reputation level.                             |
| Value       | <b>Type</b><br>int<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Minimum number of points for this level.                     |

## Usage

Use to create or edit reputation levels for the zone.

## ChatterConversation

Represents a private conversation in Chatter, consisting of messages that conversation members have sent or received. This object is available in API version 23.0 and later.

## Supported Calls

`describeObjects()`, `query()`, `retrieve()`

## Fields

| Field Name | Details                                                                                                                                     |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| Id         | <b>Type</b><br>ID<br><br><b>Properties</b><br>Defaulted on create, Filter, Group, Sort<br><br><b>Description</b><br>ID of the conversation. |

## Usage

Use this object to identify private conversations in Chatter. Users can access this object if they have the “Manage Chatter Messages” permission. This object is read-only via the API and is provided only to allow administrators to view users' Chatter messages; for example, for compliance purposes.

SEE ALSO:

## Usage

Use this object to view and delete messages sent or received via private conversations in Chatter. Users can access this object if they have the “Manage Chatter Messages” permission. Users with the “Moderate Communities Chatter Messages” permission can access this object in communities they’re a member of, only if the message has been flagged as inappropriate. This object is provided to allow administrators to view and delete users' Chatter messages, for example, for compliance purposes.

Messages are hard deleted. They aren’t sent to the recycle bin.

Deleting a message that resulted from sharing a file with someone does not delete the file itself.

## ClientBrowser

Represents a cookie added to the browser upon login, and also includes information about the browser application where the cookie was inserted. This object is available in version 28.0 and later.

## Supported Calls

`describeSObjects()`, `delete()`, `query()`, `retrieve()`

## Fields

## Usage

At every login, the device the login request is from is checked against the known devices using ClientBrowser. A match means a cookie was found on the browser that matches an entry in the ClientBrowser table, so the device is known. No match means that no matching cookie was found, so the device is unknown, and the user is asked to confirm their identity.

# CollaborationGroup

---

Represents a Chatter group. This object is available in API version 19.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

The visibility of information in groups depends on the type of group and the user's permissions.

- **Members:** Any user with the "Create and Own New Chatter Groups" permission can create public, private, and unlisted groups, including in any communities they belong to.
- **Owners and managers:** Users can modify group details for any group they own or manage. Owners can also delete groups they own.
- **Nonmembers:** These user permissions allow group access regardless of group membership.
  - "View All Data"—Allows users to view all public and private groups across their organization and its communities. Users with this permission can't view unlisted group information, unless they have the "Modify Unlisted Groups" permission as well.
  - "Modify All Data"—Allows users to view, modify, and delete all public and private groups across their organization and its communities. Users with this permission can't view or modify unlisted group information, unless they have the "Manage Unlisted Groups" permission as well.
  - "Create and Customize Communities"—Allows users to view, modify, and delete all public and private groups in communities.
  - "Manage Unlisted Groups"—Allows users to search for, access, and modify any unlisted group in an organization and its communities.
  - "Data Export"—Allows users to export any data from Salesforce, including private and unlisted group data from an organization and its communities.
- **Apex and Visualforce:** Apex code runs in system mode, which means that the permissions of the current user aren't taken into account.
  - Visualforce pages that display groups might expose unlisted or private group data to users who aren't members.
  - Because system mode disregards the user's permissions, all users who are accessing a Visualforce page that's showing a group can act as an owner of that group.
  - AppExchange apps that are written in Apex and that access all groups will expose unlisted groups to users who aren't members.

To limit and manage access to the unlisted and private groups in your organization:

- Explicitly filter out unlisted and private group information from SOQL queries in all Apex code.
- Use permission sets, profile-level permissions, and sharing checks in your code to further limit group access.
- Use Apex triggers on the CollaborationGroup object to monitor and manage the creation of groups. In Setup, enter *Group Triggers* in the Quick Find box, then select **Group Triggers** to add triggers.

## Fields

| Field             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

The URL returned for an older photo is not guaranteed to return a photo if a newer photo has been uploaded. You should always query this field for the URL of the most recent photo.<br/><br/>This field is available in API version 36.0 and later.</p>                                                                                                                                                                                                                                                                                                                                                                        |
| CanHaveGuests     | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>If set to <code>true</code>, indicates that a group allows customers. Chatter customers are users outside your company's email domains who can only see groups they're invited to and interact with members of those groups; they can't see any Salesforce information.<br/><br/>This field is available starting in API version 23.0, but groups that allow customers are accessible from earlier API versions. However, when accessed from earlier API versions, groups that allow customers aren't distinguishable from private groups. We strongly recommend that you upgrade to the latest API version. If you must use an earlier version, name groups that allow customers to indicate that they include customers.</p> |
| CollaborationType | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Create, Filter, Group, Restricted picklist, Sort, Update</p> <p><b>Description</b><br/>The type of Chatter group. The URL returned for an older photo is not guaranteed to return a photo if a newer photo has been uploaded. You should always query this field for the URL of the most recent photo.<br/><br/>This field is available in API version 20.0 and later.</p> |

## Usage

Use this object to create, edit, or delete groups in an organization or in a community. Deleting a group permanently deletes all posts and comments to the group. It also deletes all files and links posted to the group and removes the files from other locations where they were shared.

As a Chatter group member, you can post to the group using the CollaborationGroupFeed object. As a Chatter group owner or manager, you can add or remove group members using the CollaborationGroupMember object, post announcements to the group using the Announcement object, and accept or decline requests to join private groups using the CollaborationGroupMemberRequest object. Additionally, the group owner, manager, or your Salesforce system administrator can invite people to join the group using the CollaborationInvitation object.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

SEE ALSO:

- CollaborationGroupMember
- CollaborationGroupMemberRequest

## CollaborationGroupFeed

Represents a single feed item on a Chatter group feed. A group feed shows posts and comments about the group. This object is available in API version 19.0 and later.

### Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

### Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
  - "Moderate Chatter"
  -  **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.
  - "Manage Unlisted Groups"
- Only users with this permission can delete items in unlisted groups.

### Fields

| Field | Details                                                                                                                                                                                                                                                                                                                                                       |

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CommentCount       | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId       | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>When a PartnerNetworkConnection modifies a record that is tracked, the <code>CreatedBy</code> field contains the ID of the system administrator. The <code>ConnectionId</code> contains the ID of the PartnerNetworkConnection. Available if Salesforce to Salesforce is enabled for your organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ContentData        | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. | IsRichText   | <p><b>Type</b><br/>boolean</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Group, Sort</p> <p><b>Description</b><br/>Indicates whether the feed item <code>Body</code> contains rich text. Set <code>IsRichText</code> to <code>true</code> if you post a rich text feed item via the SOAP API. Otherwise, the post is rendered as plain text. Rich text supports the following HTML tags:</p> <ul style="list-style-type: none"> <li>• <code>&lt;p&gt;</code></li> <li>•  <b>Tip:</b> Though the <code>&lt;br&gt;</code> tag isn't supported, you can use <code>&lt;p&gt;&amp;nbsp;  &lt;/p&gt;</code> to create lines.</li> <li>• <code>&lt;b&gt;</code></li> <li>• <code>&lt;code&gt;</code></li> <li>• <code>&lt;i&gt;</code></li> <li>• <code>&lt;u&gt;</code></li> <li>• <code>&lt;s&gt;</code></li> <li>• <code>&lt;ul&gt;</code></li> <li>• <code>&lt;ol&gt;</code></li> <li>• <code>&lt;li&gt;</code></li> <li>• <code>&lt;img&gt;</code></li> </ul> <p>The <code>&lt;img&gt;</code> tag is accessible only via the API and must reference files in Salesforce similar to this example: <code>&lt;img src="sfdc://069B00000000omjh"&gt;&lt;/img&gt;</code></p> |

| Field            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                  |  <b>Note:</b> In API version 35.0 and later, the system replaces special characters in rich text with escaped HTML. In API version 34.0 and prior, all rich text appears as a plain-text representation.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| LastModifiedDate | <p><b>Type</b><br/>dateTime</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Sort</p> <p><b>Description</b><br/>Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p> |

## Usage

This object represents a request to join a private Chatter group, and can be used to accept or decline requests to join private groups you own or manage. On create, an email is sent to the owner and managers of the private group to be accepted or declined. When the `Status` is `Accepted` or `Declined`, an email is sent to notify the requester. When the `Status` is `Declined`, a `ResponseMessage` is optionally included to provide additional details.

Note the following when working with requests:

- Users with the “Modify All Data” or “View All Data” permission can view records for all groups, regardless of membership.
- A user can be a member of 300 groups. Requests to join groups count against this limit.
- `Status` can't be specified on create.
- You can only update a request when the `Status` is `Pending`.
- You can't delete or update a request with a `Status` of `Accepted` or `Declined`.

## CollaborationGroupRecord

---

Represents the records associated with Chatter groups.

### Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`, `undelete()`

### Fields

| Field                             | Details                                                                                                                                                                                                       |

## CollaborationInvitation

Represents an invitation to join Chatter, either directly or through a group. This object is available in API version 21.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

Invitations are available if “Allow Invitations” is enabled for your organization.

Invitations are limited to your allowed domain(s) unless the invite is sent from a private group that allows customers. Allowed domains are set by the administrator.

Invitations to customers are available if “Allow Customer Invitations” is enabled for your organization. Users must have the “Invite Customers to Chatter” permission to send invitations to people outside their Chatter domain.

## Usage

Use this object to create or delete (cancel) invitations to join Chatter. You can either invite a user to join Chatter directly or as part of a CollaborationGroup.

 **Note:** To invite someone to join a CollaborationGroup, you must be either the owner or a manager of the group or a Salesforce system administrator.

The Salesforce system administrator doesn't need to be a member of the group in order to send invitations using the API.

When the person accepts your CollaborationGroup invitation, they join the CollaborationGroup and Chatter as well.

 **Note:** You can't send invitations to users of the organization the invite was sent from.

Invited users can view profiles, post on their feed, and join groups, but can't see your Salesforce data or records.

If your organization allows groups with customers, owners and managers of private groups with the "Allow Customers" setting, as well as system administrators, can use this object to invite customers.

## Java Samples

The following example shows how to send an invitation to join Chatter:

```
public void invitePeople(String inviterUserId, String invitedEmail) throws Exception {
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(inviterUserId); //pass the userId of the inviter
    invitation.setInvitedUserEmail(invitedEmail); //email of the invited user
    insert(invitation);
}
```

The following example shows how to send an invitation to a customer user from a group that allows customers:

```
public void inviteToGroup(String GroupName, String invitedEmail) throws Exception {
    QueryResult qr = query("select id from collaborationgroup where name = '" +
        GroupName); //pass the group name
    String groupId = qr.getRecords()[0].getId();
    CollaborationInvitation invitation = new CollaborationInvitation();
    invitation.setSharedEntityId(groupId); //pass the groupId
    invitation.setInvitedUserEmail(invitedEmail); //email of the invited user
    insert(invitation);
}
```

## Apex Samples

```
String emailAddress = 'bob@external.com';
CollaborationGroup chatterGroup = [SELECT Id
    FROM CollaborationGroup
    WHERE Name='All acme.com'
    LIMIT 1];
```

```
CollaborationInvitation inv = New CollaborationInvitation();
inv.SharedEntityId = chatterGroup.id;
inv.InvitedUserEmail = emailAddress;

try {
    Insert inv;
} catch (DMLException e) {
    System.debug('There was an error with the invite: '+e);
}
```

## CombinedAttachment

This read-only object contains all notes, attachments, Google Docs, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter that are associated with a record.

## Supported Calls

`describeSObjects()`

| SharingOption | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Defaulted on create, Filter, Group, Restricted picklist, Sort, Update<br><b>Description</b><br>Controls whether or not sharing is frozen for a file. Only administrators and file owners with Collaborator access to the file can modify this field. Default is <b>Allowed</b> , which means that new shares are allowed. When set to <b>Restricted</b> , new shares are prevented without affecting existing shares.<br>This field is available in API versions 35.0 and later. |
| Title         | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>Title of the attached file.                                                                                                                                                                                                                                                                                                                                                                                                         |

## Usage

Use this object to list all notes, attachments, documents uploaded to libraries in Salesforce CRM Content, and files added to Chatter for a record, such as a related list on a detail page.

To determine if an object supports the CombinedAttachment object, call `describeSObject()` on the object. For example, `describeSObject('Account')` returns all the child relationships of the Account object, including `CombinedAttachment`. You can then query the CombinedAttachment child relationship.

```
SELECT Name, (SELECT Title FROM CombinedAttachments)
FROM Account
```

You can't directly query CombinedAttachment.

## Community (Zone)

Represents a zone that contains Idea or Question objects.

**Note:** Starting with the Summer '13 release, Chatter Answers and Ideas "communities" have been renamed to "zones." In API version 28, the API object label has changed to `Zone`, but the API type is still `Community`.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field             | Details                                                                                                                                                                                                                                        |

| NetworkId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>ID of the Chatter community that this zone is associated with. This field is available only if Salesforce Communities is enabled in your org. This field is available in API version 38.0 and later.</p> |

## Usage

Use this object to create a zone in Ideas, Chatter Answers, or Answers. Zones help organize ideas and questions into logical groups and are shared by the Ideas, Answers, and Chatter Answers.

## ConnectedApplication

Represents a connected app and its details; all fields are read-only.

Connected apps link client applications, third-party services, other Salesforce organizations, apps and resources to your organization. The connected app configuration specifies authorization and security settings for these resources. This object exposes the settings for a specified connected app.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name                         | Details                                                                                                                                                                                                                                                                         |

| StartUrl                          | <p><b>Type</b><br/>url</p> <p><b>Properties</b><br/>Filter, Nillable, Sort</p> <p><b>Description</b><br/>If the app is not accessed from a mobile device, users are directed to this URL after they've authenticated.</p>                                                                                                |

## Contact

Represents a contact, which is an individual associated with an account.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `merge()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can access only portal-enabled contacts.

## Fields

**Note:** If you are importing Contact data and need to set the value for an audit field, such as `CreatedDate`, contact Salesforce. Audit fields are automatically updated during API operations unless you request to set these fields yourself..

## Usage

Use this object to manage individuals who are associated with an Account in your organization. You can create, query, delete, or update any Attachment associated with a contact.

Create or update contacts by converting a Lead with the `convertLead()` call.

## ContactCleanInfo

Stores the metadata Data.com Clean uses to determine a contact record's clean status. Helps you automate the cleaning or related processing of contact records. ContactCleanInfo includes a number of bit vector fields.

Contact Clean Info provides a snapshot of the data in your Salesforce contact record and its matched Data.com record at the time the Salesforce record was cleaned.

Contact Clean Info includes a number of bit vector fields, whose component fields each correspond to individual object fields and provide related data or status information about those fields. For example, the bit vector field `IsDifferent` has an `IsDifferentEmail` field. If the `IsDifferentEmail` field's value is `False`, that means the `Email` field value is *the same* on the Salesforce contact record and its matched Data.com record.

ContactCleanInfo bit vector fields include:

- `CleanedBy` indicates who (a user) or what (a Clean job) cleaned the contact record.

- `IsDifferent` indicates whether or not a field on the contact record has a value that differs from the corresponding field on the matched Data.com record.
- `IsFlaggedWrong` indicates whether or not a field on the contact record has a value that is flagged as wrong to Data.com.
- `IsReviewed` indicates whether or not a field on the contact record is in a `Reviewed` state, which means that the value was reviewed but not accepted.

## Usage

Developers can create triggers that read the Contact Clean Info fields to help automate the cleaning or related processing of contact records.

Create a customized set of `Title` field values. Use triggers to map values from fields on imported or cleaned records onto a standard set of values.

## ContactFeed

Represents a single feed item in the feed on a contact record detail page. This object is available in API version 18.0 and later.

A contact feed shows recent changes to a contact record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to Contact records.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Contact object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of ContactFeed. Required when <code>Type</code> is <code>TextPost</code>. Optional when <code>Type</code> is <code>ContentPost</code> or <code>LinkPost</code>. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                 |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> |

| Field                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|              | <p><b>Description</b></p> <p>Date and time when a user last modified this record. This field is a standard system field.</p> <p>When a feed item is created, <code>LastModifiedDate</code> is the same as <code>CreatedDate</code>. If a <code>FeedComment</code> is inserted on that feed item, then <code>LastModifiedDate</code> becomes the <code>CreatedDate</code> for that <code>FeedComment</code>. Deleting the <code>FeedComment</code> does not change the <code>LastModifiedDate</code>.</p> <p>Ordering by <code>LastModifiedDate DESC</code> sorts the feed by both the most recent feed item or comment.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| DeveloperName      | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Corresponds to <b>Rule Name</b> in the user interface.<br/><br/>This field is available in API version 24.0 and later.</p> |

| Field         | Details                                                                                                                                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|               |  <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record. |
| GroupId       | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID representing the source group. A Contact owned by a User in the source Group triggers the rule to give access.                                                                                              |
| Name          | <b>Type</b><br>string<br><b>Properties</b><br>Create, Filter, Group, Sort, Update<br><b>Description</b><br>Label of the sharing rule as it appears in the user interface. Limited to 80 characters. Corresponds to <b>Label</b> on the user interface.                                                                   |
| UserOrGroupId | <b>Type</b><br>reference<br><b>Properties</b><br>Create, Filter, Group, Sort<br><b>Description</b><br>The ID representing the User or Group being granted access.                                                                                                                                                        |

## Usage

Use this object to manage the sharing rules for contacts.

SEE ALSO:

[Contact](#)

[ContactShare](#)

[Metadata API Developer Guide: SharingRules](#)

## ContactShare

Represents a list of access levels to a Contact along with an explanation of the access level. For example, if you have access to a record because you own it, the `ContactAccessLevel` is `All` and `RowCause` is `Owner`.

## Supported Calls

`describeSObjects()`, `create()`, `delete()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

Customer Portal users can't access this object.

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Usage

This object allows you to determine which users and groups can view or edit Contact records owned by other users.

SEE ALSO:

[AccountShare](#)

## ContactTag

Associates a word or short phrase with a Contact.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`

Parent relationships are created automatically.                                                                           |
| TagDefinitionId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter<br><b>Description</b><br>ID of the parent TagDefinition object that owns the tag.                                                                                                                                                                                                                                                                                             |
| Type            | <b>Type</b><br>picklist<br><b>Properties</b><br>Create, Filter, Restricted picklist<br><b>Description</b><br>Defines the visibility of a tag.<br>Valid values: <ul style="list-style-type: none"><li>• <code>Public</code>—The tag can be viewed and manipulated by all users in an organization.</li><li>• <code>Personal</code>—The tag can be viewed or manipulated only by a user with a matching <code>OwnerId</code>.</li></ul> |

## Usage

ContactTag stores the relationship between its parent TagDefinition and the Contact being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

# ContentAsset

---

Represents a Salesforce file that has been converted to an asset file in a custom app in Lightning Experience. Enables a Salesforce file to be used for org setup and configuration purposes. Asset files can be packaged and referenced by other components. This object is available in API version 38.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

- Only admin users can create, edit, or delete ContentAssets.
- It isn't necessary to create asset files for regular, collaborative use of Salesforce Files. "Assetize" files only when they're used in setup and configuration situations.
- Neither the file (ContentDocument) nor the asset settings record (ContentAssets) can be deleted if the asset file is referenced by another component.
- ContentAsset doesn't support search or most recently used (MRU) lists.
- ContentAsset doesn't support Apex triggers.
- 

## Fields

| Field             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## ContentDistribution

Represents information about sharing a document externally. This object is available in API version 32.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

- Salesforce CRM Content must be enabled to query shared documents. To query content deliveries, content deliveries must be enabled.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- Users can query the `DistributionPublicUrl` and `Password` fields only if they are the file owner, if the file is shared with them, or if the `RelatedRecordId` specifies a record that the users can access.
- If the shared document is deleted, the delete cascades to any associated `ContentDistribution`. The `ContentDistribution` is still queryable by using the `QueryAll` verb.
- If the shared document is archived, the only fields that users can edit are `ExpiryDate` and `PreferencesExpires`.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.

## Fields

| Field Name                         | Details                                                                                                                            |

## Usage

Use this object to create, update, delete, or query information about a document shared externally via a link or via Salesforce CRM Content delivery.

The ContentDistribution object supports triggers before and after these operations: insert, update, delete. It supports triggers after undelete.

**Example:** The VP of Marketing wants file authors to specify whether their files can be shared with external people using content delivery. He also wants some files to have a password. You can add a custom field `DeliveryPolicy` on the ContentVersion object. Make the custom field a picklist with the values, `Allowed`, `Blocked`, and `Password required`. Add the field to the ContentVersion layout so that the user can set the delivery policy per file. Then, add an insert trigger for the ContentDistribution object to enforce the rules based on the delivery policy set in the file.

**Note:** The `ContentVersionId` for ContentDistribution must be unique.

This trigger for the ContentDistribution object enforces the delivery policy rules for each file:

```
trigger deliveryPolicy on ContentDistribution (before insert) {
    for (ContentDistribution cd : trigger.new) {
        String versionId = DeliveryPolicyHelper.getContentVersionId(cd);
        ContentVersion version = [select DeliveryPolicy__c from ContentVersion where
Id = :versionId];
        String policy = version.DeliveryPolicy__c;
        if (policy.equals('Blocked')) {
            cd.addError('This file is not allowed to be delivered.');
```

The trigger calls this helper class:

```
public class DeliveryPolicyHelper {
    public static String getContentVersionId(ContentDistribution cd) {
        if (cd.ContentVersionId != null) {
            return cd.ContentVersionId;
        } else {
            String versionId = [select LatestPublishedVersionId from ContentDocument
where Id = :cd.ContentDocumentId].get(0).LatestPublishedVersionId;
            return versionId;
        }
    }

    public static boolean requirePassword(ContentDistribution cd) {
        return cd.PreferencesPasswordRequired;
    }
}
```

**Important:** Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

# ContentDistributionView

Represents information about views of a shared document. This read-only object is available in API version 32.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Salesforce CRM Content must be enabled to query shared documents. To query content deliveries, content deliveries must be enabled.
- Users (including users with the “View All Data” permission) can query only the files that they have access to. If the file is managed by a Content Library, the user must have “Deliver Content” enabled in the library permission definition and be a member of the library. If the file isn’t managed by a Content Library, the user must have the “Enable Creation of Content Deliveries for Salesforce Files” permission.
- If the shared document is deleted, the delete cascades to any associated ContentDistributionView. The ContentDistributionView is still queryable by using the `QueryAll` verb.
- Customer Portal users can’t access this object.
- Chatter Free users can’t access this object.

## Fields

| Field Name     | Details                                                                                                                                                                                                                       |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DistributionId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the content delivery that the document is part of.                                                                        |

| Field Name   | Details                                                                                                                                                               |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|              | <b>Description</b><br><code>true</code> if the shared document is viewed by a user in the same organization;<br><code>false</code> if viewed by an external user.     |
| ParentViewId | <b>Type</b><br>reference<br><br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><br><b>Description</b><br>ID of this instance of accessing the shared document. |

## Usage

Use this read-only object to query information about users who are accessing shared documents.

## ContentDocument

Represents a document that has been uploaded to a library in Salesforce CRM Content or Salesforce Files. This object is available in API versions 17.0 and later for Salesforce CRM Content. This object is available in API version 21.0 and later for Salesforce Files.

The maximum number of documents that can be published is 10,000,000. Archived files count towards this limit and towards storage usage limits.

- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period.
- Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.

## Supported Calls

`delete()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`

## Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission in order to query content in libraries where they have access.
- Users (including users with the “View All Data” permission) can only query files they have access to, including:
  - All Salesforce CRM Content files in libraries they're a member of and in their personal library, regardless of library permissions (API version 17.0 and later).
  - All Salesforce Files they own, posted on their profile, posted on groups they can see, and shared directly with them (API version 21.0 and later).
- A Salesforce CRM Content document can be deleted if any of the following are true:
  - The document is published into a personal library or is in the user's upload queue.

- The document is published into a public library, the user is a member of that library with the “Add Content” library privilege enabled, and the user trying to delete the document is the owner.
- The document is published into a public library that has the “Delete Content” or “Manage Library” permission enabled, and the user trying to delete the document is not the owner.

For API version 25.0 and later, you can change ownership of Salesforce Files and Salesforce CRM Content documents.

- The following must be true to change ownership of a Salesforce CRM Content document:
  - The Salesforce CRM Content app must be enabled.
  - The user who is becoming the owner of the document must have a Salesforce CRM Content feature license.
- A user can change ownership of a Salesforce CRM Content document or Salesforce file if any of the following are true:
  - The user is the current owner, or has either the “Modify All Data” or “Manage Salesforce CRM Content” permission enabled.
  - The user has the “Manage Library” permission enabled for the library containing the document.

**Note:**

- The user who is becoming the owner of the document must be a visible user who is active, but the original owner can be inactive.
- A document's owner can be changed to a user who doesn't have access to the library that contains the document. Library administrators may need to give the new owner membership to the library.

## Fields

| Field          | Details                                                                                                                                                                                                                            |

Only administrators and file owners with Collaborator access to the file can modify this field. Default is <code>Allowed</code>, which means that new shares are allowed. When set to <code>Restricted</code>, new shares are prevented without affecting existing shares.</p> <p>This field is available in API versions 35.0 and later.</p> |
| Title         | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The title of a document.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Usage

- Use this object to retrieve, query, update, and delete the latest version of a document, but not a content pack, in a library or a Salesforce file . Use the `ContentVersion` object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file.
- The `query()` call doesn't return archived documents. The `queryAll()` call returns archived documents.
- You can't add new versions of archived documents.
- To query a file that is shared only with a record, you must specify the content ID of the file.
- To create a document, create a new version via the `ContentVersion` object without setting the `ContentDocumentId`. This automatically creates a parent document record. When adding a new version of the document, you must specify an existing `ContentDocumentId` which initiates the revision process for the document. When the latest version is published, the title, owner, and publish status fields are updated in the document.
- When you delete a document, all versions of that document are deleted, including ratings, comments, and tags.
- You can't create, edit, or delete content packs via the API.

**Note:** Content metadata, such as tags, custom fields, and content owners are tracked at the version level rather than at the document level.

- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- A document record is a container for multiple version records. You create a new version to add a document to the system. The new version contains the actual file data which allows the document to have multiple versions. The version stores the body of the uploaded document.

- Assign topics to ContentDocument using `TopicAssignment` in API version 37.0 or later.

# ContentDocumentFeed

Represents a single feed item associated with ContentDocument. A content document feed shows these content document changes: creating a ContentDocument file and uploading a new ContentDocument. This object is available in versions 20.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the ContentDocument object
- "Moderate Chatter"

 **Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                       |

|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                    | <p><b>Description</b></p> <p>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ContentData        | <p><b>Type</b></p> <p>base64</p> <p><b>Properties</b></p> <p>Nullable</p> <p><b>Description</b></p> <p>Available in API version 36.0 and earlier only. ## Usage

Use this object to track changes for a ContentDocument object.

SEE ALSO:

[ContentDocument](#)

## ContentDocumentHistory

Represents the history of a document. This object is available in versions 17.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

## Fields

| Field             | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Usage

Use this read-only object to query the history of a document.

SEE ALSO:

[ContentDocument](#)

## ContentDocumentLink

Represents the link between a Salesforce CRM Content document or Salesforce file and where it's shared. A file can be shared with other users, groups, records, and Salesforce CRM Content libraries. This object is available in versions 21.0 and later for Salesforce CRM Content documents and Salesforce Files.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- Users (including users with the “View All Data” permission) can only query files they have access to, including:
  - All Salesforce CRM Content files in libraries they're a member of and in their personal library, regardless of library permissions (API version 17.0 and later).
  - All Salesforce Files they own, posted on their profile, posted on groups they can see, and shared directly with them (API version 21.0 and later).
- In API versions 33.0 and later, you can create and delete ContentDocumentLink objects with a `LinkedEntityId` of any record type that can be tracked in the feed, even if feed tracking is disabled for that record type.
- In API versions 25.0 and later, you can create ContentDocumentLink objects with a `LinkedEntityId` of type `User`, `CollaborationGroup`, or `Organization`.
- In API versions 21.0 and later, users with explicit Viewer access (the file has been directly shared with the user) to a file can delete ContentDocumentLink objects between the file and other users who have Viewer access. In the same API versions, any user with Viewer access to a file can delete ContentDocumentLink objects between the file and organizations or groups of which they are a member.

- For organizations with Communities enabled, a document can only be shared with users and groups that are a part of the [community](#) the file was created in.

|-------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|       | <p><b>Description</b></p> <p>Specifies whether this file is available to all users, internal users, or shared users. This field is available in API version 26.0 and later.</p> <p><code>Visibility</code> can have the following values.</p> <ul style="list-style-type: none"> <li>• <code>AllUsers</code>—The file is available to all users who have permission to see the file.</li> <li>• <code>InternalUsers</code>—The file is available only to internal users who have permission to see the file.</li> <li>• <code>SharedUsers</code>—The file is available to all users who can see the feed to which the file is posted. <code>SharedUsers</code> is used only for files shared with users, and is available only when an org has private org-wide sharing on by default. The <code>SharedUsers</code> value is available in API version 32.0 and later.</li> </ul> <p>Note the following exceptions for <code>Visibility</code>.</p> <ul style="list-style-type: none"> <li>• <code>AllUsers</code> &amp; <code>InternalUsers</code> values apply to files posted on standard and custom object records, but not to users, groups, or content libraries.</li> <li>• For posts to a record feed, <code>Visibility</code> is set to <code>InternalUsers</code> for all internal users by default.</li> <li>• External users can set <code>Visibility</code> only to <code>AllUsers</code>.</li> <li>• On user and group posts, only internal users can set <code>Visibility</code> to <code>InternalUsers</code>.</li> <li>• For posts to a user feed, if the organization-wide default for user sharing is set to private, <code>Visibility</code> is set to <code>SharedUsers</code>.</li> </ul> <p>The visibility setting on <code>ContentDocumentLink</code> determines a file's visibility on a record post. When a file has multiple references posted in a feed, the file's visibility is determined by the most visible setting.</p> |

## Usage

Use this object to query the locations where a file is shared or query which files are linked to a particular location. For example, the following query returns a particular document shared with a Chatter group:

```
SELECT ContentDocument.title FROM ContentDocumentLink WHERE ContentDocumentId =
'069D00000000so2' AND LinkedEntityId = '0D5000000089123'
```

- You can't run a query without filters against `ContentDocumentLink`.
- You can't filter on `ContentDocument` fields if you're filtering by `ContentDocumentId`. You can only filter on `ContentDocument` fields if you're filtering by `LinkedEntityId`.
- You can't filter on the related object fields. For example, you can't filter on the properties of the account to which a file is linked. You can filter on the properties of the file, such as the title field.

A SOQL query must filter on one of `Id`, `ContentDocumentId`, or `LinkedEntityId`.

The `ContentDocumentLink` object supports triggers before and after these operations: insert, update, delete.

**Example:** This trigger for the ContentDocumentLink object prevents public XLSX files from being shared.

```
trigger NoShareXLSX on ContentDocumentLink (after insert) {
  for (ContentDocumentLink cdl : trigger.new) {
    if (!CDLHelper.isSharingAllowed(cdl)) {
      cdl.addError('Sorry, you cannot share this file.');
```

The trigger calls this helper class.

```
public class CDLHelper {

  /**
   * Gets FileExtension of the inserted content.
   */
  public static String getFileExtension(ContentDocumentLink cdl) {
    String fileExtension;
    String docId = cdl.ContentDocumentId;
    FileExtension = [select FileExtension from ContentVersion where ContentDocumentId
= :docId].get(0).FileExtension;
    return FileExtension;
  }

  /**
   * Checks the file's PublishStatus and FileExtension to decide whether user can
share the file with others.
   * PublishStatus 'P' means the document is in a public library.
   */
  public static boolean isSharingAllowed(ContentDocumentLink cdl) {
    String docId = cdl.ContentDocumentId;
    ContentVersion version = [select PublishStatus,FileExtension from ContentVersion
where ContentDocumentId = :docId].get(0);
    if (version.PublishStatus.equals('P') && (version.FileExtension != null &&
version.FileExtension.equals('xlsx'))) {
      return false;
    }
    return true;
  }

  /**
   * Gets the parent account name if the file is linked to an account.
   */
  public static String getAccountName(ContentDocumentLink cdl) {
    String name;
    String id = cdl.LinkedEntityId;
    if (id.substring(0,3) == '001') {
      name = [select Name from Account where Id = :id].get(0).Name;
    }
    return name;
  }
}
```

 **Important:** Apex has a per organization limit of 10 concurrent requests that last longer than 5 seconds. A trigger that uploads files can easily hit this limit.

[ContentDocument](#)

# ContentFolder

Represents a folder in a content library for adding files. This object is available in API version 34.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolder.
- All users with a content feature license can modify folders in their personal library.
- To modify a folder, the user must be a member of the library and have permission to modify folders.

## Fields

| Field Name            | Details                                                                                                                                                                    |

# ContentFolderItem

Represents a file (ContentDocument) or folder (ContentFolder) that resides in a ContentFolder in a ContentWorkspace. This object is available in API version 35.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

## Fields

| Field Name            | Details                                                                                                                                                                            |

## Usage

## ContentFolderLink

Defines the association between a library and its root folder. This object is available in API version 34.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Salesforce CRM Content must be enabled to access ContentFolderLink.
- ContentFolderLink is read-only in the context of a library.

## Fields

| Field Name      | Details                                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------------|
| ContentFolderId | <b>Type</b><br>reference<br><b>Properties</b><br>Filter, Group, Sort<br><b>Description</b><br>ID of the folder. |
| ParentEntityId  | <b>Type</b><br>reference                                                                                        |

| Field Name | Details                                                                     |
|------------|-----------------------------------------------------------------------------|
|            | <b>Properties</b><br>Filter, Group, Sort                                    |
|            | <b>Description</b><br>Name of the entity the folder hierarchy is linked to. |

## ContentFolderMember

Defines the association between a file and a folder. This object is available in API version 34.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `update()`

## Special Access Rules

- Salesforce CRM Content or Chatter must be enabled to access ContentFolderMember.
- All users with a content feature license can modify folders in their personal library.
- To modify ContentFolderMember, the user must be a member of the library and have permission to modify folders.

## Fields

| Field Name            | Details                                                                                                                                        |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| ChildRecordId         | <b>Type</b><br>reference<br><br><b>Properties</b><br>Filter, Group, Sort<br><br><b>Description</b><br>ID of the file.                          |
| ParentContentFolderId | <b>Type</b><br>reference<br><br><b>Properties</b><br>Filter, Group, Sort, Update<br><br><b>Description</b><br>ID of the folder the file is in. |

# ContentHubItem

---

Represents a file or folder in a Files Connect external data source, such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

## Special Access Rules

Chatter and Files Connect must be enabled for the organization.

## Supported Calls

`describeSObjects()`, `query()`, `search()`

## Fields

| Field Name             | Details                                                                                                                                                                                                     |

## Usage

The following SOQL query examples show how to retrieve files and folders from a Files Connect external data source. These examples use placeholders for ID values for the repository ID and folder IDs. Before running these queries, replace the placeholders with valid ID values for your external data source and folders.

 **Important:** You must filter queries and searches on ContentHubItem with the ContentHubRepositoryId field; for example, `SELECT Id FROM ContentHubItem WHERE ContentHubRepositoryId = <ID of external data source>`.

**Example 1:** Get the ID and name of the root folder in an external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = NULL
```

**Example 2:** List all folders and files under the specified root folder.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
```

**Example 3:** List all external file data sources by querying ContentHubRepository.

```
SELECT DeveloperName
FROM ContentHubRepository
```

**Example 4:** List all files and folders in a given folder and external file source.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<parent folder ID>'
```

**Example 5:** To return only folders in the result set, add `IsFolder = true` in the `WHERE` clause to a query that returns files and folders. For example, the following query lists all folders under the root folder.

```
SELECT Id, Name
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND ParentId = '<root folder ID>'
AND IsFolder = true
```

**Example 6:** Retrieve a link that is used to open the specified document in an external source.

```
SELECT ExternalDocumentUrl
FROM ContentHubItem
WHERE ContentHubRepositoryId = '<repository ID>' AND Id = '<document ID>'
```

**SOSL Example:** Retrieve the ID and name of all documents that contain the search string. The result set is limited to the first 10 documents.

```
FIND {<search string>}
RETURNING ContentHubItem(Id, Name
                        WHERE ContentHubRepositoryId = '<repository ID>')
LIMIT 10
```

## ContentHubRepository

Represents a Files Connect external data source such as Microsoft SharePoint or OneDrive for Business. This object is available in API version 33.0 and later.

### Special Access Rules

Chatter and Files Connect must be enabled for the organization.

### Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

### Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DeveloperName | <p><b>Type</b></p> <p>string</p> <p><b>Properties</b></p> <p>Filter, Group, Sort</p> <p><b>Description</b></p> <p>The unique name of the record in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. This field is automatically generated but you can supply your own value if you create the record using the API.</p> |

| Field Name               | Details                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                          |  <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.                                             |
| <code>MasterLabel</code> | <b>Type</b><br>string <b>Properties</b><br>Filter, Group, Nillable, Sort <b>Description</b><br>Master label for the external data source. This display value is the internal label and does not get translated.                                                                                                                                                      |
| <code>Type</code>        | <b>Type</b><br>string <b>Properties</b><br>Filter, Group, Nillable, Sort <b>Description</b><br>The data source type. ## Usage

- The ContentNote object represents notes created with the enhanced note taking tool, released in Winter '16.
- Use ContentNote to create, query, retrieve, search, edit, and update notes.
- ContentNote is built on ContentVersion, and so it has many of the same usages.
- Not all fields can be set for notes. Only the `Content` and `Title` fields can be updated.
- The maximum file size you can upload via the SOAP API must be less than 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64. This conversion increases the document size by approximately 37%. Account for the base64 conversion increase so that the file you plan to upload is less than 50 MB.
- SOQL and SOSL queries on the ContentNote return only the most recent version of the note.
- To relate a note to a record, use [ContentDocumentLink](#).

For example, the following code creates a note and escapes any special characters so they are converted to their HTML equivalents.

```
ContentNote cn = new ContentNote();
cn.Title = 'test1';
String body = 'Hello World. Before insert/update, escape special characters such as ", ',
    &, and other standard escape characters.';
cn.Content = Blob.valueOf(body.escapeHTML4());
insert(cn);
```

In this example, the following code creates a note using text that is already formatted as HTML, so it does not need to be escaped.

```
ContentNote cn = new ContentNote();
cn.Title = 'test2';
String body = '<b>Hello World. Because this text is already formatted as HTML, it does not
    need to be escaped.
    Special characters such as &quot;;, etc. must already use their HTML equivalents.</b>';
cn.Content = body;
insert(cn);
```

## ContentVersion

Represents a specific version of a document in Salesforce CRM Content or Salesforce Files. This object is available in versions 17.0 and later for Salesforce CRM Content documents. This object is available in versions 20.0 and later for Salesforce Files.

The maximum number of versions that can be published in a 24-hour period is 36,000.

## Supported Calls

`create()`, `describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`, `search()`, `update()`, `upsert()`

## Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- Customer and Partner Portal users can only publish, version, or edit documents if they have a Salesforce CRM Content feature license.
- All users with a content feature license can create versions in their personal library.
- Users (including users with the “View All Data” permission) can only query files they have access to, including:
  - All Salesforce CRM Content files in libraries they're a member of and in their personal library, regardless of library permissions (API version 17.0 and later).
  - All Salesforce Files they own, posted on their profile, posted on groups they can see, and shared directly with them (API version 21.0 and later).
- All users can update versions in their personal library.
- The owner of a version or document can update the document if they are a member of the library, regardless of library permissions.
- To update a Salesforce CRM Content document, the user must be a member of the library with one of these library privileges enabled:
  - “Add Content”
  - “Add Content On Behalf of Others”
  - “Manage Library”

- `FileType` is defined by either `ContentUrl` for links or `PathOnClient` for documents, but not both.
- In API version 34.0 and later, any file can be shared with libraries, whether the file originated in Chatter or in Salesforce CRM Content.

## Fields

| Field               | Details                                                                                                                                                                                                                                                                                                                                                                                                                      |

| VersionData   | <b>Type</b><br>base64<br><b>Properties</b><br>Create, Nillable, Update<br><b>Description</b><br>Encoded file data. This field can't be set for links. The maximum file size you can upload via the SOAP API must be less than 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in <code>VersionData</code> . This conversion increases the document size by approximately 37%. You must account for the base64 conversion increase so that the file you plan to upload is less than 50 MB. |
| VersionNumber | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The version number. The number increments with each version of the document, for example, 1, 2, 3.                                                                                                                                                                                                                                                                                                                                      |

## Usage

- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce CRM Content document or Salesforce file. Use the `ContentDocument` object to retrieve, query, update, and delete the latest version of a document, but not a content pack, in a library or a Salesforce file .
- Use this object to create, query, retrieve, search, edit, and update a specific version of a Salesforce file. Use the `ContentDocument` object to retrieve, query, update, and delete the latest version of a Salesforce file .
- To query a file that is shared only with a record, you must specify the content ID of the file.
- Not all fields can be set for Salesforce Files.
- You can only update a version if it is the latest version and if it is published.
- You can't archive versions.
- Using API version 32.0 and later, you can update record types on versions.
- You can't delete a version via the API.
- The maximum file size you can upload via the SOAP API must be less than 50 MB. When a document is uploaded or downloaded via the API, it is converted to base64 and stored in `VersionData`. This conversion increases the document size by approximately 37%. You must account for the base64 conversion increase so that the file you plan to upload is less than 50 MB.
- To download a document via the API, you must export the `VersionData` of the document. This does not increase the download count.

- When you upload a document from your local drive using the Data Loader, you must specify the actual path in both `VersionData` and `PathOnClient`. `VersionData` identifies the location and extracts the format and `PathOnClient` identifies the type of document being uploaded.
- SOQL queries on the `ContentVersion` object return all versions of the document. SOSL searches on the `ContentVersion` object return only the most recent version of the document.
- If you query versions in the API, versions with a `PublishStatus` of `Upload Interrupted` are not returned.
- Documents published into a personal library assume the default record type that is set for the user profile of the person publishing the document (General, if no default is set for the user profile).

**Note:** An administrator can rename the default (*Content Version Layout*) page layout.

- Contact Manager, Group, Professional, Enterprise, Unlimited, and Performance Edition customers can publish a maximum of 36,000 new versions per 24-hour period. Developer Edition and trial users can publish a maximum of 2,500 new versions per 24-hour period.
- Custom validation rules can prevent an update of documents published into a personal library via the API.

## Applying Tags to ContentVersion Records

Tags can be applied to `ContentVersion` records using either Enterprise or Partner API.

To apply tags to a `ContentVersion` record, set a value in the `TagCsv` field. For example, setting this field to `one, two, three` creates and associates three tags to that version.

- The maximum length of the `TagCsv` field is 2,000 characters.
- The maximum length of an individual tag is 100 characters.
- When tags are applied to a version, the content is indexed automatically and the tags are searchable.
- You can't apply tags to a `TagCsv` that is published into a personal library.
- You can't apply tags using the `ContentDocument` object.
- You can't change or delete tag names. You can remove tags from a document, but that doesn't delete the tag.
- Tags are case insensitive. You can't have two tags with the same name even if they use different uppercase and lowercase letters. The case of the original tag is always used.

To delete tags from a `ContentVersion` record, perform a standard API update, and remove any values from the `TagCsv` field that you want to delete. For example, if the original `TagCsv` is `one, two, three`, perform an API update specifying `one, three` in the `TagCsv` field to delete `two`. To delete all tags from a `ContentVersion` you perform a standard API update by setting the field to `null`.

If you create a `ContentVersion` record and want to revise it via the API, you insert another `ContentVersion` record but associate it to the same `ContentDocument` record as the original. This has an impact on tagging:

- If you insert the revision and do not set any value in the `TagCsv` field, any tags applied to the previous version are automatically applied to the new version.
- If you insert the revision and specify a new `TagCsv` field, no tags transfer over and the tags you specify are applied instead.

When you perform a SOQL query for a `ContentVersion` record and select the `TagCsv` field, all the tags associated with that record are returned. The tags in the string are always ordered alphabetically even if they were inserted in a different order. You can't use the `TagCsv` field as part of a filter in a SOQL query. You can't query all tags in your organization.

Library tagging rules:

- API tagging respects the tagging restrictions that exist on any library that the document is published into. For example, if the library is in restricted tagging mode and only allows tags `one, three`, you can't save a version with a `TagCsv` of `one, two, three`.

- If the library is in guided tagging mode, you can apply tags to the ContentVersion. You can't query the value of guided tags on a library, but you can query the tagging model of a library.

SEE ALSO:

- [ContentDocument](#)
- [ContentVersionHistory](#)

# ContentVersionHistory

Represents the history of a specific version of a document. This object is available in version 17.0 and later.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission to query content in libraries where they have access.
- A user can query all versions of a document from their personal library and any version that is part of or shared with a library where they are a member, regardless of library permissions.

## Fields

| Field            | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

[ContentVersion](#)

# ContentWorkspace

---

Represents a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

 **Note:** This object does not apply to personal libraries.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Special Access Rules

- Customer and Partner Portal users can only edit the library document object if they have a Salesforce CRM Content feature license.
- Customer and Partner Portal users can query this object if they have the “View Content in Portal” permission. A user can query all public libraries where they are members, regardless of library permissions.

## Fields

| Field                  | Details                                                                                                                                                                                                                                    |

| TagModel                     | <p><b>Type</b><br/>picklist</p> <p><b>Properties</b><br/>Defaulted on create, Filter, Nillable, Restricted picklist</p> <p><b>Description</b><br/>The type of tagging assigned to a library. Valid values are:</p> <ul style="list-style-type: none"> <li>• <code>U</code> — Unrestricted. No restrictions on tagging. Users can enter any tag when publishing or editing content.</li> <li>• <code>G</code> — Guided. Users can enter any tag when publishing or editing content, but they are also offered a list of suggested tags.</li> <li>• <code>R</code> — Restricted. Users must choose from a list of suggested tabs.</li> </ul> |

## Usage

Use this object to query libraries to find out where documents can be published.

If the content type is not specified when publishing a new version into a library, it will be determined by the `DefaultRecordTypeId` of the primary library.

You can't create, update, or delete a library via the API.

SEE ALSO:

[ContentWorkspaceDoc](#)

## ContentWorkspaceDoc

Represents a link between a document and a public library in Salesforce CRM Content. This object is available in versions 17.0 and later.

 **Note:** This object does not apply to documents and versions in a personal library.

## Supported Calls

`create()`, `delete()`, `describeObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

- Customer and Partner Portal users must have the “View Content in Portal” permission in order to query and obtain content in libraries where they have access.
- Customer and Partner Portal users can only edit documents if they have a Salesforce CRM Content feature license.
- To create a ContentWorkspaceDoc, you must be a member of the library with one of these library privileges enabled:
  - “Add Content”
  - “Add Content On Behalf of Others”
  - “Manage Library”
- To query all library documents in a library, a user must be a member of that library, regardless of library permissions.

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                |

| Field | Details                                                                                       |
|-------|-----------------------------------------------------------------------------------------------|
|       | more than one library, but only one library owns the document and determines its permissions. |

## Usage

- Use this object to link a document to one or more libraries.
- To share a document with additional libraries, create additional ContentWorkspaceDoc records which join the document to the additional libraries.
- Inserting a ContentWorkspaceDoc triggers the publish process for public libraries.
- A document can be published into many public libraries, but it will always be owned by one library which controls the security of the document.
- A document can only be published into the document owner's personal library. You can't publish into another user's personal library. Personal libraries are not visible via the API.
- To publish a document into a personal library, you must specify your user ID as the first publish location ID. If you leave the first publish location ID blank, it defaults to the current user's ID.
- A document can be published from a personal library into a public library, but once it has been published into the public library, it can't be published into the personal library again.
- You can't publish a document from a personal library into a public library that has restricted content types.
- You can't update or delete a library document via the API.

## Usage

The Contract object represents a business agreement.

The `Status` field specifies the current state of a contract. Status strings (defined in the ContractStatus object) represent its current state (Draft, InApproval, or Activated).

Client applications must initially create a Contract in a non-Activated state. Client applications can subsequently activate a Contract by updating it and setting the value in its `Status` field to `Activated`; however, the `Status` field is the only field you can update when activating the Contract.

Once a Contract has been activated, your client application can't change its status; however, prior to activation, your client application can change the status value from `Draft` to `InApproval` via the API. Also, your client application can delete contracts whose status is `Draft` or `InApproval` but not when a contract status is `Activated`.

Client applications can use the API to create, update, delete, and query any Attachment associated with a contract.

## ContractContactRole

---

Represents the role that a given Contact plays on a Contract.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Fields

| Field                   | Details                                                                                                                                                        |

| IsPrimary | <p><b>Type</b></p> <p>boolean</p> <p><b>Properties</b></p> <p>Create, Defaulted on create, Filter, Group, Sort, Update</p> <p><b>Description</b></p> <p>Specifies whether this Contact plays the primary role on this Contract (<code>true</code>) or not (<code>false</code>). Note that each contract has only one primary contact role. Default is <code>false</code>. Label is <b>Primary</b>.</p>                                                                                                                                           |
| Role      | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Create, Filter, Nillable, Group, Sort, Update</p> <p><b>Description</b></p> <p>Name of the role played by the Contact on this Contract, such as Decision Maker, Approver, Buyer, and so on. Must be unique—there can't be multiple records in which the <code>ContractId</code>, <code>ContactId</code>, and <code>Role</code> values are identical. Different contacts can play the same role on the same contract. A contact can play different roles on the same contract.</p> |

## Usage

Use the `ContractContactRole` object to define the role that a given Contact plays on a given Contract within the context of a specific Opportunity.

## ContractFeed

Represents a single feed item in the feed on the contract record detail page. This object is available in API version 18.0 and later.

A contract feed shows recent changes to a contract record for any fields that are tracked in feeds, and posts and comments about the record. It is a useful way to stay up-to-date with changes made to contracts in Salesforce.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Modify All" on the Contract object
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Body         | <p><b>Type</b><br/>textarea</p> <p><b>Properties</b><br/>Nillable, Sort</p> <p><b>Description</b><br/>The content of ContractFeed. This field is the message that appears in the feed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId | <p><b>Type</b><br/>reference</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Usage

Use this object to track changes for a contract record.

SEE ALSO:

[Contract](#)

[EntitySubscription](#)

[NewsFeed](#)

[UserProfileFeed](#)

## ContractHistory

Represents the history of changes to the values in the fields of a contract.

## Supported Calls

`describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

## Usage

Use this object to identify changes to a contract.

This object respects field level security on the parent object.

SEE ALSO:

[ContractStatus](#)

## ContractLineItem

Represents a Product2 in a ServiceContract (customer support agreement). This object is available in API version 18.0 and later.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                         | <b>Description</b><br>Contract line item's sales price multiplied by the <code>Quantity</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>TotalPrice</code> | <b>Type</b><br>currency<br><b>Properties</b><br>Filter, Nillable<br><b>Description</b><br>This field is available only for backward compatibility. It represents the total price of the <code>ContractLineItem</code> .<br>If you specify <code>Discount</code> and <code>Quantity</code> , this field or <code>UnitPrice</code> is required.<br>This field is nillable, but you can't set both <code>TotalPrice</code> and <code>UnitPrice</code> to null in the same update request. To insert the <code>TotalPrice</code> for a contract line item via the API (given only a unit price and the quantity), calculate this field as the unit price multiplied by the quantity. |
| <code>UnitPrice</code>  | <b>Type</b><br>currency<br><b>Properties</b><br>Create, Filter, Update<br><b>Description</b><br>The unit price for the contract line item. In the user interface, this field's value is calculated by dividing the total price of the contract line item by the quantity listed for that line item. Label is <b>Sales Price</b> .<br>This field or <code>TotalPrice</code> is required. You can't specify both.<br>If you specify <code>Discount</code> and <code>Quantity</code> , this field or <code>TotalPrice</code> is required.                                                                                                                                           |

## Usage

Use this object to query and manage contract line items.

SEE ALSO:

[ContractLineItemHistory](#)

## ContractLineItemHistory

Represents the history of changes to the values in the fields on a `ContractLineItem` (items in a customer support agreement). This object is available in API version 18.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| Field              | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Usage

Use this object to identify changes to a contract line item.

This object respects field level security on the parent object.

SEE ALSO:

[ContractLineItem](#)

## ContractStatus

Represents the status of a Contract, such as Draft, InApproval, Activated, Terminated, or Expired.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

## Usage

This object represents a value in the contract status picklist. The contract status picklist provides additional information about the status of a Contract, such as its current state (`Draft`, `InApproval`, or `Activated`). You can query these records to retrieve the set of values in the contract status picklist, and then use that information while processing Contract objects to determine more information

about a given contract. For example, the application could test whether a given contract is activated based on its `Status` value and the value of the `StatusCode` property in the associated `ContractStatus` object.

## Usage

ContractTag stores the relationship between its parent TagDefinition and the Contract being tagged. Tag objects act as metadata, allowing users to describe and organize their data.

When a tag is deleted, its parent TagDefinition will also be deleted if the name is not being used; otherwise, the parent remains. Deleting a TagDefinition sends it to the Recycle Bin, along with any associated tag entries.

## CronJobDetail

Contains details about the associated scheduled job, such as the job's name and type. This object is available in API version 29.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field   | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## Usage

Use this object to query additional information about a scheduled job, such as the job's name and type.

## CronTrigger

Contains schedule information for a scheduled job. CronTrigger is similar to a cron job on UNIX systems. This object is available in API version 17.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

For example, <i>America/Los_Angeles</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Usage

Use this object to query scheduled jobs in your organization.

# CurrencyType

Represents the currencies used by an organization for which the multicurrency feature is enabled.

## Supported Calls

`create()`, `describeSObjects()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `update()`

## Special Access Rules

- This object is not available in single-currency organizations.
- You need the “Customize Application” permission to edit this object.
- Your client application can't delete this object.
- Customer Portal users can't access this object.

## Fields

| Field          | Details                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ConversionRate | <b>Type</b><br>double<br><b>Properties</b><br>Filter<br><b>Description</b><br>Required. Conversion rate of this currency type against the corporate currency.                                                                                                                                                                                                                                                     |
| DecimalPlaces  | <b>Type</b><br>int<br><b>Properties</b><br>Filter<br><b>Description</b><br>Required. For this currency, specifies the number of digits to the right of the decimal point, such as zero (0) for JPY or 2 for USD.                                                                                                                                                                                                  |
| IsActive       | <b>Type</b><br>boolean<br><b>Properties</b><br>Defaulted on create, Filter<br><b>Description</b><br>Indicates whether this currency type is active ( <code>true</code> ) or not ( <code>false</code> ). Inactive currency types do not appear in picklists in the user interface. Label is <b>Active</b> . This field defaults to <code>false</code> if no value is provided when updating or inserting a record. |

| Field       | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| IsCorporate | <p><b>Type</b></p> <p>boolean</p> <p><b>Properties</b></p> <p>Defaulted on create, Filter</p> <p><b>Description</b></p> <p>Indicates whether this currency type is the corporate currency (<code>true</code>) or not (<code>false</code>). Label is <b>Corporate Currency</b>. All other currency conversion rates are applied against this corporate currency. If a currency is already defined as the corporate currency in the user interface, it can't be unset. When a non-corporate currency is set to a corporate currency, the system reconfigures all conversion rates based on the new corporate currency.</p> |
| IsoCode     | <p><b>Type</b></p> <p>picklist</p> <p><b>Properties</b></p> <p>Filter, Restricted picklist</p> <p><b>Description</b></p> <p>Required. ISO code of the currency. Must be one of the valid alphabetic, three-letter currency ISO codes defined by the ISO 4217 standard, such as <code>USD</code>, <code>GBP</code>, or <code>JPY</code>. Must be unique within your organization. Label is <b>Currency ISO Code</b>.</p>                                                                                                                                                                                                  |

## Usage

This object is for multicurrency organizations only. Use this object to define the currencies your organization uses.

When updating an existing record, make sure to provide values for all fields to avoid undesired changes to the `CurrencyType`. For example, if a value for `IsActive` is not provided, the default (`false`) is used, which could result in a currently active `CurrencyType` becoming inactive.

## CustomBrand

Represents a custom branding and color scheme. This object is available in API version 28.0 and later.

## Supported Calls

`create()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

| ParentId   | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Create, Filter, Group, Sort, Update</p> <p><b>Description</b><br/>The ID of the parent entity that this branding applies to. The parent entity can be either a network, organization, topic, or reputation level.</p> <p>The branding applies to the entity that the <code>ParentId</code> references. For example, if the <code>ParentId</code> references a network ID, the branding applies to that network (community) only, and if the <code>ParentId</code> references an organization ID, the branding applies to the organization that it is accessed through, and so on. Label is <code>Branded Entity ID</code>.</p> |

## Usage

Use this object along with [CustomBrandAsset](#) to apply a custom branding scheme to your community. The branding scheme for the community shows in both the user interface and in Salesforce1. You must have “Create and Manage Communities” to customize community branding.

You can also use this object to apply a custom branding scheme to your organization when it is accessed through Salesforce1.

[Network](#)

## CustomBrandAsset

Represents a branding element in a custom branding scheme. For example, a color, logo image, header image, or footer text. A CustomBrandAsset can apply to a community or to an organization using Salesforce1. This object is available in API version 28.0 and later.

## Supported Calls

`create()`, `delete()`, `describeSObjects()`, `query()`, `retrieve()`, `update()`, `upsert()`

## Special Access Rules

This object is available only if Salesforce Communities is enabled in your organization.

## Usage

Use this object to add basic branding elements—color scheme, header or footer images, login page logo, or footer text—to the branding scheme ([CustomBrand](#)) for your Network. You must have “Create and Manage Communities” to customize community branding.

If you’re using communities in Salesforce1, the loading page shows the logo.

SEE ALSO:

[Network](#)

## *Custom Metadata Type\_\_mdt*

Represents a custom metadata record. This object is available in API version 34.0 and later.

The object name is a variable with the syntax *Custom Metadata Type\_\_mdt*, where *Custom Metadata Type* is the `ObjectName` for the custom metadata type associated with the custom metadata record. For example, `PicklistUsage__mdt` represents a custom metadata record based on the `PicklistUsage` custom metadata type.

## Supported Calls

`describeSObjects()`, `describeLayout()`, `query()`, `retrieve()`

|             | <p><b>Description</b></p> <p>The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| NamespacePrefix  | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><i>namespacePrefix__componentName</i></b> notation. |
| QualifiedApiName | <b>Type</b><br>string<br><b>Properties</b><br>Filter, Group, Nillable, Sort<br><b>Description</b><br>A concatenation of the namespace prefix and developer name. The format is <b><i>NamespacePrefix__DeveloperName</i></b> .                                                                                                                                                                        |

## Custom Object\_\_Feed

Represents a single feed item on a custom object detail page. This object is available in API version 18.0 and later.

A custom object feed shows recent changes to a custom object record for fields that are tracked in feeds, and posts and comments about the object. It is a useful way to stay up-to-date with changes made to a custom object. The object name is variable and uses a *Custom Object\_\_Feed* syntax, where *Custom Object* is the **Object Name** for the custom object. For example, *Offer\_\_Feed* represents a feed object for the custom object named Offer.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Special Access Rules

You can delete all feed items you created. To delete feed items you didn't create, you must have one of these permissions:

- "Modify All Data"
- "Moderate Chatter"

**Note:** Users with the "Moderate Chatter" permission can delete only the feed items and comments they see.

## Fields

| Field        | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| CommentCount | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of <code>FeedComments</code> associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ConnectionId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|       | <ul style="list-style-type: none"> <li>• <code>PollPost</code>—a poll posted on a feed.</li> <li>• <code>ProfileSkillPost</code>—generated when a skill is added to a user's Chatter profile.</li> <li>• <code>QuestionPost</code>—generated when a user posts a question.</li> <li>• <code>ReplyPost</code>—generated when Chatter Answers posts a reply.</li> <li>• <code>RypplePost</code>—generated when a user creates a Thanks badge in Work.com.</li> <li>• <code>TextPost</code>—a direct text entry on a feed.</li> <li>• <code>TrackedChange</code>—a change or group of changes to a tracked field.</li> <li>• <code>UserStatus</code>—automatically generated when a user adds a post. Deprecated.</li> </ul> <p>The following values appear in the <code>Type</code> picklist for all feed objects but apply only to <code>CaseFeed</code>:</p> <ul style="list-style-type: none"> <li>• <code>CaseCommentPost</code>—generated event when a user adds a case comment for a case object</li> <li>• <code>EmailMessageEvent</code>—generated event when an email related to a case object is sent or received</li> <li>• <code>CallLogPost</code>—generated event when a user logs a call for a case through the user interface. CTI calls also generate this event.</li> <li>• <code>ChangeStatusPost</code>—generated event when a user changes the status of a case</li> <li>• <code>AttachArticleEvent</code>—generated event when a user attaches an article to a case</li> </ul> <p> <b>Note:</b> If you set <code>Type</code> to <code>ContentPost</code>, also specify <code>ContentData</code> and <code>ContentFileName</code>.</p> |

## Usage

Use this object to track changes for a custom object. A record of this object type is automatically created when a user enables feed tracking for a custom object.

## CustomPermission

Represents a permission created to control access to a custom process or app, such as sending email. This object is available in API version 31.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name    | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| NamespacePrefix | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Nillable, Sort</p> <p><b>Description</b><br/>The namespace prefix associated with this object. Each Developer Edition organization that creates a managed package has a unique namespace prefix. Limit: 15 characters. You can refer to a component in a managed package by using the <b><code>namespacePrefix__componentName</code></b> notation.</p> <p>The namespace prefix can have one of the following values:</p> <ul style="list-style-type: none"> <li>In Developer Edition organizations, the namespace prefix is set to the namespace prefix of the organization for all objects that support it. There is an exception if an object is in an installed managed package. In that case, the object has the namespace prefix of the installed managed package. This field's value is the namespace prefix of the Developer Edition organization of the package developer.</li> <li>In organizations that are not Developer Edition organizations, <code>NamespacePrefix</code> is only set for objects that are part of an installed managed package. There is no namespace prefix for all other objects.</li> </ul> |

## Usage

Use the CustomPermission object to determine users' access to custom permissions.

For example, to query all permission sets where the Button1 permission is enabled:

```
SELECT Id, DeveloperName,  
(select Id, Parent.Name, Parent.Profile.Name from SetupEntityAccessItems)  
FROM CustomPermission  
WHERE DeveloperName = 'Button1'
```

To query all permission sets and profiles with custom permissions:

```
SELECT Assignee.Name, PermissionSet.Id,  
PermissionSet.Profile.Name,  
PermissionSet.isOwnedByProfile,  
PermissionSet.Label  
FROM PermissionSetAssignment  
WHERE PermissionSetId  
IN (SELECT ParentId  
    FROM SetupEntityAccess  
    WHERE SetupEntityType =  
    'CustomPermission')
```

To query for all SetupEntityAccess rows with custom permissions:

```
SELECT Id, ParentId, Parent.Name, SetupEntityId  
FROM SetupEntityAccess  
WHERE SetupEntityType='CustomPermission'  
AND ParentId  
IN (SELECT Id  
    FROM PermissionSet  
    WHERE isOwnedByProfile = false)
```

## CustomPermissionDependency

---

Represents the dependency between two custom permissions when one custom permission requires that you enable another custom permission. This object is available in API version 32.0 and later.

## Supported Calls

`describeLayout()`, `describeSObjects()`, `query()`, `retrieve()`

## Fields

| Field Name                 | Details                                                                                                                                                                                                                      |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CustomPermissionId         | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the custom permission that requires the permission that's specified in RequiredCustomPermissionId.</p> |
| RequiredCustomPermissionId | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The ID of the custom permission that must be enabled when CustomPermissionId is enabled.</p>                     |

## Usage

The following Apex class contains a method that returns the IDs of all custom permissions that are required for the given custom permission ID. To use this class, save it in your organization.

```
public class CustomPermissionUtil {
    public String[] getAllRequiredCustomPermissions(String customPermId) {
        return getAllRequiredHelper(new String[]{customPermId});
    }

    private String[] getAllRequiredHelper(String[] customPermIds) {
        CustomPermissionDependency[] requiredPerms = [SELECT RequiredCustomPermissionId
                                                    FROM CustomPermissionDependency
                                                    WHERE CustomPermissionId
                                                    IN :customPermIds];

        String[] requiredPermIds = new String[]{};
        for (CustomPermissionDependency cpd : requiredPerms) {
            requiredPermIds.add(cpd.RequiredCustomPermissionId);
        }
        if (requiredPermIds.size() > 0) {
            customPermIds.addAll(getAllRequiredHelper(requiredPermIds));
            return customPermIds;
        } else {
            return customPermIds;
        }
    }
}
```

For more information about using Apex classes, see the [Force.com Apex Code Developer's Guide](#).

# DandBCompany

Represents a Dun & Bradstreet® company record, which is associated with an account added from Data.com. This object is available in API version 25.0 and later.

 **Warning:** You can update fields in the DandBCompany object; however, field changes may be overwritten by Data.com Clean jobs or by using the Data.com Clean button.

## Supported Calls

`create()`, `delete()`, `describeLayout()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`, `search()`, `undelete()`, `update()`, `upsert()`

## Special Access Rules

Only organizations with Data.com Premium Prospector or Data.com Premium Clean can access this object.

## Fields

| Field Name             | Details                                                                                                                                                                                                                                     |

## Usage

Use this object to manage D&B Company records in your organization.

## Dashboard

---

Represents a dashboard, which shows data from custom reports as visual components. Access is read-only. This object is available in API version 20.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`, `search()`

## Fields

| Field                            | Details                                                                                                                                                                                                                                                                                                                                                                                            |

| DeveloperName | <p><b>Type</b><br/>string</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>Required. The unique name of the object in the API. This name can contain only underscores and alphanumeric characters, and must be unique in your org. It must begin with a letter, not include spaces, not end with an underscore, and not contain two consecutive underscores. In managed packages, this field prevents naming conflicts on package installations. With this field, a developer can change the object's name in a managed package and the changes are reflected in a subscriber's organization. Label is <code>Dashboard Unique Name</code>.</p> <p> <b>Note:</b> When creating large sets of data, always specify a unique <code>DeveloperName</code> for each record. If no <code>DeveloperName</code> is specified, performance may slow while Salesforce generates one for each record.</p> |
| FolderId      | <p><b>Type</b><br/>reference</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>Required. Returns the ID of the Folder that contains the dashboard. |       | <ul style="list-style-type: none"> <li><code>MyTeamUser</code>—The dashboard displays data according to the access level of the logged-in user, and managers can view dashboards from the point of view of users beneath them in the role hierarchy.</li> </ul> |

## Supported Query Scopes

Use these scopes to help specify the data that your SOQL query returns.

### **allPrivate**

Records saved in all users' private folders.

Requires the user permission "Manage All Private Reports and Dashboards" and [Enhanced Analytics Folder Sharing](#). If your organization was created after the Summer '13 release, you already have Enhanced Analytics Folder Sharing. Available in API version 36.0 and later.

### **created**

Records created by the user running the query.

### **everything**

All records except records saved in other users' private folders.

### **mine**

Records saved in the private folder of the user running the query.

## Usage

Provides read only access to the current values in the dashboard fields.

## Example: Dashboards in an Inactive User's Private Folder

This SOQL query returns dashboards saved in a specific user's private folder.

```
SELECT Id FROM Dashboard USING SCOPE allPrivate WHERE CreatedById = '005A0000000Bc2deFG'
```

[Report](#)

## DashboardComponent

Represents a dashboard component, which can be a chart, metric, table, or gauge on a dashboard. Access is read-only. This object is available in API version 21.0 and later.

## Supported Calls

`describeSObjects()`, `query()`, `retrieve()`

## Fields

## Usage

Provides read only access to the current values in dashboard component fields.

## DashboardComponentFeed

Represents a single feed item in the feed displayed on a dashboard component. This object is available in API version 21.0 and later.

## Supported Calls

`delete()`, `describeSObjects()`, `getDeleted()`, `getUpdated()`, `query()`, `retrieve()`

## Fields

| CommentCount       | <p><b>Type</b><br/>int</p> <p><b>Properties</b><br/>Filter, Group, Sort</p> <p><b>Description</b><br/>The number of FeedComments associated with this feed item.</p> <p> <b>Tip:</b> In a feed that supports pre-moderation, <code>CommentCount</code> isn't updated until a comment is published. For example, say you comment on a post that already has one published comment and your comment triggers moderation. Now there are two comments on the post, but the count says there's only one. In a moderated feed, your comment isn't counted until it's approved by an admin or a person with "CanApproveFeedPostAndComment" or "ModifyAllData" permission.</p> <p>This has implications for how you retrieve feed comments. In a moderated feed, rather than retrieving comments by looping through <code>CommentCount</code>, go through pagination until end of comments is returned.</p> |
| ContentData        | <p><b>Type</b><br/>base64</p> <p><b>Properties</b><br/>Nillable</p> <p><b>Description</b><br/>Available in API version 36.0 and earlier only. Required if <code>Type</code> is <code>ContentPost</code>. Encoded file data in any format, and can't be 0 bytes. Setting this field automatically sets <code>Type</code> to <code>ContentPost</code>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
